l2cap_private.h

Functions

	Name	Description
	_bt_l2cap_clear_channel_cmd_queue	This is function _bt_l2cap_clear_channel_cmd_queue.
	_bt_l2cap_eretr_pack_config_request	This is function _bt_l2cap_eretr_pack_config_request.
	_bt_l2cap_process_connect_signal	This is function _bt_l2cap_process_connect_signal.
	_l2cap_allocate_buffers	Defined by OEM through library configuration
	_l2cap_data_receive_callback	From l2cap_recv.c
	_pack_cmd_reject	This is function _pack_cmd_reject.
	_pack_config_request	This is function _pack_config_request.
	_pack_config_response	This is function _pack_config_response.
	_pack_conn_param_update_request	This is function _pack_conn_param_update_request.
	_pack_conn_param_update_response	This is function _pack_conn_param_update_response.
	_pack_conn_request	This is function _pack_conn_request.
	_pack_conn_response	This is function _pack_conn_response.
	_pack_dconn_request	This is function _pack_dconn_request.
	_pack_dconn_response	This is function _pack_dconn_response.
	_pack_echo_request	This is function _pack_echo_request.
	_pack_echo_response	This is function _pack_echo_response.
	_pack_info_request	This is function _pack_info_request.
	_pack_info_response	This is function _pack_info_response.
	_process_config_req	From cmd_config.c
	_process_config_res	This is function _process_config_res.
	_process_conn_param_update_req	This is function _process_conn_param_update_req.
	_process_conn_param_update_res	This is function _process_conn_param_update_res.
	_process_conn_req	From cmd_connect.c
	_process_conn_res	This is function _process_conn_res.
	_process_dconn_req	From cmd_disconnect.c
	_process_dconn_res	This is function _process_dconn_res.
	_process_echo_req	From cmd_echo.c
	_process_echo_res	This is function _process_echo_res.
	_process_info_req	From cmd_info.c
	_process_info_res	This is function _process_info_res.
	_process_reject	From cmd_reject.c
	_process_unknown_req	From cmd_unknown.c
	_process_unknown_res	This is function _process_unknown_res.
	_read_cmd_reject	This is function _read_cmd_reject.
	_read_config_request	This is function _read_config_request.
	_read_config_response	This is function _read_config_response.
	_read_conn_param_update_request	This is function _read_conn_param_update_request.
	_read_conn_param_update_response	This is function _read_conn_param_update_response.
	_read_conn_request	This is function _read_conn_request.
	_read_conn_response	This is function _read_conn_response.
	_read_dconn_request	This is function _read_dconn_request.
	_read_dconn_response	This is function _read_dconn_response.
	_read_echo_request	This is function _read_echo_request.
	_read_echo_response	This is function _read_echo_response.
	_read_info_request	This is function _read_info_request.
	_read_info_response	This is function _read_info_response.
	read_command	From channel_cmd_recv.c

Macros

	Name	Description
	CHANNEL_SIGNAL_CMD_DISCONNECT_FIXED	This is macro CHANNEL_SIGNAL_CMD_DISCONNECT_FIXED.
	L2CAP_EXT_FEATURES_ENABLED	This is macro L2CAP_EXT_FEATURES_ENABLED.

Types

	Name	Description
	bt_l2cap_cmd_assembler_fp	This is type bt_l2cap_cmd_assembler_fp.
	bt_l2cap_cmd_parser_fp	This is type bt_l2cap_cmd_parser_fp.
	bt_l2cap_request_handler_fp	This is type bt_l2cap_request_handler_fp.
	bt_l2cap_response_handler_fp	This is type bt_l2cap_response_handler_fp.

rfcomm.h

Functions

	Name	Description
	bt_rfcomm_allocate_dlc	brief Allocate DLC. ingroup rfcomm details This function allocates a new DLC on the specified RFCOMM session. param session The RFCOMM session. param dlci DLCI of the new DLC. return li A pointer to the new DLC if the function succeeds. li c NULL otherwise.
	bt_rfcomm_allocate_session	brief Allocate RFCOMM session. ingroup rfcomm details This function allocates a new RFCOMM session. param l2cap_mgr The L2CAP manager on which the RFCOMM session is to be created. param callback The callback function that is called when session state changes. param param An arbitrary data pointer that will be passed to the callback function specified by the c callback parameter. return li A pointer to the new RFCOMM session structure if the function succeeds. li c NULL otherwise.
	bt_rfcomm_cancel_listen	This is function bt_rfcomm_cancel_listen.
	bt_rfcomm_close_dlc	brief Close DLC. ingroup rfcomm details This function closes a DLC. If DLCI = 0, the parent RFCOMM session is also closed.
	bt_rfcomm_connect	brief Connect to a remote device. ingroup rfcomm details This function establishes an RFCOMM connection with a remote device and opens a data DLC. Changes in the session state are reported through a callback function specified when the session has been allocated via call to bt_rfcomm_allocate_session. Changes in the data DLC are reported through a callback function specified in this call. param remote_addr Address of the remote device. param server_channel A server channel of the remote RFCOMM server. param callback The callback function for reporting changes in DLC state opened by this call. param param An arbitrary data pointer... more
	bt_rfcomm_find_dlc	brief Find DLC
	bt_rfcomm_free_dlc	brief Release DLC. ingroup rfcomm details This function releases the specified DLC. param dlc The DLC to be released.
	bt_rfcomm_free_session	brief Release RFCOMM session. ingroup rfcomm details This function deallocates the specified RFCOMM session. This function does not disconnect the session. It just frees the memory used by the bt_rfcomm_session structure. The session has to be disconnected by calling bt_rfcomm_close_dlc with DLCI = 0 first. param session The RFCOMM session to be deallocated.
	bt_rfcomm_get_frame_length	This is function bt_rfcomm_get_frame_length.
	bt_rfcomm_init	brief Initialize the RFCOMM layer. ingroup rfcomm details This function initializes the RFCOMM layer of the stack. It must be called prior to any other RFCOMM function can be called.

	bt_rfcomm_listen	brief Listen for incoming connections. ingroup rfcomm details This function enables incoming connections on the specified RFCOMM session. Changes in the session state are reported through a callback function. param server_channel A server channel on which the RFCOMM session will listen and accept incoming connections. param callback The callback function that is called when session state changes. param param An arbitrary data pointer that will be passed to the callback function specified by the c callback parameter. return li c TRUE if the function succeeds. li c FALSE otherwise. The callback function is not called in this case.
	bt_rfcomm_open_dlc	brief Open DLC. ingroup rfcomm details This function opens the specified DLC. Before calling this function the RFCOMM session must be already open. This function is not to be used with DLCI = 0. Changes in DLC state are reported through a callback function. param dlc The DLC to open. param callback The callback function for reporting changes in DLC state. param param An arbitrary data pointer that will be passed to the callback function specified by the c callback parameter. return li c TRUE if the function succeeds. li c FALSE otherwise. The callback function is not called in... more
	bt_rfcomm_send_credit	This is function bt_rfcomm_send_credit.
	bt_rfcomm_send_data	brief Send data over a DLC. ingroup rfcomm details This function sends data over the specified DLC. Operation completion is reported through callback function. param dlc The DLC. param data A pointer to the data to be sent. param len Data length. param callback The callback function that is called when operation completes. return li c TRUE if the function succeeds. li c FALSE otherwise. The callback function is not called in this case.

rfcomm_config.h

Macros

	Name	Description
	__RFCOMM_CONFIG_H	This is macro __RFCOMM_CONFIG_H.
	RFCOMM_ALLOCATE_BUFFERS_FUNCTION	This is macro RFCOMM_ALLOCATE_BUFFERS_FUNCTION.
	RFCOMM_ALLOCATE_BUFFERS_RAM_SIZE_VAR	This is macro RFCOMM_ALLOCATE_BUFFERS_RAM_SIZE_VAR.
	RFCOMM_ALLOCATE_BUFFERS_VARS	This is macro RFCOMM_ALLOCATE_BUFFERS_VARS.
	RFCOMM_BUFFER_SIZE	This is macro RFCOMM_BUFFER_SIZE.
	RFCOMM_ENABLE_MULTIDEVICE_CHANNELS	brief Enable multi-device server channels. ingroup rfcomm_config details Normally each server channel can be used only once. I.e. if device A connected to channel 1, device B cannot connect to channel 1 until device A disconnects. With this option it is possible to make channels accept connections from several devices at the same time. I.e., if RFCOMM_ENABLE_MULTIDEVICE_CHANNELS is TRUE both device A and device B can connect to channel 1 at the same time.
	RFCOMM_INFO_LEN	brief Maximum size of the data portion of a UIH frame. ingroup rfcomm_config details This parameter defines the maximum size of the data portion of a UIH frame. If CFC is used the actual length of the data portion will be 1 byte less. This value must be less than or equal to HCI_L2CAP_BUFFER_LEN - RFCOMM_FRAME_HEADER_LEN - L2CAP_HEADER_LEN.
	RFCOMM_LOCAL_CREDIT	brief The number of receive buffers. ingroup rfcomm_config details This parameter defines the number of received UIH frames that can be stored on the local device. The flow control mechanism used in RFCOMM ensures that the remote side of the link always knows how many free buffers left on the local device. When the number of free buffers reaches 0, the transmitter stops sending data frames until the receiver frees some buffers. The RFCOMM layer does not actually allocate space for buffers. It uses RFCOMM_LOCAL_CREDIT to keep track of free buffers and report them to the remote side. Actual memory... more
	RFCOMM_LOCAL_CREDIT_SEND_THRESHOLD_DECL	This is macro RFCOMM_LOCAL_CREDIT_SEND_THRESHOLD_DECL.
	RFCOMM_MAX_CMD_BUFFERS	brief Maximum number of command buffers. ingroup rfcomm_config details This parameter defines the maximum number of commands that can be sent at the same time. It is usually enough to reserve 2 buffers for each DLC excluding control DLC. Therefore, this value can be defined as rn #define RFCOMM_MAX_CMD_BUFFERS (RFCOMM_MAX_DLCS - 1) * 2

	RFCOMM_MAX_DLCS	brief Maximum number of DLCs ingroup rfcomm_config details This parameter defines the maximum number of DLCs on each session. This value should be at least 2 because each session uses one DLC to convey multiplexer control messages. All other DLCs are used to emulate serial ports.
	RFCOMM_MAX_SERVER_CHANNELS	brief Maximum number of Server channels ingroup rfcomm_config details This parameter defines the maximum number of server channels exposed by the local device. This value should not exceed RFCOMM_MAX_DLCS - 1.
	RFCOMM_MAX_SESSIONS	brief Maximum number of remote devices a local device can be connected to ingroup rfcomm_config details This parameter defines the maximum number of remote devices a local device can have simultaneous connections to. This value should not exceed HCI_MAX_HCI_CONNECTIONS.

sbc.h

Provides SBC Decoder Library interface services.

Functions

	Name	Description
	sbc_decode	Decodes the encoded SBC frame.
	sbc_get_codesize	Gets the input block size.
	sbc_get_frame_duration	Gets the time one input/output block takes to play in microseconds.
	sbc_get_frame_length	Gets the output block size.
	sbc_get_state_size	Gets the SBC Decoder's state data structure.
	sbc_init	Initializes the SBC Decoder.

Macros

	Name	Description
	__SBC_H	This is macro __SBC_H.
	INP_BUF_SIZE	Bytes
	MAX_SBC_DEC_STATE_SIZE	Bytes
	OUT_BUF_SIZE	Bytes
	SBC_AM_LOUDNESS	Allocation method
	SBC_AM_SNR	This is macro SBC_AM_SNR.
	SBC_BE	This is macro SBC_BE.
	SBC_BLK_12	This is macro SBC_BLK_12.
	SBC_BLK_16	This is macro SBC_BLK_16.
	SBC_BLK_4	Blocks
	SBC_BLK_8	This is macro SBC_BLK_8.
	SBC_FREQ_16000	Sampling frequency
	SBC_FREQ_32000	This is macro SBC_FREQ_32000.
	SBC_FREQ_44100	This is macro SBC_FREQ_44100.
	SBC_FREQ_48000	This is macro SBC_FREQ_48000.
	SBC_LE	Data endianness
	SBC_MODE_DUAL_CHANNEL	This is macro SBC_MODE_DUAL_CHANNEL.
	SBC_MODE_JOINT_STEREO	This is macro SBC_MODE_JOINT_STEREO.
	SBC_MODE_MONO	Channel mode
	SBC_MODE_STEREO	This is macro SBC_MODE_STEREO.
	SBC_SB_4	Sub-bands
	SBC_SB_8	This is macro SBC_SB_8.
	ssize_t	

Structures

	Name	Description
	sbc_struct	

Types

	Name	Description
	sbc_t	This is type sbc_t.

Description

SBC Decoder Library Interface File

SBC Decoder interface services to decode the encoded data received, from the Bluetooth device, which will be executed in audioTask.

File Name

sbc.h

Company

Microchip Technology Inc.

sdp.h

Functions

	Name	Description
	bt_sdp_start	brief Start SDP server ingroup sdp details This function starts the SDP server. param l2cap_mgr The L2CAP manager on which the SDP server is to be started. param sdp_db A pointer to the SDP database define with BEGIN_SDP_DB and END_SDP_DB macros. return li c TRUE if the function succeeds. li c FALSE otherwise.

Macros

	Name	Description
	BEGIN_DE_SEQUENCE	• brief Begin a data element sequence • ingroup sdp * • details BEGIN_DE_SEQUENCE and END_DE_SEQUENCE are used to define a data element sequence which is an array of sdp_data_element structures. • The array is used a search pattern in bt_sdp_request_service_search() and bt_sdp_request_service_attribute(). • For example, to find a AVRCP Target the following code can be used: code const bt_uuid_t AVRCP_AV_REMOTE_CONTROL_CLSID = { 0x5F9B34FB, 0x80000080, 0x00001000, SDP_CLSID_AV_REMOTE_CONTROL }; const bt_uuid_t AVRCP_AV_REMOTE_CONTROL_TARGET_CLSID = { 0x5F9B34FB, 0x80000080, 0x00001000, SDP_CLSID_AV_REMOTE_CONTROL_TARGET }; BEGIN_DE_SEQUENCE(avrcp_target_service_search, 2) DE_UUID128(AVRCP_AV_REMOTE_CONTROL_CLSID) DE_UUID128(AVRCP_AV_REMOTE_CONTROL_TARGET_CLSID) END_DE_SEQUENCE(avrcp_target_service_search) . . . void findAvrcpTarget(void) { INIT_DE_SEQUENCE(avrcp_target_service_search); bt_sdp_request_service_search(channel, &seq_avrcp_target_service_search, &callback, NULL); } endcode * • param... more
	DE_BOOL	brief Declare a boolean data element ingroup sdp details This macro adds a boolean data element to a data element sequence. This macro is to be used between BEGIN_DE_SEQUENCE and END_DE_SEQUENCE. param value The data element value.
	DE_INT	brief Declare a 1-byte signed integer data element ingroup sdp details This macro adds a 1-byte signed integer data element to a data element sequence. This macro is to be used between BEGIN_DE_SEQUENCE and END_DE_SEQUENCE. param value The data element value.
	DE_STRING	brief Declare a text string data element ingroup sdp details This macro adds a text string data element to a data element sequence. The length of the generated data element will be the actual length of the string. This macro is to be used between BEGIN_DE_SEQUENCE and END_DE_SEQUENCE. param value The data element value.

	DE_STRING2	brief Declare a text string data element ingroup sdp details This macro adds a text string data element to a data element sequence. The length of the generated data element will be the value specified by the "len" parameter even if the actual length of the string is not equal to the "len" value. This macro is to be used between BEGIN_DE_SEQUENCE and END_DE_SEQUENCE. param value The data element value. param len The length of the data element value.
	DE_UINT	brief Declare a 1-byte unsigned integer data element ingroup sdp details This macro adds a 1-byte unsigned integer data element to a data element sequence. This macro is to be used between BEGIN_DE_SEQUENCE and END_DE_SEQUENCE. param value The data element value.
	DE_UINT16	brief Declare a 2-byte unsigned integer data element ingroup sdp details This macro adds a 2-byte unsigned integer data element to a data element sequence. This macro is to be used between BEGIN_DE_SEQUENCE and END_DE_SEQUENCE. param value The data element value.
	DE_URL	brief Declare a URL data element ingroup sdp details This macro adds a URL data element to a data element sequence. This macro is to be used between BEGIN_DE_SEQUENCE and END_DE_SEQUENCE. param value The data element value which is a pointer to a string.
	DE_UUID128	brief Declare a 128-bit UUID data element ingroup sdp details This macro adds a 128-bit UUID data element to a data element sequence. This macro is to be used between BEGIN_DE_SEQUENCE and END_DE_SEQUENCE. param value The data element value. The value must be a name of a variable of type bt_uuid.
	DE_UUID16	brief Declare a 16-bit UUID data element ingroup sdp details This macro adds a 16-bit UUID data element to a data element sequence. This macro is to be used between BEGIN_DE_SEQUENCE and END_DE_SEQUENCE. param value The data element value.
	DE_UUID32	brief Declare a 32-bit UUID data element ingroup sdp details This macro adds a 32-bit UUID data element to a data element sequence. This macro is to be used between BEGIN_DE_SEQUENCE and END_DE_SEQUENCE. param value The data element value.
	END_DE_SEQUENCE	brief End a data element sequence ingroup sdp details BEGIN_DE_SEQUENCE and END_DE_SEQUENCE are used to define a data element sequence which is an array of bt_sdp_data_element structures. param id The data element sequence identifier.
	INIT_DE_SEQUENCE	brief Initialize a data element sequence ingroup sdp details This macro calls a function defined in BEGIN_DE_SEQUENCE which initializes the data element sequence. param id The data element sequence identifier.
	SDP_ATTRID_AdditionalProtocolDescriptorLists	This is macro SDP_ATTRID_AdditionalProtocolDescriptorLists.
	SDP_ATTRID_BluetoothProfileDescriptorList	This is macro SDP_ATTRID_BluetoothProfileDescriptorList.
	SDP_ATTRID_BrowseGroupList	This is macro SDP_ATTRID_BrowseGroupList.
	SDP_ATTRID_ClientExecutableURL	This is macro SDP_ATTRID_ClientExecutableURL.
	SDP_ATTRID_DIPrimaryRecord	This is macro SDP_ATTRID_DIPrimaryRecord.
	SDP_ATTRID_DIProductId	This is macro SDP_ATTRID_DIProductId.
	SDP_ATTRID_DISpecificationId	This is macro SDP_ATTRID_DISpecificationId.
	SDP_ATTRID_DIVendorId	This is macro SDP_ATTRID_DIVendorId.
	SDP_ATTRID_DIVendorIdSource	This is macro SDP_ATTRID_DIVendorIdSource.
	SDP_ATTRID_DIVersion	This is macro SDP_ATTRID_DIVersion.
	SDP_ATTRID_DocumentationURL	This is macro SDP_ATTRID_DocumentationURL.
	SDP_ATTRID_GAPRemoteAudioVolumeControl	This is macro SDP_ATTRID_GAPRemoteAudioVolumeControl.
	SDP_ATTRID_GroupID	This is macro SDP_ATTRID_GroupID.
	SDP_ATTRID_HCRP_1284ID	This is macro SDP_ATTRID_HCRP_1284ID.
	SDP_ATTRID_HCRP_DeviceLocation	This is macro SDP_ATTRID_HCRP_DeviceLocation.

	SDP_ATTRID_HCRP_DeviceName	This is macro SDP_ATTRID_HCRP_DeviceName.
	SDP_ATTRID_HCRP_FriendlyName	This is macro SDP_ATTRID_HCRP_FriendlyName.
	SDP_ATTRID_HDPDataExchangeSpecification	This is macro SDP_ATTRID_HDPDataExchangeSpecification.
	SDP_ATTRID_HDPMCAPSupportedProcedures	This is macro SDP_ATTRID_HDPMCAPSupportedProcedures.
	SDP_ATTRID_HDPSuportedFeatures	This is macro SDP_ATTRID_HDPSuportedFeatures.
	SDP_ATTRID_HFPAGNetwork	This is macro SDP_ATTRID_HFPAGNetwork.
	SDP_ATTRID_HFPSupportedFeatures	This is macro SDP_ATTRID_HFPSupportedFeatures.
	SDP_ATTRID_HIDBatteryPower	This is macro SDP_ATTRID_HIDBatteryPower.
	SDP_ATTRID_HIDBootDevice	This is macro SDP_ATTRID_HIDBootDevice.
	SDP_ATTRID_HIDCountryCode	This is macro SDP_ATTRID_HIDCountryCode.
	SDP_ATTRID_HIDDescriptorList	This is macro SDP_ATTRID_HIDDescriptorList.
	SDP_ATTRID_HIDDeviceReleaseNumber	This is macro SDP_ATTRID_HIDDeviceReleaseNumber.
	SDP_ATTRID_HIDDeviceSubclass	This is macro SDP_ATTRID_HIDDeviceSubclass.
	SDP_ATTRID_HIDLANGIDBaseList	This is macro SDP_ATTRID_HIDLANGIDBaseList.
	SDP_ATTRID_HIDNormallyConnectable	This is macro SDP_ATTRID_HIDNormallyConnectable.
	SDP_ATTRID_HIDParserVersion	This is macro SDP_ATTRID_HIDParserVersion.
	SDP_ATTRID_HIDProfileVersion	This is macro SDP_ATTRID_HIDProfileVersion.
	SDP_ATTRID_HIDReconnectInitiate	This is macro SDP_ATTRID_HIDReconnectInitiate.
	SDP_ATTRID_HIDRemoteWake	This is macro SDP_ATTRID_HIDRemoteWake.
	SDP_ATTRID_HIDSDPDisable	This is macro SDP_ATTRID_HIDSDPDisable.
	SDP_ATTRID_HIDSupervisionTimeout	This is macro SDP_ATTRID_HIDSupervisionTimeout.
	SDP_ATTRID_HIDVirtualCable	This is macro SDP_ATTRID_HIDVirtualCable.
	SDP_ATTRID_IconURL	This is macro SDP_ATTRID_IconURL.
	SDP_ATTRID_INVALID	This is macro SDP_ATTRID_INVALID.
	SDP_ATTRID_LanguageBaseAttributeIDList	This is macro SDP_ATTRID_LanguageBaseAttributeIDList.
	SDP_ATTRID_OFFSET_ProviderName	This is macro SDP_ATTRID_OFFSET_ProviderName.
	SDP_ATTRID_OFFSET_ServiceDescription	This is macro SDP_ATTRID_OFFSET_ServiceDescription.
	SDP_ATTRID_OFFSET_ServiceName	This is macro SDP_ATTRID_OFFSET_ServiceName.
	SDP_ATTRID_PrimaryLanguageBaseId	This is macro SDP_ATTRID_PrimaryLanguageBaseId.
	SDP_ATTRID_ProtocolDescriptorList	This is macro SDP_ATTRID_ProtocolDescriptorList.
	SDP_ATTRID_ServiceAvailability	This is macro SDP_ATTRID_ServiceAvailability.
	SDP_ATTRID_ServiceClassIDList	This is macro SDP_ATTRID_ServiceClassIDList.
	SDP_ATTRID_ServiceDatabaseState	This is macro SDP_ATTRID_ServiceDatabaseState.
	SDP_ATTRID_ServiceID	This is macro SDP_ATTRID_ServiceID.
	SDP_ATTRID_ServiceInfoTimeToLive	This is macro SDP_ATTRID_ServiceInfoTimeToLive.
	SDP_ATTRID_ServiceRecordHandle	This is macro SDP_ATTRID_ServiceRecordHandle.
	SDP_ATTRID_ServiceRecordState	This is macro SDP_ATTRID_ServiceRecordState.
	SDP_ATTRID_SupportedFeatures	This is macro SDP_ATTRID_SupportedFeatures.
	SDP_ATTRID_VersionNumberList	This is macro SDP_ATTRID_VersionNumberList.
	SDP_CLSID_ADVANCED_AUDIO_DISTRIBUTION	This is macro SDP_CLSID_ADVANCED_AUDIO_DISTRIBUTION.
	SDP_CLSID_AUDIO_SINK	This is macro SDP_CLSID_AUDIO_SINK.
	SDP_CLSID_AUDIO_SOURCE	This is macro SDP_CLSID_AUDIO_SOURCE.
	SDP_CLSID_AV_REMOTE_CONTROL	This is macro SDP_CLSID_AV_REMOTE_CONTROL.
	SDP_CLSID_AV_REMOTE_CONTROL_CONTROLLER	This is macro SDP_CLSID_AV_REMOTE_CONTROL_CONTROLLER.
	SDP_CLSID_AV_REMOTE_CONTROL_PROFILE_ID	This is macro SDP_CLSID_AV_REMOTE_CONTROL_PROFILE_ID.
	SDP_CLSID_AV_REMOTE_CONTROL_TARGET	This is macro SDP_CLSID_AV_REMOTE_CONTROL_TARGET.
	SDP_CLSID_AVCTP	This is macro SDP_CLSID_AVCTP.
	SDP_CLSID_AVDTP	This is macro SDP_CLSID_AVDTP.
	SDP_CLSID_BrowseGroupDescriptorServiceClassID	This is macro SDP_CLSID_BrowseGroupDescriptorServiceClassID.
	SDP_CLSID_DialupNetworking	This is macro SDP_CLSID_DialupNetworking.
	SDP_CLSID_GENERIC_AUDIO	This is macro SDP_CLSID_GENERIC_AUDIO.
	SDP_CLSID_HARD_COPY_CABLE_REPLACEMENT	This is macro SDP_CLSID_HARD_COPY_CABLE_REPLACEMENT.
	SDP_CLSID_HARD_COPY_CONTROL_CHANNEL	This is macro SDP_CLSID_HARD_COPY_CONTROL_CHANNEL.
	SDP_CLSID_HARD_COPY_DATA_CHANNEL	This is macro SDP_CLSID_HARD_COPY_DATA_CHANNEL.
	SDP_CLSID_HARD_COPY_NOTIFICATION	This is macro SDP_CLSID_HARD_COPY_NOTIFICATION.

	SDP_CLSID_HCR_PRINT	This is macro SDP_CLSID_HCR_PRINT.
	SDP_CLSID_HCR_SCAN	This is macro SDP_CLSID_HCR_SCAN.
	SDP_CLSID_HDP	This is macro SDP_CLSID_HDP.
	SDP_CLSID_HDP_SINK	This is macro SDP_CLSID_HDP_SINK.
	SDP_CLSID_HDP_SOURCE	This is macro SDP_CLSID_HDP_SOURCE.
	SDP_CLSID_HFP	This is macro SDP_CLSID_HFP.
	SDP_CLSID_HFP_AG	This is macro SDP_CLSID_HFP_AG.
	SDP_CLSID_HID	This is macro SDP_CLSID_HID.
	SDP_CLSID_HIDProtocol	This is macro SDP_CLSID_HIDProtocol.
	SDP_CLSID_HSP	This is macro SDP_CLSID_HSP.
	SDP_CLSID_HSP_AG	This is macro SDP_CLSID_HSP_AG.
	SDP_CLSID_HSP_HS	This is macro SDP_CLSID_HSP_HS.
	SDP_CLSID_L2CAP	This is macro SDP_CLSID_L2CAP.
	SDP_CLSID_MCAP_CONTROL	This is macro SDP_CLSID_MCAP_CONTROL.
	SDP_CLSID_MCAP_DATA	This is macro SDP_CLSID_MCAP_DATA.
	SDP_CLSID_OBEXFileTransfer	This is macro SDP_CLSID_OBEXFileTransfer.
	SDP_CLSID_OBEXObjectPush	This is macro SDP_CLSID_OBEXObjectPush.
	SDP_CLSID_PBAP_PCE	This is macro SDP_CLSID_PBAP_PCE.
	SDP_CLSID_PBAP_PSE	This is macro SDP_CLSID_PBAP_PSE.
	SDP_CLSID_PNPInformation	This is macro SDP_CLSID_PNPInformation.
	SDP_CLSID_PublicBrowseGroup	This is macro SDP_CLSID_PublicBrowseGroup.
	SDP_CLSID_RFCOMM	This is macro SDP_CLSID_RFCOMM.
	SDP_CLSID_SerialPort	This is macro SDP_CLSID_SerialPort.
	SDP_CLSID_ServiceDiscoveryServerServiceClassID	defgroup sdp SDP This module describe functions and data structures used to start the SDP server and perform SDP queries.
	SDP_DATA_TYPE_ALTERNATIVE	This is macro SDP_DATA_TYPE_ALTERNATIVE.
	SDP_DATA_TYPE_BOOL	This is macro SDP_DATA_TYPE_BOOL.
	SDP_DATA_TYPE_INT	This is macro SDP_DATA_TYPE_INT.
	SDP_DATA_TYPE_INT128	This is macro SDP_DATA_TYPE_INT128.
	SDP_DATA_TYPE_INT16	This is macro SDP_DATA_TYPE_INT16.
	SDP_DATA_TYPE_INT32	This is macro SDP_DATA_TYPE_INT32.
	SDP_DATA_TYPE_INT64	This is macro SDP_DATA_TYPE_INT64.
	SDP_DATA_TYPE_INT8	This is macro SDP_DATA_TYPE_INT8.
	SDP_DATA_TYPE_NIL	This is macro SDP_DATA_TYPE_NIL.
	SDP_DATA_TYPE_SEQUENCE	This is macro SDP_DATA_TYPE_SEQUENCE.
	SDP_DATA_TYPE_STRING	This is macro SDP_DATA_TYPE_STRING.
	SDP_DATA_TYPE_UINT	This is macro SDP_DATA_TYPE_UINT.
	SDP_DATA_TYPE_UINT128	This is macro SDP_DATA_TYPE_UINT128.
	SDP_DATA_TYPE_UINT16	This is macro SDP_DATA_TYPE_UINT16.
	SDP_DATA_TYPE_UINT32	This is macro SDP_DATA_TYPE_UINT32.
	SDP_DATA_TYPE_UINT64	This is macro SDP_DATA_TYPE_UINT64.
	SDP_DATA_TYPE_UINT8	This is macro SDP_DATA_TYPE_UINT8.
	SDP_DATA_TYPE_URL	This is macro SDP_DATA_TYPE_URL.
	SDP_DATA_TYPE_UUID	This is macro SDP_DATA_TYPE_UUID.
	SDP_DATA_TYPE_UUID128	This is macro SDP_DATA_TYPE_UUID128.
	SDP_DATA_TYPE_UUID16	This is macro SDP_DATA_TYPE_UUID16.
	SDP_DATA_TYPE_UUID32	This is macro SDP_DATA_TYPE_UUID32.
	SDP_ERROR_INSUFFICIENT_RESOURCE	This is macro SDP_ERROR_INSUFFICIENT_RESOURCE.
	SDP_ERROR_INVALID_CONTINUATION_STATE	This is macro SDP_ERROR_INVALID_CONTINUATION_STATE.
	SDP_ERROR_INVALID_PDU_SIZE	This is macro SDP_ERROR_INVALID_PDU_SIZE.
	SDP_ERROR_INVALID_REQUEST_SYNTAX	This is macro SDP_ERROR_INVALID_REQUEST_SYNTAX.
	SDP_ERROR_INVALID_SDP_VERSION	This is macro SDP_ERROR_INVALID_SDP_VERSION.
	SDP_ERROR_INVALID_SR_HANDLE	This is macro SDP_ERROR_INVALID_SR_HANDLE.
	SDP_ERROR_RESERVED	This is macro SDP_ERROR_RESERVED.

	SDP_ErrorResponse	This is macro SDP_ErrorResponse.
	SDP_FTP_SERVICE_ID	This is macro SDP_FTP_SERVICE_ID.
	SDP_HID_SERVICE_ID	This is macro SDP_HID_SERVICE_ID.
	SDP_HSP_AG_SERVICE_ID	This is macro SDP_HSP_AG_SERVICE_ID.
	SDP_HSP_HS_SERVICE_ID	This is macro SDP_HSP_HS_SERVICE_ID.
	SDP_MAX_ATTRIBUTE_PATTERN_LEN	This is macro SDP_MAX_ATTRIBUTE_PATTERN_LEN.
	SDP_MAX_DATA_ELEMENT_LEN	This is macro SDP_MAX_DATA_ELEMENT_LEN.
	SDP_MAX_DATA_ELEMENTS	This is macro SDP_MAX_DATA_ELEMENTS.
	SDP_MAX_SEARCH_PATTERN_LEN	This is macro SDP_MAX_SEARCH_PATTERN_LEN.
	SDP_MAX_TRANSACTIONS	typedef struct _sdp_db { bt_int count; bt_sdp_service_record_p *records; } bt_sdp_db, *bt_sdp_db_p;
	SDP_PDU_HEADER_LEN	This is macro SDP_PDU_HEADER_LEN.
	SDP_RFCOMM_SERVICE_ID	This is macro SDP_RFCOMM_SERVICE_ID.
	SDP_ServiceAttributeRequest	This is macro SDP_ServiceAttributeRequest.
	SDP_ServiceAttributeResponse	This is macro SDP_ServiceAttributeResponse.
	SDP_ServiceSearchAttributeRequest	This is macro SDP_ServiceSearchAttributeRequest.
	SDP_ServiceSearchAttributeResponse	This is macro SDP_ServiceSearchAttributeResponse.
	SDP_ServiceSearchRequest	This is macro SDP_ServiceSearchRequest.
	SDP_ServiceSearchResponse	This is macro SDP_ServiceSearchResponse.
	SDP_SR_HANDLE_HDP_SINK	This is macro SDP_SR_HANDLE_HDP_SINK.
	SDP_SR_HANDLE_HDP_SOURCE	This is macro SDP_SR_HANDLE_HDP_SOURCE.
	SDP_SR_HANDLE_HFP_HF	This is macro SDP_SR_HANDLE_HFP_HF.
	SDP_SR_HANDLE_HID	This is macro SDP_SR_HANDLE_HID.
	SDP_SR_HANDLE_HID_KEYBOARD	This is macro SDP_SR_HANDLE_HID_KEYBOARD.
	SDP_SR_HANDLE_HSP_HS	This is macro SDP_SR_HANDLE_HSP_HS.
	SDP_SR_HANDLE_OBEXFileTransfer	This is macro SDP_SR_HANDLE_OBEXFileTransfer.
	SDP_SR_HANDLE_OBEXObjectPush	This is macro SDP_SR_HANDLE_OBEXObjectPush.
	SDP_SR_HANDLE_PNPINFORMATION	This is macro SDP_SR_HANDLE_PNPINFORMATION.
	SDP_SR_HANDLE_RFCOMM	This is macro SDP_SR_HANDLE_RFCOMM.
	SDP_SR_HANDLE_SERVER	This is macro SDP_SR_HANDLE_SERVER.
	SDP_SR_HANDLE_TEST	for simulating service search using continuation state

Functions

	Name	Description
	bt_sdp_request_service_attribute	brief Search attributes ingroup sdp details This function retrieves attribute values from a service record. param channel The L2CAP channel used to communicate to the remote SDP server. param sr The service record handle specifies the service record from which attribute values are to be retrieved. param pattern The attribute search pattern is a data element sequence where each element in the list is either an attribute ID or a range of attribute IDs. The pattern buffer must be valid for the duration of the search operation, i.e. until c callback is called for the first time. To define a... more
	bt_sdp_request_service_search	brief Search service records ingroup sdp details This function locates service records on a remote SDP server that match the given service search pattern. param channel The L2CAP channel used to communicate to the remote SDP server. param pattern The service search pattern is a data element sequence where each element in the sequence is a UUID. The sequence must contain at least one UUID. The maximum number of UUIDs in the sequence is 12. The pattern buffer must be valid for the duration of the search operation, i.e. until c callback is called. To define a data element sequence... more

sdp_config.h

Macros

	Name	Description
	__SDP_CONFIG_H	This is macro __SDP_CONFIG_H.

	SDP_ALLOCATE_BUFFERS_RAM_SIZE_VAR	• defgroup sdp_config Configuration
		• ingroup sdp
		*
		• This module describes parameters used to configure SDP.
		*
		• dotstack is customized using a configuration file. The configuration file tailors the dotstack to the application being built. It has to have the structure shown below.
		* code #include "cdbt/bt/bt_std.h"
		// HCI and L2CAP must always be present // SDP is required only if stack is running in dual mode. This is the default mode. // To run the stack in single mode (i.e. only BLE is supported) a BT_BLE_SINGLE_MODE symbol // must be defined: // #define BT_BLE_SINGLE_MODE
		// HCI configuration parameters #define... more

	SDP_ALLOCATE_BUFFERS_VARS	This is macro SDP_ALLOCATE_BUFFERS_VARS.
	SDP_MAX_ATTRIBUTE_RESULT_LEN	brief Maximum number of attributes to find ingroup sdp_config details This parameter defines the maximum number of attributes withing a service record the SDP server will return to the client.
	SDP_MAX_PDU_BUFFERS	brief Maximum number of SDP server PDU buffers. ingroup sdp_config details This parameter defines the maximum number of responses the SDP server can send at the same time.
	SDP_MAX_SEARCH_RESULT_LEN	brief Maximum number of service records to find. ingroup sdp_config details This parameter defines the maximum number of service records the SDP server will return to the client.

spp.h

Enumerations

	Name	Description
	_bt_spp_port_event_e	• Serial port event. Values of this enumeration represent serial port events. Events are reported to the application through a callback function. The callback function is specified when the port is allocated using bt_spp_allocate().
	_bt_spp_port_state_e	• Serial port state. Values of this enumeration represent states of the serial port.
	_bt_spp_send_status_e	Send operation status.

	bt_spp_port_event_e	• Serial port event. Values of this enumeration represent serial port events. Events are reported to the application through a callback function. The callback function is specified when the port is allocated using bt_spp_allocate().
	bt_spp_port_state_e	• Serial port state. Values of this enumeration represent states of the serial port.
	bt_spp_send_status_e	Send operation status.

Functions

	Name	Description
	bt_spp_allocate	• Allocate a serial port. The returned serial port is initially in the ::SPP_PORT_STATE_DISCONNECTED state. To establish a connection with a remote device, call bt_spp_connect(). To listen for incoming connections from other devices, call bt_spp_listen(). The p callback parameter must specify a callback function that will be used to notify about serial port events and state changes. When the port is not needed any more it must be deallocated by bt_spp_deallocate(). The maximum number of serial ports that can be allocated simultaneously is specified by the ::SPP_MAX_PORTS configuration parameter. @param l2cap_mgr L2CAP manager. @param callback Pointer to... more
	bt_spp_cancel_listen	• Stop listening for incoming connections. This function stops the port to accept incoming connections on a given server channel. @param port Serial port. @param channel The RFCOMM server channel to accept connections on. @return c TRUE if successful, c FALSE otherwise.
	bt_spp_cancel_receive	• Cancel receive data. If a receive operation is currently in progress this function will cancel it. After calling this function the receive callback specified in bt_spp_receive() will not be called. If there is no receive operation in progress calling this function has no effect. @param port Serial port.
	bt_spp_cancel_send	• Cancel send data. If a send operation is currently in progress this function will try to cancel it. When the operation is canceled the send callback function will be called with the ::SPP_SEND_STATUS_CANCELED status. If this function is called but the active send operation completes successfuly before the stack can actually cancel it the call back function will still be called with the ::SPP_SEND_STATUS_CANCELED status. If there is no send operation in progess calling this function has no effect. @param port Serial port.
	bt_spp_clr_port_options	This is function bt_spp_clr_port_options.
	bt_spp_connect	• Connect to a remote device. This function initiates a connection to a remote device. When the connection is successfully established the port's callback is called with the ::SPP_PORT_EVENT_CONNECTED event. If connection fails the callback is called with the ::SPP_PORT_EVENT_CONNECTION_FAILED event. The port must be in ::SPP_PORT_STATE_DISCONNECTED state. Otherwise, the function will fail. @param port Serial port. @param remote_addr Bluetooth address of the remote device. @param channel RFCOMM server channel on which the connection is to be established. @return c TRUE if successful, c FALSE otherwise.
	bt_spp_deallocate	• Deallocate serial port. This function deallocates the specified port structure and other resources associated with it. The port must be in ::SPP_PORT_STATE_DISCONNECTED state. Otherwise, the function will fail. If the function completes successfully the application must not try to access any fields in the structure and must not use it with any other SPP functions. Also, it becomes available for subsequent allocation by bt_spp_port_allocate(). @param port Serial port structure to deallocate. @return c TRUE if successful, c FALSE otherwise.

	bt_spp_disconnect	• Disconnect from the remote device. This function initiates the disconnection process. When it is complete the the port's callback is called with the SPP_PORT_EVENT_DISCONNECTED event. If the port is already in the disconnected state the function does nothing and the callback is not called. @param port Serial port.
	bt_spp_find_server	This is function bt_spp_find_server.
	bt_spp_find_server_ex	This is function bt_spp_find_server_ex.
	bt_spp_get_frame_length	• Get frame length. This function returns the RFCOMM frame length used by the RFCOMM protocol. The frame length depends on configuration of DotStack and configuration of the Bluetooth stack running on the remote device. In order to achieve maximum throughput over the serial port connection the application should send and receive data in chunks that are multiple of this frame length. @return RFCOMM frame length in bytes.
	bt_spp_get_hci_connection	• Get SPP port's ACL connection. This function returns a pinter to the structure that describes the ACL connection this port is on. @return Pointer to ACL connection description if the port is connected, NULL otherwise.
	bt_spp_get_local_modem_status	• Get local device's TS 07.10 control signals. This function returns current state of the local device's TS 07.10 controls signals. The signals are defined as a mask of the following constants: SPP_RS232_DSR SPP_RS232_RTS SPP_RS232_RI SPP_RS232_DCD @param port Serial port. @return local device's TS 07.10 control signals.
	bt_spp_get_remote_address	brief Get the address of the remote device this device is connected to. ingroup spp param port Serial port. return li c A pointer to bt_bdaddr structure that contains the address of the remote device.
	bt_spp_get_remote_modem_status	• Get remote device's TS 07.10 control signals. This function returns current state of the remote device's V.24 controls signals. The signals are defined as a mask of the following constants: SPP_RS232_DTR SPP_RS232_CTS SPP_RS232_RI SPP_RS232_DCD @param port Serial port. @return remote device's TS 07.10 control signals.
	bt_spp_init	• Initialize the SPP module. This function initializes all internal variables of the SPP module. It must be called prior to using any other functions in this module.
	bt_spp_listen	• Listen for incoming connections. This function registers the port to accept incoming connections from remote devices on a particular RFCOMM server channel. The specified server channel should be listed in the SDP database. Otherwise, remote devices will not be able to find out which server channel to use. When a remote device successfully establishes a connection on the specified port the port's callback is called with the ::SPP_PORT_EVENT_CONNECTED event. The port must be in ::SPP_PORT_STATE_DISCONNECTED state. Otherwise, the function will fail. @param port Serial port. @param channel The RFCOMM server channel on which to listen for connections. @return c TRUE... more
	bt_spp_receive	• Receive data. This function receives data from the serial port connection. The caller must provide a buffer and a callback function. Whenever the port receives data they are copied to the provided buffer and the callback function is called. The callback function is passed the length of received data and the same callback parameter that was specified when the port was allocated with bt_spp_allocate(). This function does not wait until the buffer is filled out completely. Any amount of received data will complete the operation. The port must be in ::SPP_PORT_STATE_CONNECTED state. Otherwise, the function will fail. Also, the... more

	bt_spp_send	• Send data. This function starts sending data over the serial port connection. Along with the data the caller must provide a callback function that is called when all data has been sent. Also, during execution of this operation the port's state callback function is called periodically with the ::SPP_PORT_EVENT_SEND_PROGRESS event. The port must be in ::SPP_PORT_STATE_CONNECTED state. Otherwise, the function will fail. Also, the function will fail if a previously started send operation is still in progress. The callback function is passed the same callback parameter that was specified when the port was allocated with bt_spp_allocate(). @param port Serial... more
	bt_spp_set_dtr	• Set local device's RS-232 DTR signal. Changes the state of local device's RS-232 DTR signal and notifies the remote device of the change. This signal corresponds to the TS 07.10's RFCOMM_MODEM_STATUS_RTC signal. If there are resources to send a command to the remote device this command will return TRUE. If the remote party has been successfully notified SPP_PORT_EVENT_LOCAL_MODEM_STATUS_CHANGED event will be reported. If the command could not be send to the remote party for any reason other than lack of resources SPP_PORT_EVENT_LOCAL_MODEM_STATUS_CHANGE_FAILED will be reported. If the status cannot be changed because there is no resources to send a... more
	bt_spp_set_local_modem_status	• Set local device's TS 07.10 control signals. Changes the state of local device's TS 07.10 control signals and notifies the remote device of the change. If there are resources to send a command to the remote device this command will return TRUE. If the remote party has been successfully notified SPP_PORT_EVENT_LOCAL_MODEM_STATUS_CHANGED event will be reported. If the command could not be send to the remote party for any reason other than lack of resources SPP_PORT_EVENT_LOCAL_MODEM_STATUS_CHANGE_FAILED will be reported. If the status cannot be changed because there is no resources to send a command to the remote device this function... more
	bt_spp_set_port_options	This is function bt_spp_set_port_options.
	bt_spp_set_rts	• Set local device's RS-232 RTS signal. Changes the state of local device's RS-232 DTR signal and notifies the remote device of the change. This signal corresponds to the TS 07.10's RFCOMM_MODEM_STATUS_RTR signal. If there are resources to send a command to the remote device this command will return TRUE. If the remote party has been successfully notified SPP_PORT_EVENT_LOCAL_MODEM_STATUS_CHANGED event will be reported. If the command could not be send to the remote party for any reason other than lack of resources SPP_PORT_EVENT_LOCAL_MODEM_STATUS_CHANGE_FAILED will be reported. If the status cannot be changed because there is no resources to send a... more

Macros

	Name	Description
	SPP_PORT_OPTION_ENCRYPTED	This is macro SPP_PORT_OPTION_ENCRYPTED.
	SPP_PORT_OPTION_MASTER	This is macro SPP_PORT_OPTION_MASTER.
	SPP_PORT_OPTION_SECURE	This is macro SPP_PORT_OPTION_SECURE.
	SPP_PORT_TYPE_INCOMING	This is macro SPP_PORT_TYPE_INCOMING.
	SPP_PORT_TYPE_OUTGOING	This is macro SPP_PORT_TYPE_OUTGOING.
	SPP_RS232_CTS	This is macro SPP_RS232_CTS.
	SPP_RS232_DCD	This is macro SPP_RS232_DCD.

	SPP_RS232_DSR	• @defgroup spp Serial Port Profile (SPP) The DotStack SPP API is a simple API for communicating over a Bluetooth link using the Bluetooth Serial Port Profile. Here are the steps for using this API: • Call the bt_spp_init() function. • Allocate a serial port structure with bt_spp_allocate(). One of the parameters to this function is a pointer to a callback function. That callback function will be called by the stack whenever the state of the serial port changes. • To connect to a remote device call bt_spp_connect(). The stack will notify when the connection is established by calling the state... more
	SPP_RS232_DTR	This is macro SPP_RS232_DTR.
	SPP_RS232_RI	This is macro SPP_RS232_RI.
	SPP_RS232_RTS	This is macro SPP_RS232_RTS.

Structures

	Name	Description
	_bt_spp_port_t	• Serial port structure. This structure represents a Bluetooth serial port. Application code may only use those fields that are documented. The rest of the fields are private to the SPP implementation.

Types

	Name	Description
	bt_spp_find_server_callback_fp	This is type bt_spp_find_server_callback_fp.
	bt_spp_port_t	This is type bt_spp_port_t.
	bt_spp_receive_callback_fp	• Serial port receive callback. This callback function is called when a receive operation initiated by bt_spp_receive() completes. @param port Serial port on which the receive operation completed. @param bytes_received Number of received bytes. @param param Callback parameter that was specified when bt_spp_allocate() was called.
	bt_spp_send_callback_fp	• Serial port send callback. This callback function is called when a send operation initiated by bt_spp_send() completes. @param port Serial port on which the send operation completed. @param bytes_sent Number of bytes sent. This parameter is just a convenience as it always specifies the same number of bytes that was passed to bt_spp_send(); @param status Completion status. It is one of the values defined in the ::bt_spp_send_status_e enumeration. @param param Callback parameter that was specified when bt_spp_allocate() was called.
	bt_spp_state_callback_fp	• Serial port state callback. This callback function is called whenever the state of a serial port is changed. @param port Serial port which state has changed. @param evt Event describing the nature of state change. It is one of the values defined in the ::bt_spp_port_event_e enumeration. @param param Callback parameter that was specified when bt_spp_allocate() was called.

Bootloader Library Help

This section describes the Bootloader Library that is available in MPLAB Harmony.

Introduction

This library provides a software Bootloader Library that is available on the Microchip family of microcontrollers with a convenient C language interface.

Description

The Bootloader Library can be used to upgrade firmware on a target device without the need for an external programmer or debugger.

A demonstration application, which can be downloaded into the target PIC32 device using the bootloader is included, which provides a personal computer host application to communicate with the bootloader firmware running inside the PIC32 device. This personal computer application is used to perform erase and programming operations.

This library was developed based on the Microchip application note, AN1388 *"PIC32 Bootloader"* (DS01388).

Bootloader Theory

A bootloader is a small application that starts the operation of the device. A bootloader does not fully operate the device, but can perform various functions prior to starting the main application. Such functions can include:

- System checks
- Firmware upgrades
- Application integrity verification
- Starting the application

Using the Library

This topic describes the basic architecture of the Bootloader Library and provides information and examples on its use.

Description

Interface Header File: `bootloader.h`

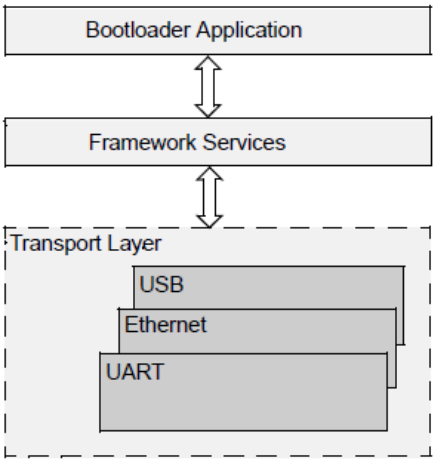
The interface to the Bootloader Library is defined in the `bootloader.h` header file. Any C language source (`.c`) file that uses the Bootloader Library should include `bootloader.h`.

Abstraction Model

This library provides the low-level abstraction of the Bootloader Library module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

Bootloader Software Abstraction Block Diagram



Bootloader Application

The main purpose of the Bootloader Application layer is to implement the callback functions necessary to enhance the bootloader. The various callback functions are described below, and are used to handle such tasks as forcing Bootloader mode, erasing and programming memory, and any cleanup before jumping to the application.

Framework Services

The Framework Services provide the main tasks of handling Flash memory. These include:

- Erasing Flash memory
- Programming hex file records into Flash memory
- Computing a CRC check of the Application in Program Memory
- Jumping to the Application

The Framework Services can be enhanced with the callback functions that can handle such things as external memory devices. Doing so requires that the hex files allocate the external memory assignments in a region that would not normally fall into the physical Flash region in the PIC32 device.

The Framework Services take an interface-agnostic approach to the actual communication medium. For the most part, it does not care whether the data comes from a PC Host via USB, UART, or Ethernet, or if it is coming by reading a file from a USB thumb drive or a SD Card. This allows the bootloader to be expanded to handle other communication interfaces with minimal impact to the Framework Services.

Transport Layer

The Transport Layer, called Datastream in the Bootloader Framework code, is used to implement the specific interface to the source of the hex file.

Library Overview

The Library Interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Bootloader Library module.

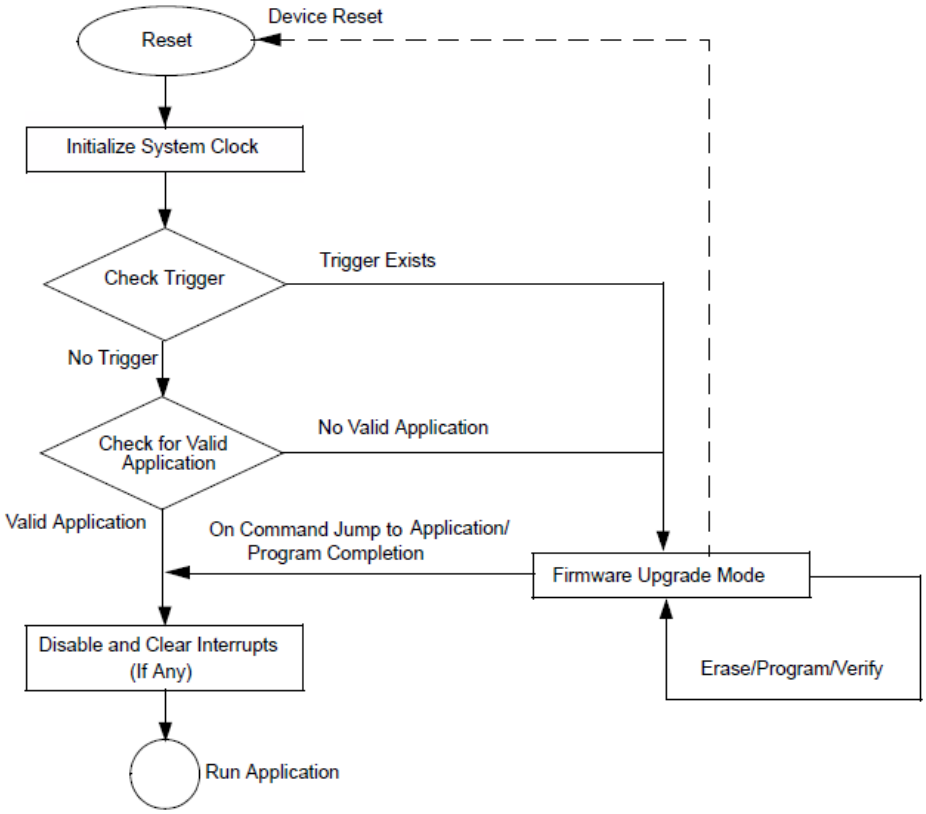
How the Library Works

This topic provides information on how the library works.

Description

The bootloader library is implemented using a framework. The bootloader firmware communicates with the personal computer host application by using a predefined communication protocol.

The following figure illustrates the bootloader architecture. The bootloader framework provides several API functions, which can be called by the bootloader application and the data stream layer. The bootloader framework assists the user to easily modify the bootloader application to adapt to different requirements. Refer to the Library Interface section for the available APIs.



Basic Flow of the Bootloader

Describes the basic flow of the PIC32 Bootloader

Description

The Bootloader code starts executing on a device Reset. If there are no conditions to enter the firmware upgrade mode, the Bootloader starts executing the user application. The Bootloader performs Flash erase/program operations while in the firmware upgrade mode.

Entering the Firmware Upgrade Mode

On a device Reset, the Bootloader forces itself into the firmware upgrade mode if the content of the user application's reset vector address is erased. On PIC32 starter kits, press and hold the switch, SW3, during power-up. While in firmware upgrade mode, the LED labeled LED1 on the PIC32 starter kit will blink.

For your custom bootloader, call the BOOTLOADER_ForceBootloadRegister function to register a custom function. From the callback function, the bootloader can check whatever situation is necessary for forcing the bootloader into Bootloader mode.

Exiting the Firmware Upgrade Mode

For USB HID, Ethernet, or the UART Bootloader, the firmware upgrade mode can be exited either by applying a hard Reset to the device, or by sending a "Jump to Application" command from the PC. For the USB Flash drive Bootloader, the firmware upgrade mode is exited either by a hard Reset or upon completion of firmware programming.

Note: The Bootloader should disable and clear any enabled interrupts before running the user application. The stray interrupts from the Bootloader may interfere with the user application and cause the application to fail. If applicable, interrupts and peripherals should be reinitialized in the user application.

Bootloader Placement in Memory

Describes the Bootloader placement in memory.

Description

The placement of the Bootloader in Flash memory controls several elements of the application and Bootloader interaction. Both have to be placed such that the application will not overwrite the Bootloader, and the Bootloader can properly program the application when it is downloaded.

Figure 1 illustrates two schemes for the Bootloader placement based on the size of the Bootloader. Devices with a large enough Boot Flash

memory can place all of the Bootloader within Boot Flash. Fitting the Bootloader within the Boot Flash memory provides the complete program Flash memory for the user application.

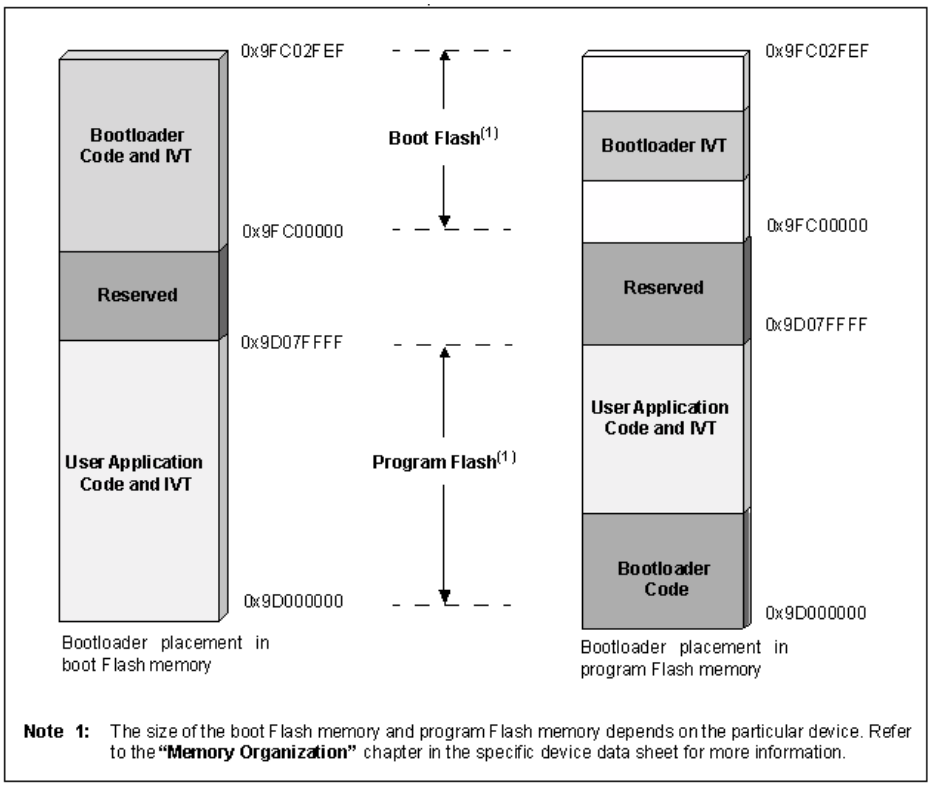
In the case of Bootloaders that exceed the size of PIC32 boot Flash, the Bootloader is split into two parts:

- For devices with 3 KB of Boot Flash, only the reset vector is placed in Boot Flash, with the Interrupt Vector Table (IVT) and C start-up code placed in Program Flash.
- For devices with 12 KB of Boot Flash, the Interrupt Vector Table (IVT) and the C start-up code are placed in Boot Flash, and the remaining portion of the Bootloader is placed inside the Program Flash.

The portion of the Bootloader that resides in Program Flash may be placed at either the beginning or the end of the Program Flash, depending on the needs of the application. The linker scripts generated by Harmony place the Bootloader code at the beginning of Program Flash (0x9D000000).

For PIC32MZ devices, with two 80 KB Boot Flash panels, the Bootloader may or may not fit entirely in one Boot Flash panel. In order to fit some of the Bootloaders, the linker script makes the two Boot Flash panels look like one contiguous Boot Flash memory. Unimplemented areas are blocked using a fill command to the linker.

Figure 1: Bootloader Placement



Handling Device Configuration Bits

Provides information on how device Configuration bits are handled.

Description

The Bootloader does not erase or write the device Configuration words while programming the new application firmware. This is because the device Configuration words settings are shared by both the Bootloader and the user application. Any modification to the device Configuration words may make the Bootloader non-functional. Therefore, it is highly recommended to have common device Configuration words settings for both the user application and the Bootloader.

When combining the Bootloader and Application Hex files in MPLAB X IDE, an error will be generated if the device Configuration words are different. This will be shown as a data conflict error, and the address given will match an address in the device Configuration words. This will indicate which word is in conflict, so that it can be resolved.

The Bootloader's Configuration words can be imported into the Application's MHC configuration file, thus simplifying the process of resolving differences.

Demonstration Application

Provides information on the demonstration applications that can be used with the Bootloader.

Description

Refer to the following sections for information on the demonstrations that are available for the Bootloader:

- *Volume I: Getting Started With MPLAB Harmony > Applications Helps > Bootloader Demonstrations*
- *Volume I: Getting Started With MPLAB Harmony > Applications Help > Examples > Peripheral Library Examples > dma_led_pattern*

PIC32MX Bootloaders

For PIC32MX bootloaders, the MHC configuration for the corresponding application must match the bootloader for the interface in use. MHC will adjust the linker script and certain bootloader definitions in source code to maximize the use of the Flash memory. For example, a UART bootloader must be matched with an application configured for UART bootloading. A USB Device bootloader must be matched with an application configured for USB Device bootloading.

To change the type of bootloader interface the demonstration application is configured for, do the following:

1. Open the dma_led_pattern project in MPLAB X IDE.
2. Select the appropriate configuration for the target device.
3. Open MHC.
4. From the Options tab, expand *Harmony Framework Configuration* > *Bootloader Library*, and select **Use Bootloader Library?**
5. Select the correct interface using the drop-down list next to Bootloader Type.
6. Regenerate the code.
7. Compile the code.
8. The generated `.hex` file can now be used with the corresponding bootloader.

Using the Bootloader Application (UART, USB HID, and Ethernet Bootloaders)

Provides information on using the Bootloader application.

Description

Refer to *Volume I: Getting Started With MPLAB Harmony > Applications Help > Bootloader Demonstrations > Demonstrations > basic > Running the Demonstration* for information on running the demonstration application.

Bootloader Communication Protocol (UART, USB HID, and Ethernet)

Provides information on the Bootloader communication protocol.

Description

The PC host application uses a communication protocol to interact with the Bootloader firmware. The PC host application acts as a master and issues commands to the Bootloader firmware to perform specific operations.

Frame Format

The communication protocol follows the frame format, as shown in Example 1. The frame format remains the same in both directions, that is, from the host application to the Bootloader, and from the Bootloader to the host application.

Example 1: Frame Format

```
[<SOH>…]<SOH>[<DATA>…]<CRCL><CRCH><EOT>
Where:
 <...> Represents a byte
 [...] Represents an optional or variable number of bytes
```

The frame starts with a control character, Start of Header (SOH), and ends with another control character, End of Transmission (EOT). The integrity of the frame is protected by two bytes of Cyclic Redundancy Check (CRC)-16, represented by CRCL (low-byte) and CRCH (high-byte).

Control Characters

Some bytes in the Data field may imitate the control characters, SOH and EOT. The Data Link Escape (DLE) character is used to escape such bytes that could be interpreted as control characters. The Bootloader always accepts the byte following a <DLE> as data, and always sends a <DLE> before any of the control characters.

Table 1: Control Character Descriptions

Control	Hex Value	Description
<SOH>	0x01	Marks the beginning of a frame.
<EOT>	0x04	Marks the end of a frame.
<DLE>	0x10	Data link escape.

Commands

The PC host application can issue the commands listed in Table 2 to the Bootloader. The first byte in the data field carries the command.

Command Value in Hexadecimal	Description
0x01	Read the Bootloader version information.
0x02	Erase the Flash.
0x03	Program the Flash.
0x04	Read the CRC.
0x05	Jump to the application.

Read Bootloader Version Information

The PC host application request for version information to the Bootloader is shown in Example 2.

Example 2: Request
```
[<SOH>…]<SOH>[<0x01>]<CRCL><CRCH><EOT>
```

The Bootloader responds to the PC request for version information in two bytes, as shown in Example 3.

Example 3: Response
```
[<SOH>…]<SOH><0x01><MAJOR_VER><MINOR_VER>
<CRCL><CRCH><EOT>

Where:
MAJOR_VER = Major version of the Bootloader
MINOR_VER = Minor version of the Bootloader
```

Erase Flash

On receiving the erase Flash command from the PC host application, the Bootloader erases that part of the program Flash, which is allocated for the user application. The request frame from the PC host application to the Bootloader is shown in Example 4.

Example 4: Request
```
[<SOH>…]<SOH><0x02><CRCL><CRCH><EOT>
```

The response frame from the Bootloader to the PC host application is shown in Example 5.

Example 5: Response
```
[<SOH>…]<SOH><0x02><CRCL><CRCH><EOT>
```

Program Flash

The PC host application sends one or multiple hex records in Intel Hex format along with the program Flash command. The MPLAB XC32 C/C++ Compiler generates the image in the Intel Hex format. Each line in the Intel hexadecimal file represents a hexadecimal record. Each hexadecimal record starts with a colon (:) and is in ASCII format. The PC host application discards the colon and converts the remaining data from ASCII to hexadecimal, and then sends the data to the Bootloader. The Bootloader extracts the destination address and data from the hex record, and writes the data into program Flash.

The request frame from the PC host application to the Bootloader is shown in Example 6.

Example 6: Request
```
[<SOH>…]<SOH><0x03>[<HEX_RECORD>…]<CRCL>
<CRCH><EOT>
```

Where, `HEX_RECORD` is the Intel Hex record in hexadecimal format.

The response from the Bootloader to the PC host application is shown in Example 7.

Example 7: Response
```
[<SOH>…]<SOH><0x03><CRCL><CRCH><EOT>
```

Read CRC

The read CRC command is used to verify the content of the program Flash after programming. The request frame from the PC host application to the Bootloader is shown in Example 8.

Example 8: Request
```
[<SOH>…]<SOH><0x04><ADRS_LB><ADRS_HB>
<ADRS_UB><ADRS_MB><NUMBYTES_LB><NUMBYTES_HB>
<NUMBYTES_UB><NUMBYTES_MB><CRCL><CRCH><EOT>
```

`ADRS_LB`, `ADRS_HB`, `ADRS_UB` and `ADRS_MB`, as shown in Example 8, represent the 32-bit Flash addresses from where the CRC calculation begins.

`NUMBYTES_LB`, `NUMBYTES_HB`, `NUMBYTES_UB` and `NUMBYTES_MB`, as shown in Example 8, represent the total number of bytes in 32-bit format for which the CRC is to be calculated.

The response from the Bootloader to the PC host application is shown in Example 9.

Example 9: Response
```
[<SOH>…]<SOH><0x04><FLASH_CRCL><FLASH_CRCH>
<CRCL><CRCH><EOT>
```

Jump to Application

The Jump to Application command from the PC host application commands the Bootloader to execute the application. The request frame from the

PC host application to the Bootloader is shown in Example 10.

Example 10: Request
`[<SOH>…]<SOH><0x05><CRCL><CRCH><EOT>`

There is no response to this command from the Bootloader because the Bootloader immediately exits the firmware upgrade mode and begins executing the application.

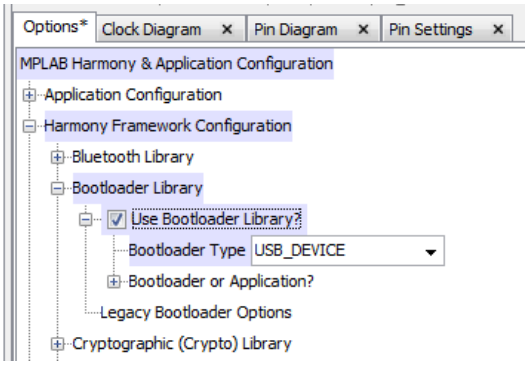
Generating the Application Linker Script

Provides information on generating the application linker script.

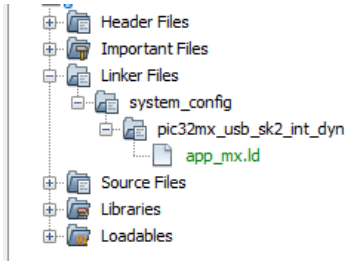
Description

The MPLAB Harmony Configurator (MHC) can generate an application linker script specifically matched to the bootloader type in use. To add the linker script to your application, do the following:

1. In MPLAB X IDE, start MHC, and open the configuration for your application.
2. Navigate to *Harmony Framework Configuration* > *Bootloader Library* and select **Use Bootloader Library?**, as shown in the following figure.



3. Select the bootloader type in use using the Bootloader Type drop-down. For PIC32MX devices, this option must match between Bootloader and Application configurations. The linker scripts and reset address are configured for each based on the size of the bootloader. Therefore, they must be the same for the bootloader to look in the correct location for the application, and jump to the application's reset address.
4. When the application code is generated, a linker script will be created and inserted into the project folder, as shown in the following figure.



Considerations While Moving the Application Image

Describes the procedure to place a user application into a desired program Flash memory region

Description

This section describes the procedure to place a user application into a desired program Flash memory region. It must be ensured that the user application's memory region does not overlap with the memory region reserved for the Bootloader.

The bootloader generated by MHC should be considered a starting point for your product's bootloader. As such, adding new features may cause the bootloader to exceed the size intended in the bootloader linker script. In addition, the bootloaders provided in the `apps/bootloader/basic` folder are configured to the `-O1` compiler optimization. It is not the smallest possible size for the bootloader, and turning on the `-Os` or MIPS16/microMIPS code options will reduce the size of the bootloader. If the size of the bootloader changes, the following steps should be performed to adjust both the bootloader and the application in order to make sure that both fit and make best use of the device memory.

1. Determine the new ending address in Program Flash for the bootloader. This can be done either by using the `.map` file generated by the MPLAB XC32 C/C++ Compiler, or by using the ELFViewer plugin for MPLAB X IDE.
2. Round the address up to the nearest page boundary. For devices with 1K page sizes, the address must end on a 0x400 boundary. For devices with 4K page sizes, the address must end on a 0x1000 boundary.
3. Within the bootloader, change the following files:

- In `btx_mx.ld`, change the length of kseg0_program_mem to the new boundary
- In `system_config.h`, change the value for BOOTLOADER_FLASH_BASE_ADDRESS to match the virtual address determined previously

4. Within the application, change the linker script, `app_mx.ld`, as follows:

- Change _ebase_address to the new boundary, plus enough pages to get the exceptions to start at an address on a 4K (0x1000) boundary.

This is to align it on the boundary required by the MIPS core.

- Change _RESET_ADDR to the new boundary previously determined
- Change the ORIGIN value for kseg0_program_mem to the new boundary

5. Recompile both the bootloader and the application, and test operations.

For PIC32MZ devices, any of the bootloaders can fit entirely into Boot Flash, although some currently take advantage of both panels of Boot Flash. This is done by making the two Boot Flash memories appear as one panel in the linker script, but using a fill command to the linker to block out the area that is not available. When the resulting file is loaded by MPLAB X IDE, you may receive the following warning:

Warning: C:/microchip/harmony/core/apps/bootloader/basic/firmware/basic.X/dist/udp_pic32mz_ef_sk/production/basic.X.production.hex contains code that is located at addresses that do not exist on the PIC32MZxxx.

This warning can be ignored, as it is a warning about the fill memory.

Note: For more information on linker script memory regions, refer to the *"MPLAB® XC32 Assembler, Linker and Utilities User's Guide"* (DS50002186) and the *"MPLAB® XC32 C/C++ Compiler User's Guide"* (DS50001686).

Bootloader Configurations

Provides information on the macros that are available to configure the Bootloader code during compilation.

Description

Most of the configuration options for the bootloaders will be done with the driver or middleware-specific options available in MHC. For example:

- UART - Adjusting the port used and the baud rate
- USB - The value of the Vendor and Product IDs
- Ethernet - The default MAC IDs and IP Address to use
- SD Card - The SPI interface that communicates with the SD card

The following table lists macros that are modified in source code only, and their usage. Depending on user requirements, the values in these macros may need to be changed.

General Macros

Macro	Usage
BOOTLOADER_FLASH_BASE_ADDRESS	Base address of the program Flash reserved for the user application. The address value must point to the beginning of a Flash page, which is dependent upon the Flash page size of the specific device. Note that setting this value to an address below the maximum memory will allow your bootloader to reserve Flash memory as needed.
BOOTLOADER_FLASH_END_ADDRESS	End address of the program Flash reserved for the user application. The address value must point to the end of a Flash page.
BOOTLOADER_RESET_ADDRESS	Address of user Reset vector. The Bootloader branches to this address when it must run the user application.
MAJOR_VERSION	Major version of the Bootloader firmware.
MINOR_VERSION	Minor version of the Bootloader firmware.

Configuring the Library

The configuration of the Bootloader Library is based on the file `system_config.h`.

This header file contains the configuration selection for the Bootloader Library. Based on the selections made, the Bootloader Library will or will not support selected features. These configuration settings will apply to all instances of the Bootloader Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Building the Library

This section lists the files that are available in the Bootloader Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/bootloader`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/src/bootloader.h	Includes all MPLAB Harmony-compatible function calls for the Bootloader Library.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
<install-dir>framework/bootloader/src/bootloader.c	This file contains the core implementation of the Bootloader Library.
<install-dir>framework/bootloader/src/datastream.c	This file contains the data stream implementation of the Bootloader Library. In addition, a datastream_<type>.c file is included with this file. For example, datastream_usart.c.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
datastream_sdcard.c	Data stream implementation when using the SD Card bootloader configuration.
datastream_udp.c	Data stream implementation when using the Ethernet UDP bootloader configuration.
datastream_usart.c	Data stream implementation when using the USART bootloader configuration.
datastream_usb_hid.c	Data stream implementation when using the USB HID Device bootloader configuration.
datastream_usb_host.c	Data stream implementation when using the USB Host bootloader configuration.

Module Dependencies

The Bootloader Library will depend on the modules used for the communication medium, as listed in the following table.

Bootloader	Module Dependency and MHC Configuration
SD Card	SD Card Driver, configured to use the SPI port and Chip Select lines in use. File System, configured with the following MHC options: • Use File System Auto Mount Feature • Media Type: SYS_FS_MEDIA_TYPE_SD_CARD • FAT File System
USART	USART Static Driver
UDP	TCP/IP, configured with the following MHC options: • IPv4 • Use UDP • One Network Configuration, with interface, host name, and IP address as desired • Enable Stack Deinitialization Operations • Enable Configuration Save/Restore Functionality • Dynamic RAM Size: 20250
USB Device	USB, configured with the following MHC options: • USB Device • Number of Endpoints Used: 2 • Number of Functions: 1 • Device Class: HID • Vendor ID: 0x04d8 • Product ID: 0x003c • Manufacturer String: As desired • Product String: As desired

USB Host	USB, configured with the following MHC options: • USB Host (Recommended) • Use MSD Host Client Driver File System, configured with the following MHC options: • Use File System Auto Mount Feature • Media Type: SYS_FS_MEDIA_TYPE_MSD

Bootloader Sizing and Optimization

Provides bootloader sizing and optimization information.

Description

The example bootloaders provided in the `apps/bootloader/basic` folder have optimization settings for use by most MPLAB XC32 C/C++ Compiler users, which is `-O1`. However, in terms of size, this option does not produce the most optimal code. The following table lists the various bootloaders, and their current size (based on Boot Flash size).

Flash Usage Based on Optimization in Bytes

Peripheral	Device Family	-O1	-Os	-Os MIPS16	-Os microAptiv
SD Card	PIC32MZ(1)	134968	122496	N/A	52110
UART	PIC32MX(1)	7376	6892	5696	N/A
UART	PIC32MZ(1)	12796	12228	N/A	10460
USB Device	PIC32MX	24944	22932	15328	N/A
USB Device	PIC32MZ(1)	38104	34976	N/A	26164
USB Host	PIC32MX	76156	66968	42808	N/A
USB Host	PIC32MZ(1)	85512	75944	N/A	53444
UDP	PIC32MX	73740	72416	48804	N/A
UDP	PIC32MZ(1)	90704	79856	N/A	Not Functional(2)

Notes:
1. The Bootloader resides entirely in Boot Flash. No Program Flash is in use.
2. The UDP bootloader does not compile for PIC32MZ devices when microMIPS is selected.

Application Interrupt Vector Table Placement

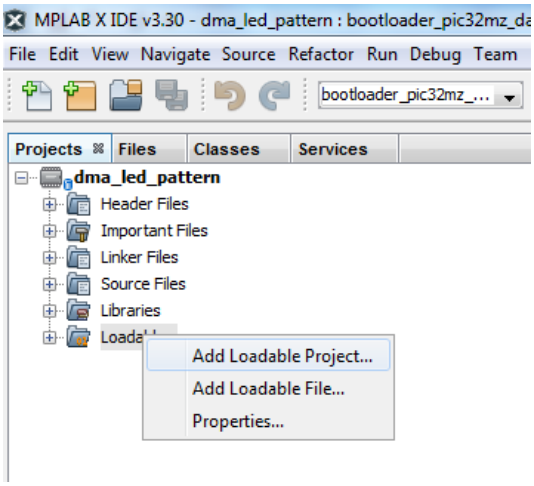
Beginning in MPLAB Harmony v1.08, the application linker scripts are able to have the interrupt vector table within the kseg0_program_mem, along with the rest of the application code. Generally, this means that it can be placed anywhere within the application code, and only the _ebase_address value in the application linker script needs to be updated.

Within the MIPS core, the base address of the interrupt vector table is set by the Ebase register (CP0 Register 15, Select 1). Because of the definition of this register, the interrupt vector table must be aligned on a 4K boundary. This applies to all PIC32 devices. The bootloader will take the start of application Program Memory as the start of the application itself. This means that the interrupt vector table will need to be located at least at the next 4K boundary after that starting address.

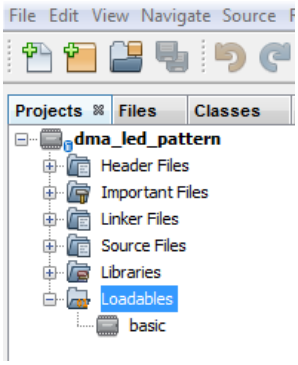
Debugging with a Bootloader and an Application

When developing a system that uses both an application and a bootloader, it is useful to be able to run both as separate projects, but have them both in the device. This involves setting the bootloader as a loadable project to the application. The steps to add the bootloader as the loadable project, are as follows.

1. Right-click the application project's `Loadables` folder, and select **Add Loadable Project…**.



2. Navigate to the project folder of the Bootloader, selecting the correct configuration if there are multiple configurations, and click **Add**.



3. When the program is built, it will generate a single hex file that contains the combined Bootloader and application.
4. When debugging the program, both will be programmed into the PIC32. However, the Bootloader will be executed, and the PIC32 will halt when it reaches the main function of the application. To step through the Bootloader, it is necessary to set a breakpoint in the bootloader code.

Commonly Encountered Situations

When creating the Bootloader and the application, you may encounter some of these situations while combining the two, and errors may be generated by the linker.

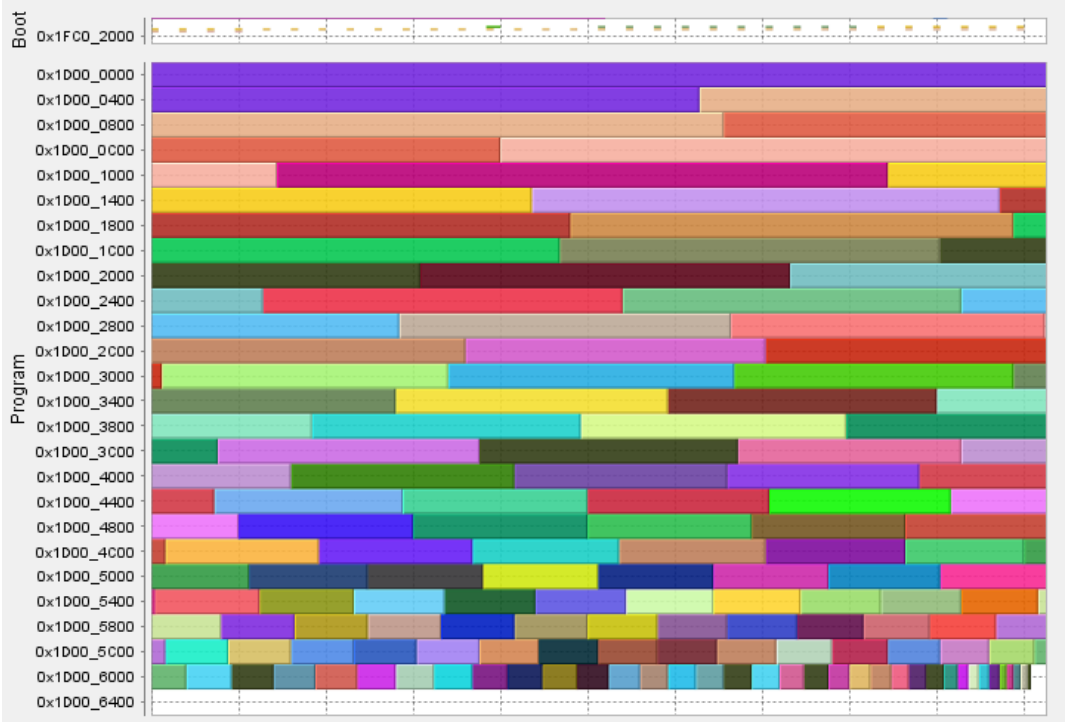
Optimizing the Bootloader

Provides information for optimizing the Bootloader.

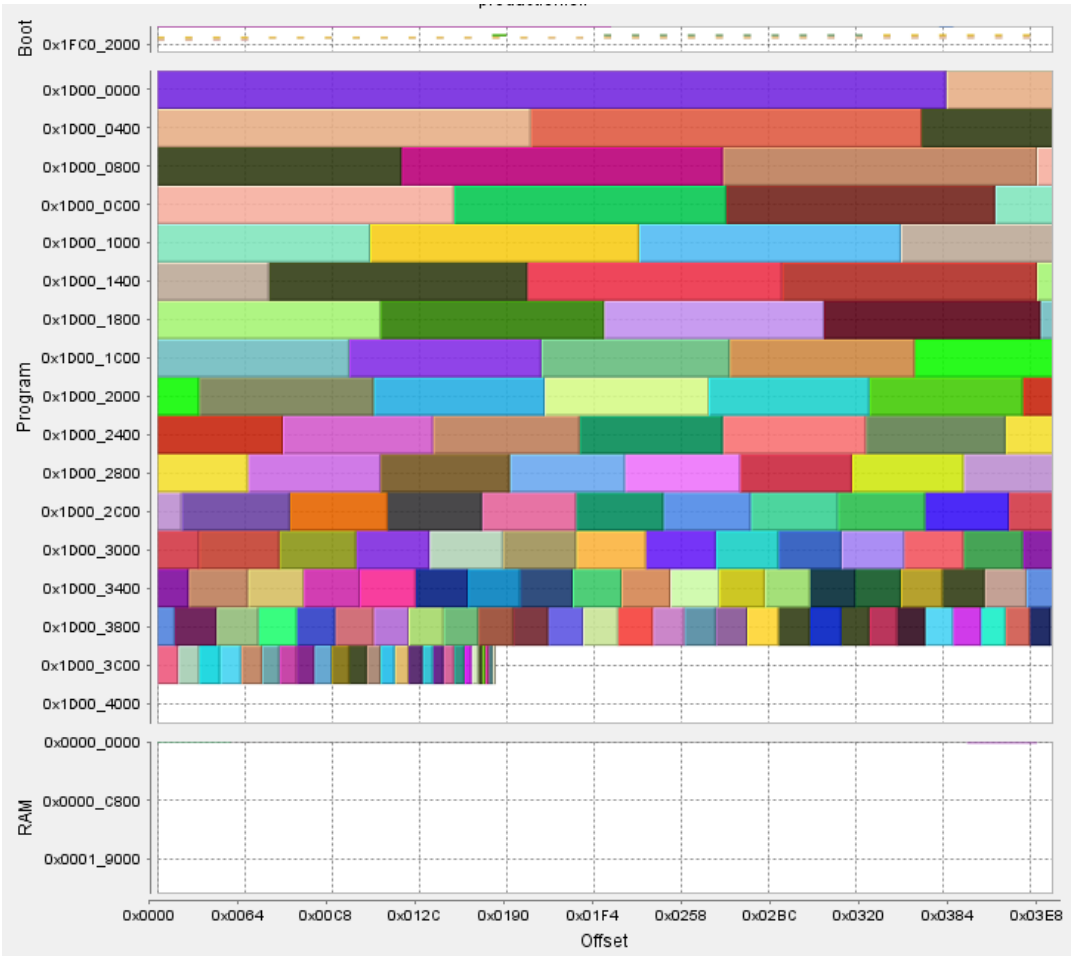
Description

By selecting a different optimization level, or by adding features to the Bootloader, the size of the Bootloader will change. These changes may require adjustments to the linker scripts of the Bootloader and the Application.

The following example will take a PIC32MX USB Device Bootloader, and set optimizations to save space. When the Bootloader is compiled with the default, `-O1`, optimization, it takes 24944 bytes of Flash. This can be seen in the following figure, which graphically shows the mapping of the Bootloader functions and Flash usage.



When the optimizations are set to `-Os`, and MIPS16 code is generated, the Bootloader code size shrinks to 15328 bytes, as shown in the following figure.



Because the Bootloader now ends at a lower address in Program Flash, the space can now be reclaimed for the application. Due to Flash page sizing, the application linker script must take the ending address of the Bootloader, and round it up to the start address of the next page. In this case, the new start address for the application can be 0x9D004000.

The MIPS32 core requires that Interrupt Vector Tables (IVTs) be placed on a 4 KB boundary, Therefore, the IVT for the Application can now be

placed at 0x9D005000, or any address above that in Program Flash that ends in 0x000.

The three lines to change in the application linker script are as follows, with the changes note in **bold** type:

Original Line of Code	Modified Line of Code
`_ebase_address = 0x9D008000;`	`_ebase_address = 0x9D00**5**000;`
`_RESET_ADDR = (0x9D007000);`	`_RESET_ADDR = (0x9D00**4**000);`
`kseg0_program_mem (rx) : ORIGIN = (0x9D000000 + 0x7000), LENGTH = 0x80000 - 0x7000`	`kseg0_program_mem (rx) : ORIGIN = (0x9D000000 + 0x**4**000), LENGTH = 0x80000 - 0x**4**000`

Library Interface

a) Functions

	Name	Description
	Bootloader_Initialize	Initializes the Bootloader Library.
	Bootloader_Tasks	Maintains the Bootloader module state machine. It manages the Bootloader module object list items and responds to Bootloader module primitive events.

b) Data Types and Constants

	Name	Description
	MAJOR_VERSION	Bootloader Major Version Shown From a Read Version on PC
	MINOR_VERSION	Bootloader Minor Version Shown From a Read Version on PC
	BOOTLOADER_CLIENT_STATUS	Enumerated data type that identifies the Bootloader module client status.
	BOOTLOADER_INIT	A structure used to initialize the bootloader defining the different bootloader.
	BOOTLOADER_TYPE	A structure used to initialize the bootloader defining the different bootloader.
	BootInfo	This is variable BootInfo.
	BOOTLOADER_BUFFER	This is type BOOTLOADER_BUFFER.
	BOOTLOADER_CALLBACK	Pointer to a Bootloader callback function data type .
	BOOTLOADER_DATA_CALLBACK	Pointer to a Bootloader callback function data type .

Description

This section describes the Application Programming Interface (API) functions of the Bootloader Library.

Refer to each section for a detailed description.

a) Functions

Bootloader_Initialize Function

Initializes the Bootloader Library.

File

bootloader.h

C

```
void Bootloader_Initialize(const BOOTLOADER_INIT * drvBootloaderInit);
```

Returns

If successful, returns a valid handle to a device layer object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function is used to initialize the Bootloader Library.

Remarks

This routine must be called before other Bootloader Library functions.

Preconditions

None.

Function

void Bootloader_Initialize (const SYS_MODULE_INDEX moduleIndex,
const SYS_MODULE_INIT * const moduleInit);

Bootloader_Tasks Function

Maintains the Bootloader module state machine. It manages the Bootloader module object list items and responds to Bootloader module primitive events.

File

bootloader.h

C

```
void Bootloader_Tasks();
```

Returns

None.

Description

This function maintains the Bootloader module state machine and manages the Bootloader Module object list items and responds to Bootloader Module events. This function should be called from the SYS_Tasks function.

Remarks

This function is normally not called directly by an application.

Preconditions

None.

Example

```
while (true)
{
    Bootloader_Tasks ();

    // Do other tasks
}
```

Parameters

Parameters	Description
index	Object index for the specified module instance.

Function

void Bootloader_Tasks (SYS_MODULE_INDEX index);

b) Data Types and Constants

MAJOR_VERSION Macro

File

bootloader.h

C

```
#define MAJOR_VERSION 4    /* Bootloader Major Version Shown From a Read Version on PC */
```

Description

Bootloader Major Version Shown From a Read Version on PC

MINOR_VERSION Macro

File

bootloader.h

C

```
#define MINOR_VERSION 1    /* Bootloader Minor Version Shown From a Read Version on PC */
```

Description

Bootloader Minor Version Shown From a Read Version on PC

BOOTLOADER_CLIENT_STATUS Enumeration

Enumerated data type that identifies the Bootloader module client status.

File

bootloader.h

C

```
typedef enum {
  BOOTLOADER_CLIENT_STATUS_CLOSED,
  BOOTLOADER_CLIENT_STATUS_READY,
  BOOTLOADER_CLIENT_STATUS_WRITEFAILURE,
  BOOTLOADER_CLIENT_STATUS_WRITESUCCESS
} BOOTLOADER_CLIENT_STATUS;
```

Members

Members	Description
BOOTLOADER_CLIENT_STATUS_CLOSED	Client is closed or the specified handle is invalid
BOOTLOADER_CLIENT_STATUS_READY	Client is ready

Description

Bootloader Client Status

This enumeration defines the possible status of the Bootloader module client. It is returned by the () function.

Remarks

None.

BOOTLOADER_INIT Structure

A structure used to initialize the bootloader defining the different bootloader.

File

bootloader.h

C

```
typedef struct {
  BOOTLOADER_TYPE drvType;
  BOOTLOADER_STATES (* drvTrigger)(void);
} BOOTLOADER_INIT;
```

Description

Bootloader Initialization Type

This structure holds the bootloader types.

Remarks

None.

BOOTLOADER_TYPE Enumeration

A structure used to initialize the bootloader defining the different bootloader.

File

bootloader.h

C

```
typedef enum {
  TYPE_I2C,
  TYPE_USART,
  TYPE_USB_HOST,
  TYPE_USB_DEVICE,
  TYPE_ETHERNET_UDP_PULL,
  TYPE_SD_CARD
} BOOTLOADER_TYPE;
```

Description

Bootloader Type

This structure holds the bootloader types.

Remarks

None.

BootInfo Variable

File

bootloader.h

C

```
const uint8_t BootInfo[2] = { MINOR_VERSION, MAJOR_VERSION };
```

Description

This is variable BootInfo.

BOOTLOADER_BUFFER Union

File

bootloader.h

C

```
typedef union {
  uint8_t buffer[1024];
  struct {
    uint8_t buff1[512];
    uint8_t buff2[512];
  } buffers;
} BOOTLOADER_BUFFER;
```

Description

This is type BOOTLOADER_BUFFER.

BOOTLOADER_CALLBACK Type

Pointer to a Bootloader callback function data type .

File

bootloader.h

C

```
typedef int (* BOOTLOADER_CALLBACK)(void);
```

Description

Bootloader General Callback Function Pointer

This data type defines a pointer to a Bootloader library callback function.

Remarks

This is used for callback on the following events:

- ERASE - Erase any additional areas (i.e. SQI, EBI, SPI memories)
- PROGRAM_COMPLETE - No more data coming
- START_APP - Anything that needs to be done prior to starting application
- BLANK_CHECK - Check external devices for erasure
- FORCE_BOOTLOAD - Any checks the bootloader wants to do before launching application

BOOTLOADER_DATA_CALLBACK Type

Pointer to a Bootloader callback function data type .

File

bootloader.h

C

```
typedef int (* BOOTLOADER_DATA_CALLBACK)(uint32_t address, uint32_t *data, uint32_t size);
```

Description

Bootloader Data to Program Callback Function Pointer

This data type defines a pointer to a Bootloader data callback function. This would be used to program data for an area not recognized by the bootloader as being in progam Flash (i.e. SPI Flash).

Remarks

This is used for callback on the following events:

- DATA_PROGRAM - Data to be programmed
- DATA_VERIFY - Compute the CRC for the given area

Files

Files

Class B Library Help

This section describes the Class B Library that is available in MPLAB Harmony.

Introduction

This library provides Class B Safety Software routines which can detect the occurrence of Faults in a single channel CPU.

Description

These routines have been developed in accordance with the IEC 60730 standard to support the Class B certification process. These routines can be directly integrated with the end user's application to test and verify the critical functionalities of a controller without affecting the end user's application. The Class B safety software routines can be called periodically at start-up or run time to test the following components:

- CPU Registers
- CPU Program Counter
- Invariable Memory
- Variable Memory
- Clock

NOTE: The term 'IEC 60730 standard' used in this document refers to the "IEC 60730-1 ed.5" Copyright © 2013 IEC, Geneva, Switzerland. www.iec.ch

Overview of the IEC 60730 Standard

Note: Microchip thanks the International Electrotechnical Commission (IEC) for permission to reproduce information from its International Standard IEC 60730-1ed.5 (2013). All such extracts are copyright of IEC, Geneva, Switzerland. All rights reserved. Further information on the IEC is available from www.iec.ch. IEC has no responsibility for the placement and con-text in which the extracts and contents are reproduced by the author, nor is IEC in any way responsible for the other content or accuracy therein.

The IEC 60730 standard defines the test and diagnostic methods that ensure the safe operation of the controlled equipment used in household appliances. Annex H of the IEC 60730 standard classifies the software into the following categories (see Appendix B: "IEC 60730-1 Table H.11.12.7"):

- Class A
- Class B
- Class C

The Class B Safety Software Library implements the important test and diagnostic methods that fall into the Class B category. These methods use various measures to detect and respond to the software-related Faults and errors.

According to the IEC 60730 standard, the controls with functions that fall into the Class B category should have one of the following structures:

- Single Channel with Functional Test - In this structure, the Functional test is executed prior to the application firmware execution
- Single Channel with Periodic Self-Test - In this structure, the Periodic tests are embedded within the firmware, and the self-test occurs periodically while the firmware is in Execution mode
- Dual Channel without Comparison - In this structure, two independent methods execute the specified operations

System Requirements

The following system requirements are recommended to run the Class B Safety Software Library:

- For the tests that require the independent time slot monitoring, the system hardware must be provided with at least two independent clock sources (e.g., crystal oscillator and line frequency).
- The user application determines whether the interrupts need to be enabled or disabled during the execution of the Class B Safety Software Library.

If an interrupt occurs during the execution of a Class B Safety Software Library routine, an unexpected change may occur in any of the registers. Therefore, when the Interrupt Service Routine (ISR) executes, the contents of the register will not match the expected content, and the ISR could return an incorrect result.

Using the Library

This topic describes the basic architecture of the Class B Library and provides information and examples on its use.

Description

Interface Header File: `classb.h`

The interface to the Class B Library is defined in the `classb.h` header file. Any C language source (`.c`) file that uses the Class B Library should include `classb.h`.

Library File:

The Class B Library archive (.a) file is installed with MPLAB Harmony.

Please refer to the What is MPLAB Harmony? section for how the Class B Library interacts with the framework.

Abstraction Model

This library provides the low-level abstraction of the Class B Library module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

Class B Software Abstraction Block Diagram

Library Overview

The Library Interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Class B Library module. The Class B Safety Software Library includes several APIs, which are intended to maximize application reliability through Fault detection. These APIs help meet the IEC 60730 standard compliance.

Library Interface Section	Description
General Functions	Provides an error string function, which takes an error and converts it into human-readable text.

How the Library Works

This topic provides information on how the library works.

Description

CPU Register Test

The CPU Register test implements functional test H.2.16.5, as defined by the IEC 60730 standard. It detects stuck-at Faults in the CPU registers. This ensures that the bits in the registers are not stuck at a value of ‘0’ or ‘1’.

The CPU Register test is a non-destructive test. It performs the following major tasks:

- The CPU registers and ghost registers are tested by first successively writing the binary sequences (length is dependent upon architecture), 010101... followed by 101010... into the registers, and then reading the values from these registers for verification.
- The test returns an error code if the returned values do not match.

Program Counter Test

The Program Counter (PC) test implements the functional test H.2.16.5 defined by the IEC 60730 standard. It detects stuck-at Faults in the PC. The PC holds the address of the next instruction to be executed. The test performs the following major tasks:

- Sets the error flag to the number of functions to be called.
- Calls the functions that are located in the Flash memory at different addresses chosen to alternate as many bits as possible in the PC.
- Each of these functions modifies the error flag.
- The error flag is tested after all functions are called.
- If the error flag is cleared, the PC has branched to all the correct locations.

Note: The size of the program memory varies by device. Thus the addresses used to test the PC will vary in order to test as many PC bits as possible. Refer to the specific device data sheet for more details.

Variable Memory Test

The Variable Memory test implements the Periodic Static Memory test H.2.19.6 defined by the IEC 60730 standard. It detects single bit Faults in variable memory. The variable memory contains data, which is intended to vary during program execution. The RAM Memory test is used to determine if any bit of the RAM memory is stuck at ‘1’ or ‘0’. The March Memory test and Checkerboard test are some of the widely used static memory algorithms for checking the DC Faults. The following tests can be implemented using the Class B Safety Software Library:

- Checkerboard
- March C/C- Test
- March B Test
- March C Stack test

March Tests

A March test performs a finite set of operations on every memory cell in a memory array. Each operation performs the following tasks:

- Writes ‘0’ to a memory cell (w0).
- Writes ‘1’ to a memory cell (w1).
- Reads the expected value ‘0’ from a memory cell (r0).
- Reads the expected value ‘1’ from a memory cell (r1).

March Test Notations

> Arrange Addresses in ascending order

< Arrange Addresses in descending order

<> Arrange Addresses in either order

r0 Indicates a read operation (Read ‘0’ from a memory cell)

r1 Indicates a read operation (Read ‘0’ from a memory cell)

w0 Indicates a write operation (Write ‘0’ to a memory cell)

w1 Indicates a write operation (Write ‘1’ to a memory cell)

MARCH C/C- TEST

The March C/C- test is used to detect the following types of Fault in the variable memory:

• Stuck-at Fault

• Addressing Fault

• Transition Fault

• Coupling Fault

The complexity of the March C/C- test is 11n and 10n respectively, where n indicates the number of bits in the memory. This test can be run as either destructive or non-destructive. If run in non- destructive mode buffer space is required to store the contents of the memory to be tested and restored. If needed, this test can be executed at the system start-up before initializing the memory.

March C Algorithm

```
{
 <> (w0); > (r0, w1); > (r1, w0);
 <> (r0); < (r0, w1); < (r1, w0); > (r0)
}
```

Note1: is be removed for C-

MARCH B Test

The March B is a non -redundant test that can detect the following types of Fault:

- Stuck-at
- Linked Idempotent Coupling
- Inversion Coupling

This test is of complexity 17n, where n indicates the number of bits in the memory. This test can be run as either destructive or non-destructive. If run in non-destructive mode buffer space is required to store the contents of the memory to be tested and restored. If needed, this test can be executed at the system start-up before initializing the memory.

MARCH B ALGORITHM

```
{
<> (w0); > (r0, w1, r1, w0, r0, w1); > (r1, w0, w1);
 < (r1, w0, w1, w0); < (r0, w1, w0);
}
```

Checkerboard RAM Test

The Checkerboard RAM test writes the checkerboard patterns to a sequence of adjacent memory locations. This test is performed in units (memory chunks) of 8 bytes. This test can be run as either destructive or non-destructive. If run in non-destructive mode buffer space is required to store the contents of the memory to be tested and restored. If needed, this test can be executed at the system start-up before initializing the memory. This test performs the following major tasks:

- Saves the contents of the memory locations to be tested in the buffer defined by bufferAddress.
- Writes the binary value (length is dependent upon architecture) 101010... to the memory location, ‘N’, and the inverted binary value, 010101..., to the memory location, ‘N+1’, and so on, until the whole memory chunk is filled.
- Reads the contents of all the memory locations in the current chunk and verifies its contents. If the values match, the function continues; otherwise it stops and returns an error.
- Step 2 and 3 are repeated by writing the inverted pattern to the same locations.
- Once a memory chunk is completed the test of the next chunk is started until all of the requested memory area is tested.

Invariable Memory (Flash/EEPROM) Test

The Invariable Memory (Flash/EEPROM) test implements the periodic modified checksum H.2.19.3.1 defined by the IEC 60730 standard. It detects the single bit Faults in the invariable memory. The invariable memory in a system, such as Flash and EEPROM memory, contains data that is not intended to change during the program execution. The Flash/EEPROM Invariable Memory test computes the periodic check-sum using the Cyclic Redundancy Check (CRC-16). The CRC polynomial used to calculate the CRC-16 is shown below.

CRC-16 = 1 1000 0000 0000 0101 = 8005 (hex)

The CRC functions can be used to test the integrity of data stored in either Flash or EEPROM memory. This is done by calculating and returning

the CRC value of the data stored in the location defined in the function call.

- If CRC_Flag is set to 0x00 at system start-up, the reference CRC checksum is computed.
- The reference checksum is stored in the Flash or EEPROM memory and the CRC flag is set to 0xFF.
- The CRC16 calculation function can be called periodically if the CRC flag is set to 0xFF.
- The checksum calculated from step 3 is compared with the reference checksum.
- If both values match, a status bit can be set by the user application to indicate that the invariable memory has passed the test and no errors were found.

FLOWCHART FOR THE INVARIABLE MEMORY TEST

Note: Other than the calls to CLASSB_CRCFlashTest and CLASSB_CRCEEPROMTest, all steps in this flowchart are to be executed by the application firmware.

Clock Test

According to the IEC 60730 standard, only harmonics and sub-harmonics of the clock need to be tested if using a quartz synchronized clock. The Clock test implements frequency monitoring H.2.18.10.1 as defined by the IEC 60730 standard. It verifies the reliability of the system clock (i.e., the system clock should be neither too fast nor too slow). The Clock Test function is used to verify the proper operation of the CPU clock. This test performs the following major tasks:

- The independent clock source (Sosc or T1OSC) is required for the test. The reference clock should be connected to a timer such as Timer1.
- During the test the number of CPU clock cycles each reference clock period is counted.
- If the number of clock cycles is outside a specified range, the function returns an error code.

Clock Test Using Line Frequency

The Clock Test function is used to verify the proper operation of the CPU clock. The 50 Hz/60 Hz line frequency is used as an independent clock source or a reference clock source. The input capture module is used for the period measurement. The 50 Hz/60 Hz line frequency is fed to the Input Capture pin (IC1) of the respective device. This test performs the following major tasks:

- The IC1 input is used as the independent clock source/reference clock source to capture the hardware Timer2. An external reference frequency, usually the line frequency, has to be applied to the IC1 input pin.
- The Input Capture 1 is configured as follows:
- Timer2 is selected as IC1 time base
- Capture is performed on every rising edge
- Capture done event is generated on every second capture.
- The hardware Timer2 prescaler is calculated (based on the input reference frequency and the current PB frequency) as being the smallest divider possible such that the 16 bit Timer2 does not overflow within a period time of the input reference signal. This way, the best resolution is achieved for the given conditions. If no valid pre-scaler value can be obtained an error value is returned.
- The IC1 performs the capture on every rising edge of the input reference frequency. For period measurement, the capture done event is generated after the IC1 module takes two time stamps i.e. after every period of the input reference (20 ms if reference frequency is 50 Hz, 16.66ms if the reference frequency is 60 Hz).
- Once the capture done event is signaled, the two Timer2 captured readings are extracted and the number of elapsed PB clocks is calculated as being the difference between the two readings. If this value crosses the defined boundary limits the function returns an appropriate error value

Calculation Example 1:

System Clock = 80 MHz

PB Clock = 80 MHz (PB divider =1:1)

Input Reference = 50 Hz

T2 Min Divider = floor(PBclk/(65536*RefClk))+1 = 25

Actual T2 Divider = 32.

The number of cycles counted in the Reference clock period is = (80,000,000/32)/50 = 50,000.

Calculation Example 2:

System Clock = 80 MHz

PB Clock = 10 MHz (PB divider =1:8)

Input Reference = 60 Hz

T2 Min Divider = floor(PBclk/(65536*RefClk))+1 = 3

Actual T2 Divider = 4.

The number of cycles counted in the Reference clock period is = (10,000,000/4)/60 = 41,666.

Configuring the Library

The configuration of the Class B Library is based on the file `system_config.h`.

This header file contains the configuration selection for the Class B Library. Based on the selections made, the Class B Library may support the selected features. These configuration settings will apply to all instances of the Class B Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Building the Library

This section lists the files that are available in the Class B Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/classb`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`classb.h`	Includes all MPLAB Harmony-compatible function calls for the Class B Library.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`<file name>`	<add description>

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
`<file name>`	<add description>

Module Dependencies

The Class B Library does not depend on any other modules.

Library Interface

a) Functions

	Name	Description
	CLASSB_ClockLineFreqTest	The CPU Clock Line Test is one of the tests that check the reliability of the system clock. It implements the independent time slot monitoring H.2.18.10.4 as defined by the IEC 60730 standard.
	CLASSB_ClockTest	The CPU Clock test is one of the tests that check the reliability of the system clock. It implements the independent time slot monitoring H.2.18.10.1 as defined by the IEC 60730 standard.
	CLASSB_CPUPCTest	The Program Counter test implements one of the functional tests H.2.16.5 as defined by the IEC 60730 standard.
	CLASSB_CPURegistersTest	The CPU Register test implements the functional test H.2.16.5 as defined by the IEC 60730 standard.
	CLASSB_CRCFlashTest	The Flash CRC16 test implements the periodic modified checksum H.2.19.3.1 as defined by the IEC 60730 standard.
	CLASSB_RAMCheckerBoardTest	The RAM Checker Board test implements one of the functional tests H.2.19.6 as defined by the IEC 60730 standard.
	CLASSB_RAMMarchBTest	The RAM March B test is one of the Variable Memory tests that implements the Periodic Static Memory test H.2.19.6 as defined by the IEC 60730 standard.
	CLASSB_RAMMarchCStackTest	The RAM March C test is one of the Variable Memory tests that implements the Periodic Static Memory test H.2.19.6 as defined by the IEC 60730 standard.
	CLASSB_RAMMarchCTest	The RAM March C test is one of the Variable Memory tests that implements the Periodic Static Memory test H.2.19.6 as defined by the IEC 60730 standard.

	Flash_CRC16	• Function: unsigned int Flash_CRC16(unsigned char* pBuff, unsigned int crcPoly, unsigned int crcReg, unsigned int bSize) * • PreCondition: pBuff valid pointer * • Input: - pBuff: buffer to calculate CRC over • - crcPoly: the generator polynomial to be used • - crcReg: initial value of the CRC LFSR (seed) • - bSize: buffer size, bytes * • Output: value of the CRC * • Side Effects: None * • Overview: Shifts bytes through the CRC shift register. * • Note: Simple (and slow) CRC16 calculation directly based • on the hardware LFSR implementation.

b) Data Types and Constants

	Name	Description
	CLASSBRESULT	This is type CLASSBRESULT.
	CLASSB_RAM_TEST_CYCLE_SIZE	This is macro CLASSB_RAM_TEST_CYCLE_SIZE.
	CLOCK_TEST_INTERRUPT_SOURCE	This is macro CLOCK_TEST_INTERRUPT_SOURCE.
	CLOCK_TEST_REFERENCE_FREQ	Defines the reference frequency that is applied to the SOSC input.
	CLOCK_TEST_TIMER	This is macro CLOCK_TEST_TIMER.
	CRC_08_GEN_POLY	Flash CRC16 Test Generator Polynomials The value of the generator polynomial is used as an input parameter for the CLASSB_CRCFlashTest() function. It specifies what polynomial to be used for the CRC calculation. Following is a list of some of the most commonly used 16 bit Generator Polynomials that can be used. Any other polynomial that has the required fault detection capabilities can be used.
	CRC_16_GEN_POLY	This is macro CRC_16_GEN_POLY.
	CRC_32_GEN_POLY	This is macro CRC_32_GEN_POLY.
	CRC_CCITT_GEN_POLY	This is macro CRC_CCITT_GEN_POLY.
	FLASH_CRC16_MASK	mask to retain the useful CRC result for 16 bit polynomial
	FLASH_CRC16_MSB	mask to obtain the MSb-1, transport to the MSb.
	FLASH_CRC32_MASK	mask to retain the useful CRC result for 32 bit polynomial
	FLASH_CRC32_MSB	mask to obtain the MSb-1, transport to the MSb.
	FLASH_CRC8_MASK	mask to retain the useful CRC result for 8 bit polynomial
	FLASH_CRC8_MSB	mask to obtain the MSb-1, transport to the MSb.
	USE_MARCHC_MINUS	This is macro USE_MARCHC_MINUS.

Description

This section describes the Application Programming Interface (API) functions of the Class B Library.

Refer to each section for a detailed description.

a) Functions

CLASSB_ClockLineFreqTest Function

The CPU Clock Line Test is one of the tests that check the reliability of the system clock. It implements the independent time slot monitoring H.2.18.10.4 as defined by the IEC 60730 standard.

File

classb_config_template.h

C

```
CLASSBRESULT CLASSB_ClockLineFreqTest(unsigned int clockFrequency, unsigned int lineFrequency, unsigned int tolerance);
```

Returns

Result identifying the pass/fail status of the test: CLASSB_TEST_PASS - The test passed. The monitored CPU clock is within the requested limits.

CLASSB_TEST_FAIL - The test failed. The monitored CPU clock is greater than the specified upper limit; The monitored CPU clock is less than the specified lower limit; The frequency of the provided reference was too low and could not be used.

Description

The CPU Clock Line Test verifies that the system clock is within specified limits. An external frequency applied on Input Capture 1 pin (IC1) is used as the reference clock. The hardware Timer2 that runs on the system Peripheral Bus (PB) clock is used to monitor the CPU clock and Peripheral Bus divider.

The test performs the following major steps:

1. The IC1 input is used as the independent clock source/reference clock source to capture the hardware Timer2. An external reference frequency, usually the line frequency, has to be applied to the IC1 input pin.
2. The Input Capture 1 is configured as follows:

- Timer2 is selected as IC1 time base
- Capture is performed on every rising edge
- Capture done event is generated on every second capture.

3. The hardware Timer2 pre-scaler is calculated (based on the input reference frequency and the current PB frequency) as being the smallest divider possible such that the 16 bit Timer2 does not overflow within a period time of the input reference signal. This way, the best resolution is achieved for the given conditions. If no valid pre-scaler value can be obtained an error value is returned.
4. The IC1 performs the capture on every rising edge of the input reference frequency. For period measurement, the capture done event is generated after the IC1 module takes two time stamps i.e. after every period of the input reference (20 ms if reference frequency is 50 Hz, 16.66ms if the reference frequency is 60 Hz).
5. Once the capture done event is signalled, the 2 Timer2 captured readings are extracted and the number of elapsed PB clocks is calculated as being the difference between the two readings. If this value crosses the defined boundary limits the function returns an appropriate error value, specifying which exactly limit (upper/lower) was violated.

Calculation example 1: System Clock = 80 MHz PB Clock = 80 MHz (PB divider =1:1) Input Reference = 50 Hz

T2 Min Divider = floor(PBclk/(65536*RefClk))+1 = 25 Actual T2 Divider = 32. The number of cycles counted in the Reference clock period is = (80,000,000/32)/50 = 50,000.

Calculation example 2: System Clock = 80 MHz PB Clock = 10 MHz (PB divider =1:8) Input Reference = 60 Hz

T2 Min Divider = floor(PBclk/(65536*RefClk))+1 = 3 Actual T2 Divider = 4. The number of cycles counted in the Reference clock period is = (10,000,000/4)/60 = 41,666.

Remarks

The test uses the hardware Input Capture 1 module. It initializes the module as needed and, after the test is done, it shuts it off. The previous state of IC1 is not preserved/restored.

The test uses the hardware Timer2. It initializes the timer as needed and, after the test is done, shuts off the timer. The previous state of Timer1 is not preserved/restored.

The value of the PB frequency which is used as input by the Timer2 is derived from the system CPU clock by dividing it with the PB divider. The test does not change the value of the PB divider, it uses the current value.

The interrupts should be disabled when executing this test as the time spent in ISR's affects the accurate timing of this routine.

The frequency of signal used as a reference on IC1 input should normally be the line frequency. However, any frequency can be used as long as a a valid Timer2 divider can be obtained (see the example calculation below for the 16 bit Timer2). If the reference frequency is too low, a valid divider for the Timer 2 won't be possible (the maximum divider for Timer2 is 256). You can go to a greater PB divider in this case. If the selected reference frequency is too high the number of Timer2 captured counts will be too small and the measurement won't have enough resolution.

Preconditions

None.

Example

```
int testRes=CLASSB_ClockLineFreqTest(80000000, 60, 80000, 100000);
if(testRes==CLASSB_TEST_PASS)
{
    // process test success
}
else
{
    // process CPU clock high failure
}
```

Parameters

Parameters	Description
clockFrequency	the current system running frequency, Hz
lineFrequency	the frequency of the reference applied to the IC1 input pin, Hz. Usual values are 50/60 Hz
tolerance	the tolerance level of the system oscillator as a percentage (0 - 100).

Function

CLASSBRESULT CLASSB_ClockLineFreqTest(unsigned int clockFrequency, unsigned int lineFrequency, uint8_t tolerance)

CLASSB_ClockTest Function

The CPU Clock test is one of the tests that check the reliability of the system clock. It implements the independent time slot monitoring H.2.18.10.1 as defined by the IEC 60730 standard.

File

classb_config_template.h

C

```
CLASSBRESULT CLASSB_ClockTest(unsigned int clockFrequency, unsigned int referenceFrequency, unsigned int testLengthMsec, unsigned int tolerance);
```

Returns

Result identifying the pass/fail status of the test: CLASSB_TEST_PASS - The test passed. The monitored CPU clock is within the requested limits.

CLASSB_TEST_FAIL - The test failed. The monitored CPU clock is greater than the specified upper limit; The monitored CPU clock is less than the specified lower limit.

Description

The CPU Clock test verifies that the system clock is within specified limits. The secondary oscillator (SOSC) is used as the reference clock. The CPU Core Timer that runs on the CPU system clock is monitored.

The test performs the following major steps:

1. The LP SOSC is used as the independent clock source/reference clock source connected to hardware Timer1.
2. The CPU Core Timer monitored in this measurement is incremented every other CPU system clock. Usually the system runs on the Primary oscillator with PLL as the clock source to the CPU. However, any clock source except the SOSC itself which is used as a reference is valid for this test.
3. Timer1 is configured to time out after the specified interval of time elapsed (e.g. 10 ms).
4. The content of the Core Timer is saved at the beginning of the measurement, once the Timer 1 is started.
5. When the hardware Timer1 times out another reading of the Core Timer is taken and the difference is made with the start value. This difference value represents the number of CPU clock cycles counted by the Core Timer during the SOSC period of time.
6. If this value crosses the defined boundary limits the function returns an appropriate error value, specifying which exactly limit (upper/lower) was violated.

Remarks

The test uses the hardware Timer1. It initializes the timer as needed and, after the test is done, shuts off the timer. The previous state of Timer1 is not preserved/restored.

The test assumes that the Core Timer is enabled and linearly counting up as it should do during normal system operation. If your code specifically disables the Core Timer, it should enable it before this test is called. If the value in the Core Timer is updated/changed as part of an ISR, this ISR should be disabled.

The interrupts should be disabled when executing this test as the time spent in ISR's affects the accurate timing of this routine.

The SOSC is used as a reference. Use the CLOCK_TEST_SOSC_FREQ for adjustments to this value, if needed.

The value of the CPU clock monitoring time, nMs, is limited because of the use of the hardware Timer1 which is a 16 bit timer. Therefore, the value loaded into this Timer1 register should not exceed 2^16-1.

Preconditions

None.

Example

```
int testRes=CLASSB_ClockTest(80000000, 100, 80000, 100000);
if(testRes==CLASSB_TEST_PASS)
{
    // process test success
}
```

```
else
{
    // process CPU clock high failure
}
```

Parameters

Parameters	Description
clockFrequency	the current system running frequency, Hz
referenceFrequency	the frequency of the reference applied to the SOSC pin, Hz.
testLengthMsec	number of milliseconds to be used for the CPU Clock monitoring. 1 <= testLengthMsec <= 1000
tolerance	the tolerance level of the system oscillator as a percentage (0 - 100).

Function

CLASSBRESULT CLASSB_ClockTest(unsigned int sysClk, int nMs, unsigned int hiClkErr, unsigned int loClkErr)

CLASSB_CPUPCTest Function

The Program Counter test implements one of the functional tests H.2.16.5 as defined by the IEC 60730 standard.

File

classb_config_template.h

C

```
CLASSBRESULT CLASSB_CPUPCTest();
```

Returns

Result identifying the pass/fail status of the test: CLASSB_TEST_PASS - The test passed. The PC register holds the correct address.

CLASSB_TEST_FAIL - The test failed. The PC register has been detected to hold an incorrect address.

Description

The Program Counter test is a functional test of the PC. It checks that the PC register is not stuck and it properly holds the address of the next instruction to be executed.

The tests performs the following major tasks:

1. The Program Counter test invokes functions that are located in memory at different addresses.
2. That all of the functions is executed is verified.

Remarks

The test uses 3 different functions: CLASSB_CPUPCTestFunction1() CLASSB_CPUPCTestFunction2() CLASSB_CPUPCTestFunction3()

Preconditions

None.

Example

```
int testRes=CLASSB_CPUPCTest();
if(testRes==PC_TEST_PASS)
{
    // process test success
}
else
{
    // process tests failure
}
```

Function

int CLASSB_CPUPCTest (void)

CLASSB_CPURegistersTest Function

The CPU Register test implements the functional test H.2.16.5 as defined by the IEC 60730 standard.

File

classb_config_template.h

C

```
CLASSBRESULT CLASSB_CPURegistersTest();
```

Returns

Result identifying the pass/fail status of the test: CLASSB_TEST_PASS - The test passed. CPU registers have not been detected to have stuck bits.

CLASSB_TEST_FAIL - The test failed. Some CPU register(s) has been detected to have stuck bits.

Description

This routine detects stuck-at Faults in the CPU registers. This ensures that the bits in the registers are not stuck at a value ?0? or ?1?.

Remarks

This is a non-destructive test.

Interrupts should be disabled when calling this test function.

Preconditions

None.

Example

```
int testRes=CLASSB_CPURegistersTest();
if(testRes==CLASSB_TEST_PASS)
{
    // process test success
}
else
{
    // process tests failure
}
```

Function

int CLASSB_CPURegistersTest (void)

CLASSB_CRCFlashTest Function

The Flash CRC16 test implements the periodic modified checksum H.2.19.3.1 as defined by the IEC 60730 standard.

File

classb_config_template.h

C

```
unsigned int CLASSB_CRCFlashTest(char* startAddress, char* endAddress, unsigned int crcPoly, unsigned int crcSeed);
```

Returns

The value of the calculated CRC over the specified memory area.

Description

This routine detects the single bit Faults in the invariable memory. The invariable memory in a system, such as Flash and EEPROM memory, contains data that is not intended to vary during the program execution.

The test calculates the 16 bit CRC of the supplied memory area using the standard LFSR (Linear Feedback Shift Register) implementation. It calculates over the memory area between the startAddress and endAddress and returns the CRC Value. The 16 bit CRC is calculated using the supplied generator polynomial and initial seed. Different generator polynomials can be used as indicated above.

Remarks

This is a non-destructive memory test.

The startAddress and endAdress over which the CRC value is calculated are PIC32 variant and application dependent. They are run-time parameters.

Preconditions

None.

Example

```
unsigned int crcRes=CLASSB_CRCFlashTest(startAddress, endAddress, CRC_16_GEN_POLY, 0xffff);
if(crcRes==prevCalculatedCrc)
{
    // process test success
}
else
{
    // process tests failure: the CRC of the memory area has changed.
}
```

Parameters

Parameters	Description
startAddress	start Address of the memory area to start CRC calculation from
endAddress	final address for which the CRC is calculated
crcPoly	the generator polynomial to be used. One of the standard supplied polynomials can be used as well as other user defined ones.
crcSeed	the initial value in the CRC LFSR. The usual recommended value is 0xffff.

Function

unsigned int CLASSB_CRCFlashTest(char* startAddress, char* endAddress, unsigned int crcPoly, unsigned int crcSeed)

CLASSB_RAMCheckerBoardTest Function

The RAM Checker Board test implements one of the functional tests H.2.19.6 as defined by the IEC 60730 standard.

File

classb_config_template.h

C

```
CLASSBRESULT CLASSB_RAMCheckerBoardTest(unsigned int * startAddress, unsigned int length);
```

Returns

Result identifying the pass/fail status of the test: CLASSB_TEST_PASS - The test passed. RAM area tested has not been detected to have stuck bits.

CLASSB_TEST_FAIL - The test failed. Some RAM area location has been detected to have stuck bits.

Description

This routine detects single bit Faults in the variable memory. This ensures that the bits in the tested RAM are not stuck at a value ?0? or ?1?.

The test writes the checkerboard pattern (0x55555555 followed by 0xaaaaaaaa) to adjacent memory locations starting at ramStartAddress. It performs the following steps:

1. A temporary memory buffer (stack) is tested for reliability.
1. The content of a 64 bytes memory chunk to be tested is saved in temporary memory buffer.
2. Writes the pattern 0x55555555 followed by 0xaaaaaaaa to adjacent memory locations filling up the 64 bytes memory chunk.
3. It reads the memory chunk adjacent locations and checks that the read-back values match the written pattern. If the values match set the success result and go to step 4. Else set the error result and go to step 6.
4. Writes the inverted pattern 0xaaaaaaaa followed by 0x55555555 to adjacent memory locations filling up the 64 bytes memory chunk.
5. It reads the memory chunk adjacent locations and checks that the read-back values match the written pattern. If the values match set the success result. Else set the error result.
6. The content of the tested 64 bytes memory chunk is restored from the temporary memory buffer.
7. If the result shows error the test is done and returns.
8. The address pointer is incremented to point to the next sequential 64 bytes memory chunk and the test is repeated from step 1 until all the number of requested memory locations is tested.

Remarks

This is a non-destructive memory test. The content of the tested memory area is saved and restored. The test operates in 64 bytes long memory chunks at a time.

At least 32 bytes should be available for stack for executing the RAM Checker Board test. The tested RAM area must not overlap the stack.

The Start Address from which the Checker Board test is to be performed is PIC32 variant and application dependent. It is a run-time parameter.

The routine accesses one 4 byte RAM word at a time.

Preconditions

None.

Example

```
int testRes=CLASSB_RAMCheckerBoardTest(startAddress, size);
if(testRes==CLASSB_TEST_PASS)
{
    // process test success
}
else
{
    // process tests failure
}
```

Parameters

Parameters	Description
ramStartAddress	start Address from which the checker Board test is to be performed Must be properly 32 bit aligned.
ramSize	number of consecutive byte locations for which the test is to be performed The size must be a number multiple of 64.

Function

int CLASSB_RAMCheckerBoardTest (int* ramStartAddress, int ramSize)

CLASSB_RAMMarchBTest Function

The RAM March B test is one of the Variable Memory tests that implements the Periodic Static Memory test H.2.19.6 as defined by the IEC 60730 standard.

File

classb_config_template.h

C

```
CLASSBRESULT CLASSB_RAMMarchBTest(unsigned int* ramStartAddress, unsigned int ramSize);
```

Returns

Result identifying the pass/fail status of the test: CLASSB_TEST_PASS - The test passed. RAM area tested has not been detected to have faults.

CLASSB_TEST_FAIL - The test failed. Some RAM area location has been detected to have faults.

Description

This test is a complete and non redundant test capable of detecting stuck-at, linked idempotent coupling or Inversion Coupling faults. This test is of complexity 17n(Where n is the number of bits tested). The test uses word (32-bit) accesses. The address must be properly word aligned and the length of the area to be tested must be an integral multiple of the data width access.

Remarks

This is a destructive memory test. Either exclude from this test RAM areas that have to be preserved or save/restore the memory area before/after running the test or run the test at system startup before the memory and the run time library is initialized (stack needs to be initialized though).

At least 100 bytes should be available for stack for executing the March B test. The tested RAM area must not overlap the stack.

Other statically allocated resources, such as the MPLAB ICD/Real ICE allocated RAM buffers should be excluded from this test.

The Start Address from which the March B test is to be performed is PIC32 variant and application dependent. It is a run-time parameter.

The routine accesses one 4 byte RAM word at a time.

Refer to the AN1229 for details regarding the CLASSB_RAMMarchBTest() and the Class B Software Library.

Preconditions

None.

Example

```
int testRes=CLASSB_RAMMarchBTest(startAddress, size);
if(testRes==CLASSB_TEST_PASS)
```

```
{
    // process test success
}
else
{
    // process tests failure
}
```

Parameters

Parameters	Description
ramStartAddress	start Address from which the March B test is to be performed Must be properly 32 bit aligned.
ramSize	number of consecutive byte locations for which the test is to be performed The size must be a number multiple of 4.

Function

int CLASSB_RAMMarchBTest (int* ramStartAddress, int ramSize)

CLASSB_RAMMarchCStackTest Function

The RAM March C test is one of the Variable Memory tests that implements the Periodic Static Memory test H.2.19.6 as defined by the IEC 60730 standard.

File

classb_config_template.h

C

```
CLASSBRESULT CLASSB_RAMMarchCStackTest(unsigned int* ramStartAddress, unsigned int ramSize);
```

Returns

Result identifying the pass/fail status of the test: CLASSB_TEST_PASS - The test passed. RAM and Stack area tested have not been detected to have faults.

CLASSB_TEST_FAIL - The test failed. Either some RAM or Stack area location has been detected to have faults,

Description

This test is a complete and non redundant test capable of detecting stuck-at, addressing, transition and coupling faults. This test is of complexity 11n(Where n is the number of bits tested). The test uses word (32-bit) accesses. The addresses must be properly word aligned and the lengths of the areas to be tested must be an integral multiple of the data width access.

Remarks

This function is just a helper to March C test both a regular RAM area and a Stack area. First the RAM area is tested using the standard March C test. If the test succeeded, the requested Stack area is saved/copied in the RAM area that has just been tested and then the March C test is run over the Stack area as if it were a regular RAM area. The saved Stack area is restored and the result of the test is returned to the user.

The RAM and Stack areas have to NOT overlap! The Stack grows downwards so the tested area is: [stackTopAddress-stackSize, stackTopAddress] Also the size of the Stack area to be tested has to be less than the size of the RAM area.

The processor SP register is changed to the point to the RAM area while the Stack area is tested. Since running the MARC C test requires at least 128 bytes of stack, the RAM area size should be at least 128 bytes long. Once the Stack area is tested, the SP register is restored.

This is a destructive memory test. Either exclude from this test RAM areas that have to be preserved or save/restore the memory area before/after running the test or run the test at system startup before the memory and the run time library is initialized (stack needs to be initialized though).

At least 128 bytes should be available for stack for executing the March C test. The tested RAM area must not overlap the stack.

Other statically allocated resources, such as the MPLAB ICD/Real ICE allocated RAM buffers should be excluded from this test.

The Start Address from which the March C test is to be performed is PIC32 variant and application dependent. It is a run-time parameter.

The routine accesses one 4 byte RAM word at a time.

Preconditions

None.

Example

```
int testRes=CLASSB_RAMMarchCStackTest(startAddress, size);
if(testRes==CLASSB_TEST_PASS)
{
    // process test success
}
else
```

```
{
    // process tests failure
}
```

Parameters

Parameters	Description
ramStartAddress	start Address of RAM area to be used as temporary stack. The stack will be copied into this memory, and the stack pointer redirected here. Has to NOT overlap the Stack area! Must be properly 32 bit aligned.
ramSize	number of consecutive byte locations for which the test is to be performed The portion of the stack to be tested will be from the Stack Start (Highest address) to this address minus ramSize. This value also defines the amount of memory available as a temporary stack. The size must be a number multiple of 4. The size of the RAM area tested has to be >= 128 bytes.

Function

CLASSBRESULT CLASSB_RAMMarchCStackTest (unsigned int* ramStartAddress,

unsigned int ramSize)

CLASSB_RAMMarchCTest Function

The RAM March C test is one of the Variable Memory tests that implements the Periodic Static Memory test H.2.19.6 as defined by the IEC 60730 standard.

File

classb_config_template.h

C

```
CLASSBRESULT CLASSB_RAMMarchCTest(unsigned int* ramStartAddress, unsigned int ramSize);
```

Returns

Result identifying the pass/fail status of the test: CLASSB_TEST_PASS - The test passed. RAM area tested has not been detected to have faults.

CLASSB_TEST_FAIL - The test failed. Some RAM area location has been detected to have faults.

Description

This test is a complete and non redundant test capable of detecting stuck-at, addressing, transition and coupling faults. This test is of complexity 11n(Where n is the number of bits tested). The test uses word (32-bit) accesses. The address must be properly word aligned and the length of the area to be tested must be an integral multiple of the data width access.

Remarks

This is a destructive memory test. Either exclude from this test RAM areas that have to be preserved or save/restore the memory area before/after running the test or run the test at system startup before the memory and the run time library is initialized (stack needs to be initialized though).

At least 100 bytes should be available for stack for executing the March C test. The tested RAM area must not overlap the stack.

Other statically allocated resources, such as the MPLAB ICD/Real ICE allocated RAM buffers should be excluded from this test.

The Start Address from which the March C test is to be performed is PIC32 variant and application dependent. It is a run-time parameter.

The routine accesses one 4 byte RAM word at a time.

Preconditions

None.

Example

```
int testRes=CLASSB_RAMMarchCTest(startAddress, size);
if(testRes==CLASSB_TEST_PASS)
{
    // process test success
}
else
{
    // process tests failure
}
```

Parameters

Parameters	Description
ramStartAddress	start Address from which the March C test is to be performed Must be properly 32 bit aligned.

ramSize	number of consecutive byte locations for which the test is to be performed The size must be a number multiple of 4.

Function

CLASSBRESULT CLASSB_RAMMarchCTest(unsigned int* ramStartAddress,
unsigned int ramSize)

Flash_CRC16 Function

File

classb_config_template.h

C

```
unsigned int Flash_CRC16(unsigned char* pBuff, unsigned int crcPoly, unsigned int crcReg, unsigned int
bSize);
```

Description

- Function: unsigned int Flash_CRC16(unsigned char* pBuff, unsigned int crcPoly, unsigned int crcReg, unsigned int bSize)
*
- PreCondition: pBuff valid pointer
*
- Input: - pBuff: buffer to calculate CRC over
- - crcPoly: the generator polynomial to be used
- - crcReg: initial value of the CRC LFSR (seed)
- - bSize: buffer size, bytes
*
- Output: value of the CRC
*
- Side Effects: None
*
- Overview: Shifts bytes through the CRC shift register.
*
- Note: Simple (and slow) CRC16 calculation directly based
- on the hardware LFSR implementation.

b) Data Types and Constants

CLASSBRESULT Enumeration

File

classb_config_template.h

C

```
typedef enum {
  CLASSB_TEST_PASS = 0,
  CLASSB_TEST_FAIL,
  CLASSB_TEST_TIMEOUT,
  CLASSB_TEST_INPROGRESS
} CLASSBRESULT;
```

Description

This is type CLASSBRESULT.

CLASSB_RAM_TEST_CYCLE_SIZE Macro

File

classb_config_template.h

C

```
#define CLASSB_RAM_TEST_CYCLE_SIZE 64
```

Description

This is macro CLASSB_RAM_TEST_CYCLE_SIZE.

CLOCK_TEST_INTERRUPT_SOURCE Macro

File

classb_config_template.h

C

```
#define CLOCK_TEST_INTERRUPT_SOURCE INT_SOURCE_TIMER_1
```

Description

This is macro CLOCK_TEST_INTERRUPT_SOURCE.

CLOCK_TEST_REFERENCE_FREQ Macro

Defines the reference frequency that is applied to the SOSC input.

File

classb_config_template.h

C

```
#define CLOCK_TEST_REFERENCE_FREQ 32768
```

Description

CPU Clock Test Secondary Oscillator (SOSC) reference frequency

This definition is used for internal calculation in the CLASSB_ClockTest() function. Normally this input is driven by a 32.768 KHz xtal. You can adjust this value if the need occurs (temperature drifts, etc).

CLOCK_TEST_TIMER Macro

File

classb_config_template.h

C

```
#define CLOCK_TEST_TIMER TMR_ID_1
```

Description

This is macro CLOCK_TEST_TIMER.

CRC_08_GEN_POLY Macro

File

classb_config_template.h

C

```
#define CRC_08_GEN_POLY 0x07     /* x^8 + x^2 + x + 1*/
```

Description

Flash CRC16 Test Generator Polynomials

The value of the generator polynomial is used as an input parameter for the CLASSB_CRCFlashTest() function. It specifies what polynomial to be used for the CRC calculation.

Following is a list of some of the most commonly used 16 bit Generator Polynomials that can be used. Any other polynomial that has the required fault detection capabilities can be used.

CRC_16_GEN_POLY Macro

File

classb_config_template.h

C

```
#define CRC_16_GEN_POLY 0x8005   /* x^16 + x^15 + x^2 + 1*/
```

Description

This is macro CRC_16_GEN_POLY.

CRC_32_GEN_POLY Macro

File

classb_config_template.h

C

```
#define CRC_32_GEN_POLY 0x04C11DB7  /* x^32 + x^26 + x^23 + x^22 + x^16 + x^12 + x^11 + x^10 + x^8 + x^7 +
x^5 + x^4 + x^2 + x + 1*/
```

Description

This is macro CRC_32_GEN_POLY.

CRC_CCITT_GEN_POLY Macro

File

classb_config_template.h

C

```
#define CRC_CCITT_GEN_POLY 0x1021   /* x^16 + x^12 + x^5 + 1*/
```

Description

This is macro CRC_CCITT_GEN_POLY.

FLASH_CRC16_MASK Macro

File

classb_config_template.h

C

```
#define FLASH_CRC16_MASK ((1L<<16)-1)            // mask to retain the useful CRC result for 16 bit
polynomial
```

Description

mask to retain the useful CRC result for 16 bit polynomial

FLASH_CRC16_MSB Macro

File

classb_config_template.h

C

```
#define FLASH_CRC16_MSB (1L<<(16-1))           // mask to obtain the MSb-1, transport to the MSb.
```

Description

mask to obtain the MSb-1, transport to the MSb.

FLASH_CRC32_MASK Macro

File

classb_config_template.h

C

```
#define FLASH_CRC32_MASK ((1L<<32)-1)            // mask to retain the useful CRC result for 32 bit
polynomial
```

Description

mask to retain the useful CRC result for 32 bit polynomial

FLASH_CRC32_MSB Macro

File

classb_config_template.h

C

```
#define FLASH_CRC32_MSB (1L<<(32-1))            // mask to obtain the MSb-1, transport to the MSb.
```

Description

mask to obtain the MSb-1, transport to the MSb.

FLASH_CRC8_MASK Macro

File

classb_config_template.h

C

```
#define FLASH_CRC8_MASK ((1L<<8)-1)              // mask to retain the useful CRC result for 8 bit
polynomial
```

Description

mask to retain the useful CRC result for 8 bit polynomial

FLASH_CRC8_MSB Macro

File

classb_config_template.h

C

```
#define FLASH_CRC8_MSB (1L<<(8-1))              // mask to obtain the MSb-1, transport to the MSb.
```

Description

mask to obtain the MSb-1, transport to the MSb.

USE_MARCHC_MINUS Macro

File

classb_config_template.h

C

```
#define USE_MARCHC_MINUS
```

Description

This is macro USE_MARCHC_MINUS.

Files

Files

Name	Description
classb_config_template.h	Class B interface header for definitions common to the Class B Library.

Description

This section lists the source and header files used by the Class B Library.

classb_config_template.h

Description

Class B Library Interface Header

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Class B Library for all families of Microchip microcontrollers. The definitions in this file are common to the Class B Library.

File Name

classb.h

Company

Microchip Technology Inc.

Crypto Library Help

This section describes the Cryptographic (Crypto) Library that is available in MPLAB Harmony.

Introduction

This library provides a software Cryptographic Library that is available on the Microchip family of microcontrollers with a convenient C language interface.

Description

The Cryptographic Library includes functions to perform encryption, decryption, hashing, authentication, and compression within the embedded application. Random number generation (RNG) functions are also provided.

Block Ciphers

The library provides DES, 3DES, and AES for block cipher needs. Depending on the algorithm in use, CBC and CTR modes are supported.

Public Key Cryptography

The library provides RSA and Elliptic Curve Cryptography (ECC) for Public Key Cryptography, and Diffie-Hellman (DH) for key agreement arrangements.

Hash Functions

The library provides MD5, SHA, SHA-256, SHA-384, and SHA-512 for hashing. These functions do not require keys or initialization vectors (IV).

Random Number Generation Functions

The library provides functions to generate either a single pseudo-random number, or a block of such numbers.

Using the Library

This topic describes the basic architecture of the Cryptographic (Crypto) Library and provides information and examples on its use.

Description

Interface Header File: `crypto.h`

The interface to the Crypto Library is defined in the `crypto.h` header file. Any C language source (`.c`) file that uses the Crypto Library should include `crypto.h`.

Library File:

The Crypto Library archive (`.a`) file is installed with MPLAB Harmony.

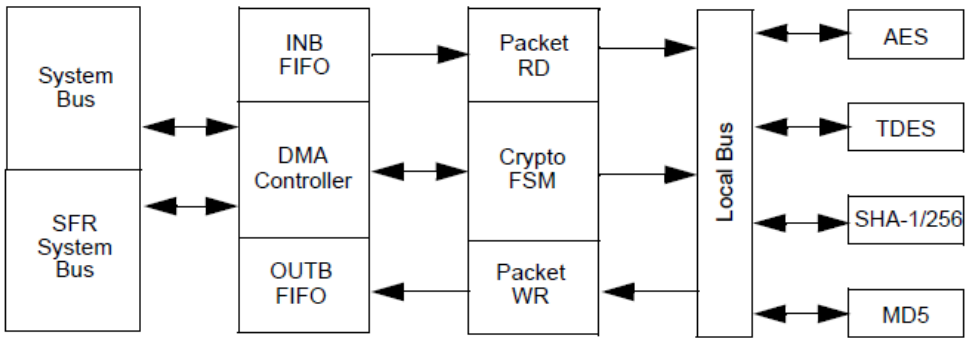
Please refer to the What is MPLAB Harmony? section for how the Crypto Library interacts with the framework.

Abstraction Model

This library provides the low-level abstraction of the Cryptographic Library module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the library interface.

Description

Cryptographic (Crypto) Software Abstraction Block Diagram



Library Overview

The Library Interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Cryptographic (Crypto) Library module.

Library Interface Section	Description
General Functions	Provides an error string function, which takes an error and converts it into human-readable text.
Compression Functions	Provides Huffman compression and decompression functions.
MD5 Functions	Provides data add, finalize, and initialize MD5 functions.
Random Number Generator Functions	Provides get, initialize, and block generate RNG functions.
AES Encryption/Decryption Functions	Provides AES encryption and decryption functions.
ECC Encryption/Decryption Functions	Provides ECC encryption and decryption functions.
RSA Encryption/Decryption Functions	Provides RSA encryption and decryption functions.
Triple DES Encryption/Decryption Functions	Provides 3DES encryption and decryption functions.
HMAC Hash Functions	Provides HMAC data add, finalize, and set key Hash functions.
SHA Hash Functions	Provides SHA data add, finalize, and initialize Hash functions.
SHA256 Hash Functions	Provides SHA256 data add, finalize, and initialize Hash functions.
SHA384 Hash Functions	Provides SHA384 data add, finalize, and initialize Hash functions.
SHA512 Hash Functions	Provides SHA512 data add, finalize, and initialize Hash functions.

Configuring the Library

The configuration of the Cryptographic Library is based on the file `system_config.h`.

This header file contains the configuration selection for the Cryptographic Library. Based on the selections made, the Cryptographic Library may support the selected features. These configuration settings will apply to all instances of the Cryptographic Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Building the Library

This section lists the files that are available in the Crypto Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/crypto`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`crypto.h`	Includes all MPLAB Harmony-compatible function calls for the Crypto Library.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
<install-dir>/build/framework/crypto/crypto.X	Include this project to bring in the library and all associated functions. There are two build configuration options available for this library: • SW – Software-only configuration for all Microchip PIC32 microcontrollers. • HW – Hardware acceleration configuration for PIC32 devices that have a hardware encryption module For both configurations, adjust the properties if 16-bit code is desired, and set the appropriate version of microcontroller.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
<install-dir>/build/framework/crypto/zlib.X	This project provides the code for Huffman compression in the Crypto Library. If the application does not use Huffman compression, this library may be excluded. There are two build configuration options available for this library: • PIC32MX – for PIC32MX devices • PIC32MZ – for PIC32MZ devices For both configurations, adjust the properties if 16-bit code is desired.

Module Dependencies

The Crypto Library does not depend on any other modules.

Library Interface

a) General Functions

	Name	Description
	CRYPT_RNG_Initialize	Initializes the random number generator.
	CRYPT_ERROR_StringGet	Reports the nature of an error.

b) Compression Functions

	Name	Description
	CRYPT_HUFFMAN_Compress	Compresses a block of data.
	CRYPT_HUFFMAN_DeCompress	Decompresses a block of data.

c) MD5 Functions

	Name	Description
	CRYPT_MD5_DataAdd	Updates the hash with the data provided.
	CRYPT_MD5_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_MD5_Initialize	Initializes the internal structures necessary for MD5 hash calculations.
	CRYPT_MD5_DataSizeSet	For PIC32MZ hardware encryption, sets the size of the input data.

d) Random Number Generator Functions

	Name	Description
	CRYPT_RNG_BlockGenerate	Createa several random numbers.
	CRYPT_RNG_Get	Gets one random number.

e) AES Encryption/Decryption Functions

	Name	Description
	CRYPT_AES_CBC_Decrypt	Performs AES decryption using Cipher-Block-Chaining (CBC).
	CRYPT_AES_CBC_Encrypt	Performs AES encryption using Cipher-Block-Chaining (CBC).
	CRYPT_AES_CTR_Encrypt	Performs AES encryption using Counter (CTR).
	CRYPT_AES_DIRECT_Decrypt	Directs decryption of one block of data.
	CRYPT_AES_DIRECT_Encrypt	Directs encryption of one block of data.

	CRYPT_AES_IvSet	Sets the initialization vector (IV) for AES processing.
	CRYPT_AES_KeySet	Sets the key and initialization vector (IV) for AES processing.

f) ECC Encryption/Decryption Functions

	Name	Description
	CRYPT_ECC_DHE_KeyMake	Creates a new ECC key.
	CRYPT_ECC_DHE_SharedSecretMake	Creates an ECC shared secret between two keys.
	CRYPT_ECC_DSA_HashSign	Signs a message digest.
	CRYPT_ECC_DSA_HashVerify	Verifies an ECC signature.
	CRYPT_ECC_Free	Cleans up an Elliptic Curve Cryptography (ECC) Context.
	CRYPT_ECC_Initialize	Initializes the context for Elliptic Curve Cryptography (ECC).
	CRYPT_ECC_KeySizeGet	Returns the key size in octets.
	CRYPT_ECC_PrivateImport	Imports private key pair in X9.63 format.
	CRYPT_ECC_PublicExport	Exports public ECC key in ANSI X9.63 format.
	CRYPT_ECC_PublicImport	Imports public key in ANSI X9.63 format.
	CRYPT_ECC_SignatureSizeGet	Returns the signature size in octets.

g) RSA Encryption/Decryption Functions

	Name	Description
	CRYPT_RSA_EncryptSizeGet	Gets the size of the RSA Key.
	CRYPT_RSA_Free	Releases the memory used for the key and clean up the context.
	CRYPT_RSA_Initialize	Initializes the internal structures necessary for RSA processing.
	CRYPT_RSA_PrivateDecrypt	Decrypts data using a private key.
	CRYPT_RSA_PrivateKeyDecode	Constructs the Private Key from a DER certificate.
	CRYPT_RSA_PublicEncrypt	Encrypts data using a public key.
	CRYPT_RSA_PublicKeyDecode	Constructs the Public Key from a DER certificate.

h) Triple DES (3DES) Encryption/Decryption Functions

	Name	Description
	CRYPT_TDES_CBC_Decrypt	Decrypts a data block using Triple DES.
	CRYPT_TDES_CBC_Encrypt	Encrypts a data block using Triple DES.
	CRYPT_TDES_IvSet	Sets the Initialization Vector (IV) for a Triple DES operation.
	CRYPT_TDES_KeySet	Initialization of Triple DES context.

i) HMAC Hash Functions

	Name	Description
	CRYPT_HMAC_DataAdd	Adds data to the HMAC calculation.
	CRYPT_HMAC_Finalize	Completes the HMAC calculation and get the results.
	CRYPT_HMAC_SetKey	Initializes the HMAC context and set the key for the hash.

j) SHA Hash functions

	Name	Description
	CRYPT_SHA_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA_Initialize	Initializes the internal structures necessary for SHA hash calculations.
	CRYPT_SHA_DataSizeSet	For PIC32MZ hardware encryption, sets the size of the input data.

k) SHA256 Hash Functions

	Name	Description
	CRYPT_SHA256_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA256_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA256_Initialize	Initializes the internal structures necessary for SHA256 hash calculations.
	CRYPT_SHA256_DataSizeSet	For PIC32MZ hardware encryption, sets the size of the input data.

l) SHA384 Hash Functions

	Name	Description
	CRYPT_SHA384_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA384_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA384_Initialize	Initializes the internal structures necessary for SHA384 hash calculations.

m) SHA512 Hash Functions

	Name	Description
	CRYPT_SHA512_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA512_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA512_Initialize	Initializes the internal structures necessary for SHA512 hash calculations.

n) Data Types and Constants

	Name	Description
	CRYPT_AES_CTX	AES
	CRYPT_ECC_CTX	ECC
	CRYPT_HMAC_CTX	HMAC
	CRYPT_MD5_CTX	MD5
	CRYPT_RNG_CTX	RNG
	CRYPT_RSA_CTX	RSA
	CRYPT_SHA_CTX	SHA
	CRYPT_SHA256_CTX	SHA-256
	CRYPT_SHA384_CTX	SHA-384
	CRYPT_SHA512_CTX	SHA-512
	CRYPT_TDES_CTX	TDES
	MC_CRYPTO_API_H	Defines Microchip CRYPTO API layer

Description

This section describes the Application Programming Interface (API) functions of the Cryptographic Library.

Refer to each section for a detailed description.

a) General Functions

CRYPT_RNG_Initialize Function

Initializes the random number generator.

File

crypto.h

C

```
int CRYPT_RNG_Initialize(CRYPT_RNG_CTX*);
```

Returns

- negative - An error occurred setting up the random number generator.
- 0 - An invalid pointer was not passed to the function.

Description

This function initializes the context that stores information relative to random number generation.

Preconditions

None.

Example

```
#define RANDOM_BYTE_SZ 32

int           ret;
```

```
CRYPT_RNG_CTX mcRng;
byte          out[RANDOM_BYTE_SZ];

ret = CRYPT_RNG_Initialize(&mcRng);

ret = CRYPT_RNG_Get(&mcRng, &out[0]);

ret = CRYPT_RNG_BlockGenerate(&mcRng, out, RANDOM_BYTE_SZ);
```

Parameters

Parameters	Description
rng	Pointer to random number generator context.

Function

int CRYPT_RNG_Initialize(CRYPT_RNG_CTX* rng)

CRYPT_ERROR_StringGet Function

Reports the nature of an error.

File

crypto.h

C

```
int CRYPT_ERROR_StringGet(int, char*);
```

Returns

- BAD_FUNC_ARG - A null string was passed for the return message.
- 0 - A null string was not passed for the return message.

Description

This function takes an error and converts it into human-readable text.

Remarks

String needs to be >= 80 chars.

Preconditions

None.

Example

```
char msg[80];

CRYPT_ERR_StringGet(ret, msg);
```

Parameters

Parameters	Description
int	Error code to convert.
str	Pointer to buffer to store the message. Must hold at least 80 characters.

Function

int CRYPT_ERROR_StringGet(int err, char* str)

b) Compression Functions

CRYPT_HUFFMAN_Compress Function

Compresses a block of data.

File

crypto.h

C

```
int CRYPT_HUFFMAN_Compress(unsigned char*, unsigned int, const unsigned char*, unsigned int, unsigned int);
```

Returns

- negative - error code
- positive - bytes stored in out buffer

Description

This function compresses a block of data using Huffman encoding.

Remarks

Output buffer must be large enough to hold the contents of the operation.

Preconditions

None.

Example

```
const unsigned char text[] = "...";
unsigned int inSz = sizeof(text);
unsigned int outSz;
unsigned char cBuffer[1024];

int ret;

ret = CRYPT_HUFFMAN_COMPRESS(cBuffer, sizeof(cBuffer), text, inSz, 0);
```

Parameters

Parameters	Description
out	Pointer to location to store the compressed data.
outSz	Maximum size of the output data in bytes.
in	Point to location of source data.
inSz	Size of the input data in bytes.
flags	Flags to control how compress operates

Function

int CRYPT_HUFFMAN_Compress(unsigned char* out, unsigned int outSz, const unsigned char* in,
unsigned int inSz, unsigned int flags)

CRYPT_HUFFMAN_DeCompress Function

Decompresses a block of data.

File

crypto.h

C

```
int CRYPT_HUFFMAN_DeCompress(unsigned char*, unsigned int, const unsigned char*, unsigned int);
```

Returns

- negative - Error code
- positive - Bytes stored in out buffer

Description

This function decompresses a block of data using Huffman encoding.

Remarks

Output buffer must be large enough to hold the contents of the operation.

Preconditions

None.

Example

```
unsigned char cBuffer[1024];
unsigned char dBuffer[1024];

int ret

ret = CRYPT_HUFFMAN_DeCompress(dBuffer, sizeof(dBuffer), cBuffer, msglen);
```

Parameters

Parameters	Description
out	Pointer to destination buffer
outSz	Size of destination buffer
in	Pointer to source buffer to decompress
inSz	Size of source buffer to decompress

Function

int CRYPT_HUFFMAN_DeCompress(unsigned char* out, unsigned int outSz, const unsigned char* in, unsigned int inSz)

c) MD5 Functions

CRYPT_MD5_DataAdd Function

Updates the hash with the data provided.

File

crypto.h

C

```
int CRYPT_MD5_DataAdd(CRYPT_MD5_CTX*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in md5 or input
- 0 - An invalid pointer was not passed to the function

Description

This function updates the hash with the data provided.

Remarks

To preserve the validity of the MD5 hash, nothing must modify the context holding variable between calls to CRYPT_MD5_DataAdd.

Preconditions

The MD5 context must be initialized prior to the first call of this function. The context must not be modified by code outside of this function.

Example

```
CRYPT_MD5_CTX md5;
uint8_t buffer[1024];
uint8_t md5sum[MD5_DIGEST_SIZE];

CRYPT_MD5_Initialize(&md5);
CRYPT_MD5_DataAdd(&md5, buffer, sizeof(buffer));
CRYPT_MD5_Finalize(&md5, md5sum);
```

Parameters

Parameters	Description
md5	Pointer to CRYPT_MD5_CTX structure which holds the hash values.
sz	Size of the data (in bytes) of the data to use to update the hash.

Function

int CRYPT_MD5_DataAdd(CRYPT_MD5_CTX* md5, const unsigned char* input, unsigned int sz)

CRYPT_MD5_Finalize Function

Finalizes the hash and puts the result into digest.

File

crypto.h

C

```
int CRYPT_MD5_Finalize(CRYPT_MD5_CTX*, unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in md5 or digest.
- 0 - An invalid pointer was not passed to the function.

Description

This function finalizes the hash and puts the result into digest.

Remarks

In order to preserve the validity of the MD5 hash, nothing must modify the context holding variable between calls to CRYPT_MD5_DataAdd and CRYPT_MD5_Finalize.

Preconditions

The MD5 context must be initialized prior to calling this function. The context must not be modified by code outside of this function.

Example

```
CRYPT_MD5_CTX md5;
uint8_t buffer[1024];
uint8_t md5sum[MD5_DIGEST_SIZE];

CRYPT_MD5_Initialize(&md5);
CRYPT_MD5_DataAdd(&md5, buffer, sizeof(buffer));
CRYPT_MD5_Finalize(&md5, md5sum);
```

Parameters

Parameters	Description
md5	Pointer to CRYPT_MD5_CTX structure which holds the hash values.
digest	Pointer to byte array to store hash result.

Function

int CRYPT_MD5_Finalize(CRYPT_MD5_CTX* md5, unsigned char* digest)

CRYPT_MD5_Initialize Function

Initializes the internal structures necessary for MD5 hash calculations.

File

crypto.h

C

```
int CRYPT_MD5_Initialize(CRYPT_MD5_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function initializes the internal structures necessary for MD5 hash calculations.

Remarks

All MD5 hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Preconditions

None.

Example

```
CRYPT_MD5_CTX md5;
uint8_t buffer[1024];
uint8_t md5sum[MD5_DIGEST_SIZE];

CRYPT_MD5_Initialize(&md5);
CRYPT_MD5_DataAdd(&md5, buffer, sizeof(buffer));
CRYPT_MD5_Finalize(&md5, md5sum);
```

Parameters

Parameters	Description
md5	Pointer to CRYPT_MD5_CTX structure which holds the hash values.

Function

int CRYPT_MD5_Initialize(CRYPT_MD5_CTX* md5)

CRYPT_MD5_DataSizeSet Function

For PIC32MZ hardware encryption, sets the size of the input data.

File

crypto.h

C

```
int CRYPT_MD5_DataSizeSet(CRYPT_MD5_CTX*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

The PIC32MZ hardware encryption module needs to know the size of the data before it starts processing. This function sets that value.

Remarks

All MD5 hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Preconditions

None.

Example

```
CRYPT_MD5_CTX md5;
uint8_t buffer[1024];
uint8_t md5sum[MD5_DIGEST_SIZE];

    CRYPT_MD5_Initialize(&md5);
    CRYPT_MD5DataSizeSet(&md5, sizeof(buffer));
CRYPT_MD5_DataAdd(&md5, buffer, sizeof(buffer));
CRYPT_MD5_Finalize(&md5, md5sum);
```

Parameters

Parameters	Description
md5	Pointer to CRYPT_MD5_CTX structure which holds the hash values.
msgSize	Size of the data (in bytes) that will be processed.

Function

int CRYPT_MD5_DataSizeSet(CRYPT_MD5_CTX* md5, unsigned int msgSize)

d) Random Number Generator Functions

CRYPT_RNG_BlockGenerate Function

Createa several random numbers.

File

crypto.h

C

```
int CRYPT_RNG_BlockGenerate(CRYPT_RNG_CTX*, unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function generates several random numbers and places them in the space allocated.

Preconditions

RNG context was initialized using the CRYPT_RNG_Initialize function.

Example

```
#define RANDOM_BYTE_SZ 32

int           ret;
CRYPT_RNG_CTX mcRng;
byte          out[RANDOM_BYTE_SZ];

ret = CRYPT_RNG_Initialize(&mcRng);

ret = CRYPT_RNG_Get(&mcRng, &out[0]);

ret = CRYPT_RNG_BlockGenerate(&mcRng, out, RANDOM_BYTE_SZ);
```

Parameters

Parameters	Description
rng	Pointer to context which saves state between calls.
b	Pointer to buffer to store the random numbers.
sz	Number of 8-bit random numbers to generate.

Function

int CRYPT_RNG_BlockGenerate(CRYPT_RNG_CTX* rng, unsigned char* b, unsigned int sz)

CRYPT_RNG_Get Function

Gets one random number.

File

crypto.h

C

```
int CRYPT_RNG_Get(CRYPT_RNG_CTX*, unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- Less than 0 - An error occurred.
- 0 or greater - Success.

Description

This function gets one random number from the random number generator.

Preconditions

RNG context was initialized using the CRYPT_RNG_Initialize function.

Example

```
#define RANDOM_BYTE_SZ 32

int           ret;
CRYPT_RNG_CTX mcRng;
byte          out[RANDOM_BYTE_SZ];

ret = CRYPT_RNG_Initialize(&mcRng);

ret = CRYPT_RNG_Get(&mcRng, &out[0]);

ret = CRYPT_RNG_BlockGenerate(&mcRng, out, RANDOM_BYTE_SZ);
```

Parameters

Parameters	Description
rng	Pointer to context which saves state between calls.
b	Pointer to 8-bit location to store the result.

Function

int CRYPT_RNG_Get(CRYPT_RNG_CTX* rng, unsigned char* b)

e) AES Encryption/Decryption Functions

CRYPT_AES_CBC_Decrypt Function

Performs AES decryption using Cipher-Block-Chaining (CBC).

File

crypto.h

C

```
int CRYPT_AES_CBC_Decrypt(CRYPT_AES_CTX*, unsigned char*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function decrypts a block of data using the AES algorithm in Cipher- Block-Chaining (CBC) mode.

Remarks

The output buffer must be equal in size to the input buffer.

Preconditions

Key and Initialization Vector (IV) must be set earlier with a call to CRYPT_AES_KeySet and CRYPT_AES_IvSet.

Example

```
CRYPT_AES_CTX mcAes;
int           ret;
byte          out1[AES_TEST_SIZE];
byte          out2[AES_TEST_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmnopqrstuv", 32);
strncpy((char*)iv,  "1234567890abcdef", 16);

ret = CRYPT_AES_KeySet(&mcAes, key, 16, iv, CRYPT_AES_ENCRYPTION);
ret = CRYPT_AES_CBC_Decrypt(&mcAes, out2, out1, AES_TEST_SIZE);
```

Parameters

Parameters	Description
aes	Pointer to context which saves state between calls.
out	Pointer to buffer to store the results of the decryption pass.
in	Pointer to buffer holding the data to be decrypted.
inSz	Size of the input data, in bytes.

Function

int CRYPT_AES_CBC_Decrypt(CRYPT_AES_CTX* aes, unsigned char* out,
const unsigned char* in, unsigned int inSz)

CRYPT_AES_CBC_Encrypt Function

Performs AES encryption using Cipher-Block-Chaining (CBC).

File

crypto.h

C

```
int CRYPT_AES_CBC_Encrypt(CRYPT_AES_CTX*, unsigned char*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function encrypts a block of data using the AES algorithm in Cipher- Block-Chaining (CBC) mode.

Remarks

The output buffer must be equal in size to the input buffer.

Preconditions

Key and Initialization Vector (IV) must be set earlier with a call to CRYPT_AES_KeySet and CRYPT_AES_IvSet.

Example

```
CRYPT_AES_CTX mcAes;
int           ret;
byte          out1[AES_TEST_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmnopqrstuv", 32);
strncpy((char*)iv,  "1234567890abcdef", 16);

ret = CRYPT_AES_KeySet(&mcAes, key, 16, iv, CRYPT_AES_ENCRYPTION);
ret = CRYPT_AES_CBC_Encrypt(&mcAes, out1, ourData, AES_TEST_SIZE);
```

Parameters

Parameters	Description
aes	Pointer to context which saves state between calls.
out	Pointer to buffer to store the results of the encryption pass.
in	Pointer to buffer holding the data to be encrypted.
inSz	Size of the input data, in bytes.

Function

int CRYPT_AES_CBC_Encrypt(CRYPT_AES_CTX* aes, unsigned char* out,
const unsigned char* in, unsigned int inSz)

CRYPT_AES_CTR_Encrypt Function

Performs AES encryption using Counter (CTR).

File

crypto.h

C

```
int CRYPT_AES_CTR_Encrypt(CRYPT_AES_CTX*, unsigned char*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function encrypts a block of data using the AES algorithm in Counter (CTR) mode.

Remarks

The output buffer must be equal in size to the input buffer.

Preconditions

Key and Initialization Vector (IV) must be set earlier with a call to CRYPT_AES_KeySet and CRYPT_AES_IvSet.

Example

```
CRYPT_AES_CTX mcAes;
int           ret;
byte          out1[AES_TEST_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmnopqrstuv", 32);
strncpy((char*)iv,  "1234567890abcdef", 16);

ret = CRYPT_AES_KeySet(&mcAes, key, 16, iv, CRYPT_AES_ENCRYPTION);
ret = CRYPT_AES_CTR_Encrypt(&mcAes, out1, ourData, AES_TEST_SIZE);
```

Parameters

Parameters	Description
aes	Pointer to context which saves state between calls.
out	Pointer to buffer to store the results of the encryption pass.
in	Pointer to buffer holding the data to be encrypted.
inSz	Size of the input data, in bytes.

Function

int CRYPT_AES_CTR_Encrypt(CRYPT_AES_CTX* aes, unsigned char* out,

const unsigned char* in, unsigned int inSz)

CRYPT_AES_DIRECT_Decrypt Function

Directs decryption of one block of data.

File

crypto.h

C

```
int CRYPT_AES_DIRECT_Decrypt(CRYPT_AES_CTX*, unsigned char*, const unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function decrypts one block of data, equal to the AES block size.

Remarks

Input and output buffers must be equal in size (CRYPT_AES_BLOCK_SIZE).

Preconditions

Key and Initialization Vector (IV) must be set earlier with a call to CRYPT_AES_KeySet and CRYPT_AES_IvSet.

Example

```
CRYPT_AES_CTX mcAes;
int           ret;
byte          out1[CRYPT_AES_BLOCK_SIZE];
byte          out2[CRYPT_AES_BLOCK_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmnopqrstuv", 32);
strncpy((char*)iv,  "1234567890abcdef", 16);

ret = CRYPT_AES_KeySet(&mcAes, key, 16, iv, CRYPT_AES_ENCRYPTION);
ret = CRYPT_AES_DIRECT_Decrypt(&mcAes, out2, out1);
```

Parameters

Parameters	Description
aes	Pointer to context which saves state between calls.
out	Pointer to buffer to store the results of the decryption.
in	Pointer to buffer where the data to decrypt is located.

Function

int CRYPT_AES_DIRECT_Decrypt(CRYPT_AES_CTX*, unsigned char*,

const unsigned char*)

CRYPT_AES_DIRECT_Encrypt Function

Directs encryption of one block of data.

File

crypto.h

C

```
int CRYPT_AES_DIRECT_Encrypt(CRYPT_AES_CTX*, unsigned char*, const unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function encrypts one block of data, equal to the AES block size.

Remarks

Input and output buffers must be equal in size (CRYPT_AES_BLOCK_SIZE).

Preconditions

Key and Initialization Vector (IV) must be set earlier with a call to CRYPT_AES_KeySet and CRYPT_AES_IvSet.

Example

```
CRYPT_AES_CTX mcAes;
int           ret;
byte          out1[CRYPT_AES_BLOCK_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmnopqrstuv", 32);
strncpy((char*)iv,  "1234567890abcdef", 16);

ret = CRYPT_AES_KeySet(&mcAes, key, 16, iv, CRYPT_AES_ENCRYPTION);
ret = CRYPT_AES_DIRECT_Encrypt(&mcAes, out1, ourData);
```

Parameters

Parameters	Description
aes	Pointer to context which saves state between calls.

out	Pointer to buffer to store the results of the encryption.
in	Pointer to buffer where the data to encrypt is located.

Function

int CRYPT_AES_DIRECT_Encrypt(CRYPT_AES_CTX* aes, unsigned char* out,
const unsigned char* in)

CRYPT_AES_IvSet Function

Sets the initialization vector (IV) for AES processing.

File

crypto.h

C

```
int CRYPT_AES_IvSet(CRYPT_AES_CTX*, const unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function sets the IV that AES will use for later processing.

Remarks

Direction, as set previously in CRYPT_AES_KeySet, is preserved.

Preconditions

The key must be set previously with CRYPT_AES_KeySet.

Example

```
CRYPT_AES_CTX mcAes;
int           ret;

strncpy((char*)iv,  "1234567890abcdef", 16);

ret = CRYPT_AES_IvSet(&mcAes, iv);
```

Parameters

Parameters	Description
aes	Pointer to context which saves state between calls.
iv	Pointer to buffer holding the initialization vector.

Function

int CRYPT_AES_IvSet(CRYPT_AES_CTX* aes, const unsigned char* iv)

CRYPT_AES_KeySet Function

Sets the key and initialization vector (IV) for AES processing.

File

crypto.h

C

```
int CRYPT_AES_KeySet(CRYPT_AES_CTX*, const unsigned char*, unsigned int, const unsigned char*, int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function sets the key and IV, and the direction (encryption or decryption) that AES will later perform.

Preconditions

None.

Example

```
CRYPT_AES_CTX mcAes;
int           ret;

strncpy((char*)key, "1234567890abcdefghijklmnopqrstuv", 32);
strncpy((char*)iv,  "1234567890abcdef", 16);

ret = CRYPT_AES_KeySet(&mcAes, key, 16, iv, CRYPT_AES_ENCRYPTION);
```

Parameters

Parameters	Description
aes	Pointer to context which saves state between calls.
key	Pointer to buffer holding the key itself.
keyLen	Length of key in bytes.
iv	Pointer to buffer holding the initialization vector.
dir	Which operation (CRYPT_AES_ENCRYPTION or CRYPT_AES_DECRYPTION).

Function

int CRYPT_AES_KeySet(CRYPT_AES_CTX* aes, const unsigned char* key,

unsigned int keylen, const unsigned char* iv, int dir)

f) ECC Encryption/Decryption Functions

CRYPT_ECC_DHE_KeyMake Function

Creates a new ECC key.

File

crypto.h

C

```
int CRYPT_ECC_DHE_KeyMake(CRYPT_ECC_CTX*, CRYPT_RNG_CTX*, int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- MEMORY_E - Could not create the memory buffer for the key.
- 0 - An invalid pointer was not passed to the function.

Description

This function creates a new ECC key.

Preconditions

The context must have been initialized with a call to CRYPT_ECC_Initialize. The random number generator context must have been initialized with a call to CRYPT_RNG_Initialize.

Example

```
CRYPT_ECC_CTX userA;
int           ret;
byte          sharedA[100];
unsigned int  aSz = (unsigned int)sizeof(sharedA);
unsigned int  usedA = 0;

ret = CRYPT_ECC_Initialize(&userA);
ret = CRYPT_ECC_DHE_KeyMake(&userA, &mcRng, 32);
```

Parameters

Parameters	Description
ecc	Pointer to context which saves state between calls.
rng	Pointer to the context for the random number generator.
keySz	The size of the key desired.

Function

int CRYPT_ECC_DHE_KeyMake(CRYPT_ECC_CTX*, CRYPT_RNG_CTX*, int)

CRYPT_ECC_DHE_SharedSecretMake Function

Creates an ECC shared secret between two keys.

File

crypto.h

C

```
int CRYPT_ECC_DHE_SharedSecretMake(CRYPT_ECC_CTX*, CRYPT_ECC_CTX*, unsigned char*, unsigned int, unsigned
int*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- MEMORY_E - Could not create the memory buffer for the shared secret.
- 0 - An invalid pointer was not passed to the function.

Description

This function takes two ECC contexts (one public, one private) and creates a shared secret between the two. The secret conforms to EC-DH from ANSI X9.63.

Preconditions

Both contexts must have been initialized with a call to CRYPT_ECC_Initialize. Both contexts have had their respective keys imported or created.

Example

```
CRYPT_ECC_CTX userA;
CRYPT_ECC_CTX userB;
int           ret;
byte          sharedA[100];
unsigned int  aSz   = (unsigned int)sizeof(sharedA);
unsigned int  usedA = 0;

ret = CRYPT_ECC_Initialize(&userA);
ret = CRYPT_ECC_Initialize(&userB);
...
// Make or import the appropriate keys
...
ret = CRYPT_ECC_DHE_SharedSecretMake(&userA, &userB, sharedA, aSz, &usedA);
```

Parameters

Parameters	Description
priv	Pointer to the private ECC context (with the private key).
pub	Pointer to the public ECC context (with the public key).
out	Destination of the shared secret.
outSz	The max size of the shared secret.
usedSz	Resulting size of the shared secret.

Function

int CRYPT_ECC_DHE_SharedSecretMake(CRYPT_ECC_CTX* priv, CRYPT_ECC_CTX* pub,

unsigned char* out, unsigned int outSz, unsigned int* usedSz)

CRYPT_ECC_DSA_HashSign Function

Signs a message digest.

File

crypto.h

C

```
int CRYPT_ECC_DSA_HashSign(CRYPT_ECC_CTX*, CRYPT_RNG_CTX*, unsigned char*, unsigned int, unsigned int*,
const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function takes a message digest and signs it using a private ECC key.

Preconditions

The ECC context must have been initialized with a call to CRYPT_ECC_Initialize. The RNG context must have been initialized with a call to CRYPT_RNG_Initialize. The private key used for the signature must have been imported or created prior to calling this function.

Example

```
CRYPT_ECC_CTX userA;
int           ret;
byte          sig[100];
unsigned int  sigSz = (unsigned int)sizeof(sig);
unsigned int  usedA = 0;

ret = CRYPT_ECC_Initialize(&userA);
...
// Import or generate private key
...
ret = CRYPT_ECC_DSA_HashSign(&userA, &mcRng, sig, sigSz, &usedA, ourData,
                             CRYPT_SHA_DIGEST_SIZE);
```

Parameters

Parameters	Description
ecc	Pointer to ECC context which saves state between calls and holds keys.
rng	Pointer to Random Number Generator context.
sig	Destination for the signature.
sigSz	The max size of the signature, in bytes.
usedSz	The resulting size of the signature, in bytes.
in	Pointer to the message digest to sign.
inSz	The length of the digest, in bytes.

Function

int CRYPT_ECC_DSA_HashSign(CRYPT_ECC_CTX* ecc, CRYPT_RNG_CTX* rng, unsigned char* sig,

unsigned int sigSz, unsigned int* usedSz, const unsigned char* in, unsigned int inSz)

CRYPT_ECC_DSA_HashVerify Function

Verifies an ECC signature.

File

crypto.h

C

```
int CRYPT_ECC_DSA_HashVerify(CRYPT_ECC_CTX*, const unsigned char*, unsigned int, unsigned char*, unsigned
int, int*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- MEMORY_E - Memory could not be allocated for the operation.
- 0 - An invalid pointer was not passed to the function.

Description

This function verifies that an ECC signature is valid.

Preconditions

The ECC context must have been initialized with a call to CRYPT_ECC_Initialize. The key used for the signature must have been imported or created prior to calling this function.

Example

```
CRYPT_ECC_CTX userA;
int           ret;
byte          sig[100];
unsigned int  sigSz = (unsigned int)sizeof(sig);
unsigned int  usedA = 0;
int verifyStatus = 0;

ret = CRYPT_ECC_Initialize(&userA);
...
// Import or generate private key
...
ret = CRYPT_ECC_DSA_HashVerify(&userA, sig, sigSz, ourData,
                               CRYPT_SHA_DIGEST_SIZE, &verifyStatus);
```

Parameters

Parameters	Description
ecc	Pointer to context which saves state between calls.
sig	The signature to verify.
sigSz	The length of the signature (octets).
hash	The hash (message digest) that was signed.
hashSz	The length of the hash (octets).
status	Result of signature (1 == valid, 0 == invalid).

Function

int CRYPT_ECC_DSA_HashVerify(CRYPT_ECC_CTX* ecc, const unsigned char* sig,

unsigned int sigSz, unsigned char* hash, unsigned int hashSz, int* status)

CRYPT_ECC_Free Function

Cleans up an Elliptic Curve Cryptography (ECC) Context.

File

crypto.h

C

```
int CRYPT_ECC_Free(CRYPT_ECC_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function cleans up memory allocated for an ECC Context.

Preconditions

The context must have been initialized previously with a call to CRYPT_ECC_Initialize.

Example

```
CRYPT_ECC_CTX userA;
int           ret;

ret = CRYPT_ECC_Initialize(&userA);
...
ret = CRYPT_ECC_Free(&userA);
```

Parameters

Parameters	Description
ecc	Pointer to context to clean up.

Function

int CRYPT_ECC_Free(CRYPT_ECC_CTX* ecc)

CRYPT_ECC_Initialize Function

Initializes the context for Elliptic Curve Cryptography (ECC).

File

crypto.h

C

```
int CRYPT_ECC_Initialize(CRYPT_ECC_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- -1 - Unable to allocate memory for the keys.
- 0 - An invalid pointer was not passed to the function.

Description

This function initializes the context used for Elliptic Curve Cryptography (ECC). The context is then passed to calls to perform key building, encryption, decryption, etc.

Preconditions

None.

Example

```
CRYPT_ECC_CTX userA;
int           ret;

ret = CRYPT_ECC_Initialize(&userA);
```

Parameters

Parameters	Description
ecc	Pointer to context to initialize.

Function

int CRYPT_ECC_Initialize(CRYPT_ECC_CTX* ecc)

CRYPT_ECC_KeySizeGet Function

Returns the key size in octets.

File

crypto.h

C

```
int CRYPT_ECC_KeySizeGet(CRYPT_ECC_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- int - The size of the key, in octets.

Description

This function returns the size of the ECC key, in octets.

Preconditions

The ECC context must have been initialized with a call to CRYPT_ECC_Initialize. The key must have been imported or created prior to calling this function.

Example

```
CRYPT_ECC_CTX userA;
int           ret;
byte          sig[100];
unsigned int  sigSz = (unsigned int)sizeof(sig);
unsigned int  usedA = 0;

ret = CRYPT_ECC_Initialize(&userA);
...
// Import or generate private key
...
ret = CRYPT_ECC_KeySizeGet(&userA);
```

Parameters

Parameters	Description
ecc	Pointer to context which saves state between calls and contains the key.

Function

int CRYPT_ECC_KeySizeGet(CRYPT_ECC_CTX* ecc)

CRYPT_ECC_PrivateImport Function

Imports private key pair in X9.63 format.

File

crypto.h

C

```
int CRYPT_ECC_PrivateImport(CRYPT_ECC_CTX*, const unsigned char*, unsigned int, const unsigned char*,
unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function imports a public/private key pair in X9.63 format.

Preconditions

The context must have been initialized with a call to CRYPT_ECC_Initialize.

Example

```
CRYPT_ECC_CTX ecc;

CRYPT_ECC_Initialize(&ecc);
...
CRYPT_ECC_PrivateImport(&ecc, priv_key, sizeof(priv_key), pub_key, sizeof(pub_key));
```

Parameters

Parameters	Description
ecc	Pointer to context which saves state between calls.

priv	Pointer to the private key.
privSz	Size of the private key, in bytes.
pub	Pointer to the public key.
pubSz	Size of the public key, in bytes.

Function

int CRYPT_ECC_PrivateImport(CRYPT_ECC_CTX* ecc, const unsigned char* priv,
unsigned int privSz, const unsigned char* pub,
unsigned int pubSz)

CRYPT_ECC_PublicExport Function

Exports public ECC key in ANSI X9.63 format.

File

crypto.h

C

```
int CRYPT_ECC_PublicExport(CRYPT_ECC_CTX*, unsigned char*, unsigned int, unsigned int*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- BUFFER_E - The output buffer was too small to store the key.
- 0 - An invalid pointer was not passed to the function.

Description

This function takes an ECC public key and exports it in ANSI X9.63 format.

Preconditions

The context must be initialized previously with a call to CRYPT_ECC_Initialize. The key must also have been constructed with a call to CRYPT_ECC_DHE_KeyMake. A random number generator must all have been initialized with a call to CRYPT_RNG_Initialize.

Example

```
CRYPT_ECC_CTX userA;
int           ret;
byte          sharedA[100];
unsigned int  aSz = (unsigned int)sizeof(sharedA);
unsigned int  usedA = 0;

ret = CRYPT_ECC_Initialize(&userA);
ret = CRYPT_ECC_DHE_KeyMake(&userA, &mcRng, 32);
ret = CRYPT_ECC_PublicExport(&userA, sharedA, aSz, &usedA);
```

Parameters

Parameters	Description
ecc	Pointer to context which saves state between calls.
out	Buffer in which to store the public key.
outSz	The available size of the buffer, in bytes.
usedSz	Return value indicating how many bytes were used.

Function

int CRYPT_ECC_PublicExport(CRYPT_ECC_CTX* ecc, unsigned char* out,
unsigned int outSz, unsigned int* usedSz)

CRYPT_ECC_PublicImport Function

Imports public key in ANSI X9.63 format.

File

crypto.h

C

```
int CRYPT_ECC_PublicImport(CRYPT_ECC_CTX*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- MEMORY_E - Memory could not be allocated for the key.
- ASN_PARSE_E - There was a parse error while going through the key.
- 0 - An invalid pointer was not passed to the function.

Description

This function imports a public key in ANSI X9.63 format into the ECC context.

Preconditions

The ECC context must have previously been initialized with a call to CRYPT_ECC_Initialize.

Example

```
CRYPT_ECC_CTX userB;
int           ret;
byte          sharedA[100];
unsigned int  aSz = (unsigned int)sizeof(sharedA);
unsigned int  usedA;

ret = CRYPT_ECC_Initialize(&userB);
...
ret = CRYPT_ECC_PublicImport(&userB, sharedA, usedA);
```

Parameters

Parameters	Description
ecc	Pointer to context which saves state between calls.
in	Input buffer the holds the public key.
inSz	Size of the input buffer, in bytes.

Function

int CRYPT_ECC_PublicImport(CRYPT_ECC_CTX* ecc, const unsigned char* in,

unsigned int inSz)

CRYPT_ECC_SignatureSizeGet Function

Returns the signature size in octets.

File

crypto.h

C

```
int CRYPT_ECC_SignatureSizeGet(CRYPT_ECC_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- int - The size of the signature.

Description

This function returns the size of the signature in a given context, in octets.

Preconditions

The ECC context must have been initialized with a call to CRYPT_ECC_Initialize. The keys must have been imported or created prior to calling this function.

Example

```
CRYPT_ECC_CTX userA;
int           ret;
byte          sig[100];
unsigned int  sigSz = (unsigned int)sizeof(sig);
```

```
unsigned int  usedA = 0;

ret = CRYPT_ECC_Initialize(&userA);
...
// Import or generate private key
...
ret = CRYPT_ECC_SignatureSizeGet(&userA);
```

Parameters

Parameters	Description
ecc	Pointer to context which saves state between calls, and contains the signature.

Function

int CRYPT_ECC_SignatureSizeGet(CRYPT_ECC_CTX* ecc)

g) RSA Encryption/Decryption Functions

CRYPT_RSA_EncryptSizeGet Function

Gets the size of the RSA Key.

File

crypto.h

C

```
int CRYPT_RSA_EncryptSizeGet(CRYPT_RSA_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- int - Size of the key.

Description

This function retrieves the size of the RSA Key in use for the context.

Preconditions

The context must be initialized with a call to CRYPT_RSA_Initialize and the keys decoded either with CRYPT_RSA_PrivateKeyDecode or CRYPT_RSA_PublicKeyDecode.

Example

```
CRYPT_RSA_CTX mcRsa;
int           ret;
unsigned int  keySz = (unsigned int)sizeof(client_key_der_1024);
byte          out1[256];

ret = CRYPT_RSA_Initialize(&mcRsa);

ret = CRYPT_RSA_PrivateKeyDecode(&mcRsa, client_key_der_1024, keySz);

ret = CRYPT_RSA_EncryptSizeGet(&mcRsa);
```

Parameters

Parameters	Description
rsa	Pointer to context which saves state between calls.

Function

int CRYPT_RSA_EncryptSizeGet(CRYPT_RSA_CTX* rsa)

CRYPT_RSA_Free Function

Releases the memory used for the key and clean up the context.

File

crypto.h

C

```
int CRYPT_RSA_Free(CRYPT_RSA_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function releases the memory used during RSA processing for storing the public/private key.

Preconditions

The context must have been set up previously with a call to CRYPT_RSA_Initialize.

Example

```
CRYPT_RSA_CTX mcRsa;
int           ret;

ret = CRYPT_RSA_Initialize(&mcRsa);
ret = CRYPT_RSA_Free(&mcRsa);
```

Parameters

Parameters	Description
rsa	Pointer to context which saves state between calls.

Function

int CRYPT_RSA_Free(CRYPT_RSA_CTX* rsa)

CRYPT_RSA_Initialize Function

Initializes the internal structures necessary for RSA processing.

File

crypto.h

C

```
int CRYPT_RSA_Initialize(CRYPT_RSA_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- -1 - Unable to allocate the memory necessary for the key.
- 0 - An invalid pointer was not passed to the function.

Description

This function initializes the context used during public-key RSA encryption and decryption.

Preconditions

None.

Example

```
CRYPT_RSA_CTX mcRsa;
int           ret;

ret = CRYPT_RSA_Initialize(&mcRsa);
```

Parameters

Parameters	Description
rsa	Pointer to RSA context which saves state between calls.

Function

int CRYPT_RSA_Initialize(CRYPT_RSA_CTX* rsa)

CRYPT_RSA_PrivateDecrypt Function

Decrypts data using a private key.

File

crypto.h

C

```
int CRYPT_RSA_PrivateDecrypt(CRYPT_RSA_CTX*, unsigned char*, unsigned int, const unsigned char*, unsigned
int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- int - Size of the actual output.

Description

This function decrypts a data block using a private key.

Preconditions

The context must be initialized using CRYPT_RSA_Initialized and the Private Key Decoded using CRYPT_RSA_PrivateKeyDecode prior to calling this function.

Example

```
CRYPT_RSA_CTX mcRsa;
int           ret;
unsigned int  keySz = (unsigned int)sizeof(client_key_der_1024);
byte          out1[256];

ret = CRYPT_RSA_Initialize(&mcRsa);

ret = CRYPT_RSA_PrivateKeyDecode(&mcRsa, client_key_der_1024, keySz);

ret = CRYPT_RSA_PrivateDecrypt(&mcRsa, out2, sizeof(out2), out1,
                               RSA_TEST_SIZE);
```

Parameters

Parameters	Description
rsa	Pointer to context which saves state between calls.
out	Pointer to output buffer to store results.
outSz	Size of output buffer.
in	Pointer to source buffer to be decrypted.
inSz	Size of input buffer.

Function

int CRYPT_RSA_PrivateDecrypt(CRYPT_RSA_CTX* rsa, unsigned char* out,

unsigned int outSz, const unsigned char* in, unsigned int inSz)

CRYPT_RSA_PrivateKeyDecode Function

Constructs the Private Key from a DER certificate.

File

crypto.h

C

```
int CRYPT_RSA_PrivateKeyDecode(CRYPT_RSA_CTX*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function builds a private key from a DER-formated certificate. DER stands for Distinguished Encoding Rules.

Preconditions

The context must have been initialized with a call to CRYPT_RSA_Initialize.

Example

```
CRYPT_RSA_CTX mcRsa;
int           ret;
unsigned int  keySz = (unsigned int)sizeof(client_key_der_1024);

ret = CRYPT_RSA_Initialize(&mcRsa);

ret = CRYPT_RSA_PrivateKeyDecode(&mcRsa, client_key_der_1024, keySz);
```

Parameters

Parameters	Description
rsa	Pointer to context which saves state between calls.
in	Pointer to buffer containing the certificate to process to extract the private key.
inSz	Size of the input data in bytes.

Function

int CRYPT_RSA_PrivateKeyDecode(CRYPT_RSA_CTX*, const unsigned char*,

unsigned int)

CRYPT_RSA_PublicEncrypt Function

Encrypts data using a public key.

File

crypto.h

C

```
int CRYPT_RSA_PublicEncrypt(CRYPT_RSA_CTX*, unsigned char*, unsigned int, const unsigned char*, unsigned
int, CRYPT_RNG_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- int - Size of the actual output.

Description

This function encrypts a data block using a public key.

Preconditions

The context must be initialized using CRYPT_RSA_Initialized and the Public Key Decoded using CRYPT_RSA_PublicKeyDecode prior to calling this function. The random number generator must be initialized with a call to CRYPT_RNG_Initialize.

Example

```
CRYPT_RSA_CTX mcRsa;
CRYPT_RNG_CTX mcRng;
int           ret;
unsigned int  keySz = (unsigned int)sizeof(client_key_der_1024);
byte          out1[256];

ret = CRYPT_RSA_Initialize(&mcRsa);
ret = CRYPT_RNG_Initialize(&mcRng);

ret = CRYPT_RSA_PublicKeyDecode(&mcRsa, client_key_der_1024, keySz);
```

```
ret = CRYPT_RSA_PublicEncrypt(&mcRsa, out1, sizeof(out1), ourData,
                              RSA_TEST_SIZE, &mcRng);
```

Parameters

Parameters	Description
rsa	Pointer to context which saves state between calls.
out	Pointer to output buffer to store results.
outSz	Size of output buffer.
in	Pointer to source buffer to be encrypted.
inSz	Size of input buffer.
rng	Pointer to Random Number Generator (RNG) context.

Function

int CRYPT_RSA_PublicEncrypt(CRYPT_RSA_CTX* rsa, unsigned char* out,
unsigned int outSz, const unsigned char* in, unsigned int inSz,
CRYPT_RNG_CTX* rng)

CRYPT_RSA_PublicKeyDecode Function

Constructs the Public Key from a DER certificate.

File

crypto.h

C

```
int CRYPT_RSA_PublicKeyDecode(CRYPT_RSA_CTX*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function builds a public key from a DER-formated certificate. DER stands for Distinguished Encoding Rules.

Preconditions

The context must have been initialized with a call to CRYPT_RSA_Initialize.

Example

```
CRYPT_RSA_CTX mcRsa;
int           ret;
unsigned int  keySz = (unsigned int)sizeof(client_key_der_1024);

ret = CRYPT_RSA_Initialize(&mcRsa);

ret = CRYPT_RSA_PublicKeyDecode(&mcRsa, client_key_der_1024, keySz);
```

Parameters

Parameters	Description
rsa	Pointer to context which saves state between calls.
in	Pointer to buffer containing the certificate to process to extract the public key.
inSz	Size of the input data in bytes.

Function

int CRYPT_RSA_PublicKeyDecode(CRYPT_RSA_CTX* rsa, const unsigned char* in,
unsigned int inSz)

h) Triple DES (3DES) Encryption/Decryption Functions

CRYPT_TDES_CBC_Decrypt Function

Decrypts a data block using Triple DES.

File

crypto.h

C

```
int CRYPT_TDES_CBC_Decrypt(CRYPT_TDES_CTX*, unsigned char*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function decrypts a block of data using a Triple DES algorithm.

Remarks

Input data must have a length a multiple of 8 bytes. Output data will be zero-padded at the end if the original data was not a multiple of 8 bytes long.

Preconditions

The context tdes must be set earlier using CRYPT_TDES_KeySet. The input block must be a multiple of 8 bytes long.

Example

```
CRYPT_TDES_CTX mcDes3;
int            ret;
byte           out1[TDES_SIZE];
byte           out2[TDES_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmn", 24);
strncpy((char*)iv,  "12345678", 8);

ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_ENCRYPTION);

ret = CRYPT_TDES_CBC_Encrypt(&mcDes3, out1, ourData, TDES_SIZE);

ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_DECRYPTION);

ret = CRYPT_TDES_CBC_Decrypt(&mcDes3, out2, out1, TDES_TEST_SIZE);
```

Parameters

Parameters	Description
tdes	Pointer to context which saves state between calls.
out	Pointer to output buffer to store the results.
in	Pointer to input buffer for the source of the data.
inSz	Size of the input data buffer.

Function

int CRYPT_TDES_CBC_Decrypt(CRYPT_TDES_CTX* tdes, unsigned char* out, const unsigned char* in, unsigned int inSz)

CRYPT_TDES_CBC_Encrypt Function

Encrypts a data block using Triple DES.

File

crypto.h

C

```
int CRYPT_TDES_CBC_Encrypt(CRYPT_TDES_CTX*, unsigned char*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function encrypts a block of data using a Triple DES algorithm.

Remarks

The input data must be padded at the end with zeros to make the length a multiple of 8.

Preconditions

The context tdes must be set earlier using CRYPT_TDES_KeySet. The input block must be a multiple of 8 bytes long.

Example

```
CRYPT_TDES_CTX mcDes3;
int            ret;
byte           out1[TDES_SIZE];
byte           out2[TDES_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmn", 24);
strncpy((char*)iv,  "12345678", 8);

ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_ENCRYPTION);

ret = CRYPT_TDES_CBC_Encrypt(&mcDes3, out1, ourData, TDES_SIZE);

ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_DECRYPTION);

ret = CRYPT_TDES_CBC_Decrypt(&mcDes3, out2, out1, TDES_TEST_SIZE);
```

Parameters

Parameters	Description
tdes	Pointer to context which saves state between calls.
out	Pointer to output buffer to store the results.
in	Pointer to input buffer for the source of the data.
inSz	Size of the input data buffer.

Function

int CRYPT_TDES_CBC_Encrypt(CRYPT_TDES_CTX* tdes, unsigned char* out, const unsigned char* in, unsigned int inSz)

CRYPT_TDES_IvSet Function

Sets the Initialization Vector (IV) for a Triple DES operation.

File

crypto.h

C

```
int CRYPT_TDES_IvSet(CRYPT_TDES_CTX*, const unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function changes the IV of a TDES context, but leaves the Key alone.

Remarks

The IV must be 8 bytes long.

Preconditions

None.

Example

```
CRYPT_TDES_CTX mcDes3;
int            ret;
byte           out1[TDES_SIZE];
byte           out2[TDES_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmn", 24);
strncpy((char*)iv,  "12345678", 8);

ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_ENCRYPTION);

ret = CRYPT_TDES_IvSet(&mcDes3, iv);

ret = CRYPT_TDES_CBC_Encrypt(&mcDes3, out1, ourData, TDES_SIZE);

ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_DECRYPTION);

ret = CRYPT_TDES_CBC_Decrypt(&mcDes3, out2, out1, TDES_TEST_SIZE);
```

Parameters

Parameters	Description
tdes	Pointer to context which saves state between calls.
iv	Pointer to buffer holding the initialization vector. Must be 8 bytes in size.

Function

int CRYPT_TDES_IvSet(CRYPT_TDES_CTX* tdes, const unsigned char* iv)

CRYPT_TDES_KeySet Function

Initialization of Triple DES context.

File

crypto.h

C

```
int CRYPT_TDES_KeySet(CRYPT_TDES_CTX*, const unsigned char*, const unsigned char*, int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function sets the key and initialization vector (IV) for a set of Triple-DES operations.

Remarks

The input data must be a multiple of 8 bytes, and must be padded at the end with zeros to meet the length.

Preconditions

None.

Example

```
CRYPT_TDES_CTX mcDes3;
int            ret;
byte           out1[TDES_SIZE];
byte           out2[TDES_SIZE];

strncpy((char*)key, "1234567890abcdefghijklmn", 24);
strncpy((char*)iv,  "12345678", 8);

ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_ENCRYPTION);

ret = CRYPT_TDES_CBC_Encrypt(&mcDes3, out1, ourData, TDES_SIZE);

ret = CRYPT_TDES_KeySet(&mcDes3, key, iv, CRYPT_TDES_DECRYPTION);
```

```
ret = CRYPT_TDES_CBC_Decrypt(&mcDes3, out2, out1, TDES_TEST_SIZE);
```

Parameters

Parameters	Description
tdes	Pointer to context which saves state between calls.
key	Pointer to buffer holding the key. Must be 24 bytes in size.
iv	Pointer to buffer holding the initialization vector. Must be 8 bytes in size.
dir	Indicates whether encryption or decryption will be done. Can be set to: • CRYPT_TDES_ENCRYPTION - For Encryption operations • CRYPT_TDES_DECRYPTION - Fro Decryption operations

Function

int CRYPT_TDES_KeySet(CRYPT_TDES_CTX* tdes, const unsigned char* key, const unsigned char* iv, int dir)

i) HMAC Hash Functions

CRYPT_HMAC_DataAdd Function

Adds data to the HMAC calculation.

File

crypto.h

C

```
int CRYPT_HMAC_DataAdd(CRYPT_HMAC_CTX*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function adds data to the HMAC so that multiple blocks of data can be processed.

Remarks

None.

Preconditions

The CRYPT_HMAC_CTX context must be initialized using the CRYPT_HMAC_SetKey function prior to any call to this function.

Example

```
CRYPT_HMAC_CTX mcHmac;
byte           mcDigest[CRYPT_SHA512_DIGEST_SIZE];

CRYPT_HMAC_SetKey(&mcHmac, CRYPT_HMAC_SHA, key, 4);

CRYPT_HMAC_DataAdd(&mcHmac, ourData, OUR_DATA_SIZE);

CRYPT_HMAC_Finalize(&mcHmac, mcDigest);
```

Parameters

Parameters	Description
hmac	Pointer to context that saves state between calls.
sz	Size of the input data in bytes.

Function

int CRYPT_HMAC_DataAdd(CRYPT_HMAC_CTX*, const unsigned char*, unsigned int)

CRYPT_HMAC_Finalize Function

Completes the HMAC calculation and get the results.

File

crypto.h

C

```
int CRYPT_HMAC_Finalize(CRYPT_HMAC_CTX*, unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function completes the HMAC calculations. The results are placed in the location pointed to by digest.

Remarks

The area pointed to by digest must be large enough to hold the results.

Preconditions

The CRYPT_HMAC_CTX context must be initialized using the CRYPT_HMAC_SetKey function prior to any call to this function.

Example

```
CRYPT_HMAC_CTX mcHmac;
byte           mcDigest[CRYPT_SHA512_DIGEST_SIZE];

CRYPT_HMAC_SetKey(&mcHmac, CRYPT_HMAC_SHA, key, 4);

CRYPT_HMAC_DataAdd(&mcHmac, ourData, OUR_DATA_SIZE);

CRYPT_HMAC_Finalize(&mcHmac, mcDigest);
```

Parameters

Parameters	Description
hmac	Pointer to context which saves state between calls.
digest	Pointer to place to put the final HMAC digest results.

Function

int CRYPT_HMAC_Finalize(CRYPT_HMAC_CTX* hmac, unsigned char* digest)

CRYPT_HMAC_SetKey Function

Initializes the HMAC context and set the key for the hash.

File

crypto.h

C

```
int CRYPT_HMAC_SetKey(CRYPT_HMAC_CTX*, int, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function initializes the HMAC context and set the key for the hash.

Remarks

None.

Preconditions

None.

Example

```
CRYPT_HMAC_CTX mcHmac;
byte           mcDigest[CRYPT_SHA512_DIGEST_SIZE];

CRYPT_HMAC_SetKey(&mcHmac, CRYPT_HMAC_SHA, key, 4);

CRYPT_HMAC_DataAdd(&mcHmac, ourData, OUR_DATA_SIZE);

CRYPT_HMAC_Finalize(&mcHmac, mcDigest);
```

Parameters

Parameters	Description
hmac	Pointer to context which saves state between calls.
type	Type of SHA operation to use with HMAC. Must be one of the
following	• CRYPT_HMAC_SHA • CRYPT_HMAC_SHA256 • CRYPT_HMAC_SHA384 • CRYPT_HMAC_SHA512
key	Secret key used for the hash.
sz	Size of the input data in bytes.

Function

int CRYPT_HMAC_SetKey(CRYPT_HMAC_CTX* hmac, int type, const unsigned char* key, unsigned int sz)

j) SHA Hash functions

CRYPT_SHA_DataAdd Function

Updates the hash with the data provided.

File

crypto.h

C

```
int CRYPT_SHA_DataAdd(CRYPT_SHA_CTX*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha or input.
- 0 - An invalid pointer was not passed to the function.

Description

This function updates the hash with the data provided.

Remarks

In order to preserve the validity of the SHA hash, nothing must modify the context holding variable between calls to CRYPT_SHA_DataAdd.

Preconditions

The SHA context must be initialized prior to the first call of this function. The context must not be modified by code outside of this function.

Example

```
CRYPT_SHA_CTX sha;
uint8_t buffer[1024];
uint8_t shaSum[SHA_DIGEST_SIZE];

CRYPT_SHA_Initialize(&sha);
CRYPT_SHA_DataAdd(&sha, buffer, sizeof(buffer));
```

```
CRYPT_SHA_Finalize(&sha, shaSum);
```

Parameters

Parameters	Description
sha	Pointer to CRYPT_SHA_CTX structure which holds the hash values.
sz	Size of the data (in bytes) of the data to use to update the hash.

Function

int CRYPT_SHA_DataAdd(CRYPT_SHA_CTX* sha, const unsigned char* input, unsigned int sz)

CRYPT_SHA_Finalize Function

Finalizes the hash and puts the result into digest.

File

crypto.h

C

```
int CRYPT_SHA_Finalize(CRYPT_SHA_CTX*, unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha or digest.
- 0 - An invalid pointer was not passed to the function.

Description

This function finalizes the hash and puts the result into digest.

Remarks

In order to preserve the validity of the SHA hash, nothing must modify the context holding variable between calls to CRYPT_SHA_DataAdd and CRYPT_SHA_Finalize.

Preconditions

The SHA context must be initialized prior to calling this function. The context must not be modified by code outside of this function.

Example

```
CRYPT_SHA_CTX sha;
uint8_t buffer[1024];
uint8_t shaSum[SHA_DIGEST_SIZE];

CRYPT_SHA_Initialize(&sha);
CRYPT_SHA_DataAdd(&sha, buffer, sizeof(buffer));
CRYPT_SHA_Finalize(&sha, shaSum);
```

Parameters

Parameters	Description
sha	Pointer to CRYPT_SHA_CTX structure which holds the hash values.
digest	Pointer to byte array to store hash result.

Function

int CRYPT_SHA_Finalize(CRYPT_SHA_CTX* sha, unsigned char* digest)

CRYPT_SHA_Initialize Function

Initializes the internal structures necessary for SHA hash calculations.

File

crypto.h

C

```
int CRYPT_SHA_Initialize(CRYPT_SHA_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function initializes the internal structures necessary for SHA hash calculations.

Remarks

All SHA hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Preconditions

None.

Example

```
CRYPT_SHA_CTX sha;
uint8_t shaSum[SHA_DIGEST_SIZE];

CRYPT_SHA_Initialize(&sha);
CRYPT_SHA_DataAdd(&sha, buffer, sizeof(buffer));
CRYPT_SHA_Finalize(&sha, shaSum);
```

Parameters

Parameters	Description
sha	Pointer to CRYPT_SHA_CTX structure which holds the hash values.

Function

int CRYPT_SHA_Initialize(CRYPT_SHA_CTX* sha)

CRYPT_SHA_DataSizeSet Function

For PIC32MZ hardware encryption, sets the size of the input data.

File

crypto.h

C

```
int CRYPT_SHA_DataSizeSet(CRYPT_SHA_CTX*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

The PIC32MZ hardware encryption module needs to know the size of the data before it starts processing. This function sets that value.

Remarks

All SHA hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Preconditions

None.

Example

```
CRYPT_SHA_CTX sha;
uint8_t buffer[1024];
uint8_t shasum[SHA_DIGEST_SIZE];

    CRYPT_SHA_Initialize(&sha);
    CRYPT_SHADataSizeSet(&sha, sizeof(buffer));
CRYPT_SHA_DataAdd(&sha, buffer, sizeof(buffer));
CRYPT_SHA_Finalize(&sha, shasum);
```

Parameters

Parameters	Description
sha	Pointer to CRYPT_SHA_CTX structure which holds the hash values.
msgSize	Size of the data (in bytes) that will be processed.

Function

int CRYPT_SHA_DataSizeSet(CRYPT_SHA_CTX* sha, unsigned int msgSize)

k) SHA256 Hash Functions

CRYPT_SHA256_DataAdd Function

Updates the hash with the data provided.

File

crypto.h

C

```
int CRYPT_SHA256_DataAdd(CRYPT_SHA256_CTX*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha256 or input.
- 0 - An invalid pointer was not passed to the function.

Description

This function updates the hash with the data provided.

Remarks

In order to preserve the validity of the SHA256 hash, nothing must modify the context holding variable between calls to CRYPT_SHA256_DataAdd.

Preconditions

The SHA256 context must be initialized prior to the first call of this function. The context must not be modified by code outside of this function.

Example

```
CRYPT_SHA256_CTX sha256;
uint8_t buffer[1024];
uint8_t shaSum[SHA256_DIGEST_SIZE];

CRYPT_SHA256_Initialize(&sha256);
CRYPT_SHA256_DataAdd(&sha256, buffer, sizeof(buffer));
CRYPT_SHA256_Finalize(&sha256, shaSum);
```

Parameters

Parameters	Description
sha256	Pointer to CRYPT_SHA256_CTX structure which holds the hash values.
sz	Size of the data (in bytes) of the data to use to update the hash.

Function

int CRYPT_SHA256_DataAdd(CRYPT_SHA256_CTX* sha256, const unsigned char* input, unsigned int sz)

CRYPT_SHA256_Finalize Function

Finalizes the hash and puts the result into digest.

File

crypto.h

C

```
int CRYPT_SHA256_Finalize(CRYPT_SHA256_CTX*, unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha or digest.
- 0 - An invalid pointer was not passed to the function.

Description

This function finalizes the hash and puts the result into digest.

Remarks

In order to preserve the validity of the SHA256 hash, nothing must modify the context holding variable between calls to CRYPT_SHA256_DataAdd and CRYPT_SHA256_Finalize.

Preconditions

The SHA256 context must be initialized prior to calling this function. The context must not be modified by code outside of this function.

Example

```
CRYPT_SHA256_CTX sha256;
uint8_t buffer[1024];
uint8_t shaSum[SHA256_DIGEST_SIZE];

CRYPT_SHA256_Initialize(&sha256);
CRYPT_SHA256_DataAdd(&sha256, buffer, sizeof(buffer));
CRYPT_SHA256_Finalize(&sha256, shaSum);
```

Parameters

Parameters	Description
sha256	Pointer to CRYPT_SHA256_CTX structure which holds the hash values.
digest	Pointer to byte array to store hash result.

Function

int CRYPT_SHA256_Finalize(CRYPT_SHA256_CTX* sha256, unsigned char* digest)

CRYPT_SHA256_Initialize Function

Initializes the internal structures necessary for SHA256 hash calculations.

File

crypto.h

C

```
int CRYPT_SHA256_Initialize(CRYPT_SHA256_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function initializes the internal structures necessary for SHA256 hash calculations.

Remarks

All SHA hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Preconditions

None.

Example

```
CRYPT_SHA256_CTX sha;
uint8_t shaSum[SHA256_DIGEST_SIZE];

CRYPT_SHA256_Initialize(&sha);
CRYPT_SHA256_DataAdd(&sha, buffer, sizeof(buffer));
CRYPT_SHA256_Finalize(&sha, shaSum);
```

Parameters

Parameters	Description
sha256	Pointer to context which saves state between calls.

Function

int CRYPT_SHA256_Initialize(CRYPT_SHA256_CTX* sha256)

CRYPT_SHA256_DataSizeSet Function

For PIC32MZ hardware encryption, sets the size of the input data.

File

crypto.h

C

```
int CRYPT_SHA256_DataSizeSet(CRYPT_SHA256_CTX*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

The PIC32MZ hardware encryption module needs to know the size of the data before it starts processing. This function sets that value.

Remarks

All SHA256 hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Preconditions

None.

Example

```
CRYPT_SHA256_CTX sha256;
uint8_t buffer[1024];
uint8_t sha256sum[SHA256_DIGEST_SIZE];

    CRYPT_SHA256_Initialize(&sha256);
    CRYPT_SHA256DataSizeSet(&sha256, sizeof(buffer));
CRYPT_SHA256_DataAdd(&sha256, buffer, sizeof(buffer));
CRYPT_SHA256_Finalize(&sha256, sha256sum);
```

Parameters

Parameters	Description
sha256	Pointer to CRYPT_SHA256_CTX structure which holds the hash values.
msgSize	Size of the data (in bytes) that will be processed.

Function

int CRYPT_SHA256_DataSizeSet(CRYPT_SHA256_CTX* sha256, unsigned int msgSize)

l) SHA384 Hash Functions

CRYPT_SHA384_DataAdd Function

Updates the hash with the data provided.

File

crypto.h

C

```
int CRYPT_SHA384_DataAdd(CRYPT_SHA384_CTX*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha384 or input.
- 0 - An invalid pointer was not passed to the function.

Description

This function updates the hash with the data provided.

Remarks

In order to preserve the validity of the SHA384 hash, nothing must modify the context holding variable between calls to CRYPT_SHA384_DataAdd.

Preconditions

The SHA384 context must be initialized prior to the first call of this function. The context must not be modified by code outside of this function.

Example

```
CRYPT_SHA384_CTX sha384;
uint8_t buffer[1024];
uint8_t shaSum[SHA384_DIGEST_SIZE];

CRYPT_SHA384_Initialize(&sha384);
CRYPT_SHA384_DataAdd(&sha384, buffer, sizeof(buffer));
CRYPT_SHA384_Finalize(&sha384, shaSum);
```

Parameters

Parameters	Description
sha384	Pointer to CRYPT_SHA384_CTX structure which holds the hash values.
sz	Size of the data (in bytes) of the data to use to update the hash.

Function

int CRYPT_SHA384_DataAdd(CRYPT_SHA384_CTX* sha384, const unsigned char* input, unsigned int sz)

CRYPT_SHA384_Finalize Function

Finalizes the hash and puts the result into digest.

File

crypto.h

C

```
int CRYPT_SHA384_Finalize(CRYPT_SHA384_CTX*, unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha384 or digest.
- 0 - An invalid pointer was not passed to the function.

Description

This function finalizes the hash and puts the result into digest.

Remarks

In order to preserve the validity of the SHA384 hash, nothing must modify the context holding variable between calls to CRYPT_SHA384_DataAdd and CRYPT_SHA384_Finalize.

Preconditions

The SHA384 context must be initialized prior to calling this function. The context must not be modified by code outside of this function.

Example

```
CRYPT_SHA384_CTX sha384;
uint8_t buffer[1024];
uint8_t shaSum[SHA384_DIGEST_SIZE];

CRYPT_SHA384_Initialize(&sha384);
CRYPT_SHA384_DataAdd(&sha384, buffer, sizeof(buffer));
CRYPT_SHA384_Finalize(&sha384, shaSum);
```

Parameters

Parameters	Description
sha384	Pointer to CRYPT_SHA384_CTX structure which holds the hash values.
digest	Pointer to byte array to store hash result.

Function

int CRYPT_SHA384_Finalize(CRYPT_SHA384_CTX* sha384, unsigned char* digest)

CRYPT_SHA384_Initialize Function

Initializes the internal structures necessary for SHA384 hash calculations.

File

crypto.h

C

```
int CRYPT_SHA384_Initialize(CRYPT_SHA384_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function
- 0 - An invalid pointer was not passed to the function

Description

This function initializes the internal structures necessary for SHA384 hash calculations.

Remarks

All SHA384 hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Preconditions

None.

Example

```
CRYPT_SHA384_CTX sha384;
uint8_t shaSum[SHA384_DIGEST_SIZE];

CRYPT_SHA384_Initialize(&sha384);
CRYPT_SHA384_DataAdd(&sha384, buffer, sizeof(buffer));
CRYPT_SHA384_Finalize(&sha384, shaSum);
```

Parameters

Parameters	Description
sha384	Pointer to CRYPT_SHA384_CTX structure which holds the hash values.

Function

int CRYPT_SHA384_Initialize(CRYPT_SHA384_CTX* sha384)

m) SHA512 Hash Functions

CRYPT_SHA512_DataAdd Function

Updates the hash with the data provided.

File

crypto.h

C

```
int CRYPT_SHA512_DataAdd(CRYPT_SHA512_CTX*, const unsigned char*, unsigned int);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha512 or input.
- 0 - An invalid pointer was not passed to the function.

Description

This function updates the hash with the data provided.

Remarks

In order to preserve the validity of the SHA512 hash, nothing must modify the context holding variable between calls to CRYPT_SHA512_DataAdd.

Preconditions

The SHA512 context must be initialized prior to the first call of this function. The context must not be modified by code outside of this function.

Example

```
CRYPT_SHA512_CTX sha512;
uint8_t buffer[1024];
uint8_t sha512Sum[SHA512_DIGEST_SIZE];

CRYPT_SHA512_Initialize(&sha512);
CRYPT_SHA512_DataAdd(&sha512, buffer, sizeof(buffer));
CRYPT_SHA512_Finalize(&sha512, sha512Sum);
```

Parameters

Parameters	Description
sha512	Pointer to CRYPT_SHA512_CTX structure which holds the hash values.
sz	Size of the data (in bytes) of the data to use to update the hash.

Function

int CRYPT_SHA512_DataAdd(CRYPT_SHA512_CTX* sha512, const unsigned char* input, unsigned int sz)

CRYPT_SHA512_Finalize Function

Finalizes the hash and puts the result into digest.

File

crypto.h

C

```
int CRYPT_SHA512_Finalize(CRYPT_SHA512_CTX*, unsigned char*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function, either in sha512 or digest.
- 0 - An invalid pointer was not passed to the function.

Description

This function finalizes the hash and puts the result into digest.

Remarks

In order to preserve the validity of the SHA512 hash, nothing must modify the context holding variable between calls to CRYPT_SHA512_DataAdd and CRYPT_SHA512_Finalize.

Preconditions

The SHA512 context must be initialized prior to calling this function. The context must not be modified by code outside of this function.

Example

```
CRYPT_SHA512_CTX sha512;
uint8_t buffer[1024];
uint8_t sha512Sum[SHA512_DIGEST_SIZE];

CRYPT_SHA512_Initialize(&sha512);
CRYPT_SHA512_DataAdd(&sha512, buffer, sizeof(buffer));
CRYPT_SHA512_Finalize(&sha512, sha512Sum);
```

Parameters

Parameters	Description
sha512	Pointer to CRYPT_SHA512_CTX structure which holds the hash values.
digest	Pointer to byte array to store hash result.

Function

int CRYPT_SHA512_Finalize(CRYPT_SHA512_CTX* sha512, unsigned char* digest)

CRYPT_SHA512_Initialize Function

Initializes the internal structures necessary for SHA512 hash calculations.

File

crypto.h

C

```
int CRYPT_SHA512_Initialize(CRYPT_SHA512_CTX*);
```

Returns

- BAD_FUNC_ARG - An invalid pointer was passed to the function.
- 0 - An invalid pointer was not passed to the function.

Description

This function initializes the internal structures necessary for SHA512 hash calculations.

Remarks

All SHA512 hashes have to start at a particular value before adding new data to it. This function sets the necessary values for the structure.

Preconditions

None.

Example

```
CRYPT_SHA512_CTX sha512;
uint8_t sha512Sum[SHA512_DIGEST_SIZE];

CRYPT_SHA512_Initialize(&sha512);
CRYPT_SHA512_DataAdd(&sha512, buffer, sizeof(buffer));
CRYPT_SHA512_Finalize(&sha512, sha512Sum);
```

Parameters

Parameters	Description
sha512	Pointer to CRYPT_SHA512_CTX structure which holds the hash values.

Function

int CRYPT_SHA512_Initialize(CRYPT_SHA512_CTX* sha512)

n) Data Types and Constants

CRYPT_AES_CTX Structure

File

crypto.h

C

```
struct CRYPT_AES_CTX {

Files

Files

Name	Description
crypto.h	Crypto Framework Library header for cryptographic functions.

Description

This section lists the source and header files used by the Crypto Library.

crypto.h

Crypto Framework Library header for cryptographic functions.

Functions

	Name	Description
	CRYPT_AES_CBC_Decrypt	Performs AES decryption using Cipher-Block-Chaining (CBC).
	CRYPT_AES_CBC_Encrypt	Performs AES encryption using Cipher-Block-Chaining (CBC).
	CRYPT_AES_CTR_Encrypt	Performs AES encryption using Counter (CTR).
	CRYPT_AES_DIRECT_Decrypt	Directs decryption of one block of data.
	CRYPT_AES_DIRECT_Encrypt	Directs encryption of one block of data.
	CRYPT_AES_IvSet	Sets the initialization vector (IV) for AES processing.
	CRYPT_AES_KeySet	Sets the key and initialization vector (IV) for AES processing.
	CRYPT_ECC_DHE_KeyMake	Creates a new ECC key.
	CRYPT_ECC_DHE_SharedSecretMake	Creates an ECC shared secret between two keys.
	CRYPT_ECC_DSA_HashSign	Signs a message digest.
	CRYPT_ECC_DSA_HashVerify	Verifies an ECC signature.
	CRYPT_ECC_Free	Cleans up an Elliptic Curve Cryptography (ECC) Context.
	CRYPT_ECC_Initialize	Initializes the context for Elliptic Curve Cryptography (ECC).
	CRYPT_ECC_KeySizeGet	Returns the key size in octets.
	CRYPT_ECC_PrivateImport	Imports private key pair in X9.63 format.
	CRYPT_ECC_PublicExport	Exports public ECC key in ANSI X9.63 format.
	CRYPT_ECC_PublicImport	Imports public key in ANSI X9.63 format.
	CRYPT_ECC_SignatureSizeGet	Returns the signature size in octets.
	CRYPT_ERROR_StringGet	Reports the nature of an error.
	CRYPT_HMAC_DataAdd	Adds data to the HMAC calculation.
	CRYPT_HMAC_Finalize	Completes the HMAC calculation and get the results.
	CRYPT_HMAC_SetKey	Initializes the HMAC context and set the key for the hash.
	CRYPT_HUFFMAN_Compress	Compresses a block of data.
	CRYPT_HUFFMAN_DeCompress	Decompresses a block of data.
	CRYPT_MD5_DataAdd	Updates the hash with the data provided.
	CRYPT_MD5_DataSizeSet	For PIC32MZ hardware encryption, sets the size of the input data.
	CRYPT_MD5_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_MD5_Initialize	Initializes the internal structures necessary for MD5 hash calculations.
	CRYPT_RNG_BlockGenerate	Createa several random numbers.
	CRYPT_RNG_Get	Gets one random number.
	CRYPT_RNG_Initialize	Initializes the random number generator.
	CRYPT_RSA_EncryptSizeGet	Gets the size of the RSA Key.
	CRYPT_RSA_Free	Releases the memory used for the key and clean up the context.
	CRYPT_RSA_Initialize	Initializes the internal structures necessary for RSA processing.
	CRYPT_RSA_PrivateDecrypt	Decrypts data using a private key.
	CRYPT_RSA_PrivateKeyDecode	Constructs the Private Key from a DER certificate.
	CRYPT_RSA_PublicEncrypt	Encrypts data using a public key.

	CRYPT_RSA_PublicKeyDecode	Constructs the Public Key from a DER certificate.
	CRYPT_SHA_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA_DataSizeSet	For PIC32MZ hardware encryption, sets the size of the input data.
	CRYPT_SHA_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA_Initialize	Initializes the internal structures necessary for SHA hash calculations.
	CRYPT_SHA256_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA256_DataSizeSet	For PIC32MZ hardware encryption, sets the size of the input data.
	CRYPT_SHA256_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA256_Initialize	Initializes the internal structures necessary for SHA256 hash calculations.
	CRYPT_SHA384_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA384_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA384_Initialize	Initializes the internal structures necessary for SHA384 hash calculations.
	CRYPT_SHA512_DataAdd	Updates the hash with the data provided.
	CRYPT_SHA512_Finalize	Finalizes the hash and puts the result into digest.
	CRYPT_SHA512_Initialize	Initializes the internal structures necessary for SHA512 hash calculations.
	CRYPT_TDES_CBC_Decrypt	Decrypts a data block using Triple DES.
	CRYPT_TDES_CBC_Encrypt	Encrypts a data block using Triple DES.
	CRYPT_TDES_IvSet	Sets the Initialization Vector (IV) for a Triple DES operation.
	CRYPT_TDES_KeySet	Initialization of Triple DES context.

Decoder Libraries Help

This section provides descriptions of the Decoder libraries that are available in MPLAB Harmony.

AAC Decoder Library

This section describes the AAC Decoder Library.

Introduction

The AAC Decoder Library is available for the PIC32MX family of microcontrollers.

Description

The AAC Decoder Library is a premium product and is not included in the standard release of MPLAB Harmony and must be purchased separately. Refer to the Microchip Premium MPLAB Harmony Audio web page (www.microchip.com/pic32harmonypremiumaudio) for additional information.

This AAC algorithm Non-Modifiable Binary Code is designed for 80 MHz or greater PIC32MX MCUs. Keep in mind, this code requires 62 MIPS peak 34 MIPS average performance, 61 KB Flash and 12 KB RAM without frame buffer memory for operation on the PIC32MX MCU. This product is the non-modifiable binary. A modifiable source-code version of this code is also available on Microchip Direct (SW320013-2). Users are responsible for licensing for their products through Via Licensing.

Assembly Language Issue

There is an assembly language issue in the AAC Decoder Library that misaligns the stack pointer. Contrary to the MIPS programming specification, this error is benign except when the application is built for a device with a hardware Floating Point Unit (FPU), such as the PIC32MZ EF family of devices. In this case, the sub-routine context-saving operations will produce an exception and stop the application. A work around exists for this issue, which involves disabling FPU context-saving for Interrupt Service Routines (ISRs).

The work around is to convert all ISRs from:

```
void __ISR(vector,ipl) MyInterruptHandler(void)
```

and change them to:

```
void __attribute__((vector),interrupt(ipl),nomips16,no_fpu)) MyInterruptHandler(void)
```

where, `vector` and `ipl` are replaced with the actual interrupt vector and interrupt priority level.

An example of this work around can be found in the universal_audio_decoders demonstration.

So as long as no FPU operations occur in ISRs and the routines are called by ISRs, this work around will prevent the misaligned stack pointer from causing an exception. If FPU operations result from an ISR with no_fpu enabled, a general exception will result.

Using the Library

This topic describes the basic architecture of the AAC Decoder Library and provides information and examples on its use.

Description

Interface Header File: `decoder_aac.h`

The interface to the AAC Decoder Library is defined in the `decoder_aac.h` header file. Any C language source (`.c`) file that uses the MP3 Decoder Library should include `decoder_aac.h`.

Please refer to the What is MPLAB Harmony? section for how the AAC Decoder Library interacts with the framework.

Library Overview

The Library Interface routines are divided into various sub-sections, each of which addresses one of the blocks or the overall operation of the AAC Decoder Library module.

Library Interface

a) General Functions

	Name	Description
	AAC_Decoder	This is function AAC_Decoder.
	AAC_WriteWavHeader	Generates the .wav file header, if applicable.
	AACDecoder_GetFrameSize	Used to get the AAC Decoder frame size.
	AACDecoder_GetStateSize	This function allocates memory for each channel being used.

	AACDecoder_Init	Views the received point and clears the structure.
	AACDecoder_InterleaveSamples	This function interleaves left and right channel data.
	isAACdecoder_enabled	This is function isAACdecoder_enabled.
	AAC_Decode	This function decodes AAC data.
	AAC_Initialize	This is function AAC_Initialize.
	AAC_RegisterDecoderEventHandlerCallback	This is function AAC_RegisterDecoderEventHandlerCallback.
	AAC_GetSamplingFrequency	This is function AAC_GetSamplingFrequency.

b) Data Types and Constants

	Name	Description
	INTPCM	
	AAC_DECODER_STATES	This is type AAC_DECODER_STATES.
	WAVE	This is type WAVE.
	AAC_PROFILE	This is macro AAC_PROFILE.
	AAC_SAMPLING_FREQUENCY_INDEX	This is type AAC_SAMPLING_FREQUENCY_INDEX.
	AAC_ERROR_COUNT_MAX	This is macro AAC_ERROR_COUNT_MAX.
	AACDECODER_STATE_SIZE	in Bytes
	FRAME_SIZE	in Samples
	INPUT_BUF_SIZE	in Bytes
	MAX_STACK	in Bytes
	STACK	This is macro STACK.
	AAC_FRAME_HEADER_SIZE	in Bytes
	SetReadBytesInAppData	This is type SetReadBytesInAppData.

Description

This section describes the Application Programming Interface (API) functions of the AAC Decoder Library.

Refer to each section for a detailed description.

a) General Functions

AAC_Decoder Function

File

aac.h

C

```
int16_t AAC_Decoder(uint8_t * input, uint16_t inSize, uint16_t * read, int16_t * output, uint16_t *
written);
```

Description

This is function AAC_Decoder.

AAC_WriteWavHeader Function

Generates the .wav file header, if applicable.

File

decoder_aac.h

C

```
void AAC_WriteWavHeader(void * haacDecoderInfo, WAVE * wav);
```

Returns

None.

Description

This function is called only if the output needs to be written into a .wav file. If the output is for play out or for writing into a .pcm file, this function

shall not be called. In case of wave file generation, the application shall leave 44 bytes space free at the start of the file and begin writing decoded samples from the 45th byte location onwards. Once the entire data had been decoded, this function is called. The function generates the .wav file header using the information available in the state memory and fills the WaveBuf array. The application copies the content of this buffer into the file in the reserved place available at the start of the file.

Preconditions

None.

Example

```
AAC_WriteWavHeader(haacDecoderInfo, wav);
```

Parameters

Parameters	Description
*haacDecoderInfo	The pointer for the structure that stores decoder information
*adts_ptr	pointer to WAVE header buffer

Function

void AAC_WriteWavHeader(void *haacDecoderInfo, WAVE *wav);

AACDecoder_GetFrameSize Function

Used to get the AAC Decoder frame size.

File

decoder_aac.h

C

```
int32_t AACDecoder_GetFrameSize(void * haacDecoderInfo, uint8_t * adts_ptr);
```

Returns

This function returns the size (in bytes) of the next frame to be decoded.

Description

This function is called every time before calling the AAC decode function. The frame size is extracted from the relevant field of the ADTS header for returning and also the frame size (in bits) is updated in the channel state.

Preconditions

None.

Parameters

Parameters	Description
*haacDecoderInfo	The pointer to the ADTS Header is passed. The application extracts the next available seven bytes from the file and passes them as ADTS header.
*adts_ptr	The pointer to the state memory is passed.

Function

int32_t AACDecoder_GetFrameSize(void *haacDecoderInfo, uint8_t *adts_ptr);

AACDecoder_GetStateSize Function

This function allocates memory for each channel being used.

File

decoder_aac.h

C

```
int32_t AACDecoder_GetStateSize();
```

Returns

This function returns the size of the AAC Decoder state structure in bytes.

Description

Based on the return value, the application allocates the required memory for the AAC Decoder state. This function is called only once for each channel before the channel is initialized.

If dynamic memory allocation (malloc) is not to be used, this function need not be called and the AAC Decoder state buffer shall be statically defined at compile time with the size of the AAC Decoder state structure (constant).

Preconditions

None.

Example

```
int32_t aac_State_Size;
aac_State_Size = AACDecoder_GetStateSize();
```

Function

int32_t AACDecoder_GetStateSize(void)

AACDecoder_Init Function

Views the received point and clears the structure.

File

decoder_aac.h

C

```
void AACDecoder_Init(void * haacDecoderInfo, uint8_t * adts_ptr);
```

Returns

None.

Description

This function is called only once for each channel before starting the decoding of the first frame. This function views the received pointer as structure pointer and clears the entire structure. Subsequently it initializes the selective variables with the default values. Also, the information on sampling frequency and number of channels are extracted from the header and are stored in the channel state structure.

After returning from this function, the application resets the file pointer to origin as these seven bytes will be fetched again to extract the frame size through the function mentioned next.

Preconditions

None.

Example

```
int32_t aac_State_Size;
AACDecoder_Init(haacDecoderInfo, appData.data);
```

Parameters

Parameters	Description
*haacDecoderInfo	The pointer for the structure that stores decoder information
*adts_ptr	pointer to AAC header structure

Function

void AACDecoder_Init(void *haacDecoderInfo, uint8_t *adts_ptr);

AACDecoder_InterleaveSamples Function

This function interleaves left and right channel data.

File

decoder_aac.h

C

```
int16_t AACDecoder_InterleaveSamples(INTPCM * pTimeCh0, void * state);
```

Returns

This function returns the number of samples in the I/O buffer:

- 1024 - for mono
- 2048 - for stereo

Description

For stereo audio, the left and right channels are interleaved here and stored in the same I/O buffer. For mono channels, nothing is done.

Preconditions

None.

Example

```
outSize = AACDecoder_InterleaveSamples(outBuf, haacDecoderInfo);
```

Parameters

Parameters	Description
*pState	The pointer to the state memory is passed. The details about the number of channels, mono or stereo, is used.
*outBuf	Pointer to the I/O buffer.

Function

int32_t AACDecoder_InterleaveSamples (void *pState, int16_t *outBuf);

isAACdecoder_enabled Function

File

aac.h

C

```
bool isAACdecoder_enabled();
```

Description

This is function isAACdecoder_enabled.

AAC_Decode Function

This function decodes AAC data.

File

decoder_aac.h

C

```
int16_t AAC_Decode(void * DecoderState, uint8_t * inBufferptr, INTPCM * pTimeData, int16_t * outFlag,
int32_t * restBytes);
```

Returns

This function returns either the value '0' or '1' to indicate the status of the decode operation.

- 0 - indicates success
- 1 - indicates failure or end of available encoded data. Upon receiving the value '1', the application aborts processing the channel.

Description

This function is called once to decode one frame. This function will be called in an infinite while loop until the end of frame is detected or the decode function returns the value '1'.

Preconditions

None.

Example

```
errorStatus = AAC_Decode(haacDecoderInfo, inBuffer, outBuf, &outFlag, &restbit);
```

Parameters

Parameters	Description
*DecoderState	The pointer to the state memory is passed.
*inBufferptr	Pointer to the input buffer, where the encoded bit stream is available. Based on the return value from AACDecoder_GetFrameSize(), the application fetches the needed bytes from the bit stream file and fills in this buffer.
*pTimeData	Pointer to the buffer where the output samples are to be stored
*outFlag	The pointer to a variable for output flag: 0 for no valid data (for initial few frames) 1 for valid data present (for all subsequent frames) After decoding the frame, the function indicates whether valid data is present in the output buffer. • restBytes - Pointer to the variable that indicates how many bytes have not decoded. • Normally the number is 0.

Function

int32_t AAC_Decode(void *DecoderState,uint8_t *inBufferptr,short *pTimeData, int16_t *outFlag)

AAC_Initialize Function

File

aac.h

C

```
bool AAC_Initialize(void * heap, uint16_t size, uint8_t * ptr, SYS_FS_HANDLE aacFilehandle);
```

Description

This is function AAC_Initialize.

AAC_RegisterDecoderEventHandlerCallback Function

File

aac.h

C

```
void AAC_RegisterDecoderEventHandlerCallback(SetReadBytesInAppData fptr);
```

Description

This is function AAC_RegisterDecoderEventHandlerCallback.

AAC_GetSamplingFrequency Function

File

aac.h

C

```
int32_t AAC_GetSamplingFrequency(uint8_t * ptr);
```

Description

This is function AAC_GetSamplingFrequency.

b) Data Types and Constants

INTPCM Type

File

decoder_aac.h

C

```
typedef short INTPCM;
```

Section

Middleware & Other Library Configuration

AAC_DECODER_STATES Enumeration

File

aac.h

C

```
typedef enum {
  AAC_GET_FRAME_SIZE,
  AAC_DECODE_FRAME
} AAC_DECODER_STATES;
```

Description

This is type AAC_DECODER_STATES.

WAVE Structure

File

decoder_aac.h

C

```
typedef struct {
  int32_t riff;
  int32_t len;
  int32_t wave;
  int32_t fmt;
  int32_t sublen;
  int16_t mode;
  int16_t num_chnls;
  int32_t samp_freq;
  int32_t bytes_per_sec;
  int16_t bytes_per_sample;
  int16_t bits_per_sample;
  int32_t data;
  int32_t data_len;
} WAVE;
```

Members

Members	Description
int16_t mode;	1 for uncompressed PCM
int16_t num_chnls;	1 for mono and 2 for stereo
int32_t bytes_per_sec;	bytes_per_sample * samp_freq
int16_t bytes_per_sample;	bits_per_sample/8 * num_channels : bytes per set of sample
int16_t bits_per_sample;	bits per word (left or right - not both)

Description

This is type WAVE.

AAC_PROFILE Macro

File

decoder_aac.h

C

```
#define AAC_PROFILE 1
```

Description

This is macro AAC_PROFILE.

AAC_SAMPLING_FREQUENCY_INDEX Enumeration

File

aac.h

C

```
typedef enum {
  SAMPLING_FREQUENCY_IDX0 = 0,
  SAMPLING_FREQUENCY_IDX1,
  SAMPLING_FREQUENCY_IDX2,
  SAMPLING_FREQUENCY_IDX3,
  SAMPLING_FREQUENCY_IDX4,
  SAMPLING_FREQUENCY_IDX5,
  SAMPLING_FREQUENCY_IDX6,
  SAMPLING_FREQUENCY_IDX7,
  SAMPLING_FREQUENCY_IDX8,
  SAMPLING_FREQUENCY_IDX9,
  SAMPLING_FREQUENCY_IDX10,
  SAMPLING_FREQUENCY_IDX11,
  SAMPLING_FREQUENCY_IDX12,
  SAMPLING_FREQUENCY_IDX13,
  SAMPLING_FREQUENCY_IDX14,
  SAMPLING_FREQUENCY_IDX15
} AAC_SAMPLING_FREQUENCY_INDEX;
```

Description

This is type AAC_SAMPLING_FREQUENCY_INDEX.

AAC_ERROR_COUNT_MAX Macro

File

aac.h

C

```
#define AAC_ERROR_COUNT_MAX 1
```

Description

This is macro AAC_ERROR_COUNT_MAX.

AACDECODER_STATE_SIZE Macro

File

decoder_aac.h

C

```
#define AACDECODER_STATE_SIZE 11032                // in Bytes
```

Description

in Bytes

FRAME_SIZE Macro

File

decoder_aac.h

C

```
#define FRAME_SIZE 1024                 // in Samples
```

Description

in Samples

INPUT_BUF_SIZE Macro

File

decoder_aac.h

C

```
#define INPUT_BUF_SIZE (6144*2/8)          // in Bytes
```

Description

in Bytes

MAX_STACK Macro

File

decoder_aac.h

C

```
#define MAX_STACK 0x5000                // in Bytes
```

Description

in Bytes

STACK Macro

File

decoder_aac.h

C

```
#define STACK 1
```

Description

This is macro STACK.

AAC_FRAME_HEADER_SIZE Macro

File

decoder_aac.h

C

```
#define AAC_FRAME_HEADER_SIZE 7                  // in Bytes
```

Description

in Bytes

SetReadBytesInAppData Type

File

aac.h

C

```
typedef void (* SetReadBytesInAppData)(int32_t val);
```

Description

This is type SetReadBytesInAppData.

Types

	Name	Description
	INTPCM	

Description

AAC Decoder Library Interface File

The header file consists of function declaration for the abstract functions to invoke decoding . The header file also defines the size of input samples and i/p and o/p buffer. This configuration header must not define any prototypes or data definitions (or include any files that do). It only provides macro definitions for build-time configuration options that are not instantiated until used by another MPLAB Harmony module or application.

File Name

decoder_aac.h

Company

Microchip Technology Inc.

MP3 Decoder Library

This section describes the MP3 Decoder Library.

Introduction

The MP3 Decoder Library is available for the PIC32 family of microcontrollers.

Description

The MP3 Decoder Library is a premium product and is not included in the standard release of MPLAB Harmony and must be purchased separately. Refer to the Microchip Premium MPLAB Harmony Audio web page (www.microchip.com/pic32harmonypremiumaudio) for additional information.

The Compact MP3 algorithm is designed to fit in small memory footprint PIC32MX Microcontrollers. This code requires only 28 MIPS of performance (CD Quality audio), 42 KB Flash and 11 KB RAM memory for operation on the PIC32MX. This part number is for Non-modifiable binary code. Source code is also available (refer to the previous web link). Users are responsible for patent-only licensing through Technicolor.

Assembly Language Issue

There is an assembly language issue in the MP3 Decoder Library that misaligns the stack pointer. Contrary to the MIPS programming specification, this error is benign except when the application is built for a device with a hardware Floating Point Unit (FPU), such as the PIC32MZ EF family of devices. In this case, the sub-routine context-saving operations will produce an exception and stop the application. A work around exists for this issue, which involves disabling FPU context-saving for Interrupt Service Routines (ISRs).

The work around is to convert all ISRs from:

```
void __ISR(vector,ipl) MyInterruptHandler(void)
```

and change them to:

```
void __attribute__((vector),interrupt(ipl),nomips16,no_fpu)) MyInterruptHandler(void)
```

where, `vector` and `ipl` are replaced with the actual interrupt vector and interrupt priority level.

An example of this work around can be found in the universal_audio_decoders demonstration.

So as long as no FPU operations occur in ISRs and the routines are called by ISRs, this work around will prevent the misaligned stack pointer from causing an exception. If FPU operations result from an ISR with no_fpu enabled, a general exception will result.

Using the Library

This topic describes the basic architecture of the MP3 Decoder Library and provides information and examples on its use.

Description

Interface Header File: `decoder_mp3.h`

The interface to the MP3 Decoder Library is defined in the `decoder_mp3.h` header file. Any C language source (`.c`) file that uses the MP3 Decoder Library should include `decoder_mp3.h`.

Please refer to the What is MPLAB Harmony? section for how the MP3 Decoder Library interacts with the framework.

Library Overview

The Library Interface routines are divided into various sub-sections, each of which addresses one of the blocks or the overall operation of the MP3 Decoder Library module.

Library Interface

a) General Functions

	Name	Description
	MP3_Decode	This is function MP3_Decode.
	MP3Initialize	The function views the received pointer as a structure pointer and clears the entire structure.
	MP3_EventHandler	This is function MP3_EventHandler.
	MP3Decode	This function is called once to decode one frame.
	MP3DecoderGetStateSize	This function allocates memory used for decoding.
	MP3_ParseVBR	This is function MP3_ParseVBR.
	MP3DecoderInit	The function views the received pointer as a structure pointer and clears the entire structure.
	isMP3decoder_enabled	This is function isMP3decoder_enabled.
	ID3_Initialize	void ID3_Initialize (void);
	ID3_EventHandler	This is function ID3_EventHandler.
	ID3_Parse	This is function ID3_Parse.
	ID3_ParseFrameV22	This is function ID3_ParseFrameV22.
	ID3_ParseFrameV23	This is function ID3_ParseFrameV23.
	ID3_Parse_Frame	This is function ID3_Parse_Frame.
	MP3Decode	This function is called once to decode one frame.
	MP3_GetAudioSize	This is function MP3_GetAudioSize.
	MP3_UpdatePlaytime	This is function MP3_UpdatePlaytime.
	MP3_Initialize	This is function MP3_Initialize.
	MP3_RegisterDecoderEventHandlerCallback	This is function MP3_RegisterDecoderEventHandlerCallback.
	MP3_GetChannels	This is function MP3_GetChannels.

b) Data Types and Constants

	Name	Description
	MP3_FORMAT	
	MP3_STATE_SIZE	11024
	MP3_EVENT	This is type MP3_EVENT.
	MP3_FRAME_HEADER	This is type MP3_FRAME_HEADER.
	MP3_STATE	This is type MP3_STATE.
	MP3_XING_HEADER	This is type MP3_XING_HEADER.
	MP3_ERROR_COUNT_MAX	This is macro MP3_ERROR_COUNT_MAX.
	MP3_HEADER_CHANNELS_DUAL	This is macro MP3_HEADER_CHANNELS_DUAL.
	MP3_HEADER_CHANNELS_JOINT	This is macro MP3_HEADER_CHANNELS_JOINT.

	MP3_HEADER_CHANNELS_MONO	This is macro MP3_HEADER_CHANNELS_MONO.
	MP3_HEADER_CHANNELS_STEREO	This is macro MP3_HEADER_CHANNELS_STEREO.
	MP3_HEADER_SAMPLERATE_32000	This is macro MP3_HEADER_SAMPLERATE_32000.
	MP3_HEADER_SAMPLERATE_44100	This is macro MP3_HEADER_SAMPLERATE_44100.
	MP3_HEADER_SAMPLERATE_48000	This is macro MP3_HEADER_SAMPLERATE_48000.
	MP3_HEADER_SAMPLERATE_RESV	This is macro MP3_HEADER_SAMPLERATE_RESV.
	MP3_PLAYTIME_H	This is macro MP3_PLAYTIME_H.
	MP3_XING_HEADER_START_MONO	This is macro MP3_XING_HEADER_START_MONO.
	MP3_XING_HEADER_START_STEREO	This is macro MP3_XING_HEADER_START_STEREO.
	ID3_EVENT	This is type ID3_EVENT.
	ID3_STATE	This is type ID3_STATE.
	ID3V1_EXTENDED_TAG	This is type ID3V1_EXTENDED_TAG.
	ID3V1_TAG	This is type ID3V1_TAG.
	ID3V2_TAG_HEADER	This is type ID3V2_TAG_HEADER.
	ID3V22_FRAME	This is type ID3V22_FRAME.
	ID3V22_FRAME_HEADER	This is type ID3V22_FRAME_HEADER.
	ID3V23_FRAME	This is type ID3V23_FRAME.
	ID3V23_FRAME_HEADER	This is type ID3V23_FRAME_HEADER.
	ID3_H	This is macro ID3_H.
	ID3_STRING_SIZE	This is macro ID3_STRING_SIZE.
	ID3V22_ALBUM	This is macro ID3V22_ALBUM.
	ID3V22_ARTIST	This is macro ID3V22_ARTIST.
	ID3V22_TITLE	This is macro ID3V22_TITLE.
	ID3V22_ZERO	This is macro ID3V22_ZERO.
	ID3V23_ALBUM	This is macro ID3V23_ALBUM.
	ID3V23_ARTIST	This is macro ID3V23_ARTIST.
	ID3V23_TITLE	This is macro ID3V23_TITLE.
	ID3V23_ZERO	This is macro ID3V23_ZERO.
	MP3_CHANNEL_INFO	
	MP3MPEG1L3_SAMPLES_PER_FRAME	MPEG1 LayerIII, samples per frame
	MP3MPEG2L3_SAMPLES_PER_FRAME	MPEG2/2.5 LayerIII, samples per frame
	MP3_DEC	This is type MP3_DEC.
	DecoderEventHandlerCB	This is type DecoderEventHandlerCB.

Description

This section describes the Application Programming Interface (API) functions of the MP3 Decoder Library.

Refer to each section for a detailed description.

a) General Functions

MP3_Decode Function

File

mp3.h

C

```
bool MP3_Decode(uint8_t * input, uint16_t inSize, uint16_t * read, uint8_t * output, uint16_t * written);
```

Description

This is function MP3_Decode.

MP3Initialize Function

The function views the received pointer as a structure pointer and clears the entire structure.

File

decoder_mp3_microaptiv.h

C

```
bool MP3Initialize(void * state);
```

Returns

This function returns a boolean value.

- 0 - indicates unsuccessful initialization
- 1 - indicates successful initialization

Description

The function views the received pointer as a structure pointer and clears the entire structure. Subsequently, it initializes the selective variable with the default values. The function is called only once before initiating the decoding process.

Preconditions

None.

Example

```
MP3Initialize ( mp3.decoderVars );
```

Parameters

Parameters	Description
*state	The pointer to the allocated state memory is passed.

Function

bool MP3Initialize(void *state);

MP3_EventHandler Function

File

mp3.h

C

```
bool MP3_EventHandler(MP3_EVENT event, uint32_t data);
```

Description

This is function MP3_EventHandler.

MP3Decode Function

This function is called once to decode one frame.

File

decoder_mp3_microaptiv.h

C

```
uint16_t MP3Decode(void * state, uint8_t * in, uint16_t inSize, uint16_t * used, MP3_FORMAT * format, void
* outBuffer, uint16_t * outSize);
```

Returns

This function returns either the value '0' or '1' to indicate the status of the decode operation.

- 1 - indicates success
- 0 - indicates failure or end of available encoded data. Upon receiving the value '0' the application aborts processing the channel.

Description

This function is called once to decode one frame. This function will be called in an infinite while loop until the end of the frame is detected or the decode function returns the value '0'. Unlike most speech applications where the encoded data for each frame is deterministic, this is not the case for audio applications. Therefore, the application provides a portion of input data (usually more than what is necessary for a single frame). The decoder parses the input and decodes it with a portion of the data. The decode function passes the information of how many bytes of data were used to the application so that the application saves the remaining data and presents to the decoder for the subsequent frame.

Preconditions

None.

Example

```
MP3Decode ( mp3.decoderVars, input, inSize, read, &mp3.format, output, written )
```

Parameters

Parameters	Description
*state	The pointer to the state memory is passed.
*in	The pointer to the input buffer , where the encoded bit stream is available.
inSize	A variable of data type uint16_t indicating the number of valid bytes available in the input buffer.
*used	The pointer to a variable is passed to the function. After decoding the frame the function writes the number of bytes consumed from the current frame decoder operation.
*format	The pointer to a channel info structure is passed to the function the decider updates this structure after every call
*outBuffer	The pointer to the output sample buffer where the decided pcm samples are to be written,
*outSize	The pointer to a variable is passed to the function. After decoding the frame the function writes the number of valid bytes available in the output buffer.

Function

uint16_t MP3Decode (void *state, uint8_t *in, uint16_t inSize, uint16_t *used,
MP3_FORMAT *format, void *outBuffer, uint16_t *outSize);

MP3DecoderGetStateSize Function

This function allocates memory used for decoding.

File

decoder_mp3_microaptiv.h

C

```
uint32_t MP3DecoderGetStateSize();
```

Returns

This function returns the size of the MP3 Decoder state structure in bytes.

Description

Based on the return value, the application allocates the required memory for the MP3 Decoder state. This function is called only once before initializing the decoder state. If dynamic memory allocation (malloc) is not needed, it is not necessary to call this function and the MP3 Decoder state buffer will be statically defined at the compile time with the size of the MP3 decoder state structure.

Preconditions

None.

Example

```
Word mp3StateSize;
mp3StateSize = MP3DecoderGetStateSize();
```

Function

uint32_t MP3DecoderGetStateSize(void);

MP3_ParseVBR Function

File

mp3.h

C

```
bool MP3_ParseVBR(uint8_t* data);
```

Description

This is function MP3_ParseVBR.

MP3DecoderInit Function

The function views the received pointer as a structure pointer and clears the entire structure.

File

decoder_mp3_advanced.h

C

```
void MP3DecoderInit(void * State);
```

Returns

None.

Description

The function views the received pointer as a structure pointer and clears the entire structure. Subsequently, it initializes the selective variable with the default values. The function is called only once before initiating the decoding process.

Preconditions

None.

Example

```
MP3Initialize ( mp3.decoderVars );
```

Parameters

Parameters	Description
*state	The pointer to the allocated state memory is passed.

Function

void MP3DecoderInit(void *state);

isMP3decoder_enabled Function

File

mp3.h

C

```
bool isMP3decoder_enabled();
```

Description

This is function isMP3decoder_enabled.

ID3_Initialize Function

File

id3.h

C

```
int32_t ID3_Initialize(uint8_t * buffer);
```

Description

void ID3_Initialize (void);

ID3_EventHandler Function

File

id3.h

C

```
bool ID3_EventHandler(ID3_EVENT event, uint32_t data);
```

Description

This is function ID3_EventHandler.

ID3_Parse Function

File

id3.h

C

```
uint32_t ID3_Parse(uint8_t * buff, uint16_t size);
```

Description

This is function ID3_Parse.

ID3_ParseFrameV22 Function

File

id3.h

C

```
void ID3_ParseFrameV22(ID3V22_FRAME * frame, uint32_t frameSize, char * id, uint16_t event);
```

Description

This is function ID3_ParseFrameV22.

ID3_ParseFrameV23 Function

File

id3.h

C

```
void ID3_ParseFrameV23(ID3V23_FRAME * frame, uint32_t frameSize, char * id, uint16_t event);
```

Description

This is function ID3_ParseFrameV23.

ID3_Parse_Frame Function

File

id3.h

C

```
uint32_t ID3_Parse_Frame(uint8_t * buffer, size_t left, int8_t * ret);
```

Description

This is function ID3_Parse_Frame.

MP3Decode Function

This function is called once to decode one frame.

File

decoder_mp3_advanced.h

C

```
int16_t MP3Decode(void * state, uint8_t * In, uint16_t inSize, uint16_t * used, MP3_CHANNEL_INFO * format,
void * outBuffer, uint16_t * outSize);
```

Returns

This function returns either the value '0' or '1' or '2' to indicate the status of the decode operation.

- 0 - indicates success
- 1 - indicates that no data is available (thus marking end of file)
- 2 - indicates failure or invalid or corrupted data

Description

This function is called once to decode one frame. This function will be called in an infinite while loop until the end of the frame is detected or the decode function returns the value '0'. Unlike most speech applications where the encoded data for each frame is deterministic, this is not the case for audio applications. Therefore, the application provides a portion of input data (usually more than what is necessary for a single frame). The decoder parses the input and decodes it with a portion of the data. The decode function passes the information of how many bytes of data were used to the application so that the application saves the remaining data and presents to the decoder for the subsequent frame.

Preconditions

None.

Example

```
MP3Decode ( mp3.decoderVars, input, inSize, read, &mp3.format, output, written )
```

Parameters

Parameters	Description
*state	The pointer to the state memory is passed.
*in	The pointer to the input buffer , where the encoded bit stream is available.
inSize	A variable of data type uint16_t indicating the number of valid bytes available in the input buffer.
*used	The pointer to a variable is passed to the function. After decoding the frame the function writes the number of bytes consumed from the current frame decoder operation.
*format	The pointer to a channel info structure is passed to the function. The decoder updates this structure after every call. Additional member 'MPEG_Type' to indicate the MPEG version is added in this structure.
*outBuffer	The pointer to the output sample buffer where the decided pcm samples are to be written,
*outSize	The pointer to a variable is passed to the function. After decoding the frame the function writes the number of valid bytes available in the output buffer.

Function

int16_t MP3Decode (void *state, uint8_t *In, uint16_t inSize, uint16_t *used,
MP3_CHANNEL_INFO *format, void *outBuffer, uint16_t *outSize);

MP3_GetAudioSize Function

File

mp3.h

C

```
uint32_t MP3_GetAudioSize();
```

Description

This is function MP3_GetAudioSize.

MP3_UpdatePlaytime Function

File

mp3.h

C

```
uint32_t MP3_UpdatePlaytime();
```

Description

This is function MP3_UpdatePlaytime.

MP3_Initialize Function

File

mp3.h

C

```
bool MP3_Initialize(void * heap, uint16_t size, SYS_FS_HANDLE mp3Filehandle);
```

Description

This is function MP3_Initialize.

MP3_RegisterDecoderEventHandlerCallback Function

File

mp3.h

C

```
void MP3_RegisterDecoderEventHandlerCallback(DecoderEventHandlerCB fptr);
```

Description

This is function MP3_RegisterDecoderEventHandlerCallback.

MP3_GetChannels Function

File

mp3.h

C

```
uint8_t MP3_GetChannels();
```

Description

This is function MP3_GetChannels.

b) Data Types and Constants

MP3_FORMAT Structure

File

decoder_mp3_microaptiv.h

C

```
typedef struct {
  uint16_t Kbps;
  uint16_t sampleRate;
  uint8_t bitsPerSample;
  uint8_t channels;
} MP3_FORMAT;
```

Section

Middleware & Other Library Configuration

MP3_STATE_SIZE Macro

File

mp3.h

C

```
#define MP3_STATE_SIZE 16876//11024
```

Description

11024

MP3_EVENT Enumeration

File

mp3.h

C

```
typedef enum {
  MP3_EVENT_TAG_ARTIST,
  MP3_EVENT_TAG_ALBUM,
  MP3_EVENT_TAG_TITLE,
  MP3_EVENT_STREAM_START,
  MP3_EVENT_SAMPLERATE,
  MP3_EVENT_BITRATE,
  MP3_EVENT_TRACK_TIME
} MP3_EVENT;
```

Members

Members	Description
MP3_EVENT_TAG_ARTIST	Align TAG_ARTIST, TAG_ALBUM and TAG_TITLE with ID3 EVENT_TAGS

Description

This is type MP3_EVENT.

MP3_FRAME_HEADER Union

File

mp3.h

C

```
typedef union {
  uint32_t data;
  struct {
    uint8_t sync0 : 8;
    uint8_t CRC : 1;
    uint8_t layer : 2;
    uint8_t mpeg : 2;
    uint8_t sync1 : 3;
    uint8_t padding : 1;
    uint8_t samprate : 2;
    uint8_t bitrate : 4;
    uint8_t nc : 4;
    uint8_t extend : 2;
    uint8_t stereo : 2;
  }
} MP3_FRAME_HEADER;
```

Description

This is type MP3_FRAME_HEADER.

MP3_STATE Enumeration

File

mp3.h

C

```
typedef enum {
  MP3_STATE_STREAM
} MP3_STATE;
```

Description

This is type MP3_STATE.

MP3_XING_HEADER Structure

File

mp3.h

C

```
typedef struct {
  int8_t tag[4];
  union {
    uint32_t flags;
    struct {
      uint32_t frameInfo : 1;
      uint32_t sizeInfo : 1;
      uint32_t tocInfo : 1;
      uint32_t qualityInfo : 1;
    }
  }
  uint8_t frames[4];
  uint8_t size[4];
  uint8_t toc[100];
  uint8_t quality;
} MP3_XING_HEADER;
```

Description

This is type MP3_XING_HEADER.

MP3_ERROR_COUNT_MAX Macro

File

mp3.h

C

```
#define MP3_ERROR_COUNT_MAX 1
```

Description

This is macro MP3_ERROR_COUNT_MAX.

MP3_HEADER_CHANNELS_DUAL Macro

File

mp3.h

C

```
#define MP3_HEADER_CHANNELS_DUAL 0b10
```

Description

This is macro MP3_HEADER_CHANNELS_DUAL.

MP3_HEADER_CHANNELS_JOINT Macro

File

mp3.h

C

```
#define MP3_HEADER_CHANNELS_JOINT 0b01
```

Description

This is macro MP3_HEADER_CHANNELS_JOINT.

MP3_HEADER_CHANNELS_MONO Macro

File

mp3.h

C

```
#define MP3_HEADER_CHANNELS_MONO 0b11
```

Description

This is macro MP3_HEADER_CHANNELS_MONO.

MP3_HEADER_CHANNELS_STEREO Macro

File

mp3.h

C

```
#define MP3_HEADER_CHANNELS_STEREO 0b00
```

Description

This is macro MP3_HEADER_CHANNELS_STEREO.

MP3_HEADER_SAMPLERATE_32000 Macro

File

mp3.h

C

```
#define MP3_HEADER_SAMPLERATE_32000 0b10
```

Description

This is macro MP3_HEADER_SAMPLERATE_32000.

MP3_HEADER_SAMPLERATE_44100 Macro

File

mp3.h

C

```
#define MP3_HEADER_SAMPLERATE_44100 0b00
```

Description

This is macro MP3_HEADER_SAMPLERATE_44100.

MP3_HEADER_SAMPLERATE_48000 Macro

File

mp3.h

C

```
#define MP3_HEADER_SAMPLERATE_48000 0b01
```

Description

This is macro MP3_HEADER_SAMPLERATE_48000.

MP3_HEADER_SAMPLERATE_RESV Macro

File

mp3.h

C

```
#define MP3_HEADER_SAMPLERATE_RESV 0b11
```

Description

This is macro MP3_HEADER_SAMPLERATE_RESV.

MP3_PLAYTIME_H Macro

File

mp3.h

C

```
#define MP3_PLAYTIME_H
```

Description

This is macro MP3_PLAYTIME_H.

MP3_XING_HEADER_START_MONO Macro

File

mp3.h

C

```
#define MP3_XING_HEADER_START_MONO 17
```

Description

This is macro MP3_XING_HEADER_START_MONO.

MP3_XING_HEADER_START_STEREO Macro

File

mp3.h

C

```
#define MP3_XING_HEADER_START_STEREO 32
```

Description

This is macro MP3_XING_HEADER_START_STEREO.

ID3_EVENT Enumeration

File

id3.h

C

```
typedef enum {
  ID3_EVENT_TAG_ARTIST,
  ID3_EVENT_TAG_ALBUM,
  ID3_EVENT_TAG_TITLE
} ID3_EVENT;
```

Description

This is type ID3_EVENT.

ID3_STATE Enumeration

File

id3.h

C

```
typedef enum {
  ID3_STATE_INIT,
  ID3_STATE_READ_V1,
  ID3_STATE_READ_V2_HEADER,
  ID3_STATE_READ_V2_FRAME,
  ID3_STATE_FINISHED
} ID3_STATE;
```

Description

This is type ID3_STATE.

ID3V1_EXTENDED_TAG Structure

File

id3.h

C

```
typedef struct {
  uint8_t tag[4];
  int8_t title[60];
  int8_t artist[60];
  int8_t album[60];
  uint8_t speed;
  int8_t genre[30];
  int8_t startTime[6];
  int8_t endTime[6];
} ID3V1_EXTENDED_TAG;
```

Description

This is type ID3V1_EXTENDED_TAG.

ID3V1_TAG Structure

File

id3.h

C

```
typedef struct {
  uint8_t tag[3];
  int8_t title[30];
  int8_t artist[30];
```

```
    int8_t album[30];
    int8_t year[4];
    union {
      int8_t comment[30];
      struct {
        int8_t commentShort[28];
        uint8_t zero;
        uint8_t track;
      }
    }
    uint8_t genre;
  } ID3V1_TAG;
```

Description

This is type ID3V1_TAG.

ID3V2_TAG_HEADER Structure

File

id3.h

C

```
typedef struct {
  uint8_t tag[3];
  uint8_t version;
  uint8_t empty;
  uint8_t flag;
  uint8_t size[4];
} ID3V2_TAG_HEADER;
```

Description

This is type ID3V2_TAG_HEADER.

ID3V22_FRAME Structure

File

id3.h

C

```
typedef struct {
  uint8_t id[3];
  uint8_t size[3];
  uint8_t encoding;
  uint8_t contents[1];
} ID3V22_FRAME;
```

Description

This is type ID3V22_FRAME.

ID3V22_FRAME_HEADER Structure

File

id3.h

C

```
typedef struct {
  uint8_t id[3];
  uint8_t size[3];
} ID3V22_FRAME_HEADER;
```

Description

This is type ID3V22_FRAME_HEADER.

ID3V23_FRAME Structure

File

id3.h

C

```
typedef struct {
  uint8_t id[4];
  uint8_t size[4];
  uint8_t flags[2];
  uint8_t encoding;
  uint8_t contents[1];
} ID3V23_FRAME;
```

Description

This is type ID3V23_FRAME.

ID3V23_FRAME_HEADER Structure

File

id3.h

C

```
typedef struct {
  uint8_t id[4];
  uint8_t size[4];
  uint8_t flags[2];
} ID3V23_FRAME_HEADER;
```

Description

This is type ID3V23_FRAME_HEADER.

ID3_H Macro

File

id3.h

C

```
#define ID3_H
```

Description

This is macro ID3_H.

ID3_STRING_SIZE Macro

File

id3.h

C

```
#define ID3_STRING_SIZE 128
```

Description

This is macro ID3_STRING_SIZE.

ID3V22_ALBUM Macro

File

id3.h

C

```
#define ID3V22_ALBUM "TAL"
```

Description

This is macro ID3V22_ALBUM.

ID3V22_ARTIST Macro

File

id3.h

C

```
#define ID3V22_ARTIST "TP1"
```

Description

This is macro ID3V22_ARTIST.

ID3V22_TITLE Macro

File

id3.h

C

```
#define ID3V22_TITLE "TT2"
```

Description

This is macro ID3V22_TITLE.

ID3V22_ZERO Macro

File

id3.h

C

```
#define ID3V22_ZERO "\0\0\0"
```

Description

This is macro ID3V22_ZERO.

ID3V23_ALBUM Macro

File

id3.h

C

```
#define ID3V23_ALBUM "TALB"
```

Description

This is macro ID3V23_ALBUM.

ID3V23_ARTIST Macro

File

id3.h

C

```
#define ID3V23_ARTIST "TPE1"
```

Description

This is macro ID3V23_ARTIST.

ID3V23_TITLE Macro

File

id3.h

C

```
#define ID3V23_TITLE "TIT2"
```

Description

This is macro ID3V23_TITLE.

ID3V23_ZERO Macro

File

id3.h

C

```
#define ID3V23_ZERO "\0\0\0\0"
```

Description

This is macro ID3V23_ZERO.

MP3_CHANNEL_INFO Structure

File

decoder_mp3_advanced.h

C

```
typedef struct {
  int16_t bitsPerWord;
  int16_t channels;
  int32_t samplingRate;
  int32_t bitRate;
  int32_t MPEG_Type;
} MP3_CHANNEL_INFO;
```

Section

Middleware & Other Library Configuration

MP3MPEG1L3_SAMPLES_PER_FRAME Macro

File

mp3.h

C

```
#define MP3MPEG1L3_SAMPLES_PER_FRAME 1152 // MPEG1 LayerIII, samples per frame
```

Description

MPEG1 LayerIII, samples per frame

MP3MPEG2L3_SAMPLES_PER_FRAME Macro

File

mp3.h

C

```
#define MP3MPEG2L3_SAMPLES_PER_FRAME 576  // MPEG2/2.5 LayerIII, samples per frame
```

Description

MPEG2/2.5 LayerIII, samples per frame

MP3_DEC Structure

File

mp3.h

C

```
typedef struct {
  uint16_t mp3SampleRate;
  uint32_t mp3BitRate;
  uint32_t mp3Duration;
  uint32_t firstFramePos;
  bool isVBR;
  uint32_t mp3ValidBytes;
  uint8_t stereo;
} MP3_DEC;
```

Members

Members	Description
uint32_t firstFramePos;	first frame position in file
uint32_t mp3ValidBytes;	for VBR MP3, mp3ValidBytes is the number of bytes in file is given by XING header, for CBR MP3, mp3ValidBytes is MP3 audio file size - first frame position

Description

This is type MP3_DEC.

DecoderEventHandlerCB Type

File

mp3.h

C

```
typedef bool (* DecoderEventHandlerCB)(uint32_t event, uint32_t data);
```

Description

This is type DecoderEventHandlerCB.

Opus Decoder Library

This section describes the Opus Decoder Library.

Introduction

Introduces the Opus Decoder Library.

Description

Opus is an open, royalty-free, highly versatile audio codec. Opus is unmatched for interactive speech and music transmission over the Internet, but is also intended for storage and streaming applications. It is standardized by the Internet Engineering Task Force (IETF) as RFC 6716, which incorporated technology from Skype's SILK codec and Xiph.Org's CELT codec.

Opus Features

Supported features are:

- Bit rates from 6 kb/s to 510 kb/s
- Sampling rates from 8 kHz (narrowband) to 48 kHz (fullband)
- Frame sizes from 2.5 ms to 60 ms
- Support for both constant bit rate (CBR) and variable bit rate (VBR)
- Audio bandwidth from narrowband to fullband
- Support for speech and music
- Support for mono and stereo
- Support for up to 255 channels (mult-istream frames)
- Dynamically adjustable bit rate, audio bandwidth, and frame size
- Good loss robustness and packet loss concealment (PLC)
- Floating point and fixed-point implementation

The full specification, RFC 6716, including the reference implementation is available from http://www.opus-codec.org. An up-to-date implementation of the Opus standard is available from the Opus Codec downloads page by visiting: https://www.opus-codec.org/downloads/

Typical Applications

- Building and home safety systems; Intercoms
- Smart appliances
- Walkie-talkies
- Toys
- Robots
- Any application using message playback

Resources

Feature	Option	Usage
Opus Library Flash Size	Release Build	< 143 KB
Opus Decoder RAM	Heap Size (Mono mode) Heap Size (Stereo mode)	17 KB 25 KB
Opus Decoding Performance (measured using a PIC32MX270F512L device)	16 kbps Voice 12 kbps Voice	6.8 MCPS/13.6 MIPS 4.8 MCPS/9.6 MIPS

Using the Library

This topic describes the basic architecture of the Opus Decoder Library and provides information and examples on its use.

Description

Interface Header File: `opus.h`

The interface to the Opus Decoder Library is defined in the `opus.h` header file. Any C language source (`.c`) file that uses the Opus Decoder Library should include `opus.h`.

Please refer to the What is MPLAB Harmony? section for how the Opus Decoder Library interacts with the framework.

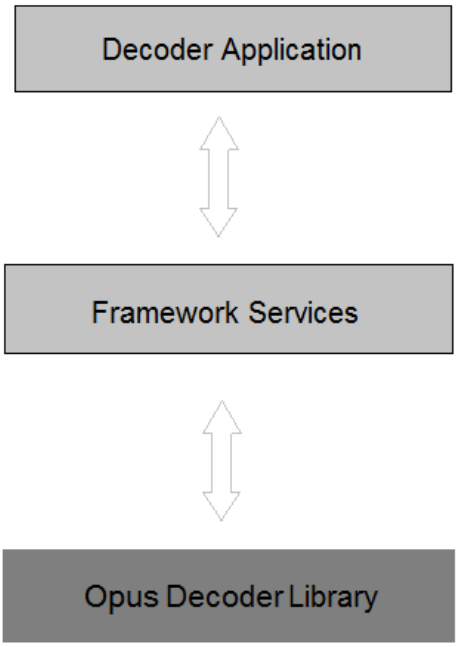
Abstraction Model

Describes the abstraction model for the Opus Decoder Library.

Description

This Opus Library is an Open Source/Free Software patent-free audio compression format designed for interactive speech and music transmission over the Internet. The MPLAB Harmony framework provides an abstraction layer to easily interact with this library. Refer to the universal_audio_decoders demonstration for reference.

Abstraction Model Diagram



Library Overview

The Library Interface routines are divided into various sub-sections, each of which addresses one of the blocks or the overall operation of the Opus Decoder Library module.

How the Library Works

This section describes how to work with the MPLAB Harmony Opus abstraction layer interface, which provides simplifier APIs for using the Opus Decoder Library.

Description

For complete documentation and how to implement Opus, visit https://www.opus-codec.org.

Code Example

The following code provides an example for initializing the Opus Decoder and decoding a packet.

```
void DECODER_Initialize(decoder_type){
  switch(decoder_type){
    case OPUS:
      APP_ERROR_MSG ret = OPUS_Initialize(appDataPtr->fileHandle);
      if(ret == APP_SUCCESS)
      {
        // setup other components,
        // for example, audio CODEC, display, etc...
      }
  }
}

void App_Task()
{
  while(1){
    while(audio is not end){
      // Read one Opus packet
      appData.nBytesRead = OPUS_DiskRead(input_ptr);
     // Decode one packet
     ret = OPUS_Decoder (input_ptr,inSize,read,output,written,outBufSize);
     if(ret == success)
     {
       // continue decoding
     }else{
      // handle decoding errors;
```

```
        }
    }
      // Clean up
      OPUS_Cleanup();
      break;
    }
  }
```

Library Interface

a) General Functions

	Name	Description
	OPUS_ARG_NONNULL	This is function OPUS_ARG_NONNULL.
	OPUS_ARG_NONNULL	This is function OPUS_ARG_NONNULL.
	opus_decoder_create	Allocates and initializes an decoder state.
	opus_decoder_destroy	Frees an OpusDecoder allocated by opus_decoder_create.
	opus_decoder_get_size	Gets the size of an OpusDecoder structure.
	opus_encoder_create	Allocates and initializes an encoder state.
	opus_encoder_destroy	Frees an OpusEncoder allocated by opus_encoder_create.
	opus_encoder_get_size	Gets the size of an OpusEncoder structure.
	isOPUSdecoder_enabled	Checks if Opus decoder is enabled by MHC configuration.
	OPUS_Cleanup	Frees the memory allocated by the Opus Decoder.
	OPUS_Decoder	Called once to decode one Opus packet.
	OPUS_DiskRead	Called once to read one Opus packet.
	OPUS_GetChannels	Returns the number of channels for this Opus audio.
	OPUS_GetSamplingRate	Returns the sampling rate of Opus audio.
	OPUS_Initialize	Initializes the Opus decoder and creates an Opus decoder state structure.

b) Data Types and Constants

	Name	Description
	OpusDecoder	Opus decoder state.
	OpusEncoder	This contains the complete state of an Opus encoder. It is position independent and can be freely copied. See opus_encoder_create,opus_encoder_init.
	OPUS_H	Opus reference implementation API
	OPUS_ERROR_MSG	Ogg Container Structures
	opusDecDcpt	This is type opusDecDcpt.
	sOggPageHdr	header of an Ogg page, full segment info included
	sOpusHeader	This is type sOpusHeader.
	sOpusPktDcpt	decoder data packet descriptor
	sOpusStreamDcpt	info needed by the stream at run-time
	DECODER_OPUS_SUPPORT_H	This is macro DECODER_OPUS_SUPPORT_H.
	OPUS_INPUT_BUFFER_SIZE	MACROS
	OPUS_MAX_FRAME_SIZE	120ms @ 48Khz
	OPUS_OUTPUT_BUFFER_SIZE	This is macro OPUS_OUTPUT_BUFFER_SIZE.

Description

This section describes the Application Programming Interface (API) functions of the Opus Decoder Library.

Refer to each section for a detailed description.

a) General Functions

OPUS_ARG_NONNULL Function

File

opus.h

C

```
OPUS_ARG_NONNULL(1);
```

Description

This is function OPUS_ARG_NONNULL.

OPUS_ARG_NONNULL Function

File

opus.h

C

```
OPUS_ARG_NONNULL(4);
```

Description

This is function OPUS_ARG_NONNULL.

opus_decoder_create Function

Allocates and initializes an decoder state.

File

opus.h

C

```
OPUS_EXPORT OPUS_WARN_UNUSED_RESULT OpusDecoder * opus_decoder_create(opus_int32 Fs, int channels, int *
error);
```

Returns

- OpusEncoder - Opus encoder state structure.

Description

This function allocates and initializes an decoder state.

Remarks

Internally, Opus stores data at 48000 Hz, so that should be the default value for Fs. However, the decoder can efficiently decode to buffers at 8, 12, 16, and 24 kHz so if for some reason the caller cannot use data at the full sample rate, or knows the compressed data does not use the full frequency range, it can request decoding at a reduced rate. Likewise, the decoder is capable of filling in either mono or interleaved stereo pcm buffers, at the caller's request.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
Fs	Sampling rate of input signal (Hz). This must be one of 8000, 12000, 16000, 24000, or 48000.
channels	Number of channels (1 or 2) in input signal.
error	(out) OPUS_OK Success or opus_errorcodes.

Function

OPUS_EXPORT OPUS_WARN_UNUSED_RESULT OpusDecoder *opus_decoder_create(opus_int32 Fs,
int channels, int *error)

opus_decoder_destroy Function

Frees an OpusDecoder allocated by opus_decoder_create.

File

opus.h

C

```
OPUS_EXPORT void opus_decoder_destroy(OpusDecoder * st);
```

Returns

None.

Description

This function frees an OpusDecoder allocated by opus_decoder_create.

Remarks

None.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
st	State to be freed.

Function

OPUS_EXPORT void opus_decoder_destroy(OpusDecoder *st)

opus_decoder_get_size Function

Gets the size of an OpusDecoder structure.

File

opus.h

C

```
OPUS_EXPORT OPUS_WARN_UNUSED_RESULT int opus_decoder_get_size(int channels);
```

Returns

- int - The size in bytes.

Description

This function gets the size of an OpusDecoder structure.

Remarks

None.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
channels	Number of channels. This value must be 1 or 2.

Function

OPUS_EXPORT OPUS_WARN_UNUSED_RESULT int opus_decoder_get_size(int channels)

opus_encoder_create Function

Allocates and initializes an encoder state.

File

opus.h

C

```
OPUS_EXPORT OPUS_WARN_UNUSED_RESULT OpusEncoder * opus_encoder_create(opus_int32 Fs, int channels, int application, int * error);
```

Returns

- OpusEncoder - Opus encoder state structure.

Description

This function allocates and initializes an encoder state. There are three coding modes:

OPUS_APPLICATION_VOIP provides the best quality at a given bit rate for voice signals. It enhances the input signal by high-pass filtering and emphasizing formants and harmonics. Optionally, t includes in-band forward error correction to protect against packet loss. Use this mode for typical VoIP applications. Because of the enhancement, even at high bit rates the output may sound different from the input.

OPUS_APPLICATION_AUDIO provides the best quality at a given bit rate for most non-voice signals like music. Use this mode for music and mixed (music/voice) content, broadcast, and applications requiring less than 15 ms of coding delay.

OPUS_APPLICATION_RESTRICTED_LOWDELAY configures a low-delay mode that disables the speech-optimized mode in exchange for slightly reduced delay. This mode can only be set on a newly initialized or freshly reset encoder because it changes the codec delay.

Remarks

Regardless of the sampling rate and the number channels selected, the Opus encoder can switch to a lower audio bandwidth or number of channels if the bit rate selected is too low. This also means that it is safe to always use 48 kHz stereo input and let the encoder optimize the encoding.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
Fs	Sampling rate of input signal (Hz). This value must be one of 8000, 12000, 16000, 24000, or 48000.
channels	Number of channels (1 or 2) in input signal.
application	Coding mode (OPUS_APPLICATION_VOIP/ OPUS_APPLICATION_AUDIO/ OPUS_APPLICATION_RESTRICTED_LOWDELAY).
error	opus_errorcodes of this function.

Function

OPUS_EXPORT OPUS_WARN_UNUSED_RESULT OpusEncoder *opus_encoder_create(opus_int32 Fs,

int channels, int application, int *error)

opus_encoder_destroy Function

Frees an OpusEncoder allocated by opus_encoder_create.

File

opus.h

C

```
OPUS_EXPORT void opus_encoder_destroy(OpusEncoder * st);
```

Returns

None.

Description

This function frees an OpusEncoder allocated by opus_encoder_create.

Remarks

None.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
st	State to be freed.

Function

OPUS_EXPORT void opus_encoder_destroy(OpusEncoder *st)

opus_encoder_get_size Function

Gets the size of an OpusEncoder structure.

File

opus.h

C

```
OPUS_EXPORT OPUS_WARN_UNUSED_RESULT int opus_encoder_get_size(int channels);
```

Returns

- int - The size in bytes.

Description

This function gets the size of an OpusEncoder structure.

Remarks

None.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
channels	Number of channels. This value must be 1 or 2.

Function

OPUS_EXPORT OPUS_WARN_UNUSED_RESULT int opus_encoder_get_size(int channels)

isOPUSdecoder_enabled Function

Checks if Opus decoder is enabled by MHC configuration.

File

opus_support.h

C

```
bool isOPUSdecoder_enabled();
```

Returns

None.

Description

The function checks if Opus decoder is enabled by MHC configuration.

Preconditions

None.

Example

```
bool opusEnabled = isOPUSdecoder_enabled ();
```

Function

bool isOPUSdecoder_enabled()

OPUS_Cleanup Function

Frees the memory allocated by the Opus Decoder.

File

opus_support.h

C

```
void OPUS_Cleanup();
```

Returns

None.

Description

This function frees the memory that was allocated by the Opus Decoder and is called when the Opus Decoder ends.

Preconditions

None.

Example

```
OPUS_Cleanup();
```

Function

void OPUS_Cleanup()

OPUS_Decoder Function

Called once to decode one Opus packet.

File

opus_support.h

C

```
OPUS_ERROR_MSG OPUS_Decoder(const uint8_t * input, uint16_t inSize, uint16_t * read, int16_t * output,
uint16_t * written, uint16_t outSize);
```

Returns

The status code of this function.

Description

This function is called once to decode one packet, this function will be called in an infinite while loop until the end of the packet is detected or the decode function returns failure value.

Preconditions

None.

Example

```
OPUS_ERROR_MSG ret = OPUS_Decoder(input, inSize, read, output, written, outSize);
```

Parameters

Parameters	Description
*input	The pointer to the input buffer, where the encoded bit stream is available
inSize	A variable of data type uint16_t indicating the number of valid bytes available in the input buffer
*read	The pointer to a variable is passed to the function. After decoding the packet the function writes the number of bytes consumed from the current frame decoder operation
*output	The pointer to the output sample buffer where the decided PCM samples are to be written
*written	The pointer to a variable is passed to the function. After decoding the frame the function writes the number of valid bytes available in the output buffer
outSize	A variable that indicates the size of output buffer, used for avoiding buffer overwritten.

Function

OPUS_ERROR_MSG OPUS_Decoder(const uint8_t *input, uint16_t inSize, uint16_t *read,
int16_t *output, uint16_t *written, uint16_t outSize)

OPUS_DiskRead Function

Called once to read one Opus packet.

File

opus_support.h

C

```
int32_t OPUS_DiskRead(uint8_t * inBuff);
```

Returns

This function returns the size of this Opus packet.

Description

This function is called once to read one Opus packet.

Preconditions

None.

Example

```
int32_t bytesRead = OPUS_DiskRead(inputBuffer);
```

Parameters

Parameters	Description
*inBuff	The pointer to the input buffer, where the Opus encoded data are to be written.

Function

int32_t OPUS_DiskRead(uint8_t *inBuff)

OPUS_GetChannels Function

Returns the number of channels for this Opus audio.

File

opus_support.h

C

```
uint8_t OPUS_GetChannels();
```

Returns

- -1 - 1 channel, mono mode
- -2 - 2 channels, stereo mode

Description

This function returns the number of channels for this Opus audio.

Preconditions

None.

Example

```
uint8_t channelNumber = OPUS_GetChannels();
```

Function

uint8_t OPUS_GetChannels()

OPUS_GetSamplingRate Function

Returns the sampling rate of Opus audio.

File

opus_support.h

C

```
int32_t OPUS_GetSamplingRate();
```

Returns

The sampling rate of Opus audio.

Description

This function returns the sampling rate of this Opus file, return value is always 48000, Opus playback sample rate should be 48000 as described in the OggOpus spec.

Preconditions

None.

Example

```
int32_t sampleRate = OPUS_GetSamplingRate();
```

Function

int32_t OPUS_GetSamplingRate()

OPUS_Initialize Function

Initializes the Opus decoder and creates an Opus decoder state structure.

File

opus_support.h

C

```
OPUS_ERROR_MSG OPUS_Initialize(const SYS_FS_HANDLE opus_file_handler);
```

Returns

The status code of this function.

Description

This function initializes the Opus decoder and creates an Opus decoder state structure.

Preconditions

None.

Example

```
OPUS_ERROR_MSG ret = OPUS_Initialize(fileHandler);
```

Parameters

Parameters	Description
opus_file_handler	The file handler of current Opus file which will be decoded.

Function

OPUS_ERROR_MSG OPUS_Initialize(const SYS_FS_HANDLE opus_file_handler)

b) Data Types and Constants

OpusDecoder Type

Opus decoder state.

File

opus.h

C

```
typedef struct OpusDecoder OpusDecoder;
```

Description

Opus decoder state.

This structure contains the complete state of an Opus decoder. It is position independent and can be freely copied. See opus_decoder_create,opus_decoder_init.

Remarks

None.

OpusEncoder Type

This contains the complete state of an Opus encoder. It is position independent and can be freely copied. See opus_encoder_create,opus_encoder_init.

File

opus.h

C

```
typedef struct OpusEncoder OpusEncoder;
```

Description

Opus encoder state

This contains the complete state of an Opus encoder. It is position independent and can be freely copied. See opus_encoder_create,opus_encoder_init.

Remarks

None.

OPUS_H Macro

Opus reference implementation API

File

opus.h

C

```
#define OPUS_H
```

File Name

opus.h

OPUS_ERROR_MSG Enumeration

File

opus_support.h

C

```
typedef enum {
  OPUS_SUCCESS = 1,
  OPUS_READ_ERROR,
  OPUS_STREAM_ERROR,
  OPUS_BUFF_ERROR,
  OPUS_STREAM_END,
  OPUS_PLAYBACK_ERROR,
  OPUS_OUT_OF_MEM_ERROR,
  OPUS_DISK_ERROR,
  OPUS_GENERAL_ERROR
} OPUS_ERROR_MSG;
```

Description

Ogg Container Structures

opusDecDcpt Structure

File

opus_support.h

C

```
typedef struct {
  int processedPktNo;
  int currPktNo;
  int nInBytes;
} opusDecDcpt;
```

Members

Members	Description
int processedPktNo;	counter of processed packets
int currPktNo;	number of the currently received packet from the stream
int nInBytes;	bytes available in the input buffer

Description

This is type opusDecDcpt.

sOggPageHdr Structure

File

opus_support.h

C

```
typedef struct {
  int32_t pageCapture;
  int8_t struct_ver;
  int8_t headerFlags;
  int64_t granulePos;
  int32_t streamNo;
  int32_t pageNo;
  int32_t pageCrc;
  uint8_t pageSegments;
  uint8_t segmentTbl[255];
} sOggPageHdr;
```

Members

Members	Description
int32_t pageCapture;	should be OGG_ID_MAGIC
int8_t struct_ver;	version of the Ogg file format. Should be 0 (RFC3533)
int8_t headerFlags;	an eOggHeaderFlags value
int64_t granulePos;	stream dependent position info
int32_t streamNo;	logical bit stream identifier
int32_t pageNo;	page sequence number
int32_t pageCrc;	CRC32 checksum of the page
uint8_t pageSegments;	number of page segments to follow
uint8_t segmentTbl[255];	actually segmentTbl[pageSegments]; contains the lace values for all segments in the page

Description

header of an Ogg page, full segment info included

sOpusHeader Structure

File

opus_support.h

C

```
typedef struct {
  char signature[8];
  uint8_t version;
  uint8_t channels;
  uint16_t preskip;
  uint32_t input_sample_rate;
  uint16_t gain;
  uint8_t channel_mapping;
  int8_t nb_streams;
  int8_t nb_coupled;
  unsigned char stream_map[255];
} sOpusHeader;
```

Members

Members	Description
char signature[8];	Magic signature: "OpusHead
uint8_t version;	Version number: 0x01 for this spec
uint8_t channels;	Number of channels: 1..255
uint16_t preskip;	This is the number of samples (at 48kHz) to discard from the decoder output when starting playback
uint32_t input_sample_rate;	Original input sample rate in Hz, this is not the sample rate to use for playback of the encoded data
uint16_t gain;	output gain in dB
uint8_t channel_mapping;	This byte indicates the order and semantic meaning of various channels encoded in each Opus packet The rest is only used if channel_mapping != 0
int8_t nb_streams;	This field indicates the total number of streams so the decoder can correctly parse the packed Opus packets inside the Ogg packet
int8_t nb_coupled;	Describes the number of streams whose decoders should be configured to produce two channels

Description

This is type sOpusHeader.

sOpusPktDcpt Structure

File

opus_support.h

C

```
typedef struct {
  int pktBytes;
  int pktSeqNo;
} sOpusPktDcpt;
```

Members

Members	Description
int pktBytes;	how many bytes in this packet
int pktSeqNo;	packet sequence number

Description

decoder data packet descriptor

sOpusStreamDcpt Structure

File

opus_support.h

C

```
typedef struct {
  sOggPageHdr pageHdr;
  int segIx;
  int pktIx;
  int prevBytes;
} sOpusStreamDcpt;
```

Members

Members	Description
sOggPageHdr pageHdr;	current page header
int segIx;	current packet segment index in the current page
int pktIx;	current packet index, 0 -> ...
int prevBytes;	previous value of the bytes in the encoded output buffer

Description

info needed by the stream at run-time

DECODER_OPUS_SUPPORT_H Macro

File

opus_support.h

C

```
#define DECODER_OPUS_SUPPORT_H
```

Description

This is macro DECODER_OPUS_SUPPORT_H.

OPUS_INPUT_BUFFER_SIZE Macro

File

opus_support.h

C

```
#define OPUS_INPUT_BUFFER_SIZE (1024*2)
```

Description

MACROS

OPUS_MAX_FRAME_SIZE Macro

File

opus_support.h

C

```
#define OPUS_MAX_FRAME_SIZE (960*6) // 120ms @ 48Khz
```

Description

120ms @ 48Khz

OPUS_OUTPUT_BUFFER_SIZE Macro

File

opus_support.h

C

```
#define OPUS_OUTPUT_BUFFER_SIZE (1024*7)
```

Description

This is macro OPUS_OUTPUT_BUFFER_SIZE.

Files

Files

Name	Description

Speex Decoder Library

This section describes the Speex Decoder Library.

Introduction

Introduces the Speex Decoder Library.

Description

Speex is a Code Excited Linear Prediction (CELP) based open source patent-free audio compression format designed for speech.

Speex Features

- Fixed-point implementation
- Narrowband (8 kHz) and wideband (16 kHz) bit-streams
- Wide range of bit-rates available (from 2.15 kbps to 44 kbps)
- Perceptual enhancement (attempts to reduce the perception of the noise/distortion produced by the encoding/decoding process. In most cases, perceptual enhancement brings the sound further from the original objectively (e.g. considering only SNR), but in the end it still sounds better (subjective improvement)

Visit www.speex.org for further details and complete documentation

Typical Applications

- Answering machines; Voice recorders
- Building and home safety systems; Intercoms
- Smart appliances
- Walkie-talkies; Toys and robots
- Any application using message playback

Resources

Feature	Option	Usage
Speex Library Flash Size	Release Build	< 60 KB
	Debug Build	< 92 KB
Speex Decoder RAM	Dynamic	4 KB
	Stack	2 KB
Speex Decoding Performance	Narrow Mode	280 KB/sec

Using the Library

This topic describes the basic architecture of the Speex Decoder Library and provides information and examples on its use.

Description

Interface Header File: `speex.h`

The interface to the Speex Decoder Library is defined in the `speex.h` header file. Any C language source (`.c`) file that uses the Speex Decoder Library should include `speex.h`.

Please refer to the What is MPLAB Harmony? section for how the Speex Decoder Library interacts with the framework.

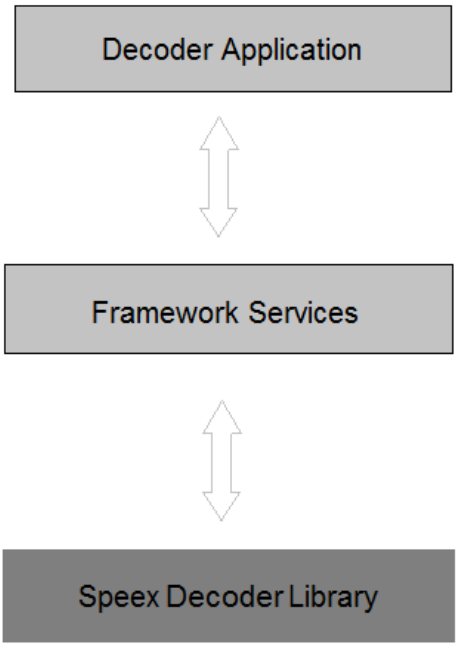
Abstraction Model

Describes the abstraction model for the Speex Decoder Library.

Description

This Speex Library is an Open Source/Free Software patent-free audio compression format designed for speech. The MPLAB Harmony framework provides an abstraction layer to easily interact with this library. Refer to the universal_audio_decoders demonstration for reference.

Abstraction Model Diagram



Library Overview

The Library Interface routines are divided into various sub-sections, each of which addresses one of the blocks or the overall operation of the Speex Decoder Library module.

How the Library Works

This section describes how to work with the MPLAB Harmony Speex abstraction layer interface, which provides simplifier APIs for using the Speex Decoder Library.

Description

For complete documentation and how to implement Speex, visit www.speex.org.

Code Example

The following code provides an example for initializing the Speex Decoder Library and reading and decoding one Speex packet.

```
void Decoder_Initialize(decoder_type){
    switch (decoder_type){
        case SPEEX:
            ret = SPEEX_Initialize();
            if(ret == success)
            {
                // start decoding
            }
    }
}

void App_Task()
{
    while(1){
        while(audio is not end){
            // Read one Speex packet
            appData.nBytesRead = SPEEX_DiskRead(input_ptr);

            // Decode one packet
            ret = SPEEX_Decoder (input_ptr,inSize,read,output,written);
            if(ret == success)
            {
                // continue decoding
            }else{
                // handle decoding errors;
```

```
            }
        }
        // Clean up
        SPEEX_Cleanup();
    }

}
```

Library Interface

a) General Functions

	Name	Description
	isSPEEXdecoder_enabled	Indicates whether the Speex Decoder is enabled.
	SPEEX_Cleanup	Frees the memory allocated by the Speex Decoder.
	SPEEX_Decoder	Called once to decode one packet.
	SPEEX_DiskRead	Reads one packet of Ogg-Speex audio.
	SPEEX_GetBitrate	Returns the bit rate of Ogg-Speex audio.
	SPEEX_GetSamplingRate	Returns the sampling rate of Ogg-Speex audio.
	SPEEX_Initialize	Reads the Speex header page and initializes the Speex Decoder state.

b) Data Types and Constants

	Name	Description
	eSpxFlags	Speex flags
	pProgressFnc	progress display function
	progressDcpt	encoder/decoder progress activity descriptor
	sOggPageSegHdr	header of an Ogg page, full segment info included
	SPEEX_ERROR_MSG	This is type SPEEX_ERROR_MSG.
	spxCdcDcpt	Speex codec descriptor common part of encoder/decoder since we don't take the trouble to have a type to distinguish between descriptors, we need to have a common part
	spxDecDcpt	This is type spxDecDcpt.
	sSpeexHeader	the Speex header, the first page in the Speex stream
	sSpxPktDcpt	decoder data packet descriptor
	sSpxRunDcpt	run-time Speex descriptor obtained from the stream with AudioStreamGetRunInfo()
	sSpxStreamDcpt	info needed by the stream at run-time
	OGG_ID_SPEEX	The Speex packet ID
	SPEEX_INPUT_BUFFER_SIZE	This is macro SPEEX_INPUT_BUFFER_SIZE.
	SPEEX_OUTPUT_BUFFER_SIZE	This is macro SPEEX_OUTPUT_BUFFER_SIZE.
	SPEEX_STRING_LENGTH	The size of the Speex string
	SPEEX_SUPPORT_H	This is macro SPEEX_SUPPORT_H.
	SPEEX_VENDOR_STR	comment in Ogg header
	SPEEX_VERSION	The Speex version string
	SPEEX_VERSION_ID	Version identifier
	SPEEX_VERSION_LENGTH	The size of the Speex version string
	SPX_CODEC_BUFF_DIV	20% is sufficient
	SPX_CODEC_BUFF_MUL	Values to adjust the average decoder buffer size

Description

This section describes the Application Programming Interface (API) functions of the Speex Decoder Library.

Refer to each section for a detailed description.

a) General Functions

isSPEEXdecoder_enabled Function

Indicates whether the Speex Decoder is enabled.

File

speex.h

C

```
bool isSPEEXdecoder_enabled();
```

Returns

This function returns a Boolean value.

- true - Indicates that the Speex Decoder is enabled
- false - Indicates that the Speex Decoder is disabled

Description

This function indicates whether the Speex Decoder is enabled.

Preconditions

None.

Example

```
appData.SPEEX_decoder_enabled   = isSPEEXdecoder_enabled();
```

Function

bool isSPEEXdecoder_enabled()

SPEEX_Cleanup Function

Frees the memory allocated by the Speex Decoder.

File

speex.h

C

```
void SPEEX_Cleanup();
```

Returns

None.

Description

This function frees the memory that was allocated by the Speex Decoder and is called when the Speex Decoder ends.

Preconditions

None.

Example

```
SPEEX_Cleanup();
```

Function

void SPEEX_Cleanup()

SPEEX_Decoder Function

Called once to decode one packet.

File

speex.h

C

```
SPEEX_ERROR_MSG SPEEX_Decoder(uint8_t * input, uint16_t inSize, uint16_t * read, int16_t * output, uint16_t
* written);
```

Returns

This function returns an enum value.

- SPEEX_SUCCESS - Indicates success
- SPEEX_READ_ERROR - Indicates read failure
- SPEEX_STREAM_ERROR - Indicates Ogg-Speex parsing error
- SPEEX_STREAM_END - Indicates end of the stream

Description

This function is called once to decode one frame. This function will be called in an infinite while loop until the end of the frame is detected or the decode function returns failure value.

Preconditions

None.

Example

```
res = SPEEX_Decoder (input,inSize,read,output,written);
```

Parameters

Parameters	Description
*input	The pointer to the input buffer , where the encoded bit stream is available
inSize	A variable of data type uint16_t indicating the number of valid bytes available in the input buffer
*read	The pointer to a variable is passed to the function. After decoding the frame the function writes the number of bytes consumed from the current frame decoder operation.
*output	The pointer to the output sample buffer where the decided PCM samples are to be written,
*written	The pointer to a variable is passed to the function. After decoding the frame the function writes the number of valid bytes available in the output buffer.

Function

SPEEX_ERROR_MSG SPEEX_Decoder(uint8_t *input, uint16_t inSize, uint16_t *read,
int16_t *output, uint16_t *written);

SPEEX_DiskRead Function

Reads one packet of Ogg-Speex audio.

File

speex.h

C

```
int32_t SPEEX_DiskRead(uint8_t * inBuff);
```

Returns

This function returns the size of reading bytes.

Description

This function is called once to read one packet.

Preconditions

None.

Example

```
appData.nBytesRead = SPEEX_DiskRead(ptr);
```

Parameters

Parameters	Description
*inBuff	The pointer to the input buffer, where one packet data is to to be written

Function

int32_t SPEEX_DiskRead(uint8_t *inBuff)

SPEEX_GetBitrate Function

Returns the bit rate of Ogg-Speex audio.

File

speex.h

C

```
int32_t SPEEX_GetBitrate();
```

Returns

This function returns the bit rate.

Description

This function returns the bit rate rate of Ogg-Speex audio.

Preconditions

This function can only be called after the SPEEX_Initialize function.

Example

```
decoderBitrate = SPEEX_GetBitrate()/1000;
```

Function

int32_t SPEEX_GetBitrate()

SPEEX_GetSamplingRate Function

Returns the sampling rate of Ogg-Speex audio.

File

speex.h

C

```
int32_t SPEEX_GetSamplingRate();
```

Returns

This function returns the sampling rate.

Description

This function returns the sampling rate of Ogg-Speex audio.

Preconditions

This function can only be called after the SPEEX_Initialize function.

Example

```
sampling_frequency = SPEEX_GetSamplingRate();
```

Function

int32_t SPEEX_GetSamplingRate()

SPEEX_Initialize Function

Reads the Speex header page and initializes the Speex Decoder state.

File

speex.h

C

```
SPEEX_ERROR_MSG SPEEX_Initialize(uintptr_t spx_file_handle);
```

Returns

This function returns an enum value.

- SPEEX_SUCCESS - Indicates success
- SPEEX_READ_ERROR - Indicates read failure
- SPEEX_STREAM_ERROR - Indicates Ogg-Speex parsing error
- SPEEX_STREAM_END - Indicates end of the stream

Description

The function internally calls the Speex Codec Decoder initialization function. The function is called only once before initiating the decoding process.

Preconditions

Call SPEEX_Cleanup function before this function for safety.

Example

```
APP_ERROR_MSG res = SPEEX_Initialize(spx_file_handle);
```

Function

SPEEX_ERROR_MSG SPEEX_Initialize(uintptr_t spx_file_handle);

b) Data Types and Constants

eSpxFlags Enumeration

File

speex.h

C

```
typedef enum {
  SPX_FLAG_WB = 0x1,
  SPX_FLAG_VBR = 0x2,
  SPX_FLAG_BRATE_OVR = 0x4,
  SPX_FLAG_PRCPT_ENH = 0x8
} eSpxFlags;
```

Members

Members	Description
SPX_FLAG_WB = 0x1	wide/narrow band
SPX_FLAG_VBR = 0x2	VBR
SPX_FLAG_BRATE_OVR = 0x4	bit rate setting overrides the encoder quality
SPX_FLAG_PRCPT_ENH = 0x8	decoder perceptual enhancement on/off

Description

Speex flags

Remarks

at most 8 flags are supported right now!

pProgressFnc Type

File

speex.h

C

```
typedef void (* pProgressFnc)(int nBytes);
```

Description

progress display function

progressDcpt Structure

File

speex.h

C

```
typedef struct {
  int progressStep;
  int progressCnt;
  pProgressFnc progressFnc;
} progressDcpt;
```

Members

Members	Description
int progressStep;	no of bytes to process before calling the progress callback
int progressCnt;	current counter
pProgressFnc progressFnc;	progress callback

Description

encoder/decoder progress activity descriptor

sOggPageSegHdr Structure

File

speex.h

C

```
typedef struct {
  int32_t pageCapture;
  int8_t struct_ver;
  int8_t headerFlags;
  int64_t granulePos;
  int32_t streamNo;
  int32_t pageNo;
  int32_t pageCrc;
  int8_t pageSegments;
  uint8_t segmentTbl[255];
} sOggPageSegHdr;
```

Members

Members	Description
int32_t pageCapture;	should be OGG_ID_MAGIC
int8_t struct_ver;	version of the Ogg file format. Should be 0 (RFC3533)
int8_t headerFlags;	an eOggHeaderFlags value
int64_t granulePos;	stream dependent position info
int32_t streamNo;	logical bit stream identifier
int32_t pageNo;	page sequence number
int32_t pageCrc;	CRC32 checksum of the page
int8_t pageSegments;	number of page segments to follow
uint8_t segmentTbl[255];	actually segmentTbl[pageSegments]; contains the lace values for all segments in the page

Description

header of an Ogg page, full segment info included

SPEEX_ERROR_MSG Enumeration

File

speex.h

C

```
typedef enum {
  SPEEX_SUCCESS = 1,
  SPEEX_READ_ERROR,
  SPEEX_STREAM_ERROR,
  SPEEX_BUFF_ERROR,
  SPEEX_STREAM_END,
  SPEEX_PLAYBACK_ERROR,
  SPEEX_OUT_OF_MEM_ERROR,
  SPEEX_DISK_ERROR,
  SPEEX_GENERAL_ERROR
} SPEEX_ERROR_MSG;
```

Description

This is type SPEEX_ERROR_MSG.

spxCdcDcpt Structure

File

speex.h

C

```
typedef struct {
  SpeexBits spxBits;
  void* spxState;
  int inBuffSize;
  int outBuffSize;
  int nOutBytes;
} spxCdcDcpt;
```

Members

Members	Description
SpeexBits spxBits;	codec control structure
void* spxState;	codec state
int inBuffSize;	input buffer size
int nOutBytes;	bytes available in the output buffer

Description

Speex codec descriptor common part of encoder/decoder since we don't take the trouble to have a type to distinguish between descriptors, we need to have a common part

spxDecDcpt Structure

File

speex.h

C

```
typedef struct {
  spxCdcDcpt cdc;
  int framesPerPacket;
  int frameSize;
  int processedPktNo;
  int currPktNo;
  int nInBytes;
  int outFrameSize;
} spxDecDcpt;
```

Members

Members	Description
spxCdcDcpt cdc;	common part
int framesPerPacket;	frames per Ogg packet
int frameSize;	size of the frames
int processedPktNo;	counter of processed packets

int currPktNo;	number of the currently received packet from the stream
int nInBytes;	bytes available in the input buffer

Description

This is type spxDecDcpt.

sSpeexHeader Structure

File

speex.h

C

```
typedef struct {
  char speexString[SPEEX_STRING_LENGTH];
  char speexVer[SPEEX_VERSION_LENGTH];
  int32_t speexVerId;
  int32_t headerSize;
  int32_t sampleRate;
  int32_t wBand;
  int32_t modeBitsStreamVer;
  int32_t nChannels;
  int32_t bitRate;
  int32_t frameSamples;
  int32_t vbr;
  int32_t framesPerPacket;
  int32_t extraHeaders;
  int32_t reserved1;
  int32_t reserved2;
} sSpeexHeader;
```

Members

Members	Description
char speexString[SPEEX_STRING_LENGTH];	identify the Speex bit-stream: OGG_ID_SPEEX
char speexVer[SPEEX_VERSION_LENGTH];	Speex version that encoded the file
int32_t speexVerId;	Speex version (for checking compatibility)
int32_t headerSize;	sizeof(SpeexHeader)
int32_t sampleRate;	Sampling rate used
int32_t wBand;	0 for narrowband, 1 for wideband
int32_t modeBitsStreamVer;	Version ID of the bit-stream
int32_t nChannels;	Number of channels encoded
int32_t bitRate;	Bit-rate used
int32_t frameSamples;	Size of frames, samples
int32_t vbr;	1 for a VBR encoding, 0 otherwise
int32_t framesPerPacket;	Number of frames stored per Ogg packet
int32_t extraHeaders;	Number of additional headers after the comments
int32_t reserved1;	Reserved for future use, 0
int32_t reserved2;	Reserved for future use, 0

Description

the Speex header, the first page in the Speex stream

sSpxPktDcpt Structure

File

speex.h

C

```
typedef struct {
  int pktBytes;
  int pktSeqNo;
} sSpxPktDcpt;
```

Members

Members	Description
int pktBytes;	how many bytes in this packet
int pktSeqNo;	packet sequence number

Description

decoder data packet descriptor

sSpxRunDcpt Structure

File

speex.h

C

```
typedef struct {
  int streamNo;
  int streamVer;
  unsigned short frameSamples;
  unsigned short bitRate;
  unsigned char framesPerPacket;
  unsigned char packetsPerPage;
  unsigned char complexity;
  unsigned char qualFactor;
  char spxFlags;
  char reserved[3];
} sSpxRunDcpt;
```

Members

Members	Description
int streamNo;	stream number inside the container
int streamVer;	stream version
unsigned short frameSamples;	Size of frames, in samples
unsigned short bitRate;	encoder bit rate
unsigned char framesPerPacket;	Number of frames stored per Ogg packet, <10
unsigned char packetsPerPage;	number of packets in an Ogg page <= 255
unsigned char complexity;	encoder complexity 1-10
unsigned char qualFactor;	encoder quality factor 1-10
char spxFlags;	eSpxFlags: run time flags, wideband, VBR
char reserved[3];	future expansion/padding

Description

run-time Speex descriptor obtained from the stream with AudioStreamGetRunInfo()

sSpxStreamDcpt Structure

File

speex.h

C

```
typedef struct {
  sSpxRunDcpt runDcpt;
  sOggPageSegHdr pageHdr;
  int segIx;
  int pktIx;
  int prevBytes;
} sSpxStreamDcpt;
```

Members

Members	Description
sSpxRunDcpt runDcpt;	global info

sOggPageSegHdr pageHdr;	current page header
int segIx;	current packet segment index in the current page
int pktIx;	current packet index, 0 -> ...
int prevBytes;	previous value of the bytes in the encoded output buffer

Description

info needed by the stream at run-time

OGG_ID_SPEEX Macro

File

speex.h

C

```
#define OGG_ID_SPEEX "Speex   "    // The Speex packet ID
```

Description

The Speex packet ID

SPEEX_INPUT_BUFFER_SIZE Macro

File

speex.h

C

```
#define SPEEX_INPUT_BUFFER_SIZE 1024
```

Description

This is macro SPEEX_INPUT_BUFFER_SIZE.

SPEEX_OUTPUT_BUFFER_SIZE Macro

File

speex.h

C

```
#define SPEEX_OUTPUT_BUFFER_SIZE 1024*7
```

Description

This is macro SPEEX_OUTPUT_BUFFER_SIZE.

SPEEX_STRING_LENGTH Macro

File

speex.h

C

```
#define SPEEX_STRING_LENGTH 8           // The size of the Speex string
```

Description

The size of the Speex string

SPEEX_SUPPORT_H Macro

File

speex.h

C

```
#define SPEEX_SUPPORT_H
```

Description

This is macro SPEEX_SUPPORT_H.

SPEEX_VENDOR_STR Macro

File

speex.h

C

```
#define SPEEX_VENDOR_STR "Encoded by Microchip Audio Library ver 1.0"    // comment in Ogg header
```

Description

comment in Ogg header

SPEEX_VERSION Macro

File

speex.h

C

```
#define SPEEX_VERSION "speex-1.2beta3"    // The Speex version string
```

Description

The Speex version string

SPEEX_VERSION_ID Macro

File

speex.h

C

```
#define SPEEX_VERSION_ID 1                    // Version identifier
```

Description

Version identifier

SPEEX_VERSION_LENGTH Macro

File

speex.h

C

```
#define SPEEX_VERSION_LENGTH 20               // The size of the Speex version string
```

Description

The size of the Speex version string

SPX_CODEC_BUFF_DIV Macro

File

speex.h

C

```
#define SPX_CODEC_BUFF_DIV 5    // 20% is sufficient
```

Description

20% is sufficient

SPX_CODEC_BUFF_MUL Macro

File

speex.h

C

```
#define SPX_CODEC_BUFF_MUL 6    // Values to adjust the average decoder buffer size
```

Description

Values to adjust the average decoder buffer size

Files

Files

Name	Description
speex.h	This file is an abstraction layer of the Speex Library.

Description

This section lists the source and header files used by the Speex Decoder Library.

speex.h

This file is an abstraction layer of the Speex Library.

Enumerations

	Name	Description
	eSpxFlags	Speex flags
	SPEEX_ERROR_MSG	This is type SPEEX_ERROR_MSG.

Functions

	Name	Description
	isSPEEXdecoder_enabled	Indicates whether the Speex Decoder is enabled.
	SPEEX_Cleanup	Frees the memory allocated by the Speex Decoder.
	SPEEX_Decoder	Called once to decode one packet.
	SPEEX_DiskRead	Reads one packet of Ogg-Speex audio.
	SPEEX_GetBitrate	Returns the bit rate of Ogg-Speex audio.
	SPEEX_GetSamplingRate	Returns the sampling rate of Ogg-Speex audio.
	SPEEX_Initialize	Reads the Speex header page and initializes the Speex Decoder state.

Macros

	Name	Description
	OGG_ID_SPEEX	The Speex packet ID
	SPEEX_INPUT_BUFFER_SIZE	This is macro SPEEX_INPUT_BUFFER_SIZE.
	SPEEX_OUTPUT_BUFFER_SIZE	This is macro SPEEX_OUTPUT_BUFFER_SIZE.
	SPEEX_STRING_LENGTH	The size of the Speex string
	SPEEX_SUPPORT_H	This is macro SPEEX_SUPPORT_H.
	SPEEX_VENDOR_STR	comment in Ogg header
	SPEEX_VERSION	The Speex version string
	SPEEX_VERSION_ID	Version identifier
	SPEEX_VERSION_LENGTH	The size of the Speex version string
	SPX_CODEC_BUFF_DIV	20% is sufficient
	SPX_CODEC_BUFF_MUL	Values to adjust the average decoder buffer size

Structures

	Name	Description
	progressDcpt	encoder/decoder progress activity descriptor
	sOggPageSegHdr	header of an Ogg page, full segment info included
	spxCdcDcpt	Speex codec descriptor common part of encoder/decoder since we don't take the trouble to have a type to distinguish between descriptors, we need to have a common part
	spxDecDcpt	This is type spxDecDcpt.
	sSpeexHeader	the Speex header, the first page in the Speex stream
	sSpxPktDcpt	decoder data packet descriptor
	sSpxRunDcpt	run-time Speex descriptor obtained from the stream with AudioStreamGetRunInfo()
	sSpxStreamDcpt	info needed by the stream at run-time

Types

	Name	Description
	pProgressFnc	progress display function

Microchip Technology Inc.

WMA Decoder Library

This section describes the WMA Decoder Library.

Introduction

The WMA Decoder Library is available for the PIC32 family of microcontrollers.

Description

The WMA Decoder Library is a premium product and is not included in the standard release of MPLAB Harmony and must be purchased separately. The library is only available in binary format, and is only available to Microsoft Windows Media Component Licensees. For licensing information, please visit: http://windows.microsoft.com/en-us/windows/windowsmedia-components-licensing. Refer to the Microchip Premium MPLAB Harmony Audio web page (www.microchip.com/pic32harmonypremiumaudio) for additional information.

Windows Media Audio (WMA) developed by Microsoft, is a format enabling the storage of digital audio using the Lossy compression algorithm.

The Microchip WMA Decoder can decode audio signals sampled at up to 48 kHz with up to two discrete channels. The WMA Decoder also supports VBR and CBR encoded audio stream. In most circumstances, `.wma` files are contained in Advance Systems Format (ASF), which is supported by the WMA Decoder. The WMA Decoder library is optimized (C/ASM) and is available for all PIC32MX devices.

Assembly Language Issue

There is an assembly language issue in the WMA Decoder Library that misaligns the stack pointer. Contrary to the MIPS programming specification, this error is benign except when the application is built for a device with a hardware Floating Point Unit (FPU), such as the PIC32MZ EF family of devices. In this case, the sub-routine context-saving operations will produce an exception and stop the application. A work around exists for this issue, which involves disabling FPU context-saving for Interrupt Service Routines (ISRs).

The work around is to convert all ISRs from:

```
void __ISR(vector,ipl) MyInterruptHandler(void)
```

and change them to:

```
void __attribute__((vector),interrupt(ipl),nomips16,no_fpu)) MyInterruptHandler(void)
```

where, `vector` and `ipl` are replaced with the actual interrupt vector and interrupt priority level.

An example of this work around can be found in the universal_audio_decoders demonstration.

So as long as no FPU operations occur in ISRs and the routines are called by ISRs, this work around will prevent the misaligned stack pointer from causing an exception. If FPU operations result from an ISR with no_fpu enabled, a general exception will result.

Using the Library

This topic describes the basic architecture of the WMA Decoder Library and provides information and examples on its use.

Description

Interface Header File: `decoder_wma.h`

The interface to the WMA Decoder Library is defined in the `decoder_wma.h` header file. Any C language source (`.c`) file that uses the MP3 Decoder Library should include `decoder_wma.h`.

Please refer to the What is MPLAB Harmony? section for how the WMA Decoder Library interacts with the framework.

Library Overview

The Library Interface routines are divided into various sub-sections, each of which addresses one of the blocks or the overall operation of the WMA Decoder Library module.

Library Interface

a) General Functions

	Name	Description
	stpnr	This is function stpnr.
	WMA_Decode	This function is called once to decode one or multiple frames.
	WMA_Decoder_Init	This function reads the pointers and clears the structure.
	WMA_FileGetPCM	Extracts the 16-bit samples.
	WMA_GetEncodeData	Retrieves encoded data from the WAVE file header.
	WMA_GetStateSize	This function requires the required memory for the WMA Decoder state.
	WMA_PacketData	Extracts the encoded bitstream from the packet's payload.
	WMA_PacketDatasize	This function determines the packet size for decoding.
	WMA_Parser	Parses the WMA data.
	WMA_Decoder	This is function WMA_Decoder.
	WMA_SamplingFrequency_Get	This is function WMA_SamplingFrequency_Get.
	WMA_Header_Current_Offset	This function returns the amount of data used and updates the pointer.
	WMA_WaveHdr	Generates the .wav file header and fills the WavBuf array.
	WMA_FileDecodeClr	Clears all of the allocated memory.
	WMA_FreeMemory	This is function WMA_FreeMemory.
	isWMAdecoder_enabled	This is function isWMAdecoder_enabled.
	WMA_BitRate_Get	This is function WMA_BitRate_Get.
	WMA_GetHeaderPacketOffset	This is function WMA_GetHeaderPacketOffset.
	WMA_Initialize	This is function WMA_Initialize.
	WMA_RegisterAppCallback	This is function WMA_RegisterAppCallback.
	WMA_GetChannels	This is function WMA_GetChannels.

b) Data Types and Constants

	Name	Description
	SYS_DEBUG_BUFFER_DMA_READY	This should be defined in system_config.h. It is added here as a build safe-guard.
	WMA_DECODER_STATES	This is type WMA_DECODER_STATES.
	WMA_ERROR_COUNT_MAX	This is macro WMA_ERROR_COUNT_MAX.
	WMA_H	This is macro WMA_H.
	Chnl_Info	This is type Chnl_Info.
	WMA_Status	This is type WMA_Status.
	BYTES_PER_SAMPLE	This is macro BYTES_PER_SAMPLE.
	MAX_SAMPLES	in Bytes #define WAVE_HEADER_SIZE 44 //in Bytes
	WMA_MAX_INPUT_BUFFER_SIZE	in Bytes
	GetReadBytesInAppData	This is type GetReadBytesInAppData.
	SetReadBytesReadFlagInAppData	This is type SetReadBytesReadFlagInAppData.

Description

This section describes the Application Programming Interface (API) functions of the WMA Decoder Library.

Refer to each section for a detailed description.

a) General Functions

stpnr Function

File

decoder_wma.h

C

```
static __inline int stpnr(int x);
```

Description

This is function stpnr.

WMA_Decode Function

This function is called once to decode one or multiple frames.

File

decoder_wma.h

C

```
int32_t WMA_Decode(void* paudec, int* pcSamplesReady, int* paudecState);
```

Returns

This function returns the error type.

Description

This function is called once to decode one or multiple frames. This function will be called in an infinite while loop until the end-of-frame is detected or the decode function returns an error value. Unlike most speech applications, where the encoded data for each frame is deterministic, this is not the case in audio applications. Therefore, the application provides a chunk of input packet data (usually more than what is necessary for a single frame). The decoder parses them and decodes with a portion of the data. The decode function passes the information of how many bytes of data were used to the application so that the application saves the remaining data and presents to the decoder for the subsequent frame.

Remarks

None.

Preconditions

None.

Example

```
Int res;
res = WMA_Decode(WMA_State, &nDecodedSamples, &chnlInfo.WMAState);
```

Parameters

Parameters	Description
paudec	The pointer to the WMA Decoder handler
pcSamplesReady	The pointer to the number of decoded samples
paudecState	The pointer to the state of the decoder

Function

int32_t WMA_Decode (void* paudec, int* pcSamplesReady, int* paudecState);

WMA_Decoder_Init Function

This function reads the pointers and clears the structure.

File

decoder_wma.h

C

```
WMA_Status WMA_Decoder_Init(void* pState, Chnl_Info * chnl, char * WMADataBuf);
```

Returns

This function returns the error result.

Description

This function views the received pointer as structure pointer and clears the entire structure. Subsequently, it initializes the selective variables with the default values. This function is called only once for each file before starting the decoding of an entire packet.

Preconditions

None.

Example

```
void *WMA_State;
Chnl_Info chnlInfo;
WMA_Status WMA_status;
char WMA_InBuf[MAX_INPUT_BUF];

WMA_Status = WMA_Decoder_Init (WMA_State, &chnlInfo, WMA_InBuf);
```

Parameters

Parameters	Description
pState	The pointer to the allocated state memory.
*chnl	Holds the essential audio file information and state of the file
WMADataBuf	The pointer to the input buffer

Function

WMA_Status WMA_Decoder_Init (void* pState, Chnl_Info *chnl, char * WMADataBuf);

WMA_FileGetPCM Function

Extracts the 16-bit samples.

File

decoder_wma.h

C

```
uint32_t WMA_FileGetPCM(void * pInt, short * pCh, uint32_t max_nsamples);
```

Returns

This function returns the number of samples.

Description

This function is used to extract the 16-bit samples.

Preconditions

None.

Example

```
nDecodedSamples = WMA_FileGetPCM (WMA_State, WMA_OutBuf, nDecodedSamples);
```

Parameters

Parameters	Description
*pInt	The pointer to the WMA handler
*pCh	The pointer to the output data
max_nsamples	Total number of samples

Function

uint32_t WMA_FileGetPCM (void *pInt, short *pCh, uint32_t max_nsamples);

WMA_GetEncodeData Function

Retrieves encoded data from the WAVE file header.

File

decoder_wma.h

C

```
void WMA_GetEncodeData(void * fWMA, char * pData, int pDtSz);
```

Returns

None.

Description

The function is used to retrieve the encoded data from the WAVE file header.

Preconditions

None.

Parameters

Parameters	Description
*fWMA	The WMA file
*pData	The pointer to the data
pDtSz	The pointer to the data size

Function

void WMA_GetEncodeData(void *fWMA, char *pData, int pDtSz);

WMA_GetStateSize Function

This function requires the required memory for the WMA Decoder state.

File

decoder_wma.h

C

```
uint32_t WMA_GetStateSize();
```

Returns

This function returns the size of the WMA Decoder state structure in bytes.

Description

Based on the return value, the application allocates the required memory for the WMA Decoder state. This function is called only once for each channel before the channel is initialized. If dynamic memory allocation (malloc) is not needed, it is not necessary to call this function and the WMA Decoder state buffer will be statically defined at compile time with the size of the WMA Decoder state structure (constant).

Preconditions

None.

Example

```
unsigned long nDecodedSamples;
nDecodedSamples = WMA_GetStateSize();
```

Function

uint32_t WMA_GetStateSize(void);

WMA_PacketData Function

Extracts the encoded bitstream from the packet's payload.

File

decoder_wma.h

C

```
int WMA_PacketData(void * p, char * InBuf, int residue);
```

Returns

None.

Description

This function is used to extract the encoded bitstream from the packet’s payload. This function is repeated until there are no bytes to decode.

Preconditions

None.

Example

```
void *WMA_State;
Chnl_Info chnlInfo;
Int res, residue;
res = WMA_PacketData(WMA_State,WMA_InBuf,residue);
```

Parameters

Parameters	Description
*p	The pointer to the WMA handler
InBuf	The pointer to the input buffer
residue	The pointer to the input file

Function

int WMA_PacketData(void *p, char * InBuf, int residue);

WMA_PacketDatasize Function

This function determines the packet size for decoding.

File

decoder_wma.h

C

```
int32_t WMA_PacketDatasize(void * p);
```

Returns

This function returns the packet data size.

Description

This function determines the packet size for decoding and sends request to the main program to read the number of bytes data for decoding. This function is called repetitively until there are no bytes to decode.

Preconditions

None.

Example

```
void *WMA_State;
int packetdatasize;
packetdatasize = WMA_PacketDatasize(WMA_State);
```

Parameters

Parameters	Description
*p	The pointer to the WMA handler

Function

int32_t WMA_PacketDatasize(void *p);

WMA_Parser Function

Parses the WMA data.

File

decoder_wma.h

C

```
int WMA_Parser(void * pInt);
```

Returns

None.

Description

This function is used to parse the WMA data.

Preconditions

None.

Parameters

Parameters	Description
*pInt	The pointer to the WMA handler

Function

int WMA_Parser(void *pInt);

WMA_Decoder Function

File

wma.h

C

```
int16_t WMA_Decoder(uint8_t * input, uint16_t inSize, uint16_t * read, int16_t * output, uint16_t *
written);
```

Description

This is function WMA_Decoder.

WMA_SamplingFrequency_Get Function

File

wma.h

C

```
int32_t WMA_SamplingFrequency_Get();
```

Description

This is function WMA_SamplingFrequency_Get.

WMA_Header_Current_Offset Function

This function returns the amount of data used and updates the pointer.

File

decoder_wma.h

C

```
uint32_t WMA_Header_Current_Offset(void * pInt);
```

Returns

This function returns the amount of data used.

Description

This function returns the amount of data used and updates the file pointer location to read input data from the current offset after parsing the header information. This function is called only once for each file before starting the decoding of entire packets.

Preconditions

None.

Example

```
Uint32_t packet_offset;
packet_offset = WMA_Header_Current_Offset(WMA_State);
```

Parameters

Parameters	Description
*pInt	The pointer to the WMA Handler

Function

uint32_t WMA_Header_Current_Offset(tWMAFileStateInternal *pInt)

WMA_WaveHdr Function

Generates the .wav file header and fills the WavBuf array.

File

decoder_wma.h

C

```
void WMA_WaveHdr(char * WavHdr, void * hWMA, uint32_t DataLen);
```

Returns

None.

Description

For wave file generation, the application will leave 44 bytes of free space at the beginning of the file and begins writing decoded samples from the 45th byte location onwards. Once the entire data had been decoded, this function is called. The function generates the .wav file header and fills the WavBuf array. The application copies the contents of this buffer into the reserved place available at the beginning of the file.

Preconditions

None.

Example

```
WMA_WaveHdr(WavBuf, WMA_State, DataLen);
```

Parameters

Parameters	Description
*WavHdr	The pointer to the header buffer of a WAVE file. The buffer size is 44 bytes.
*hWMA	The pointer to the WMA Handler
DataLen	Integer variable indicating the total number of samples written into the file

Function

void WMA_WaveHdr(char *WavHdr, void *hWMA, uint32_t DataLen);

WMA_FileDecodeClr Function

Clears all of the allocated memory.

File

decoder_wma.h

C

```
void WMA_FileDecodeClr(void* WMA_State);
```

Returns

None.

Description

This function is used to clear all of the allocated WMA state memory.

Preconditions

None.

Function

void WMA_FileDecodeClr(void* WMA_State);

WMA_FreeMemory Function

File

wma.h

C

```
void WMA_FreeMemory();
```

Description

This is function WMA_FreeMemory.

isWMAdecoder_enabled Function

File

wma.h

C

```
bool isWMAdecoder_enabled();
```

Description

This is function isWMAdecoder_enabled.

WMA_BitRate_Get Function

File

wma.h

C

```
int32_t WMA_BitRate_Get();
```

Description

This is function WMA_BitRate_Get.

WMA_GetHeaderPacketOffset Function

File

wma.h

C

```
int32_t WMA_GetHeaderPacketOffset();
```

Description

This is function WMA_GetHeaderPacketOffset.

WMA_Initialize Function

File

wma.h

C

```
void WMA_Initialize(SYS_FS_HANDLE wmaFilehandle, uint32_t inputBufferSize);
```

Description

This is function WMA_Initialize.

WMA_RegisterAppCallback Function

File

wma.h

C

```
void WMA_RegisterAppCallback(SetReadBytesReadFlagInAppData fptr0, GetReadBytesInAppData fptr1);
```

Description

This is function WMA_RegisterAppCallback.

WMA_GetChannels Function

File

wma.h

C

```
uint8_t WMA_GetChannels();
```

Description

This is function WMA_GetChannels.

b) Data Types and Constants

SYS_DEBUG_BUFFER_DMA_READY Macro

File

sys_debug.h

C

```
#define SYS_DEBUG_BUFFER_DMA_READY
```

Description

This should be defined in system_config.h. It is added here as a build safe-guard.

WMA_DECODER_STATES Enumeration

File

wma.h

C

```
typedef enum {
  WMA_GET_FRAME_SIZE,
  WMA_DECODE_FRAME
} WMA_DECODER_STATES;
```

Description

This is type WMA_DECODER_STATES.

WMA_ERROR_COUNT_MAX Macro

File

wma.h

C

```
#define WMA_ERROR_COUNT_MAX 1
```

Description

This is macro WMA_ERROR_COUNT_MAX.

WMA_H Macro

File

wma.h

C

```
#define WMA_H
```

Description

This is macro WMA_H.

Chnl_Info Structure

File

decoder_wma.h

C

```
typedef struct {
  long SamplesPerSec;
  long Channels;
  long BitRate;
  long Version;
  long ByteUsed;
  int WMAState;
  long PacketSize;
} Chnl_Info;
```

Members

Members	Description
long SamplesPerSec;	Sampling Frequency
long Channels;	No of Channels
long BitRate;	Bit Rate
long Version;	WMA Version
long ByteUsed;	Used Input Data

int WMAState;	Input or Decode State
long PacketSize;	Size of Packet

Description

This is type Chnl_Info.

WMA_Status Enumeration

File

decoder_wma.h

C

```
typedef enum {
  WMA_NO_ERR = 0,
  WMA_NEED_DATA = 1,
  WMA_ERR = 2
} WMA_Status;
```

Description

This is type WMA_Status.

BYTES_PER_SAMPLE Macro

File

decoder_wma.h

C

```
#define BYTES_PER_SAMPLE 2
```

Description

This is macro BYTES_PER_SAMPLE.

MAX_SAMPLES Macro

File

decoder_wma.h

C

```
#define MAX_SAMPLES 2048                    //in Bytes
```

Description

in Bytes #define WAVE_HEADER_SIZE 44 //in Bytes

WMA_MAX_INPUT_BUFFER_SIZE Macro

File

decoder_wma.h

C

```
#define WMA_MAX_INPUT_BUFFER_SIZE 1024*20   //in Bytes
```

Description

in Bytes

GetReadBytesInAppData Type

File

wma.h

C

```
typedef int32_t (* GetReadBytesInAppData)();
```

Description

This is type GetReadBytesInAppData.

SetReadBytesReadFlagInAppData Type

File

wma.h

C

```
typedef void (* SetReadBytesReadFlagInAppData)(int32_t val, bool b);
```

Description

This is type SetReadBytesReadFlagInAppData.

Files

Files

Driver Libraries Help

This section provides descriptions of the Driver libraries that are available in MPLAB Harmony.

Driver Library Overview

This topic provides help for the MPLAB Harmony driver libraries. It includes a general driver usage overview, as well as sections providing a programmer's reference for each driver that describes its interface and explains how to use it.

Introduction

Introduces MPLAB Harmony device drivers and explains common usage concepts.

Description

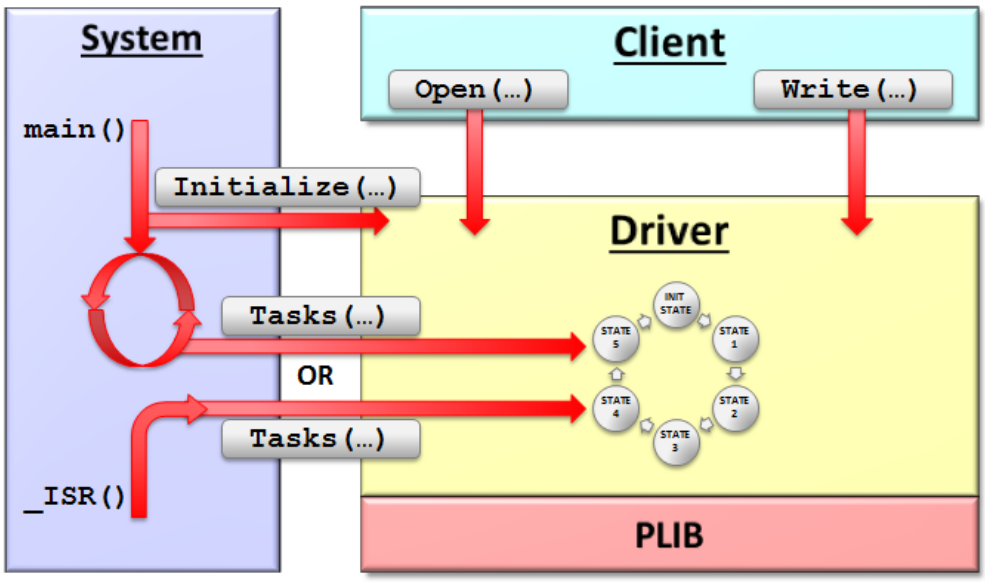
MPLAB Harmony device drivers (usually referred to as "drivers") provide simple, highly abstracted C-language interfaces to peripherals and other resources. A driver's interface allows applications and other client modules to easily interact with the peripheral it controls using consistent usage models. Some functions are similar on all drivers, while other functions are unique to a particular type of driver or peripheral. However, driver interface functions are generally independent of the details of how a given peripheral is implemented on any specific hardware or of how many instances of that peripheral exist in a given system.

Drivers normally utilize MPLAB Harmony Peripheral Libraries (PLIBs) to access and control peripheral hardware that is built into the processor (and is directly addressable by it). However, drivers can also support external peripheral hardware by calling another driver that directly controls a built-in peripheral to which the external peripheral is connected. For example, an SD Card driver may use a SPI driver to access its external SD Card Flash device. A driver may even be completely abstracted away from any hardware (utilizing no peripheral hardware at all), simply controlling some software resource (such as a buffer queue) or providing some service (such as data formatting or encryption). Using this method, driver and other modules may be "stacked" into layers of software, with each responsible for the details of managing its own resources while hiding those details from client modules that use them.

Regardless of the type of peripheral or resource that a MPLAB Harmony driver manages, a driver has the following fundamental responsibilities:

- Provide a common system-level interface to the resource
- Provide a highly abstracted file system style client interface to the resource
- Manage the state of the peripheral or resource
- Manage access to the resource

A driver's system interface can be thought of as being a horizontal interface and its client interface can be thought of as being a vertical interface, as shown in the following block diagram.



The horizontal or "system" interface provides functions to initialize the driver and keep it running. To keep a driver running, a system loop or ISR function (but never both in the same system) calls its state machine "tasks" function repeatedly, as necessary. Therefore, a driver's system interface is normally only called by code that is generated by the MPLAB Harmony Configurator (MHC) when you select and configure the driver. Its purpose is to ensure that the driver works independently (conceptually in the background), providing the capabilities it implements. By contrast, the application (or any other "client" of the driver) normally only interacts with the driver's vertical "client" interface (often thought of as the driver's API). The client interface provides functions to open the driver for use and interact with it, reading or writing data or performing device-type specific operations. The client interface is what allows the application to access the peripheral in a safe and easy way without worrying about the details of the driver or what other clients it may be serving.

The following sections describe in general terms how to use these two interfaces and give specific examples to help illustrate the concepts. The

subsequent help sections for each individual driver describe their specific interfaces in detail; listing all supported functions, parameters, and return values as well as their data types and expected behavior. You may also refer to the MPLAB Harmony Driver Development guide for additional information on MPLAB Harmony drivers and for information on how to develop your own drivers, if needed.

Using a Driver's System Interface

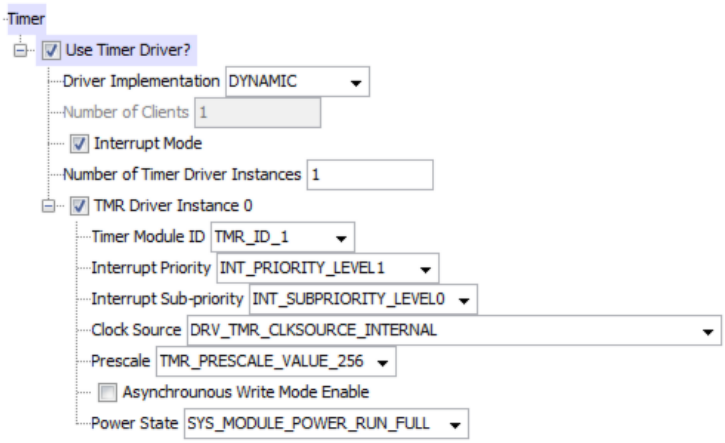
Introduces the System Interface of a MPLAB Harmony device driver and explains its usage.

Description

An MPLAB Harmony driver's system interface provides functions to initialize, deinitialize, and reinitialize an instance of a driver, as well as functions to maintain its state machine (and/or implement its Interrupt Service Routine) and check its current "running" status. Normally, as an MPLAB Harmony application developer or a developer of a "client" module that uses the driver, you will not call the system interface functions directly. The MHC generates calls to the system interface functions of any driver that is used in a project when it generates the system configuration files. Exactly which functions are called and exactly how they're called depends on the configuration options selected in the project's active configuration.

For example, when the box next to "Use Timer Driver?" is selected in the MHC Options tree (within *MPLAB Harmony & Application Configuration* > *Harmony Framework Configuration* > *Drivers* > *Timer*), as shown in the following figure, the MHC will generate all necessary definitions and function calls for the Timer Driver's system interface.

Example Timer Driver MHC Options



These configuration selections, which are set by default once "Use Timer Driver" is selected, will cause the MHC to generate the following definitions in the `system_config.h` header file for the main project's current configuration when **Generate Code** is clicked.

Example Driver Options in system_config.h

```
/*** Timer Driver Configuration ***/
#define DRV_TMR_INTERRUPT_MODE            true
#define DRV_TMR_INSTANCES_NUMBER          1
#define DRV_TMR_CLIENTS_NUMBER            1

/*** Timer Driver 0 Configuration ***/
#define DRV_TMR_PERIPHERAL_ID_IDX0         TMR_ID_1
#define DRV_TMR_INTERRUPT_SOURCE_IDX0      INT_SOURCE_TIMER_1
#define DRV_TMR_CLOCK_SOURCE_IDX0          DRV_TMR_CLKSOURCE_INTERNAL
#define DRV_TMR_PRESCALE_IDX0              TMR_PRESCALE_VALUE_256
#define DRV_TMR_OPERATION_MODE_IDX0        DRV_TMR_OPERATION_MODE_16_BIT
#define DRV_TMR_ASYNC_WRITE_ENABLE_IDX0    false
#define DRV_TMR_POWER_STATE_IDX0           SYS_MODULE_POWER_RUN_FULL
```

It is important to notice that the Driver Implementation selection in the MHC graphical interface does not correlate to a `#define` statement in the `system_config.h` file. Instead, it determines which implementation of the driver this configuration will use. Drivers may have more than one implementation. For example, most drivers have both static and dynamic implementations. A static implementation is usually the smaller of the two, but it is only capable of controlling one instance of a peripheral. An equivalent dynamic implementation will be larger, but it is capable of managing multiple instances of the same type of peripheral using a single instance of the source code (and thus, one instance of the object code). Some drivers may have additional implementations, each one optimized for a different usage. The Driver Implementation pull-down control in the MHC graphical interface allows you to select which implementation the current configuration will use. Normally, you can use only a single implementation of a driver in a given configuration. If you change driver implementations, it changes which implementation is used for all all instances of a peripheral.

The number of instances option, for example, Number of Timer Driver Instances, which correlates to the DRV_TMR_INSTANCES_NUMBER definition, determines how many instances of a static driver implementation will be generated or how many instances of a peripheral a dynamic driver implementation will manage. Drivers may also be designed to allow multiple different clients (applications or other modules) to share the same instance of a peripheral or resource. Therefore, a driver will have an option to determine a maximum number of simultaneous clients that it can support. For example, Number of Clients (DRV_TMR_CLIENTS_NUMBER) in the Timer Driver, which is fixed at one (1) and cannot be

changed, which indicates that the Timer Driver is a single-client driver). The last implementation-specific configuration option in this example is the "Interrupt Mode" (DRV_TMR_INTERRUPT_MODE) setting. This option determines if the implementation is configured to run polled or interrupt driven (discussed further, in a following section). MPLAB Harmony drivers are generally designed to run most effectively in an interrupt-driven configuration, but they can also be run in a polled configuration to simplify debugging or to support task prioritization in an RTOS configuration.

The remaining configuration options are all instance-specific initialization options. For a dynamic implementation of a driver, these options are passed into the driver's Initialize function through an "init" data structure, as shown in the following example.

Example Driver Init Structure in system_init.c

```
const DRV_TMR_INIT drvTmr0InitData =
{
    .moduleInit.sys.powerState = DRV_TMR_POWER_STATE_IDX0,
    .tmrId = DRV_TMR_PERIPHERAL_ID_IDX0,
    .clockSource = DRV_TMR_CLOCK_SOURCE_IDX0,
    .prescale = DRV_TMR_PRESCALE_IDX0,
    .mode = DRV_TMR_OPERATION_MODE_16_BIT,
    .interruptSource = DRV_TMR_INTERRUPT_SOURCE_IDX0,
    .asyncWriteEnable = false,
};
```

The exact meaning and usage of these options are described in the **Configuring the Library** section in the Help documentation for each library. The live MHC Help windowpane displays the associated help section whenever you select one of these options in the options tree.

There is one instance-specific initialization option of which you should take special notice: the peripheral ID option (.tmrId, in the Timer Driver example shown). This initialization option associates the driver instance (a zero-based index number) with the peripheral-hardware instance number, as defined by the data sheet for the processor in use. For a dynamic driver, this association is actually made when the driver's initialize function is called and passes a pointer to the init data structure, as shown in the following code example.

Example Driver Initialize Call in system_init.c

```
/* Initialize Drivers */
sysObj.drvTmr0 = DRV_TMR_Initialize(DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&drvTmr0InitData);
```

In this example, the driver index (DRV_TMR_INDEX_0) is defined as a numeric constant with a value of zero (0). This line of code associates driver instance 0 with hardware timer instance 1 by calling the DRV_TMR_Initialize function from the system initialization code and passing a pointer to the `drvTmr0InitData` structure. As shown earlier, the Timer Driver's init structure contains the value TMR_ID_1 (defined by the timer peripheral library), in its `.tmrId` data member.

In a static implementation, the driver peripheral ID macro (DRV_TMR_PERIPHERAL_ID_IDX0) defined in `system_config.h` is hard-coded into the driver's instance-specific initialization function when it is generated by the MHC, instead of defining an "init" structure, as shown in the following example; however, the effect is the same.

Example Static Driver Initialize Function

```
void DRV_TMR0_Initialize(void)
{
    PLIB_TMR_Stop(DRV_TMR_PERIPHERAL_ID_IDX0);
    PLIB_TMR_ClockSourceSelect(DRV_TMR_PERIPHERAL_ID_IDX0, DRV_TMR_CLOCK_SOURCE_IDX0);
    PLIB_TMR_PrescaleSelect(DRV_TMR_PERIPHERAL_ID_IDX0, DRV_TMR_PRESCALE_IDX0);
    PLIB_TMR_Mode16BitEnable(DRV_TMR_PERIPHERAL_ID_IDX0);
    PLIB_TMR_Counter16BitClear(DRV_TMR_PERIPHERAL_ID_IDX0);
    PLIB_TMR_Period16BitSet(DRV_TMR_PERIPHERAL_ID_IDX0, 0);
}
```

The DRV_TMR0_Initialize function (with an instance number '0' in the name) in the previous example, is a static version of the DRV_TMR_Initialize system interface function. The call to this function is created by the MHC when it generates the system code. Therefore, that call is always generated with the correct name and with the correct instance number in the name. However, when calling client interface functions (open, close, read, write, etc.) from your own applications, you *should not* use an instance number in the function name. Dynamic drivers implement the client interface functions without any index numbers in their names. Instead, they use an index or handle parameter to identify the instance of the driver with which to interact. Also, when using static implementations of the drivers, the dynamic API functions are mapped (using the index or handle parameter) to the appropriate static function with the index number in its name. Therefore, calling the dynamic API function makes your application always portable, using whichever driver instance is configured to the index value with which you open the driver.

Note: Calling the static versions of the interface function (with the index numbers in their names) is not prohibited. However, it will limit the portability of your application.

Understanding this mechanism is critical to understanding how to access the desired peripheral hardware instance. Therefore, it is worth looking at a few demonstration applications to see how it is used. Also, refer to *Volume III: MPLAB Harmony Development > Key Concepts > Key One-to-Many Relationships* for additional information on the concepts of having multiple implementations, instances, and clients.

Something else worth noting about the previous example call to the Timer Driver's initialize functions is that when using a dynamic implementation, it returns a value called an "object handle". In the previous example, that object handle was stored in a system configuration object data member (`sysObj.drvTmr0`). Object handles returned by module initialization functions are stored in a system configuration structure normally named `sysObj`. The definition of this structure is generated in the `system_definitions.h` header file the MHC, as shown in the following example.

Example System Object Data Structure Definition in system_definitions.h

```
typedef struct
{
    SYS_MODULE_OBJ  sysDevcon;
```

```
    SYS_MODULE_OBJ  drvTmr0;

} SYSTEM_OBJECTS;

extern SYSTEM_OBJECTS sysObj;
```

As shown in the previous example, this structure is “extern’d” for use by the other system files. It should not be used by application or library files, only by the system files for a single configuration. The `sysObj` structure is defined (and allocated in memory) by the `system_init.c` file, as shown in the following example.

Example System sysObj Definition in system_init.c

```
/* Structure to hold the object handles for the modules in the system. */
SYSTEM_OBJECTS sysObj;
```

For this discussion, you can ignore the `sysDevcon` member of the SYSTEM_OBJECTS structure as it will contain the handle for a different library. The important thing to note is that the `drvTmr0` member must be passed into the Timer Driver’s other system interface functions so that the driver has access to the data it needs manage that specific instance of itself (and the associated peripheral hardware), as shown by the following timer ISR example.

Example Timer ISR in system_interrupt.c

```
void __ISR(_TIMER_1_VECTOR, ipl1AUTO) IntHandlerDrvTmrInstance0(void)
{
    DRV_TMR_Tasks(sysObj.drvTmr0);
}
```

In this ISR example, there are three important things to notice.

First, the ISR function itself is associated with a specific vector through the `__ISR` macro. Different interrupt vectors are associated with different peripheral instances and interrupts on different processors. That is why MPLAB Harmony ISR vector functions are generated in the configuration-specific `system_interrupt.c` file instead of being part of the driver library itself.

Second, the DRV_TMR_Tasks function implements the actual ISR logic of the TMR driver. Most MPLAB Harmony drivers are designed to run interrupt driven and their tasks functions implement the software state machine logic necessary to keep the driver’s interrupt sequence moving from one interrupt to the next until the driver’s task is complete.

Third, the `sysObj.drvTmr0` object handle’s value is passed into the driver’s tasks function so that it has access to the data it requires to control instance zero (0) of the Timer Driver and its associated hardware instance, which must match the ISR vector instance from which it is called.

By default, the Timer Driver is configured to run interrupt-driven, as shown previously. This is not necessarily true for all drivers. However, most drivers (including the Timer Driver) can run in a Polled mode by simply changing the configuration settings. For example, by clearing the "Interrupt Mode" option in the MHC configuration tree and regenerating the configuration code, the previous example ISR will be removed from `system_interrupt.c` and a call to the Timer Driver’s tasks function will be added to the polled system tasks function, as shown by the following `system_tasks.c` example code.

Example Call to Timer Tasks from system_tasks.c

```
void SYS_Tasks ( void )
{
    /* Maintain system services */
    SYS_DEVCON_Tasks(sysObj.sysDevcon);

    /* Maintain Device Drivers */
    DRV_TMR_Tasks(sysObj.drvTmr0);

    /* Maintain the application's state machine. */
    APP_Tasks();
}
```

In this example, the Timer Driver’s tasks function is called from the polled loop in main by the SYS_Tasks function. The driver’s tasks must still receive the `sysObj.drvTmr0` object handle value and its logic operates in exactly the same way, with one exception. Because the driver is now polled, the DRV_TMR_INTERRUPT_MODE option is now defined as false. This causes the driver to be built so that it does not enable its own interrupt, allowing it to run in the polled loop and to not require an ISR.

For additional information on the device driver system interface, refer to *Volume III: MPLAB Harmony Development > MPLAB Harmony Driver Development Guide > System Interface* and to the documentation for the individual system interface functions for the driver in question.

Using a Driver's Client Interface

Introduces the Client Interface (or API) of a MPLAB Harmony device driver and explains common usage models.

Description

Applications (or any other “client” of a MPLAB Harmony device driver) normally only interact with the driver’s client interface (often called its API). The client interface provides functions to “open” the driver (creating a link between the client and the driver) and interact with it, to transfer data or perform operations that are specific to a given type of device, and to “close” the driver (releasing the link). Once a driver has been configured and the configuration code has been generated, the application can assume that the driver will be initialized by the system-wide initialization function (SYS_Initialize) and that its tasks functions will be called as required from either the system-wide tasks function (SYS_Tasks) or from the appropriate ISR, depending upon how the driver was designed and configured.

To interact with the driver, a client must first call the driver's open function. This is necessary because all other client interface functions require a "handle" to the device driver that is returned by the open function, as shown in the following example.

Example Call to a Driver's Open Function

```
appData.handleTmr = DRV_TMR_Open(APP_TMR_DRV_INDEX, DRV_IO_INTENT_EXCLUSIVE);
if( DRV_HANDLE_INVALID != appData.handleTmr )
{
    // Advance to next application state.
}
```

In this example, the first parameter to the DRV_TMR_Open function is the APP_TMR_DRV_INDEX macro, which is a constant defined to the value of the desired driver instance index number in the `system_config.h` header file. This value must be the same as the index number used when the desired driver was initialized (as shown in the previous section). This is how the client becomes associated with a specific instance of a driver.

The second parameter identifies how the client intends to use the driver. Here, the client wants to have exclusive access to the driver. This means that no other client can currently have an active handle to this driver or this call will fail and return a value of DRV_HANDLE_INVALID. Drivers can also be opened as shared, as blocking or non-blocking and for reading, writing, or both. Refer to the help for the DRV_IO_INTENT data type for additional information about the IO intent parameter of driver open functions. This parameter is merely an advisory parameter. How it is used by the driver is implementation dependent and will be described in the driver's help documentation.

Finally, if the open function was successful, the returned value will be a valid handle to the driver instance. This value is opaque and meaningless to the caller, but it must be passed back to the driver as the first parameter to every other client interface function provided by the driver. A valid handle identifies both the instance of the driver with which the caller interacts and it identifies the client performing the call. This means that, two different client applications or modules opening the same driver in the same system at the same time will receive different values for their "opened" handle. If, for any reason, the driver cannot support the "open" request (it is not finished initializing itself, it has already been opened for exclusive access, or cannot accept new open requests for any reason), it will return a value of DRV_HANDLE_INVALID, indicating the client cannot use it at this time. The DRV_HANDLE_INVALID value is the only non-opaque value that a client should consider meaningful. All other values are only meaningful to the driver that provided them.

Note: The `appData.handleTmr` variable in the previous example is a member of the application's `appData` structure. This structure is generated by the MHC as part of the initial application template and should be used to hold an applications state variables.

When the client is finished using a driver, it may close it, as shown in the following example.

Example Call to a Driver's Close Function

```
DRV_TMR_Close(appData.handleTmr);
```

This action releases the link to the driver, invalidating the handle and releasing any resources allocated by the driver to track requests from the client. Notice that the close function demonstrates the use of the driver handle, requiring it as a parameter. However, after the close function returns, the handle value cannot be used again. Therefore, the client should not call the driver's close function until it is done using the driver or it will have to call open again and obtain a new handle to use the driver again. In fact, since many embedded applications are always running, they often do not bother to close drivers they use. But, applications that can go idle or that can be stopped and restarted or that need to share a driver with other clients, but want to conserve resources, or that want use the driver exclusively, can close a driver when they are finished with it for a time and reopen it later when needed. In fact, this is a good way to share a single-client driver, or a driver that supports exclusive access, allowing each client to open it and use it only when a valid handle is obtained.

Using a Driver in an Application

Describes how to write a state-machine based application that uses a MPLAB Harmony driver.

Description

MPLAB Harmony generally treats all software modules, including applications, as state machines that have an "initialize" function and a "tasks" function. In fact, when not using a RTOS, it essentially treats the entire system as one large state machine that runs in a common super loop in the "main" function, as shown in the following code example.

Example Main Function

```
int main ( void )
{
    SYS_Initialize(NULL);

    while(true)
    {
        SYS_Tasks();
    }

    return (EXIT_FAILURE);
}
```

For the purpose of this discussion, it is important to understand that the application's APP_Initialize function is called from the SYS_Initialize function, along with the initialization of functions of all drivers and other libraries before execution enters the endless `while(true)` super loop that continuously calls the system-wide SYS_Tasks function. The application's APP_Tasks function is then called from the SYS_Tasks function inside of the super loop, along with all other polled modules in the system. If you are not already familiar with the organization of an MPLAB

Harmony project, please refer to *Volume I: Getting Started With MPLAB Harmony > What is MPLAB Harmony?* for more information.

An application that uses a driver must define a DRV_HANDLE variable, as shown in the following example application header file.

Example Driver Application Header (app.h)

```
#include "driver/usart/drv_usart.h"

typedef enum
{
    APP_STATE_SETUP=0,
    APP_STATE_MESSAGE_SEND,
    APP_STATE_MESSAGE_WAIT,
    APP_STATE_DONE

} APP_STATES;

typedef struct
{
    APP_STATES  state;
    DRV_HANDLE  usart;
    char *      message;

} APP_DATA;
```

In this previous example, the driver handle variable is named `usart`. To keep the application well organized, it is common to keep all of the application's state variables (including one called "state" that holds the current state of the application's state machine) in a common structure (APP_DATA). This structure must be allocated in the application's source file (usually named `app.c`) and initialized by the application's initialization function, as shown in the following example.

Example Driver Application Initialization

```
APP_DATA appData;

void APP_Initialize ( void )
{
    /* Place the App in its initial state. */
    appData.state   = APP_STATE_SETUP;
    appData.usart   = DRV_HANDLE_INVALID;
    appData.message = "Hello World\n";
}
```

The APP_Initialze function must initialize the state variable (appData.state) to put the application's state machine in its initial state (the APP_STATE_SETUP value from the APP_STATES enumeration). It must also initialize the driver-handle variable (`appData.usart`), so that the state machine knows it is not yet valid, and any other application variables (like the string pointer, `appData.message`).

Once the application's data structure has been initialized, it is safe for the system (the main and SYS_Tasks functions) to call the application's APP_Tasks function from the super loop to keep it running. The APP_Tasks function then executes state transition code as it switches between states, as demonstrated by the following example.

Example Application State Machine Using a Driver

```
void APP_Tasks ( void )
{
    switch ( appData.state )
    {
        case APP_STATE_SETUP:
        {
            if (SetupApplication() == true)
            {
                appData.state = APP_STATE_MESSAGE_SEND;
            }
            break;
        }

        case APP_STATE_MESSAGE_SEND:
        {
            if (MessageSend() == true)
            {
                appData.state = APP_STATE_MESSAGE_WAIT;
            }
            break;
        }

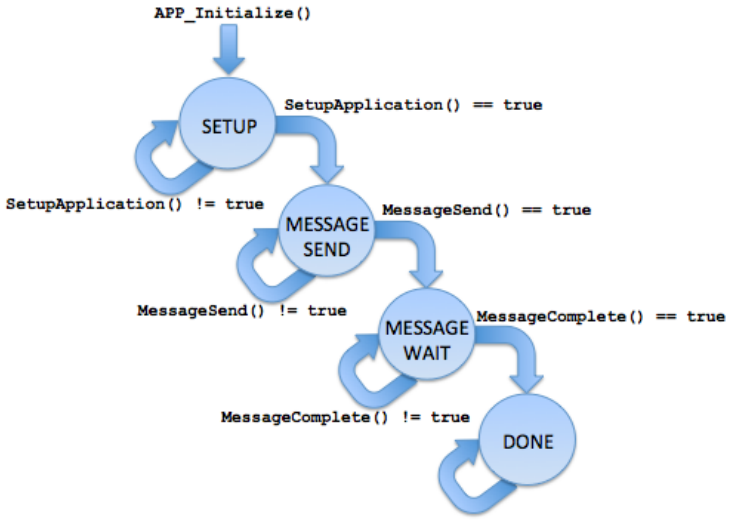
        case APP_STATE_MESSAGE_WAIT:
        {
```

```
            if (MessageComplete() == true)
            {
                appData.state = APP_STATE_DONE;
            }
            break;
        }

        case APP_STATE_DONE:
        default:
        {
            break;
        }
    }
}
```

There are numerous ways to implement a state machine. However, in this example, the application changes state when the APP_Tasks function assigns a new value from the APP_STATES enumeration to the `appData.states` variable. This happens when one of the state transition function returns true. The end result is an overall application state machine execution that retries each state transition until it succeeds before moving on to the next state, as shown in the following diagram.

Application State Machine



Note: The APP_STATE_ prefix and all inter-word underscores were removed from the state names to simplify the diagram.

After APP_Initialize places the state machine in its initial APP_STATE_SETUP state, the APP_Tasks function will call the SetupApplication function when it is called. When SetupApplication returns true indicating it has completed its task, the state machine advances to the next state. Otherwise, it stays in the same state and retries the tasks in the SetupApplication function. This pattern repeats for the APP_STATE_MESSAGE_SEND state and the `MessageSend` function as well as the APP_STATE_MESSAGE_WAIT state and the `MessageComplete` function. When all functions have returned true, the state machine to transitions to the APP_STATE_DONE state where it unconditionally stays having completed its tasks.

The sum total of the tasks performed by each transition function completes the overall task of the application. For an application that uses a driver like this example, this includes opening the driver, sending the message, and closing the driver when the message has been sent. How each individual transition function in this example application accomplishes its portion of the overall task, is described in the examples in the following sections to demonstrate how drivers are commonly used.

Opening a Driver

Describes how to open a driver in a state-machine based application.

Description

To use a MPLAB Harmony driver, an application (or other client) must call the driver's "open" function and obtain a valid handle to it, as shown by the following code example.

Example Opening a Driver

```
static bool SetupApplication ( void )
{
    if (appData.usart == DRV_HANDLE_INVALID)
    {
```

```
        appData.usart = DRV_USART_Open(APP_USART_DRIVER_INDEX,
                                       (DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NONBLOCKING));
    }

    if (appData.usart == DRV_HANDLE_INVALID)
    {
        return false;
    }

    return true;
}
```

This example demonstrates the implementation of a state-transition function in a state machine-based application (as shown in the previous Using a Driver in an Application section). The `SetupApplication` function assumes that the `appData.usart` variable has been initialized to a value of DRV_HANDLE_INVALID when the application's state machine was initialized. Therefore, it checks this variable every time it is called to see if it has already completed its task. If `appData.usart` contains a value of DRV_HANDLE_INVALID, this indicates that the driver has not yet been successfully opened, causing the function to attempt to open the driver by calling DRV_USART_Open.

If the USART driver is ready and able to support a new client it will return a valid handle. If it is not ready or able to accept a new client, the driver will return DRV_HANDLE_INVALID and the `SetupApplication` function will return false and the application will stay in the same state and try to open the driver again the next time its state machine tasks function is called. When DRV_USART_Open returns a valid handle (a handle that is not equal to DRV_HANDLE_INVALID), the `SetupApplication` function returns true, allowing the application's state machine to advance.

This technique allows the application to try repeatedly to open the driver until it succeeds and guarantees that the application's state machine will not advance until it has done so. A more sophisticated application might use a time-out mechanism or some other error handling logic to take alternative action if it cannot open the driver in an acceptable time period. However, this simple implementation demonstrates the basic concept of how an MPLAB Harmony application (or any other client module) can safely open a driver before attempting to use it.

Using Driver Interface Functions

Describes how to use a device driver's synchronous client interface functions, such as those that read and write data.

Description

To use a MPLAB Harmony driver's client interface, the application must first obtain a valid handle from the driver's "open" function. The examples in this section assume that that has already occurred and that the value of the USART driver handle in the appData.usart variable is valid. The following example code demonstrates the implementation of a state transition function in a state machine-based application (as shown in the previous Using a Driver in an Application section) that writes data to a USART driver for transmission on the associated USART peripheral.

Example Writing Data To a Driver

```
static bool MessageSend ( void )
{
    size_t  count;
    size_t  length = strlen(appData.message);

    count = DRV_USART_Write(appData.usart, appData.message, length);

    appData.message += count;

    if (count == length)
    {
        return true;
    }

    return false;
}
```

In this example, the appData.message variable is a char pointer pointing to a null-terminated C-language string that was defined and initialized, as shown in the Using a Driver in an Application section. When `MessageSend` function is first called by the application's state machine, it points to the first character in the string to be transmitted. The function calculates the current length of the message string (using the standard C-language strlen function) and calls the driver's DRV_USART_Write function, passing it the valid driver handle (`appData.usart`) along with the pointer to the message string and its length, to transmit the message string on the associated USART.

If the driver is configured for blocking, the DRV_USART_Write function will not return until it has processed all of the data in the message string. However, that usually requires the use of a RTOS. Normally, in a bare-metal system (one that does not use a RTOS), MPLAB Harmony drivers are used in a non-blocking mode. In that case, a driver will perform as much of a task as it can when one of its interface functions is called without blocking. This means that the function will then return immediately, not waiting for the task to complete, and provide information on how much of the task was completed so the client can react appropriately. In this example, the DRV_USART_Write function will return a count of the number of bytes that were processed by the USART driver by this call to the function.

The `MessageSend` function captures the number of bytes processed by the DRV_USART_Write function in a local count variable. It then effectively removes those bytes from the message string by incrementing the pointer by count bytes (`appData.message` is a char pointer that increments by the size of one byte for every '1' added to it). Then, the `MessageSend` function checks to see if it was able to write the entire string by comparing the value of count to the value of length that it calculated before calling the driver's write function. If the two are equal, the task is

complete and the MessageSend function returns true and the application's state machine can continue to the next state. If the two values are not equal, this indicates there are remaining bytes in the message string. The MessageSend function returns false and the application must stay in the same state so that the function can attempt to send the remaining bytes next time it is called. A driver only accepts data when it can process it; therefore, the client can call its data transfer function as many times as necessary, even when the function returns bytes processed if it cannot accept more data at that time.

When a client has called a driver interface function there are really only two possibilities. Either the operation has completed when the function returns, or the operation continues after the function has returned. If the operation completes immediately, the client can continue on without taking further action. However, in this example, while the USART driver may have accepted some of the bytes in the message string (perhaps copying them to an internal hardware or software FIFO buffer), it still takes some time to transmit the data over the USART peripheral. In many cases the client may need to know when the operation has actually completed. For this reason, most drivers provide one or more status functions that client applications may call to determine the current status of an operation, as demonstrated in the following example.

Example Using a Driver Status Function

```
static bool MessageComplete ( void )
{
    if (DRV_USART_ClientStatus(appData.usart) == DRV_USART_CLIENT_STATUS_BUSY)
    {
        return false;
    }
    return true;
}
```

This example extends the previous one and assumes that the MessageSend function has returned true and the application has moved to a new state where it calls this function to determine when the driver is idle, which indicates that the message has been completely transmitted. To do that, the MessageComplete function calls the DRV_USART_ClientStatus function. If its return value is DRV_USART_CLIENT_STATUS_BUSY, the USART driver is still working on a previous request by the client. If any other status value is returned, this indicates that the driver is no longer busy with a current request and the MessageComplete function returns true so that the client application's state machine can move on. A more sophisticated example would check for other possible status values that might indicate some error has occurred and take appropriate action. However, this example is sufficient to demonstrate the concept of checking a driver status function to determine when it is safe to move to another state.

Since the client application stays in the same state calling the status function each time its tasks function is called until the desired status is returned, it is effectively polling the status as if it were in a while loop. In fact, it is in the system-wide while loop. However, by not trapping the CPU within its own internal while loop, the application allows other modules (including, potentially, the driver it is using) to continue running and servicing requests. Failing to allow the rest of the system to run can result in a deadlock where the polling application is waiting for a status; however, the driver it is polling will never be able to provide the expected status, as the driver's own tasks function is not allowed to run. This is why it is important to use the technique described here to "poll" status from modules outside of the current module.

Using Asynchronous and Callback Functions

Describes how to use an asynchronous interface function to start a driver operation and receive a callback when the operation is complete.

Description

When a client calls a function that is part of an asynchronous interface, the function starts the request and returns immediately, without finishing the request. The client can then either poll a status function to determine when the request has finished (as demonstrated in the Using Driver Interface Functions section) or it can utilize a callback function to receive a notification from the driver when the request has finished. So, the difference between an asynchronous interface and a synchronous interface is that a synchronous interface may finish all or part of the request before returning, whereas an asynchronous interface will always return immediately having only started the request. Determination of when the request has completed is handled separately.

The examples in this section reimplement some of the code from the example application described in the previous sections to demonstrate how to use asynchronous queuing and callback interfaces instead of the synchronous status-polling interface demonstrated in the Using Driver Interface Functions section. To use an asynchronous interface, we will first add a couple of new variables to our example application's data structure, as shown by the following structure definition.

Example Driver Application Header (app.h)

```
typedef struct
{
    APP_STATES              state;
    DRV_HANDLE              usart;
    char *                  message;
    DRV_USART_BUFFER_HANDLE messageHandle;
    bool                    messageDone;

} APP_DATA;
```

The state, usart, and message members of the APP_DATA structure are used in exactly the same way as they were in the previous examples. The messageHandle variable will be explained later and the messageDone variable is a Boolean flag used by the callback function to indicate to the application's state machine that the message has been completely processed by the driver. Using these new mechanisms results in very minor changes to the application's state machine, as shown in the following example APP_Initialize and APP_Tasks implementations.

Example Driver Application State Machine (app.c)

```
void APP_Initialize ( void )
{
    appData.state           = APP_STATE_SETUP;
    appData.usart           = DRV_HANDLE_INVALID;
    appData.message         = APP_MESSAGE;
    appData.messageHandle   = DRV_USART_BUFFER_HANDLE_INVALID;
}

void APP_Tasks ( void )
{
    switch ( appData.state )
    {
        case APP_STATE_SETUP:
        {
            if (SetupApplication() == true)
            {
                appData.state = APP_STATE_MESSAGE_SEND;
            }
            break;
        }

        case APP_STATE_MESSAGE_SEND:
        {
            if (MessageSend() == true)
            {
                appData.state = APP_STATE_MESSAGE_WAIT;
            }
            break;
        }

        case APP_STATE_MESSAGE_WAIT:
        {
            if (appData.messageDone)
            {
                DRV_USART_Close(appData.usart);
                appData.state = APP_STATE_DONE;
            }
            break;
        }

        case APP_STATE_DONE:
        default:
        {
            break;
        }
    }
}
```

As described previously, the `SetupApplication` state transition function opens the USART driver and the `MessageSend` function sends the message to it. However, there is no need for a `MessageComplete` state transition function. Instead, the application must implement a callback function that will set the `appData.messageDone` Boolean flag when the driver calls the application "back" to indicate that the message has been sent.

Note: The `AppInitialize` function initializes the `state`, `usart`, and `message` members of the `appData` structure as previously described. And, it also initializes the `messageHandle` member with an invalid value to indicate that the message has not yet been sent. However, it does not initialize the `messageDone` flag because it is more appropriate to clear the flag elsewhere, immediately before calling the driver to send the message.

To use a callback mechanism requires the client to implement and register a callback function. A client must register this function after opening the driver, but prior to calling the driver to initiate the operation. This is often done in the same state transition that opens the driver, as shown in the following `SetupApplication` example.

Example Registering a Driver Callback Function

```
static void BufferDone ( DRV_USART_BUFFER_EVENT  event,
                         DRV_USART_BUFFER_HANDLE bufferHandle,
                         uintptr_t context )
{
    APP_DATA *pAppData = (APP_DATA *)context;

    if (event == DRV_USART_BUFFER_EVENT_COMPLETE)
```

```
    {
        if (bufferHandle == pAppData->messageHandle)
        {
            pAppData->messageDone = true;
            return;
        }
    }

    /* Error */
    return;
}

static bool SetupApplication ( void )
{
    if (appData.usart == DRV_HANDLE_INVALID)
    {
        appData.usart = DRV_USART_Open(APP_USART_DRIVER_INDEX,
                                       (DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NONBLOCKING));
    }

    if (appData.usart == DRV_HANDLE_INVALID)
    {
        return false;
    }

    DRV_USART_BufferEventHandlerSet(appData.usart, BufferDone, (uintptr_t)&appData);
    return true;
}
```

This code block implements both the `BufferDone` callback function and the application's `SetupApplication` state transition function. After successfully opening the driver, the `SetupApplication` function calls the DRV_USART_BufferEventHandlerSet function and passes it the driver handle (`appData.usart`) once it is valid, along with the address of the `BufferDone` callback function and a context value.

The context value can be anything that will fit in an integer large enough to hold a pointer (it is a `uintptr_t` variable). However, this parameter is most commonly used to pass a pointer to the caller's own data structure as demonstrated here (even though it is not strictly necessary). This is done primarily to support multi-instance clients. (Refer to *Volume III: MPLAB Harmony Development > Key Concepts* for information on multiple instances.) A multi-instance client is designed to manage multiple instances of itself by allocating multiple instances of its own data structure, but only one instance of its object code. Passing a pointer to the data structure in the context variable identifies the specific instance that was used when calling the driver.

Once the callback function has been registered with the driver, the application can transition to a state where it attempts to initiate an asynchronous operation. The following example demonstrates the use of a buffer-queuing write function to transmit a message over the USART.

Example Queuing a Buffer to a Driver

```
static bool MessageSend ( void )
{
    appData.messageDone = false;
    DRV_USART_BufferAddWrite(appData.usart, &appData.messageHandle,
                             appData.message, strlen(appData.message));

    if (appData.messageHandle == DRV_USART_BUFFER_HANDLE_INVALID)
    {
        return false;
    }

    return true;
}
```

Before attempting to send the message, this implementation of the `MessageSend` state transition function clears the `appData.messageDone` flag so it can detect when the message has completed. Then, it calls the DRV_USART_BufferAddWrite function to queue up the buffer containing the message to be transmitted by the USART driver. To that function, it passes the USART driver handle (`appData.usart`), the address of the `appData.messageHandle` variable, the pointer to the message buffer (`appData.message`), and the size of the buffer in bytes as calculated by the `strlen` function. The USART driver then adds this buffer to its internal queue of buffers to transmit and provides a handle to the caller that identifies that buffer's place in the queue by storing it to the `appData.messageHandle` variable.

If, for some reason, the driver is unable to successfully queue up the buffer (perhaps the queue is full), it will assign a value of DRV_USART_BUFFER_HANDLE_INVALID to the `appData.messageHandle` variable. If that happens, the `MessageSend` function returns false and the application will stay in the same state and retry the operation again next time its tasks function is called. But, if the operation succeeds, the application advances to the next state.

Once the driver completes the operation, it will call the client's callback function. As shown in the `BufferDone` code example, the driver passes it an enumeration value that identifies which event has just occurred (the `DRV_USART_BUFFER_EVENT_COMPLETE` value) in the event parameter. It also passes it the handle of the buffer that has just completed (`bufferHandle`). The client can use the `bufferHandle` value to verify that it

matches the value stored in the appData.bufferHandle variable to uniquely identify an individual buffer. This is very useful when a client queues up multiple buffers at the same, which is being shown in this example as a demonstration.

The context parameter to the BufferDone function contains a pointer to the application's global (appData) data structure. (This is the same value that was passed in the context parameter to the DRV_USART_BufferEventHandlerSet function.) While not strictly necessary in this example, it is very useful for multi-instance clients such as dynamic device drivers and middleware to identify which instance of the client requested the operation. The callback function simply casts the context value back into a pointer to the client's own data structure's data type (APP_DATA in this example) and uses it to access the structure members. (Again, please refer to *Volume III: MPLAB Harmony Development > Key Concepts* for information on multiple instances.)

The callback function uses the event parameter to identify why the callback occurred. If it was called to indicate that the buffer has been processed, the event parameter will contain the value DRV_USART_BUFFER_EVENT_COMPLETE. If it contains any other value an error has occurred. The BufferDone callback also checks to verify that the buffer that completed was the same buffer that it queued up by comparing the bufferHandle value it was passed with the value assigned to the appData.messageHandle variable when the application called DRV_USART_BufferAddWrite. It accesses the message handle value it saved using the pAppData pointer given to it through the context parameter just. Once it has verified that the buffer it queued has completed, it sets the pAppData->messageDone flag to notify the application's state machine and execution returns to the driver.

Note: It is important to understand that the MessageDone callback function executes in the context of the driver, not the application. Depending on how the system is configured, this means that it may be called from within the driver's ISR context or from another thread context if using a RTOS.

In this example, the APP_Tasks application state machine function is essentially the same as the state machine for the synchronous example. The only difference is that when the application is in the APP_STATE_MESSAGE_WAIT state, it checks the appData.messageDone flag to determine when to close the driver and transition to the APP_STATE_DONE state instead of calling a transition function. (It could still do this in a state transition function, but it was done differently in this example to emphasize the concept.)

The advantage of using an asynchronous interface over a synchronous one is that it allows the client's state machine to continue on, potentially doing something else while the requested operation completes. Whereas a synchronous interface has the possibility of blocking the client's state machine until the operation finishes (when used in a RTOS configuration). An asynchronous interface will always return immediately without blocking (whether a RTOS is used or not). Because of this, most asynchronous interfaces will also allow queuing of more than one operation at a time. This allows client applications to keep a driver continuously busy by keeping the driver's queue full, maximizing data throughput or operation speed. By contrast, a synchronous interface requires one operation to complete before the synchronous function can be called again to cause the next one to begin.

The cost of this capability is that an asynchronous interface has the added complexity of a callback function (if the client cares when the operation finishes) and the fact that a callback function may be called from within the driver's ISR context, depending on how the driver was designed and configured. This fact generally restricts what can be done within the callback function. For example, it is usually a bad idea to perform lengthy processing within a callback function as it will block all lower priority ISRs (as well as the main loop or other threads) while that processing occurs. Also, it is usually best to not call back into the driver's own interface functions unless those functions are documented as being safe to call from within the driver's callback context. Many interface functions (particularly data transfer and data queuing functions) must use semaphores or mutexes to protect their internal data structures in RTOS environments and those constructs cannot be used from within an ISR.

It is also important to not make non-atomic (read-modify-write) accesses to the client's own state data from within the callback function, as the client cannot protect itself against an interrupt that is owned by the driver. That is why a separate Boolean flag variable is commonly used to indicate to the client that the callback has occurred. Most other processing should occur in the client's state machine. It is usually best to simply capture the event and return as quickly as possible from the callback function and let the application's state machine tasks function perform any lengthy processing or calling back into the driver.

Please refer to *Volume III: MPLAB Harmony Development* for additional information.

Library Interface

Constants

	Name	Description
	DRV_CONFIG_NOT_SUPPORTED	Not supported configuration.
	DRV_HANDLE_INVALID	Invalid device handle.
	DRV_IO_ISBLOCKING	Returns if the I/O intent provided is blocking
	DRV_IO_ISEXCLUSIVE	Returns if the I/O intent provided is non-blocking.
	DRV_IO_ISNONBLOCKING	Returns if the I/O intent provided is non-blocking.
	_DRV_COMMON_H	This is macro _DRV_COMMON_H.
	_PLIB_UNSUPPORTED	Abstracts the use of the unsupported attribute defined by the compiler.

Data Types

	Name	Description
	DRV_CLIENT_STATUS	Identifies the current status/state of a client's connection to a driver.
	DRV_HANDLE	Handle to an opened device driver.
	DRV_IO_BUFFER_TYPES	Identifies to which buffer a device operation will apply.

	DRV_IO_INTENT	Identifies the intended usage of the device when it is opened.

Description

Data Types

DRV_CLIENT_STATUS Enumeration

Identifies the current status/state of a client's connection to a driver.

File

driver_common.h

C

```
typedef enum {
  DRV_CLIENT_STATUS_ERROR_EXTENDED = -10,
  DRV_CLIENT_STATUS_ERROR = -1,
  DRV_CLIENT_STATUS_CLOSED = 0,
  DRV_CLIENT_STATUS_BUSY = 1,
  DRV_CLIENT_STATUS_READY = 2,
  DRV_CLIENT_STATUS_READY_EXTENDED = 10
} DRV_CLIENT_STATUS;
```

Members

Members	Description
DRV_CLIENT_STATUS_ERROR_EXTENDED = -10	Indicates that a driver-specific error has occurred.
DRV_CLIENT_STATUS_ERROR = -1	An unspecified error has occurred.
DRV_CLIENT_STATUS_CLOSED = 0	The driver is closed, no operations for this client are ongoing, and/or the given handle is invalid.
DRV_CLIENT_STATUS_BUSY = 1	The driver is currently busy and cannot start additional operations.
DRV_CLIENT_STATUS_READY = 2	The module is running and ready for additional operations
DRV_CLIENT_STATUS_READY_EXTENDED = 10	Indicates that the module is in a driver-specific ready/run state.

Description

Driver Client Status

This enumeration identifies the current status/state of a client's link to a driver.

Remarks

The enumeration used as the return type for the client-level status routines defined by each device driver or system module (for example, DRV_USART_ClientStatus) must be based on the values in this enumeration.

DRV_HANDLE Type

Handle to an opened device driver.

File

driver_common.h

C

```
typedef uintptr_t DRV_HANDLE;
```

Description

Device Handle

This handle identifies the open instance of a device driver. It must be passed to all other driver routines (except the initialization, deinitialization, or power routines) to identify the caller.

Remarks

Every application or module that wants to use a driver must first call the driver's open routine. This is the only routine that is absolutely required for

every driver.

If a driver is unable to allow an additional module to use it, it must then return the special value DRV_HANDLE_INVALID. Callers should check the handle returned for this value to ensure this value was not returned before attempting to call any other driver routines using the handle.

DRV_IO_BUFFER_TYPES Enumeration

Identifies to which buffer a device operation will apply.

File

driver_common.h

C

```
typedef enum {
  DRV_IO_BUFFER_TYPE_NONE = 0x00,
  DRV_IO_BUFFER_TYPE_READ = 0x01,
  DRV_IO_BUFFER_TYPE_WRITE = 0x02,
  DRV_IO_BUFFER_TYPE_RW = DRV_IO_BUFFER_TYPE_READ|DRV_IO_BUFFER_TYPE_WRITE
} DRV_IO_BUFFER_TYPES;
```

Members

Members	Description
DRV_IO_BUFFER_TYPE_NONE = 0x00	Operation does not apply to any buffer
DRV_IO_BUFFER_TYPE_READ = 0x01	Operation applies to read buffer
DRV_IO_BUFFER_TYPE_WRITE = 0x02	Operation applies to write buffer
DRV_IO_BUFFER_TYPE_RW = DRV_IO_BUFFER_TYPE_READ|DRV_IO_BUFFER_TYPE_WRITE	Operation applies to both read and write buffers

Description

Device Driver IO Buffer Identifier

This enumeration identifies to which buffer (read, write, both, or neither) a device operation will apply. This is used for "flush" (or similar) operations.

DRV_IO_INTENT Enumeration

Identifies the intended usage of the device when it is opened.

File

driver_common.h

C

```
typedef enum {
  DRV_IO_INTENT_READ,
  DRV_IO_INTENT_WRITE,
  DRV_IO_INTENT_READWRITE,
  DRV_IO_INTENT_BLOCKING,
  DRV_IO_INTENT_NONBLOCKING,
  DRV_IO_INTENT_EXCLUSIVE,
  DRV_IO_INTENT_SHARED
} DRV_IO_INTENT;
```

Members

Members	Description
DRV_IO_INTENT_READ	Read
DRV_IO_INTENT_WRITE	Write
DRV_IO_INTENT_READWRITE	Read and Write
DRV_IO_INTENT_BLOCKING	The driver will block and will return when the operation is complete
DRV_IO_INTENT_NONBLOCKING	The driver will return immediately
DRV_IO_INTENT_EXCLUSIVE	The driver will support only one client at a time
DRV_IO_INTENT_SHARED	The driver will support multiple clients at a time

Description

Device Driver I/O Intent

This enumeration identifies the intended usage of the device when the caller opens the device. It identifies the desired behavior of the device

driver for the following:

- Blocking or non-blocking I/O behavior (do I/O calls such as read and write block until the operation is finished or do they return immediately and require the caller to call another routine to check the status of the operation)
- Support reading and/or writing of data from/to the device
- Identify the buffering behavior (sometimes called "double buffering" of the driver. Indicates if the driver should maintain its own read/write buffers and copy data to/from these buffers to/from the caller's buffers.
- Identify the DMA behavior of the peripheral

Remarks

The buffer allocation method is not identified by this enumeration. Buffers can be allocated statically at build time, dynamically at run-time, or even allocated by the caller and passed to the driver for its own usage if a driver-specific routine is provided for such. This choice is left to the design of the individual driver and is considered part of its interface.

These values can be considered "flags". One selection from each of the groups below can be ORed together to create the complete value passed to the driver's open routine.

Constants

DRV_CONFIG_NOT_SUPPORTED Macro

Not supported configuration.

File

driver_common.h

C

```
#define DRV_CONFIG_NOT_SUPPORTED (((unsigned short) -1))
```

Description

Not supported configuration

If the configuration option is not supported on an instance of the peripheral, use this macro to equate to that configuration. This option should be listed as a possible value in the description of that configuration option.

DRV_HANDLE_INVALID Macro

Invalid device handle.

File

driver_common.h

C

```
#define DRV_HANDLE_INVALID (((DRV_HANDLE) -1))
```

Description

Invalid Device Handle

If a driver is unable to allow an additional module to use it, it must then return the special value DRV_HANDLE_INVALID. Callers should check the handle returned for this value to ensure this value was not returned before attempting to call any other driver routines using the handle.

Remarks

None.

DRV_IO_ISBLOCKING Macro

Returns if the I/O intent provided is blocking

File

driver_common.h

C

```
#define DRV_IO_ISBLOCKING(intent) (intent & DRV_IO_INTENT_BLOCKING)
```

Description

Device Driver Blocking Status Macro

This macro returns if the I/O intent provided is blocking.

Remarks

None.

DRV_IO_ISEXCLUSIVE Macro

Returns if the I/O intent provided is non-blocking.

File

driver_common.h

C

```
#define DRV_IO_ISEXCLUSIVE(intent) (intent & DRV_IO_INTENT_EXCLUSIVE)
```

Description

Device Driver Exclusive Status Macro

This macro returns if the I/O intent provided is non-blocking.

Remarks

None.

DRV_IO_ISNONBLOCKING Macro

Returns if the I/O intent provided is non-blocking.

File

driver_common.h

C

```
#define DRV_IO_ISNONBLOCKING(intent) (intent & DRV_IO_INTENT_NONBLOCKING )
```

Description

Device Driver Non Blocking Status Macro

This macro returns if the I/ intent provided is non-blocking.

Remarks

None.

_DRV_COMMON_H Macro

File

driver_common.h

C

```
#define _DRV_COMMON_H
```

Description

This is macro _DRV_COMMON_H.

_PLIB_UNSUPPORTED Macro

Abstracts the use of the unsupported attribute defined by the compiler.

File

driver_common.h

C

```
#define _PLIB_UNSUPPORTED
```

Description

Unsupported Attribute Abstraction

This macro nulls the definition of the _PLIB_UNSUPPORTED macro, to support compilation of the drivers for all different variants.

Remarks

None.

Example

void _PLIB_UNSUPPORTED PLIB_USART_Enable(USART_MODULE_ID index);

This function will not generate a compiler error if the interface is not defined for the selected device.

Files

Files

Name	Description
driver.h	This file aggregates all of the driver library interface headers.
driver_common.h	This file defines the common macros and definitions used by the driver definition and implementation headers.

Description

driver.h

This file aggregates all of the driver library interface headers.

Description

Driver Library Interface Header Definitions

Driver Library Interface Header This file aggregates all of the driver library interface headers so client code only needs to include this one single header to obtain prototypes and definitions for the interfaces to all driver libraries. A device driver provides a simple well-defined interface to a hardware peripheral that can be used without operating system support or that can be easily ported to a variety of operating systems. A driver has the fundamental responsibilities:

- Providing a highly abstracted interface to a peripheral
- Controlling access to a peripheral
- Managing the state of a peripheral

Remarks

The directory in which this file resides should be added to the compiler's search path for header files.

File Name

drv.h

Company

Microchip Technology Inc.

driver_common.h

This file defines the common macros and definitions used by the driver definition and implementation headers.

Enumerations

	Name	Description
	DRV_CLIENT_STATUS	Identifies the current status/state of a client's connection to a driver.
	DRV_IO_BUFFER_TYPES	Identifies to which buffer a device operation will apply.
	DRV_IO_INTENT	Identifies the intended usage of the device when it is opened.

Macros

	Name	Description
	_DRV_COMMON_H	This is macro _DRV_COMMON_H.
	_PLIB_UNSUPPORTED	Abstracts the use of the unsupported attribute defined by the compiler.
	DRV_CONFIG_NOT_SUPPORTED	Not supported configuration.
	DRV_HANDLE_INVALID	Invalid device handle.
	DRV_IO_ISBLOCKING	Returns if the I/O intent provided is blocking
	DRV_IO_ISEXCLUSIVE	Returns if the I/O intent provided is non-blocking.
	DRV_IO_ISNONBLOCKING	Returns if the I/O intent provided is non-blocking.

Types

	Name	Description
	DRV_HANDLE	Handle to an opened device driver.

Description

ADC Driver Library

This section describes the Analog-to-Digital Converter (ADC) Driver Library.

Introduction

This Analog-to-Digital Converter (ADC) driver provides an interface to manage the ADC module on the Microchip family of microcontrollers.

Description

An ADC is a vital part of any system that interfaces to real-world signals. While there are many techniques for analog-to-digital conversion, the Microchip family of microcontrollers uses Successive Approximation as one of its primary techniques.

Through MHC, this driver provides APIs to interact with the ADC module.

Note: Only Static implementation is supported for the ADC Driver Library.

Library Interface

Functions

	Name	Description
	DRV_ADC_Deinitialize	Deinitializes the DRV_ADC_Initialize driver module **Implementation:** Static
	DRV_ADC_Initialize	Initializes the ADC driver. **Implementation:** Static
	DRV_ADC_SamplesAvailable	Identifies if specified ADC Driver input has any samples available to read. **Implementation:** Static
	DRV_ADC_SamplesRead	Reads the converted sample data from ADC input Data buffer. **Implementation:** Static
	DRV_ADC_Start	Starts the software trigger for the ADC driver sampling and converting analog to digital values. **Implementation:** Static

	DRV_ADC_Stop	Stops the Global Software Level Trigger from continuing triggering for converting ADC data. **Implementation:** Static
	DRV_ADCx_Close	Closes the ADC instance for the specified driver index. **Implementation:** Static
	DRV_ADCx_Open	Opens the ADC instance for the specified driver index. **Implementation:** Static

Description

This section lists the interface routines, data types, constants and macros for the library.

Functions

DRV_ADC_Deinitialize Function

Deinitializes the DRV_ADC_Initialize driver module

Implementation: Static

File

help_drv_adc.h

C

```
void DRV_ADC_Deinitialize();
```

Returns

None.

Description

This function deinitializes the ADC Driver module for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters.

Remarks

None.

Preconditions

None.

Function

void DRV_ADC_Deinitialize(void)

DRV_ADC_Initialize Function

Initializes the ADC driver.

Implementation: Static

File

help_drv_adc.h

C

```
void DRV_ADC_Initialize();
```

Returns

None.

Description

This function initializes the ADC Driver module for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters.

Remarks

This function must be called before any other ADC function is called. This function should only be called once during system initialization.

Preconditions

None.

Function

void DRV_ADC_Initialize(void)

DRV_ADC_SamplesAvailable Function

Identifies if specified ADC Driver input has any samples available to read.

Implementation: Static

File

help_drv_adc.h

C

```
bool DRV_ADC_SamplesAvailable(uint8_t bufIndex);
```

Returns

- true - When ADC data buffer is available to be read
- false - When ADC data buffer is not available

Description

This function identifies whether the specified ADC Driver input has any samples available to read.

Remarks

None.

Preconditions

The following functions have been called:

- DRV_ADC_Initialize
- DRV_ADCx_Open
- DRV_ADC_Start or other triggered by source setup in MHC

Parameters

Parameters	Description
uint8_t bufIndex	ADC input number (ANx)

Function

bool DRV_ADC_SamplesAvailable(uint8_t bufIndex);

DRV_ADC_SamplesRead Function

Reads the converted sample data from ADC input Data buffer.

Implementation: Static

File

help_drv_adc.h

C

```
uint32_t DRV_ADC_SamplesRead(uint8_t bufIndex);
```

Returns

uint32_t - ADC converted sample data.

Description

This function returns the converted sample data from ADC input Data buffer.

Remarks

None.

Preconditions

The following functions have been called:

- DRV_ADC_Initialize
- DRV_ADCx_Open
- DRV_ADC_Start or other triggered by source setup in MHC

Parameters

Parameters	Description
uint8_t bufIndex	Analog input number (ANx)

Function

uint32_t DRV_ADC_SamplesRead(uint8_t bufIndex);

DRV_ADC_Start Function

Starts the software trigger for the ADC driver sampling and converting analog to digital values.

Implementation: Static

File

help_drv_adc.h

C

```
void DRV_ADC_Start();
```

Returns

None.

Description

This function provides a global edge and level trigger for the ADC driver to start the conversion.

Remarks

None.

Preconditions

The following functions have been called:

- DRV_ADC_Initialize
- DRV_ADCx_Open

Function

void DRV_ADC_Start(void);

DRV_ADC_Stop Function

Stops the Global Software Level Trigger from continuing triggering for converting ADC data.

Implementation: Static

File

help_drv_adc.h

C

```
void DRV_ADC_Stop();
```

Returns

None.

Description

This function stops the Global Software Level Trigger from continuing triggering for converting ADC data.

Remarks

None.

Preconditions

The following functions have been called:

- DRV_ADC_Initialize
- DRV_ADCx_Open

Function

void DRV_ADC_Stop(void);

DRV_ADCx_Close Function

Closes the ADC instance for the specified driver index.

Implementation: Static

File

help_drv_adc.h

C

```
void DRV_ADCx_Close();
```

Returns

None.

Description

This function closes the specified driver instance (where 'x' is the instance number) making it ready for clients to use it.

Remarks

'x' indicates the instance number.

Preconditions

DRV_ADC_Initialize has been called.

Function

void DRV_ADCx_Close(void)

DRV_ADCx_Open Function

Opens the ADC instance for the specified driver index.

Implementation: Static

File

help_drv_adc.h

C

```
void DRV_ADCx_Open();
```

Returns

None.

Description

This function opens the specified driver instance (where 'x' is the instance number) making it ready for clients to use it.

Remarks

'x' indicates the instance number.

Preconditions

DRV_ADC_Initialize has been called.

Function

void DRV_ADCx_Open(void)

Camera Driver Libraries

This section describes the Camera Driver Libraries.

Introduction

This section provides information on the Camera Driver libraries that are provided in MPLAB Harmony and describes the APIs that are common to all drivers.

Library Interface

a) Common Driver Functions

	Name	Description
	DRV_CAMERA_Close	Closes an opened instance of an CAMERA module driver.
	DRV_CAMERA_Deinitialize	Deinitializes the index instance of the CAMERA module.
	DRV_CAMERA_Initialize	Initializes hardware and data for the index instance of the CAMERA module.
	DRV_CAMERA_Open	Opens the specified instance of the Camera driver for use and provides an "open instance" handle.
	DRV_CAMERA_Reinitialize	Reinitializes hardware and data for the index instance of the CAMERA module.
	DRV_CAMERA_Status	Provides the current status of the index instance of the CAMERA module.
	DRV_CAMERA_Tasks	This is function DRV_CAMERA_Tasks.

b) Common Data Types and Constants

	Name	Description
	DRV_CAMERA_INIT	Defines the data required to initialize or reinitialize the CAMERA driver.
	DRV_CAMERA_INTERRUPT_PORT_REMAP	Defines the data required to initialize the CAMERA driver interrupt port remap.
	DRV_CAMERA_INDEX_0	Camera driver index definitions.
	DRV_CAMERA_INDEX_1	This is macro DRV_CAMERA_INDEX_1.
	DRV_CAMERA_INDEX_COUNT	Number of valid CAMERA driver indices.
	CAMERA_MODULE_ID	This is type CAMERA_MODULE_ID.

Description

Camera Driver APIs that are common to all Camera drivers.

a) Common Driver Functions

DRV_CAMERA_Close Function

Closes an opened instance of an CAMERA module driver.

File

drv_camera.h

C

```
void DRV_CAMERA_Close(DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened instance of an CAMERA module driver, making the specified handle invalid.

Remarks

None.

Preconditions

The DRV_CAMERA_Initialize routine must have been called for the specified CAMERA device instance and the DRV_CAMERA_Status must

have returned SYS_STATUS_READY.

DRV_CAMERA_Open must have been called to obtain a valid opened device handle.

Example

```
myCameraHandle = DRV_CAMERA_Open(DRV_CAMERA_ID_1, DRV_IO_INTENT_NONBLOCKING|DRV_IO_INTENT_READWRITE);

DRV_CAMERA_Close(myCameraHandle);
```

Parameters

Parameters	Description
drvHandle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_CAMERA_Close (const DRV_HANDLE drvHandle)

DRV_CAMERA_Deinitialize Function

Deinitializes the index instance of the CAMERA module.

File

drv_camera.h

C

```
void DRV_CAMERA_Deinitialize(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

This function deinitializes the index instance of the CAMERA module, disabling its operation (and any hardware for driver modules). It deinitializes only the specified module instance. It also resets all the internal data structures and fields for the specified instance to the default settings.

Remarks

None.

Preconditions

The DRV_CAMERA_Initialize function should have been called before calling this function.

Example

```
SYS_STATUS   cameraStatus;

DRV_CAMERA_Deinitialize(DRV_CAMERA_ID_1);

cameraStatus = DRV_CAMERA_Status(DRV_CAMERA_ID_1);
```

Parameters

Parameters	Description
index	Index, identifying the instance of the CAMERA module to be deinitialized

Function

void DRV_CAMERA_Deinitialize (const SYS_MODULE_ID index)

DRV_CAMERA_Initialize Function

Initializes hardware and data for the index instance of the CAMERA module.

File

drv_camera.h

C

```
SYS_MODULE_OBJ DRV_CAMERA_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

None.

Description

This function initializes hardware for the index instance of the CAMERA module, using the hardware initialization given data. It also initializes any internal driver data structures making the driver ready to be opened.

Remarks

None.

Preconditions

None.

Example

```
DRV_CAMERA_INIT_DATA        cameraInitData;
SYS_STATUS                  cameraStatus;

// Populate the cameraInitData structure
cameraInitData.moduleInit.powerState = SYS_MODULE_POWER_RUN_FULL;
cameraInitData.moduleInit.moduleCode = (DRV_CAMERA_INIT_DATA_MASTER | DRV_CAMERA_INIT_DATA_SLAVE);

DRV_CAMERA_Initialize(DRV_CAMERA_ID_1, (SYS_MODULE_INIT*)&cameraInitData);
cameraStatus = DRV_CAMERA_Status(DRV_CAMERA_ID_1);
```

Parameters

Parameters	Description
index	Index, identifying the instance of the CAMERA module to be initialized
data	Pointer to the data structure containing any data necessary to initialize the hardware. This pointer may be null if no data is required and the default initialization is to be used.

Function

void DRV_CAMERA_Initialize (const CAMERA_MODULE_ID index,
const SYS_MODULE_INIT *const data)

DRV_CAMERA_Open Function

Opens the specified instance of the Camera driver for use and provides an "open instance" handle.

File

drv_camera.h

C

```
DRV_HANDLE DRV_CAMERA_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a value identifying both the caller and the module instance). If an error occurs, the returned value is DRV_HANDLE_INVALID.

Description

This function opens the specified instance of the Camera module for use and provides a handle that is required to use the remaining driver routines.

This function opens a specified instance of the Camera module driver for use by any client module and provides an "open instance" handle that must be provided to any of the other Camera driver operations to identify the caller and the instance of the Camera driver/hardware module.

Preconditions

The DRV_CAMERA_Initialize routine must have been called for the specified CAMERA device instance and the DRV_CAMERA_Status must have returned SYS_STATUS_READY.

Example

```
DRV_HANDLE                cameraHandle;
DRV_CAMERA_CLIENT_STATUS   cameraClientStatus;
```

```
cameraHandle = DRV_CAMERA_Open(DRV_CAMERA_ID_1, DRV_IO_INTENT_NONBLOCKING|DRV_IO_INTENT_READWRITE);
if (DRV_HANDLE_INVALID == cameraHandle)
{
    // Handle open error
}

cameraClientStatus = DRV_CAMERA_ClientStatus(cameraHandle);

// Close the device when it is no longer needed.
DRV_CAMERA_Close(cameraHandle);
```

Parameters

Parameters	Description
index	Index, identifying the instance of the CAMERA module to be opened.
intent	Flags parameter identifying the intended usage and behavior of the driver. Multiple flags may be ORed together to specify the intended usage of the device. See the DRV_IO_INTENT definition.

Function

DRV_HANDLE DRV_CAMERA_Open (const SYS_MODULE_INDEX index,
const DRV_IO_INTENT intent)

DRV_CAMERA_Reinitialize Function

Reinitializes hardware and data for the index instance of the CAMERA module.

File

drv_camera.h

C

```
void DRV_CAMERA_Reinitialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT *const data);
```

Returns

None.

Description

This function reinitializes hardware for the index instance of the CAMERA module, using the hardware initialization given data. It also reinitializes any internal driver data structures making the driver ready to be opened.

Remarks

None.

Preconditions

The DRV_CAMERA_Initialize function should have been called before calling this function.

Example

```
SYS_MODULE_INIT cameraInit;
SYS_STATUS      cameraStatus;

DRV_CAMERA_Reinitialize(DRV_CAMERA_ID_1, &cameraStatus);
```

Parameters

Parameters	Description
index	Index, identifying the instance of the CAMERA module to be reinitialized
data	Pointer to the data structure containing any data necessary to reinitialize the hardware. This pointer may be null if no data is required and default configuration is to be used.

Function

void DRV_CAMERA_Reinitialize(const SYS_MODULE_ID index,
const SYS_MODULE_INIT *const data)

DRV_CAMERA_Status Function

Provides the current status of the index instance of the CAMERA module.

File

drv_camera.h

C

```
SYS_STATUS DRV_CAMERA_Status(const SYS_MODULE_INDEX index);
```

Returns

The current status of the index instance.

Description

This function provides the current status of the index instance of the CAMERA module.

Remarks

None.

Preconditions

The DRV_CAMERA_Initialize function should have been called before calling this function.

Function

SYS_STATUS DRV_CAMERA_Status (const CAMERA_MODULE_ID index)

DRV_CAMERA_Tasks Function

File

drv_camera.h

C

```
void DRV_CAMERA_Tasks(SYS_MODULE_OBJ object);
```

Description

This is function DRV_CAMERA_Tasks.

b) Common Data Types and Constants

DRV_CAMERA_INIT Structure

Defines the data required to initialize or reinitialize the CAMERA driver.

File

drv_camera.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  int cameraId;
  SYS_MODULE_OBJ (* drvInitialize)(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
  DRV_HANDLE (* drvOpen)(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
  INT_SOURCE interruptSource;
  DRV_CAMERA_INTERRUPT_PORT_REMAP interruptPort;
  uint16_t orientation;
  uint16_t horizontalResolution;
  uint16_t verticalResolution;
} DRV_CAMERA_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
int cameraId;	ID
uint16_t orientation;	Orientation of the display (given in degrees of 0,90,180,270)
uint16_t horizontalResolution;	Horizontal Resolution of the displayed orientation in Pixels

Description

CAMERA Driver Initialization Data

This data type defines the data required to initialize or reinitialize the CAMERA driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

DRV_CAMERA_INTERRUPT_PORT_REMAP Structure

Defines the data required to initialize the CAMERA driver interrupt port remap.

File

drv_camera.h

C

```
typedef struct {
  PORTS_REMAP_INPUT_FUNCTION inputFunction;
  PORTS_REMAP_INPUT_PIN inputPin;
  PORTS_ANALOG_PIN analogPin;
  PORTS_PIN_MODE pinMode;
  PORTS_CHANNEL channel;
  PORTS_DATA_MASK dataMask;
} DRV_CAMERA_INTERRUPT_PORT_REMAP;
```

Description

CAMERA Driver Interrupt Port Remap Initialization Data

This data type defines the data required to initialize the CAMERA driver interrupt port remap.

Remarks

None.

DRV_CAMERA_INDEX_0 Macro

Camera driver index definitions.

File

drv_camera.h

C

```
#define DRV_CAMERA_INDEX_0 0
```

Description

Camera Driver Module Index Numbers

These constants provide the Camera driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_CAMERA_Initialize and DRV_CAMERA_Open functions to identify the driver instance in use.

DRV_CAMERA_INDEX_1 Macro

File

drv_camera.h

C

```
#define DRV_CAMERA_INDEX_1 1
```

Description

This is macro DRV_CAMERA_INDEX_1.

DRV_CAMERA_INDEX_COUNT Macro

Number of valid CAMERA driver indices.

File

drv_camera.h

C

```
#define DRV_CAMERA_INDEX_COUNT 1
```

Description

CAMERA Driver Module Index Count

This constant identifies the number of valid CAMERA driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

CAMERA_MODULE_ID Enumeration

File

drv_camera.h

C

```
typedef enum {
  CAMERA_MODULE_OVM7690
} CAMERA_MODULE_ID;
```

Description

This is type CAMERA_MODULE_ID.

Files

Files

Name	Description
drv_camera.h	Camera device driver interface file.

Description

drv_camera.h

Camera device driver interface file.

Enumerations

	Name	Description
	CAMERA_MODULE_ID	This is type CAMERA_MODULE_ID.

Functions

	Name	Description
	DRV_CAMERA_Close	Closes an opened instance of an CAMERA module driver.
	DRV_CAMERA_Deinitialize	Deinitializes the index instance of the CAMERA module.
	DRV_CAMERA_Initialize	Initializes hardware and data for the index instance of the CAMERA module.
	DRV_CAMERA_Open	Opens the specified instance of the Camera driver for use and provides an "open instance" handle.
	DRV_CAMERA_Reinitialize	Reinitializes hardware and data for the index instance of the CAMERA module.
	DRV_CAMERA_Status	Provides the current status of the index instance of the CAMERA module.
	DRV_CAMERA_Tasks	This is function DRV_CAMERA_Tasks.

Macros

	Name	Description
	DRV_CAMERA_INDEX_0	Camera driver index definitions.
	DRV_CAMERA_INDEX_1	This is macro DRV_CAMERA_INDEX_1.
	DRV_CAMERA_INDEX_COUNT	Number of valid CAMERA driver indices.

Structures

	Name	Description
	DRV_CAMERA_INIT	Defines the data required to initialize or reinitialize the CAMERA driver.
	DRV_CAMERA_INTERRUPT_PORT_REMAP	Defines the data required to initialize the CAMERA driver interrupt port remap.

Description

Camera Driver Interface

The Camera driver provides a abstraction to all camera drivers.

File Name

drv_camera.h

Company

Microchip Technology Inc.

OVM7690 Camera Driver Library

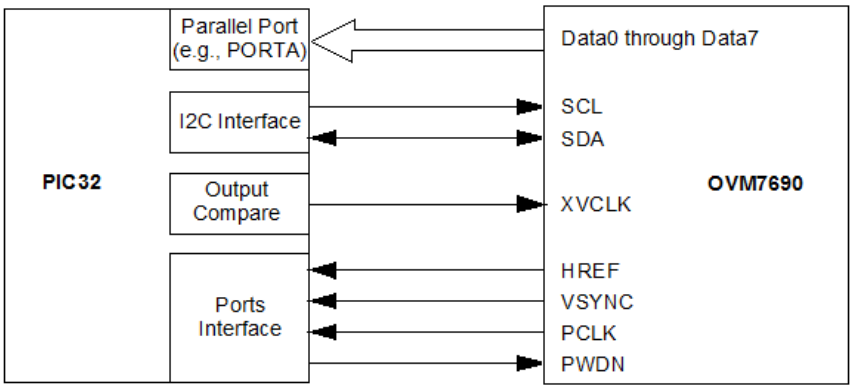
This topic describes the OVM7690 Camera Driver Library.

Introduction

The OVM7690 Camera Driver provides a high-level interface to manage the OmniVision Technologies, Inc. OVM7690 640x480 CameraCube™ device (referred to as the OVM7690) that is interfaced with serial and parallel ports to a Microchip microcontroller for providing camera solutions.

Description

The OVM7690 640x480 CameraCube™ device (referred to as the OVM7690) can be interfaced to a Microchip microcontroller using the I2C serial interface and parallel port interface. The I2C serial interface is used for control command transfer. The I2C module from the microcontroller is connected to the SCCB serial interface of the OVM7690. The parallel port interface is used to transfer pixel data from the OVM7690 to the microcontroller. There are few other signals from the camera to be interfaced with the microcontroller. The XVCLK pin of the camera is driven by the Output Compare module. Frame synchronization signals such as HREF and VSYNC from the camera are connected to suitable pins supporting change notification within the microcontroller. The PCLK pin of the camera drives the pixel clock and is connected at the pin of the microcontroller supporting external interrupts. The PWDN pin of the camera supports camera power-down mode and is connected at any output port pin of the microcontroller. A typical interface of the OVM7690 to a PIC32 device is provided in the following diagram:



Using the Library

This topic describes the basic architecture of the OVM7690 Camera Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_camera_ovm7690.h`

The interface to the Camera Driver Library is defined in the `drv_camera_ovm7690.h` header file.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address the overall operation of the OVM7690 Camera Driver Library.

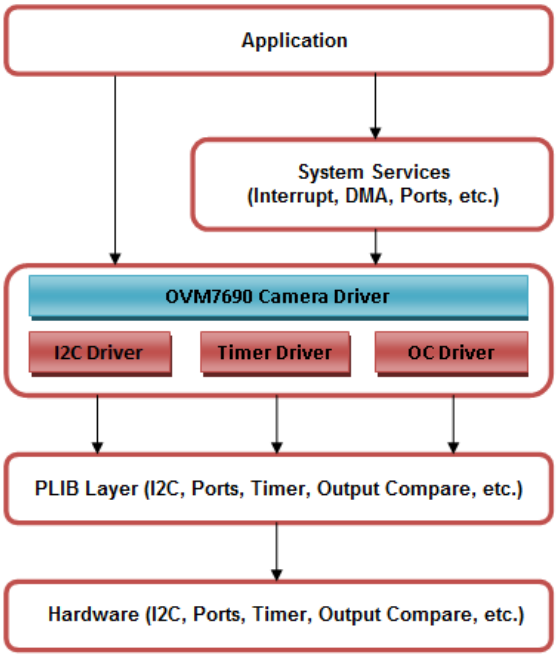
Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization and deinitialization.
Client Setup Functions	Provides open and close functions.
Camera-specific Functions	Provides APIs that are camera-specific.
Other Functions	Provides miscellaneous driver-specific functions such as register set functions, among others.

Abstraction Model

This library provides a low-level abstraction of the OVM7690 Camera Driver Library on Microchip's microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The OVM7690 Camera Driver is modeled using the abstraction model, as shown in the following diagram.



How the Library Works

Provides information on how the OVM7690 Camera Driver Library works.

Description

The library provides interfaces to support:

- System functionality
- Client functionality

System Initialization

The system performs the Initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization, each instance of the OVM7690 would be initialized with the following configuration settings that are supported by the specific OVM7690 device hardware:

- Camera ID: OVM7690 ID
- Source Port: Address of source port to which the pixel data is received
- Horizontal Sync Channel: Channel of the pin to be configured as horizontal sync
- Horizontal Sync Position: Horizontal sync port pin position from selected port channel
- Vertical Sync Channel: Channel the pin to be configured as vertical sync
- Vertical Sync Position: Vertical sync port pin position from selected port channel
- Horizontal Sync Interrupt Source
- Vertical Sync Interrupt Source
- DMA Channel: DMA channel to transfer pixel data from camera to frame buffer
- DMA Channel Trigger Source
- Bits Per Pixel: Bits per pixel to define the size of frame line

The DRV_CAMERA_OVM7690_Initialize API returns an object handle of the type SYS_MODULE_OBJ. The object handler returned by the Initialize Interface would be used by the other interfaces such as DRV_CAMERA_OVM7690_Deinitialize.

Client Access

For the application to start using an instance of the module, it must call the DRV_CAMERA_OVM7690_Open function. The DRV_CAMERA_OVM7690_Open function provides a driver handle to the OVM7690 Camera Driver instance for operations. If the driver is deinitialized using the function DRV_CAMERA_OVM7690_Deinitialize function, the application must call the DRV_CAMERA_OVM7690_Open function again to set up the instance of the driver.

Client Operations

Client operations provide the API interface for control command and pixel data transfer from the OVM7690 Camera Driver to the Graphics Frame Buffer.

Configuring the Library

Macros

	Name	Description
	DRV_OVM7690_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.

Description

The configuration of the OVM7690 Camera Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the OVM7690 Camera Driver build. Based on the selections made here and the system setup, the OVM7690 Camera Driver may support the selected features. These configuration settings will apply to all instances of the driver.

This header can be placed anywhere in the application specific folders and the path of this header needs to be presented to the include search for a successful build. Refer to the Applications Help section for more details.

Control Commands

The following OVM7690-specific control commands are provided:

- DRV_CAMERA_OVM7690_FrameBufferAddressSet
- DRV_CAMERA_OVM7690_Start
- DRV_CAMERA_OVM7690_Stop
- DRV_CAMERA_OVM7690_FrameRectSet

Application Process

An application needs to perform following steps:

1. The system should have completed necessary setup initializations.
2. The I2C driver object should have been initialized by calling DRV_I2C_Initialize.
3. The Timer driver object should have been initialized by calling DRV_Timer_Initialize,
4. The Output Control driver object should have been initialized by calling DRV_OC_Initialize,
5. The OVM7690 Camera Driver object should have been initialized by calling DRV_CAMERA_OVM7690_Initialize,
6. Open the OVM7690 Camera Driver client by calling DRV_CAMERA_OVM7690_Open.
7. Pass the Graphics Frame buffer address to OVM7690 Camera Driver by calling DRV_CAMERA_OVM7690_FrameBufferAddressSet.
8. Set the Frame Rectangle area by calling DRV_CAMERA_OVM7690_FrameRectSet.
9. Set Other Camera settings such as: soft reset, enabling pclk, enabling href, enabling vsync, output color format, reversing HREF polarity, gating clock to the HREF, pixel clock frequency, sub-sampling mode by calling DRV_CAMERA_OVM7690_RegisterSet.
10. Start the OVM7690 Camera by calling DRV_CAMERA_OVM7690_Start.

DRV_OVM7690_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_ovm7690_config_template.h

C

```
#define DRV_OVM7690_INTERRUPT_MODE false
```

Description

OVM7690 Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of OVM7690 operation is desired
- false - Select if polling mode of OVM7690 operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

Building the Library

This section lists the files that are available in the OVM7690 Camera Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/camera/ovm7690`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_camera_ovm7690.h`	This file provides the interface definitions of the OVM7690 Camera Driver.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/drv_camera_ovm7690.c`	This file contains the implementation of the OVM7690 Camera Driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The OVM7690 Camera Driver Library depends on the following modules:

- I2C Driver Library
- Output Compare Driver Library
- Timer Driver Library

Library Interface

a) System Functions

	Name	Description
	DRV_CAMERA_OVM7690_Initialize	Initializes the OVM7690 Camera instance for the specified driver index.
	DRV_CAMERA_OVM7690_Deinitialize	Deinitializes the specified instance of the OVM7690 Camera Driver module.
	DRV_CAMERA_OVM7690_RegisterSet	Sets the camera OVM7690 configuration registers.
	DRV_CAMERA_OVM7690_Tasks	Maintains the OVM7690 state machine.

b) Client Setup Functions

	Name	Description
	DRV_CAMERA_OVM7690_Open	Opens the specified OVM7690 Camera Driver instance and returns a handle to it.
	DRV_CAMERA_OVM7690_Close	Closes an opened instance of the OVM7690 Camera Driver.

c) Camera-specific Functions

	Name	Description
	DRV_CAMERA_OVM7690_FrameBufferAddressSet	Sets the framebuffer address.
	DRV_CAMERA_OVM7690_FrameRectSet	Sets the frame rectangle set.
	DRV_CAMERA_OVM7690_Start	Starts camera rendering to the display.
	DRV_CAMERA_OVM7690_Stop	Stops rendering the camera Pixel data.

d) Other Functions

	Name	Description
	DRV_CAMERA_OVM7690_HsyncEventHandler	Horizontal synchronization event handler.
	DRV_CAMERA_OVM7690_VsyncEventHandler	Vertical synchronization event handler .

	_DRV_CAMERA_OVM7690_DMAEventHandler	This is function _DRV_CAMERA_OVM7690_DMAEventHandler.
	_DRV_CAMERA_OVM7690_delayMS	This is function _DRV_CAMERA_OVM7690_delayMS.
	_DRV_CAMERA_OVM7690_HardwareSetup	This is function _DRV_CAMERA_OVM7690_HardwareSetup.

e) Data Types and Constants

	Name	Description
	DRV_CAMERA_OVM7690_CLIENT_OBJ	OVM7690 Camera Driver client object.
	DRV_CAMERA_OVM7690_CLIENT_STATUS	Identifies OVM7690 Camera possible client status.
	DRV_CAMERA_OVM7690_ERROR	Identifies OVM7690 Camera possible errors.
	DRV_CAMERA_OVM7690_INIT	OVM7690 Camera Driver initialization parameters.
	DRV_CAMERA_OVM7690_OBJ	OVM7690 Camera Driver instance object.
	DRV_CAMERA_OVM7690_RECT	OVM7690 Camera window rectangle coordinates.
	DRV_CAMERA_OVM7690_REG12_OP_FORMAT	Lists OVM7690 Camera device register addresses.
	DRV_CAMERA_OVM7690_INDEX_0	OVM7690 driver index definitions.
	DRV_CAMERA_OVM7690_INDEX_1	This is macro DRV_CAMERA_OVM7690_INDEX_1.
	DRV_CAMERA_OVM7690_REG12_SOFT_RESET	OVM7690 Camera Driver Register 0x12 Soft reset flag.
	DRV_CAMERA_OVM7690_SCCB_READ_ID	OVM7690 Camera SCCB Interface device Read Slave ID.
	DRV_CAMERA_OVM7690_SCCB_WRITE_ID	OVM7690 Camera SCCB Interface device Write Slave ID.

Description

This section describes the Application Programming Interface (API) functions of the Camera Driver Library.

a) System Functions

DRV_CAMERA_OVM7690_Initialize Function

Initializes the OVM7690 Camera instance for the specified driver index.

File

drv_camera_ovm7690.h

C

```
SYS_MODULE_OBJ DRV_CAMERA_OVM7690_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the OVM7690 Camera Driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the init parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the OVM7690 Camera module ID. Refer to the description of the DRV_CAMERA_OVM7690_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This function must be called before any other OVM7690 Camera Driver function is called.

This function should only be called once during system initialization unless DRV_CAMERA_OVM7690_Deinitialize is called to deinitialize the driver instance. This function will NEVER block for hardware access.

Preconditions

None.

Example

```
// The following code snippet shows an example OVM7690 driver initialization.

DRV_CAMERA_OVM7690_INIT     cameraInit;
SYS_MODULE_OBJ              objectHandle;

cameraInit.cameraID                 = CAMERA_MODULE_OVM7690;
cameraInit.sourcePort               = (void *)&PORTK,
```

```
cameraInit.hsyncInterruptSource    = INT_SOURCE_CHANGE_NOTICE_A,
cameraInit.vsyncInterruptSource    = INT_SOURCE_CHANGE_NOTICE_J,
cameraInit.dmaChannel              = DRV_CAMERA_OVM7690_DMA_CHANNEL_INDEX,
cameraInit.dmaTriggerSource        = DMA_TRIGGER_EXTERNAL_2,
cameraInit.bpp                     = GFX_CONFIG_COLOR_DEPTH,

objectHandle = DRV_CAMERA_OVM7690_Initialize( DRV_CAMERA_OVM7690_INDEX_0,
                                              (SYS_MODULE_INIT*)&cameraInit);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_CAMERA_OVM7690_Initialize
(
const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init
)

DRV_CAMERA_OVM7690_Deinitialize Function

Deinitializes the specified instance of the OVM7690 Camera Driver module.

File

drv_camera_ovm7690.h

C

```
void DRV_CAMERA_OVM7690_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function deinitializes the specified instance of the OVM7690 Camera Driver module, disabling its operation (and any hardware), and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This function will NEVER block waiting for hardware.

Preconditions

Function DRV_CAMERA_OVM7690_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object; //  Returned from DRV_CAMERA_OVM7690_Initialize
SYS_STATUS          status;

DRV_CAMERA_OVM7690_Deinitialize(object);

status = DRV_CAMERA_OVM7690_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_CAMERA_OVM7690_Initialize function

Function

void DRV_CAMERA_OVM7690_Deinitialize(SYS_MODULE_OBJ object)

DRV_CAMERA_OVM7690_RegisterSet Function

Sets the camera OVM7690 configuration registers.

File

drv_camera_ovm7690.h

C

```
DRV_CAMERA_OVM7690_ERROR DRV_CAMERA_OVM7690_RegisterSet(DRV_CAMERA_OVM7690_REGISTER_ADDRESS regIndex,
uint8_t regValue);
```

Returns

- DRV_CAMERA_OVM7690_ERROR_INVALID_HANDLE - Invalid driver Handle.
- DRV_CAMERA_OVM7690_ERROR_NONE - No error.

Description

This function sets the OVM7690 Camera configuration registers using the SCCB interface.

Remarks

This function can be used separately or within an interface.

Preconditions

The DRV_CAMERA_OVM7690_Initialize function must have been called for the specified OVM7690 Camera Driver instance.

DRV_CAMERA_OVM7690_Open must have been called to obtain a valid opened device handle.

The SCCB interface also must have been initialized to configure the OVM7690 Camera Driver.

Example

```
DRV_HANDLE handle;
uint8_t reg12 = DRV_CAMERA_OVM7690_REG12_SOFT_RESET;

 handle = DRV_CAMERA_OVM7690_Open(DRV_CAMERA_OVM7690_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
 if (DRV_HANDLE_INVALID == handle)
 {
     //error
     return;
 }

 if ( DRV_CAMERA_OVM7690_RegisterSet( DRV_CAMERA_OVM7690_REG12_REG_ADDR,
                                      reg12 ) !=
                                      DRV_CAMERA_OVM7690_ERROR_NONE )
 {
     //error
     return;
 }
```

Parameters

Parameters	Description
regIndex	Defines the OVM7690 configuration register addresses.
regValue	Defines the register value to be set.

Function

DRV_CAMERA_OVM7690_ERROR DRV_CAMERA_OVM7690_RegisterSet

(

DRV_CAMERA_OVM7690_REGISTER_ADDRESS regIndex,

uint8_t regValue
)

DRV_CAMERA_OVM7690_Tasks Function

Maintains the OVM7690 state machine.

File

drv_camera_ovm7690.h

C

```
void DRV_CAMERA_OVM7690_Tasks(SYS_MODULE_OBJ object);
```

Function

void DRV_CAMERA_OVM7690_Tasks(SYS_MODULE_OBJ object);

b) Client Setup Functions

DRV_CAMERA_OVM7690_Open Function

Opens the specified OVM7690 Camera Driver instance and returns a handle to it.

File

drv_camera_ovm7690.h

C

```
DRV_HANDLE DRV_CAMERA_OVM7690_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the function returns a valid open instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Errors can occur:

- if the number of client objects allocated via DRV_CAMERA_OVM7690_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client
- if the driver is not ready to be opened, typically when the initialize function has not completed execution

Description

This function opens the specified OVM7690 Camera Driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

Remarks

The handle returned is valid until the DRV_CAMERA_OVM7690_Close function is called. This function will NEVER block waiting for hardware.If the requested intent flags are not supported, the function will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application.

Preconditions

Function DRV_CAMERA_OVM7690_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_CAMERA_OVM7690_Open(DRV_CAMERA_OVM7690_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver. See function description for details.

Function

```
DRV_HANDLE DRV_CAMERA_OVM7690_Open
(
const    SYS_MODULE_INDEX index,
const    DRV_IO_INTENT ioIntent
)
```

DRV_CAMERA_OVM7690_Close Function

Closes an opened instance of the OVM7690 Camera Driver.

File

drv_camera_ovm7690.h

C

```
void DRV_CAMERA_OVM7690_Close(DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened instance of the OVM7690 Camera Driver, invalidating the handle. Any buffers in the driver queue that were submitted by this client will be removed. After calling this function, the handle passed in "handle" must not be used with any of the remaining driver routines (with one possible exception described in the "Remarks" section). A new handle must be obtained by calling DRV_CAMERA_OVM7690_Open before the caller may use the driver again

Remarks

Usually there is no need for the client to verify that the Close operation has completed. The driver will abort any ongoing operations when this function is called.

Preconditions

The DRV_CAMERA_OVM7690_Initialize function must have been called for the specified OVM7690 Camera Driver instance.

DRV_CAMERA_OVM7690_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_USART_Open
DRV_CAMERA_OVM7690_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's Open function

Function

void DRV_CAMERA_OVM7690_Close(DRV_Handle handle)

c) Camera-specific Functions

DRV_CAMERA_OVM7690_FrameBufferAddressSet Function

Sets the framebuffer address.

File

drv_camera_ovm7690.h

C

```
DRV_CAMERA_OVM7690_ERROR DRV_CAMERA_OVM7690_FrameBufferAddressSet(DRV_HANDLE handle, void * frameBuffer);
```

Returns

- DRV_CAMERA_OVM7690_ERROR_INVALID_HANDLE - Invalid driver Handle.
- DRV_CAMERA_OVM7690_ERROR_NONE - No error.

Description

This function will set the framebuffer address. This framebuffer address will point to the location at which frame data is to be rendered. This buffer is shared with the display controller to display the frame on the display.

Remarks

This function is mandatory. A valid framebuffer address must be set to display the camera data.

Preconditions

The DRV_CAMERA_OVM7690_Initialize function must have been called for the specified OVM7690 Camera Driver instance.

DRV_CAMERA_OVM7690_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;
uint16_t frameBuffer[DISP_VER_RESOLUTION][DISP_HOR_RESOLUTION];

handle = DRV_CAMERA_OVM7690_Open(DRV_CAMERA_OVM7690_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    //error
    return;
}

if ( DRV_CAMERA_OVM7690_FrameBufferAddressSet( handle, (void *) frameBuffer ) !=
                                    DRV_CAMERA_OVM7690_ERROR_NONE )
{
    //error
    return;
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's Open function

Function

DRV_CAMERA_OVM7690_ERROR DRV_CAMERA_OVM7690_FrameBufferAddressSet

(

DRV_HANDLE handle,

void * frameBuffer

)

DRV_CAMERA_OVM7690_FrameRectSet Function

Sets the frame rectangle set.

File

drv_camera_ovm7690.h

C

```
DRV_CAMERA_OVM7690_ERROR DRV_CAMERA_OVM7690_FrameRectSet(DRV_HANDLE handle, uint32_t left, uint32_t top,
uint32_t right, uint32_t bottom);
```

Returns

- DRV_CAMERA_OVM7690_ERROR_INVALID_HANDLE - Invalid driver Handle.
- DRV_CAMERA_OVM7690_ERROR_NONE - No error.

Description

This function sets the frame rectangle coordinates. The frame within the rectangle is copied to the framebuffer. The left and top values are expected to be less than right and bottom respectively. Left, top, right, and bottom values are also expected to be within range of screen coordinates. Internally it calls the DRV_CAMERA_OVM7690_RegisterSet function to set the respective registers. The rectangle coordinates are also maintained in the driver object.

Remarks

This function is optional if default values are expected to be used.

Preconditions

The DRV_CAMERA_OVM7690_Initialize function must have been called for the specified OVM7690 Camera Driver instance.

DRV_CAMERA_OVM7690_Open must have been called to obtain a valid opened device handle.

The SCCB interface also must have been initialized to configure the OVM7690 Camera Driver.

Example

```
DRV_HANDLE handle;
uint32_t left   = 0x69;
uint32_t top    = 0x0E;
uint32_t right  = DISP_HOR_RESOLUTION + 0x69;
uint32_t bottom = DISP_VER_RESOLUTION + 0x69;

handle = DRV_CAMERA_OVM7690_Open(DRV_CAMERA_OVM7690_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    //error
    return;
}

if ( DRV_CAMERA_OVM7690_FrameRectSet( handle, left, top, right, bottom ) !=
                                      DRV_CAMERA_OVM7690_ERROR_NONE )
{
    //error
    return;
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's Open function
left	left frame coordinate
top	top frame coordinate
right	right frame coordinate
bottom	bottom frame coordinate

Function

DRV_CAMERA_OVM7690_ERROR DRV_CAMERA_OVM7690_FrameRectSet

(

DRV_HANDLE handle,

uint32_t left,

uint32_t top,

uint32_t right,

uint32_t bottom

)

DRV_CAMERA_OVM7690_Start Function

Starts camera rendering to the display.

File

drv_camera_ovm7690.h

C

```
DRV_CAMERA_OVM7690_ERROR DRV_CAMERA_OVM7690_Start(DRV_HANDLE handle);
```

Returns

- DRV_CAMERA_OVM7690_ERROR_INVALID_HANDLE - Invalid driver Handle.
- DRV_CAMERA_OVM7690_ERROR_NONE - No error.

Description

This function starts the camera rendering to the display by writing the pixel data to the framebuffer. The framebuffer is shared between the OVM7690 Camera and the display controller.

Remarks

This function is mandatory. Camera module will not update the framebuffer without calling this function.

Preconditions

The DRV_CAMERA_OVM7690_Initialize function must have been called for the specified OVM7690 Camera Driver instance.

DRV_CAMERA_OVM7690_Open must have been called to obtain a valid opened device handle.

DRV_CAMERA_OVM7690_FrameBufferAddressSet must have been called to set a valid framebuffer address.

Example

```
DRV_HANDLE handle;
uint16_t frameBuffer[DISP_VER_RESOLUTION][DISP_HOR_RESOLUTION];

handle = DRV_CAMERA_OVM7690_Open(DRV_CAMERA_OVM7690_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    //error
    return;
}

if ( DRV_CAMERA_OVM7690_FrameBufferAddressSet( handle, (void *) frameBuffer ) !=
                                    DRV_CAMERA_OVM7690_ERROR_NONE )
{
    //error
    return;
}

if ( DRV_CAMERA_OVM7690_Start( handle ) !=
                                    DRV_CAMERA_OVM7690_ERROR_NONE )
{
    //error
    return;
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's Open function

Function

```
DRV_CAMERA_OVM7690_ERROR DRV_CAMERA_OVM7690_Start
(
    DRV_HANDLE handle
);
```

DRV_CAMERA_OVM7690_Stop Function

Stops rendering the camera Pixel data.

File

drv_camera_ovm7690.h

C

```
DRV_CAMERA_OVM7690_ERROR DRV_CAMERA_OVM7690_Stop(DRV_HANDLE handle);
```

Returns

- DRV_CAMERA_OVM7690_ERROR_INVALID_HANDLE - Invalid driver Handle.
- DRV_CAMERA_OVM7690_ERROR_NONE - No error.

Description

This function starts the camera rendering to the display by writing the pixel data to the framebuffer. The framebuffer is shared between the OVM7690 Camera and the display controller.

Remarks

This function only disables the interrupt for HSYNC and VSYNC. To stop the camera the power-down pin needs to be toggled to an active-high value., which will stop the camera internal clock and maintain the register values.

Preconditions

The DRV_CAMERA_OVM7690_Initialize function must have been called for the specified OVM7690 Camera Driver instance.

DRV_CAMERA_OVM7690_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;

handle = DRV_CAMERA_OVM7690_Open(DRV_CAMERA_OVM7690_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    //error
    return;
}

if ( DRV_CAMERA_OVM7690_Stop( handle ) !=
                                    DRV_CAMERA_OVM7690_ERROR_NONE )
{
    //error
    return;
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's Open function.

Function

```
DRV_CAMERA_OVM7690_ERROR DRV_CAMERA_OVM7690_Stop
(
    DRV_HANDLE handle
);
```

d) Other Functions

DRV_CAMERA_OVM7690_HsyncEventHandler Function

Horizontal synchronization event handler.

File

drv_camera_ovm7690.h

C

```
void DRV_CAMERA_OVM7690_HsyncEventHandler(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is called when the OVM7690 Camera sends a Horizontal Sync Pulse on the HSYNC line. It sets the next line address in the DMA module.

Remarks

This function is mandatory.

Preconditions

The DRV_CAMERA_OVM7690_Initialize function must have been called for the specified OVM7690 Camera Driver instance.

DRV_CAMERA_OVM7690_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_CAMERA_OVM7690_INIT     cameraInit;
SYS_MODULE_OBJ              objectHandle;

cameraInit.cameraID                 = CAMERA_MODULE_OVM7690;
cameraInit.sourcePort               = (void *)&PORTK,
cameraInit.hsyncInterruptSource     = INT_SOURCE_CHANGE_NOTICE_A,
cameraInit.vsyncInterruptSource     = INT_SOURCE_CHANGE_NOTICE_J,
cameraInit.dmaChannel               = DRV_CAMERA_OVM7690_DMA_CHANNEL_INDEX,
cameraInit.dmaTriggerSource         = DMA_TRIGGER_EXTERNAL_2,
cameraInit.bpp                      = GFX_CONFIG_COLOR_DEPTH,

objectHandle = DRV_CAMERA_OVM7690_Initialize( DRV_CAMERA_OVM7690_INDEX_0,
                                              (SYS_MODULE_INIT*)&cameraInit);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}

handle = DRV_CAMERA_OVM7690_Open(DRV_CAMERA_OVM7690_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    //error
    return;
}

void __ISR( HSYNC_ISR_VECTOR) _Ovm7690HSyncHandler(void)
{
    DRV_CAMERA_OVM7690_HsyncEventHandler(objectHandle);

    SYS_INT_SourceStatusClear(HSYNC_INTERRUPT_SOURCE);
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_CAMERA_OVM7690_Initialize function

Function

void DRV_CAMERA_OVM7690_HsyncEventHandler(SYS_MODULE_OBJ object)

DRV_CAMERA_OVM7690_VsyncEventHandler Function

Vertical synchronization event handler .

File

drv_camera_ovm7690.h

C

```
void DRV_CAMERA_OVM7690_VsyncEventHandler(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is called when the OVM7690 Camera sends a Vertical Sync Pulse on the VSYNC line. It clears the number of lines drawn variable.

Remarks

This function is mandatory.

Preconditions

The DRV_CAMERA_OVM7690_Initialize function must have been called for the specified OVM7690 Camera Driver instance.

DRV_CAMERA_OVM7690_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_CAMERA_OVM7690_INIT     cameraInit;
SYS_MODULE_OBJ              objectHandle;

cameraInit.cameraID                 = CAMERA_MODULE_OVM7690;
cameraInit.sourcePort               = (void *)&PORTK,
cameraInit.hsyncInterruptSource     = INT_SOURCE_CHANGE_NOTICE_A,
cameraInit.vsyncInterruptSource     = INT_SOURCE_CHANGE_NOTICE_J,
cameraInit.dmaChannel               = DRV_CAMERA_OVM7690_DMA_CHANNEL_INDEX,
cameraInit.dmaTriggerSource         = DMA_TRIGGER_EXTERNAL_2,
cameraInit.bpp                      = GFX_CONFIG_COLOR_DEPTH,

objectHandle = DRV_CAMERA_OVM7690_Initialize( DRV_CAMERA_OVM7690_INDEX_0,
                                              (SYS_MODULE_INIT*)&cameraInit);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}

handle = DRV_CAMERA_OVM7690_Open(DRV_CAMERA_OVM7690_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    //error
    return;
}

void __ISR( VSYNC_ISR_VECTOR) _Ovm7690VSyncHandler(void)
{
    DRV_CAMERA_OVM7690_VsyncEventHandler(objectHandle);

    SYS_INT_SourceStatusClear(VSYNC_INTERRUPT_SOURCE);
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_CAMERA_OVM7690_Initialize function

Function

void DRV_CAMERA_OVM7690_VsyncEventHandler(SYS_MODULE_OBJ object)

_DRV_CAMERA_OVM7690_DMAEventHandler Function

File

drv_camera_ovm7690.h

C

```
void _DRV_CAMERA_OVM7690_DMAEventHandler(SYS_DMA_TRANSFER_EVENT event, SYS_DMA_CHANNEL_HANDLE handle,
uintptr_t contextHandle);
```

Description

This is function _DRV_CAMERA_OVM7690_DMAEventHandler.

_DRV_CAMERA_OVM7690_delayMS Function

File

drv_camera_ovm7690.h

C

```
void _DRV_CAMERA_OVM7690_delayMS(unsigned int delayMs);
```

Description

This is function _DRV_CAMERA_OVM7690_delayMS.

_DRV_CAMERA_OVM7690_HardwareSetup Function

File

drv_camera_ovm7690.h

C

```
void _DRV_CAMERA_OVM7690_HardwareSetup(DRV_CAMERA_OVM7690_OBJ * dObj);
```

Description

This is function _DRV_CAMERA_OVM7690_HardwareSetup.

e) Data Types and Constants

DRV_CAMERA_OVM7690_CLIENT_OBJ Structure

OVM7690 Camera Driver client object.

File

drv_camera_ovm7690.h

C

```
typedef struct {
  DRV_CAMERA_OVM7690_OBJ * hDriver;
  DRV_IO_INTENT ioIntent;
  bool inUse;
  DRV_CAMERA_OVM7690_ERROR error;
  DRV_CAMERA_OVM7690_CLIENT_STATUS status;
} DRV_CAMERA_OVM7690_CLIENT_OBJ;
```

Members

Members	Description
DRV_CAMERA_OVM7690_OBJ * hDriver;	The hardware instance object associated with the client
DRV_IO_INTENT ioIntent;	The I/O intent with which the client was opened
bool inUse;	This flags indicates if the object is in use or is available
DRV_CAMERA_OVM7690_ERROR error;	Driver Error
DRV_CAMERA_OVM7690_CLIENT_STATUS status;	Client status

Description

OVM7690 Camera Driver Client Object.

This structure provides a definition of the OVM7690 Camera Driver client object.

Remarks

These values are been updated into the DRV_CAMERA_OVM7690_Open function.

DRV_CAMERA_OVM7690_CLIENT_STATUS Enumeration

Identifies OVM7690 Camera possible client status.

File

drv_camera_ovm7690.h

C

```
typedef enum {
  DRV_CAMERA_OVM7690_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR,
  DRV_CAMERA_OVM7690_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED,
  DRV_CAMERA_OVM7690_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY,
  DRV_CAMERA_OVM7690_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY
} DRV_CAMERA_OVM7690_CLIENT_STATUS;
```

Members

Members	Description
DRV_CAMERA_OVM7690_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR	An error has occurred.
DRV_CAMERA_OVM7690_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED	The driver is closed, no operations for this client are ongoing, and/or the given handle is invalid.
DRV_CAMERA_OVM7690_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY	The driver is currently busy and cannot start additional operations.
DRV_CAMERA_OVM7690_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY	The module is running and ready for additional operations

Description

OVM7690 Camera Client Status.

This enumeration defines possible OVM7690 Camera Client Status.

Remarks

This enumeration values are set by driver interfaces: DRV_CAMERA_OVM7690_Open and DRV_CAMERA_OVM7690_Close.

DRV_CAMERA_OVM7690_ERROR Enumeration

Identifies OVM7690 Camera possible errors.

File

drv_camera_ovm7690.h

C

```
typedef enum {
  DRV_CAMERA_OVM7690_ERROR_INVALID_HANDLE,
  DRV_CAMERA_OVM7690_ERROR_NONE
} DRV_CAMERA_OVM7690_ERROR;
```

Members

Members	Description
DRV_CAMERA_OVM7690_ERROR_INVALID_HANDLE	OVM7690 Camera Driver Invalid Handle
DRV_CAMERA_OVM7690_ERROR_NONE	OVM7690 Camera Driver error none

Description

OVM7690 Camera Error flag

This enumeration defines possible OVM7690 Camera errors.

Remarks

This enumeration values are returned by driver interfaces in case of errors.

DRV_CAMERA_OVM7690_INIT Structure

OVM7690 Camera Driver initialization parameters.

File

drv_camera_ovm7690.h

C

```
typedef struct {
  CAMERA_MODULE_ID cameraID;
  void * sourcePort;
  PORTS_CHANNEL hsyncChannel;
  PORTS_BIT_POS hsyncPosition;
  PORTS_CHANNEL vsyncChannel;
  PORTS_BIT_POS vsyncPosition;
  INT_SOURCE hsyncInterruptSource;
  INT_SOURCE vsyncInterruptSource;
  DMA_CHANNEL dmaChannel;
  DMA_TRIGGER_SOURCE dmaTriggerSource;
  uint16_t bpp;
} DRV_CAMERA_OVM7690_INIT;
```

Members

Members	Description
CAMERA_MODULE_ID cameraID;	Camera module ID
void * sourcePort;	Source Port Address
PORTS_CHANNEL hsyncChannel;	HSYNC pin channel
PORTS_BIT_POS hsyncPosition;	HSYNC pin bit position
PORTS_CHANNEL vsyncChannel;	VSYNC pin channel
PORTS_BIT_POS vsyncPosition;	VSYNC pin bit position
INT_SOURCE hsyncInterruptSource;	HSYNC Interrupt Source
INT_SOURCE vsyncInterruptSource;	VSYNC Interrupt Source
DMA_CHANNEL dmaChannel;	DMA channel
DMA_TRIGGER_SOURCE dmaTriggerSource;	DMA trigger source
uint16_t bpp;	Bits per pixel

Description

OVM7690 Camera Initialization parameters

This structure defines OVM7690 Camera Driver initialization parameters.

Remarks

These values should be passed into the DRV_CAMERA_OVM7690_Initialize function.

DRV_CAMERA_OVM7690_OBJ Structure

OVM7690 Camera Driver instance object.

File

drv_camera_ovm7690.h

C

```
typedef struct {
  CAMERA_MODULE_ID moduleId;
  SYS_STATUS status;
  bool inUse;
  bool isExclusive;
  size_t nClients;
  PORTS_CHANNEL hsyncChannel;
  PORTS_BIT_POS hsyncPosition;
  PORTS_CHANNEL vsyncChannel;
  PORTS_BIT_POS vsyncPosition;
  INT_SOURCE hsyncInterruptSource;
  INT_SOURCE vsyncInterruptSource;
  SYS_DMA_CHANNEL_HANDLE dmaHandle;
  DMA_CHANNEL dmaChannel;
  DMA_TRIGGER_SOURCE dmaTriggerSource;
  bool dmaTransferComplete;
  void * sourcePort;
  uint32_t frameLineCount;
```

```
  uint32_t frameLineSize;
  void * frameLineAddress;
  void * frameBufferAddress;
  DRV_CAMERA_OVM7690_RECT rect;
  uint16_t bpp;
} DRV_CAMERA_OVM7690_OBJ;
```

Members

Members	Description
CAMERA_MODULE_ID moduleId;	The module index associated with the object
SYS_STATUS status;	The status of the driver
bool inUse;	Flag to indicate this object is in use
bool isExclusive;	Flag to indicate that driver has been opened exclusively.
size_t nClients;	Keeps track of the number of clients • that have opened this driver
PORTS_CHANNEL hsyncChannel;	HSYNC pin channel
PORTS_BIT_POS hsyncPosition;	HSYNC pin bit position
PORTS_CHANNEL vsyncChannel;	VSYNC pin channel
PORTS_BIT_POS vsyncPosition;	VSYNC pin bit position
INT_SOURCE hsyncInterruptSource;	HSYNC Interrupt Source
INT_SOURCE vsyncInterruptSource;	VSYNC Interrupt Source
SYS_DMA_CHANNEL_HANDLE dmaHandle;	DMA Handle
DMA_CHANNEL dmaChannel;	Read DMA channel
DMA_TRIGGER_SOURCE dmaTriggerSource;	DMA Trigger Source
bool dmaTransferComplete;	DMA Transfer Complete Flag
void * sourcePort;	Source Port Address
uint32_t frameLineCount;	Frame Line Count
uint32_t frameLineSize;	Frame Line Size
void * frameLineAddress;	Frame Line Address
void * frameBufferAddress;	Framebuffer Address
DRV_CAMERA_OVM7690_RECT rect;	Window Rectangle
uint16_t bpp;	Bits per pixel supported

Description

OVM7690 Camera Driver Instance Object

This structure provides a definition of the OVM7690 Camera Driver instance object.

Remarks

These values are been updated into the DRV_CAMERA_OVM7690_Initialize function.

DRV_CAMERA_OVM7690_RECT Structure

OVM7690 Camera window rectangle coordinates.

File

drv_camera_ovm7690.h

C

```
typedef struct {
  uint32_t left;
  uint32_t top;
  uint32_t right;
  uint32_t bottom;
} DRV_CAMERA_OVM7690_RECT;
```

Members

Members	Description
uint32_t left;	OVM7690 Camera Window left coordinate
uint32_t top;	OVM7690 Camera Window top coordinate
uint32_t right;	OVM7690 Camera Window right coordinate

uint32_t bottom;	OVM7690 Camera Window bottom coordinate

Description

OVM7690 Camera Window Rect

This structure defines window rectangle co-ordinates as left, right, top, and bottom.

Remarks

These values should be passed into the DRV_CAMERA_OVM7690_FrameRectSet function.

DRV_CAMERA_OVM7690_REG12_OP_FORMAT Enumeration

Lists OVM7690 Camera device register addresses.

File

drv_camera_ovm7690.h

C

```
typedef enum {
  DRV_CAMERA_OVM7690_REG12_OP_FORMAT_RAW_2
} DRV_CAMERA_OVM7690_REG12_OP_FORMAT;
```

Members

Members	Description
DRV_CAMERA_OVM7690_REG12_OP_FORMAT_RAW_2	Bayer Raw Format

Description

OVM7690 Camera Device Register Addresses.

This enumeration defines the list of device register addresses.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_CAMERA_OVM7690_RegisterSet function. Refer to the specific device data sheet for more information.

DRV_CAMERA_OVM7690_INDEX_0 Macro

OVM7690 driver index definitions.

File

drv_camera_ovm7690.h

C

```
#define DRV_CAMERA_OVM7690_INDEX_0 0
```

Description

OVM7690 Camera Driver Module Index

These constants provide OVM7690 Camera Driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_CAMERA_OVM7690_Initialize and DRV_CAMERA_OVM7690_Open routines to identify the driver instance in use.

DRV_CAMERA_OVM7690_INDEX_1 Macro

File

drv_camera_ovm7690.h

C

```
#define DRV_CAMERA_OVM7690_INDEX_1 1
```

Description

This is macro DRV_CAMERA_OVM7690_INDEX_1.

DRV_CAMERA_OVM7690_REG12_SOFT_RESET Macro

OVM7690 Camera Driver Register 0x12 Soft reset flag.

File

drv_camera_ovm7690.h

C

```
#define DRV_CAMERA_OVM7690_REG12_SOFT_RESET
```

Description

OVM7690 Camera Driver Soft reset flag.

This macro provides a definition of the OVM7690 Camera Register 0x12 Soft reset flag.

Remarks

These constants should be used in place of hard-coded numeric literals.

DRV_CAMERA_OVM7690_SCCB_READ_ID Macro

OVM7690 Camera SCCB Interface device Read Slave ID.

File

drv_camera_ovm7690.h

C

```
#define DRV_CAMERA_OVM7690_SCCB_READ_ID
```

Description

OVM7690 Camera Driver SCCB Read ID

This macro provides a definition of the OVM7690 Camera SCCB Interface device Read Slave ID.

Remarks

These constants should be used in place of hard-coded numeric literals.

DRV_CAMERA_OVM7690_SCCB_WRITE_ID Macro

OVM7690 Camera SCCB Interface device Write Slave ID.

File

drv_camera_ovm7690.h

C

```
#define DRV_CAMERA_OVM7690_SCCB_WRITE_ID
```

Description

OVM7690 Camera Driver SCCB Write ID

This macro provides a definition of the OVM7690 Camera SCCB Interface device Write Slave ID.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_CAMERA_OVM7690_RegisterSet function to identify the OVM7690 Camera SCCB Interface device Write Slave ID.

drv_camera_ovm7690.h

OVM7690 Camera Driver local data structures.

Enumerations

	Name	Description
	DRV_CAMERA_OVM7690_CLIENT_STATUS	Identifies OVM7690 Camera possible client status.
	DRV_CAMERA_OVM7690_ERROR	Identifies OVM7690 Camera possible errors.
	DRV_CAMERA_OVM7690_REG12_OP_FORMAT	Lists OVM7690 Camera device register addresses.

Functions

	Name	Description
	_DRV_CAMERA_OVM7690_delayMS	This is function _DRV_CAMERA_OVM7690_delayMS.
	_DRV_CAMERA_OVM7690_DMAEventHandler	This is function _DRV_CAMERA_OVM7690_DMAEventHandler.
	_DRV_CAMERA_OVM7690_HardwareSetup	This is function _DRV_CAMERA_OVM7690_HardwareSetup.
	DRV_CAMERA_OVM7690_Close	Closes an opened instance of the OVM7690 Camera Driver.
	DRV_CAMERA_OVM7690_Deinitialize	Deinitializes the specified instance of the OVM7690 Camera Driver module.
	DRV_CAMERA_OVM7690_FrameBufferAddressSet	Sets the framebuffer address.
	DRV_CAMERA_OVM7690_FrameRectSet	Sets the frame rectangle set.
	DRV_CAMERA_OVM7690_HsyncEventHandler	Horizontal synchronization event handler.
	DRV_CAMERA_OVM7690_Initialize	Initializes the OVM7690 Camera instance for the specified driver index.
	DRV_CAMERA_OVM7690_Open	Opens the specified OVM7690 Camera Driver instance and returns a handle to it.
	DRV_CAMERA_OVM7690_RegisterSet	Sets the camera OVM7690 configuration registers.
	DRV_CAMERA_OVM7690_Start	Starts camera rendering to the display.
	DRV_CAMERA_OVM7690_Stop	Stops rendering the camera Pixel data.
	DRV_CAMERA_OVM7690_Tasks	Maintains the OVM7690 state machine.
	DRV_CAMERA_OVM7690_VsyncEventHandler	Vertical synchronization event handler .

CAN Driver Library

This section describes the CAN Driver Library.

Introduction

The CAN Static Driver provides a high-level interface to manage the CAN module on the Microchip family of microcontrollers.

Description

Through MHC, this driver provides an API to initialize the CAN module, as well as the baud rate. The API also allows simple transmit and receive functionality.

Library Interface

Function(s)

	Name	Description
	DRV_CAN_ChannelMessageReceive	Receives a message on a channel for the specified driver index. **Implementation:** Static
	DRV_CAN_ChannelMessageTransmit	Transmits a message on a channel for the specified driver index. **Implementation:** Static
	DRV_CAN_Close	Closes the CAN instance for the specified driver index. **Implementation:** Static
	DRV_CAN_Deinitialize	Deinitializes the DRV_CAN_Initialize instance that has been called for the specified driver index. **Implementation:** Static
	DRV_CAN_Initialize	Initializes the CAN instance for the specified driver index. **Implementation:** Static
	DRV_CAN_Open	Opens the CAN instance for the specified driver index. **Implementation:** Static

Description

This section describes the Application Programming Interface (API) functions of the CAN Driver Library.

Function(s)

DRV_CAN_ChannelMessageReceive Function

Receives a message on a channel for the specified driver index.

Implementation: Static

File

help_drv_can.h

C

```
bool DRV_CAN_ChannelMessageReceive(CAN_CHANNEL channelNum, int address, uint8_t DLC, uint8_t* message);
```

Returns

- true - When a message has been received
- false - When a message has not been received

Description

This routine receives data into a buffer from the CAN bus according to the channel, address, and data length given.

Remarks

This routine receives a standard or extended messages based upon the CAN Driver setup.

Preconditions

DRV_CAN_Initialize has been called.

Parameters

Parameters	Description
CAN_CHANNEL channelNum	CAN channel to use
int address	CAN address to receive on
uint8_t DLC	Data Length Code of Message
uint8_t* message	Pointer to put the message data to receive

Function

bool DRV_CAN_ChannelMessageReceive(CAN_CHANNEL channelNum, int address,
uint8_t DLC, uint8_t* message);

DRV_CAN_ChannelMessageTransmit Function

Transmits a message on a channel for the specified driver index.

Implementation: Static

File

help_drv_can.h

C

```
bool DRV_CAN_ChannelMessageTransmit(CAN_CHANNEL channelNum, int address, uint8_t DLC, uint8_t* message);
```

Returns

Boolean "true" when a message has been transmitted.

Description

This routine transmits a data buffer on the CAN bus according to the channel, address, and data length given.

Remarks

This routine receives a standard or extended messages based upon the CAN Driver setup.

Preconditions

DRV_CAN_Initialize has been called.

Parameters

Parameters	Description
CAN_CHANNEL channelNum	CAN channel to use
int address	CAN address to transmit on
uint8_t DLC	Data Length Code of Message
uint8_t* message	Pointer to the message data to send

Function

bool DRV_CAN_ChannelMessageTransmit(CAN_CHANNEL channelNum, int address,
uint8_t DLC, uint8_t* message);

DRV_CAN_Close Function

Closes the CAN instance for the specified driver index.

Implementation: Static

File

help_drv_can.h

C

```
void DRV_CAN_Close();
```

Returns

None.

Description

This routine closes the CAN driver instance for the specified driver instance, making it ready for clients to use it.

Preconditions

DRV_CAN_Initialize has been called.

Function

void DRV_CAN_Close(void)

DRV_CAN_Deinitialize Function

Deinitializes the DRV_CAN_Initialize instance that has been called for the specified driver index.

Implementation: Static

File

help_drv_can.h

C

```
void DRV_CAN_Deinitialize();
```

Returns

None.

Description

This routine deinitializes the CAN Driver instance for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters.

Preconditions

None.

Function

void DRV_CAN_Deinitialize(void)

DRV_CAN_Initialize Function

Initializes the CAN instance for the specified driver index.

Implementation: Static

File

help_drv_can.h

C

```
void DRV_CAN_Initialize();
```

Returns

None.

Description

This routine initializes the CAN Driver instance for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters.

Remarks

This routine must be called before any other CAN routine is called. This routine should only be called once during system initialization.

Preconditions

None.

Function

void DRV_CAN_Initialize(void)

DRV_CAN_Open Function

Opens the CAN instance for the specified driver index.

Implementation: Static

File

help_drv_can.h

C

```
void DRV_CAN_Open();
```

Returns

None.

Description

This routine opens the CAN Driver instance for the specified driver instance, making it ready for clients to use it.

Preconditions

DRV_CAN_Initialize has been called.

Function

void DRV_CAN_Open(void)

Codec Driver Libraries

This section describes the Codec Driver Libraries available in MPLAB Harmony.

AK4384 Codec Driver Library

This topic describes the AK4384 Codec Driver Library.

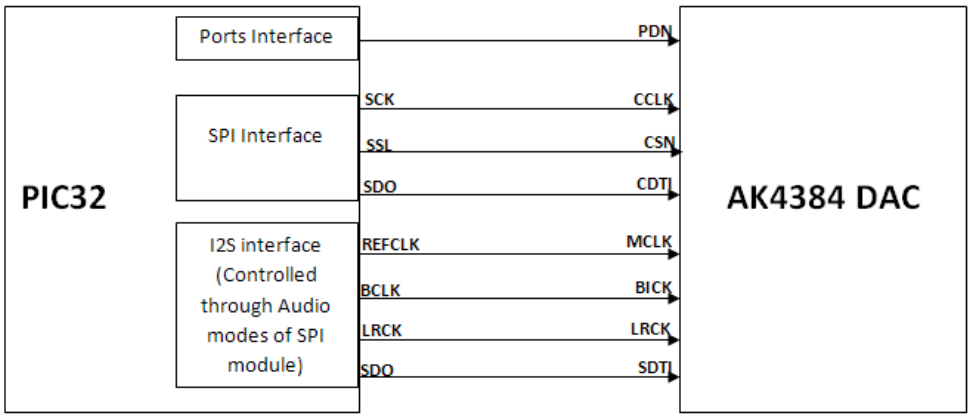
Introduction

This library provides an interface to manage the AK4384 106 dB 192 kHz 24-Bit DAC that is serially interfaced to a Microchip microcontroller for providing Audio Solutions.

Description

The AK4384 module is 24-bit Audio DAC from Asahi Kasei Microdevices Corporation. The AK4384 can be interfaced to Microchip microcontrollers through SPI and I2S serial interfaces. SPI interface is used for control command transfer. The I2S interface is used for Audio data output.

A typical interface of AK4384 to a Microchip PIC32 device is provided in the following diagram:



Features

The AK4384 Codec Driver supports the following features:

- Sampling Rate Ranging from 8 kHz to 192 kHz
- 128 times Oversampling (Normal Speed mode)
- 64 times Oversampling (Double Speed mode)
- 32 times Oversampling (Quad Speed mode)
- Digital de-emphasis for 32k, 44.1k and 48 kHz sampling
- Soft mute
- Digital Attenuator (Linear 256 steps)
- I/F format:
- 24-bit MSB justified
- 24/20/16-bit LSB justified
- I2S
- Master clock:
- 256 fs, 384 fs, 512 fs, 768 fs, or 1152 fs (Normal Speed mode)
- 128 fs, 192 fs, 256 fs, or 384 fs (Double Speed mode)
- 128 fs or 192 fs (Quad Speed mode)

Using the Library

This topic describes the basic architecture of the AK4384 Codec Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_ak4384.h`

The interface to the AK4384 Codec Driver library is defined in the `drv_ak4384.h` header file. Any C language source (`.c`) file that uses the AK4384 Codec Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

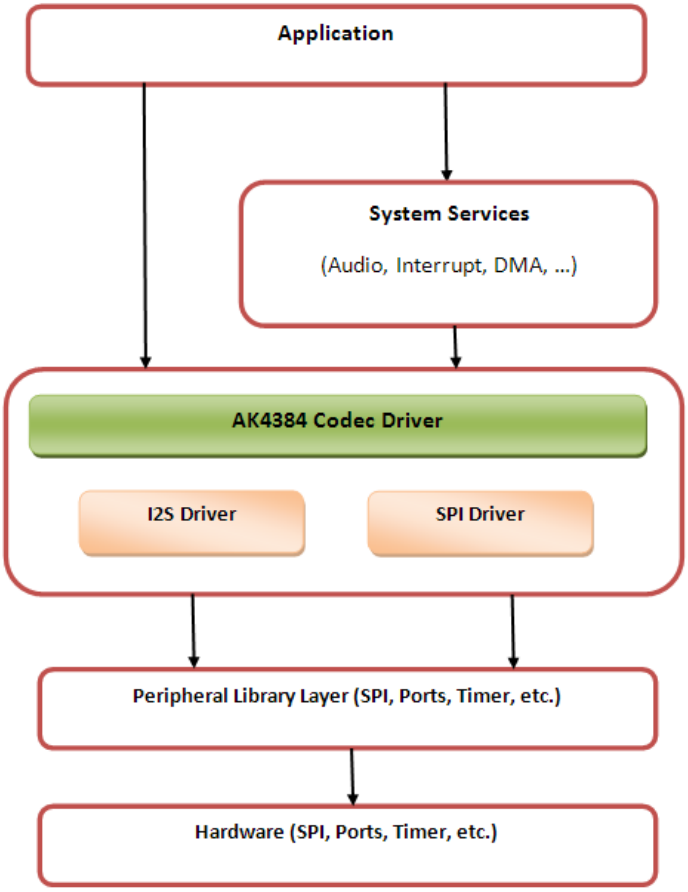
Abstraction Model

This library provides a low-level abstraction of the AK4384 Codec Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The abstraction model shown in the following diagram depicts how the AK4384 Codec Driver is positioned in the MPLAB Harmony framework. The AK4384 Codec Driver uses the SPI and I2S drivers for control and audio data transfers to the AK4384 module.

AK4384 Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The AK4384 Codec Driver Library provides an API interface to transfer control commands and digital audio data to the serially interfaced AK4384 DAC module. The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the AK4384 Codec Driver Library.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Client Setup Functions	Provides open and close functions.
Codec Specific Functions	Provides functions that are Codec-specific.
Data Transfer Functions	Provides data transfer functions.
Other Functions	Provides driver specific miscellaneous functions such as sampling rate setting, control command functions, etc.
Data Types and Constants	These data types and constants are required while interacting and setting up the AK4384 Codec Driver Library.

How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality

System Access

This topic provides information on system initialization, implementations, and provides a system access code example.

Description

System Initialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization, each instance of the AK4384 module would be initialized with the following configuration settings (either passed dynamically at run time using DRV_AK4384_INIT or by using Initialization Overrides) that are supported by the specific AK4384 device hardware:

- Device requested power state: one of the System Module Power States. For specific details please refer to **Data Types and Constants** in the Library Interface section.
- SPI driver module index. The module index should be same as the one used in initializing the SPI Driver.
- I2S driver module index. The module index should be same as the one used in initializing the I2S Driver.
- Sampling rate
- Master clock detection mode
- Power down pin port initialization
- Queue size for the audio data transmit buffer

The DRV_AK4384_Initialize API returns an object handle of the type SYS_MODULE_OBJ. The object handle returned by the Initialize interface would be used by the other system interfaces such as DRV_ AK4384_Deinitialize, DRV_ AK4384_Status and DRV_I2S_Tasks.

Implementations

The AK4384 Codec Driver can have the following implementations:

Implementation	Description	MPLAB Harmony Components
Implementation 1	Dedicated hardware for control (SPI) and data (I2S) interface.	Standard MPLAB Harmony drivers for SPI and I2S interfaces.
Implementation 2	Dedicated hardware for data (I2S) interface. Ports pins for control interface.	Standard MPLAB Harmony drivers for I2S interface. Virtual MPLAB Harmony drivers for SPI interface.
Implementation 3	Dedicated hardware for data (I2S) interface. Ports pins for control.	Standard MPLAB Harmony drivers for I2S interface. An internal bit-banged implementation of control interface in the AK4384 Codec Driver.

If Implementation 3 is in use, while initializing fields of DRV_AK4384_INIT structure, the SPI Driver module index initialization is redundant. The user can pass a dummy value.

For Implementation 3, the user has to additionally initialize parameters to support bit-banged control interface implementation. These additional parameters can be passed by assigning values to the respective macros in `system_config.h`.

Example:

```
DRV_AK4384_INIT drvak4384Init =
{
    .moduleInit.value = SYS_MODULE_POWER_RUN_FULL,
    .volume = 120,
    .mclkMode = DRV_AK4384_MCLK_MODE_MANUAL,
    .queueSizeTransmit = 2,
};

/*
 The SPI module index should be same as the one used in
 initializing the SPI driver.
 The SPI module index initialization is redundant
 if Implementation 3 is in use.
 */
drvak4384Init.spiDriverModuleIndex = DRV_SPI_INDEX_0;

/*
 The I2S module index should be same as the one used in
 initializing the I2S driver.
 */
drvak4384Init.i2sDriverModuleIndex = DRV_I2S_INDEX_0;

ak4384DevObject = DRV_AK4384_Initialize(DRV_AK4384_INDEX_0, (SYS_MODULE_INIT *) &drvak4384Init);
if (SYS_MODULE_OBJ_INVALID == ak4384DevObject)
{
```

```
    // Handle error
}
```

Task Routine

The DRV_AK4384_Tasks will be called from the System Task Service.

Client Access

This topic describes client access and includes a code example.

Description

For the application to start using an instance of the module, it must call the DRV_AK4384_Open function. The DRV_AK4384_Open provides a driver handle to the AK4384 Codec Driver instance for operations. If the driver is deinitialized using the function DRV_AK4384_Deinitialize, the application must call the DRV_AK4384_Open function again to set up the instance of the driver.

For the various options available for IO_INTENT, please refer to **Data Types and Constants** in the Library Interface section.

Note: It is necessary to check the status of driver initialization before opening a driver instance. The status of the AK4384 Codec Driver can be known by calling DRV_AK4384_Status.

Example:

```
DRV_HANDLE handle;
SYS_STATUS ak4384Status;
    ak4384Status = DRV_AK4384_Status(sysObjects.ak4384DevObject);
        if (SYS_STATUS_READY == ak4384Status)
        {
                // The driver can now be opened.
                appData.ak4384Client.handle = DRV_AK4384_Open
                                              (DRV_AK4384_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
                if(appData.ak4384Client.handle != DRV_HANDLE_INVALID)
                {
                    appData.state = APP_STATE_AK4384_SET_BUFFER_HANDLER;
                }
                else
                {
                    SYS_DEBUG(0, "Find out what's wrong \r\n");
                }
    }
    else
    {
        /* AK4384 Driver Is not ready */
                ;
    }
```

Client Operations

This topic describes client operations and provides a code example.

Description

Client operations provide the API interface for control command and audio data transfer to the AK4384 Codec.

The following AK4384 Codec specific control command functions are provided:

Notes:

1. The calling and execution of the following functions does not guarantee that the function (and its associated Codec command) has been set in the Codec peer interfaced through the SPI. It just means that the submission of the command has started over the SPI.
2. Regarding Note 1, the user should not call the following functions consecutively, which could result in unexpected behavior. If needed, the user should confirm the completion status of a function before calling any of the other functions.
3. To know the completion status of the following functions, users can register a command event callback handler by calling the function 'DRV_AK4384_CommandEventHandlerSet'. The callback handler will be called when the last submitted command (submitted by calling one of the following functions) has completed.

- DRV_AK4384_SamplingRateSet
- DRV_AK4384_SamplingRateGet
- DRV_AK4384_VolumeSet
- DRV_AK4384_VolumeGet
- DRV_AK4384_MuteOn

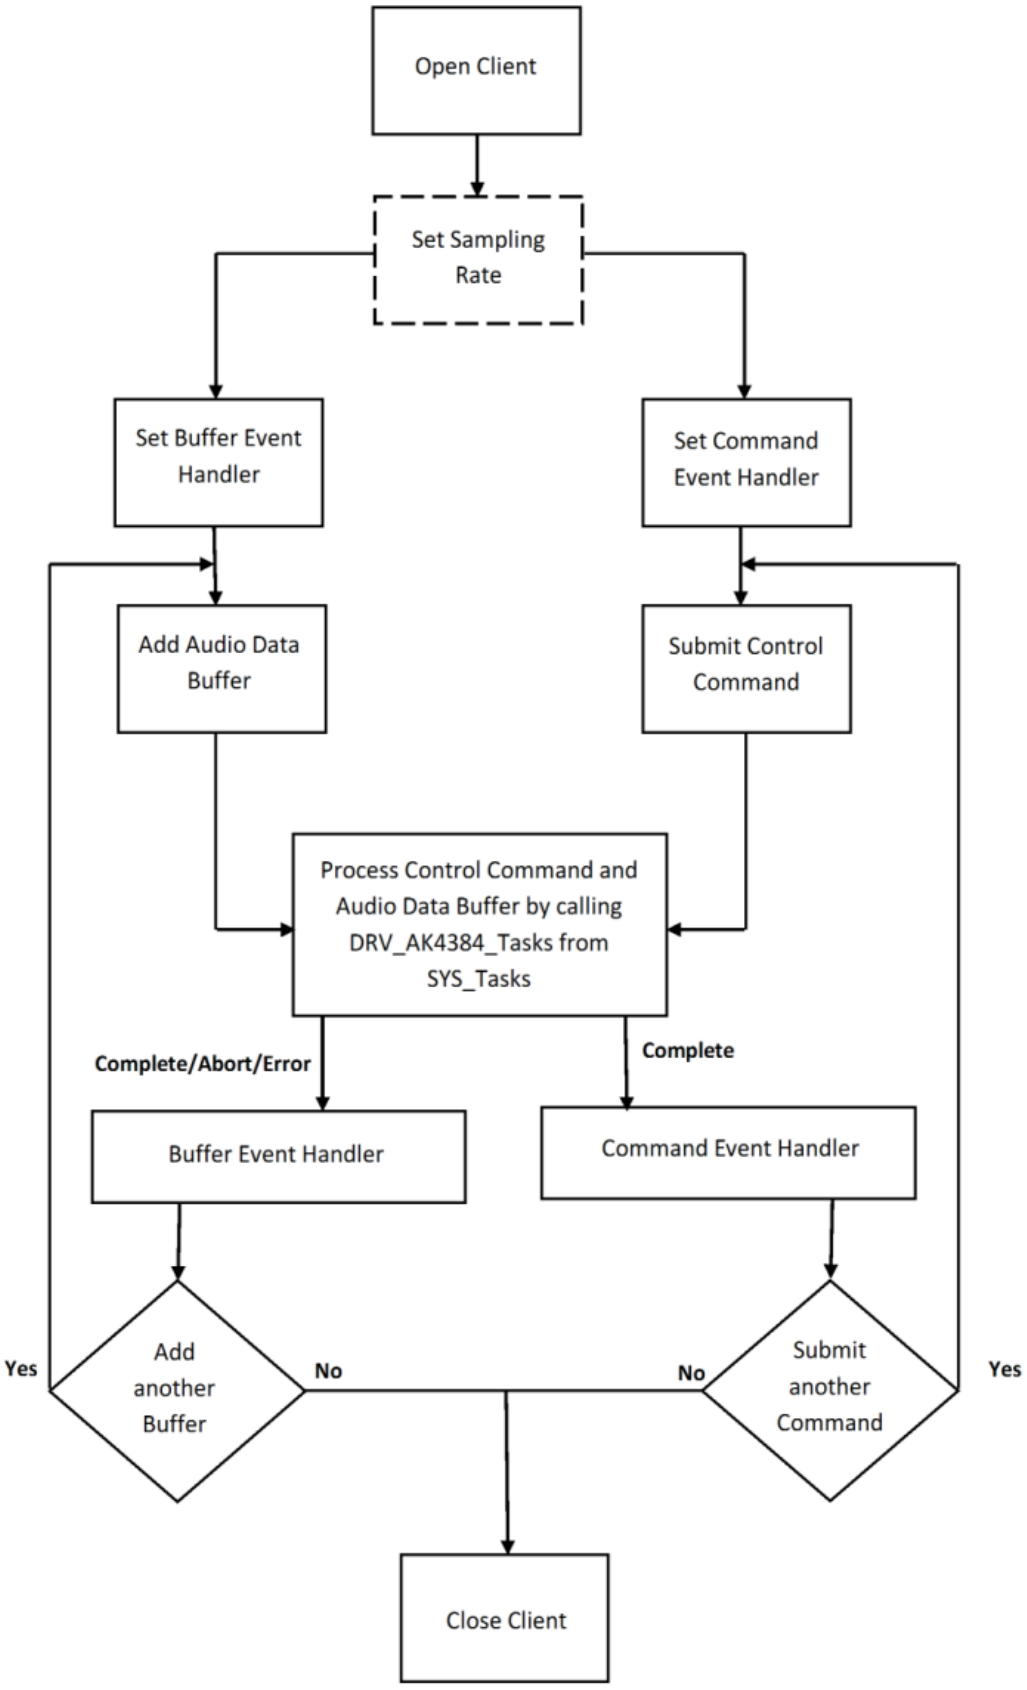
- DRV_AK4384_MuteOff
- DRV_AK4384_ZeroDetectEnable
- DRV_AK4384_ZeroDetectDisable
- DRV_AK4384_ZeroDetectModeSet
- DRV_AK4384_ZeroDetectInvertEnable
- DRV_AK4384_ZeroDetectInvertDisable
- DRV_AK4384_ChannelOutputInvertEnable
- DRV_AK4384_ChannelOutputInvertDisable
- DRV_AK4384_SlowRollOffFilterEnable
- DRV_AK4384_SlowRollOffFilterDisable
- DRV_AK4384_DeEmphasisFilterSet

These functions schedule a non-blocking control command transfer operation. These functions submit the control command request to the AK4384 Codec. A notification for the submitted requests can be received by registering a command callback event with the driver. The driver notifies by calling the callback on successfully transmitting the command to the AK4384 Codec module.

The function DRV_AK4384_BufferAddWrite is a buffered data operation functions. This function schedules non-blocking audio data transfer operation. The function adds the request to the hardware instance queues and returns a buffer handle. The requesting client also registers a callback event with the driver. The driver notifies the client with DRV_AK4384_BUFFER_EVENT_COMPLETE, DRV_AK4384_BUFFER_EVENT_ERROR, or DRV_AK4384_BUFFER_EVENT_ABORT events.

The submitted control commands and audio buffer add requests are processed under DRV_AK4384_Tasks function. This function is called from the SYS_Tasks routine.

The following diagram illustrates the control commands and audio buffered data operations.



Note: It is not necessary to close and reopen the client between multiple transfers.

An application using the buffered functionality needs to perform the following steps:

1. The system should have completed necessary setup and initializations.
2. The I2S Driver object should have been initialized by calling DRV_I2S_Initialize.

3. The SPI Driver object should have been initialized by calling DRV_SPI_Initialize.
4. The AK4384 Codec Driver object should be initialized by calling DRV_AK4384_Initialize.
5. The necessary sampling rate value should be set up by calling DRV_AK4384_ SamplingRateSet.
6. Register buffer event handler for the client handle by calling DRV_AK4384_BufferEventHandlerSet.
7. Register command event handler for the client handle by calling DRV_AK4384_CommandEventHandlerSet.
8. Submit a command by calling specific command API.
9. Add a buffer to initiate the data transfer by calling DRV_AK4384_BufferAddWrite.
10. The submitted command and Audio data processing happens b calling DRV_AK4384_Tasks from SYS_Tasks.
11. Repeat steps 9 through 10 to handle multiple buffer transmission and reception.
12. When the client is done, it can use DRV_AK4384_Close to close the client handle.

Example:

```
typedef enum
{
    APP_STATE_AK4384_OPEN,
    APP_STATE_AK4384_SET_COMMAND_HANDLER,
    APP_STATE_AK4384_SET_BUFFER_HANDLER,
    APP_STATE_AK4384_SET_SAMPLING_RATE_COMMAND,
    APP_STATE_AK4384_ADD_BUFFER,
    APP_STATE_AK4384_WAIT_FOR_BUFFER_COMPLETE,
    APP_STATE_AK4384_BUFFER_COMPLETE
} APP_STATES;

typedef struct
{
    DRV_HANDLE handle;
    DRV_AK4384_BUFFER_HANDLE writeBufHandle;
    DRV_AK4384_BUFFER_EVENT_HANDLER bufferHandler;
    DRV_AK4384_COMMAND_EVENT_HANDLER commandHandler;
    uintptr_t context;
    uint8_t *txbufferObject;
    size_t bufferSize;

} APP_AK4384_CLIENT;

typedef struct
{
    /* Application's current state*/
    APP_STATES state;
    /* USART client handle */
    APP_AK4384_CLIENT ak4384Client;
} APP_DATA;
APP_DATA appData;
SYS_MODULE_OBJ ak4384DevObject;
DRV_AK4384_INIT drvak4384Init =
{
    .moduleInit.value = SYS_MODULE_POWER_RUN_FULL,
    .volume = 120,
    .mclkMode = DRV_AK4384_MCLK_MODE_MANUAL,
    .queueSizeTransmit = 2,
};

void SYS_Initialize(void * data)
{
    /*
     The SPI module index should be same as the one used in
     initializing the SPI driver.
     The SPI module index initialization is redundant
     if Implementation 3 (Described in System Access) is in use.
     */
    drvak4384Init.spiDriverModuleIndex = DRV_SPI_INDEX_0;

    /*
     The I2S module index should be same as the one used in
     initializing the I2S driver.
     */
    drvak4384Init.i2sDriverModuleIndex = DRV_I2S_INDEX_0;
```

```

Configuring the Library

Macros

	Name	Description
	DRV_AK4384_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_AK4384_CONTROL_CLOCK	Sets up clock frequency for the control interface (SPI)
	DRV_AK4384_INPUT_REFCLOCK	Identifies the input REFCLOCK source to generate the MCLK to codec.
	DRV_AK4384_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_AK4384_TIMER_DRIVER_MODULE_INDEX	Identifies the Timer Module Index for custom virtual SPI driver implementation.
	DRV_AK4384_TIMER_PERIOD	Identifies the period for the bit bang timer.
	DRV_AK4384_BCLK_BIT_CLK_DIVISOR	Sets up the BCLK to LRCK Ratio to Generate Audio Stream for 32, 44.1, and 48K sampling frequency
	DRV_AK4384_MCLK_SAMPLE_FREQ_MULTPLIER	Sets up the MCLK to LRCK Ratio to Generate Audio Stream for 32, 44.1 and 48K sampling frequency

Description

The configuration of the AK4384 Codec Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the AK4384 Codec Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the AK4384 Codec Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_AK4384_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_ak4384_config_template.h

C

```
#define DRV_AK4384_CLIENTS_NUMBER DRV_AK4384_INSTANCES_NUMBER
```

Description

AK4384 Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance. Typically only one client could be connected to one hardware instance. This value represents the total number of clients to be supported across all hardware instances. Therefore, if there are five AK4384 hardware interfaces, this number will be 5.

Remarks

None.

DRV_AK4384_CONTROL_CLOCK Macro

Sets up clock frequency for the control interface (SPI)

File

drv_ak4384_config_template.h

C

```
#define DRV_AK4384_CONTROL_CLOCK
```

Description

AK4384 Control Interface Clock Speed configuration

Sets up clock frequency for the control interface (SPI). The maximum value supported is 5MHZ.

Remarks

1. This Macro is useful only when a hardware SPI module is not available(used) or a virtual SPI driver is not available(used) for the control interface to the AK4384 CODEC.
2. This constant needs to defined only for a bit banged implementation of control interface with in the driver.

DRV_AK4384_INPUT_REFCLOCK Macro

Identifies the input REFCLOCK source to generate the MCLK to codec.

File

drv_ak4384_config_template.h

C

```
#define DRV_AK4384_INPUT_REFCLOCK
```

Description

AK4384 Input reference clock

Identifies the input REFCLOCK source to generate the MCLK to codec.

Remarks

None.

DRV_AK4384_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported

File

drv_ak4384_config_template.h

C

```
#define DRV_AK4384_INSTANCES_NUMBER
```

Description

AK4384 driver objects configuration

Sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of AK4384 CODEC modules that are needed by the application. Hardware Instance support consumes RAM memory space. If this macro is not defined, then the driver will be built statically.

Remarks

None.

DRV_AK4384_TIMER_DRIVER_MODULE_INDEX Macro

Identifies the Timer Module Index for custom virtual SPI driver implementation.

File

drv_ak4384_config_template.h

C

```
#define DRV_AK4384_TIMER_DRIVER_MODULE_INDEX
```

Description

AK4384 Timer Module Index

Identifies the Timer Module Index for custom virtual SPI driver implementation. The AK4384 uses SPI protocol for control interface. The Timer Module Index is needed by AK4384 driver to implement a virtual SPI driver for control command exchange with the AK4384 CODEC.

Remarks

1. This Macro is useful only when a hardware SPI module is not available(used) or a virtual SPI driver is not available(used) for the control interface to the AK4384 CODEC.
2. This constant needs to defined only for a bit banged implementation of control interface with in the driver.

DRV_AK4384_TIMER_PERIOD Macro

Identifies the period for the bit bang timer.

File

drv_ak4384_config_template.h

C

```
#define DRV_AK4384_TIMER_PERIOD
```

Description

AK4384 Timer Period

Identifies the period for the bit bang timer after which the timer interrupt should occur. The value assigned should align with the expected control interface clock defined by AK4384_CONTROL_CLOCK.

Remarks

1. This Macro is useful only when a hardware SPI module is not available(used) or a virtual SPI driver is not available(used) for the control interface to the AK4384 CODEC.
2. This constant needs to defined only for a bit banged implementation of control interface with in the driver.

DRV_AK4384_BCLK_BIT_CLK_DIVISOR Macro

Sets up the BCLK to LRCK Ratio to Generate Audio Stream for 32, 44.1, and 48K sampling frequency

File

drv_ak4384_config_template.h

C

```
#define DRV_AK4384_BCLK_BIT_CLK_DIVISOR
```

Description

AK4384 BCLK to LRCK Ratio to Generate Audio Stream

Sets up the BCLK to LRCK Ratio to Generate Audio Stream for 32, 44.1 and 48K I2S sampling frequency

Following BCLK to LRCK ratios are supported 16bit LSB Justified >=32fs 20bit LSB Justified >=40fs 24bit MSB Justified >=48fs 24bit I2S Compatible >=48fs 24bit LSB Justified >=48fs

Typical values for the divisor are 1,2,4 and 8

Remarks

None.

DRV_AK4384_MCLK_SAMPLE_FREQ_MULTPLIER Macro

Sets up the MCLK to LRCK Ratio to Generate Audio Stream for 32, 44.1 and 48K sampling frequency

File

drv_ak4384_config_template.h

C

```
#define DRV_AK4384_MCLK_SAMPLE_FREQ_MULTPLIER
```

Description

AK4384 MCLK to LRCK Ratio to Generate Audio Stream

Sets up the MCLK to LRCK Ratio to Generate Audio Stream for 32, 44.1, and 48K I2S sampling frequency

Supported MCLK to LRCK Ratios are as below 256fs, 384fs, 512fs, 768fs or 1152fs [Normal Speed Mode(8kHz~48kHz)] 128fs, 192fs, 256fs or 384fs [Double Speed Mode(60kHz~96kHz)] 128fs, 192fs [Quad Speed Mode(120kHz~192kHz)]

Remarks

None

Configuring the MHC

Provides examples on how to configure the MPLAB Harmony Configurator (MHC) for a specific driver.

Description

The following three figures show examples of MHC configurations for the AK4384 Codec Driver, I2S Driver, and the Timer Driver.

Figure 1: AK4384 Codec Driver MHC Configuration

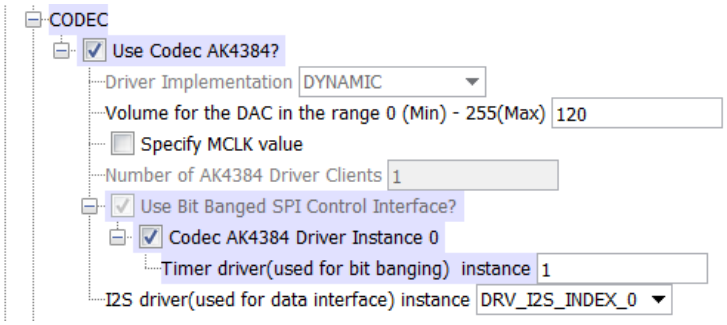

Figure 2: I2S Driver MHC Configuration

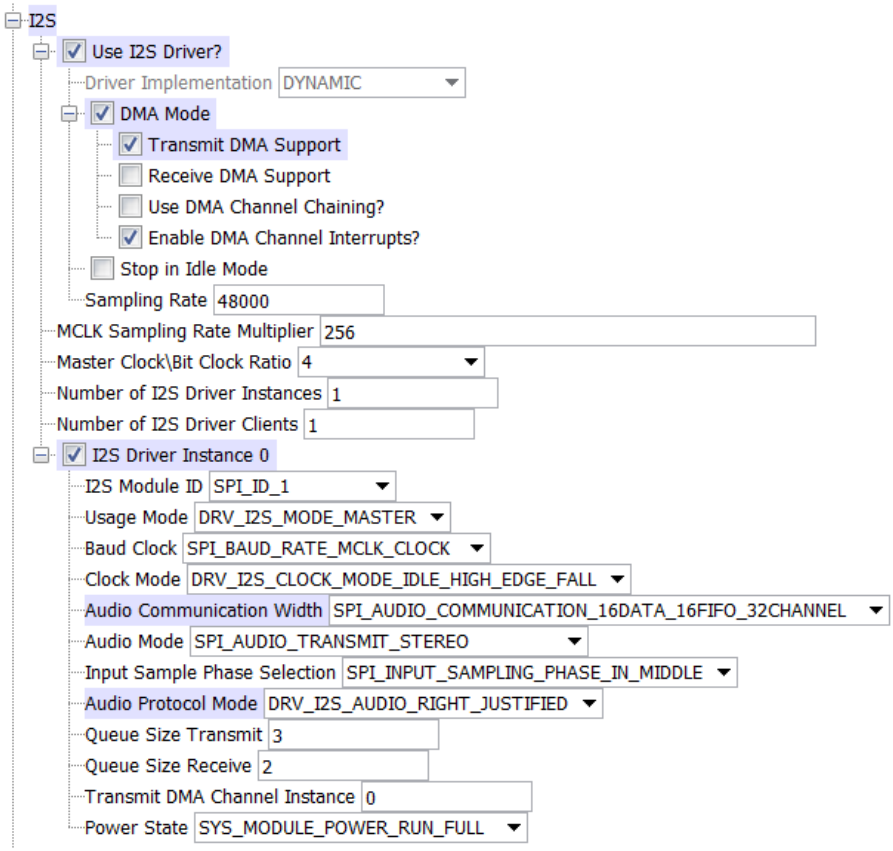

Figure 3: Timer Driver MHC Configuration

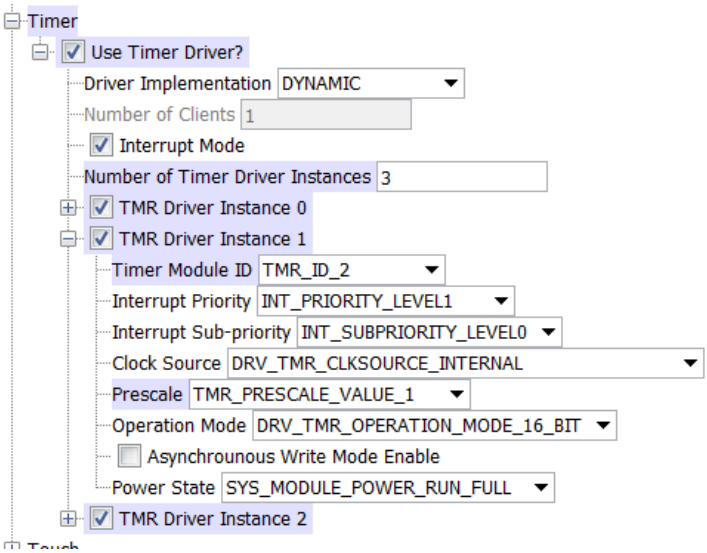

Building the Library

This section lists the files that are available in the AK4384 Codec Driver Library.

Description

This section list the files that are available in the `/src` folder of the AK4384 Codec Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/codec/ak4384`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_ak4384.h`	Header file that exports the driver API.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_ak4384_bit_banged_control_interface.c`	This file contains implementation of the AK4384 Codec Driver with a custom bit-banged implementation for control interface driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
`/src/dynamic/drv_ak4384_virtual_control_interface.c`	This file contains implementation of the AK4384 Codec Driver with a virtual SPI driver as control interface driver. **Note:** This file is currently unsupported.
`/src/dynamic/drv_ak4384.c`	This file contains the core implementation of the AK4384 Codec Driver **Note:** This file currently unsupported.

Module Dependencies

The AK4384 Driver Library depends on the following modules:

- I2S Driver Library
- SPI Driver Library
- Timer Driver Library

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_AK4384_Initialize	Initializes hardware and data for the instance of the AK4384 DAC module. **Implementation:** Dynamic
	DRV_AK4384_Deinitialize	Deinitializes the specified instance of the AK4384 driver module. **Implementation:** Dynamic
	DRV_AK4384_Status	Gets the current status of the AK4384 driver module. **Implementation:** Dynamic
	DRV_AK4384_Tasks	Maintains the driver's control and data interface state machine. **Implementation:** Dynamic

b) Client Setup Functions

	Name	Description
	DRV_AK4384_Open	Opens the specified AK4384 driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_AK4384_Close	Closes an opened-instance of the AK4384 driver. **Implementation:** Dynamic

c) Codec Specific Functions

	Name	Description
	DRV_AK4384_ChannelOutputInvertDisable	Disables output polarity of the selected Channel. **Implementation:** Dynamic
	DRV_AK4384_ChannelOutputInvertEnable	Enables output polarity of the selected channel. **Implementation:** Dynamic
	DRV_AK4384_DeEmphasisFilterSet	Allows specifies enabling of digital de-emphasis filter. **Implementation:** Dynamic
	DRV_AK4384_MuteOff	Disables AK4384 output for soft mute. **Implementation:** Dynamic
	DRV_AK4384_MuteOn	Allows AK4384 output for soft mute on. **Implementation:** Dynamic
	DRV_AK4384_SamplingRateGet	This function gets the sampling rate set on the DAC AK4384. **Implementation:** Dynamic
	DRV_AK4384_SamplingRateSet	This function sets the sampling rate of the media stream. **Implementation:** Dynamic
	DRV_AK4384_SlowRollOffFilterDisable	Disables Slow Roll-off filter function. **Implementation:** Dynamic
	DRV_AK4384_SlowRollOffFilterEnable	Enables Slow Roll-off filter function. **Implementation:** Dynamic
	DRV_AK4384_VolumeGet	This function gets the volume for AK4384 Codec. **Implementation:** Dynamic
	DRV_AK4384_VolumeSet	This function sets the volume for AK4384 Codec. **Implementation:** Dynamic
	DRV_AK4384_ZeroDetectDisable	Disables AK4384 channel-independent zeros detect function. **Implementation:** Dynamic
	DRV_AK4384_ZeroDetectEnable	Enables AK4384 channel-independent zeros detect function. **Implementation:** Dynamic
	DRV_AK4384_ZeroDetectInvertDisable	Disables inversion of polarity for zero detect function. **Implementation:** Dynamic
	DRV_AK4384_ZeroDetectInvertEnable	Enables inversion of polarity for zero detect function. **Implementation:** Dynamic
	DRV_AK4384_ZeroDetectModeSet	Sets mode of AK4384 channel-independent zeros detect function. **Implementation:** Dynamic

d) Data Transfer Functions

	Name	Description
	DRV_AK4384_BufferAddWrite	Schedule a non-blocking driver write operation. **Implementation:** Dynamic
	DRV_AK4384_BufferEventHandlerSet	This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. **Implementation:** Dynamic
	DRV_AK4384_BufferCombinedQueueSizeGet	This function returns the number of bytes queued (to be processed) in the buffer queue. **Implementation:** Dynamic
	DRV_AK4384_BufferProcessedSizeGet	This function returns number of bytes that have been processed for the specified buffer. **Implementation:** Dynamic

e) Other Functions

	Name	Description
	DRV_AK4384_CommandEventHandlerSet	This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished. **Implementation:** Dynamic
	DRV_AK4384_VersionGet	Returns the version of the AK4384 driver. **Implementation:** Dynamic
	DRV_AK4384_VersionStrGet	Returns the version of AK4384 driver in string format. **Implementation:** Dynamic
	DRV_AK4384_BufferQueueFlush	This function flushes off the buffers associated with the client object. **Implementation:** Dynamic

f) Data Types and Constants

	Name	Description
	DRV_AK4384_AUDIO_DATA_FORMAT	Identifies the Serial Audio data interface format.
	DRV_AK4384_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_AK4384_BUFFER_EVENT_HANDLER	Pointer to a AK4384 Driver Buffer Event handler function.
	DRV_AK4384_BUFFER_HANDLE	Handle identifying a write buffer passed to the driver.
	DRV_AK4384_CHANNEL	Identifies Left/Right Audio channel
	DRV_AK4384_COMMAND_EVENT_HANDLER	Pointer to a AK4384 Driver Command Event Handler Function
	DRV_AK4384_DEEMPHASIS_FILTER	Identifies de-emphasis filter function.
	DRV_AK4384_INIT	Defines the data required to initialize or reinitialize the AK4384 driver.
	DRV_AK4384_MCLK_MODE	Identifies the mode of master clock to AK4384 DAC.
	DRV_AK4384_ZERO_DETECT_MODE	Identifies Zero Detect Function mode
	DRV_AK4384_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_AK4384_COUNT	Number of valid AK4384 driver indices.
	DRV_AK4384_INDEX_0	AK4384 driver index definitions.
	DRV_AK4384_INDEX_1	This is macro DRV_AK4384_INDEX_1.
	DRV_AK4384_INDEX_2	This is macro DRV_AK4384_INDEX_2.
	DRV_AK4384_INDEX_3	This is macro DRV_AK4384_INDEX_3.
	DRV_AK4384_INDEX_4	This is macro DRV_AK4384_INDEX_4.
	DRV_AK4384_INDEX_5	This is macro DRV_AK4384_INDEX_5.

Description

This section describes the API functions of the AK4384 Codec Driver library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_AK4384_Initialize Function

Initializes hardware and data for the instance of the AK4384 DAC module.

Implementation: Dynamic

File

drv_ak4384.h

C

```
SYS_MODULE_OBJ DRV_AK4384_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the AK4384 driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the 'init' parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized.

Remarks

This routine must be called before any other AK4384 routine is called.

This routine should only be called once during system initialization unless DRV_AK4384_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

DRV_I2S_Initialize must be called before calling this function to initialize the data interface of this CODEC driver. DRV_SPI_Initialize must be called if SPI driver is used for handling the control interface of this CODEC driver.

Example

```
DRV_AK4384_INIT                init;
SYS_MODULE_OBJ                 objectHandle;

init.moduleInit.value          = SYS_MODULE_POWER_RUN_FULL;
init.spiDriverModuleIndex      = DRV_SPI_INDEX_0;  // This will be ignored for a custom
                                                   // control interface driver implementation
init.i2sDriverModuleIndex      = DRV_I2S_INDEX_0;
init.mclkMode                  = DRV_AK4384_MCLK_MODE_MANUAL;
init.audioDataFormat           = DRV_AK4384_AUDIO_DATA_FORMAT_24BIT_I2S;
init.powerDownPortChannel      = PORT_CHANNEL_G;
init.powerDownBitPosition      = PORTS_BIT_POS_15;

objectHandle = DRV_AK4384_Initialize(DRV_AK4384_0, (SYS_MODULE_INIT*)init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the driver instance to be initialized
init	Pointer to the data structure containing any data necessary to initialize the hardware. This pointer may be null if no data is required and default initialization is to be used.

Function

```
SYS_MODULE_OBJ  DRV_AK4384_Initialize
(
const       SYS_MODULE_INDEX drvIndex,
const       SYS_MODULE_INIT *const init
);
```

DRV_AK4384_Deinitialize Function

Deinitializes the specified instance of the AK4384 driver module.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the AK4384 driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This routine will NEVER block waiting for hardware.

Preconditions

Function DRV_AK4384_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_AK4384_Initialize
SYS_STATUS          status;

DRV_AK4384_Deinitialize(object);

status = DRV_AK4384_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_AK4384_Initialize routine

Function

void DRV_AK4384_Deinitialize(SYS_MODULE_OBJ object)

DRV_AK4384_Status Function

Gets the current status of the AK4384 driver module.

Implementation: Dynamic

File

drv_ak4384.h

C

```
SYS_STATUS DRV_AK4384_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_DEINITIALIZED - Indicates that the driver has been deinitialized

SYS_STATUS_READY - Indicates that any previous module operation for the specified module has completed

SYS_STATUS_BUSY - Indicates that a previous module operation for the specified module has not yet completed

SYS_STATUS_ERROR - Indicates that the specified module is in an error state

Description

This routine provides the current status of the AK4384 driver module.

Remarks

A driver can opened only when its status is SYS_STATUS_READY.

Preconditions

Function DRV_AK4384_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_AK4384_Initialize
SYS_STATUS          ak4384Status;

ak4384Status = DRV_AK4384_Status(object);
if (SYS_STATUS_READY == ak4384Status)
{
    // This means the driver can be opened using the
    // DRV_AK4384_Open function.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_AK4384_Initialize routine

Function

SYS_STATUS DRV_AK4384_Status(SYS_MODULE_OBJ object)

DRV_AK4384_Tasks Function

Maintains the driver's control and data interface state machine.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal control and data interface state machine and implement its control and data interface implementations. This function should be called from the SYS_Tasks function.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks).

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_AK4384_Initialize

while (true)
{
    DRV_AK4384_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_AK4384_Initialize)

Function

void DRV_AK4384_Tasks(SYS_MODULE_OBJ object);

b) Client Setup Functions

DRV_AK4384_Open Function

Opens the specified AK4384 driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_ak4384.h

C

```
DRV_HANDLE DRV_AK4384_Open(const SYS_MODULE_INDEX iDriver, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Errors can occur under following conditions:

- if the number of client objects allocated via DRV_AK4384_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid
- if the ioIntent options passed are not relevant to this driver

Description

This routine opens the specified AK4384 driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The DRV_IO_INTENT_BLOCKING and DRV_IO_INTENT_NONBLOCKING ioIntent options are not relevant to this driver. All the data transfer functions of this driver are non blocking.

Only DRV_IO_INTENT_WRITE is a valid ioIntent option as AK4384 is DAC only.

Specifying a DRV_IO_INTENT_EXCLUSIVE will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Remarks

The handle returned is valid until the DRV_AK4384_Close routine is called. This routine will NEVER block waiting for hardware.If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

Function DRV_AK4384_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_AK4384_Open(DRV_AK4384_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver. See function description for details.

Function

DRV_HANDLE DRV_AK4384_Open

(

const SYS_MODULE_INDEX drvIndex,

const DRV_IO_INTENT ioIntent
)

DRV_AK4384_Close Function

Closes an opened-instance of the AK4384 driver.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This routine closes an opened-instance of the AK4384 driver, invalidating the handle. Any buffers in the driver queue that were submitted by this client will be removed. After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_AK4384_Open before the caller may use the driver again

Remarks

Usually there is no need for the driver client to verify that the Close operation has completed. The driver will abort any ongoing operations when this routine is called.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_AK4384_Open

DRV_AK4384_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4384_Close(DRV_Handle handle)

c) Codec Specific Functions

DRV_AK4384_ChannelOutputInvertDisable Function

Disables output polarity of the selected Channel.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_ChannelOutputInvertDisable(DRV_HANDLE handle, DRV_AK4384_CHANNEL chan);
```

Returns

None.

Description

This function disables output polarity of the selected Channel.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_ChannelOutputInvertDisable(myAK4384Handle, DRV_AK4384_CHANNEL_LEFT);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
chan	Left or Right channel

Function

void DRV_AK4384_ChannelOutputInvertDisable(DRV_HANDLE handle, DRV_AK4384_CHANNEL chan)

DRV_AK4384_ChannelOutputInvertEnable Function

Enables output polarity of the selected channel.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_ChannelOutputInvertEnable(DRV_HANDLE handle, DRV_AK4384_CHANNEL chan);
```

Returns

None.

Description

This function enables output polarity of the selected channel.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_ChannelOutputInvertEnable(myAK4384Handle, DRV_AK4384_CHANNEL_LEFT);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
chan	Left or Right channel

Function

void DRV_AK4384_ChannelOutputInvertEnable(DRV_HANDLE handle, DRV_AK4384_CHANNEL chan)

DRV_AK4384_DeEmphasisFilterSet Function

Allows specifies enabling of digital de-emphasis filter.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_DeEmphasisFilterSet(DRV_HANDLE handle, DRV_AK4384_DEEMPHASIS_FILTER filter);
```

Returns

None.

Description

This function allows specifies enabling of digital de-emphasis for 32, 44.1 or 48 kHz sampling rates (tc = 50/15 µs)

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_DeEmphasisFilterSet(myAK4384Handle, DRV_AK4384_DEEMPHASIS_FILTER_44_1KHZ)
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
filter	Specifies Enable of de-emphasis filter

Function

void DRV_AK4384_DeEmphasisFilterSet

(

DRV_HANDLE handle,

DRV_AK4384_DEEMPHASIS_FILTER filter

)

DRV_AK4384_MuteOff Function

Disables AK4384 output for soft mute.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_MuteOff(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables AK4384 output for soft mute.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

    DRV_AK4384_MuteOff(myAK4384Handle); //AK4384 output soft mute disabled
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4384_MuteOff(DRV_HANDLE handle)

DRV_AK4384_MuteOn Function

Allows AK4384 output for soft mute on.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_MuteOn(DRV_HANDLE handle);
```

Returns

None.

Description

This function Enables AK4384 output for soft mute.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_MuteOn(myAK4384Handle);  //AK4384 output soft muted
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4384_MuteOn(DRV_HANDLE handle);

DRV_AK4384_SamplingRateGet Function

This function gets the sampling rate set on the DAC AK4384.

Implementation: Dynamic

File

drv_ak4384.h

C

```
uint32_t DRV_AK4384_SamplingRateGet(DRV_HANDLE handle);
```

Returns

None.

Description

This function gets the sampling rate set on the DAC AK4384.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
uint32_t baudRate;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

baudRate = DRV_AK4384_SamplingRateGet(myAK4384Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_AK4384_SamplingRateGet(DRV_HANDLE handle)

DRV_AK4384_SamplingRateSet Function

This function sets the sampling rate of the media stream.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_SamplingRateSet(DRV_HANDLE handle, uint32_t samplingRate);
```

Returns

None.

Description

This function sets the media sampling rate for the client handle.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_SamplingRateSet(myAK4384Handle, 48000);  //Sets 48000 media sampling rate
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
baudRate	Baud Rate to be set

Function

void DRV_AK4384_SamplingRateSet(DRV_HANDLE handle, uint32_t samplingRate)

DRV_AK4384_SlowRollOffFilterDisable Function

Disables Slow Roll-off filter function.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_SlowRollOffFilterDisable(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables Slow Roll-off filter function. Sharp Roll-off filter function gets enabled.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_SlowRollOffFilterDisable(myAK4384Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4384_SlowRollOffFilterDisable(DRV_HANDLE handle);

DRV_AK4384_SlowRollOffFilterEnable Function

Enables Slow Roll-off filter function.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_SlowRollOffFilterEnable(DRV_HANDLE handle);
```

Returns

None.

Description

This function enables Slow Roll-off filter function.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_SlowRollOffFilterEnable(myAK4384Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4384_SlowRollOffFilterEnable(DRV_HANDLE handle);

DRV_AK4384_VolumeGet Function

This function gets the volume for AK4384 Codec.

Implementation: Dynamic

File

drv_ak4384.h

C

```
uint8_t DRV_AK4384_VolumeGet(DRV_HANDLE handle, DRV_AK4384_CHANNEL chan);
```

Returns

None.

Description

This functions gets the current volume programmed to the DAC AK4384.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;
uint8_t volume;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

  volume = DRV_AK4384_VolumeGet(myAK4384Handle, DRV_AK4384_CHANNEL_LEFT_RIGHT);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
chan	Audio channel volume to get.

Function

uint8_t DRV_AK4384_VolumeGet(DRV_HANDLE handle, DRV_AK4384_CHANNEL chan)

DRV_AK4384_VolumeSet Function

This function sets the volume for AK4384 Codec.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_VolumeSet(DRV_HANDLE handle, DRV_AK4384_CHANNEL chan, uint8_t volume);
```

Returns

None.

Description

This functions sets the volume value from 0-255, which can attenuate from 0 dB to –48 dB and mute.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

    DRV_AK4384_VolumeSet(myAK4384Handle, DRV_AK4384_CHANNEL_LEFT_RIGHT, 120); //Step 120 volume
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

chan	Audio channel volume to be set
volume	volume value from 0-255, which can attenuate from 0 dB to –48 dB and mute

Function

void DRV_AK4384_VolumeSet(DRV_HANDLE handle, DRV_AK4384_CHANNEL chan, uint8_t volume)

DRV_AK4384_ZeroDetectDisable Function

Disables AK4384 channel-independent zeros detect function.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_ZeroDetectDisable(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables AK4384 channel-independent zeros detect function.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_ZeroDetectDisable(myAK4384Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4384_ZeroDetectDisable(DRV_HANDLE handle)

DRV_AK4384_ZeroDetectEnable Function

Enables AK4384 channel-independent zeros detect function.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_ZeroDetectEnable(DRV_HANDLE handle);
```

Returns

None.

Description

This function enables AK4384 channel-independent zeros detect function.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_ZeroDetectEnable(myAK4384Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4384_ZeroDetectEnable(DRV_HANDLE handle)

DRV_AK4384_ZeroDetectInvertDisable Function

Disables inversion of polarity for zero detect function.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_ZeroDetectInvertDisable(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables inversion of polarity for zero detect function. DZF goes “H” at Zero Detection.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_ZeroDetectInvertDisable(myAK4384Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4384_ZeroDetectInvertDisable(DRV_HANDLE handle)

DRV_AK4384_ZeroDetectInvertEnable Function

Enables inversion of polarity for zero detect function.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_ZeroDetectInvertEnable(DRV_HANDLE handle);
```

Returns

None.

Description

This function enables inversion of polarity for zero detect function. DZF goes “L” at Zero Detection

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_ZeroDetectInvertEnable(myAK4384Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4384_ZeroDetectInvertEnable(DRV_HANDLE handle)

DRV_AK4384_ZeroDetectModeSet Function

Sets mode of AK4384 channel-independent zeros detect function.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_ZeroDetectModeSet(DRV_HANDLE handle, DRV_AK4384_ZERO_DETECT_MODE zdMode);
```

Returns

None.

Description

This function sets mode of AK4384 channel-independent zeros detect function

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

DRV_AK4384_ZeroDetectModeSet(myAK4384Handle, DRV_AK4384_ZERO_DETECT_MODE_ANDED);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
zdMode	Specifies zero detect function mode.

Function

void DRV_AK4384_ZeroDetectModeSet

(

DRV_HANDLE handle,

DRV_AK4384_ZERO_DETECT_MODE zdMode

)

d) Data Transfer Functions

DRV_AK4384_BufferAddWrite Function

Schedule a non-blocking driver write operation.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_BufferAddWrite(const DRV_HANDLE handle, DRV_AK4384_BUFFER_HANDLE * bufferHandle, void *
buffer, size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_AK4384_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking write operation. The function returns with a valid buffer handle in the bufferHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance transmit queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_AK4384_BUFFER_HANDLE_INVALID if:

- a buffer could not be allocated to the request
- the input buffer pointer is NULL
- the buffer size is '0'
- the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_AK4384_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_AK4384_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the AK4384 Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another AK4384 driver instance. It should not otherwise be called directly in an ISR.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 device instance and the DRV_AK4384_Status must have returned SYS_STATUS_READY.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE must have been specified in the DRV_AK4384_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4384_BUFFER_HANDLE bufferHandle;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

// Client registers an event handler with driver

DRV_AK4384_BufferEventHandlerSet(myAK4384Handle,
                APP_AK4384BufferEventHandler, (uintptr_t)&myAppObj);

DRV_AK4384_BufferAddWrite(myAK4384handle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_AK4384_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_AK4384BufferEventHandler(DRV_AK4384_BUFFER_EVENT event,
        DRV_AK4384_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_AK4384_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK4384_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the AK4384 instance as return by the DRV_AK4384_Open function.
buffer	Data to be transmitted.
size	Buffer size in bytes.
bufferHandle	Pointer to an argument that will contain the return buffer handle.

Function

void DRV_AK4384_BufferAddWrite
(
const DRV_HANDLE handle,
DRV_AK4384_BUFFER_HANDLE *bufferHandle,
void *buffer, size_t size
)

DRV_AK4384_BufferEventHandlerSet Function

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_BufferEventHandlerSet(DRV_HANDLE handle, const DRV_AK4384_BUFFER_EVENT_HANDLER
eventHandler, const uintptr_t contextHandle);
```

Returns

None.

Description

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. When a client calls DRV_AK4384_BufferAddWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "buffer add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued buffer transfer has completed, it does not need to register a callback.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4384_BUFFER_HANDLE bufferHandle;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

// Client registers an event handler with driver

DRV_AK4384_BufferEventHandlerSet(myAK4384Handle,
                APP_AK4384BufferEventHandler, (uintptr_t)&myAppObj);

DRV_AK4384_BufferAddWrite(myAK4384handle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_AK4384_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_AK4384BufferEventHandler(DRV_AK4384_BUFFER_EVENT event,
        DRV_AK4384_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
```

```
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_AK4384_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK4384_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_AK4384_BufferEventHandlerSet

(

DRV_HANDLE handle,

const DRV_AK4384_BUFFER_EVENT_HANDLER eventHandler,

const uintptr_t contextHandle

)

DRV_AK4384_BufferCombinedQueueSizeGet Function

This function returns the number of bytes queued (to be processed) in the buffer queue.

Implementation: Dynamic

File

drv_ak4384.h

C

```
size_t DRV_AK4384_BufferCombinedQueueSizeGet(DRV_HANDLE handle);
```

Returns

Returns the number of the bytes that have been processed for this buffer. Returns 0 for an invalid or an expired client handle.

Description

This function returns the number of bytes queued (to be processed) in the buffer queue associated with the driver instance to which the calling client belongs. The client can use this function to know number of bytes that is in the queue to be transmitted.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

One of DRV_AK4384_BufferAddRead/DRV_AK4384_BufferAddWrite function must have been called and buffers should have been queued for transmission.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;
size_t bufferQueuedSize;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4384_BUFFER_HANDLE bufferHandle;

// myI2SHandle is the handle returned
// by the DRV_AK4384_Open function.

// Client registers an event handler with driver. This is done once

DRV_AK4384_BufferEventHandlerSet(myAK4384Handle, APP_AK4384BufferEventHandle,
                                                    (uintptr_t)&myAppObj);

DRV_AK4384_BufferAddRead(myAK4384handle,&bufferHandle,
                                  myBuffer, MY_BUFFER_SIZE);

if(DRV_AK4384_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// The data is being processed after adding the buffer to the queue.
// The user can get to know dynamically available data in the queue to be
// transmitted by calling DRV_AK4384_BufferCombinedQueueSizeGet
bufferQueuedSize = DRV_AK4384_BufferCombinedQueueSizeGet(myAK4384Handle);
```

Parameters

Parameters	Description
handle	Opened client handle associated with a driver object.

Function

size_t DRV_AK4384_BufferCombinedQueueSizeGet(DRV_HANDLE handle)

DRV_AK4384_BufferProcessedSizeGet Function

This function returns number of bytes that have been processed for the specified buffer.

Implementation: Dynamic

File

drv_ak4384.h

C

```
size_t DRV_AK4384_BufferProcessedSizeGet(DRV_AK4384_BUFFER_HANDLE bufferHandle);
```

Returns

Returns the number of the bytes that have been processed for this buffer. Returns 0 for an invalid or an expired buffer handle.

Description

This function returns number of bytes that have been processed for the specified buffer. The client can use this function, in a case where the buffer has terminated due to an error, to obtain the number of bytes that have been processed. If this function is called on a invalid buffer handle, or if the buffer handle has expired, the function returns 0.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified I2S driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

One of DRV_AK4384_BufferAddRead, DRV_AK4384_BufferAddWrite function must have been called and a valid buffer handle returned.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4384_BUFFER_HANDLE bufferHandle;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

// Client registers an event handler with driver. This is done once

DRV_AK4384_BufferEventHandlerSet(myAK4384Handle, APP_AK4384BufferEventHandle,
                                                    (uintptr_t)&myAppObj);

DRV_AK4384_BufferAddRead(myAK4384handle,&bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_AK4384_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_AK4384BufferEventHandler(DRV_AK4384_BUFFER_EVENT event,
        DRV_AK4384_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;
    size_t processedBytes;

    switch(event)
    {
        case DRV_AK4384_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK4384_BUFFER_EVENT_ERROR:

            // Error handling here.
            // We can find out how many bytes were processed in this
            // buffer before the error occurred.

            processedBytes = DRV_AK4384_BufferProcessedSizeGet(bufferHandle);

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferhandle	Handle of the buffer of which the processed number of bytes to be obtained.

Function

size_t DRV_AK4384_BufferProcessedSizeGet(DRV_AK4384_BUFFER_HANDLE bufferHandle)

e) Other Functions

DRV_AK4384_CommandEventHandlerSet Function

This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_CommandEventHandlerSet(DRV_HANDLE handle, const DRV_AK4384_COMMAND_EVENT_HANDLER
eventHandler, const uintptr_t contextHandle);
```

Returns

None.

Description

This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.

When a client calls DRV_AK4384_BufferAddWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "AK4384 CODEC Specific Client Routines" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the command has completed, it does not need to register a callback.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

// Client registers an event handler with driver

DRV_AK4384_CommandEventHandlerSet(myAK4384Handle,
                APP_AK4384CommandEventHandler, (uintptr_t)&myAppObj);

DRV_AK4384_DeEmphasisFilterSet(myAK4384Handle, DRV_AK4384_DEEMPHASIS_FILTER_44_1KHZ)

// Event is received when
// the buffer is processed.

void APP_AK4384CommandEventHandler(uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
            // Last Submitted command is completed.
            // Perform further processing here
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
eventHandler	Pointer to the event handler function.

context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_AK4384_CommandEventHandlerSet
(
DRV_HANDLE handle,
const DRV_AK4384_COMMAND_EVENT_HANDLER eventHandler,
const uintptr_t contextHandle
)

DRV_AK4384_VersionGet Function

Returns the version of the AK4384 driver.

Implementation: Dynamic

File

drv_ak4384.h

C

```
uint32_t DRV_AK4384_VersionGet();
```

Returns

Returns the version of AK4384 driver.

Description

The version number returned from the DRV_AK4384_VersionGet function is an unsigned integer in the following decimal format. * 10000 + * 100 + Where the numbers are represented in decimal and the meaning is the same as above. Note that there is no numerical representation of release type.

Remarks

None.

Example 1

For version "0.03a", return: 0 * 10000 + 3 * 100 + 0 For version "1.00", return: 1 * 100000 + 0 * 100 + 0

Example 2

```
uint32_t ak4384version;
ak4384version = DRV_AK4384_VersionGet();
```

Function

uint32_t DRV_AK4384_VersionGet(void)

DRV_AK4384_VersionStrGet Function

Returns the version of AK4384 driver in string format.

Implementation: Dynamic

File

drv_ak4384.h

C

```
int8_t* DRV_AK4384_VersionStrGet();
```

Returns

returns a string containing the version of AK4384 driver.

Description

The DRV_AK4384_VersionStrGet function returns a string in the format: ".[.][]" Where: is the AK4384 driver's version number. is the AK4384 driver's version number. is an optional "patch" or "dot" release number (which is not included in the string if it equals '00'). is an optional release

type ('a' for alpha, 'b' for beta not the entire word spelled out) that is not included if the release is a production version (i.e., not an alpha or beta). The String does not contain any spaces.

Remarks

None.

Preconditions

None.

Example 1

"0.03a" "1.00"

Example 2

```
int8_t *ak4384string;
ak4384string = DRV_AK4384_VersionStrGet();
```

Function

int8_t* DRV_AK4384_VersionStrGet(void)

DRV_AK4384_BufferQueueFlush Function

This function flushes off the buffers associated with the client object.

Implementation: Dynamic

File

drv_ak4384.h

C

```
void DRV_AK4384_BufferQueueFlush(const DRV_HANDLE handle);
```

Returns

None.

Description

This function flushes off the buffers associated with the client object and disables the DMA channel used for transmission.

Remarks

None.

Preconditions

The DRV_AK4384_Initialize routine must have been called for the specified AK4384 driver instance.

DRV_AK4384_Open must have been called to obtain a valid opened device handle.

One of DRV_AK4384_BufferAddRead/DRV_AK4384_BufferAddWrite function must have been called and buffers should have been queued for transmission.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;
size_t bufferQueuedSize;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4384_BUFFER_HANDLE bufferHandle;

// myAK4384Handle is the handle returned
// by the DRV_AK4384_Open function.

// Client registers an event handler with driver. This is done once

DRV_AK4384_BufferEventHandlerSet(myAK4384Handle, APP_AK4384BufferEventHandle,
                                                    (uintptr_t)&myAppObj);

DRV_AK4384_BufferAddRead(myAK4384handle,&bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_AK4384_BUFFER_HANDLE_INVALID == bufferHandle)
```

```
{
    // Error handling here
}

// The data is being processed after adding the buffer to the queue.
// The user can stop the data processing and flushoff the data
// in the queue by calling DRV_AK4384_BufferQueueFlush
DRV_AK4384_BufferQueueFlush(myAK4384Handle);
```

Parameters

Parameters	Description
handle	Opened client handle associated with a driver object.

Function

void DRV_AK4384_BufferQueueFlush(DRV_HANDLE handle)

f) Data Types and Constants

DRV_AK4384_AUDIO_DATA_FORMAT Enumeration

Identifies the Serial Audio data interface format.

File

drv_ak4384.h

C

```
typedef enum {
  DRV_AK4384_AUDIO_DATA_FORMAT_16BIT_RIGHT_JUSTIFIED = 0,
  DRV_AK4384_AUDIO_DATA_FORMAT_20BIT_RIGHT_JUSTIFIED,
  DRV_AK4384_AUDIO_DATA_FORMAT_24BIT_LEFT_JUSTIFIED,
  DRV_AK4384_AUDIO_DATA_FORMAT_24BIT_I2S,
  DRV_AK4384_AUDIO_DATA_FORMAT_24BIT_RIGHT_JUSTIFIED
} DRV_AK4384_AUDIO_DATA_FORMAT;
```

Members

Members	Description
DRV_AK4384_AUDIO_DATA_FORMAT_16BIT_RIGHT_JUSTIFIED = 0	16 bit Right Justified Audio data format
DRV_AK4384_AUDIO_DATA_FORMAT_20BIT_RIGHT_JUSTIFIED	20 bit Right Justified Audio data format
DRV_AK4384_AUDIO_DATA_FORMAT_24BIT_LEFT_JUSTIFIED	24 bit Left Justified Audio data format
DRV_AK4384_AUDIO_DATA_FORMAT_24BIT_I2S	24 bit I2S Audio data format
DRV_AK4384_AUDIO_DATA_FORMAT_24BIT_RIGHT_JUSTIFIED	24 bit Right Justified Audio data format

Description

AK4384 Audio data format

This enumeration identifies Serial Audio data interface format.

Remarks

None.

DRV_AK4384_BUFFER_EVENT Enumeration

Identifies the possible events that can result from a buffer add request.

File

drv_ak4384.h

C

```
typedef enum {
  DRV_AK4384_BUFFER_EVENT_COMPLETE,
  DRV_AK4384_BUFFER_EVENT_ERROR,
  DRV_AK4384_BUFFER_EVENT_ABORT
```

```
} DRV_AK4384_BUFFER_EVENT;
```

Members

Members	Description
DRV_AK4384_BUFFER_EVENT_COMPLETE	Data was transferred successfully.
DRV_AK4384_BUFFER_EVENT_ERROR	Error while processing the request
DRV_AK4384_BUFFER_EVENT_ABORT	Data transfer aborted (Applicable in DMA mode)

Description

AK4384 Driver Events

This enumeration identifies the possible events that can result from a buffer add request caused by the client calling either the DRV_AK4384_BufferAddWrite function.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that the client registered with the driver by calling the DRV_AK4384_BufferEventHandlerSet function when a buffer transfer request is completed.

DRV_AK4384_BUFFER_EVENT_HANDLER Type

Pointer to a AK4384 Driver Buffer Event handler function.

File

drv_ak4384.h

C

```
typedef void (* DRV_AK4384_BUFFER_EVENT_HANDLER)(DRV_AK4384_BUFFER_EVENT event, DRV_AK4384_BUFFER_HANDLE
bufferHandle, uintptr_t contextHandle);
```

Returns

None.

Description

AK4384 Driver Buffer Event Handler Function

This data type defines the required function signature for the AK4384 driver buffer event handling callback function. A client must register a pointer to a buffer event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive buffer related event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

If the event is DRV_AK4384_BUFFER_EVENT_COMPLETE, this means that the data was transferred successfully.

If the event is DRV_AK4384_BUFFER_EVENT_ERROR, this means that the data was not transferred successfully. The bufferHandle parameter contains the buffer handle of the buffer that failed. The DRV_AK4384_BufferProcessedSizeGet function can be called to find out how many bytes were processed.

The bufferHandle parameter contains the buffer handle of the buffer that associated with the event.

The context parameter contains a handle to the client context, provided at the time the event handling function was registered using the DRV_AK4384_BufferEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The buffer handle in bufferHandle expires after this event handler exits. In that the buffer object that was allocated is deallocated by the driver after the event handler exits.

The event handler function executes in the data driver (I2S) peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

DRV_AK4384_BufferAddWrite function can be called in the event handler to add a buffer to the driver queue.

Example

```
void APP_MyBufferEventHandler( DRV_AK4384_BUFFER_EVENT event,
                               DRV_AK4384_BUFFER_HANDLE bufferHandle,
                               uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
```

```
    {
        case DRV_AK4384_BUFFER_EVENT_COMPLETE:
            // Handle the completed buffer.
        break;

        case DRV_AK4384_BUFFER_EVENT_ERROR:
        default:
            // Handle error.
        break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
bufferHandle	Handle identifying the buffer to which the event relates
context	Value identifying the context of the application that registered the event handling function.

DRV_AK4384_BUFFER_HANDLE Type

Handle identifying a write buffer passed to the driver.

File

drv_ak4384.h

C

```
typedef uintptr_t DRV_AK4384_BUFFER_HANDLE;
```

Description

AK4384 Driver Buffer Handle

A buffer handle value is returned by a call to the DRV_AK4384_BufferAddWrite function. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from the "buffer add" function is returned back to the client by the "event handler callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_AK4384_CHANNEL Enumeration

Identifies Left/Right Audio channel

File

drv_ak4384.h

C

```
typedef enum {
  DRV_AK4384_CHANNEL_LEFT,
  DRV_AK4384_CHANNEL_RIGHT,
  DRV_AK4384_CHANNEL_LEFT_RIGHT,
  DRV_AK4384_NUMBER_OF_CHANNELS
} DRV_AK4384_CHANNEL;
```

Description

AK4384 Audio Channel

This enumeration identifies Left/Right Audio channel

Remarks

None.

DRV_AK4384_COMMAND_EVENT_HANDLER Type

Pointer to a AK4384 Driver Command Event Handler Function

File

drv_ak4384.h

C

```
typedef void (* DRV_AK4384_COMMAND_EVENT_HANDLER)(uintptr_t contextHandle);
```

Returns

None.

Description

AK4384 Driver Command Event Handler Function

This data type defines the required function signature for the AK4384 driver command event handling callback function.

A command is a control instruction to the AK4384 Codec. For example, Mute ON/OFF, Zero Detect Enable/Disable, etc.

A client must register a pointer to a command event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive command related event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

The occurrence of this call back means that the last control command was transferred successfully.

The context parameter contains a handle to the client context, provided at the time the event handling function was registered using the DRV_AK4384_CommandEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) of the client that made the buffer add request.

The event handler function executes in the control data driver interrupt context. It is recommended of the application to not perform process intensive or blocking operations with in this function.

Example

```
void APP_AK4384CommandEventHandler( uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    // Last Submitted command is completed.
    // Perform further processing here
}
```

Parameters

Parameters	Description
context	Value identifying the context of the application that registered the event handling function.

DRV_AK4384_DEEMPHASIS_FILTER Enumeration

Identifies de-emphasis filter function.

File

drv_ak4384.h

C

```
typedef enum {
  DRV_AK4384_DEEMPHASIS_FILTER_44_1KHZ,
  DRV_AK4384_DEEMPHASIS_FILTER_OFF,
  DRV_AK4384_DEEMPHASIS_FILTER_48KHZ,
  DRV_AK4384_DEEMPHASIS_FILTER_32KHZ
} DRV_AK4384_DEEMPHASIS_FILTER;
```

Members

Members	Description
DRV_AK4384_DEEMPHASIS_FILTER_44_1KHZ	De-Emphasis filter for 44.1kHz.
DRV_AK4384_DEEMPHASIS_FILTER_OFF	De-Emphasis filter Off This is the default setting.

DRV_AK4384_DEEMPHASIS_FILTER_48KHZ	De-Emphasis filter for 48kHz.
DRV_AK4384_DEEMPHASIS_FILTER_32KHZ	De-Emphasis filter for 32kHz.

Description

AK4384 De-Emphasis Filter

This enumeration identifies the settings for de-emphasis filter function.

Remarks

None.

DRV_AK4384_INIT Structure

Defines the data required to initialize or reinitialize the AK4384 driver.

File

drv_ak4384.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX spiDriverModuleIndex;
  SYS_MODULE_INDEX i2sDriverModuleIndex;
  uint8_t volume;
  DRV_AK4384_MCLK_MODE mclkMode;
} DRV_AK4384_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX spiDriverModuleIndex;	Identifies control module(SPI) driver ID for control interface of Codec
SYS_MODULE_INDEX i2sDriverModuleIndex;	Identifies data module(I2S) driver ID for data interface of Codec
uint8_t volume;	Volume
DRV_AK4384_MCLK_MODE mclkMode;	Set MCLK mode.

Description

AK4384 Driver Initialization Data

This data type defines the data required to initialize or reinitialize the AK4384 Codec driver.

Remarks

None.

DRV_AK4384_MCLK_MODE Enumeration

Identifies the mode of master clock to AK4384 DAC.

File

drv_ak4384.h

C

```
typedef enum {
  DRV_AK4384_MCLK_MODE_MANUAL,
  DRV_AK4384_MCLK_MODE_AUTO
} DRV_AK4384_MCLK_MODE;
```

Members

Members	Description
DRV_AK4384_MCLK_MODE_MANUAL	Master clock frequency mode Manual
DRV_AK4384_MCLK_MODE_AUTO	Master clock frequency mode Auto This is the default mode.

Description

AK4384 Master clock frequency mode

This enumeration identifies mode of master clock to AK4384 DAC. In Manual Setting Mode, the sampling speed is set by setting DFS0/1 bits in Control Register 2. The frequency of MCLK at each sampling speed is set automatically. In Auto Setting Mode, the MCLK frequency is detected automatically

Remarks

None.

DRV_AK4384_ZERO_DETECT_MODE Enumeration

Identifies Zero Detect Function mode

File

drv_ak4384.h

C

```
typedef enum {
  DRV_AK4384_ZERO_DETECT_MODE_CHANNEL_SEPARATED,
  DRV_AK4384_ZERO_DETECT_MODE_ANDED
} DRV_AK4384_ZERO_DETECT_MODE;
```

Members

Members	Description
DRV_AK4384_ZERO_DETECT_MODE_CHANNEL_SEPARATED	Zero Detect channel separated. When the input data at each channel is continuously zeros for 8192 LRCK cycles, DZF pin of each channel goes to “H” This is the default mode.
DRV_AK4384_ZERO_DETECT_MODE_ANDED	Zero Detect Anded DZF pins of both channels go to “H” only when the input data at both channels are continuously zeros for 8192 LRCK cycles

Description

AK4384 Zero Detect mode

This enumeration identifies the mode of zero detect function

Remarks

None.

DRV_AK4384_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_ak4384.h

C

```
#define DRV_AK4384_BUFFER_HANDLE_INVALID ((DRV_AK4384_BUFFER_HANDLE)(-1))
```

Description

AK4384 Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_AK4384_BufferAddWrite function if the buffer add request was not successful.

Remarks

None.

DRV_AK4384_COUNT Macro

Number of valid AK4384 driver indices.

File

drv_ak4384.h

C

```
#define DRV_AK4384_COUNT
```

Description

AK4384 Driver Module Count

This constant identifies the maximum number of AK4384 Driver instances that should be defined by the application. Defining more instances than this constant will waste RAM memory space.

This constant can also be used by the application to identify the number of AK4384 instances on this microcontroller.

Remarks

This value is device-specific.

DRV_AK4384_INDEX_0 Macro

AK4384 driver index definitions.

File

drv_ak4384.h

C

```
#define DRV_AK4384_INDEX_0 0
```

Description

Driver AK4384 Module Index

These constants provide AK4384 driver index definition.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_AK4384_Initialize and DRV_AK4384_Open routines to identify the driver instance in use.

DRV_AK4384_INDEX_1 Macro

File

drv_ak4384.h

C

```
#define DRV_AK4384_INDEX_1 1
```

Description

This is macro DRV_AK4384_INDEX_1.

DRV_AK4384_INDEX_2 Macro

File

drv_ak4384.h

C

```
#define DRV_AK4384_INDEX_2 2
```

Description

This is macro DRV_AK4384_INDEX_2.

DRV_AK4384_INDEX_3 Macro

File

drv_ak4384.h

C

```
#define DRV_AK4384_INDEX_3 3
```

Description

This is macro DRV_AK4384_INDEX_3.

DRV_AK4384_INDEX_4 Macro

File

drv_ak4384.h

C

```
#define DRV_AK4384_INDEX_4 4
```

Description

This is macro DRV_AK4384_INDEX_4.

DRV_AK4384_INDEX_5 Macro

File

drv_ak4384.h

C

```
#define DRV_AK4384_INDEX_5 5
```

Description

This is macro DRV_AK4384_INDEX_5.

drv_ak4384.h

AK4384 Codec Driver Interface header file

Enumerations

	Name	Description
	DRV_AK4384_AUDIO_DATA_FORMAT	Identifies the Serial Audio data interface format.
	DRV_AK4384_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_AK4384_CHANNEL	Identifies Left/Right Audio channel
	DRV_AK4384_DEEMPHASIS_FILTER	Identifies de-emphasis filter function.
	DRV_AK4384_MCLK_MODE	Identifies the mode of master clock to AK4384 DAC.
	DRV_AK4384_ZERO_DETECT_MODE	Identifies Zero Detect Function mode

Functions

	Name	Description
	DRV_AK4384_BufferAddWrite	Schedule a non-blocking driver write operation. **Implementation:** Dynamic
	DRV_AK4384_BufferCombinedQueueSizeGet	This function returns the number of bytes queued (to be processed) in the buffer queue. **Implementation:** Dynamic
	DRV_AK4384_BufferEventHandlerSet	This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. **Implementation:** Dynamic

	DRV_AK4384_BufferProcessedSizeGet	This function returns number of bytes that have been processed for the specified buffer. **Implementation:** Dynamic
	DRV_AK4384_BufferQueueFlush	This function flushes off the buffers associated with the client object. **Implementation:** Dynamic
	DRV_AK4384_ChannelOutputInvertDisable	Disables output polarity of the selected Channel. **Implementation:** Dynamic
	DRV_AK4384_ChannelOutputInvertEnable	Enables output polarity of the selected channel. **Implementation:** Dynamic
	DRV_AK4384_Close	Closes an opened-instance of the AK4384 driver. **Implementation:** Dynamic
	DRV_AK4384_CommandEventHandlerSet	This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished. **Implementation:** Dynamic
	DRV_AK4384_DeEmphasisFilterSet	Allows specifies enabling of digital de-emphasis filter. **Implementation:** Dynamic
	DRV_AK4384_Deinitialize	Deinitializes the specified instance of the AK4384 driver module. **Implementation:** Dynamic
	DRV_AK4384_Initialize	Initializes hardware and data for the instance of the AK4384 DAC module. **Implementation:** Dynamic
	DRV_AK4384_MuteOff	Disables AK4384 output for soft mute. **Implementation:** Dynamic
	DRV_AK4384_MuteOn	Allows AK4384 output for soft mute on. **Implementation:** Dynamic
	DRV_AK4384_Open	Opens the specified AK4384 driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_AK4384_SamplingRateGet	This function gets the sampling rate set on the DAC AK4384. **Implementation:** Dynamic
	DRV_AK4384_SamplingRateSet	This function sets the sampling rate of the media stream. **Implementation:** Dynamic
	DRV_AK4384_SlowRollOffFilterDisable	Disables Slow Roll-off filter function. **Implementation:** Dynamic
	DRV_AK4384_SlowRollOffFilterEnable	Enables Slow Roll-off filter function. **Implementation:** Dynamic
	DRV_AK4384_Status	Gets the current status of the AK4384 driver module. **Implementation:** Dynamic
	DRV_AK4384_Tasks	Maintains the driver's control and data interface state machine. **Implementation:** Dynamic
	DRV_AK4384_VersionGet	Returns the version of the AK4384 driver. **Implementation:** Dynamic
	DRV_AK4384_VersionStrGet	Returns the version of AK4384 driver in string format. **Implementation:** Dynamic
	DRV_AK4384_VolumeGet	This function gets the volume for AK4384 Codec. **Implementation:** Dynamic
	DRV_AK4384_VolumeSet	This function sets the volume for AK4384 Codec. **Implementation:** Dynamic
	DRV_AK4384_ZeroDetectDisable	Disables AK4384 channel-independent zeros detect function. **Implementation:** Dynamic
	DRV_AK4384_ZeroDetectEnable	Enables AK4384 channel-independent zeros detect function. **Implementation:** Dynamic
	DRV_AK4384_ZeroDetectInvertDisable	Disables inversion of polarity for zero detect function. **Implementation:** Dynamic
	DRV_AK4384_ZeroDetectInvertEnable	Enables inversion of polarity for zero detect function. **Implementation:** Dynamic
	DRV_AK4384_ZeroDetectModeSet	Sets mode of AK4384 channel-independent zeros detect function. **Implementation:** Dynamic

Macros

	Name	Description
	DRV_AK4384_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_AK4384_COUNT	Number of valid AK4384 driver indices.
	DRV_AK4384_INDEX_0	AK4384 driver index definitions.
	DRV_AK4384_INDEX_1	This is macro DRV_AK4384_INDEX_1.
	DRV_AK4384_INDEX_2	This is macro DRV_AK4384_INDEX_2.
	DRV_AK4384_INDEX_3	This is macro DRV_AK4384_INDEX_3.
	DRV_AK4384_INDEX_4	This is macro DRV_AK4384_INDEX_4.
	DRV_AK4384_INDEX_5	This is macro DRV_AK4384_INDEX_5.

Structures

	Name	Description
	DRV_AK4384_INIT	Defines the data required to initialize or reinitialize the AK4384 driver.

Types

	Name	Description
	DRV_AK4384_BUFFER_EVENT_HANDLER	Pointer to a AK4384 Driver Buffer Event handler function.
	DRV_AK4384_BUFFER_HANDLE	Handle identifying a write buffer passed to the driver.
	DRV_AK4384_COMMAND_EVENT_HANDLER	Pointer to a AK4384 Driver Command Event Handler Function

Description

AK4384 Codec Driver Interface

The AK4384 Codec device driver interface provides a simple interface to manage the AK4384 106 dB 192 kHz 24-Bit DAC that can be interfaced Microchip Microcontroller. This file provides the interface definition for the AK4384 Codec device driver.

AK4642 Codec Driver Library

This topic describes the AK4642 Codec Driver Library.

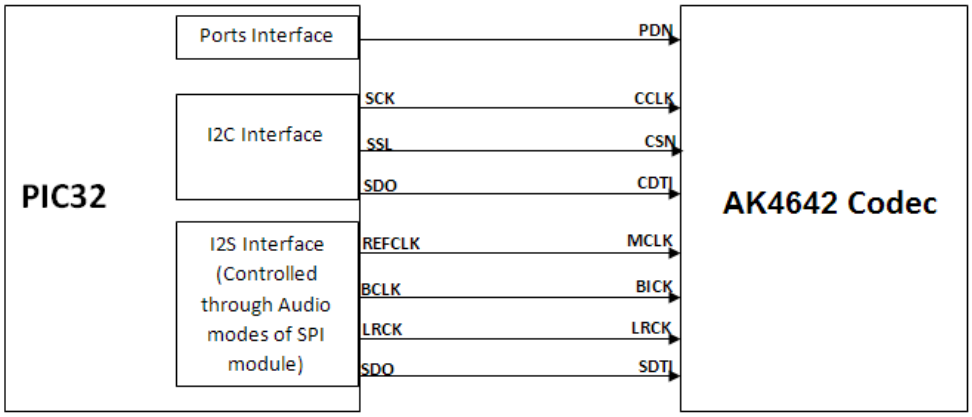
Introduction

This library provides an interface to manage the AK4642 Codec that is serially interfaced to a Microchip microcontroller for providing Audio Solutions.

Description

The AK4642 module is 16/24-bit Audio Codec from Asahi Kasei Microdevices Corporation. The AK4642 can be interfaced to Microchip microcontrollers through I2C and I2S serial interfaces. The I2C interface is used for control command transfer. The I2S interface is used for Audio data output.

A typical interface of AK4642 to a Microchip PIC32 device is provided in the following diagram:



Features

The AK4642 Codec Driver supports the following features:

- Audio Interface Format: MSB first
- ADC: 16-bit MSB justified, 16/24-bit I2S
- DAC: 16-bit MSB justified, 16bit LSB justified, 16/24-bit I2S
- Sampling Frequency Range: 8 kHz to 48 kHz
- Digital Volume Control: +12dB ~ .115dB, 0.5dB Step
- SoftMute: On and Off
- Master Clock Frequencies: 32 fs/64 fs/128fs/256fs

Using the Library

This topic describes the basic architecture of the AK4642 Codec Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_ak4642.h`

The interface to the AK4642 Codec Driver library is defined in the `drv_ak4642.h` header file. Any C language source (`.c`) file that uses the AK4642 Codec Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

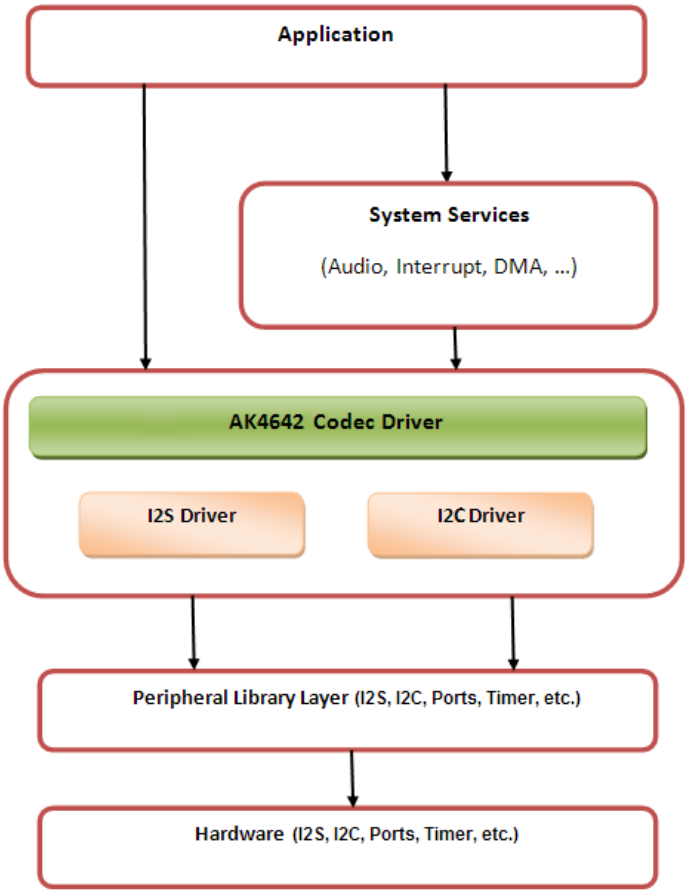
Abstraction Model

This library provides a low-level abstraction of the AK4642 Codec Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The abstraction model shown in the following diagram depicts how the AK4642 Codec Driver is positioned in the MPLAB Harmony framework. The AK4642 Codec Driver uses the SPI and I2S drivers for control and audio data transfers to the AK4642 module.

AK4642 Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The AK4642 Codec Driver Library provides an API interface to transfer control commands and digital audio data to the serially interfaced AK4642 DAC module. The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the AK4642 Codec Driver Library.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Client Setup Functions	Provides open and close functions.
Codec Specific Functions	Provides functions that are codec specific.
Data Transfer Functions	Provides data transfer functions.
Other Functions	Provides driver specific miscellaneous functions such as sampling rate setting, control command functions, etc.
Data Types and Constants	These data types and constants are required while interacting and setting up the AK4642 Codec Driver Library.

How the Library Works

The library provides interfaces to support:

- System Functionality

- Client Functionality

System Access

This topic provides information on system initialization, implementations, and provides a system access code example.

Description

System Initialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization, each instance of the AK4642 module would be initialized with the following configuration settings (either passed dynamically at run time using DRV_AK4642_INIT or by using Initialization Overrides) that are supported by the specific AK4642 device hardware:

- Device requested power state: one of the System Module Power States. For specific details please refer to **Data Types and Constants** in the Library Interface section.
- I2C driver module index. The module index should be same as the one used in initializing the I2C Driver.
- I2S driver module index. The module index should be same as the one used in initializing the I2S Driver.
- Sampling rate
- Master clock detection mode
- Power down pin port initialization

The DRV_AK4642_Initialize API returns an object handle of the type SYS_MODULE_OBJ. The object handle returned by the Initialize interface would be used by the other system interfaces such as DRV_ AK4642_Deinitialize, DRV_ AK4642_Status and DRV_I2S_Tasks.

Implementations

The AK4642 Codec Driver can have the following implementations:

Implementation	Description	MPLAB Harmony Components
Implementation 1	Dedicated hardware for control (I2C) and data (I2S) interface.	Standard MPLAB Harmony drivers for I2C and I2S interfaces.
Implementation 2	Dedicated hardware for data (I2S) interface. Ports pins for control interface.	Standard MPLAB Harmony drivers for I2S interface. Virtual MPLAB Harmony drivers for I2C interface.

Example:

```
DRV_AK4642_INIT drvak4642Init =
{
    .moduleInit.value = SYS_MODULE_POWER_RUN_FULL,
    .i2sDriverModuleIndex = DRV_AK4642_I2S_DRIVER_MODULE_INDEX_IDX0,
    .i2cDriverModuleIndex = DRV_AK4642_I2C_DRIVER_MODULE_INDEX_IDX0,
    .volume = DRV_AK4642_VOLUME,
};

/*
  The I2C and I2S module index should be same as the one used in
  initializing the I2C and I2S drivers.
 */

ak4642DevObject = DRV_AK4642_Initialize(DRV_AK4642_INDEX_0, (SYS_MODULE_INIT *) &drvak4642Init);
if (SYS_MODULE_OBJ_INVALID == ak4642DevObject)
{
    // Handle error
}
```

Task Routine

The DRV_AK4642_Tasks will be called from the System Task Service.

Client Access

This topic describes client access and includes a code example.

Description

For the application to start using an instance of the module, it must call the DRV_AK4642_Open function. The DRV_AK4642_Open provides a driver handle to the AK4642 Codec Driver instance for operations. If the driver is deinitialized using the function DRV_AK4642_Deinitialize, the application must call the DRV_AK4642_Open function again to set up the instance of the driver.

For the various options available for IO_INTENT, please refer to

Data Types and Constants in the Library Interface section.

Note: It is necessary to check the status of driver initialization before opening a driver instance. The status of the AK4642 Codec Driver can be known by calling DRV_AK4642_Status.

Example:

```
DRV_HANDLE handle;
SYS_STATUS ak4642Status;
    ak4642Status = DRV_AK4642_Status(sysObjects.ak4642DevObject);
        if (SYS_STATUS_READY == ak4642Status)
        {
               // The driver can now be opened.
               appData.ak4642Client.handle = DRV_AK4642_Open
                                            (DRV_AK4642_INDEX_0,
                                             DRV_IO_INTENT_WRITE |
                                             DRV_IO_INTENT_EXCLUSIVE );
               if(appData.ak4642Client.handle != DRV_HANDLE_INVALID)
               {
                   appData.state = APP_STATE_AK4642_SET_BUFFER_HANDLER;
               }
               else
               {
                   SYS_DEBUG(0, "Find out what's wrong \r\n");
               }
    }
    else
    {
        /* AK4642 Driver Is not ready */
                ;
    }
```

Client Operations

This topic describes client operations and provides a code example.

Description

Client operations provide the API interface for control command and audio data transfer to the AK4642 Codec.

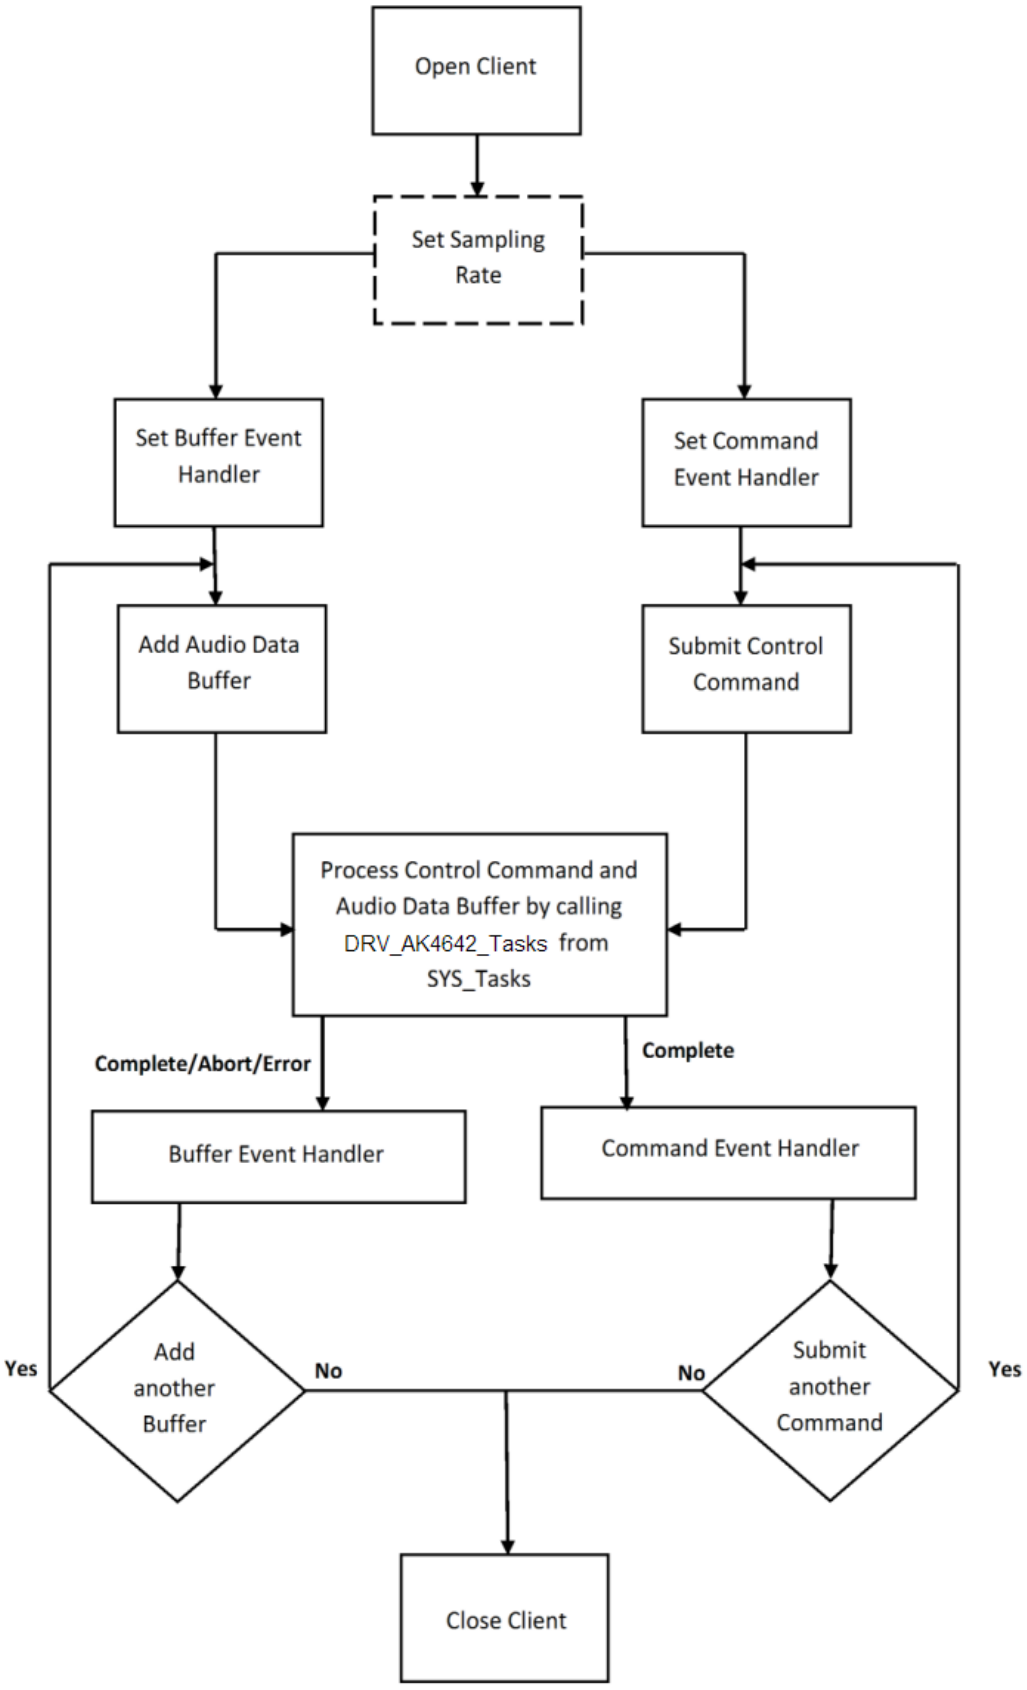
The following AK4642 Codec specific control command functions are provided:

- DRV_AK4642_SamplingRateSet
- DRV_AK4642_SamplingRateGet
- DRV_AK4642_VolumeSet
- DRV_AK4642_VolumeGet
- DRV_AK4642_MuteOn
- DRV_AK4642_MuteOff
- DRV_AK4642_IntExtMicSet
- DRV_AK4642_MonoStereoMicSet

These functions schedule a non-blocking control command transfer operation. These functions submit the control command request to the I2C Driver transmit queue, where the request is processed immediately if it is the first request, or it is processed when the previous request is complete.

DRV_AK4642_BufferAddWrite, DRV_AK4642_BufferAddRead, and DRV_AK4642_BufferAddWriteRead are buffered data operation functions. These functions schedule non-blocking audio data transfer operations. These functions add the request to the I2S Driver transmit or receive buffer queue depending on the request type, and are executed immediately if it is the first buffer, or executed later when the previous buffer is complete. The driver notifies the client with DRV_AK4642_BUFFER_EVENT_COMPLETE, DRV_AK4642_BUFFER_EVENT_ERROR, or DRV_AK4642_BUFFER_EVENT_ABORT events.

The following diagram illustrates the control commands and audio buffered data operations.



Note: It is not necessary to close and reopen the client between multiple transfers.

An application using the buffered functionality needs to perform the following steps:

1. The system should have completed necessary setup and initializations.
2. The I2S driver object should have been initialized by calling DRV_I2S_Initialize.

3. The I2C driver object should have been initialized by calling DRV_I2C_Initialize.
4. The AK4642 driver object should be initialized by calling DRV_AK4642_Initialize.
5. The necessary sampling rate value should be set up by calling DRV_AK4642_ SamplingRateSet.
6. Register buffer event handler for the client handle by calling DRV_AK4642_BufferEventHandlerSet.
7. Submit a command by calling specific command API.
8. Add a buffer to initiate the data transfer by calling DRV_AK4642_BufferAddWrite, DRV_AK4642_BufferAddRead, and DRV_AK4642_BufferAddWriteRead.
9. Call the DRV_AK4642_BufferAddWrite, DRV_AK4642_BufferAddRead, or DRV_AK4642_BufferAddWriteRead function for handling multiple buffer transmissions or receptions.
10. When the client is done, it can use DRV_AK4642_Close to close the client handle.

Example:

```
typedef enum
{
    APP_STATE_AK4642_OPEN,
    APP_STATE_AK4642_SET_BUFFER_HANDLER,
    APP_STATE_AK4642_ADD_FIRST_BUFFER_READ,
    APP_STATE_AK4642_ADD_BUFFER_OUT,
    APP_STATE_AK4642_ADD_BUFFER_IN,
    APP_STATE_AK4642_WAIT_FOR_BUFFER_COMPLETE,
} APP_STATES;

typedef struct
{
    DRV_HANDLE handle;
    DRV_AK4642_BUFFER_HANDLE writereadBufHandle;

Configuring the Library

Macros

	Name	Description
	DRV_AK4642_BCLK_BIT_CLK_DIVISOR	Sets up the BCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency
	DRV_AK4642_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_AK4642_INPUT_REFCLOCK	Identifies the input REFCLOCK source to generate the MCLK to codec.
	DRV_AK4642_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_AK4642_MCLK_SAMPLE_FREQ_MULTPLIER	Sets up the MCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency
	DRV_AK4642_MCLK_SOURCE	Indicate the input clock frequency to generate the MCLK to codec.

Description

The configuration of the AK4642 Codec Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the AK4642 Codec Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the AK4642 Codec Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_AK4642_BCLK_BIT_CLK_DIVISOR Macro

Sets up the BCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency

C

```
#define DRV_AK4642_BCLK_BIT_CLK_DIVISOR
```

Description

AK4642 BCLK to LRCK Ratio to Generate Audio Stream

Sets up the BCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency

Following BCLK to LRCK ratios are supported 16bit data 16 bit channel :- 32fs, hence divisor would be 8 16bit data 32 bit channel :- 64fs, hence divisor would be 4

Remarks

None.

DRV_AK4642_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_ak4642_config_template.h

C

```
#define DRV_AK4642_CLIENTS_NUMBER DRV_AK4642_INSTANCES_NUMBER
```

Description

AK4642 Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance. Typically only one client could be connected to one hardware instance. This value represents the total number of clients to be supported across all hardware instances. Therefore, if there are five AK4642 hardware interfaces, this number will be 5.

Remarks

None.

DRV_AK4642_INPUT_REFCLOCK Macro

Identifies the input REFCLOCK source to generate the MCLK to codec.

File

drv_ak4642_config_template.h

C

```
#define DRV_AK4642_INPUT_REFCLOCK
```

Description

AK4642 Input reference clock

Identifies the input REFCLOCK source to generate the MCLK to codec.

Remarks

None.

DRV_AK4642_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported

File

drv_ak4642_config_template.h

C

```
#define DRV_AK4642_INSTANCES_NUMBER
```

Description

AK4642 driver objects configuration

Sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of AK4642 CODEC modules that are needed by the application. Hardware Instance support consumes RAM memory space. If this macro is not defined, then the driver will be built statically.

Remarks

None.

DRV_AK4642_MCLK_SAMPLE_FREQ_MULTPLIER Macro

Sets up the MCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency

File

drv_ak4642_config_template.h

C

```
#define DRV_AK4642_MCLK_SAMPLE_FREQ_MULTPLIER
```

Description

AK4642 MCLK to LRCK Ratio to Generate Audio Stream

Sets up the MCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency I2S sampling frequency

Supported MCLK to Sampling frequency Ratios are as below 256fs, 384fs, 512fs, 768fs or 1152fs

Remarks

None

DRV_AK4642_MCLK_SOURCE Macro

Indicate the input clock frequency to generate the MCLK to codec.

File

drv_ak4642_config_template.h

C

```
#define DRV_AK4642_MCLK_SOURCE
```

Description

AK4642 Data Interface Master Clock Speed configuration

Indicate the input clock frequency to generate the MCLK to codec.

Remarks

None.

Configuring the MHC

Provides examples on how to configure the MPLAB Harmony Configurator (MHC) for a specific driver.

Description

The following three figures show examples of MHC configurations for the AK4642 Codec Driver, I2S Driver, and the I2C Driver.

Figure 1: AK4642 Codec Driver MHC Configuration

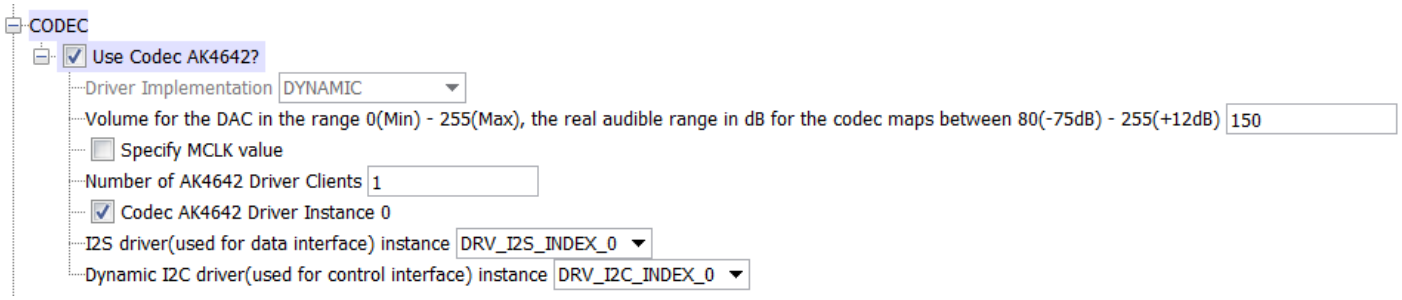

Figure 2: I2S Driver MHC Configuration

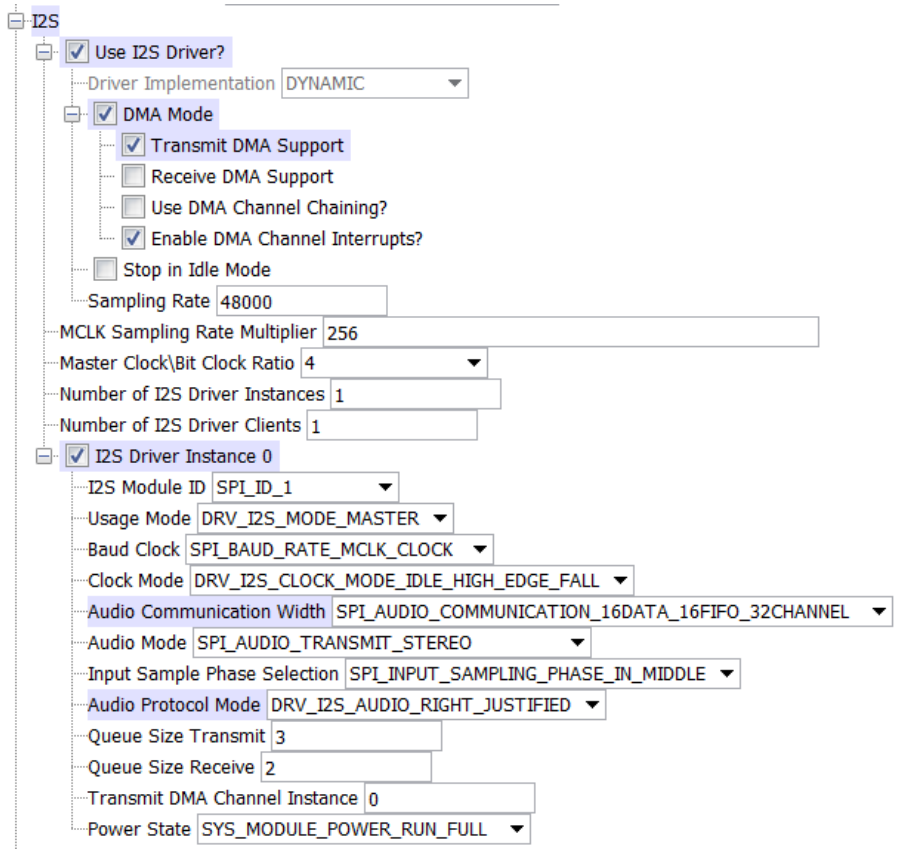

Figure 3: I2C Driver MHC Configuration

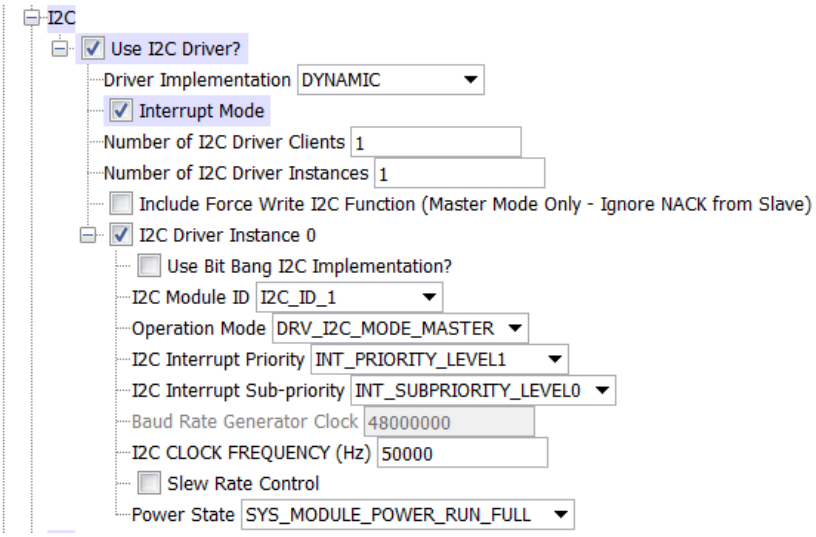

Migrating the AK4642 Driver From Earlier Versions of Microchip Harmony

Prior to version 1.08 of MPLAB Harmony, the AK4642 Codec Driver Library used the static I2C driver implementation. Beginning with v1.08 of MPLAB Harmony, applications must use the Dynamic Driver implementation with the MHC configured as shown in Figure 3. In addition, PIC32MZ configurations require the "Include Force Write I2C Function (Master Mode Only - Ignore NACK from Slave)" option to be selected.

Building the Library

This section lists the files that are available in the AK4642 Codec Driver Library.

Description

This section list the files that are available in the `/src` folder of the AK4642 Codec Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/codec/ak4642`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_ak4642.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_ak4642.c`	This file contains implementation of the AK4642 Codec Driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
There are no optional files for this driver.	N/A

Module Dependencies

The AK4642 Driver Library depends on the following modules:

- I2S Driver Library
- I2C Driver Library

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_AK4642_Initialize	Initializes hardware and data for the instance of the AK4642 DAC module
	DRV_AK4642_Deinitialize	Deinitializes the specified instance of the AK4642 driver module
	DRV_AK4642_Status	Gets the current status of the AK4642 driver module.
	DRV_AK4642_Tasks	Maintains the driver's control and data interface state machine.

b) Client Setup Functions

	Name	Description
	DRV_AK4642_Open	Opens the specified AK4642 driver instance and returns a handle to it
	DRV_AK4642_Close	Closes an opened-instance of the AK4642 driver

c) Codec Specific Functions

	Name	Description
	DRV_AK4642_MuteOff	This function disables AK4642 output for soft mute.
	DRV_AK4642_MuteOn	This function allows AK4642 output for soft mute on.
	DRV_AK4642_SamplingRateGet	This function gets the sampling rate set on the AK4642. **Implementation:** Dynamic
	DRV_AK4642_SamplingRateSet	This function sets the sampling rate of the media stream.
	DRV_AK4642_VolumeGet	This function gets the volume for AK4642 CODEC.
	DRV_AK4642_VolumeSet	This function sets the volume for AK4642 CODEC.
	DRV_AK4642_IntExtMicSet	This function sets up the codec for the internal or the external microphone use.
	DRV_AK4642_MonoStereoMicSet	This function sets up the codec for the Mono or Stereo microphone mode.

d) Data Transfer Functions

	Name	Description
	DRV_AK4642_BufferAddWrite	Schedule a non-blocking driver write operation.
	DRV_AK4642_BufferAddRead	Schedule a non-blocking driver read operation.
	DRV_AK4642_BufferAddWriteRead	Schedule a non-blocking driver write-read operation. **Implementation:** Dynamic
	DRV_AK4642_BufferEventHandlerSet	This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

e) Other Functions

	Name	Description
	DRV_AK4642_CommandEventHandlerSet	This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.
	DRV_AK4642_VersionGet	This function returns the version of AK4642 driver
	DRV_AK4642_VersionStrGet	This function returns the version of AK4642 driver in string format.

f) Data Types and Constants

	Name	Description
	_DRV_AK4642_H	Include files.
	DRV_AK4642_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_AK4642_COUNT	Number of valid AK4642 driver indices
	DRV_AK4642_INDEX_0	AK4642 driver index definitions
	DRV_AK4642_INDEX_1	This is macro DRV_AK4642_INDEX_1.
	DRV_AK4642_INDEX_2	This is macro DRV_AK4642_INDEX_2.
	DRV_AK4642_INDEX_3	This is macro DRV_AK4642_INDEX_3.
	DRV_AK4642_INDEX_4	This is macro DRV_AK4642_INDEX_4.
	DRV_AK4642_INDEX_5	This is macro DRV_AK4642_INDEX_5.
	DRV_AK4642_AUDIO_DATA_FORMAT	Identifies the Serial Audio data interface format.
	DRV_AK4642_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_AK4642_BUFFER_EVENT_HANDLER	Pointer to a AK4642 Driver Buffer Event handler function
	DRV_AK4642_BUFFER_HANDLE	Handle identifying a write buffer passed to the driver.
	DRV_AK4642_CHANNEL	Identifies Left/Right Audio channel
	DRV_AK4642_COMMAND_EVENT_HANDLER	Pointer to a AK4642 Driver Command Event Handler Function
	DRV_AK4642_INIT	Defines the data required to initialize or reinitialize the AK4642 driver
	DRV_AK4642_INT_EXT_MIC	Identifies the Mic input source.
	DRV_AK4642_MONO_STEREO_MIC	Identifies the Mic input as Mono / Stereo.

Description

This section describes the API functions of the AK4642 Codec Driver library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_AK4642_Initialize Function

Initializes hardware and data for the instance of the AK4642 DAC module

File

drv_ak4642.h

C

```
SYS_MODULE_OBJ DRV_AK4642_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the AK4642 driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the init parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized.

Remarks

This routine must be called before any other AK4642 routine is called.

This routine should only be called once during system initialization unless DRV_AK4642_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

DRV_I2S_Initialize must be called before calling this function to initialize the data interface of this CODEC driver. DRV_I2C_Initialize must be called if SPI driver is used for handling the control interface of this CODEC driver.

Example

```
DRV_AK4642_INIT                 init;
SYS_MODULE_OBJ                  objectHandle;

init->inUse                             = true;
init->status                            = SYS_STATUS_BUSY;
init->numClients                        = 0;
init->i2sDriverModuleIndex              = ak4642Init->i2sDriverModuleIndex;
init->i2cDriverModuleIndex              = ak4642Init->i2cDriverModuleIndex;
init->samplingRate                      = DRV_AK4642_AUDIO_SAMPLING_RATE;
init->audioDataFormat                   = DRV_AK4642_AUDIO_DATA_FORMAT_MACRO;

init->isInInterruptContext              = false;

init->commandCompleteCallback = (DRV_AK4642_COMMAND_EVENT_HANDLER)0;
init->commandContextData = 0;
init->mclk_multiplier = DRV_AK4642_MCLK_SAMPLE_FREQ_MULTPLIER;

objectHandle = DRV_AK4642_Initialize(DRV_AK4642_0, (SYS_MODULE_INIT*)init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the driver instance to be initialized
init	Pointer to the data structure containing any data necessary to initialize the hardware. This pointer may be null if no data is required and default initialization is to be used.

Function

SYS_MODULE_OBJ DRV_AK4642_Initialize
(
const SYS_MODULE_INDEX drvIndex,
const SYS_MODULE_INIT *const init
);

DRV_AK4642_Deinitialize Function

Deinitializes the specified instance of the AK4642 driver module

File

drv_ak4642.h

C

```
void DRV_AK4642_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the AK4642 driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the De-initialize operation must be called before the Initialize operation can be called again. This routine will NEVER block waiting for hardware.

Preconditions

Function DRV_AK4642_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_AK4642_Initialize
SYS_STATUS          status;

DRV_AK4642_Deinitialize(object);

status = DRV_AK4642_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_AK4642_Initialize routine

Function

void DRV_AK4642_Deinitialize(SYS_MODULE_OBJ object)

DRV_AK4642_Status Function

Gets the current status of the AK4642 driver module.

File

drv_ak4642.h

C

```
SYS_STATUS DRV_AK4642_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_DEINITIALIZED - Indicates that the driver has been deinitialized

SYS_STATUS_READY - Indicates that any previous module operation for the specified module has completed

SYS_STATUS_BUSY - Indicates that a previous module operation for the specified module has not yet completed

SYS_STATUS_ERROR - Indicates that the specified module is in an error state

Description

This routine provides the current status of the AK4642 driver module.

Remarks

A driver can opened only when its status is SYS_STATUS_READY.

Preconditions

Function DRV_AK4642_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_AK4642_Initialize
SYS_STATUS          AK4642Status;
```

```
AK4642Status = DRV_AK4642_Status(object);
if (SYS_STATUS_READY == AK4642Status)
{
    // This means the driver can be opened using the
    // DRV_AK4642_Open() function.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_AK4642_Initialize routine

Function

SYS_STATUS DRV_AK4642_Status(SYS_MODULE_OBJ object)

DRV_AK4642_Tasks Function

Maintains the driver's control and data interface state machine.

File

drv_ak4642.h

C

```
void DRV_AK4642_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal control and data interface state machine and implement its control and data interface implementations. This function should be called from the SYS_Tasks() function.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks).

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_AK4642_Initialize

while (true)
{
    DRV_AK4642_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_AK4642_Initialize)

Function

void DRV_AK4642_Tasks(SYS_MODULE_OBJ object);

b) Client Setup Functions

DRV_AK4642_Open Function

Opens the specified AK4642 driver instance and returns a handle to it

File

drv_ak4642.h

C

```
DRV_HANDLE DRV_AK4642_Open(const SYS_MODULE_INDEX iDriver, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Error can occur

- if the number of client objects allocated via DRV_AK4642_CLIENTS_NUMBER is insufficient.
- if the client is trying to open the driver but driver has been opened exclusively by another client.
- if the driver hardware instance being opened is not initialized or is invalid.
- if the ioIntent options passed are not relevant to this driver.

Description

This routine opens the specified AK4642 driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The DRV_IO_INTENT_BLOCKING and DRV_IO_INTENT_NONBLOCKING ioIntent options are not relevant to this driver. All the data transfer functions of this driver are non blocking.

AK4642 can be opened with DRV_IO_INTENT_WRITE, or DRV_IO_INTENT_READ or DRV_IO_INTENT_WRITEREAD io_intent option. This decides whether the driver is used for headphone output, or microphone input or both modes simultaneously.

Specifying a DRV_IO_INTENT_EXCLUSIVE will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Remarks

The handle returned is valid until the DRV_AK4642_Close routine is called. This routine will NEVER block waiting for hardware.If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

Function DRV_AK4642_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_AK4642_Open(DRV_AK4642_INDEX_0, DRV_IO_INTENT_WRITEREAD | DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver. See function description for details.

Function

DRV_HANDLE DRV_AK4642_Open

(

const SYS_MODULE_INDEX drvIndex,

const DRV_IO_INTENT ioIntent

)

DRV_AK4642_Close Function

Closes an opened-instance of the AK4642 driver

File

drv_ak4642.h

C

```
void DRV_AK4642_Close(const DRV_HANDLE handle);
```

Returns

- None

Description

This routine closes an opened-instance of the AK4642 driver, invalidating the handle. Any buffers in the driver queue that were submitted by this client will be removed. After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_AK4642_Open before the caller may use the driver again

Remarks

Usually there is no need for the driver client to verify that the Close operation has completed. The driver will abort any ongoing operations when this routine is called.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_AK4642_Open

DRV_AK4642_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4642_Close(DRV_Handle handle)

c) Codec Specific Functions

DRV_AK4642_MuteOff Function

This function disables AK4642 output for soft mute.

File

drv_ak4642.h

C

```
void DRV_AK4642_MuteOff(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables AK4642 output for soft mute.

Remarks

None.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myAK4642Handle is the handle returned
// by the DRV_AK4642_Open function.

    DRV_AK4642_MuteOff(myAK4642Handle); //AK4642 output soft mute disabled
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4642_MuteOff(DRV_HANDLE handle)

DRV_AK4642_MuteOn Function

This function allows AK4642 output for soft mute on.

File

drv_ak4642.h

C

```
void DRV_AK4642_MuteOn(DRV_HANDLE handle);
```

Returns

None.

Description

This function Enables AK4642 output for soft mute.

Remarks

None.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myAK4642Handle is the handle returned
// by the DRV_AK4642_Open function.

DRV_AK4642_MuteOn(myAK4642Handle);  //AK4642 output soft muted
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4642_MuteOn(DRV_HANDLE handle);

DRV_AK4642_SamplingRateGet Function

This function gets the sampling rate set on the AK4642.

Implementation: Dynamic

File

drv_ak4642.h

C

```
uint32_t DRV_AK4642_SamplingRateGet(DRV_HANDLE handle);
```

Description

This function gets the sampling rate set on the DAC AK4642.

Remarks

None.

Example

```
uint32_t baudRate;

// myAK4642Handle is the handle returned
// by the DRV_AK4642_Open function.

baudRate = DRV_AK4642_SamplingRateGet(myAK4642Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_AK4642_SamplingRateGet(DRV_HANDLE handle)

DRV_AK4642_SamplingRateSet Function

This function sets the sampling rate of the media stream.

File

drv_ak4642.h

C

```
void DRV_AK4642_SamplingRateSet(DRV_HANDLE handle, uint32_t samplingRate);
```

Returns

None.

Description

This function sets the media sampling rate for the client handle.

Remarks

None.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

Example

```
// myAK4642Handle is the handle returned
// by the DRV_AK4642_Open function.

DRV_AK4642_SamplingRateSet(myAK4642Handle, 48000);  //Sets 48000 media sampling rate
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
samplingRate	Sampling frequency in Hz

Function

void DRV_AK4642_SamplingRateSet(DRV_HANDLE handle, uint32_t samplingRate)

DRV_AK4642_VolumeGet Function

This function gets the volume for AK4642 CODEC.

File

drv_ak4642.h

C

```
uint8_t DRV_AK4642_VolumeGet(DRV_HANDLE handle, DRV_AK4642_CHANNEL channel);
```

Returns

None.

Description

This functions gets the current volume programmed to the CODEC AK4642.

Remarks

None.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;
uint8_t volume;

// myAK4642Handle is the handle returned
// by the DRV_AK4642_Open function.

  volume = DRV_AK4642_VolumeGet(myAK4642Handle, DRV_AK4642_CHANNEL_LEFT);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
channel	argument indicating Left or Right or Both channel volume to be modified

Function

uint8_t DRV_AK4642_VolumeGet(DRV_HANDLE handle, DRV_AK4642_CHANNEL channel)

DRV_AK4642_VolumeSet Function

This function sets the volume for AK4642 CODEC.

File

drv_ak4642.h

C

```
void DRV_AK4642_VolumeSet(DRV_HANDLE handle, DRV_AK4642_CHANNEL channel, uint8_t volume);
```

Returns

None

Description

This functions sets the volume value from 0-255. The codec has DAC value to volume range mapping as :- 00 H : +12dB FF H : -115dB In order to make the volume value to dB mapping monotonically increasing from 00 to FF, re-mapping is introduced which reverses the volume value to dB mapping as well as normalizes the volume range to a more audible dB range. The current driver implementation assumes that all dB values under -60 dB are inaudible to the human ear. Re-Mapped values 00 H : -60 dB FF H : +12 dB

Remarks

None.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myAK4642Handle is the handle returned
// by the DRV_AK4642_Open function.

    DRV_AK4642_VolumeSet(myAK4642Handle,DRV_AK4642_CHANNEL_LEFT, 120);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
channel	argument indicating Left or Right or Both channel volume to be modified
volume	volume value specified in the range 0-255 (0x00 to 0xFF)

Function

void DRV_AK4642_VolumeSet(DRV_HANDLE handle, DRV_AK4642_CHANNEL channel, uint8_t volume);

DRV_AK4642_IntExtMicSet Function

This function sets up the codec for the internal or the external microphone use.

File

drv_ak4642.h

C

```
void DRV_AK4642_IntExtMicSet(DRV_HANDLE handle, DRV_AK4642_INT_EXT_MIC micInput);
```

Returns

None

Description

This function sets up the codec for the internal or the external microphone use.

Remarks

None.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
micInput	Internal vs External mic input

Function

void DRV_AK4642_IntExtMicSet(DRV_HANDLE handle);

DRV_AK4642_MonoStereoMicSet Function

This function sets up the codec for the Mono or Stereo microphone mode.

File

drv_ak4642.h

C

```
void DRV_AK4642_MonoStereoMicSet(DRV_HANDLE handle, DRV_AK4642_MONO_STEREO_MIC mono_stereo_mic);
```

Returns

None

Description

This function sets up the codec for the Mono or Stereo microphone mode.

Remarks

Currently the ak4642 codec does not work in the MONO_LEFT_CHANNEL mode. This issue will be followed up with AKM.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
mono_stereo_mic	Mono / Stereo mic setup

Function

void DRV_AK4642_MonoStereoMicSet(DRV_HANDLE handle);

d) Data Transfer Functions

DRV_AK4642_BufferAddWrite Function

Schedule a non-blocking driver write operation.

File

drv_ak4642.h

C

```
void DRV_AK4642_BufferAddWrite(const DRV_HANDLE handle, DRV_AK4642_BUFFER_HANDLE * bufferHandle, void *
buffer, size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_AK4642_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking write operation. The function returns with a valid buffer handle in the bufferHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance transmit queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_AK4642_BUFFER_HANDLE_INVALID:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0.

- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_AK4642_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_AK4642_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the AK4642 Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another AK4642 driver instance. It should not otherwise be called directly in an ISR.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 device instance and the DRV_AK4642_Status must have returned SYS_STATUS_READY.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE must have been specified in the DRV_AK4642_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4642_BUFFER_HANDLE bufferHandle;

// myAK4642Handle is the handle returned
// by the DRV_AK4642_Open function.

// Client registers an event handler with driver

DRV_AK4642_BufferEventHandlerSet(myAK4642Handle,
                APP_AK4642BufferEventHandler, (uintptr_t)&myAppObj);

DRV_AK4642_BufferAddWrite(myAK4642handle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_AK4642_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_AK4642BufferEventHandler(DRV_AK4642_BUFFER_EVENT event,
        DRV_AK4642_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_AK4642_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK4642_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the AK4642 instance as return by the DRV_AK4642_Open function.
buffer	Data to be transmitted.
size	Buffer size in bytes.

bufferHandle	Pointer to an argument that will contain the return buffer handle.

Function

void DRV_AK4642_BufferAddWrite
(
const DRV_HANDLE handle,
DRV_AK4642_BUFFER_HANDLE *bufferHandle,
void *buffer, size_t size
)

DRV_AK4642_BufferAddRead Function

Schedule a non-blocking driver read operation.

File

drv_ak4642.h

C

```
void DRV_AK4642_BufferAddRead(const DRV_HANDLE handle, DRV_AK4642_BUFFER_HANDLE * bufferHandle, void * buffer, size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_AK4642_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking read operation. The function returns with a valid buffer handle in the bufferHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance receive queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_AK4642_BUFFER_HANDLE_INVALID

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0.
- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_AK4642_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_AK4642_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the AK4642 Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another AK4642 driver instance. It should not otherwise be called directly in an ISR.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 device instance and the DRV_AK4642_Status must have returned SYS_STATUS_READY.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ must have been specified in the DRV_AK4642_Open call.

Parameters

Parameters	Description
handle	Handle of the AK4642 instance as return by the DRV_AK4642_Open function.
buffer	Data to be transmitted.
size	Buffer size in bytes.
bufferHandle	Pointer to an argument that will contain the return buffer handle.

Function

void DRV_AK4642_BufferAddRead
(
const DRV_HANDLE handle,
DRV_AK4642_BUFFER_HANDLE *bufferHandle,

void *buffer, size_t size

)

DRV_AK4642_BufferAddWriteRead Function

Schedule a non-blocking driver write-read operation.

Implementation: Dynamic

File

drv_ak4642.h

C

```
void DRV_AK4642_BufferAddWriteRead(const DRV_HANDLE handle, DRV_AK4642_BUFFER_HANDLE * bufferHandle, void *
transmitBuffer, void * receiveBuffer, size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_AK4642_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking write-read operation. The function returns with a valid buffer handle in the bufferHandle argument if the write-read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_AK4642_BUFFER_EVENT_COMPLETE:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only or write only
- if the buffer size is 0
- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_AK4642_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_AK4642_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the AK4642 Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another AK4642 driver instance. It should not otherwise be called directly in an ISR.

This function is useful when there is valid read expected for every AK4642 write. The transmit and receive size must be same.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 device instance and the DRV_AK4642_Status must have returned SYS_STATUS_READY.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READWRITE must have been specified in the DRV_AK4642_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybufferTx[MY_BUFFER_SIZE];
uint8_t mybufferRx[MY_BUFFER_SIZE];
DRV_AK4642_BUFFER_HANDLE bufferHandle;

// myak4642Handle is the handle returned
// by the DRV_AK4642_Open function.

// Client registers an event handler with driver

DRV_AK4642_BufferEventHandlerSet(myak4642Handle,
                APP_AK4642BufferEventHandler, (uintptr_t)&myAppObj);

DRV_AK4642_BufferAddWriteRead(myak4642handle, &bufferHandle,
                                    mybufferTx,mybufferRx,MY_BUFFER_SIZE);

if(DRV_AK4642_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
```

```
}

// Event is received when
// the buffer is processed.

void APP_AK4642BufferEventHandler(DRV_AK4642_BUFFER_EVENT event,
        DRV_AK4642_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_AK4642_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK4642_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the AK4642 instance as returned by the DRV_AK4642_Open function
bufferHandle	Pointer to an argument that will contain the return buffer handle
transmitBuffer	The buffer where the transmit data will be stored
receiveBuffer	The buffer where the received data will be stored
size	Buffer size in bytes

Function

void DRV_AK4642_BufferAddWriteRead
(
const DRV_HANDLE handle,
DRV_AK4642_BUFFER_HANDLE *bufferHandle,
void *transmitBuffer,
void *receiveBuffer,
size_t size
)

DRV_AK4642_BufferEventHandlerSet Function

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

File

drv_ak4642.h

C

```
void DRV_AK4642_BufferEventHandlerSet(DRV_HANDLE handle, const DRV_AK4642_BUFFER_EVENT_HANDLER
eventHandler, const uintptr_t contextHandle);
```

Returns

None.

Description

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. When a client calls DRV_AK4642_BufferAddWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "buffer add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued buffer transfer has completed, it does not need to register a callback.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4642_BUFFER_HANDLE bufferHandle;

// myAK4642Handle is the handle returned
// by the DRV_AK4642_Open function.

// Client registers an event handler with driver

DRV_AK4642_BufferEventHandlerSet(myAK4642Handle,
                APP_AK4642BufferEventHandler, (uintptr_t)&myAppObj);

DRV_AK4642_BufferAddWrite(myAK4642handle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_AK4642_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_AK4642BufferEventHandler(DRV_AK4642_BUFFER_EVENT event,
        DRV_AK4642_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_AK4642_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK4642_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_AK4642_BufferEventHandlerSet
(
DRV_HANDLE handle,
const DRV_AK4642_BUFFER_EVENT_HANDLER eventHandler,
const uintptr_t contextHandle
)

e) Other Functions

DRV_AK4642_CommandEventHandlerSet Function

This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.

File

drv_ak4642.h

C

```
void DRV_AK4642_CommandEventHandlerSet(DRV_HANDLE handle, const DRV_AK4642_COMMAND_EVENT_HANDLER
eventHandler, const uintptr_t contextHandle);
```

Returns

None.

Description

This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.

When a client calls DRV_AK4642_BufferAddWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "AK4642 CODEC Specific Client Routines" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the command has completed, it does not need to register a callback.

Preconditions

The DRV_AK4642_Initialize routine must have been called for the specified AK4642 driver instance.

DRV_AK4642_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4642_BUFFER_HANDLE bufferHandle;

// myAK4642Handle is the handle returned
// by the DRV_AK4642_Open function.

// Client registers an event handler with driver

DRV_AK4642_CommandEventHandlerSet(myAK4642Handle,
                APP_AK4642CommandEventHandler, (uintptr_t)&myAppObj);

DRV_AK4642_DeEmphasisFilterSet(myAK4642Handle, DRV_AK4642_DEEMPHASIS_FILTER_44_1KHZ)

// Event is received when
// the buffer is processed.

void APP_AK4642CommandEventHandler(uintptr_t contextHandle)
{
```

```
    // contextHandle points to myAppObj.

    switch(event)
    {
            // Last Submitted command is completed.
            // Perform further processing here
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_AK4642_CommandEventHandlerSet

(

DRV_HANDLE handle,

const DRV_AK4642_COMMAND_EVENT_HANDLER eventHandler,

const uintptr_t contextHandle

)

DRV_AK4642_VersionGet Function

This function returns the version of AK4642 driver

File

drv_ak4642.h

C

```
uint32_t DRV_AK4642_VersionGet();
```

Returns

returns the version of AK4642 driver.

Description

The version number returned from the DRV_AK4642_VersionGet function is an unsigned integer in the following decimal format. * 10000 + * 100 + Where the numbers are represented in decimal and the meaning is the same as above. Note that there is no numerical representation of release type.

Remarks

None.

Preconditions

None.

Example 1

For version "0.03a", return: 0 * 10000 + 3 * 100 + 0 For version "1.00", return: 1 * 100000 + 0 * 100 + 0

Example 2

```
uint32_t AK4642version;
AK4642version = DRV_AK4642_VersionGet();
```

Function

uint32_t DRV_AK4642_VersionGet(void)

DRV_AK4642_VersionStrGet Function

This function returns the version of AK4642 driver in string format.

File

drv_ak4642.h

C

```
int8_t* DRV_AK4642_VersionStrGet();
```

Returns

returns a string containing the version of AK4642 driver.

Description

The DRV_AK4642_VersionStrGet function returns a string in the format: ".[.][]" Where: is the AK4642 driver's version number. is the AK4642 driver's version number. is an optional "patch" or "dot" release number (which is not included in the string if it equals "00"). is an optional release type ("a" for alpha, "b" for beta ? not the entire word spelled out) that is not included if the release is a production version (I.e. Not an alpha or beta).

The String does not contain any spaces. For example, "0.03a" "1.00"

Remarks

None

Preconditions

None.

Example

```
int8_t *AK4642string;
AK4642string = DRV_AK4642_VersionStrGet();
```

Function

int8_t* DRV_AK4642_VersionStrGet(void)

f) Data Types and Constants

_DRV_AK4642_H Macro

File

drv_ak4642.h

C

```
#define _DRV_AK4642_H
```

Description

Include files.

DRV_AK4642_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_ak4642.h

C

```
#define DRV_AK4642_BUFFER_HANDLE_INVALID ((DRV_AK4642_BUFFER_HANDLE)(-1))
```

Description

AK4642 Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_AK4642_BufferAddWrite() and the DRV_AK4642_BufferAddRead() function if the buffer add request was not successful.

Remarks

None.

DRV_AK4642_COUNT Macro

Number of valid AK4642 driver indices

File

drv_ak4642.h

C

```
#define DRV_AK4642_COUNT
```

Description

AK4642 Driver Module Count

This constant identifies the maximum number of AK4642 Driver instances that should be defined by the application. Defining more instances than this constant will waste RAM memory space.

This constant can also be used by the application to identify the number of AK4642 instances on this microcontroller.

Remarks

This value is part-specific.

DRV_AK4642_INDEX_0 Macro

AK4642 driver index definitions

File

drv_ak4642.h

C

```
#define DRV_AK4642_INDEX_0 0
```

Description

Driver AK4642 Module Index

These constants provide AK4642 driver index definition.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_AK4642_Initialize and DRV_AK4642_Open routines to identify the driver instance in use.

C

```
#define DRV_AK4642_INDEX_5 5
```

Description

This is macro DRV_AK4642_INDEX_5.

DRV_AK4642_AUDIO_DATA_FORMAT Enumeration

Identifies the Serial Audio data interface format.

File

drv_ak4642.h

C

```
typedef enum {
  DRV_AK4642_AUDIO_DATA_FORMAT_NOT_APPLICABLE = 0,
  DRV_AK4642_AUDIO_DATA_FORMAT_16BITMSB_SDTO_16BITLSB_SDTI,
  DRV_AK4642_AUDIO_DATA_FORMAT_16BITMSB_SDTO_16BITMSB_SDTI,
  DRV_AK4642_AUDIO_DATA_FORMAT_I2S
} DRV_AK4642_AUDIO_DATA_FORMAT;
```

Description

AK4642 Audio data format

This enumeration identifies Serial Audio data interface format.

DRV_AK4642_BUFFER_EVENT Enumeration

Identifies the possible events that can result from a buffer add request.

File

drv_ak4642.h

C

```
typedef enum {
  DRV_AK4642_BUFFER_EVENT_COMPLETE,
  DRV_AK4642_BUFFER_EVENT_ERROR,
  DRV_AK4642_BUFFER_EVENT_ABORT
} DRV_AK4642_BUFFER_EVENT;
```

Members

Members	Description
DRV_AK4642_BUFFER_EVENT_COMPLETE	Data was transferred successfully.
DRV_AK4642_BUFFER_EVENT_ERROR	Error while processing the request
DRV_AK4642_BUFFER_EVENT_ABORT	Data transfer aborted (Applicable in DMA mode)

Description

AK4642 Driver Events

This enumeration identifies the possible events that can result from a buffer add request caused by the client calling either the DRV_AK4642_BufferAddWrite() or the DRV_AK4642_BufferAddRead() function.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that the client registered with the driver by calling the DRV_AK4642_BufferEventHandlerSet function when a buffer transfer request is completed.

DRV_AK4642_BUFFER_EVENT_HANDLER Type

Pointer to a AK4642 Driver Buffer Event handler function

File

drv_ak4642.h

C

```
typedef void (* DRV_AK4642_BUFFER_EVENT_HANDLER)(DRV_AK4642_BUFFER_EVENT event, DRV_AK4642_BUFFER_HANDLE
bufferHandle, uintptr_t contextHandle);
```

Returns

None.

Description

AK4642 Driver Buffer Event Handler Function

This data type defines the required function signature for the AK4642 driver buffer event handling callback function. A client must register a pointer to a buffer event handling function who's function signature (parameter and return value types) match the types specified by this function pointer in order to receive buffer related event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

If the event is DRV_AK4642_BUFFER_EVENT_COMPLETE, this means that the data was transferred successfully.

If the event is DRV_AK4642_BUFFER_EVENT_ERROR, this means that the data was not transferred successfully. The bufferHandle parameter contains the buffer handle of the buffer that failed. The DRV_AK4642_BufferProcessedSizeGet() function can be called to find out how many bytes were processed.

The bufferHandle parameter contains the buffer handle of the buffer that associated with the event.

The context parameter contains a handle to the client context, provided at the time the event handling function was registered using the DRV_AK4642_BufferEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The buffer handle in bufferHandle expires after this event handler exits. In that the buffer object that was allocated is deallocated by the driver after the event handler exits.

The event handler function executes in the data driver(i2S) peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

DRV_AK4642_BufferAddWrite function can be called in the event handler to add a buffer to the driver queue.

Example

```
void APP_MyBufferEventHandler( DRV_AK4642_BUFFER_EVENT event,
                               DRV_AK4642_BUFFER_HANDLE bufferHandle,
                               uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_AK4642_BUFFER_EVENT_COMPLETE:
            // Handle the completed buffer.
        break;

        case DRV_AK4642_BUFFER_EVENT_ERROR:
        default:
            // Handle error.
        break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
bufferHandle	Handle identifying the buffer to which the event relates
context	Value identifying the context of the application that registered the event handling function.

DRV_AK4642_BUFFER_HANDLE Type

Handle identifying a write buffer passed to the driver.

File

drv_ak4642.h

C

```
typedef uintptr_t DRV_AK4642_BUFFER_HANDLE;
```

Description

AK4642 Driver Buffer Handle

A buffer handle value is returned by a call to the DRV_AK4642_BufferAddWrite() or DRV_AK4642_BufferAddRead() function. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from the "buffer add" function is returned back to the client by the "event handler callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None

DRV_AK4642_CHANNEL Enumeration

Identifies Left/Right Audio channel

File

drv_ak4642.h

C

```
typedef enum {
  DRV_AK4642_CHANNEL_LEFT,
  DRV_AK4642_CHANNEL_RIGHT,
  DRV_AK4642_CHANNEL_LEFT_RIGHT,
  DRV_AK4642_NUMBER_OF_CHANNELS
} DRV_AK4642_CHANNEL;
```

Description

AK4642 Audio Channel

This enumeration identifies Left/Right Audio channel

Remarks

None.

DRV_AK4642_COMMAND_EVENT_HANDLER Type

Pointer to a AK4642 Driver Command Event Handler Function

File

drv_ak4642.h

C

```
typedef void (* DRV_AK4642_COMMAND_EVENT_HANDLER)(uintptr_t contextHandle);
```

Returns

None.

Description

AK4642 Driver Command Event Handler Function

This data type defines the required function signature for the AK4642 driver command event handling callback function.

A command is a control instruction to the AK4642 CODEC. Example Mute ON/OFF, Zero Detect Enable/Disable etc.

A client must register a pointer to a command event handling function who's function signature (parameter and return value types) match the types specified by this function pointer in order to receive command related event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

The occurrence of this call back means that the last control command was transferred successfully.

The context parameter contains a handle to the client context, provided at the time the event handling function was registered using the DRV_AK4642_CommandEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The event handler function executes in the control data driver interrupt context. It is recommended of the application to not perform process intensive or blocking operations with in this function.

Example

```
void APP_AK4642CommandEventHandler( uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    // Last Submitted command is completed.
    // Perform further processing here
}
```

Parameters

Parameters	Description
context	Value identifying the context of the application that registered the event handling function.

DRV_AK4642_INIT Structure

Defines the data required to initialize or reinitialize the AK4642 driver

File

drv_ak4642.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX i2sDriverModuleIndex;
```

```
  SYS_MODULE_INDEX i2cDriverModuleIndex;
  uint32_t samplingRate;
  uint8_t volume;
  DRV_AK4642_AUDIO_DATA_FORMAT audioDataFormat;
} DRV_AK4642_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX i2sDriverModuleIndex;	Identifies data module(I2S) driver ID for data interface of CODEC
SYS_MODULE_INDEX i2cDriverModuleIndex;	Identifies data module(I2C) driver ID for control interface of CODEC
uint32_t samplingRate;	Sampling rate
uint8_t volume;	Volume
DRV_AK4642_AUDIO_DATA_FORMAT audioDataFormat;	Identifies the Audio data format

Description

AK4642 Driver Initialization Data

This data type defines the data required to initialize or reinitialize the AK4642 CODEC driver.

Remarks

None.

DRV_AK4642_INT_EXT_MIC Enumeration

Identifies the Mic input source.

File

drv_ak4642.h

C

```
typedef enum {
  INT_MIC,
  EXT_MIC
} DRV_AK4642_INT_EXT_MIC;
```

Description

AK4642 Mic Internal / External Input

This enumeration identifies the Mic input source.

DRV_AK4642_MONO_STEREO_MIC Enumeration

Identifies the Mic input as Mono / Stereo.

File

drv_ak4642.h

C

```
typedef enum {
  ALL_ZEROS,
  MONO_RIGHT_CHANNEL,
  MONO_LEFT_CHANNEL,
  STEREO
} DRV_AK4642_MONO_STEREO_MIC;
```

Description

AK4642 Mic Mono / Stereo Input

This enumeration identifies the Mic input as Mono / Stereo.

Files

Files

drv_ak4642_config_template.h	AK4642 Codec Driver Configuration Template.

Description

This section lists the source and header files used by the AK4642 Codec Driver Library.

drv_ak4642.h

AK4642 CODEC Driver Interface header file

Enumerations

	Name	Description
	DRV_AK4642_AUDIO_DATA_FORMAT	Identifies the Serial Audio data interface format.
	DRV_AK4642_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_AK4642_CHANNEL	Identifies Left/Right Audio channel
	DRV_AK4642_INT_EXT_MIC	Identifies the Mic input source.
	DRV_AK4642_MONO_STEREO_MIC	Identifies the Mic input as Mono / Stereo.

Functions

	Name	Description
	DRV_AK4642_BufferAddRead	Schedule a non-blocking driver read operation.
	DRV_AK4642_BufferAddWrite	Schedule a non-blocking driver write operation.
	DRV_AK4642_BufferAddWriteRead	Schedule a non-blocking driver write-read operation. **Implementation:** Dynamic
	DRV_AK4642_BufferEventHandlerSet	This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.
	DRV_AK4642_Close	Closes an opened-instance of the AK4642 driver
	DRV_AK4642_CommandEventHandlerSet	This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.
	DRV_AK4642_Deinitialize	Deinitializes the specified instance of the AK4642 driver module
	DRV_AK4642_Initialize	Initializes hardware and data for the instance of the AK4642 DAC module
	DRV_AK4642_IntExtMicSet	This function sets up the codec for the internal or the external microphone use.
	DRV_AK4642_MonoStereoMicSet	This function sets up the codec for the Mono or Stereo microphone mode.
	DRV_AK4642_MuteOff	This function disables AK4642 output for soft mute.
	DRV_AK4642_MuteOn	This function allows AK4642 output for soft mute on.
	DRV_AK4642_Open	Opens the specified AK4642 driver instance and returns a handle to it
	DRV_AK4642_SamplingRateGet	This function gets the sampling rate set on the AK4642. **Implementation:** Dynamic
	DRV_AK4642_SamplingRateSet	This function sets the sampling rate of the media stream.
	DRV_AK4642_Status	Gets the current status of the AK4642 driver module.
	DRV_AK4642_Tasks	Maintains the driver's control and data interface state machine.
	DRV_AK4642_VersionGet	This function returns the version of AK4642 driver
	DRV_AK4642_VersionStrGet	This function returns the version of AK4642 driver in string format.
	DRV_AK4642_VolumeGet	This function gets the volume for AK4642 CODEC.
	DRV_AK4642_VolumeSet	This function sets the volume for AK4642 CODEC.

Macros

	Name	Description
	_DRV_AK4642_H	Include files.
	DRV_AK4642_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_AK4642_COUNT	Number of valid AK4642 driver indices

	DRV_AK4642_INDEX_0	AK4642 driver index definitions
	DRV_AK4642_INDEX_1	This is macro DRV_AK4642_INDEX_1.
	DRV_AK4642_INDEX_2	This is macro DRV_AK4642_INDEX_2.
	DRV_AK4642_INDEX_3	This is macro DRV_AK4642_INDEX_3.
	DRV_AK4642_INDEX_4	This is macro DRV_AK4642_INDEX_4.
	DRV_AK4642_INDEX_5	This is macro DRV_AK4642_INDEX_5.

Structures

	Name	Description
	DRV_AK4642_INIT	Defines the data required to initialize or reinitialize the AK4642 driver

Types

	Name	Description
	DRV_AK4642_BUFFER_EVENT_HANDLER	Pointer to a AK4642 Driver Buffer Event handler function
	DRV_AK4642_BUFFER_HANDLE	Handle identifying a write buffer passed to the driver.
	DRV_AK4642_COMMAND_EVENT_HANDLER	Pointer to a AK4642 Driver Command Event Handler Function

Description

AK4642 CODEC Driver Interface

The AK4642 CODEC device driver interface provides a simple interface to manage the AK4642 16/24-Bit CODEC that can be interfaced Microchip Microcontroller. This file provides the interface definition for the AK4642 CODEC device driver.

File Name

AK4953 Codec Driver Library

This topic describes the AK4953 Codec Driver Library.

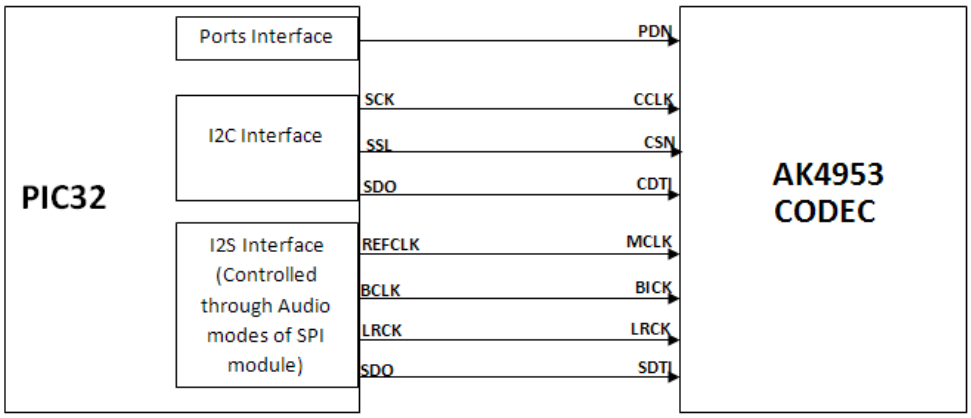
Introduction

This library provides an interface to manage the AK4953 Codec that is serially interfaced to a Microchip microcontroller for providing Audio Solutions.

Description

The AK4953 module is 16/24-bit Audio Codec from Asahi Kasei Microdevices Corporation. The AK4953 can be interfaced to Microchip microcontrollers through I2C and I2S serial interfaces. The I2C interface is used for control command transfer. The I2S interface is used for Audio data output.

A typical interface of AK4953 to a Microchip PIC32 device is provided in the following diagram:



Features

The AK4953 Codec supports the following features:

- Audio Interface Format: MSB first
- ADC: 24-bit MSB justified, 16/24-bit I2S
- DAC: 24-bit MSB justified, 1-6bit LSB justified, 24-bit LSB justified, 16/24-bit I2S
- Sampling Frequency Range: 8 kHz to 192 kHz
- Digital Volume Control: +12dB ~ .115dB, 0.5dB Step
- SoftMute: On and Off
- Master Clock Frequencies: 32 fs/64 fs/128 fs/256 fs

Using the Library

This topic describes the basic architecture of the AK4953 Codec Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_AK4953.h`

The interface to the AK4953 Codec Driver library is defined in the `drv_AK4953.h` header file. Any C language source (`.c`) file that uses the AK4953 Codec Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The AK4953 Codec Driver Library provides an API interface to transfer control commands and digital audio data to the serially interfaced AK4953 DAC module. The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the AK4953 Codec Driver Library.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Status Functions	Provides status functions.
Other Functions	Provides driver specific miscellaneous functions such as sampling rate setting, control command functions, etc.

Data Types and Constants	These data types and constants are required while interacting and setting up the AK4953 Codec Driver Library.

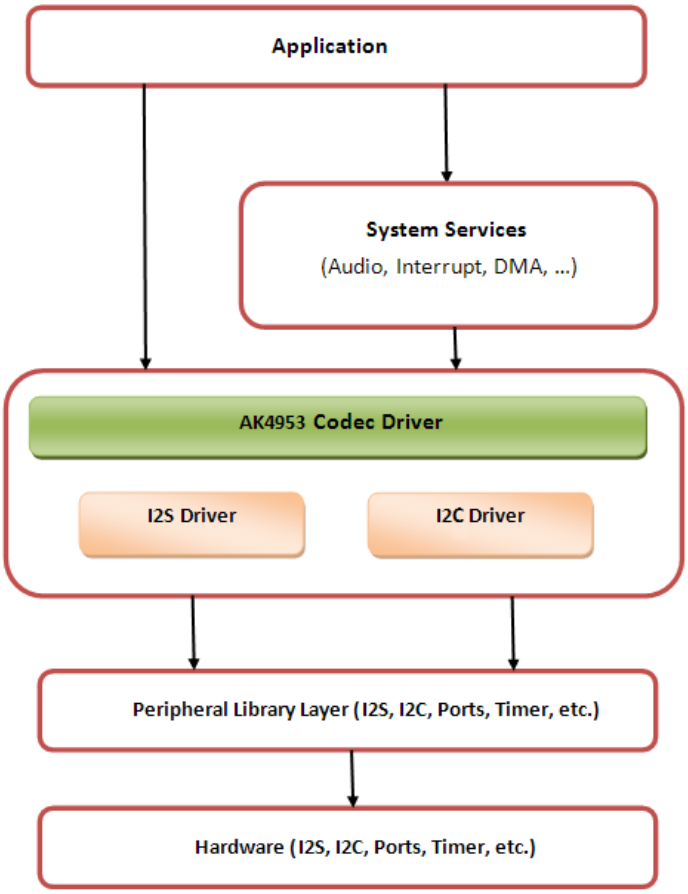
Abstraction Model

This library provides a low-level abstraction of the AK4953 Codec Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The abstraction model shown in the following diagram depicts how the AK4953 Codec Driver is positioned in the MPLAB Harmony framework. The AK4953 Codec Driver uses the SPI and I2S drivers for control and audio data transfers to the AK4953 module.

AK4953 Driver Abstraction Model



How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality

System Access

This topic describes system initialization, implementations, and includes a system access code example.

Description

System Initialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization, each instance of the AK4953 module would be initialized with the following configuration settings (either passed dynamically

at run time using DRV_AK4953_INIT or by using Initialization Overrides) that are supported by the specific AK4953 device hardware:

- Device requested power state: one of the System Module Power States. For specific details please refer to **Data Types and Constants** in the Library Interface section.
- I2C driver module index. The module index should be same as the one used in initializing the I2C Driver.
- I2S driver module index. The module index should be same as the one used in initializing the I2S Driver.
- Sampling rate
- Audio data format. The audio data format should match with the audio data format settings done in I2S driver initialization
- Power down pin port initialization
- Queue size for the audio data transmit buffer

The DRV_AK4953_Initialize API returns an object handle of the type SYS_MODULE_OBJ. The object handle returned by the Initialize interface would be used by the other system interfaces such as DRV_ AK4953_Deinitialize, DRV_ AK4953_Status and DRV_I2S_Tasks.

Implementations

The AK4953 Codec Driver can has the following implementation:

Description	MPLAB Harmony Components
Dedicated hardware for control (I2C) and data (I2S) interface.	Standard MPLAB Harmony drivers for I2C and I2S interfaces.

Example:

```
DRV_AK4953_INIT drvak4953Codec0InitData =
{
    .moduleInit.value = SYS_MODULE_POWER_RUN_FULL,
    .i2sDriverModuleIndex = DRV_AK4953_I2S_DRIVER_MODULE_INDEX_IDX0,
    .i2cDriverModuleIndex = DRV_AK4953_I2C_DRIVER_MODULE_INDEX_IDX0,
    .volume = DRV_AK4953_VOLUME,
    .queueSizeTransmit = DRV_AK4953_TRANSMIT_QUEUE_SIZE,
};

// Initialize the I2C driver
   DRV_I2C0_Initialize();

// Initialize the I2S driver. The I2S module index should be same as the one used in initializing
// the I2S driver.
   sysObj.drvI2S0 = DRV_I2S_Initialize(DRV_I2S_INDEX_0, (SYS_MODULE_INIT *)&drvI2S0InitData);

// Initialize the Codec driver
   sysObj.drvak4953Codec0 = DRV_AK4953_Initialize(DRV_AK4953_INDEX_0, (SYS_MODULE_INIT
*)&drvak4953Codec0InitData);

if (SYS_MODULE_OBJ_INVALID == AK4953DevObject)
{
// Handle error
}
```

Task Routine

The DRV_AK4953_Tasks will be called from the System Task Service.

Client Access

For the application to start using an instance of the module, it must call the DRV_AK4953_Open function. The DRV_AK4953_Open provides a driver handle to the AK4953 Codec Driver instance for operations. If the driver is deinitialized using the function DRV_AK4953_Deinitialize, the application must call the DRV_AK4953_Open function again to set up the instance of the driver.

For the various options available for IO_INTENT, please refer to **Data Types and Constants** in the Library Interface section.

Client Operations

This topic provides information on client operations and includes a control command and audio buffered data operation flow diagram.

Description

Client operations provide the API interface for control command and audio data transfer to the AK4953 Codec.

The following AK4953 Codec specific control command functions are provided:

- DRV_AK4953_SamplingRateSet
- DRV_AK4953_SamplingRateGet

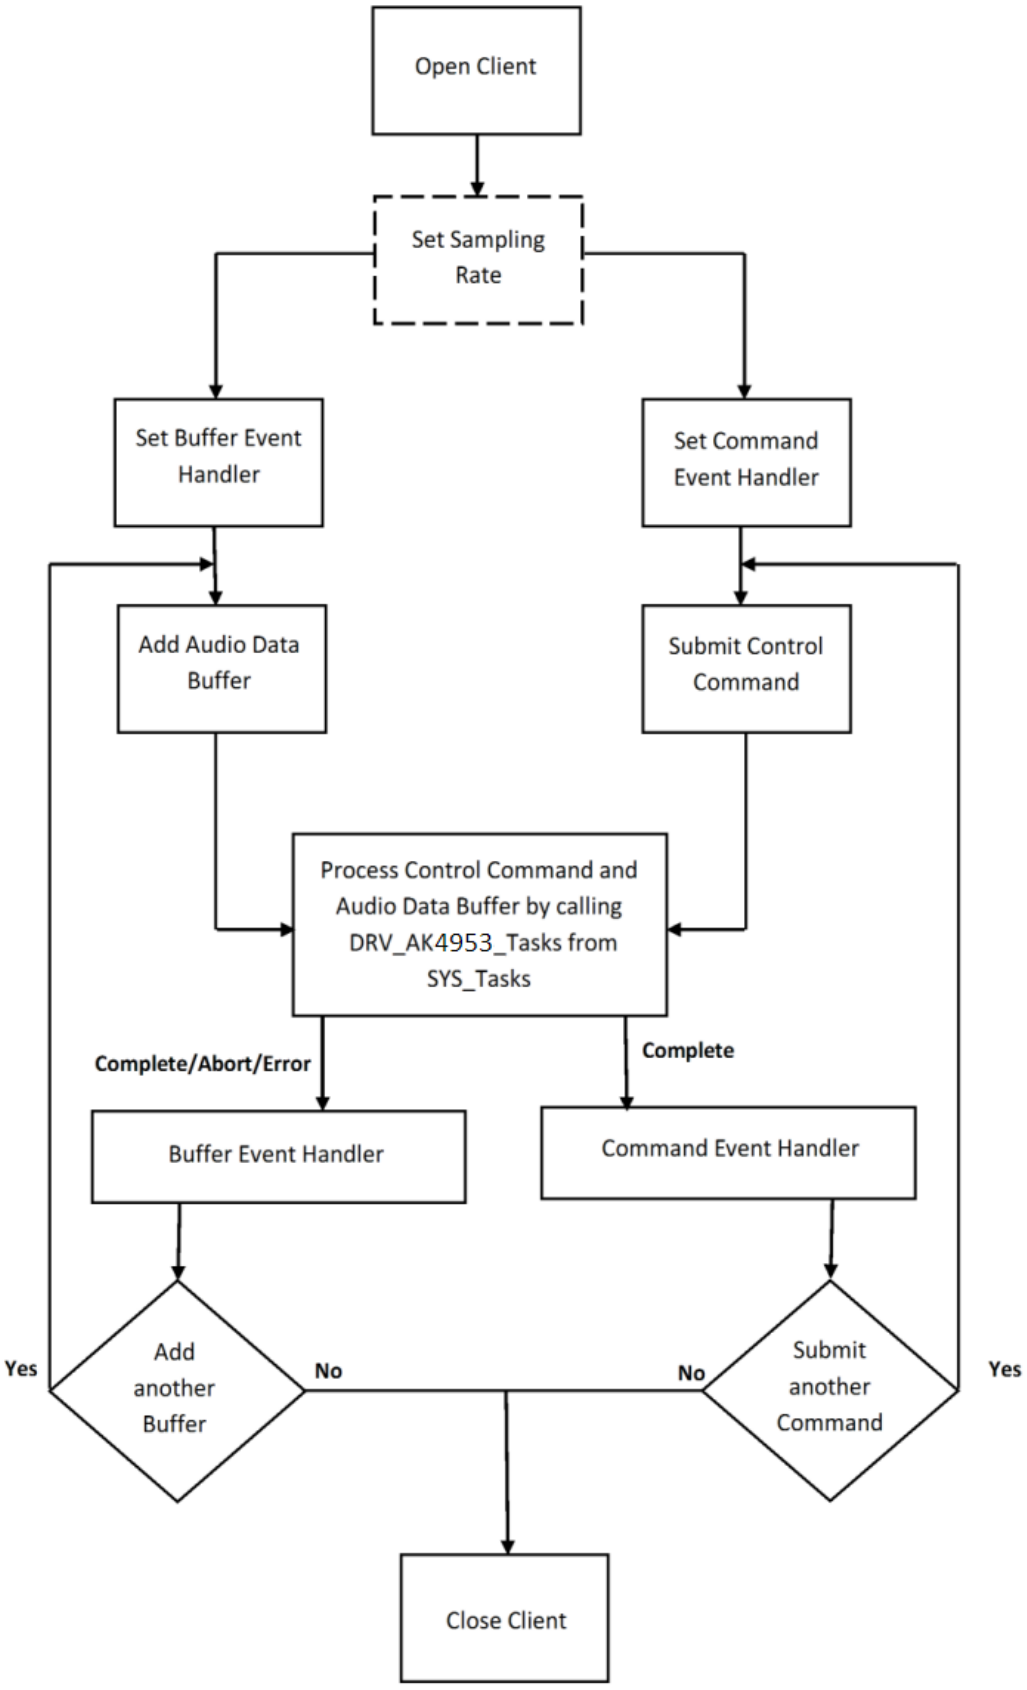
- DRV_AK4953_VolumeSet
- DRV_AK4953_VolumeGet
- DRV_AK4953_MuteOn
- DRV_AK4953_MuteOff
- DRV_AK4953_IntExtMicSet
- DRV_AK4953_MonoStereoMicSet

These functions schedule a non-blocking control command transfer operation. These functions submit the control command request to the AK4953 Codec. These functions submit the control command request to I2C Driver transmit queue, the request is processed immediately if it is the first request, or processed when the previous request is complete.

DRV_AK4953_BufferAddWrite, DRV_AK4953_BufferAddRead, and DRV_AK4953_BufferAddWriteRead are buffered data operation functions.

These functions schedule non-blocking audio data transfer operations. These functions add the request to I2S Driver transmit or receive buffer queue depends on the request type, and are executed immediately if it is the first buffer, or executed later when the previous buffer is complete. The driver notifies the client with DRV_AK4953_BUFFER_EVENT_COMPLETE, DRV_AK4953_BUFFER_EVENT_ERROR, or DRV_AK4953_BUFFER_EVENT_ABORT events.

The following diagram illustrates the control commands and audio buffered data operations.



Note: It is not necessary to close and reopen the client between multiple transfers.

Configuring the Library

Macros

	Name	Description
	DRV_AK4953_BCLK_BIT_CLK_DIVISOR	Sets up the BCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency
	DRV_AK4953_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_AK4953_INPUT_REFCLOCK	Identifies the input REFCLOCK source to generate the MCLK to codec.
	DRV_AK4953_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_AK4953_MCLK_SAMPLE_FREQ_MULTPLIER	Sets up the MCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency
	DRV_AK4953_MCLK_SOURCE	Indicate the input clock frequency to generate the MCLK to codec.
	DRV_AK4953_QUEUE_DEPTH_COMBINED	Number of entries of all queues in all instances of the driver.

Description

The configuration of the AK4953 Codec Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the AK4953 Codec Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the AK4953 Codec Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_AK4953_BCLK_BIT_CLK_DIVISOR Macro

Sets up the BCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency

File

drv_ak4953_config_template.h

C

```
#define DRV_AK4953_BCLK_BIT_CLK_DIVISOR
```

Description

AK4953 BCLK to LRCK Ratio to Generate Audio Stream

Sets up the BCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency

Following BCLK to LRCK ratios are supported 16bit data 16 bit channel :- 32fs, hence divisor would be 8 16bit data 32 bit channel :- 64fs, hence divisor would be 4

Remarks

None.

DRV_AK4953_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_ak4953_config_template.h

C

```
#define DRV_AK4953_CLIENTS_NUMBER DRV_AK4953_INSTANCES_NUMBER
```

Description

AK4953 Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance. Typically only one client could be connected to one hardware instance. This value represents the total number of clients to be supported across all hardware instances. Therefore, if there are five AK4953 hardware interfaces, this number will be 5.

Remarks

None.

DRV_AK4953_INPUT_REFCLOCK Macro

Identifies the input REFCLOCK source to generate the MCLK to codec.

File

drv_ak4953_config_template.h

C

```
#define DRV_AK4953_INPUT_REFCLOCK
```

Description

AK4953 Input reference clock

Identifies the input REFCLOCK source to generate the MCLK to codec.

Remarks

None.

DRV_AK4953_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported

File

drv_ak4953_config_template.h

C

```
#define DRV_AK4953_INSTANCES_NUMBER
```

Description

AK4953 driver objects configuration

Sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of AK4953 CODEC modules that are needed by the application. Hardware Instance support consumes RAM memory space. If this macro is not defined, then the driver will be built statically.

Remarks

None.

DRV_AK4953_MCLK_SAMPLE_FREQ_MULTPLIER Macro

Sets up the MCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency

File

drv_ak4953_config_template.h

C

```
#define DRV_AK4953_MCLK_SAMPLE_FREQ_MULTPLIER
```

Description

AK4953 MCLK to LRCK Ratio to Generate Audio Stream

Sets up the MCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency I2S sampling frequency

Supported MCLK to Sampling frequency Ratios are as below 256fs, 384fs, 512fs, 768fs or 1152fs

Remarks

None

DRV_AK4953_MCLK_SOURCE Macro

Indicate the input clock frequency to generate the MCLK to codec.

File

drv_ak4953_config_template.h

C

```
#define DRV_AK4953_MCLK_SOURCE
```

Description

AK4953 Data Interface Master Clock Speed configuration

Indicate the input clock frequency to generate the MCLK to codec.

Remarks

None.

DRV_AK4953_QUEUE_DEPTH_COMBINED Macro

Number of entries of all queues in all instances of the driver.

File

drv_ak4953_config_template.h

C

```
#define DRV_AK4953_QUEUE_DEPTH_COMBINED
```

Description

AK4953 Driver Buffer Queue Entries

This macro defined the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for transmit operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build). The hardware instance transmit buffer queue will queue transmit buffers submitted by the DRV_AK4953_BufferAddWrite function.

A buffer queue will contains buffer queue entries, each related to a BufferAdd request. This configuration macro defines total number of buffer entries that will be available for use between all AK4953 driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking write requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. More the number of buffer entries, greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its transmit buffer queue size.

As an example, consider the case of static single client driver application where full duplex non blocking operation is desired without queuing, the minimum transmit queue depth and minimum receive queue depth should be 1. Hence the total number of buffer entries should be 2.

As an example, consider the case of a dynamic driver (say two instances) where instance one will queue up to three write requests and up to two read requests, and instance two will queue up to two write requests and up to six read requests, the value of this macro should be 13 (2 + 3 + 2 + 6).

Configuring the MHC

Provides examples on how to configure the MPLAB Harmony Configurator (MHC) for a specific driver.

Description

The following three figures show examples of MHC configurations for the AK4953 Codec Driver, I2S Driver, and the I2C Driver.

Figure 1: AK4953 Codec Driver MHC Configuration

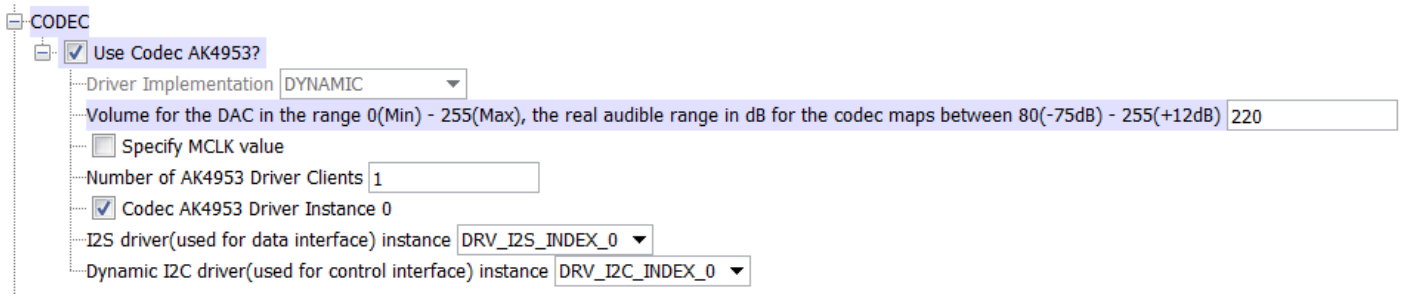


Figure 2: I2S Driver MHC Configuration

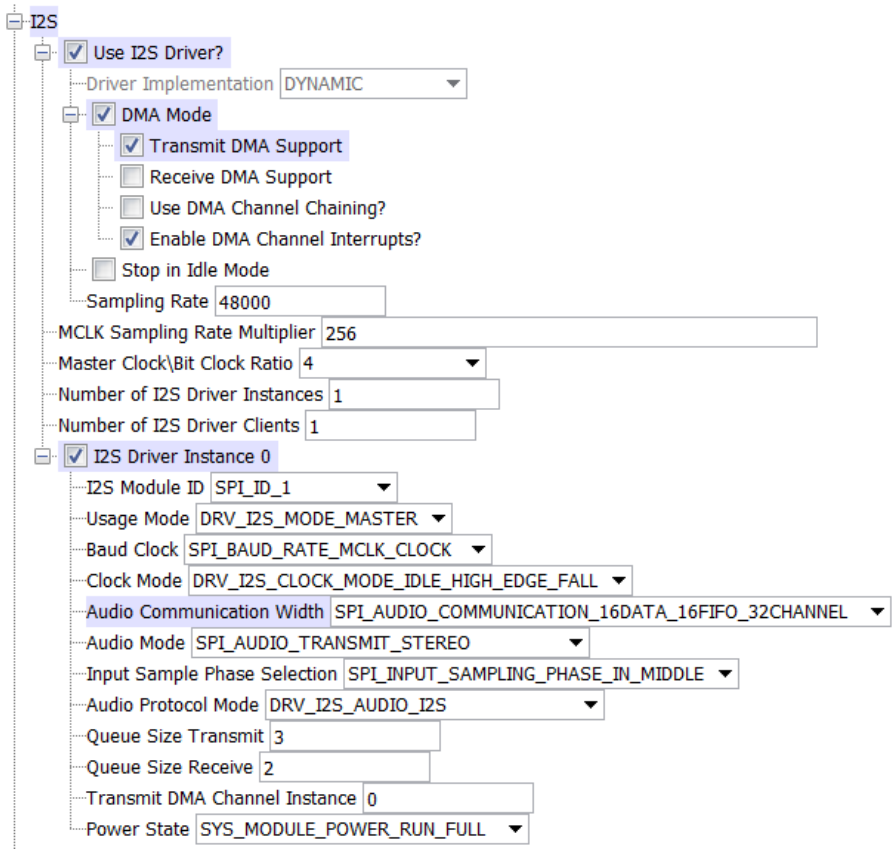

Figure 3: I2C Driver MHC Configuration

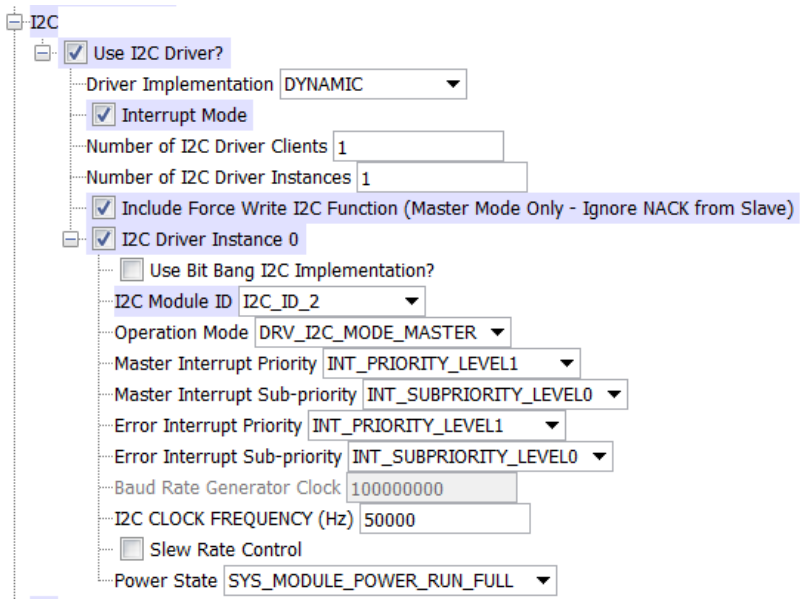

Migrating the AK4953 Driver From Earlier Versions of Microchip Harmony

Prior to version 1.08 of MPLAB Harmony, the AK4953 Codec Driver Library used the static I2C driver implementation. Beginning with v1.08 of MPLAB Harmony, applications must use the Dynamic Driver implementation with the MHC configured as shown in Figure 3. In addition, PIC32MZ configurations require the "Include Force Write I2C Function (Master Mode Only - Ignore NACK from Slave)" option to be selected.

Building the Library

This section lists the files that are available in the AK4953 Codec Driver Library.

Description

This section list the files that are available in the `/src` folder of the AK4953 Codec Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/codec/ak4953`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_ak4953.h`	Header file that exports the driver API.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_ak4953.c`	This file contains implementation of the AK4953 Codec Driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The AK4953 Codec Driver Library depends on the following modules:

- I2S Driver Library
- I2C Driver Library

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_AK4953_Initialize	Initializes hardware and data for the instance of the AK4953 DAC module. **Implementation:** Dynamic
	DRV_AK4953_Deinitialize	Deinitializes the specified instance of the AK4953 driver module. **Implementation:** Dynamic
	DRV_AK4953_Open	Opens the specified AK4953 driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_AK4953_Close	Closes an opened-instance of the AK4953 driver. **Implementation:** Dynamic
	DRV_AK4953_Tasks	Maintains the driver's control and data interface state machine. **Implementation:** Dynamic
	DRV_AK4953_CommandEventHandlerSet	This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished. **Implementation:** Dynamic
	DRV_AK4953_BufferEventHandlerSet	This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.
	DRV_AK4953_SamplingRateSet	This function sets the sampling rate of the media stream. **Implementation:** Dynamic

b) Status Functions

	Name	Description
	DRV_AK4953_SamplingRateGet	This function gets the sampling rate set on the DAC AK4953. **Implementation:** Dynamic

	DRV_AK4953_Status	Gets the current status of the AK4953 driver module. **Implementation:** Dynamic
	DRV_AK4953_VersionGet	This function returns the version of AK4953 driver. **Implementation:** Dynamic
	DRV_AK4953_VersionStrGet	This function returns the version of AK4953 driver in string format. **Implementation:** Dynamic
	DRV_AK4953_VolumeGet	This function gets the volume for AK4953 CODEC. **Implementation:** Dynamic

c) Other Functions

	Name	Description
	DRV_AK4953_BufferAddWrite	Schedule a non-blocking driver write operation. **Implementation:** Dynamic
	DRV_AK4953_BufferAddWriteRead	Schedule a non-blocking driver write-read operation. **Implementation:** Dynamic
	DRV_AK4953_MuteOff	This function disables AK4953 output for soft mute. **Implementation:** Dynamic
	DRV_AK4953_MuteOn	This function allows AK4953 output for soft mute on. **Implementation:** Dynamic
	DRV_AK4953_VolumeSet	This function sets the volume for AK4953 CODEC. **Implementation:** Dynamic
	DRV_AK4953_BufferAddRead	Schedule a non-blocking driver read operation.
	DRV_AK4953_IntExtMicSet	This function sets up the codec for the internal or the external microphone use.
	DRV_AK4953_MonoStereoMicSet	This function sets up the codec for the Mono or Stereo microphone mode.

d) Data Types and Constants

	Name	Description
	DRV_AK4953_AUDIO_DATA_FORMAT	Identifies the Serial Audio data interface format.
	DRV_AK4953_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_AK4953_BUFFER_EVENT_HANDLER	Pointer to a AK4953 Driver Buffer Event handler function
	DRV_AK4953_BUFFER_HANDLE	Handle identifying a write buffer passed to the driver.
	DRV_AK4953_COMMAND_EVENT_HANDLER	Pointer to a AK4953 Driver Command Event Handler Function
	DRV_AK4953_DIGITAL_BLOCK_CONTROL	Identifies Bass-Boost Control function
	DRV_AK4953_INIT	Defines the data required to initialize or reinitialize the AK4953 driver
	_DRV_AK4953_H	Include files.
	DRV_AK4953_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_AK4953_COUNT	Number of valid AK4953 driver indices
	DRV_AK4953_INDEX_0	AK4953 driver index definitions
	DRV_AK4953_INDEX_1	This is macro DRV_AK4953_INDEX_1.
	DRV_AK4953_INDEX_2	This is macro DRV_AK4953_INDEX_2.
	DRV_AK4953_INDEX_3	This is macro DRV_AK4953_INDEX_3.
	DRV_AK4953_INDEX_4	This is macro DRV_AK4953_INDEX_4.
	DRV_AK4953_INDEX_5	This is macro DRV_AK4953_INDEX_5.
	DRV_I2C_INDEX	This is macro DRV_I2C_INDEX.
	DRV_AK4953_CHANNEL	Identifies Left/Right Audio channel
	DRV_AK4953_INT_EXT_MIC	Identifies the Mic input source.
	DRV_AK4953_MONO_STEREO_MIC	Identifies the Mic input as Mono / Stereo.

Description

This section describes the API functions of the AK4953 Codec Driver library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_AK4953_Initialize Function

Initializes hardware and data for the instance of the AK4953 DAC module.

Implementation: Dynamic

File

drv_ak4953.h

C

```
SYS_MODULE_OBJ DRV_AK4953_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the AK4953 driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the init parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized.

Remarks

This routine must be called before any other AK4953 routine is called.

This routine should only be called once during system initialization unless DRV_AK4953_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

DRV_I2S_Initialize must be called before calling this function to initialize the data interface of this CODEC driver. Also DRV_I2C_Initialize must be called before calling this function to initialize the control interface of this CODEC driver.

Example

```
DRV_AK4953_INIT                init;
SYS_MODULE_OBJ                 objectHandle;

init->inUse                          = true;
init->status                         = SYS_STATUS_BUSY;
init->numClients                     = 0;
init->i2sDriverModuleIndex           = ak4953Init->i2sDriverModuleIndex;
init->i2cDriverModuleIndex           = ak4953Init->i2cDriverModuleIndex;
init->samplingRate                   = DRV_AK4953_AUDIO_SAMPLING_RATE;
init->audioDataFormat                = DRV_AK4953_AUDIO_DATA_FORMAT_MACRO;
for(index=0; index < DRV_AK4953_NUMBER_OF_CHANNELS; index++)
{
    init->volume[index] = ak4953Init->volume;
}
init->isInInterruptContext           = false;

init->commandCompleteCallback = (DRV_AK4953_COMMAND_EVENT_HANDLER)0;
init->commandContextData = 0;

init->mclk_multiplier = DRV_AK4953_MCLK_SAMPLE_FREQ_MULTPLIER;

objectHandle = DRV_AK4953_Initialize(DRV_AK4953_0, (SYS_MODULE_INIT*)init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the driver instance to be initialized
init	Pointer to the data structure containing any data necessary to initialize the hardware. This pointer may be null if no data is required and default initialization is to be used.

Function

```
    SYS_MODULE_OBJ  DRV_AK4953_Initialize
(
const           SYS_MODULE_INDEX drvIndex,
const           SYS_MODULE_INIT *const init
);
```

DRV_AK4953_Deinitialize Function

Deinitializes the specified instance of the AK4953 driver module.

Implementation: Dynamic

File

drv_ak4953.h

C

```
void DRV_AK4953_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the AK4953 driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the De-initialize operation must be called before the Initialize operation can be called again. This routine will NEVER block waiting for hardware.

Preconditions

Function DRV_AK4953_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_AK4953_Initialize
SYS_STATUS          status;

DRV_AK4953_Deinitialize(object);

status = DRV_AK4953_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_AK4953_Initialize routine

Function

void DRV_AK4953_Deinitialize(SYS_MODULE_OBJ object)

DRV_AK4953_Open Function

Opens the specified AK4953 driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_ak4953.h

C

```
DRV_HANDLE DRV_AK4953_Open(const SYS_MODULE_INDEX iDriver, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Error can occur

- if the number of client objects allocated via DRV_AK4953_CLIENTS_NUMBER is insufficient.
- if the client is trying to open the driver but driver has been opened exclusively by another client.
- if the driver hardware instance being opened is not initialized or is invalid.
- if the ioIntent options passed are not relevant to this driver.

Description

This routine opens the specified AK4953 driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The DRV_IO_INTENT_BLOCKING and DRV_IO_INTENT_NONBLOCKING ioIntent options are not relevant to this driver. All the data transfer functions of this driver are non blocking.

AK4953 can be opened with DRV_IO_INTENT_WRITE, or DRV_IO_INTENT_READ or DRV_IO_INTENT_WRITEREAD io_intent option. This decides whether the driver is used for headphone output, or microphone input or both modes simultaneously.

Specifying a DRV_IO_INTENT_EXCLUSIVE will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Remarks

The handle returned is valid until the DRV_AK4953_Close routine is called. This routine will NEVER block waiting for hardware.If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

Function DRV_AK4953_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_AK4953_Open(DRV_AK4953_INDEX_0, DRV_IO_INTENT_WRITEREAD | DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver. See function description for details.

Function

DRV_HANDLE DRV_AK4953_Open

(

const SYS_MODULE_INDEX drvIndex,

const DRV_IO_INTENT ioIntent

)

DRV_AK4953_Close Function

Closes an opened-instance of the AK4953 driver.

Implementation: Dynamic

File

drv_ak4953.h

C

```
void DRV_AK4953_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This routine closes an opened-instance of the AK4953 driver, invalidating the handle. Any buffers in the driver queue that were submitted by this client will be removed. After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_AK4953_Open before the caller may use the driver again

Remarks

Usually there is no need for the driver client to verify that the Close operation has completed. The driver will abort any ongoing operations when this routine is called.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_AK4953_Open

DRV_AK4953_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4953_Close(DRV_Handle handle)

DRV_AK4953_Tasks Function

Maintains the driver's control and data interface state machine.

Implementation: Dynamic

File

drv_ak4953.h

C

```
void DRV_AK4953_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal control and data interface state machine and implement its control and data interface implementations. This function should be called from the SYS_Tasks() function.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks).

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_AK4953_Initialize

while (true)
{
    DRV_AK4953_Tasks (object);
```

```
    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_AK4953_Initialize)

Function

void DRV_AK4953_Tasks(SYS_MODULE_OBJ object);

DRV_AK4953_CommandEventHandlerSet Function

This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.

Implementation: Dynamic

File

drv_ak4953.h

C

```
void DRV_AK4953_CommandEventHandlerSet(DRV_HANDLE handle, const DRV_AK4953_COMMAND_EVENT_HANDLER
eventHandler, const uintptr_t contextHandle);
```

Returns

None.

Description

This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.

When a client calls DRV_AK4953_BufferAddWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "AK4953 CODEC Specific Client Routines" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the command has completed, it does not need to register a callback.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4953_BUFFER_HANDLE bufferHandle;

// myAK4953Handle is the handle returned
// by the DRV_AK4953_Open function.

// Client registers an event handler with driver

DRV_AK4953_CommandEventHandlerSet(myAK4953Handle,
                APP_AK4953CommandEventHandler, (uintptr_t)&myAppObj);

DRV_AK4953_DeEmphasisFilterSet(myAK4953Handle, DRV_AK4953_DEEMPHASIS_FILTER_44_1KHZ)

// Event is received when
// the buffer is processed.

void APP_AK4953CommandEventHandler(uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.
```

```
    switch(event)
    {
            // Last Submitted command is completed.
            // Perform further processing here
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_AK4953_CommandEventHandlerSet

(

DRV_HANDLE handle,

const DRV_AK4953_COMMAND_EVENT_HANDLER eventHandler,

const uintptr_t contextHandle

)

DRV_AK4953_BufferEventHandlerSet Function

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

File

drv_ak4953.h

C

```
void DRV_AK4953_BufferEventHandlerSet(DRV_HANDLE handle, const DRV_AK4953_BUFFER_EVENT_HANDLER
eventHandler, const uintptr_t contextHandle);
```

Returns

None.

Description

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. When a client calls DRV_AK4953_BufferAddRead function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "buffer add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued buffer transfer has completed, it does not need to register a callback.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4953_BUFFER_HANDLE bufferHandle;

// myAK4953Handle is the handle returned
// by the DRV_AK4953_Open function.

// Client registers an event handler with driver

DRV_AK4953_BufferEventHandlerSet(myAK4953Handle,
```

```
                APP_AK4953BufferEventHandler, (uintptr_t)&myAppObj);

DRV_AK4953_BufferAddRead(myAK4953handle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_AK4953_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_AK4953BufferEventHandler(DRV_AK4953_BUFFER_EVENT event,
        DRV_AK4953_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_AK4953_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK4953_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_AK4953_BufferEventHandlerSet
(
DRV_HANDLE handle,
const DRV_AK4953_BUFFER_EVENT_HANDLER eventHandler,
const uintptr_t contextHandle
)

DRV_AK4953_SamplingRateSet Function

This function sets the sampling rate of the media stream.

Implementation: Dynamic

File

drv_ak4953.h

C

```
void DRV_AK4953_SamplingRateSet(DRV_HANDLE handle, uint32_t samplingRate);
```

Returns

None.

Description

This function sets the media sampling rate for the client handle.

Remarks

None.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Example

```
// myAK4953Handle is the handle returned
// by the DRV_AK4953_Open function.

DRV_AK4953_SamplingRateSet(myAK4953Handle, 48000);  //Sets 48000 media sampling rate
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4953_SamplingRateSet(DRV_HANDLE handle, uint32_t samplingRate)

b) Status Functions

DRV_AK4953_SamplingRateGet Function

This function gets the sampling rate set on the DAC AK4953.

Implementation: Dynamic

File

drv_ak4953.h

C

```
uint32_t DRV_AK4953_SamplingRateGet(DRV_HANDLE handle);
```

Returns

None.

Description

This function gets the sampling rate set on the DAC AK4953.

Remarks

None.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Example

```
uint32_t baudRate;

// myAK4953Handle is the handle returned
// by the DRV_AK4953_Open function.

baudRate = DRV_AK4953_SamplingRateGet(myAK4953Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_AK4953_SamplingRateGet(DRV_HANDLE handle)

DRV_AK4953_Status Function

Gets the current status of the AK4953 driver module.

Implementation: Dynamic

File

drv_ak4953.h

C

```
SYS_STATUS DRV_AK4953_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_DEINITIALIZED - Indicates that the driver has been deinitialized

SYS_STATUS_READY - Indicates that any previous module operation for the specified module has completed

SYS_STATUS_BUSY - Indicates that a previous module operation for the specified module has not yet completed

SYS_STATUS_ERROR - Indicates that the specified module is in an error state

Description

This routine provides the current status of the AK4953 driver module.

Remarks

A driver can opened only when its status is SYS_STATUS_READY.

Preconditions

Function DRV_AK4953_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_AK4953_Initialize
SYS_STATUS          AK4953Status;

AK4953Status = DRV_AK4953_Status(object);
if (SYS_STATUS_READY == AK4953Status)
{
    // This means the driver can be opened using the
    // DRV_AK4953_Open() function.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_AK4953_Initialize routine

Function

SYS_STATUS DRV_AK4953_Status(SYS_MODULE_OBJ object)

DRV_AK4953_VersionGet Function

This function returns the version of AK4953 driver.

Implementation: Dynamic

File

drv_ak4953.h

C

```
uint32_t DRV_AK4953_VersionGet();
```

Returns

returns the version of AK4953 driver.

Description

The version number returned from the DRV_AK4953_VersionGet function is an unsigned integer in the following decimal format. * 10000 + * 100 + Where the numbers are represented in decimal and the meaning is the same as above. Note that there is no numerical representation of release type.

Remarks

None.

Preconditions

None.

Example 1

For version "0.03a", return: 0 * 10000 + 3 * 100 + 0 For version "1.00", return: 1 * 100000 + 0 * 100 + 0

Example 2

```
uint32_t AK4953version;
AK4953version = DRV_AK4953_VersionGet();
```

Function

uint32_t DRV_AK4953_VersionGet(void)

DRV_AK4953_VersionStrGet Function

This function returns the version of AK4953 driver in string format.

Implementation: Dynamic

File

drv_ak4953.h

C

```
int8_t* DRV_AK4953_VersionStrGet();
```

Returns

returns a string containing the version of AK4953 driver.

Description

The DRV_AK4953_VersionStrGet function returns a string in the format: ".[.][]" Where: is the AK4953 driver's version number. is the AK4953 driver's version number. is an optional "patch" or "dot" release number (which is not included in the string if it equals "00"). is an optional release type ("a" for alpha, "b" for beta ? not the entire word spelled out) that is not included if the release is a production version (I.e. Not an alpha or beta).

The String does not contain any spaces.

Remarks

None.

Preconditions

None.

Example 1

"0.03a" "1.00"

Example 2

```
int8_t *AK4953string;
AK4953string = DRV_AK4953_VersionStrGet();
```

Function

int8_t* DRV_AK4953_VersionStrGet(void)

DRV_AK4953_VolumeGet Function

This function gets the volume for AK4953 CODEC.

Implementation: Dynamic

File

drv_ak4953.h

C

```
uint8_t DRV_AK4953_VolumeGet(DRV_HANDLE handle, DRV_AK4953_CHANNEL chan);
```

Returns

None.

Description

This functions gets the current volume programmed to the CODEC AK4953.

Remarks

None.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;
uint8_t volume;

// myAK4953Handle is the handle returned
// by the DRV_AK4953_Open function.

  volume = DRV_AK4953_VolumeGet(myAK4953Handle,DRV_AK4953_CHANNEL_LEFT);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
chan	Audio channel volume to be set

Function

uint8_t DRV_AK4953_VolumeGet(DRV_HANDLE handle, DRV_AK4953_CHANNEL chan)

c) Other Functions

DRV_AK4953_BufferAddWrite Function

Schedule a non-blocking driver write operation.

Implementation: Dynamic

File

drv_ak4953.h

C

```
void DRV_AK4953_BufferAddWrite(const DRV_HANDLE handle, DRV_AK4953_BUFFER_HANDLE * bufferHandle, void *
buffer, size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_AK4953_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking write operation. The function returns with a valid buffer handle in the bufferHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance transmit queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_AK4953_BUFFER_HANDLE_INVALID

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0.
- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_AK4953_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_AK4953_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the AK4953 Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another AK4953 driver instance. It should not otherwise be called directly in an ISR.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 device instance and the DRV_AK4953_Status must have returned SYS_STATUS_READY.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE must have been specified in the DRV_AK4953_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK4953_BUFFER_HANDLE bufferHandle;

// myAK4953Handle is the handle returned
// by the DRV_AK4953_Open function.

// Client registers an event handler with driver

DRV_AK4953_BufferEventHandlerSet(myAK4953Handle,
                APP_AK4953BufferEventHandler, (uintptr_t)&myAppObj);

DRV_AK4953_BufferAddWrite(myAK4953handle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_AK4953_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_AK4953BufferEventHandler(DRV_AK4953_BUFFER_EVENT event,
        DRV_AK4953_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_AK4953_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK4953_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
```

```
            break;
        }
    }
```

Parameters

Parameters	Description
handle	Handle of the AK4953 instance as return by the DRV_AK4953_Open function.
buffer	Data to be transmitted.
size	Buffer size in bytes.
bufferHandle	Pointer to an argument that will contain the return buffer handle.

Function

void DRV_AK4953_BufferAddWrite

(

const DRV_HANDLE handle,

DRV_AK4953_BUFFER_HANDLE *bufferHandle,

void *buffer, size_t size

)

DRV_AK4953_BufferAddWriteRead Function

Schedule a non-blocking driver write-read operation.

Implementation: Dynamic

File

drv_ak4953.h

C

```
void DRV_AK4953_BufferAddWriteRead(const DRV_HANDLE handle, DRV_AK4953_BUFFER_HANDLE * bufferHandle, void *
transmitBuffer, void * receiveBuffer, size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_AK4953_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking write-read operation. The function returns with a valid buffer handle in the bufferHandle argument if the write-read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_AK4953_BUFFER_EVENT_COMPLETE:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only or write only
- if the buffer size is 0
- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_AK4953_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_AK4953_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the AK4953 Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another AK4953 driver instance. It should not otherwise be called directly in an ISR.

This function is useful when there is valid read expected for every AK4953 write. The transmit and receive size must be same.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 device instance and the DRV_AK4953_Status must have returned SYS_STATUS_READY.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READWRITE must have been specified in the DRV_AK4953_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybufferTx[MY_BUFFER_SIZE];
uint8_t mybufferRx[MY_BUFFER_SIZE];
DRV_AK4953_BUFFER_HANDLE bufferHandle;

// myak4953Handle is the handle returned
// by the DRV_AK4953_Open function.

// Client registers an event handler with driver

DRV_AK4953_BufferEventHandlerSet(myak4953Handle,
                APP_AK4953BufferEventHandler, (uintptr_t)&myAppObj);

DRV_AK4953_BufferAddWriteRead(myak4953handle, &bufferHandle,
                                    mybufferTx,mybufferRx,MY_BUFFER_SIZE);

if(DRV_AK4953_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_AK4953BufferEventHandler(DRV_AK4953_BUFFER_EVENT event,
        DRV_AK4953_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_AK4953_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK4953_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the AK4953 instance as returned by the DRV_AK4953_Open function
bufferHandle	Pointer to an argument that will contain the return buffer handle
transmitBuffer	The buffer where the transmit data will be stored
receiveBuffer	The buffer where the received data will be stored
size	Buffer size in bytes

Function

void DRV_AK4953_BufferAddWriteRead
(
const DRV_HANDLE handle,
DRV_AK4953_BUFFER_HANDLE *bufferHandle,
void *transmitBuffer,
void *receiveBuffer,
size_t size
)

DRV_AK4953_MuteOff Function

This function disables AK4953 output for soft mute.

Implementation: Dynamic

File

drv_ak4953.h

C

```
void DRV_AK4953_MuteOff(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables AK4953 output for soft mute.

Remarks

None.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myAK4953Handle is the handle returned
// by the DRV_AK4953_Open function.

    DRV_AK4953_MuteOff(myAK4953Handle); //AK4953 output soft mute disabled
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4953_MuteOff(DRV_HANDLE handle)

DRV_AK4953_MuteOn Function

This function allows AK4953 output for soft mute on.

Implementation: Dynamic

File

drv_ak4953.h

C

```
void DRV_AK4953_MuteOn(DRV_HANDLE handle);
```

Returns

None.

Description

This function Enables AK4953 output for soft mute.

Remarks

None.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myAK4953Handle is the handle returned
// by the DRV_AK4953_Open function.

DRV_AK4953_MuteOn(myAK4953Handle);  //AK4953 output soft muted
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4953_MuteOn(DRV_HANDLE handle);

DRV_AK4953_VolumeSet Function

This function sets the volume for AK4953 CODEC.

Implementation: Dynamic

File

drv_ak4953.h

C

```
void DRV_AK4953_VolumeSet(DRV_HANDLE handle, DRV_AK4953_CHANNEL channel, uint8_t volume);
```

Returns

None.

Description

This functions sets the volume value from 0-255. The codec has DAC value to volume range mapping as :- 00 H : +12dB FF H : -115dB In order to make the volume value to dB mapping monotonically increasing from 00 to FF, re-mapping is introduced which reverses the volume value to dB mapping as well as normalizes the volume range to a more audible dB range. The current driver implementation assumes that all dB values under -60 dB are inaudible to the human ear. Re-Mapped values 00 H : -60 dB FF H : +12 dB

Remarks

None.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myAK4953Handle is the handle returned
// by the DRV_AK4953_Open function.
```

```
DRV_AK4953_VolumeSet(myAK4953Handle, DRV_AK4953_CHANNEL_LEFT, 120);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
chan	Audio channel volume to be set
volume	volume value specified in the range 0-255 (0x00 to 0xFF)

Function

void DRV_AK4953_VolumeSet(DRV_HANDLE handle, DRV_AK4953_CHANNEL channel, uint8_t volume);

DRV_AK4953_BufferAddRead Function

Schedule a non-blocking driver read operation.

File

drv_ak4953.h

C

```
void DRV_AK4953_BufferAddRead(const DRV_HANDLE handle, DRV_AK4953_BUFFER_HANDLE * bufferHandle, void * buffer, size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_AK4953_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking read operation. The function returns with a valid buffer handle in the bufferHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance receive queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_AK4953_BUFFER_HANDLE_INVALID

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0.
- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_AK4953_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_AK4953_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the AK4953 Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another AK4953 driver instance. It should not otherwise be called directly in an ISR.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 device instance and the DRV_AK4953_Status must have returned SYS_STATUS_READY.

DRV_AK4953_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ must have been specified in the DRV_AK4953_Open call.

Parameters

Parameters	Description
handle	Handle of the AK4953 instance as return by the DRV_AK4953_Open function.
buffer	Data to be transmitted.
size	Buffer size in bytes.
bufferHandle	Pointer to an argument that will contain the return buffer handle.

Function

void DRV_AK4953_BufferAddRead

(

const DRV_HANDLE handle,

DRV_AK4953_BUFFER_HANDLE *bufferHandle,
void *buffer, size_t size
)

DRV_AK4953_IntExtMicSet Function

This function sets up the codec for the internal or the external microphone use.

File

drv_ak4953.h

C

```
void DRV_AK4953_IntExtMicSet(DRV_HANDLE handle, DRV_AK4953_INT_EXT_MIC micInput);
```

Returns

None

Description

This function sets up the codec for the internal or the external microphone use.

Remarks

None.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.
DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
micInput	Internal vs External mic input

Function

void DRV_AK4953_IntExtMicSet(DRV_HANDLE handle);

DRV_AK4953_MonoStereoMicSet Function

This function sets up the codec for the Mono or Stereo microphone mode.

File

drv_ak4953.h

C

```
void DRV_AK4953_MonoStereoMicSet(DRV_HANDLE handle, DRV_AK4953_MONO_STEREO_MIC mono_stereo_mic);
```

Returns

None

Description

This function sets up the codec for the Mono or Stereo microphone mode.

Remarks

None.

Preconditions

The DRV_AK4953_Initialize routine must have been called for the specified AK4953 driver instance.
DRV_AK4953_Open must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_AK4953_MonoStereoMicSet(DRV_HANDLE handle);

d) Data Types and Constants

DRV_AK4953_AUDIO_DATA_FORMAT Enumeration

Identifies the Serial Audio data interface format.

File

drv_ak4953.h

C

```
typedef enum {
  DRV_AK4953_AUDIO_DATA_FORMAT_24BIT_MSB_SDTO_24BIT_LSB_SDTI = 0,
  DRV_AK4953_AUDIO_DATA_FORMAT_24BIT_MSB_SDTO_16BIT_LSB_SDTI,
  DRV_AK4953_AUDIO_DATA_FORMAT_24BIT_MSB_SDTO_24BIT_MSB_SDTI,
  DRV_AK4953_AUDIO_DATA_FORMAT_I2S
} DRV_AK4953_AUDIO_DATA_FORMAT;
```

Description

AK4953 Audio data format

This enumeration identifies Serial Audio data interface format.

DRV_AK4953_BUFFER_EVENT Enumeration

Identifies the possible events that can result from a buffer add request.

File

drv_ak4953.h

C

```
typedef enum {
  DRV_AK4953_BUFFER_EVENT_COMPLETE,
  DRV_AK4953_BUFFER_EVENT_ERROR,
  DRV_AK4953_BUFFER_EVENT_ABORT
} DRV_AK4953_BUFFER_EVENT;
```

Members

Members	Description
DRV_AK4953_BUFFER_EVENT_COMPLETE	Data was transferred successfully.
DRV_AK4953_BUFFER_EVENT_ERROR	Error while processing the request
DRV_AK4953_BUFFER_EVENT_ABORT	Data transfer aborted (Applicable in DMA mode)

Description

AK4953 Driver Events

This enumeration identifies the possible events that can result from a buffer add request caused by the client calling either the DRV_AK4953_BufferAddWrite() function.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that the client registered with the driver by calling the DRV_AK4953_BufferEventHandlerSet function when a buffer transfer request is completed.

DRV_AK4953_BUFFER_EVENT_HANDLER Type

Pointer to a AK4953 Driver Buffer Event handler function

File

drv_ak4953.h

C

```
typedef void (* DRV_AK4953_BUFFER_EVENT_HANDLER)(DRV_AK4953_BUFFER_EVENT event, DRV_AK4953_BUFFER_HANDLE
bufferHandle, uintptr_t contextHandle);
```

Returns

None.

Description

AK4953 Driver Buffer Event Handler Function

This data type defines the required function signature for the AK4953 driver buffer event handling callback function. A client must register a pointer to a buffer event handling function who's function signature (parameter and return value types) match the types specified by this function pointer in order to receive buffer related event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

If the event is DRV_AK4953_BUFFER_EVENT_COMPLETE, this means that the data was transferred successfully.

If the event is DRV_AK4953_BUFFER_EVENT_ERROR, this means that the data was not transferred successfully. The bufferHandle parameter contains the buffer handle of the buffer that failed. The DRV_AK4953_BufferProcessedSizeGet() function can be called to find out how many bytes were processed.

The bufferHandle parameter contains the buffer handle of the buffer that associated with the event.

The context parameter contains a handle to the client context, provided at the time the event handling function was registered using the DRV_AK4953_BufferEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The buffer handle in bufferHandle expires after this event handler exits. In that the buffer object that was allocated is deallocated by the driver after the event handler exits.

The event handler function executes in the data driver (I2S) peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

DRV_AK4953_BufferAddWrite function can be called in the event handler to add a buffer to the driver queue.

Example

```
void APP_MyBufferEventHandler( DRV_AK4953_BUFFER_EVENT event,
                               DRV_AK4953_BUFFER_HANDLE bufferHandle,
                               uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_AK4953_BUFFER_EVENT_COMPLETE:
            // Handle the completed buffer.
        break;

        case DRV_AK4953_BUFFER_EVENT_ERROR:
        default:
            // Handle error.
        break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
bufferHandle	Handle identifying the buffer to which the event relates
context	Value identifying the context of the application that registered the event handling function.

DRV_AK4953_BUFFER_HANDLE Type

Handle identifying a write buffer passed to the driver.

File

drv_ak4953.h

C

```
typedef uintptr_t DRV_AK4953_BUFFER_HANDLE;
```

Description

AK4953 Driver Buffer Handle

A buffer handle value is returned by a call to the DRV_AK4953_BufferAddWrite() function. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from the "buffer add" function is returned back to the client by the "event handler callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None

DRV_AK4953_COMMAND_EVENT_HANDLER Type

Pointer to a AK4953 Driver Command Event Handler Function

File

drv_ak4953.h

C

```
typedef void (* DRV_AK4953_COMMAND_EVENT_HANDLER)(uintptr_t contextHandle);
```

Returns

None.

Description

AK4953 Driver Command Event Handler Function

This data type defines the required function signature for the AK4953 driver command event handling callback function.

A command is a control instruction to the AK4953 CODEC. Example Mute ON/OFF, Zero Detect Enable/Disable etc.

A client must register a pointer to a command event handling function who's function signature (parameter and return value types) match the types specified by this function pointer in order to receive command related event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

The occurrence of this call back means that the last control command was transferred successfully.

The context parameter contains a handle to the client context, provided at the time the event handling function was registered using the DRV_AK4953_CommandEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The event handler function executes in the control data driver interrupt context. It is recommended of the application to not perform process intensive or blocking operations with in this function.

Example

```
void APP_AK4953CommandEventHandler( uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    // Last Submitted command is completed.
    // Perform further processing here
}
```

Parameters

Parameters	Description
context	Value identifying the context of the application that registered the event handling function.

DRV_AK4953_DIGITAL_BLOCK_CONTROL Enumeration

Identifies Bass-Boost Control function

File

drv_ak4953.h

C

```
typedef enum {
  DRV_AK4953_RECORDING_MODE,
  DRV_AK4953_PLAYBACK_MODE,
  DRV_AK4953_RECORDING_PLAYBACK_2_MODE,
  DRV_AK4953_LOOPBACK_MODE
} DRV_AK4953_DIGITAL_BLOCK_CONTROL;
```

Members

Members	Description
DRV_AK4953_RECORDING_MODE	This is the default setting
DRV_AK4953_PLAYBACK_MODE	Min control
DRV_AK4953_RECORDING_PLAYBACK_2_MODE	Medium control
DRV_AK4953_LOOPBACK_MODE	Maximum control

Description

AK4953 Bass-Boost Control

This enumeration identifies the settings for Bass-Boost Control function.

Remarks

None.

DRV_AK4953_INIT Structure

Defines the data required to initialize or reinitialize the AK4953 driver

File

drv_ak4953.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX i2sDriverModuleIndex;
  SYS_MODULE_INDEX i2cDriverModuleIndex;
  uint32_t samplingRate;
  uint8_t volume;
  DRV_AK4953_AUDIO_DATA_FORMAT audioDataFormat;
} DRV_AK4953_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX i2sDriverModuleIndex;	Identifies data module(I2S) driver ID for data interface of CODEC
SYS_MODULE_INDEX i2cDriverModuleIndex;	Identifies data module(I2C) driver ID for control interface of CODEC
uint32_t samplingRate;	Sampling rate
uint8_t volume;	Volume
DRV_AK4953_AUDIO_DATA_FORMAT audioDataFormat;	Identifies the Audio data format

Description

AK4953 Driver Initialization Data

This data type defines the data required to initialize or reinitialize the AK4953 CODEC driver.

Remarks

None.

_DRV_AK4953_H Macro

File

drv_ak4953.h

C

```
#define _DRV_AK4953_H
```

Description

Include files.

DRV_AK4953_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_ak4953.h

C

```
#define DRV_AK4953_BUFFER_HANDLE_INVALID ((DRV_AK4953_BUFFER_HANDLE)(-1))
```

Description

AK4953 Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_AK4953_BufferAddWrite() function if the buffer add request was not successful.

Remarks

None

DRV_AK4953_COUNT Macro

Number of valid AK4953 driver indices

File

drv_ak4953.h

C

```
#define DRV_AK4953_COUNT
```

Description

AK4953 Driver Module Count

This constant identifies the maximum number of AK4953 Driver instances that should be defined by the application. Defining more instances than this constant will waste RAM memory space.

This constant can also be used by the application to identify the number of AK4953 instances on this microcontroller.

Remarks

This value is part-specific.

DRV_AK4953_INDEX_0 Macro

AK4953 driver index definitions

File

drv_ak4953.h

C

```
#define DRV_AK4953_INDEX_0 0
```

Description

Driver AK4953 Module Index

These constants provide AK4953 driver index definition.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_AK4953_Initialize and DRV_AK4953_Open routines to identify the driver instance in use.

DRV_AK4953_INDEX_1 Macro

File

drv_ak4953.h

C

```
#define DRV_AK4953_INDEX_1 1
```

Description

This is macro DRV_AK4953_INDEX_1.

DRV_AK4953_INDEX_2 Macro

File

drv_ak4953.h

C

```
#define DRV_AK4953_INDEX_2 2
```

Description

This is macro DRV_AK4953_INDEX_2.

DRV_AK4953_INDEX_3 Macro

File

drv_ak4953.h

C

```
#define DRV_AK4953_INDEX_3 3
```

Description

This is macro DRV_AK4953_INDEX_3.

DRV_AK4953_INDEX_4 Macro

File

drv_ak4953.h

C

```
#define DRV_AK4953_INDEX_4 4
```

Description

This is macro DRV_AK4953_INDEX_4.

DRV_AK4953_INDEX_5 Macro

File

drv_ak4953.h

C

```
#define DRV_AK4953_INDEX_5 5
```

Description

This is macro DRV_AK4953_INDEX_5.

DRV_I2C_INDEX Macro

File

drv_ak7755.h

C

```
#define DRV_I2C_INDEX DRV_AK7755_I2C_INSTANCES_NUMBER
```

Description

This is macro DRV_I2C_INDEX.

DRV_AK4953_CHANNEL Enumeration

Identifies Left/Right Audio channel

File

drv_ak4953.h

C

```
typedef enum {
  DRV_AK4953_CHANNEL_LEFT,
  DRV_AK4953_CHANNEL_RIGHT,
  DRV_AK4953_CHANNEL_LEFT_RIGHT,
  DRV_AK4953_NUMBER_OF_CHANNELS
} DRV_AK4953_CHANNEL;
```

Description

AK4953 Audio Channel

This enumeration identifies Left/Right Audio channel

Remarks

None.

DRV_AK4953_INT_EXT_MIC Enumeration

Identifies the Mic input source.

File

drv_ak4953.h

C

```
typedef enum {
  INT_MIC,
  EXT_MIC
} DRV_AK4953_INT_EXT_MIC;
```

Description

AK4953 Mic Internal / External Input

This enumeration identifies the Mic input source.

DRV_AK4953_MONO_STEREO_MIC Enumeration

Identifies the Mic input as Mono / Stereo.

File

drv_ak4953.h

C

```
typedef enum {
```

```
  ALL_ZEROS,
  MONO_RIGHT_CHANNEL,
  MONO_LEFT_CHANNEL,
  STEREO
} DRV_AK4953_MONO_STEREO_MIC;
```

Description

AK4953 Mic Mono / Stereo Input

This enumeration identifies the Mic input as Mono / Stereo.

Files

Files

Name	Description
drv_ak4953.h	AK4953 CODEC Driver Interface header file
drv_ak4953_config_template.h	AK4953 Codec Driver Configuration Template.

Description

This section lists the source and header files used by the AK4953Codec Driver Library.

drv_ak4953.h

AK4953 CODEC Driver Interface header file

Enumerations

	Name	Description
	DRV_AK4953_AUDIO_DATA_FORMAT	Identifies the Serial Audio data interface format.
	DRV_AK4953_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_AK4953_CHANNEL	Identifies Left/Right Audio channel
	DRV_AK4953_DIGITAL_BLOCK_CONTROL	Identifies Bass-Boost Control function
	DRV_AK4953_INT_EXT_MIC	Identifies the Mic input source.
	DRV_AK4953_MONO_STEREO_MIC	Identifies the Mic input as Mono / Stereo.

Functions

	Name	Description
	DRV_AK4953_BufferAddRead	Schedule a non-blocking driver read operation.
	DRV_AK4953_BufferAddWrite	Schedule a non-blocking driver write operation. **Implementation:** Dynamic
	DRV_AK4953_BufferAddWriteRead	Schedule a non-blocking driver write-read operation. **Implementation:** Dynamic
	DRV_AK4953_BufferEventHandlerSet	This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.
	DRV_AK4953_Close	Closes an opened-instance of the AK4953 driver. **Implementation:** Dynamic
	DRV_AK4953_CommandEventHandlerSet	This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished. **Implementation:** Dynamic
	DRV_AK4953_Deinitialize	Deinitializes the specified instance of the AK4953 driver module. **Implementation:** Dynamic
	DRV_AK4953_Initialize	Initializes hardware and data for the instance of the AK4953 DAC module. **Implementation:** Dynamic
	DRV_AK4953_IntExtMicSet	This function sets up the codec for the internal or the external microphone use.
	DRV_AK4953_MonoStereoMicSet	This function sets up the codec for the Mono or Stereo microphone mode.
	DRV_AK4953_MuteOff	This function disables AK4953 output for soft mute. **Implementation:** Dynamic
	DRV_AK4953_MuteOn	This function allows AK4953 output for soft mute on. **Implementation:** Dynamic
	DRV_AK4953_Open	Opens the specified AK4953 driver instance and returns a handle to it. **Implementation:** Dynamic

	DRV_AK4953_SamplingRateGet	This function gets the sampling rate set on the DAC AK4953. **Implementation:** Dynamic
	DRV_AK4953_SamplingRateSet	This function sets the sampling rate of the media stream. **Implementation:** Dynamic
	DRV_AK4953_Status	Gets the current status of the AK4953 driver module. **Implementation:** Dynamic
	DRV_AK4953_Tasks	Maintains the driver's control and data interface state machine. **Implementation:** Dynamic
	DRV_AK4953_VersionGet	This function returns the version of AK4953 driver. **Implementation:** Dynamic
	DRV_AK4953_VersionStrGet	This function returns the version of AK4953 driver in string format. **Implementation:** Dynamic
	DRV_AK4953_VolumeGet	This function gets the volume for AK4953 CODEC. **Implementation:** Dynamic
	DRV_AK4953_VolumeSet	This function sets the volume for AK4953 CODEC. **Implementation:** Dynamic

Macros

	Name	Description
	_DRV_AK4953_H	Include files.
	DRV_AK4953_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_AK4953_COUNT	Number of valid AK4953 driver indices
	DRV_AK4953_INDEX_0	AK4953 driver index definitions
	DRV_AK4953_INDEX_1	This is macro DRV_AK4953_INDEX_1.
	DRV_AK4953_INDEX_2	This is macro DRV_AK4953_INDEX_2.
	DRV_AK4953_INDEX_3	This is macro DRV_AK4953_INDEX_3.
	DRV_AK4953_INDEX_4	This is macro DRV_AK4953_INDEX_4.
	DRV_AK4953_INDEX_5	This is macro DRV_AK4953_INDEX_5.

Structures

	Name	Description
	DRV_AK4953_INIT	Defines the data required to initialize or reinitialize the AK4953 driver

Types

	Name	Description
	DRV_AK4953_BUFFER_EVENT_HANDLER	Pointer to a AK4953 Driver Buffer Event handler function
	DRV_AK4953_BUFFER_HANDLE	Handle identifying a write buffer passed to the driver.
	DRV_AK4953_COMMAND_EVENT_HANDLER	Pointer to a AK4953 Driver Command Event Handler Function

Description

AK4953 CODEC Driver Interface

The AK4953 CODEC device driver interface provides a simple interface to manage the AK4953 106dB 192kHz 24-Bit DAC that can be interfaced Microchip Microcontroller. This file provides the interface definition for the AK4953 CODEC device driver.

File Name

drv_AK4953.h

Company

Microchip Technology Inc.

drv_ak4953_config_template.h

AK4953 Codec Driver Configuration Template.

Macros

	Name	Description
	DRV_AK4953_BCLK_BIT_CLK_DIVISOR	Sets up the BCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency

	DRV_AK4953_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_AK4953_INPUT_REFCLOCK	Identifies the input REFCLOCK source to generate the MCLK to codec.
	DRV_AK4953_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_AK4953_MCLK_SAMPLE_FREQ_MULTPLIER	Sets up the MCLK to LRCK Ratio to Generate Audio Stream for specified sampling frequency
	DRV_AK4953_MCLK_SOURCE	Indicate the input clock frequency to generate the MCLK to codec.
	DRV_AK4953_QUEUE_DEPTH_COMBINED	Number of entries of all queues in all instances of the driver.

Description

AK4953 Codec Driver Configuration Template

These file provides the list of all the configurations that can be used with the driver. This file should not be included in the driver.

AK7755 Codec Driver Library

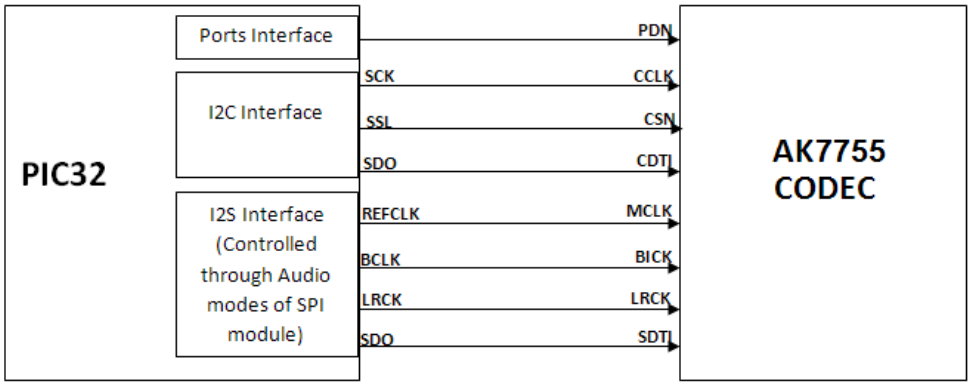
This topic describes the AK7755 Codec Driver Library.

Introduction

This library provides an interface to manage the AK7755 Codec that is serially interfaced to a Microchip microcontroller for providing Audio Solutions.

Description

The AK7755 module is 16/20/24-bit Audio Codec from Asahi Kasei Microdevices Corporation. The AK7755 can be interfaced to Microchip microcontrollers through I2C and I2S serial interfaces. The I2C interface is used for control command transfer. The I2S interface is used for Audio data output. A typical interface of the AK7755 Codec to a Microchip PIC32 device is provided in the following diagram:



Features

The AK7755 Codec supports the following features:

- Two Digital Interfaces (I/F1, I/F2):
- 4-channel/6-channel Digital Signal Input Port: MSB justified 24-bit, LSB justified 24/20/16-bit, I2S
- Short/Long Frame
- 24-bit linear, 8-bit A-law, 8-bit µ-law
- TDM 256 fs (8-channel) MSB Justified and I2S Formats
- SoftMute: On and Off
- Stereo 24-bit ADC:
- Sampling Frequency: fs = 8 kHz ~96 kHz
- ADC Characteristics S/(N+D): 91 dB, DR, S/N: 102 dB
- Two-Channel Analog Input Selector (Differential, Single-ended Input)
- Channel Independent Microphone Analog Gain Amplifier (0 ~18 dB (2 dB Step), 18 ~36 dB (3 dB Step))
- Analog DRC (Dynamic Range Control)

- Channel Independent Digital Volume (24 ~-103 dB, 0.5 dB Step Mute)
- Digital HPF for DC Offset Cancelling
- Mono 24-bit ADC:
- Sampling Frequency: 8 kHz ~ 96 kHz
- ADC Characteristics S/(N+D): 90 dB; DR, S/N: 100 dB
- Line Amplifier: 21 dB ~ -21 dB, 3 dB Step
- Digital Volume (24 dB ~ -103 dB, 0.5 dB step, Mute)
- Digital HPF for DC Offset Cancelling
- Stereo 24-bit DAC:
- Sampling Frequency: fs = 8 kHz ~ 96 kHz
- Digital Volume (12 dB ~ -115 dB, 0.5 step, Mute)
- Digital De-emphasis Filter (tc = 50/15 µs, fs = 32 kHz, 44.1 kHz, 48 kHz)
- Master Clock: 2560 fs (internally generated by PLL from 32, 48, 64, 128, 256 and 384 fs clock)

Using the Library

This topic describes the basic architecture of the AK7755 Codec Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_AK7755.h`

The interface to the AK7755 Codec Driver library is defined in the `drv_AK7755.h` header file. Any C language source (`.c`) file that uses the AK7755 Codec Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

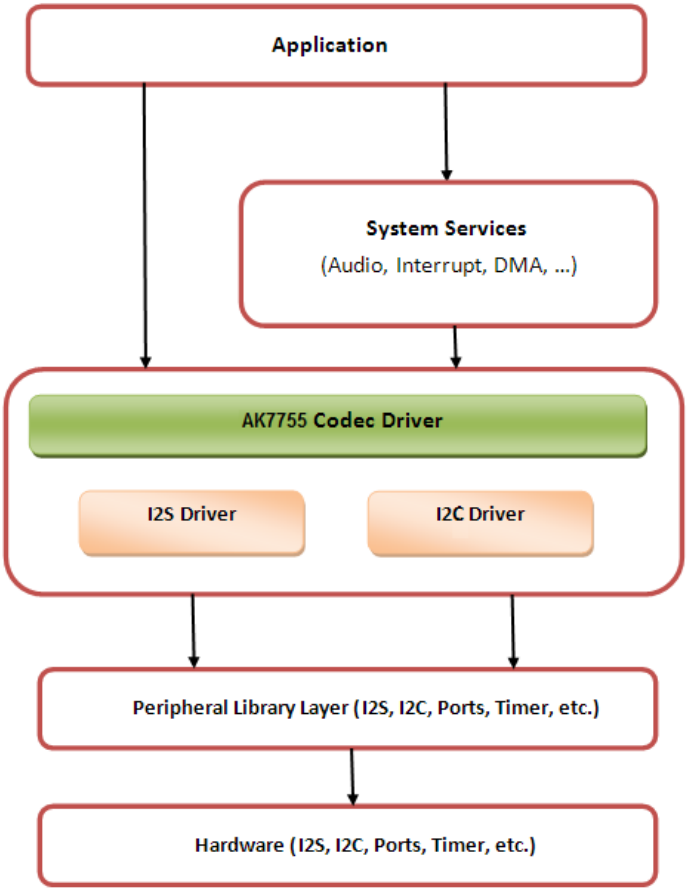
Abstraction Model

This library provides a low-level abstraction of the AK7755 Codec Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The abstraction model shown in the following diagram depicts how the AK7755 Codec Driver is positioned in the MPLAB Harmony framework. The AK7755 Codec Driver uses the SPI and I2S drivers for control and audio data transfers to the AK7755 module.

AK7755 Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The AK7755 Codec Driver Library provides an API interface to transfer control commands and digital audio data to the serially interfaced AK7755 DAC module. The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the AK7755 Codec Driver Library.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Status Functions	Provides status functions.
Other Functions	Provides driver specific miscellaneous functions such as sampling rate setting, control command functions, etc.
Data Types and Constants	These data types and constants are required while interacting and setting up the AK7755 Codec Driver Library.

How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality

System Access

This topic describes system initialization, implementations, and includes a system access code example.

Description

System Initialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization, each instance of the AK7755 module would be initialized with the following configuration settings (either passed dynamically at run time using DRV_AK7755_INIT or by using Initialization Overrides) that are supported by the specific AK7755 device hardware:

- Device requested power state: one of the System Module Power States. For specific details please refer to **Data Types and Constants** in the Library Interface section.
- I2C driver module index. The module index should be same as the one used in initializing the I2C Driver.
- I2S driver module index. The module index should be same as the one used in initializing the I2S Driver.
- Sampling rate
- Audio data format. The audio data format should match with the audio data format settings done in I2S driver initialization
- Power down pin port initialization
- Queue size for the audio data transmit buffer

The DRV_AK7755_Initialize API returns an object handle of the type SYS_MODULE_OBJ. The object handle returned by the Initialize interface would be used by the other system interfaces such as DRV_ AK7755_Deinitialize, DRV_ AK7755_Status and DRV_I2S_Tasks.

Implementations

The AK7755 Codec Driver can has the following implementation:

Description	MPLAB Harmony Components
Dedicated hardware for control (I2C) and data (I2S) interface.	Standard MPLAB Harmony drivers for I2C and I2S interfaces.

Example:

```
DRV_AK7755_INIT drvak7755Codec0InitData =
{
    .moduleInit.value = SYS_MODULE_POWER_RUN_FULL,
    .i2sDriverModuleIndex = DRV_AK7755_I2S_DRIVER_MODULE_INDEX_IDX0,
    .i2cDriverModuleIndex = DRV_AK7755_I2C_DRIVER_MODULE_INDEX_IDX0,
    .volume = DRV_AK7755_VOLUME,
    .queueSizeTransmit = DRV_AK7755_TRANSMIT_QUEUE_SIZE,
};

// Initialize the I2C driver
   DRV_I2C0_Initialize();

// Initialize the I2S driver. The I2S module index should be same as the one used in initializing
// the I2S driver.
   sysObj.drvI2S0 = DRV_I2S_Initialize(DRV_I2S_INDEX_0, (SYS_MODULE_INIT *)&drvI2S0InitData);

// Initialize the Codec driver
   sysObj.drvak7755Codec0 = DRV_AK7755_Initialize(DRV_AK7755_INDEX_0, (SYS_MODULE_INIT
*)&drvak7755Codec0InitData);

if (SYS_MODULE_OBJ_INVALID == AK7755DevObject)
{
// Handle error
}
```

Task Routine

The DRV_AK7755_Tasks will be called from the System Task Service.

Client Access

For the application to start using an instance of the module, it must call the DRV_AK7755_Open function. The DRV_AK7755_Open provides a driver handle to the AK7755 Codec Driver instance for operations. If the driver is deinitialized using the function DRV_AK7755_Deinitialize, the application must call the DRV_AK7755_Open function again to set up the instance of the driver.

For the various options available for IO_INTENT, please refer to **Data Types and Constants** in the Library Interface section.

Client Operations

This topic provides information on client operations and includes a control command and audio buffered data operation flow diagram.

Description

Client operations provide the API interface for control command and audio data transfer to the AK7755 Codec.

The following AK7755 Codec specific control command functions are provided:

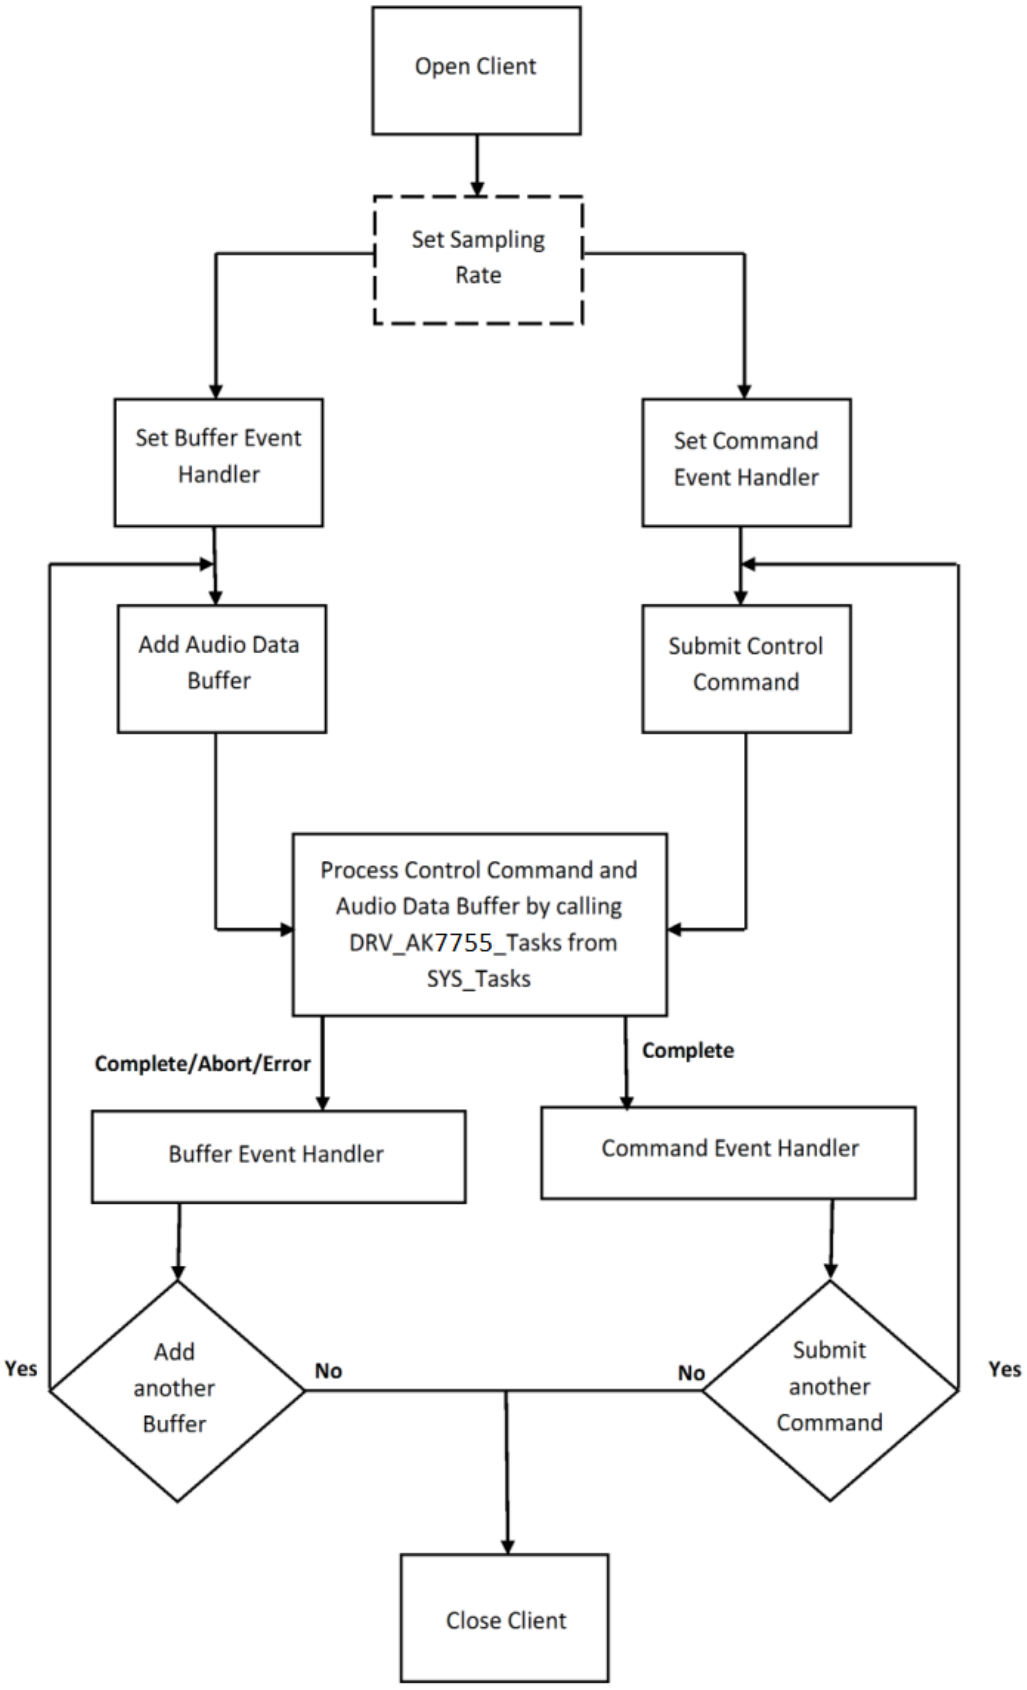
- DRV_AK7755_SamplingRateSet
- DRV_AK7755_SamplingRateGet
- DRV_AK7755_VolumeSet
- DRV_AK7755_VolumeGet
- DRV_AK7755_MuteOn
- DRV_AK7755_MuteOff
- DRV_AK7755_IntExtMicSet
- DRV_AK7755_MonoStereoMicSet

These functions schedule a non-blocking control command transfer operation. These functions submit the control command request to the AK7755 Codec. These functions submit the control command request to I2C Driver transmit queue, the request is processed immediately if it is the first request, or processed when the previous request is complete.

DRV_AK7755_BufferAddWrite, DRV_AK7755_BufferAddRead, and DRV_AK7755_BufferAddWriteRead are buffered data operation functions.

These functions schedule non-blocking audio data transfer operations. These functions add the request to I2S Driver transmit or receive buffer queue depends on the request type, and are executed immediately if it is the first buffer, or executed later when the previous buffer is complete. The driver notifies the client with DRV_AK7755_BUFFER_EVENT_COMPLETE, DRV_AK7755_BUFFER_EVENT_ERROR, or DRV_AK7755_BUFFER_EVENT_ABORT events.

The following diagram illustrates the control commands and audio buffered data operations.



Note: It is not necessary to close and reopen the client between multiple transfers.

Configuring the Library

Macros

	Name	Description
	DRV_AK7755_BCLK_BIT_CLK_DIVISOR	Sets up the BCLK to LRCK ratio to generate the audio stream for the specified sampling frequency.
	DRV_AK7755_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_AK7755_INPUT_REFCLOCK	Identifies the input REFCLOCK source to generate the MCLK to the codec.
	DRV_AK7755_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_AK7755_MCLK_SAMPLE_FREQ_MULTPLIER	Sets up the MCLK to LRCK ratio to generate the audio stream for the specified sampling frequency.
	DRV_AK7755_MCLK_SOURCE	Indicates the input clock frequency to generate the MCLK to the codec.

Description

The configuration of the AK7755 Codec Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the AK7755 Codec Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the AK7755 Codec Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_AK7755_BCLK_BIT_CLK_DIVISOR Macro

Sets up the BCLK to LRCK ratio to generate the audio stream for the specified sampling frequency.

File

drv_ak7755_config_template.h

C

```
#define DRV_AK7755_BCLK_BIT_CLK_DIVISOR
```

Description

AK7755 BCLK to LRCK Ratio to Generate Audio Stream

This macro sets up the BCLK to LRCK ratio to generate the audio stream for the specified sampling frequency.

The following BCLK to LRCK ratios are supported:

- 16-bit data 16-bit channel: 32 fs; therefore, the divisor would be 8
- 16-bit data 32-bit channel: 64 fs; therefore, the divisor would be 4

Remarks

None.

DRV_AK7755_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_ak7755_config_template.h

C

```
#define DRV_AK7755_CLIENTS_NUMBER DRV_AK7755_INSTANCES_NUMBER
```

Description

AK7755 Client Count Configuration

This macro sets up the maximum number of clients that can be connected to any hardware instance. Typically only one client could be connected to one hardware instance. This value represents the total number of clients to be supported across all hardware instances. Therefore, if there are five AK7755 hardware interfaces, this number will be 5.

Remarks

None.

DRV_AK7755_INPUT_REFCLOCK Macro

Identifies the input REFCLOCK source to generate the MCLK to the codec.

File

drv_ak7755_config_template.h

C

```
#define DRV_AK7755_INPUT_REFCLOCK
```

Description

AK7755 Input reference clock

This macro identifies the input REFCLOCK source to generate the MCLK to the codec.

Remarks

None.

DRV_AK7755_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported

File

drv_ak7755_config_template.h

C

```
#define DRV_AK7755_INSTANCES_NUMBER
```

Description

AK7755 driver objects configuration

This macro sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of AK7755 Codec modules that are needed by the application. Hardware Instance support consumes RAM memory space. If this macro is not defined, the driver will be built statically.

Remarks

None.

DRV_AK7755_MCLK_SAMPLE_FREQ_MULTPLIER Macro

Sets up the MCLK to LRCK ratio to generate the audio stream for the specified sampling frequency.

File

drv_ak7755_config_template.h

C

```
#define DRV_AK7755_MCLK_SAMPLE_FREQ_MULTPLIER
```

Description

AK7755 MCLK to LRCK Ratio to Generate Audio Stream

This macro sets up the MCLK to LRCK ratio to generate the audio stream for the specified I2S sampling frequency.

The supported MCLK to sampling frequency ratios are as follows:

- 256 fs
- 384 fs
- 512 fs
- 768 fs
- 1152 fs

Remarks

None.

DRV_AK7755_MCLK_SOURCE Macro

Indicates the input clock frequency to generate the MCLK to the codec.

File

drv_ak7755_config_template.h

C

```
#define DRV_AK7755_MCLK_SOURCE
```

Description

AK7755 Data Interface Master Clock Speed configuration

This macro indicates the input clock frequency to generate the MCLK to the codec.

Remarks

None.

Configuring the MHC

Description

The following three figures show examples of MHC configurations for the AK7755 Codec Driver, I2S Driver, and the I2C Driver.

Figure 1: AK7755 Codec Driver MHC Configuration

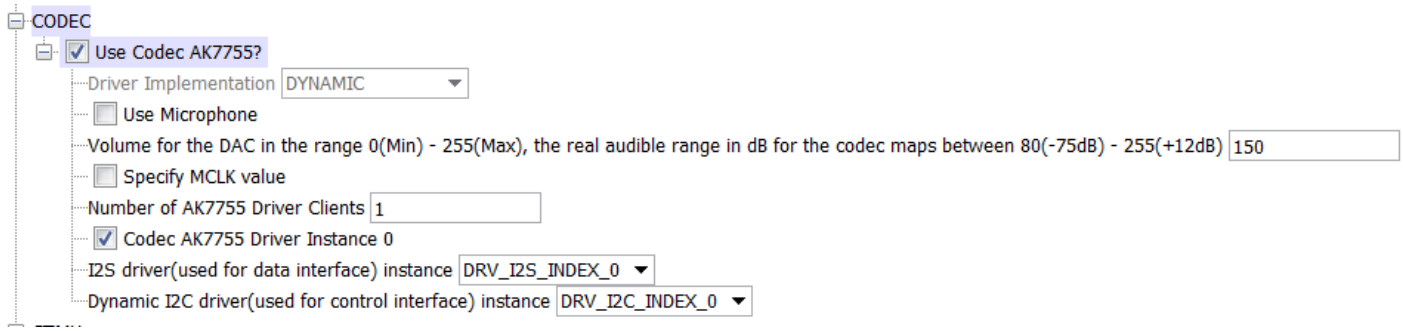


Figure 2: I2S Driver MHC Configuration

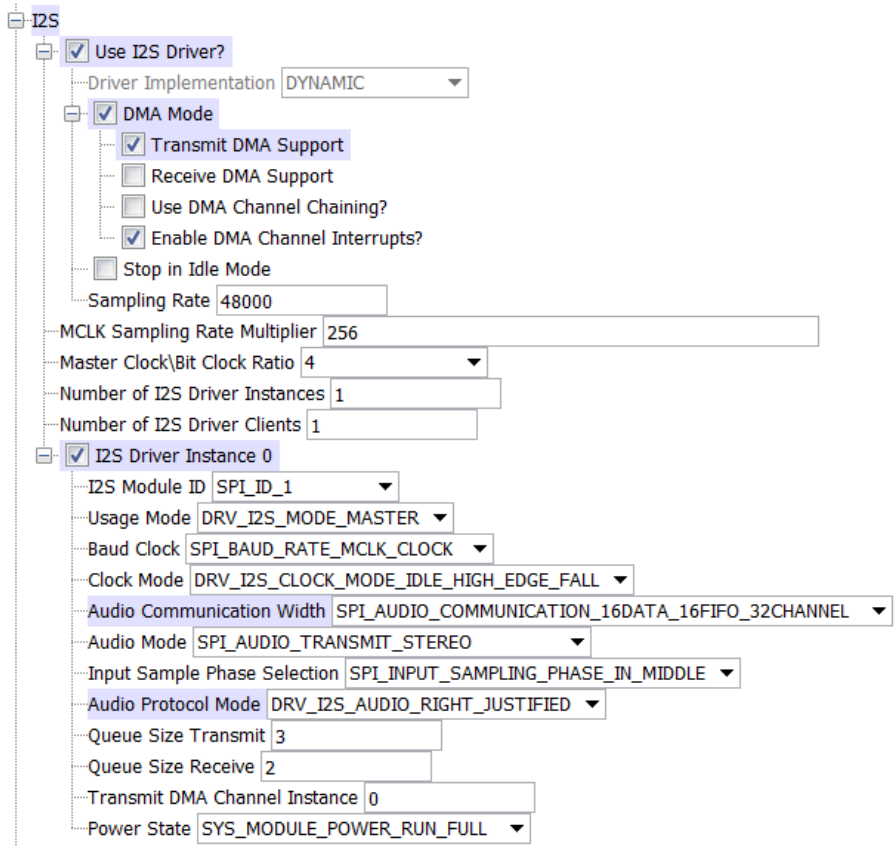

Figure 3: I2C Driver MHC Configuration

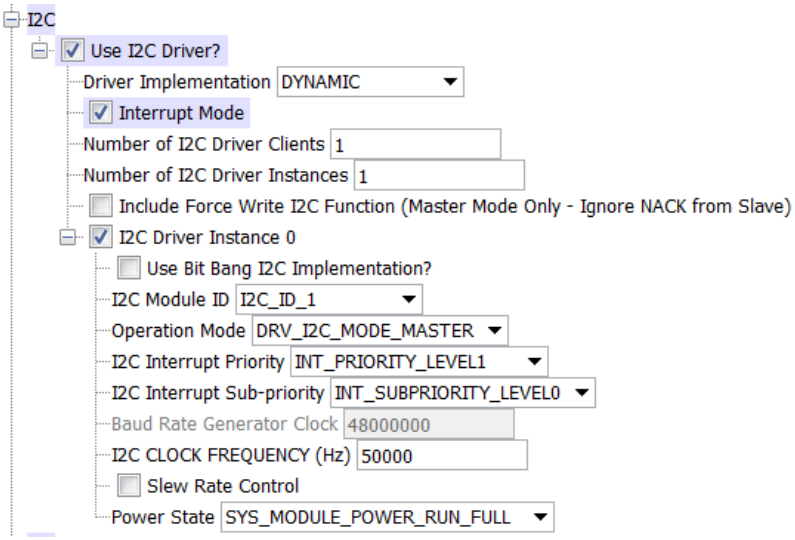

Migrating the AK7755 Driver From Earlier Versions of Microchip Harmony

Prior to version 1.08 of MPLAB Harmony, the AK7755 Codec Driver Library used the static I2C driver implementation. Beginning with v1.08 of MPLAB Harmony, applications must use the Dynamic Driver implementation with the MHC configured as shown in Figure 3. In addition, PIC32MZ configurations require the "Include Force Write I2C Function (Master Mode Only - Ignore NACK from Slave)" option to be selected.

Building the Library

This section lists the files that are available in the AK7755 Codec Driver Library.

Description

This section list the files that are available in the `/src` folder of the AK7755 Codec Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/codec/ak7755`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_ak7755.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_ak7755.c`	This file contains implementation of the AK7755 Codec Driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The AK7755 Codec Driver Library depends on the following modules:

- I2S Driver Library
- I2C Driver Library

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_AK7755_Close	Closes an opened-instance of the AK7755 Codec Driver.
	DRV_AK7755_Deinitialize	Deinitializes the specified instance of the AK7755 Codec Driver module.
	DRV_AK7755_Initialize	Initializes hardware and data for the instance of the AK7755 DAC module
	DRV_AK7755_Open	Opens the specified AK7755 Codec Driver instance and returns a handle to it
	DRV_AK7755_Tasks	Maintains the driver's control and data interface state machine.
	DRV_AK7755_BufferEventHandlerSet	This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.
	DRV_AK7755_CommandEventHandlerSet	Allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.
	DRV_AK7755_SamplingRateSet	This function sets the sampling rate of the media stream.

b) Status Functions

	Name	Description
	DRV_AK7755_SamplingRateGet	This function gets the sampling rate set on the AK7755. **Implementation:** Dynamic
	DRV_AK7755_Status	Gets the current status of the AK7755 Codec Driver module.
	DRV_AK7755_VersionGet	Returns the version of the AK7755 Codec Driver.
	DRV_AK7755_VersionStrGet	This function returns the version of AK7755 Codec Driver in string format.
	DRV_AK7755_VolumeGet	Gets the volume for the AK7755 Codec Driver.

c) Other Functions

	Name	Description
	DRV_AK7755_VolumeSet	This function sets the volume for AK7755 CODEC.
	DRV_AK7755_BufferAddRead	Schedule a non-blocking driver read operation.
	DRV_AK7755_BufferAddWrite	Schedule a non-blocking driver write operation.

	DRV_AK7755_BufferAddWriteRead	This is function DRV_AK7755_BufferAddWriteRead.
	DRV_AK7755_IntExtMicSet	Sets up the codec for the internal or the external microphone use.
	DRV_AK7755_MonoStereoMicSet	Sets up the codec for the Mono or Stereo microphone mode.
	DRV_AK7755_MuteOff	Disables AK7755 output for soft mute.
	DRV_AK7755_MuteOn	Allows AK7755 output for soft mute on.

d) Data Types and Constants

	Name	Description
	_DRV_AK7755_H	Include files.
	DRV_AK7755_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_AK7755_COUNT	Number of valid AK7755 Codec Driver indices
	DRV_AK7755_INDEX_0	AK7755 driver index definitions
	DRV_AK7755_INDEX_1	This is macro DRV_AK7755_INDEX_1.
	DRV_AK7755_INDEX_2	This is macro DRV_AK7755_INDEX_2.
	DRV_AK7755_INDEX_3	This is macro DRV_AK7755_INDEX_3.
	DRV_AK7755_INDEX_4	This is macro DRV_AK7755_INDEX_4.
	DRV_AK7755_INDEX_5	This is macro DRV_AK7755_INDEX_5.
	DRV_AK7755_BICK_FS_FORMAT	This is type DRV_AK7755_BICK_FS_FORMAT.
	DRV_AK7755_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_AK7755_BUFFER_EVENT_HANDLER	Pointer to a AK7755 Driver Buffer Event handler function.
	DRV_AK7755_BUFFER_HANDLE	Handle identifying a write buffer passed to the driver.
	DRV_AK7755_CHANNEL	Identifies left/right audio channel.
	DRV_AK7755_COMMAND_EVENT_HANDLER	Pointer to a AK7755 Codec Driver command event handler function.
	DRV_AK7755_DAC_INPUT_FORMAT	Identifies the Serial Audio data interface format.
	DRV_AK7755_DSP_DIN1_INPUT_FORMAT	This is type DRV_AK7755_DSP_DIN1_INPUT_FORMAT.
	DRV_AK7755_DSP_DOUT1_OUTPUT_FORMAT	This is type DRV_AK7755_DSP_DOUT1_OUTPUT_FORMAT.
	DRV_AK7755_DSP_DOUT4_OUTPUT_FORMAT	This is type DRV_AK7755_DSP_DOUT4_OUTPUT_FORMAT.
	DRV_AK7755_DSP_PROGRAM	This is type DRV_AK7755_DSP_PROGRAM.
	DRV_AK7755_INIT	Defines the data required to initialize or reinitialize the AK7755 Codec Driver.
	DRV_AK7755_INT_EXT_MIC	Identifies the Mic input source.
	DRV_AK7755_LRCK_IF_FORMAT	This is type DRV_AK7755_LRCK_IF_FORMAT.
	DRV_AK7755_MONO_STEREO_MIC	Identifies the Mic input as Mono/Stereo.

Description

This section describes the API functions of the AK7755 Codec Driver library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_AK7755_Close Function

Closes an opened-instance of the AK7755 Codec Driver.

File

drv_ak7755.h

C

```
void DRV_AK7755_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the AK7755 Codec Driver, invalidating the handle. Any buffers in the driver queue that were submitted by this client will be removed. After calling this function, the handle passed in "handle" must not be used with any of the remaining driver functions. A new handle must be obtained by calling DRV_AK7755_Open before the caller may use the driver again.

Remarks

Usually there is no need for the driver client to verify that the Close operation has completed. The driver will abort any ongoing operations when this function is called.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_AK7755_Open

DRV_AK7755_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

void DRV_AK7755_Close(DRV_Handle handle)

DRV_AK7755_Deinitialize Function

Deinitializes the specified instance of the AK7755 Codec Driver module.

File

drv_ak7755.h

C

```
void DRV_AK7755_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function deinitializes the specified instance of the AK7755 Codec Driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This function will NEVER block waiting for hardware.

Preconditions

The DRV_AK7755_Initialize function should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_AK7755_Initialize
SYS_STATUS          status;

DRV_AK7755_Deinitialize(object);

status = DRV_AK7755_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_AK7755_Initialize function

Function

void DRV_AK7755_Deinitialize(SYS_MODULE_OBJ object)

DRV_AK7755_Initialize Function

Initializes hardware and data for the instance of the AK7755 DAC module

File

drv_ak7755.h

C

```
SYS_MODULE_OBJ DRV_AK7755_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the AK7755 Codec Driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the init parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized.

Remarks

This function must be called before any other AK7755 function is called.

This function should only be called once during system initialization unless DRV_AK7755_Deinitialize is called to deinitialize the driver instance. This function will NEVER block for hardware access.

Preconditions

DRV_I2S_Initialize must be called before calling this function to initialize the data interface of this codec driver. DRV_SPI_Initialize must be called if SPI driver is used for handling the control interface of this codec driver.

Example

```
DRV_AK7755_INIT                init;
SYS_MODULE_OBJ                 objectHandle;

init->inUse                          = true;
init->status                         = SYS_STATUS_BUSY;
init->numClients                     = 0;
init->i2sDriverModuleIndex           = ak7755Init->i2sDriverModuleIndex;
init->i2cDriverModuleIndex           = ak7755Init->i2cDriverModuleIndex;
init->samplingRate                   = DRV_AK7755_AUDIO_SAMPLING_RATE;
init->audioDataFormat                = DRV_AK7755_AUDIO_DATA_FORMAT_MACRO;

init->isInInterruptContext           = false;

init->commandCompleteCallback = (DRV_AK7755_COMMAND_EVENT_HANDLER)0;
init->commandContextData = 0;
init->mclk_multiplier = DRV_AK7755_MCLK_SAMPLE_FREQ_MULTPLIER;

objectHandle = DRV_AK7755_Initialize(DRV_AK7755_0, (SYS_MODULE_INIT*)init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the driver instance to be initialized
init	Pointer to the data structure containing any data necessary to initialize the hardware. This pointer may be null if no data is required and default initialization is to be used.

Function

SYS_MODULE_OBJ DRV_AK7755_Initialize

(
const SYS_MODULE_INDEX drvIndex,
const SYS_MODULE_INIT *const init
);

DRV_AK7755_Open Function

Opens the specified AK7755 Codec Driver instance and returns a handle to it

File

drv_ak7755.h

C

```
DRV_HANDLE DRV_AK7755_Open(const SYS_MODULE_INDEX iDriver, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Error can occur

- if the number of client objects allocated via DRV_AK7755_CLIENTS_NUMBER is insufficient.
- if the client is trying to open the driver but driver has been opened exclusively by another client.
- if the driver hardware instance being opened is not initialized or is invalid.
- if the ioIntent options passed are not relevant to this driver.

Description

This function opens the specified AK7755 Codec Driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The DRV_IO_INTENT_BLOCKING and DRV_IO_INTENT_NONBLOCKING ioIntent options are not relevant to this driver. All the data transfer functions of this driver are non blocking.

Only DRV_IO_INTENT_WRITE is a valid ioIntent option as AK7755 is DAC only.

Specifying a DRV_IO_INTENT_EXCLUSIVE will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Remarks

The handle returned is valid until the DRV_AK7755_Close function is called. This function will NEVER block waiting for hardware.If the requested intent flags are not supported, the function will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

The DRV_AK7755_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_AK7755_Open(DRV_AK7755_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver. See function description for details.

Function

DRV_HANDLE DRV_AK7755_Open
(
const SYS_MODULE_INDEX drvIndex,

const DRV_IO_INTENT ioIntent
)

DRV_AK7755_Tasks Function

Maintains the driver's control and data interface state machine.

File

drv_ak7755.h

C

```
void DRV_AK7755_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal control and data interface state machine and implement its control and data interface implementations. This function should be called from the SYS_Tasks function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function (SYS_Tasks).

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_AK7755_Initialize

while (true)
{
    DRV_AK7755_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_AK7755_Initialize)

Function

void DRV_AK7755_Tasks(SYS_MODULE_OBJ object);

DRV_AK7755_BufferEventHandlerSet Function

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

File

drv_ak7755.h

C

```
void DRV_AK7755_BufferEventHandlerSet(DRV_HANDLE handle, const DRV_AK7755_BUFFER_EVENT_HANDLER
eventHandler, const uintptr_t contextHandle);
```

Returns

None.

Description

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. When a client calls DRV_AK7755_BufferAddWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "buffer add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued buffer transfer has completed, it does not need to register a callback.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK7755_BUFFER_HANDLE bufferHandle;

// myAK7755Handle is the handle returned
// by the DRV_AK7755_Open function.

// Client registers an event handler with driver

DRV_AK7755_BufferEventHandlerSet(myAK7755Handle,
                APP_AK7755BufferEventHandler, (uintptr_t)&myAppObj);

DRV_AK7755_BufferAddWrite(myAK7755handle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_AK7755_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_AK7755BufferEventHandler(DRV_AK7755_BUFFER_EVENT event,
        DRV_AK7755_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_AK7755_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK7755_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_AK7755_BufferEventHandlerSet

(

DRV_HANDLE handle,
const DRV_AK7755_BUFFER_EVENT_HANDLER eventHandler,
const uintptr_t contextHandle
)

DRV_AK7755_CommandEventHandlerSet Function

Allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.

File

drv_ak7755.h

C

```
void DRV_AK7755_CommandEventHandlerSet(DRV_HANDLE handle, const DRV_AK7755_COMMAND_EVENT_HANDLER
eventHandler, const uintptr_t contextHandle);
```

Returns

None.

Description

This function allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.

When a client calls DRV_AK7755_BufferAddWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "AK7755 CODEC Specific Client Routines" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the command has completed, it does not need to register a callback.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK7755_BUFFER_HANDLE bufferHandle;

// myAK7755Handle is the handle returned
// by the DRV_AK7755_Open function.

// Client registers an event handler with driver

DRV_AK7755_CommandEventHandlerSet(myAK7755Handle,
                APP_AK7755CommandEventHandler, (uintptr_t)&myAppObj);

DRV_AK7755_DeEmphasisFilterSet(myAK7755Handle, DRV_AK7755_DEEMPHASIS_FILTER_44_1KHZ)

// Event is received when
// the buffer is processed.

void APP_AK7755CommandEventHandler(uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
            // Last Submitted command is completed.
            // Perform further processing here
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_AK7755_CommandEventHandlerSet
(
DRV_HANDLE handle,
const DRV_AK7755_COMMAND_EVENT_HANDLER eventHandler,
const uintptr_t contextHandle
)

DRV_AK7755_SamplingRateSet Function

This function sets the sampling rate of the media stream.

File

drv_ak7755.h

C

```
void DRV_AK7755_SamplingRateSet(DRV_HANDLE handle, uint32_t samplingRate);
```

Returns

None.

Description

This function sets the media sampling rate for the client handle.

Remarks

None.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.
DRV_AK7755_Open must have been called to obtain a valid opened device handle.

Example

```
// myAK7755Handle is the handle returned
// by the DRV_AK7755_Open function.

DRV_AK7755_SamplingRateSet(myAK7755Handle, 48000);  //Sets 48000 media sampling rate
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
samplingRate	Sampling frequency in Hz

Function

void DRV_AK7755_SamplingRateSet(DRV_HANDLE handle, uint32_t samplingRate)

b) Status Functions

DRV_AK7755_SamplingRateGet Function

This function gets the sampling rate set on the AK7755.

Implementation: Dynamic

File

drv_ak7755.h

C

```
uint32_t DRV_AK7755_SamplingRateGet(DRV_HANDLE handle);
```

Description

This function gets the sampling rate set on the DAC AK7755.

Remarks

None.

Example

```
uint32_t baudRate;

// myAK7755Handle is the handle returned
// by the DRV_AK7755_Open function.

baudRate = DRV_AK7755_SamplingRateGet(myAK7755Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

uint32_t DRV_AK7755_SamplingRateGet(DRV_HANDLE handle)

DRV_AK7755_Status Function

Gets the current status of the AK7755 Codec Driver module.

File

drv_ak7755.h

C

```
SYS_STATUS DRV_AK7755_Status(SYS_MODULE_OBJ object);
```

Returns

- SYS_STATUS_DEINITIALIZED - Indicates that the driver has been deinitialized
- SYS_STATUS_READY - Indicates that any previous module operation for the specified module has completed
- SYS_STATUS_BUSY - Indicates that a previous module operation for the specified module has not yet completed
- SYS_STATUS_ERROR - Indicates that the specified module is in an error state

Description

This function provides the current status of the AK7755 Codec Driver module.

Remarks

A driver can be opened only when its status is SYS_STATUS_READY.

Preconditions

The DRV_AK7755_Initialize function should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_AK7755_Initialize
SYS_STATUS          AK7755Status;

AK7755Status = DRV_AK7755_Status(object);
if (SYS_STATUS_READY == AK7755Status)
{
    // This means the driver can be opened using the
    // DRV_AK7755_Open function.
```

```
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_AK7755_Initialize function

Function

SYS_STATUS DRV_AK7755_Status(SYS_MODULE_OBJ object)

DRV_AK7755_VersionGet Function

Returns the version of the AK7755 Codec Driver.

File

drv_ak7755.h

C

```
uint32_t DRV_AK7755_VersionGet();
```

Returns

Returns the version of the AK7755 Codec Driver.

Description

The version number returned from the DRV_AK7755_VersionGet function is an unsigned integer in the following decimal format:

- * 10000 + * 100 +

Where the numbers are represented in decimal and the meaning is the same as above. Note that there is no numerical representation of release type.

Remarks

None.

Preconditions

None.

Example 1

- For version "0.03a", return: 0 * 10000 + 3 * 100 + 0
- For version "1.00", return: 1 * 100000 + 0 * 100 + 0

Example 2

```
uint32_t AK7755version;
AK7755version = DRV_AK7755_VersionGet();
```

Function

uint32_t DRV_AK7755_VersionGet(void)

DRV_AK7755_VersionStrGet Function

This function returns the version of AK7755 Codec Driver in string format.

File

drv_ak7755.h

C

```
int8_t* DRV_AK7755_VersionStrGet();
```

Returns

returns a string containing the version of the AK7755 Codec Driver.

Description

The DRV_AK7755_VersionStrGet function returns a string in the format: ".[.][]" Where:

- is the AK7755 Codec Driver's version number.
- is the AK7755 Codec Driver's version number.

- is an optional "patch" or "dot" release number (which is not

included in the string if it equals "00").

- is an optional release type ("a" for alpha, "b" for beta ?

not the entire word spelled out) that is not included if the release is a production version (I.e. Not an alpha or beta).

The String does not contain any spaces. For example, "0.03a" "1.00"

Remarks

None

Preconditions

None.

Example

```
int8_t *AK7755string;
AK7755string = DRV_AK7755_VersionStrGet();
```

Function

int8_t* DRV_AK7755_VersionStrGet(void)

DRV_AK7755_VolumeGet Function

Gets the volume for the AK7755 Codec Driver.

File

drv_ak7755.h

C

```
uint8_t DRV_AK7755_VolumeGet(DRV_HANDLE handle, DRV_AK7755_CHANNEL channel);
```

Returns

None.

Description

This functions gets the current volume programmed to the AK7755 Codec Driver.

Remarks

None.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;
uint8_t volume;

// myAK7755Handle is the handle returned
// by the DRV_AK7755_Open function.

  volume = DRV_AK7755_VolumeGet(myAK7755Handle, DRV_AK7755_CHANNEL_LEFT);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
channel	argument indicating Left or Right or Both channel volume to be modified

Function

uint8_t DRV_AK7755_VolumeGet(DRV_HANDLE handle, DRV_AK7755_CHANNEL channel)

c) Other Functions

DRV_AK7755_VolumeSet Function

This function sets the volume for AK7755 CODEC.

File

drv_ak7755.h

C

```
void DRV_AK7755_VolumeSet(DRV_HANDLE handle, DRV_AK7755_CHANNEL channel, uint8_t volume);
```

Returns

None

Description

This functions sets the volume value from 0-255, which can attenuate from -115 dB to +12 dB. All decibels below approximately -50 dB are inaudible.

Remarks

None.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myAK7755Handle is the handle returned
// by the DRV_AK7755_Open function.

    DRV_AK7755_VolumeSet(myAK7755Handle,DRV_AK7755_CHANNEL_LEFT, 120);  //Step 120 volume
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's Open function
channel	argument indicating Left or Right or Both channel volume to be modified
volume	Updated volume specified in the range 0-255

Function

void DRV_AK7755_VolumeSet(DRV_HANDLE handle, DRV_AK7755_CHANNEL channel, uint8_t volume);

DRV_AK7755_BufferAddRead Function

Schedule a non-blocking driver read operation.

File

drv_ak7755.h

C

```
void DRV_AK7755_BufferAddRead(const DRV_HANDLE handle, DRV_AK7755_BUFFER_HANDLE * bufferHandle, void *
buffer, size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_AK7755_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking read operation. The function returns with a valid buffer handle in the bufferHandle argument if the read

request was scheduled successfully. The function adds the request to the hardware instance receive queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_AK7755_BUFFER_HANDLE_INVALID

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0.
- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_AK7755_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_AK7755_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the AK7755 Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another AK7755 Codec Driver instance. It should not otherwise be called directly in an ISR.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 device instance and the DRV_AK7755_Status must have returned SYS_STATUS_READY.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ must have been specified in the DRV_AK7755_Open call.

Parameters

Parameters	Description
handle	Handle of the AK7755 instance as return by the DRV_AK7755_Open function.
buffer	Data to be transmitted.
size	Buffer size in bytes.
bufferHandle	Pointer to an argument that will contain the return buffer handle.

Function

void DRV_AK7755_BufferAddRead

(

const DRV_HANDLE handle,

DRV_AK7755_BUFFER_HANDLE *bufferHandle,

void *buffer, size_t size

)

DRV_AK7755_BufferAddWrite Function

Schedule a non-blocking driver write operation.

File

drv_ak7755.h

C

```
void DRV_AK7755_BufferAddWrite(const DRV_HANDLE handle, DRV_AK7755_BUFFER_HANDLE * bufferHandle, void *
buffer, size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_AK7755_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking write operation. The function returns with a valid buffer handle in the bufferHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance transmit queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_AK7755_BUFFER_HANDLE_INVALID:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_AK7755_BUFFER_EVENT_COMPLETE event if

the buffer was processed successfully of DRV_AK7755_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the AK7755 Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another AK7755 Codec Driver instance. It should not otherwise be called directly in an ISR.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 device instance and the DRV_AK7755_Status must have returned SYS_STATUS_READY.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE must have been specified in the DRV_AK7755_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_AK7755_BUFFER_HANDLE bufferHandle;

// myAK7755Handle is the handle returned
// by the DRV_AK7755_Open function.

// Client registers an event handler with driver

DRV_AK7755_BufferEventHandlerSet(myAK7755Handle,
                APP_AK7755BufferEventHandler, (uintptr_t)&myAppObj);

DRV_AK7755_BufferAddWrite(myAK7755handle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_AK7755_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when the buffer is processed.

void APP_AK7755BufferEventHandler(DRV_AK7755_BUFFER_EVENT event,
        DRV_AK7755_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_AK7755_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_AK7755_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the AK7755 instance as return by the DRV_AK7755_Open function.
buffer	Data to be transmitted.
size	Buffer size in bytes.
bufferHandle	Pointer to an argument that will contain the return buffer handle.

Function

void DRV_AK7755_BufferAddWrite
(
const DRV_HANDLE handle,
DRV_AK7755_BUFFER_HANDLE *bufferHandle,
void *buffer, size_t size
)

DRV_AK7755_BufferAddWriteRead Function

File

drv_ak7755.h

C

```
void DRV_AK7755_BufferAddWriteRead(const DRV_HANDLE handle, DRV_AK7755_BUFFER_HANDLE * bufferHandle, void *
transmitBuffer, void * receiveBuffer, size_t size);
```

Description

This is function DRV_AK7755_BufferAddWriteRead.

DRV_AK7755_IntExtMicSet Function

Sets up the codec for the internal or the external microphone use.

File

drv_ak7755.h

C

```
void DRV_AK7755_IntExtMicSet(DRV_HANDLE handle, DRV_AK7755_INT_EXT_MIC micInput);
```

Returns

None.

Description

This function sets up the codec for the internal or the external microphone use.

Remarks

None.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
micInput	Internal vs. External microphone input

Function

void DRV_AK7755_IntExtMicSet(DRV_HANDLE handle);

DRV_AK7755_MonoStereoMicSet Function

Sets up the codec for the Mono or Stereo microphone mode.

File

drv_ak7755.h

C

```
void DRV_AK7755_MonoStereoMicSet(DRV_HANDLE handle, DRV_AK7755_MONO_STEREO_MIC mono_stereo_mic);
```

Returns

None.

Description

This function sets up the codec for the Mono or Stereo microphone mode.

Remarks

None.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
mono_stereo_mic	Mono/Stereo microphone setup

Function

void DRV_AK7755_MonoStereoMicSet(DRV_HANDLE handle);

DRV_AK7755_MuteOff Function

Disables AK7755 output for soft mute.

File

drv_ak7755.h

C

```
void DRV_AK7755_MuteOff(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables AK7755 output for soft mute.

Remarks

None.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myAK7755Handle is the handle returned
// by the DRV_AK7755_Open function.

    DRV_AK7755_MuteOff(myAK7755Handle); //AK7755 output soft mute disabled
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

void DRV_AK7755_MuteOff(DRV_HANDLE handle)

DRV_AK7755_MuteOn Function

Allows AK7755 output for soft mute on.

File

drv_ak7755.h

C

```
void DRV_AK7755_MuteOn(DRV_HANDLE handle);
```

Returns

None.

Description

This function enables AK7755 output for soft mute.

Remarks

None.

Preconditions

The DRV_AK7755_Initialize function must have been called for the specified AK7755 Codec Driver instance.

DRV_AK7755_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myAK7755Handle is the handle returned
// by the DRV_AK7755_Open function.

DRV_AK7755_MuteOn(myAK7755Handle);  //AK7755 output soft muted
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

void DRV_AK7755_MuteOn(DRV_HANDLE handle);

d) Data Types and Constants

_DRV_AK7755_H Macro

File

drv_ak7755.h

C

```
#define _DRV_AK7755_H
```

Description

Include files.

DRV_AK7755_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_ak7755.h

C

```
#define DRV_AK7755_BUFFER_HANDLE_INVALID ((DRV_AK7755_BUFFER_HANDLE)(-1))
```

Description

AK7755 Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_AK7755_BufferAddWrite and the DRV_AK7755_BufferAddRead function if the buffer add request was not successful.

Remarks

None.

DRV_AK7755_COUNT Macro

Number of valid AK7755 Codec Driver indices

File

drv_ak7755.h

C

```
#define DRV_AK7755_COUNT
```

Description

AK7755 Driver Module Count

This constant identifies the maximum number of AK7755 Codec Driver instances that should be defined by the application. Defining more instances than this constant will waste RAM memory space.

This constant can also be used by the application to identify the number of AK7755 instances on this microcontroller.

Remarks

This value is device-specific.

DRV_AK7755_INDEX_0 Macro

AK7755 driver index definitions

File

drv_ak7755.h

C

```
#define DRV_AK7755_INDEX_0 0
```

Description

Driver AK7755 Module Index

These constants provide AK7755 Codec Driver index definition.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_AK7755_Initialize and DRV_AK7755_Open functions to identify the driver instance in use.

DRV_AK7755_INDEX_1 Macro

File

drv_ak7755.h

C

```
#define DRV_AK7755_INDEX_1 1
```

Description

This is macro DRV_AK7755_INDEX_1.

DRV_AK7755_INDEX_2 Macro

File

drv_ak7755.h

C

```
#define DRV_AK7755_INDEX_2 2
```

Description

This is macro DRV_AK7755_INDEX_2.

DRV_AK7755_INDEX_3 Macro

File

drv_ak7755.h

C

```
#define DRV_AK7755_INDEX_3 3
```

Description

This is macro DRV_AK7755_INDEX_3.

DRV_AK7755_INDEX_4 Macro

File

drv_ak7755.h

C

```
#define DRV_AK7755_INDEX_4 4
```

Description

This is macro DRV_AK7755_INDEX_4.

DRV_AK7755_INDEX_5 Macro

File

drv_ak7755.h

C

```
#define DRV_AK7755_INDEX_5 5
```

Description

This is macro DRV_AK7755_INDEX_5.

DRV_AK7755_BICK_FS_FORMAT Enumeration

File

drv_ak7755.h

C

```
typedef enum {
  DRV_AK7755_BICK_64FS,
  DRV_AK7755_BICK_48FS,
  DRV_AK7755_BICK_32FS,
  DRV_AK7755_BICK_256FS
} DRV_AK7755_BICK_FS_FORMAT;
```

Description

This is type DRV_AK7755_BICK_FS_FORMAT.

DRV_AK7755_BUFFER_EVENT Enumeration

Identifies the possible events that can result from a buffer add request.

File

drv_ak7755.h

C

```
typedef enum {
  DRV_AK7755_BUFFER_EVENT_COMPLETE,
  DRV_AK7755_BUFFER_EVENT_ERROR,
  DRV_AK7755_BUFFER_EVENT_ABORT
} DRV_AK7755_BUFFER_EVENT;
```

Members

Members	Description
DRV_AK7755_BUFFER_EVENT_COMPLETE	Data was transferred successfully.
DRV_AK7755_BUFFER_EVENT_ERROR	Error while processing the request
DRV_AK7755_BUFFER_EVENT_ABORT	Data transfer aborted (Applicable in DMA mode)

Description

AK7755 Driver Events

This enumeration identifies the possible events that can result from a buffer add request caused by the client calling either the DRV_AK7755_BufferAddWrite or the DRV_AK7755_BufferAddRead function.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that the client registered with the driver by calling the DRV_AK7755_BufferEventHandlerSet function when a buffer transfer request is completed.

DRV_AK7755_BUFFER_EVENT_HANDLER Type

Pointer to a AK7755 Driver Buffer Event handler function.

File

drv_ak7755.h

C

```
typedef void (* DRV_AK7755_BUFFER_EVENT_HANDLER)(DRV_AK7755_BUFFER_EVENT event, DRV_AK7755_BUFFER_HANDLE
bufferHandle, uintptr_t contextHandle);
```

Returns

None.

Description

AK7755 Driver Buffer Event Handler Function

This data type defines the required function signature for the AK7755 Codec Driver buffer event handling callback function. A client must register a

pointer to a buffer event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive buffer related event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

If the event is DRV_AK7755_BUFFER_EVENT_COMPLETE, this means that the data was transferred successfully.

If the event is DRV_AK7755_BUFFER_EVENT_ERROR, this means that the data was not transferred successfully. The bufferHandle parameter contains the buffer handle of the buffer that failed. The DRV_AK7755_BufferProcessedSizeGet function can be called to find out how many bytes were processed.

The bufferHandle parameter contains the buffer handle of the buffer that associated with the event.

The context parameter contains a handle to the client context, provided at the time the event handling function was registered using the DRV_AK7755_BufferEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The buffer handle in bufferHandle expires after this event handler exits. In that the buffer object that was allocated is deallocated by the driver after the event handler exits.

The event handler function executes in the data driver (i.e., I2S) peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

DRV_AK7755_BufferAddWrite function can be called in the event handler to add a buffer to the driver queue.

Example

```
void APP_MyBufferEventHandler( DRV_AK7755_BUFFER_EVENT event,
                               DRV_AK7755_BUFFER_HANDLE bufferHandle,
                               uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_AK7755_BUFFER_EVENT_COMPLETE:
            // Handle the completed buffer.
        break;

        case DRV_AK7755_BUFFER_EVENT_ERROR:
        default:
            // Handle error.
        break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
bufferHandle	Handle identifying the buffer to which the event relates
context	Value identifying the context of the application that registered the event handling function.

DRV_AK7755_BUFFER_HANDLE Type

Handle identifying a write buffer passed to the driver.

File

drv_ak7755.h

C

```
typedef uintptr_t DRV_AK7755_BUFFER_HANDLE;
```

Description

AK7755 Driver Buffer Handle

A buffer handle value is returned by a call to the DRV_AK7755_BufferAddWrite or DRV_AK7755_BufferAddRead function. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from the "buffer add" function is returned back to the client by the "event handler callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler

function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_AK7755_CHANNEL Enumeration

Identifies left/right audio channel.

File

drv_ak7755.h

C

```
typedef enum {
  DRV_AK7755_CHANNEL_LEFT,
  DRV_AK7755_CHANNEL_RIGHT,
  DRV_AK7755_CHANNEL_LEFT_RIGHT,
  DRV_AK7755_NUMBER_OF_CHANNELS
} DRV_AK7755_CHANNEL;
```

Description

AK7755 Audio Channel

This enumeration identifies the left/right audio channel.

Remarks

None.

DRV_AK7755_COMMAND_EVENT_HANDLER Type

Pointer to a AK7755 Codec Driver command event handler function.

File

drv_ak7755.h

C

```
typedef void (* DRV_AK7755_COMMAND_EVENT_HANDLER)(uintptr_t contextHandle);
```

Returns

None.

Description

AK7755 Driver Command Event Handler Function

This data type defines the required function signature for the AK7755 Codec Driver command event handling callback function.

A command is a control instruction to the AK7755 Codec. For example, Mute ON/OFF, Zero Detect Enable/Disable, etc.

A client must register a pointer to a command event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive command related event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

The occurrence of this call back means that the last control command was transferred successfully.

The context parameter contains a handle to the client context, provided at the time the event handling function was registered using the DRV_AK7755_CommandEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The event handler function executes in the control data driver interrupt context. It is recommended of the application to not perform process intensive or blocking operations with in this function.

Example

```
void APP_AK7755CommandEventHandler( uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    // Last Submitted command is completed.
```

```
    // Perform further processing here
}
```

Parameters

Parameters	Description
context	Value identifying the context of the application that registered the event handling function.

DRV_AK7755_DAC_INPUT_FORMAT Enumeration

Identifies the Serial Audio data interface format.

File

drv_ak7755.h

C

```
typedef enum {
  DRV_AK7755_DAC_INPUT_24BITMSB,
  DRV_AK7755_DAC_INPUT_24BITLSB,
  DRV_AK7755_DAC_INPUT_20BITLSB,
  DRV_AK7755_DAC_INPUT_16BITLSB
} DRV_AK7755_DAC_INPUT_FORMAT;
```

Members

Members	Description
DRV_AK7755_DAC_INPUT_20BITLSB	not supported

Description

AK7755 Audio Data Format

This enumeration identifies the Serial Audio data interface format.

DRV_AK7755_DSP_DIN1_INPUT_FORMAT Enumeration

File

drv_ak7755.h

C

```
typedef enum {
  DRV_AK7755_DSP_DIN1_INPUT_24BITMSB,
  DRV_AK7755_DSP_DIN1_INPUT_24BITLSB,
  DRV_AK7755_DSP_DIN1_INPUT_20BITLSB,
  DRV_AK7755_DSP_DIN1_INPUT_16BITLSB
} DRV_AK7755_DSP_DIN1_INPUT_FORMAT;
```

Description

This is type DRV_AK7755_DSP_DIN1_INPUT_FORMAT.

DRV_AK7755_DSP_DOUT1_OUTPUT_FORMAT Enumeration

File

drv_ak7755.h

C

```
typedef enum {
  DRV_AK7755_DSP_DOUT1_OUTPUT_24BITMSB,
  DRV_AK7755_DSP_DOUT1_OUTPUT_24BITLSB,
  DRV_AK7755_DSP_DOUT1_OUTPUT_20BITLSB,
  DRV_AK7755_DSP_DOUT1_OUTPUT_16BITLSB
} DRV_AK7755_DSP_DOUT1_OUTPUT_FORMAT;
```

Description

This is type DRV_AK7755_DSP_DOUT1_OUTPUT_FORMAT.

DRV_AK7755_DSP_DOUT4_OUTPUT_FORMAT Enumeration

File

drv_ak7755.h

C

```
typedef enum {
  DRV_AK7755_DSP_DOUT4_OUTPUT_24BITMSB,
  DRV_AK7755_DSP_DOUT4_OUTPUT_24BITLSB,
  DRV_AK7755_DSP_DOUT4_OUTPUT_20BITLSB,
  DRV_AK7755_DSP_DOUT4_OUTPUT_16BITLSB
} DRV_AK7755_DSP_DOUT4_OUTPUT_FORMAT;
```

Description

This is type DRV_AK7755_DSP_DOUT4_OUTPUT_FORMAT.

DRV_AK7755_DSP_PROGRAM Enumeration

File

drv_ak7755.h

C

```
typedef enum {
  DRV_AK7755_DSP_ECHO_CANCELLATION,
  DRV_AK7755_DSP_REGULAR
} DRV_AK7755_DSP_PROGRAM;
```

Description

This is type DRV_AK7755_DSP_PROGRAM.

DRV_AK7755_INIT Structure

Defines the data required to initialize or reinitialize the AK7755 Codec Driver.

File

drv_ak7755.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX i2sDriverModuleIndex;
  SYS_MODULE_INDEX i2cDriverModuleIndex;
  uint32_t samplingRate;
  uint8_t volume;
} DRV_AK7755_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX i2sDriverModuleIndex;	Identifies data module (I2S) driver ID for data interface of CODEC
SYS_MODULE_INDEX i2cDriverModuleIndex;	Identifies data module (I2C) driver ID for control interface of CODEC
uint32_t samplingRate;	Sampling rate
uint8_t volume;	Volume

Description

AK7755 Driver Initialization Data

This data type defines the data required to initialize or reinitialize the AK7755 Codec Driver.

Remarks

None.

DRV_AK7755_INT_EXT_MIC Enumeration

Identifies the Mic input source.

File

drv_ak7755.h

C

```
typedef enum {
  INT_MIC,
  EXT_MIC
} DRV_AK7755_INT_EXT_MIC;
```

Description

AK7755 Mic Internal / External Input

This enumeration identifies the Mic input source.

Remarks

None.

DRV_AK7755_LRCK_IF_FORMAT Enumeration

File

drv_ak7755.h

C

```
typedef enum {
  DRV_AK7755_LRCK_IF_STANDARD,
  DRV_AK7755_LRCK_IF_I2S_COMPATIBLE,
  DRV_AK7755_LRCK_IF_PCM_SHORT_FRAME,
  DRV_AK7755_LRCK_IF_PCM_LONG_FRAME
} DRV_AK7755_LRCK_IF_FORMAT;
```

Description

This is type DRV_AK7755_LRCK_IF_FORMAT.

DRV_AK7755_MONO_STEREO_MIC Enumeration

Identifies the Mic input as Mono/Stereo.

File

drv_ak7755.h

C

```
typedef enum {
  ALL_ZEROS,
  MONO_RIGHT_CHANNEL,
  MONO_LEFT_CHANNEL,
  STEREO
} DRV_AK7755_MONO_STEREO_MIC;
```

Description

AK7755 Mic Mono/Stereo Input

This enumeration identifies the Mic input as Mono/Stereo.

Remarks

None.

drv_ak7755_config_template.h	AK7755 Codec Driver configuration template.

Description

This section lists the source and header files used by the AK7755Codec Driver Library.

drv_ak7755.h

AK7755 CODEC Driver Interface header file

Enumerations

	Name	Description
	DRV_AK7755_BICK_FS_FORMAT	This is type DRV_AK7755_BICK_FS_FORMAT.
	DRV_AK7755_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_AK7755_CHANNEL	Identifies left/right audio channel.
	DRV_AK7755_DAC_INPUT_FORMAT	Identifies the Serial Audio data interface format.
	DRV_AK7755_DSP_DIN1_INPUT_FORMAT	This is type DRV_AK7755_DSP_DIN1_INPUT_FORMAT.
	DRV_AK7755_DSP_DOUT1_OUTPUT_FORMAT	This is type DRV_AK7755_DSP_DOUT1_OUTPUT_FORMAT.
	DRV_AK7755_DSP_DOUT4_OUTPUT_FORMAT	This is type DRV_AK7755_DSP_DOUT4_OUTPUT_FORMAT.
	DRV_AK7755_DSP_PROGRAM	This is type DRV_AK7755_DSP_PROGRAM.
	DRV_AK7755_INT_EXT_MIC	Identifies the Mic input source.
	DRV_AK7755_LRCK_IF_FORMAT	This is type DRV_AK7755_LRCK_IF_FORMAT.
	DRV_AK7755_MONO_STEREO_MIC	Identifies the Mic input as Mono/Stereo.

Functions

	Name	Description
	DRV_AK7755_BufferAddRead	Schedule a non-blocking driver read operation.
	DRV_AK7755_BufferAddWrite	Schedule a non-blocking driver write operation.
	DRV_AK7755_BufferAddWriteRead	This is function DRV_AK7755_BufferAddWriteRead.
	DRV_AK7755_BufferEventHandlerSet	This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.
	DRV_AK7755_Close	Closes an opened-instance of the AK7755 Codec Driver.
	DRV_AK7755_CommandEventHandlerSet	Allows a client to identify a command event handling function for the driver to call back when the last submitted command have finished.
	DRV_AK7755_Deinitialize	Deinitializes the specified instance of the AK7755 Codec Driver module.
	DRV_AK7755_Initialize	Initializes hardware and data for the instance of the AK7755 DAC module
	DRV_AK7755_IntExtMicSet	Sets up the codec for the internal or the external microphone use.
	DRV_AK7755_MonoStereoMicSet	Sets up the codec for the Mono or Stereo microphone mode.
	DRV_AK7755_MuteOff	Disables AK7755 output for soft mute.
	DRV_AK7755_MuteOn	Allows AK7755 output for soft mute on.
	DRV_AK7755_Open	Opens the specified AK7755 Codec Driver instance and returns a handle to it
	DRV_AK7755_SamplingRateGet	This function gets the sampling rate set on the AK7755. **Implementation:** Dynamic
	DRV_AK7755_SamplingRateSet	This function sets the sampling rate of the media stream.
	DRV_AK7755_Status	Gets the current status of the AK7755 Codec Driver module.
	DRV_AK7755_Tasks	Maintains the driver's control and data interface state machine.
	DRV_AK7755_VersionGet	Returns the version of the AK7755 Codec Driver.
	DRV_AK7755_VersionStrGet	This function returns the version of AK7755 Codec Driver in string format.
	DRV_AK7755_VolumeGet	Gets the volume for the AK7755 Codec Driver.
	DRV_AK7755_VolumeSet	This function sets the volume for AK7755 CODEC.

Macros

	Name	Description
	_DRV_AK7755_H	Include files.
	DRV_AK7755_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_AK7755_COUNT	Number of valid AK7755 Codec Driver indices
	DRV_AK7755_INDEX_0	AK7755 driver index definitions
	DRV_AK7755_INDEX_1	This is macro DRV_AK7755_INDEX_1.
	DRV_AK7755_INDEX_2	This is macro DRV_AK7755_INDEX_2.
	DRV_AK7755_INDEX_3	This is macro DRV_AK7755_INDEX_3.
	DRV_AK7755_INDEX_4	This is macro DRV_AK7755_INDEX_4.
	DRV_AK7755_INDEX_5	This is macro DRV_AK7755_INDEX_5.
	DRV_I2C_INDEX	This is macro DRV_I2C_INDEX.

Structures

	Name	Description
	DRV_AK7755_INIT	Defines the data required to initialize or reinitialize the AK7755 Codec Driver.

Types

	Name	Description
	DRV_AK7755_BUFFER_EVENT_HANDLER	Pointer to a AK7755 Driver Buffer Event handler function.
	DRV_AK7755_BUFFER_HANDLE	Handle identifying a write buffer passed to the driver.
	DRV_AK7755_COMMAND_EVENT_HANDLER	Pointer to a AK7755 Codec Driver command event handler function.

Description

AK7755 CODEC Driver Interface

The AK7755 CODEC device driver interface provides a simple interface to manage the AK7755 16/24-Bit Codec that can be interfaced Microchip Microcontroller. This file provides the interface definition for the AK7755 Codec device driver.

File Name

drv_ak7755.h

Company

Microchip Technology Inc.

drv_ak7755_config_template.h

AK7755 Codec Driver configuration template.

Macros

	Name	Description
	DRV_AK7755_BCLK_BIT_CLK_DIVISOR	Sets up the BCLK to LRCK ratio to generate the audio stream for the specified sampling frequency.
	DRV_AK7755_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_AK7755_INPUT_REFCLOCK	Identifies the input REFCLOCK source to generate the MCLK to the codec.
	DRV_AK7755_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_AK7755_MCLK_SAMPLE_FREQ_MULTPLIER	Sets up the MCLK to LRCK ratio to generate the audio stream for the specified sampling frequency.
	DRV_AK7755_MCLK_SOURCE	Indicates the input clock frequency to generate the MCLK to the codec.

Description

AK7755 Codec Driver Configuration Template

These file provides the list of all the configurations that can be used with the driver. This file should not be included in the driver.

File Name

drv_ak7755_config_template.h

Comparator Driver Library

This section describes the Comparator Driver Library.

Introduction

The Comparator Static Driver provides a high-level interface to manage the Comparator module on the Microchip family of microcontrollers.

Description

Through MHC, this driver provides an API to initialize the Comparator module, as well as reference channels, CVREF, inputs, and interrupts.

Library Interface

Function(s)

	Name	Description
	DRV_CMP_Initialize	Initializes the Comparator instance for the specified driver index. **Implementation:** Static

Description

This section describes the Application Programming Interface (API) functions of the Comparator Driver Library.

Function(s)

DRV_CMP_Initialize Function

Initializes the Comparator instance for the specified driver index.

Implementation: Static

File

help_drv_cmp.h

C

```
void DRV_CMP_Initialize();
```

Returns

None.

Description

This routine initializes the Comparator driver instance for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters. The driver instance index is independent of the Comparator module ID. For example, driver instance 0 can be assigned to Comparator 2.

Remarks

This routine must be called before any other Comparator routine is called. This routine should only be called once during system initialization.

Preconditions

None.

Function

void DRV_CMP_Initialize(void)

CPLD XC2C64A Driver Library

This section describes the CPLD XC2C64A Driver Library.

Introduction

This library provides an interface to manage the CPLD XC2C64A devices on Microchip starter kits.

Description

A CPLD is provided on the Multimedia Expansion Board (MEB), which can be used to configure the graphics controller bus interface, SPI channel and Chip Selects used for SPI Flash, the MRF24WBOMA, and the expansion slot. The general I/O inputs are used to change the configuration, which can be done at run-time.

Specific CPLD configuration information is available in the *"Multimedia Expansion Board (MEB) User's Guide"* (DS60001160), which is available from the MEB product page: http://www.microchip.com/Developmenttools/ProductDetails.aspx?PartNO=DM320005

Using the Library

This topic describes the basic architecture of the CPLD XC2C64A Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_xc2c64a.h`

The interface to the CPLD XC2C64A Driver Library is defined in the `drv_xc2c64a.h` header file. Any C language source (`.c`) file that uses the CPLD XC2C64A Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the CPLD XC2C64A Driver.

Library Interface Section	Description
Functions	Provides CPLD XC2C64A initialization and configuration functions.

Configuring the Library

The configuration of the CPLD XC2C64A Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the CPLD XC2C64A Driver. Based on the selections made, the CPLD XC2C64A may support the selected features. These configuration settings will apply to all instances of the CPLD XC2C64A Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Building the Library

This section lists the files that are available in the CPLD XC2C64A Driver Library.

Description

This section list the files that are available in the `/src` folder of the CPLD XC2C64A Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/cpld/xc2c64a`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_xc2c64a.h`	Header file that exports the CPLD XC2C64A Driver API.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/dynamic/drv_xc2c64a.c	Basic CPLD XC2C64A Driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library

Module Dependencies

The CPLD XC2C64A Driver Library is not dependent on other modules.

Library Interface

a) Functions

	Name	Description
	CPLDGetDeviceConfiguration	Returns the selected device. **Implementation:** Static
	CPLDGetGraphicsConfiguration	Returns the selected PMP bus, 8 or 16-bit, interface to the graphics controller. **Implementation:** Static
	CPLDGetSPIConfiguration	Returns the selected SPI Channel. **Implementation:** Static
	CPLDInitialize	Initializes the control I/O to the CPLD and places the CPLD in a known state. **Implementation:** Static
	CPLDSetGraphicsConfiguration	Selects the PMP bus, 8 or 16-bit, interface to the graphic controller. **Implementation:** Static
	CPLDSetSPIFlashConfiguration	Selects the SPI Flash device. **Implementation:** Static
	CPLDSetWiFiConfiguration	Selects the Wi-Fi device. **Implementation:** Static
	CPLDSetZigBeeConfiguration	Selects the ZigBee/MiWi device. **Implementation:** Static

b) Data Types and Constants

	Name	Description
	CPLD_DEVICE_CONFIGURATION	CPLD device configuration.
	CPLD_GFX_CONFIGURATION	CPLD graphics controller PMP bus configuration.
	CPLD_SPI_CONFIGURATION	CPLD SPI channel selection.

Description

This section describes the API functions of the CPLD XC2C64A Driver Library.

Refer to each section for a detailed description.

a) Functions

CPLDGetDeviceConfiguration Function

Returns the selected device.

Implementation: Static

File

drv_xc2c64a.h

C

```
CPLD_DEVICE_CONFIGURATION CPLDGetDeviceConfiguration();
```

Returns

- CPLD_DEVICE_SPI_FLASH - SPI Flash.
- CPLD_DEVICE_WiFi - Zero G 802.11 Wi-Fi.
- CPLD_DEVICE_ZIGBEE - ZigBee/MiWi.

Description

This routine returns the selected CPLD device.

Remarks

None.

Preconditions

The initialization routine, CPLDInitialize, must be called.

Example

```
// Initialize the CPLD
CPLDInitialize();

if(CPLDGetDeviceConfiguration() != CPLD_DEVICE_SPI_FLASH)
{
    // error - not setup as default

}
```

Function

CPLD_DEVICE_CONFIGURATION CPLDGetDeviceConfiguration(void)

CPLDGetGraphicsConfiguration Function

Returns the selected PMP bus, 8 or 16-bit, interface to the graphics controller.

Implementation: Static

File

drv_xc2c64a.h

C

```
CPLD_GFX_CONFIGURATION CPLDGetGraphicsConfiguration();
```

Returns

- CPLD_GFX_CONFIG_8BIT - Graphics controller is configured for 8-bit PMP data bus interface.
- CPLD_GFX_CONFIG_16BIT - Graphics controller is configured for 16-bit PMP data bus interface.

Description

This routine gets the configuration of the PMP, 8 or 16-bit, data bus interface.

Remarks

None.

Preconditions

The initialization routine, CPLDInitialize, must be called.

Example

```
// Initialize the CPLD
CPLDInitialize();

if(CPLDGetGraphicsConfiguration() != CPLD_GFX_CONFIG_8BIT)
{
    // error - not setup as default
}
```

Function

CPLD_GFX_CONFIGURATION CPLDGetGraphicsConfiguration(void)

CPLDGetSPIConfiguration Function

Returns the selected SPI Channel.

Implementation: Static

File

drv_xc2c64a.h

C

```
CPLD_SPI_CONFIGURATION CPLDGetSPIConfiguration();
```

Returns

- CPLD_SPI2A - SPI Channel 2A with chip select PORT G bit 9 and external interrupt 1 or 3
- CPLD_SPI3A - SPI Channel 3A with chip select PORT F bit 12 and change notice 9
- CPLD_SPI2 - SPI Channel 2 with chip select PORT G bit 9 and external interrupt 1 or 3

Description

This routine returns the selected SPI channel.

Remarks

SPI channels 2 and 2A are located on the same pins. SPI channels 2A and 3A are only available on PIC32MX5xx/6xx/7xx series parts.

Preconditions

The initialization routine, CPLDInitialize, must be called.

Example

```
// Initialize the CPLD
CPLDInitialize();

if(CPLDGetSPIConfiguration() != CPLD_SPI2A)
{
    // error - not setup as default

}
```

Function

CPLD_SPI_CONFIGURATION CPLDGetSPIConfiguration(void)

CPLDInitialize Function

Initializes the control I/O to the CPLD and places the CPLD in a known state.

Implementation: Static

File

drv_xc2c64a.h

C

```
void CPLDInitialize();
```

Returns

None.

Description

This routine configures the control I/O and places the CPLD in a known state.

- Graphics Controller Bus - 8-bit PMP data interface.
- SPI Channel - SPI2/SPI2A.

- Chip Select - PORT G bit 9.
- External Interrupt 1 or 3
- Device - SPI Flash.

Remarks

None.

Preconditions

None.

Example

```
// Initialize the CPLD
CPLDInitialize();

// CPLD is configured in the default state
```

Function

void CPLDInitialize(void)

CPLDSetGraphicsConfiguration Function

Selects the PMP bus, 8 or 16-bit, interface to the graphic controller.

Implementation: Static

File

drv_xc2c64a.h

C

```
void CPLDSetGraphicsConfiguration(CPLD_GFX_CONFIGURATION configuration);
```

Returns

None.

Description

This routine sets the configuration pins on the graphics controller to select between an 8 or 16-bit data bus interface.

Remarks

The graphics controller interface configuration must be done before initializing the graphics controller.

Preconditions

The initialization routine, CPLDInitialize, must be called.

Example

Setting the graphics controller to a 16-bit interface

```
// Initialize the CPLD
CPLDInitialize();

// configure the graphics controller for a 16-bit PMP interface.
CPLDSetGraphicsConfiguration(CPLD_GFX_CONFIG_16BIT);
```

Setting the graphics controller to a 8-bit interface

```
// Initialize the CPLD
CPLDInitialize();

// configure the graphics controller for a 8-bit PMP interface.
CPLDSetGraphicsConfiguration(CPLD_GFX_CONFIG_8BIT);
```

Parameters

Parameters	Description
configuration	the type of interface configuration.

Function

void CPLDSetGraphicsConfiguration(CPLD_GFX_CONFIGURATION configuration)

CPLDSetSPIFlashConfiguration Function

Selects the SPI Flash device.

Implementation: Static

File

drv_xc2c64a.h

C

```
void CPLDSetSPIFlashConfiguration(CPLD_SPI_CONFIGURATION configuration);
```

Returns

None.

Description

This routine configures the CPLD to communicate to the SPI Flash device with the selected SPI channel and Chip Select.

Remarks

SPI channels 2 and 2A are located on the same pins. SPI channels 2A and 3A are only available on PIC32MX5xx/6xx/7xx series parts.

Preconditions

The initialization routine, CPLDInitialize, must be called.

Example

Setting CPLD to SPI Flash using SPI channel 2 and chip select PORT G bit 9

```
// Initialize the CPLD
CPLDInitialize();

// configure the SPI Flash to use SPI channel 2 and chip select PORT G bit 9
CPLDSetSPIFlashConfiguration(CPLD_SPI2);
```

Setting CPLD to SPI Flash using SPI channel 2A and chip select PORT G bit 9

```
// Initialize the CPLD
CPLDInitialize();

// configure the SPI Flash to use SPI channel 2A and chip select PORT G bit 9
CPLDSetSPIFlashConfiguration(CPLD_SPI2A);
```

Setting CPLD to SPI Flash using SPI channel 3A and chip select PORT F bit 12

```
// Initialize the CPLD
CPLDInitialize();

// configure the SPI Flash to use SPI channel 3A and chip select PORT F bit 12
CPLDSetSPIFlashConfiguration(CPLD_SPI3A);
```

Parameters

Parameters	Description
configuration	the type of SPI channel used by the SPI Flash device.

Function

void CPLDSetSPIFlashConfiguration(CPLD_SPI_CONFIGURATION configuration)

CPLDSetWiFiConfiguration Function

Selects the Wi-Fi device.

Implementation: Static

File

drv_xc2c64a.h

C

```
void CPLDSetWiFiConfiguration(CPLD_SPI_CONFIGURATION configuration);
```

Returns

None.

Description

This routine configures the CPLD to communicate to the Wi-Fi device with the selected SPI channel, chip select and external interrupt or change notice.

Remarks

SPI channels 2 and 2A are located on the same pins. SPI channels 2A and 3A are only available on PIC32MX5xx/6xx/7xx series parts.

Preconditions

The initialization routine, CPLDInitialize, must be called.

Example

Setting CPLD to Wi-Fi using SPI channel 2, chip select PORT G bit 9 and external interrupt 3

```
// Initialize the CPLD
CPLDInitialize();

// configure the Wi-Fi to use SPI channel 2, chip select PORT G bit 9 and external interrupt 3
CPLDSetWiFiConfiguration(CPLD_SPI2);
```

Setting CPLD to Wi-Fi using SPI channel 2A, chip select PORT G bit 9 and external interrupt 3

```
// Initialize the CPLD
CPLDInitialize();

// configure the Wi-Fi to use SPI channel 2A, chip select PORT G bit 9 and external interrupt 3
CPLDSetWiFiConfiguration(CPLD_SPI2A);
```

Setting CPLD to Wi-Fi using SPI channel 3A, chip select PORT F bit 12 and change notice 9

```
// Initialize the CPLD
CPLDInitialize();

// configure the Wi-Fi to use SPI channel 3A, chip select PORT F bit 12 and change notice 9
CPLDSetWiFiConfiguration(CPLD_SPI3A);
```

Parameters

Parameters	Description
configuration	the type of SPI channel used by the Wi-Fi device.

Function

void CPLDSetWiFiConfiguration(CPLD_SPI_CONFIGURATION configuration)

CPLDSetZigBeeConfiguration Function

Selects the ZigBee/MiWi device.

Implementation: Static

File

drv_xc2c64a.h

C

```
void CPLDSetZigBeeConfiguration(CPLD_SPI_CONFIGURATION configuration);
```

Returns

None.

Description

This routine configures the CPLD to communicate to the ZigBee/MiWi device with the selected SPI channel, chip select and external interrupt or change notice.

Remarks

SPI channels 2 and 2A are located on the same pins. SPI channels 2A and 3A are only available on PIC32MX5xx/6xx/7xx series parts.

Preconditions

The initialization routine, CPLDInitialize, must be called.

Example

Setting CPLD to ZigBee/MiWi using SPI channel 2, chip select PORT G bit 9 and external interrupt 3

```
// Initialize the CPLD
CPLDInitialize();

// configure the ZigBee/MiWi to use SPI channel 2, chip select PORT G bit 9 and external interrupt 3
CPLDSetZigBeeConfiguration(CPLD_SPI2);
```

Setting CPLD to ZigBee/MiWi using SPI channel 2A, chip select PORT G bit 9 and external interrupt 3

```
// Initialize the CPLD
CPLDInitialize();

// configure the ZigBee/MiWi to use SPI channel 2A, chip select PORT G bit 9 and external interrupt 3
CPLDSetZigBeeConfiguration(CPLD_SPI2A);
```

Setting CPLD to ZigBee/MiWi using SPI channel 3A, chip select PORT F bit 12 and change notice 9

```
// Initialize the CPLD
CPLDInitialize();

// configure the ZigBee/MiWi to use SPI channel 3A, chip select PORT F bit 12 and change notice 9
CPLDSetZigBeeConfiguration(CPLD_SPI3A);
```

Parameters

Parameters	Description
configuration	the type of SPI channel used by the ZigBee/MiWi device.

Function

void CPLDSetZigBeeConfiguration(CPLD_SPI_CONFIGURATION configuration)

b) Data Types and Constants

CPLD_DEVICE_CONFIGURATION Enumeration

CPLD device configuration.

File

drv_xc2c64a.h

C

```
typedef enum {
  CPLD_DEVICE_SPI_FLASH,
  CPLD_DEVICE_WiFi,
  CPLD_DEVICE_ZIGBEE
} CPLD_DEVICE_CONFIGURATION;
```

Members

Members	Description
CPLD_DEVICE_SPI_FLASH	SPI Flash
CPLD_DEVICE_WiFi	Zero G Wi-Fi
CPLD_DEVICE_ZIGBEE	ZigBee/MiWi

Description

The CPLD can be configured to communicate to three different devices. The application may call routine, CPLDGetDeviceConfiguration, to obtain what device the CPLD is configured to communicate with.

Remarks

None.

Example

```
// select 16-bit PMP data bus
if(CPLDGetDeviceConfiguration() != CPLD_DEVICE_SPI_FLASH)
{
    // error - not default configuration
}
```

CPLD_GFX_CONFIGURATION Enumeration

CPLD graphics controller PMP bus configuration.

File

drv_xc2c64a.h

C

```
typedef enum {
  CPLD_GFX_CONFIG_8BIT,
  CPLD_GFX_CONFIG_16BIT
} CPLD_GFX_CONFIGURATION;
```

Members

Members	Description
CPLD_GFX_CONFIG_8BIT	Configure the Graphics Controller to use 8-bit PMP data bus
CPLD_GFX_CONFIG_16BIT	Configure the Graphics Controller to use 16-bit PMP data bus

Description

The application can select what PMP bus configuration, 8 or 16-bit data bus, when interfacing with the graphics controller.

Remarks

None.

Example

```
// select 16-bit PMP data bus
CPLDSetGraphicsConfiguration(CPLD_GFX_CONFIG_16BIT);
```

CPLD_SPI_CONFIGURATION Enumeration

CPLD SPI channel selection.

File

drv_xc2c64a.h

C

```
typedef enum {
  CPLD_SPI2A,
  CPLD_SPI3A,
  CPLD_SPI2
} CPLD_SPI_CONFIGURATION;
```

Members

Members	Description
CPLD_SPI2A	PIC32 SPI Channel 2A and chip select PORT G bit 9
CPLD_SPI3A	PIC32 SPI Channel 3A and chip select PORT F bit 12
CPLD_SPI2	PIC32 SPI Channel 2 and chip select PORT G bit 9

Description

The application can select what SPI channel will be used as the communication interface. It will also select the Chip Select use for the device.

Remarks

Only one SPI channel can be select for a device. SPI channels 2 and 2A are located on the same pins. SPI channels 2A and 3A are only available on PIC32MX5xx/6xx/7xx series devices.

Example

```
// select SPI channel two for SPI Flash
CPLDSetSPIFlashConfiguration(CPLD_SPI2);
```

Description

CUPLD Controller Interface File.

This library provides a low-level abstraction of the CUPLD device. It can be used to simplify low-level access to the device without the necessity of interacting directly with the communication module's registers, thus hiding differences from one serial device variant to another.

File Name

drv_xc2c64a.h

ENC28J60 Driver Library Help

This section provides information on the ENC28J60 Driver Library.

Introduction

This library provides a driver-level abstraction of the ENC28J60 integrated Ethernet MAC and 10Base-T PHY that can be connected to the PIC32. The driver implements the virtual MAC driver model that the MPLAB Harmony TCP/IP Stack requires. Please see the TCP/IP Stack Library MAC Driver Module for details.

The "Host-To-Network"_layer of a TCP/IP stack organization covers the Data Link and Physical Layers of the standard OSI stack. The Ethernet Controller provides the Data Link or Media Access Control Layer, in addition to other functions discussed in this section.

Description

The ENC28J60 External MAC and PHY is an external module to the PIC32 that is connected through a Serial Peripheral Interface (SPI). This driver interfaces with the SPI driver to communicate with the external device to implement a complete Ethernet node in a system.

The following are some of the key features of this module:

- Supports 10 Mbps physical-to-physical layer Ethernet data transfer
- Full-Duplex and Half-Duplex operation
- Broadcast, Multicast and Unicast packets
- Hardware flow control for both Full and Half-Duplex mode
- Fully configurable interrupts
- Configurable receive packet filtering using:
- 64-bit Hash Table
- 64-byte Pattern Match
- Magic Packet™ Filtering
- Supports Packet Payload Checksum calculation
- CRC Check
- Supports SPI interface

Using the Library

This topic describes the basic architecture and functionality of the software driver for the ENC28J60 stand-alone Ethernet Controller with SPI, and is meant for advanced users or TCP/IP stack driver developers.

Description

The user of this driver is the MPLAB Harmony TCP/IP stack. This Ethernet driver is not intended as a system-wide driver that the application or other system modules may use. It is intended for the sole use of the MPLAB Harmony TCP/IP stack and implements the virtual MAC model required by the stack.

Interface Header File: `drv_enc28j60.h`

The interface to the ENC28J60 Driver Library is defined in the `drv_enc28j60.h` header file. Any C language source (`.c`) file that uses the ENC28J60 Driver Library should include `drv_enc28j60.h`.

Library File: The ENC28J60 Driver Library archive (`.a`) file is installed with MPLAB Harmony.

Please refer to the Understanding MPLAB Harmony section for how the driver interacts with the framework.

Abstraction Model

The ENC28J60 Driver Library provides the low-level abstraction of the communications protocol to communicate to the ENC28J60 external MAC though the SPI peripheral on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the ENC28J60 Driver Library interface.

Description

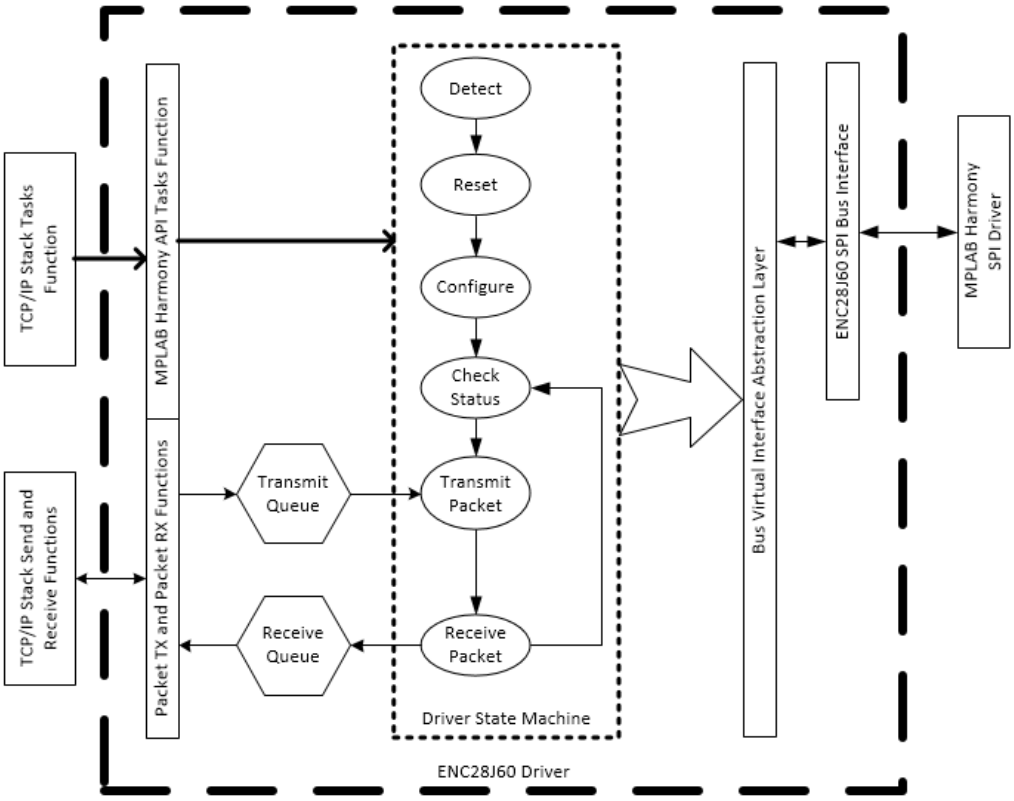
The ENC28J60 Driver library has several different layers to it, as illustrated in the following figure. The interface layer has two main sections that are used the most often: The Tasks function, and the TCP/IP Send and Receive functions.

The Tasks function manages the internal state machine which detects, resets, and then configures the ENC28J60 External MAC. It also handles the monitoring of the hardware status, sending and receiving packets.

The TCP/IP Send and Receive functions interact with the RAM-based queue of packets that are queued to send and packets that have been queued waiting for pick-up by the stack.

The main state machine does not interface directly to the SPI bus, but instead, interfaces to a virtual bus abstraction layer that allows for the replacement of the specific underlying bus implementation.

Abstraction Model



Library Overview

Refer to the section Driver Overview for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each sub-section addresses one of the blocks or the overall operation of the ENC28J60 Driver Library.

Library Interface Section	Description
System Interaction Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Data Transfer Functions	Provides data transfer functions available in the configuration.
Status Functions	Provides status functions.
Miscellaneous Functions	Provides miscellaneous driver functions.

How the Library Works

The library provides interfaces to support the TCP/IP virtual MAC interface.

Configuring the SPI Driver

This section describes the configuration settings for the ENC28J60 Driver Library.

Description

Configuration

The ENC hardware requires a specific configuration of the SPI driver to work correctly. Inside the MHC SPI Driver configuration be sure to select:

- Run the SPI at frequencies of at least 8 MHz
- Clock mode of DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_FALL
- Input phase of SPI_INPUT_SAMPLING_PHASE_AT_END

Recommended Settings

- Interrupt Driver mode
- Enhanced Buffer mode
- DMA mode enabled:
- DMA block transfer size of at least 1600 bytes
- Size of DMA buffer for dummy data of at least 1600 bytes
- Ensure when setting up DMA in interrupt mode that the DMA interrupts are a higher priority than the SPI Driver interrupt

Example:

```
/*** SPI Driver Static Allocation Options ***/
#define DRV_SPI_INSTANCES_NUMBER           1
#define DRV_SPI_CLIENTS_NUMBER             1
#define DRV_SPI_ELEMENTS_PER_QUEUE         30

/*** SPI Driver DMA Options ***/
#define DRV_SPI_DMA_TXFER_SIZE             2048
#define DRV_SPI_DMA_DUMMY_BUFFER_SIZE      2048

/* SPI Driver Instance 0 Configuration */
#define DRV_SPI_SPI_ID_IDX0              SPI_ID_1
#define DRV_SPI_TASK_MODE_IDX0           DRV_SPI_TASK_MODE_ISR
#define DRV_SPI_SPI_MODE_IDX0            DRV_SPI_MODE_MASTER
#define DRV_SPI_ALLOW_IDLE_RUN_IDX0      false
#define DRV_SPI_SPI_PROTOCOL_TYPE_IDX0   DRV_SPI_PROTOCOL_TYPE_STANDARD
#define DRV_SPI_SPI_PROTOCOL_TYPE_IDX0   DRV_SPI_PROTOCOL_TYPE_STANDARD
#define DRV_SPI_COMM_WIDTH_IDX0          SPI_COMMUNICATION_WIDTH_8BITS
#define DRV_SPI_SPI_CLOCK_IDX0           CLK_BUS_PERIPHERAL_2
#define DRV_SPI_BAUD_RATE_IDX0           13333333
#define DRV_SPI_BUFFER_TYPE_IDX0         DRV_SPI_BUFFER_TYPE_ENHANCED
#define DRV_SPI_CLOCK_MODE_IDX0          DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_FALL
#define DRV_SPI_INPUT_PHASE_IDX0         SPI_INPUT_SAMPLING_PHASE_AT_END
#define DRV_SPI_TX_INT_SOURCE_IDX0       INT_SOURCE_SPI_1_TRANSMIT
#define DRV_SPI_RX_INT_SOURCE_IDX0       INT_SOURCE_SPI_1_RECEIVE
#define DRV_SPI_ERROR_INT_SOURCE_IDX0    INT_SOURCE_SPI_1_ERROR
#define DRV_SPI_INT_VECTOR_IDX0          INT_VECTOR_SPI1
#define DRV_SPI_INT_PRIORITY_IDX0        INT_PRIORITY_LEVEL1
#define DRV_SPI_INT_SUB_PRIORITY_IDX0    INT_SUBPRIORITY_LEVEL0
#define DRV_SPI_QUEUE_SIZE_IDX0          30
#define DRV_SPI_RESERVED_JOB_IDX0        1
#define DRV_SPI_TX_DMA_CHANNEL_IDX0      DMA_CHANNEL_1
#define DRV_SPI_TX_DMA_THRESHOLD_IDX0    16
#define DRV_SPI_RX_DMA_CHANNEL_IDX0      DMA_CHANNEL_0
#define DRV_SPI_RX_DMA_THRESHOLD_IDX0    16 Driver Library
```

Configuring the Library

Macros

	Name	Description
	DRV_ENC28J60_CLIENT_INSTANCES	Selects the maximum number of clients.
	DRV_ENC28J60_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.

Description

The configuration of the ENC28J60 Driver Library is based on the file `sys_config.h`.

This header file contains the configuration selection for the ENC28J60 Driver Library. Based on the selections made, the ENC28J60 Driver Library may support the selected features. These configuration settings will apply to all instances of the ENC28J60 Driver Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_ENC28J60_CLIENT_INSTANCES Macro

Selects the maximum number of clients.

File

drv_enc28j60_config_template.h

C

```
#define DRV_ENC28J60_CLIENT_INSTANCES 1
```

Description

enc28j60 maximum number of clients

This definition selects the maximum number of clients that the enc28j60 driver can support at run-time.

Remarks

Mandatory definition.

DRV_ENC28J60_INSTANCES_NUMBER Macro

Selects the maximum number of hardware instances that can be supported by the dynamic driver.

File

drv_enc28j60_config_template.h

C

```
#define DRV_ENC28J60_INSTANCES_NUMBER 1
```

Description

enc28j60 hardware instance configuration

This definition selects the maximum number of hardware instances that can be supported by the dynamic driver.

Remarks

Mandatory definition.

Building the Library

This section lists the files that are available in the ENC28J60 Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/enc28j60`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source Folder Name	Description
`/drv_enc28j60.h`	This file provides the interface definitions of the ENC28J60 Driver.

Required File(s)

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

All of the required files listed in the following table are automatically loaded into the MPLAB X IDE project by the MHC.

Source Folder Name	Description
`/src/dynamic/drv_drv_enc28j60_api.c`	This file contains the API function implementations.
`/src/dynamic/drv_enc28j60_main_state.c`	This file contains the main state machine functions.
`/src/dynamic/drv_enc28j60_utils.c`	This file contains functions that are used throughout the driver.
`/src/dynamic/bus/spi/drv_enc28j60_spi_bus.c`	This file contains the functions to interface with the SPI bus.

/src/dynamic/closed_state/drv_enc28j60_closed_state.c	This file contains the functions for handling the driver closed state.
/src/dynamic/initialization_state/drv_enc28j60_configure_state.c	This file contains the functions for configuring the ENC hardware.
/src/dynamic/initialization_state/drv_enc28j60_detect_state.c	This file contains the functions for detecting the ENC hardware.
/src/dynamic/initialization_state/drv_enc28j60_initialization_state.c	This file contains the functions for the initialization state machine.
/src/dynamic/initialization_state/drv_enc28j60_reset_state.c	This file contains the functions for resetting the ENC hardware.
/src/dynamic/packet/drv_enc28j60_rx_packet.c	This file contains the functions for receiving a packet from the ENC hardware.
/src/dynamic/packet/drv_enc28j60_tx_packet.c	This file contains the functions for sending a packet to the ENC hardware.
/src/dynamic/running_state/drv_enc28j60_change_duplex_state.c	This file contains the functions for configuring the duplex mode of the ENC hardware.
/src/dynamic/running_state/drv_enc28j60_check_int_state.c	This file contains the functions for checking and processing the ENC hardware interrupts.
/src/dynamic/running_state/drv_enc28j60_check_status_state.c	This file contains the functions for checking the status of the ENC hardware.
/src/dynamic/running_state/drv_enc28j60_check_tx_status_state.c	This file contains the functions for checking the status of a transmitted packet.
/src/dynamic/running_state/drv_enc28j60_running_state.c	This file contains the functions for managing the running state machine.
/src/dynamic/running_state/drv_enc28j60_reset_rx_state.c	This file contains the functions for managing the RX state machine reset requirement during run-time.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source Folder Name	Description
N/A	No optional files exist for this library.

Module Dependencies

The ENC28J60 Driver Library depends on the following modules:

- SPI Driver Library
- TCP/IP Stack Library
- TCP/IP Stack MAC Driver Module

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_ENC28J60_Deinitialize	Deinitializes the ENC28J60 Driver Instance. **Implementation:** Dynamic
	DRV_ENC28J60_Initialize	Initializes the ENC28J60 Driver Instance, with the configuration data. **Implementation:** Dynamic
	DRV_ENC28J60_Process	Additional processing that happens outside the tasks function. **Implementation:** Dynamic
	DRV_ENC28J60_Reinitialize	Reinitializes the instance of the ENC28J60 driver. **Implementation:** Dynamic
	DRV_ENC28J60_SetMacCtrlInfo	This function sets the MAC control information for the driver. **Implementation:** Dynamic
	DRV_ENC28J60_StackInitialize	This function initializes the driver with a TCPIP_MAC_INIT object. **Implementation:** Dynamic

	DRV_ENC28J60_Tasks	Main task function for the driver. **Implementation:** Dynamic

b) Client Level Functions

	Name	Description
	DRV_ENC28J60_Close	Closes a client handle to the driver. **Implementation:** Dynamic
	DRV_ENC28J60_ConfigGet	Gets the current configuration. **Implementation:** Dynamic
	DRV_ENC28J60_LinkCheck	This function returns the status of the link. **Implementation:** Dynamic
	DRV_ENC28J60_Open	This function is called by the client to open a handle to a driver instance. **Implementation:** Dynamic
	DRV_ENC28J60_ParametersGet	Get the parameters of the device. **Implementation:** Dynamic
	DRV_ENC28J60_PowerMode	This function sets the power mode of the device. **Implementation:** Dynamic
	DRV_ENC28J60_RegisterStatisticsGet	Get the register statistics. **Implementation:** Dynamic
	DRV_ENC28J60_StatisticsGet	Retrieve the devices statistics. **Implementation:** Dynamic
	DRV_ENC28J60_Status	Gets the current status of the driver. **Implementation:** Dynamic

c) Receive Functions

	Name	Description
	DRV_ENC28J60_PacketRx	Receive a packet from the driver. **Implementation:** Dynamic
	DRV_ENC28J60_RxFilterHashTableEntrySet	This function adds an entry to the hash table. **Implementation:** Dynamic

d) Transmit Functions

	Name	Description
	DRV_ENC28J60_PacketTx	This function queues a packet for transmission. **Implementation:** Dynamic

e) Event Functions

	Name	Description
	DRV_ENC28J60_EventAcknowledge	Acknowledges an event. **Implementation:** Dynamic
	DRV_ENC28J60_EventMaskSet	Sets the event mask. **Implementation:** Dynamic
	DRV_ENC28J60_EventPendingGet	Gets the current events. **Implementation:** Dynamic

f) Data Types and Constants

	Name	Description
	_DRV_ENC28J60_Configuration	Defines the data required to initialize or reinitialize the ENC28J60 Driver.
	DRV_ENC28J60_Configuration	Defines the data required to initialize or reinitialize the ENC28J60 Driver.
	DRV_ENC28J60_MDIX_TYPE	Defines the enumeration for controlling the MDIX select.
	DRV_ENC28J60_MACObject	ENC28J60 External MAC Virtualization Table

Description

This section describes the Application Programming Interface (API) functions of the ENC28J60 Driver Library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_ENC28J60_Deinitialize Function

Deinitializes the ENC28J60 Driver Instance.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
void DRV_ENC28J60_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

ENC28J60 Deinitialization

This function deallocates any resources allocated by the initialization function.

Preconditions

The driver had to be successfully initialized with DRV_ENC28J60_Initialize.

Parameters

Parameters	Description
Object	the valid object returned from DRV_ENC28J60_Initialize

DRV_ENC28J60_Initialize Function

Initializes the ENC28J60 Driver Instance, with the configuration data.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
SYS_MODULE_OBJ DRV_ENC28J60_Initialize(SYS_MODULE_INDEX index, SYS_MODULE_INIT * init);
```

Returns

- Valid handle to the driver instance - If successful
- SYS_MODULE_OBJ_INVALID - If unsuccessful

Description

ENC28J60 Initialization

This function initializes the ENC28J60 Driver with configuration data passed into it by either the system_init function or by the DRV_ENC28J60_StackInitialize function. Calling this function alone is not enough to initialize the driver, DRV_ENC28J60_SetMacCtrlInfo must be called with valid data before the driver is ready to be opened.

Preconditions

None.

Parameters

Parameters	Description
index	This is the index of the driver instance to be initialized. The definition DRV_ENC28J60_NUM_DRV_INSTANCES controls how many instances are available.
init	This is a pointer to a DRV_ENC28J60_CONFIG structure.

DRV_ENC28J60_Process Function

Additional processing that happens outside the tasks function.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
TCPIP_MAC_RES DRV_ENC28J60_Process(DRV_HANDLE hMac);
```

Returns

- TCPIP_MAC_RES_TYPE_ERR - if the hMac is invalid
- TCPIP_MAC_RES_OP_ERR - if the hMac is valid

Description

ENC28J60 Process

This function does additional processing that is not done inside the tasks function.

Remarks

This function does nothing in the first release.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle

DRV_ENC28J60_Reinitialize Function

Reinitializes the instance of the ENC28J60 driver.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
void DRV_ENC28J60_Reinitialize(SYS_MODULE_OBJ object, const SYS_MODULE_INIT * const init);
```

Returns

None

Description

ENC28J60 Reinitialization

This function will deinitialize and initialize the driver instance. As with DRV_ENC28J60_Initialize DRV_ENC28J60_SetMacCtrlInfo must be called for the driver to be useful.

Remarks

This function is not planned to be implemented for the first release.

Preconditions

The driver had to be successfully initialized with DRV_ENC28J60_Initialize.

DRV_ENC28J60_SetMacCtrlInfo Function

This function sets the MAC control information for the driver.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
void DRV_ENC28J60_SetMacCtrlInfo(SYS_MODULE_OBJ object, TCPIP_MAC_MODULE_CTRL * init);
```

Returns

None.

Description

ENC28J60 Set MAC Control Information

This function is used to pass in the TCPIP_MAC_CONTROL_INIT information that is used for allocation and deallocation of memory, event signaling, etc. This function is needed to be called so that the driver can enter initialization state when the tasks function is called.

Preconditions

The driver had to be successfully initialized with ENC28J60_Initialize.

DRV_ENC28J60_StackInitialize Function

This function initializes the driver with a TCPIP_MAC_INIT object.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
SYS_MODULE_OBJ DRV_ENC28J60_StackInitialize(SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

Returns a valid handle to the driver instance - If successful SYS_MODULE_OBJ_INVALID - If unsuccessful

Description

ENC28J60 Stack Initialization

This function is used by the TCP/IP stack to fully initialize the driver with both the ENC28J60 specific configuration and the MAC control information. With this function there is no need to call DRV_ENC28J60_SetMacCtrlInfo.

Preconditions

None.

Parameters

Parameters	Description
index	This is the index of the driver instance to be initialized. The definition DRV_ENC28J60_NUM_DRV_INSTANCES controls how many instances are available.
init	This is a pointer to a TCPIP_MAC_INIT structure.

DRV_ENC28J60_Tasks Function

Main task function for the driver.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
void DRV_ENC28J60_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

ENC28J60 Tasks

This function will execute the main state machine for the ENC28J60 driver.

Preconditions

The driver had to be successfully initialized with DRV_ENC28J60_Initialize.

Parameters

Parameters	Description
object	The object valid passed back to DRV_ENC28J60_Initialize

b) Client Level Functions

DRV_ENC28J60_Close Function

Closes a client handle to the driver.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
void DRV_ENC28J60_Close(DRV_HANDLE handle);
```

Returns

None.

Description

ENC28J60 Close

This function closes a handle to the driver. If it is the last client open, the driver will send an RX Disable command to the ENC hardware and move to the closed state.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
handle	The successfully opened handle

DRV_ENC28J60_ConfigGet Function

Gets the current configuration.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
size_t DRV_ENC28J60_ConfigGet(DRV_HANDLE hMac, void* configBuff, size_t buffSize, size_t* pConfigSize);
```

Returns

Number of bytes copied to the buffer

Description

ENC28J60 Get Configuration

Gets the current configuration.

Remarks

This function does nothing in the first release.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
configBuff	location to copy the configuration too
buffSize	buffer size
pConfigSize	configuration size needed

DRV_ENC28J60_LinkCheck Function

This function returns the status of the link.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
bool DRV_ENC28J60_LinkCheck(DRV_HANDLE hMac);
```

Returns

- true - if the link is active
- false - all other times

Description

ENC28J60 Link Check

This function checks the status of the link and returns it to the caller.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle

DRV_ENC28J60_Open Function

This function is called by the client to open a handle to a driver instance.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
DRV_HANDLE DRV_ENC28J60_Open(SYS_MODULE_INDEX index, DRV_IO_INTENT intent);
```

Returns

Returns a valid handle - If successful INVALID_HANDLE - If unsuccessful

Description

ENC28J60 Open

The client will call this function to open a handle to the driver. When the first instance is opened than the driver will send the RX enabled command to the ENC hardware.

Preconditions

The driver had to be successfully initialized with DRV_ENC28J60_Initialize.

Parameters

Parameters	Description
index	This is the index of the driver instance to be initialized. The definition DRV_ENC28J60_NUM_DRV_INSTANCES controls how many instances are available.

intent	The intent to use when opening the driver. Only exclusive is supported

DRV_ENC28J60_ParametersGet Function

Get the parameters of the device.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
TCPIP_MAC_RES DRV_ENC28J60_ParametersGet(DRV_HANDLE hMac, TCPIP_MAC_PARAMETERS* pMacParams);
```

Returns

- TCPIP_MAC_RES_TYPE_ERR - if the hMac is invalid
- TCPIP_MAC_RES_OK - if the hMac is valid

Description

ENC28J60 Get Parameters

Get the parameters of the device, which includes that it is an Ethernet device and what it's MAC address is. Users of the ENC28J60 must generate a unique MAC address for each controller used.

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
pMacParams	pointer to put the parameters

DRV_ENC28J60_PowerMode Function

This function sets the power mode of the device.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
bool DRV_ENC28J60_PowerMode(DRV_HANDLE hMac, TCPIP_MAC_POWER_MODE pwrMode);
```

Returns

- false - This functionality is not supported in this version of the driver

Description

ENC28J60 Power Mode

This function sets the power mode of the ENC28J60.

Remarks

This functionality is not implemented in the first release.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
pwrMode	the power mode to set

DRV_ENC28J60_RegisterStatisticsGet Function

Get the register statistics.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
TCPIP_MAC_RES DRV_ENC28J60_RegisterStatisticsGet(DRV_HANDLE hMac, TCPIP_MAC_STATISTICS_REG_ENTRY*
pRegEntries, int nEntries, int* pHwEntries);
```

Returns

- TCPIP_MAC_RES_TYPE_ERR - if the hMac is invalid
- TCPIP_MAC_RES_OP_ERR - if the hMac is valid

Description

ENC28J60 Get Register Statistics

Get the device specific statistics.

Remarks

Statistics are not planned for the first release

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
pRegEntries	
nEntries	
pHwEntries	

DRV_ENC28J60_StatisticsGet Function

Retrieve the devices statistics.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
TCPIP_MAC_RES DRV_ENC28J60_StatisticsGet(DRV_HANDLE hMac, TCPIP_MAC_RX_STATISTICS* pRxStatistics,
TCPIP_MAC_TX_STATISTICS* pTxStatistics);
```

Returns

- TCPIP_MAC_RES_TYPE_ERR - if the hMac is invalid
- TCPIP_MAC_RES_OP_ERR - if the hMac is valid

Description

ENC28J60 Get Statistics

Get the current statistics stored in the driver.

Remarks

Statistics are not planned for the first release.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle

DRV_ENC28J60_Status Function

Gets the current status of the driver.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
SYS_STATUS DRV_ENC28J60_Status(SYS_MODULE_OBJ obect);
```

Returns

- SYS_STATUS_ERROR - if an invalid handle has been passed in
- SYS_STATUS_UNINITIALIZED - if the driver has not completed initialization
- SYS_STATUS_BUSY - if the driver is closing and moving to the closed state
- SYS_STATUS_READY - if the driver is ready for client commands

Description

ENC28J60 Status

This function will get the status of the driver instance.

Preconditions

The driver had to be successfully initialized with DRV_ENC28J60_Initialize().

Parameters

Parameters	Description
object	The object valid passed back to DRV_ENC28J60_Initialize()

c) Receive Functions

DRV_ENC28J60_PacketRx Function

Receive a packet from the driver.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
TCPIP_MAC_PACKET* DRV_ENC28J60_PacketRx(DRV_HANDLE hMac, TCPIP_MAC_RES* pRes, const
TCPIP_MAC_PACKET_RX_STAT** ppPktStat);
```

Returns

- Pointer to a valid packet - if successful
- NULL - if unsuccessful

Description

ENC28J60 Receive Packet

This function retrieves a packet from the driver. The packet needs to be acknowledged with the linked acknowledge function so it can be reused.

Remarks

ppPktStat is ignored in the first release.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
pRes	the result of the operation
ppPktStat	pointer to the receive statistics

DRV_ENC28J60_RxFilterHashTableEntrySet Function

This function adds an entry to the hash table.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
TCPIP_MAC_RES DRV_ENC28J60_RxFilterHashTableEntrySet(DRV_HANDLE hMac, TCPIP_MAC_ADDR* DestMACAddr);
```

Returns

- TCPIP_MAC_RES_TYPE_ERR - if the hMac is invalid
- TCPIP_MAC_RES_OP_ERR - if the hMac is valid

Description

ENC28J60 Receive Filter Hash Table Entry Set

This function adds to the MAC's hash table for hash table matching.

Remarks

This functionality is not implemented in the first release.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
DestMACAddr	MAC address to add to the hash table

d) Transmit Functions

DRV_ENC28J60_PacketTx Function

This function queues a packet for transmission.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
TCPIP_MAC_RES DRV_ENC28J60_PacketTx(DRV_HANDLE hMac, TCPIP_MAC_PACKET * ptrPacket);
```

Returns

- TCPIP_MAC_RES_OP_ERR - if the client handle is invalid
- TCPIP_MAC_RES_IS_BUSY - if the driver is not in the run state
- TCPIP_MAC_RES_QUEUE_TX_FULL - if there are no free descriptors
- TCPIP_MAC_RES_OK - on successful queuing of the packet

Description

ENC28J60 Packet Transmit

This function will take a packet and add it to the queue for transmission. When the packet has finished transmitting the driver will call the packets acknowledge function. When that acknowledge function is complete the driver will forget about the packet.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
ptrPacket	pointer to the packet

e) Event Functions

DRV_ENC28J60_EventAcknowledge Function

Acknowledges an event.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
bool DRV_ENC28J60_EventAcknowledge(DRV_HANDLE hMac, TCPIP_MAC_EVENT macEvents);
```

Returns

- true - if successful
- false - if not successful

Description

ENC28J60 Acknowledge Event

This function acknowledges an event.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
macEvents	the events to acknowledge

DRV_ENC28J60_EventMaskSet Function

Sets the event mask.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
bool DRV_ENC28J60_EventMaskSet(DRV_HANDLE hMac, TCPIP_MAC_EVENT macEvents, bool enable);
```

Returns

- true - if the mask could be set
- false - if the mast could not be set

Description

ENC28J60 Set Event Mask

Sets the event mask to what is passed in.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
macEvents	the mask to enable or disable
enable	to enable or disable events

DRV_ENC28J60_EventPendingGet Function

Gets the current events.

Implementation: Dynamic

File

drv_enc28j60.h

C

```
TCPIP_MAC_EVENT DRV_ENC28J60_EventPendingGet(DRV_HANDLE hMac);
```

Returns

- TCPIP_MAC_EV_NONE - Returned on an error
- List of events - Returned on event other than an error

Description

ENC28J60 Get Events

This function gets the current events.

Preconditions

The client had to be successfully opened with DRV_ENC28J60_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle

f) Data Types and Constants

DRV_ENC28J60_Configuration Structure

Defines the data required to initialize or reinitialize the ENC28J60 Driver.

File

drv_enc28j60.h

C

```
typedef struct _DRV_ENC28J60_Configuration {
  uint16_t txDescriptors;
  uint16_t rxDescriptors;
  uint16_t rxDescBufferSize;
  SYS_MODULE_INDEX spiDrvIndex;
  uint32_t spiBps;
  uint16_t rxBufferSize;
  uint16_t maxFrameSize;
  PORTS_MODULE_ID spiSSPortModule;
  PORTS_CHANNEL spiSSPortChannel;
```

```
  PORTS_BIT_POS spiSSPortPin;
  bool intEnable;
  PORTS_MODULE_ID intPortModule;
  PORTS_CHANNEL intPortChannel;
  PORTS_BIT_POS intPortPin;
  DRV_ENC28J60_MDIX_TYPE mdixControl;
  PORTS_MODULE_ID mdixPortModule;
  PORTS_CHANNEL mdixPortChannel;
  PORTS_BIT_POS mdixPortPin;
} DRV_ENC28J60_Configuration;
```

Members

Members	Description
uint16_t txDescriptors;	Number of TX Descriptors to Allocate
uint16_t rxDescriptors;	Number of RX Descriptors to Allocate
uint16_t rxDescBufferSize;	Size of the buffer each RX Descriptor will use. Make sure its not smaller than maxFrameSize
SYS_MODULE_INDEX spiDrvIndex;	Index of the SPI driver to use
uint32_t spiBps;	Bus speed to use for the SPI interface. Section 1.0 of the ENC28J60 data sheets says the maximum is 20000000 Hz. It is not recommended to go above this value.
uint16_t rxBufferSize;	The ENC28J60 hardware has a 8 k dram. rxBufferSize defines how much of that memory is used by the rxBuffer
uint16_t maxFrameSize;	The maximum frame size to be supported by the hardware. 1536 is the default
PORTS_MODULE_ID spiSSPortModule;	Port Module of the GPIO pin hooked up to the CS/SS pin of the ENC28J60
PORTS_CHANNEL spiSSPortChannel;	Port Channel of the GPIO pin hooked up to the CS/SS pin of the ENC28J60
PORTS_BIT_POS spiSSPortPin;	Pin position of the GPIO pin hooked up to the CS/SS pin of the ENC28J60
bool intEnable;	Use Interrupts or not.
PORTS_MODULE_ID intPortModule;	Port Module of the GPIO pin hooked up to the INT pin of the ENC28J60
PORTS_CHANNEL intPortChannel;	Port Channel of the GPIO pin hooked up to the INT pin of the ENC28J60
PORTS_BIT_POS intPortPin;	Pin Position of the GPIO pin hooked up to the INT pin of the ENC28J60
DRV_ENC28J60_MDIX_TYPE mdixControl;	To select the control type of the MDIX. This is only needed for hooking up to switches that don't have auto-mdix.
PORTS_MODULE_ID mdixPortModule;	Port Module of the GPIO pin hooked up to the MDIX select pin
PORTS_CHANNEL mdixPortChannel;	Port Channel of the GPIO pin hooked up to the MDIX select pin
PORTS_BIT_POS mdixPortPin;	Pin Position of the GPIO pin hooked up to the MDIX select pin

Description

ENC28J60 Driver Initialization Data

This data type defines the data required to initialize or reinitialize the ENC28J60 driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

DRV_ENC28J60_MDIX_TYPE Enumeration

Defines the enumeration for controlling the MDIX select.

File

drv_enc28j60.h

C

```
typedef enum {
  DRV_ENC28J60_NO_CONTROL = 0,
  DRV_ENC28J60_NORMAL,
  DRV_ENC28J60_REVERSE = 0
} DRV_ENC28J60_MDIX_TYPE;
```

Members

Members	Description
DRV_ENC28J60_NO_CONTROL = 0	No Control
DRV_ENC28J60_NORMAL	Normal MDIX
DRV_ENC28J60_REVERSE = 0	Reverse MDIX

Description

ENC28J60 Driver MDIX Control type

This type defines the enumeration for controlling the MDIX select.

Remarks

None.

DRV_ENC28J60_MACObject Variable

File

drv_enc28j60.h

C

```
const TCPIP_MAC_OBJECT DRV_ENC28J60_MACObject;
```

Description

ENC28J60 External MAC Virtualization Table

Files

Files

Name	Description
drv_enc28j60.h	ENC28J60 Driver interface definition.
drv_enc28j60_config_template.h	enc28j60 Driver configuration definitions template.

Description

drv_enc28j60.h

ENC28J60 Driver interface definition.

Enumerations

	Name	Description
	DRV_ENC28J60_MDIX_TYPE	Defines the enumeration for controlling the MDIX select.

Functions

	Name	Description
	DRV_ENC28J60_Close	Closes a client handle to the driver. **Implementation:** Dynamic
	DRV_ENC28J60_ConfigGet	Gets the current configuration. **Implementation:** Dynamic
	DRV_ENC28J60_Deinitialize	Deinitializes the ENC28J60 Driver Instance. **Implementation:** Dynamic
	DRV_ENC28J60_EventAcknowledge	Acknowledges an event. **Implementation:** Dynamic
	DRV_ENC28J60_EventMaskSet	Sets the event mask. **Implementation:** Dynamic
	DRV_ENC28J60_EventPendingGet	Gets the current events. **Implementation:** Dynamic
	DRV_ENC28J60_Initialize	Initializes the ENC28J60 Driver Instance, with the configuration data. **Implementation:** Dynamic
	DRV_ENC28J60_LinkCheck	This function returns the status of the link. **Implementation:** Dynamic
	DRV_ENC28J60_Open	This function is called by the client to open a handle to a driver instance. **Implementation:** Dynamic

	DRV_ENC28J60_PacketRx	Receive a packet from the driver. **Implementation:** Dynamic
	DRV_ENC28J60_PacketTx	This function queues a packet for transmission. **Implementation:** Dynamic
	DRV_ENC28J60_ParametersGet	Get the parameters of the device. **Implementation:** Dynamic
	DRV_ENC28J60_PowerMode	This function sets the power mode of the device. **Implementation:** Dynamic
	DRV_ENC28J60_Process	Additional processing that happens outside the tasks function. **Implementation:** Dynamic
	DRV_ENC28J60_RegisterStatisticsGet	Get the register statistics. **Implementation:** Dynamic
	DRV_ENC28J60_Reinitialize	Reinitializes the instance of the ENC28J60 driver. **Implementation:** Dynamic
	DRV_ENC28J60_RxFilterHashTableEntrySet	This function adds an entry to the hash table. **Implementation:** Dynamic
	DRV_ENC28J60_SetMacCtrlInfo	This function sets the MAC control information for the driver. **Implementation:** Dynamic
	DRV_ENC28J60_StackInitialize	This function initializes the driver with a TCPIP_MAC_INIT object. **Implementation:** Dynamic
	DRV_ENC28J60_StatisticsGet	Retrieve the devices statistics. **Implementation:** Dynamic
	DRV_ENC28J60_Status	Gets the current status of the driver. **Implementation:** Dynamic
	DRV_ENC28J60_Tasks	Main task function for the driver. **Implementation:** Dynamic

Structures

	Name	Description
	_DRV_ENC28J60_Configuration	Defines the data required to initialize or reinitialize the ENC28J60 Driver.

ENCx24J600 Driver Library Help

This section provides information on the ENCx24J600 Driver Library.

Introduction

This library provides a driver-level abstraction of the ENCx24J600 Ethernet MAC that can be connected to the PIC32. The driver implements the virtual MAC driver model that the MPLAB Harmony TCP/IP Stack requires. Please see the TCP/IP Stack Library MAC Driver Module for details.

The "Host-To-Network"_layer of a TCP/IP stack organization covers the Data Link and Physical Layers of the standard OSI stack. The Ethernet Controller provides the Data Link or Media Access Control Layer, in addition to other functions discussed in this section.

Description

The ENCx24J600 External MAC is an external module to the PIC32 that is connected through a SPI or PSP interface. This driver interfaces with the SPI driver to communicate with the external device to implement a complete Ethernet node in a system.

The following are some of the key features of this module:

- Supports 10/100 Ethernet
- Full-Duplex and Half-Duplex operation
- Broadcast, Multicast and Unicast packets
- Manual and automatic flow control
- Supports Auto-MDIX
- Fully configurable interrupts
- Configurable receive packet filtering using:
- 64-bit Hash Table
- 64-byte Pattern Match
- Magic Packet™ Filtering
- Runt Packet Detection and Filtering
- Supports Packet Payload Checksum calculation
- CRC Check
- Supports SPI interface

Using the Library

This topic describes the basic architecture and functionality of the Ethernet MAC driver and is meant for advanced users or TCP/IP stack driver developers.

Description

The user of this driver is the MPLAB Harmony TCP/IP stack. This Ethernet driver is not intended as a system-wide driver that the application or other system modules may use. It is intended for the sole use of the MPLAB Harmony TCP/IP stack and implements the virtual MAC model required by the stack.

Interface Header File: `drv_encx24j600.h`

The interface to the ENCx24J600 Driver Library is defined in the `drv_encx24j600.h` header file. Any C language source (`.c`) file that uses the ENCx24J600 Driver Library should include `drv_encx24j600.h`.

Library File: The ENCx24J600 Driver Library archive (`.a`) file is installed with MPLAB Harmony.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

The ENCx24J600 Driver Library provides the low-level abstraction of the communications protocol to communicate to the ENCx24J600 external MAC though the SPI peripheral on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the ENCx24J600 Driver Library interface.

Description

The ENCx24J600 Driver library has several different layers to it, as illustrated in the following figure. The interface layer has two main sections that

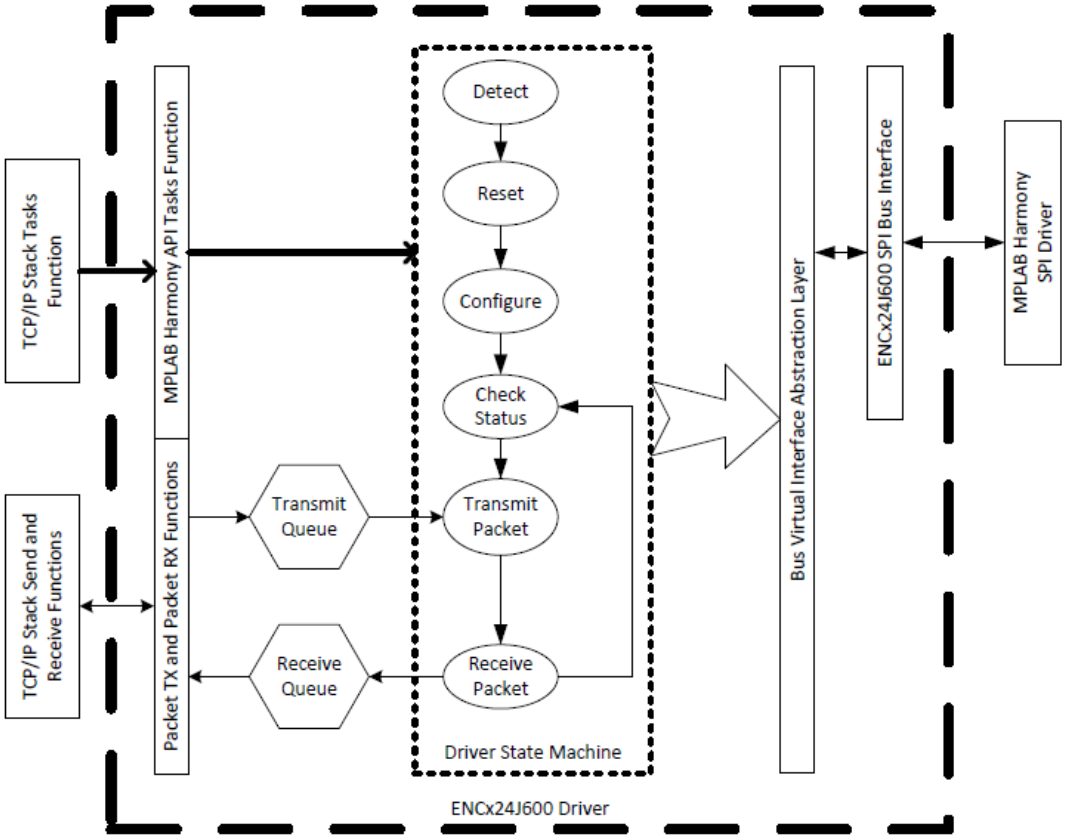
are used the most often: The Tasks function, and the TCP/IP Send and Receive functions.

The Tasks function manages the internal state machine which detects, resets, and then configures the ENCx24J600 External MAC. It also handles the monitoring of the hardware status, sending and receiving packets.

The TCP/IP Send and Receive functions interact with the RAM-based queue of packets that are queued to send and packets that have been queued waiting for pick-up by the stack.

The main state machine does not interface directly to the SPI bus, but instead, interfaces to a virtual bus abstraction layer that allows for the replacement of the specific underlying bus implementation.

Abstraction Model



Library Overview

Refer to the section Driver Overview for how the driver operates in a system.

The library interface routines are divided into various sub-sections, each sub-section addresses one of the blocks or the overall operation of the ENCx24J600 Driver Library.

Library Interface Section	Description
System Interaction Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Data Transfer Functions	Provides data transfer functions available in the configuration.
Status Functions	Provides status functions.
Miscellaneous Functions	Provides miscellaneous driver functions.

How the Library Works

The library provides interfaces to support the TCP/IP virtual MAC interface.

Configuring the SPI Driver

This section describes the configuration settings for the ENCx24J600 Driver Library.

Description

Configuration

The ENC hardware requires a specific configuration of the SPI driver to work correctly. Inside the MHC SPI Driver configuration be sure to select:

- SPI clock rate of 14000000 or less. With a PB clock of 80 MHz, 13333333 is the clock rate.
- Clock mode of DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_FALL
- Input phase of SPI_INPUT_SAMPLING_PHASE_AT_END

Recommended Settings

- Interrupt Driver mode
- Enhanced Buffer mode
- DMA mode enabled:
- DMA block transfer size of at least 1600 bytes
- Size of DMA buffer for dummy data of at least 1600 bytes
- Ensure when setting up DMA in interrupt mode that the DMA interrupts are a higher priority than the SPI Driver interrupt

Example:

```
/*** SPI Driver Static Allocation Options ***/
#define DRV_SPI_INSTANCES_NUMBER           1
#define DRV_SPI_CLIENTS_NUMBER             1
#define DRV_SPI_ELEMENTS_PER_QUEUE         30

/*** SPI Driver DMA Options ***/
#define DRV_SPI_DMA_TXFER_SIZE             2048
#define DRV_SPI_DMA_DUMMY_BUFFER_SIZE      2048

/* SPI Driver Instance 0 Configuration */
#define DRV_SPI_SPI_ID_IDX0              SPI_ID_1
#define DRV_SPI_TASK_MODE_IDX0           DRV_SPI_TASK_MODE_ISR
#define DRV_SPI_SPI_MODE_IDX0            DRV_SPI_MODE_MASTER
#define DRV_SPI_ALLOW_IDLE_RUN_IDX0      false
#define DRV_SPI_SPI_PROTOCOL_TYPE_IDX0   DRV_SPI_PROTOCOL_TYPE_STANDARD
#define DRV_SPI_SPI_PROTOCOL_TYPE_IDX0   DRV_SPI_PROTOCOL_TYPE_STANDARD
#define DRV_SPI_COMM_WIDTH_IDX0          SPI_COMMUNICATION_WIDTH_8BITS
#define DRV_SPI_SPI_CLOCK_IDX0           CLK_BUS_PERIPHERAL_2
#define DRV_SPI_BAUD_RATE_IDX0           13333333
#define DRV_SPI_BUFFER_TYPE_IDX0         DRV_SPI_BUFFER_TYPE_ENHANCED
#define DRV_SPI_CLOCK_MODE_IDX0          DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_FALL
#define DRV_SPI_INPUT_PHASE_IDX0         SPI_INPUT_SAMPLING_PHASE_AT_END
#define DRV_SPI_TX_INT_SOURCE_IDX0       INT_SOURCE_SPI_1_TRANSMIT
#define DRV_SPI_RX_INT_SOURCE_IDX0       INT_SOURCE_SPI_1_RECEIVE
#define DRV_SPI_ERROR_INT_SOURCE_IDX0    INT_SOURCE_SPI_1_ERROR
#define DRV_SPI_INT_VECTOR_IDX0          INT_VECTOR_SPI1
#define DRV_SPI_INT_PRIORITY_IDX0        INT_PRIORITY_LEVEL1
#define DRV_SPI_INT_SUB_PRIORITY_IDX0    INT_SUBPRIORITY_LEVEL0
#define DRV_SPI_QUEUE_SIZE_IDX0          30
#define DRV_SPI_RESERVED_JOB_IDX0        1
#define DRV_SPI_TX_DMA_CHANNEL_IDX0      DMA_CHANNEL_1
#define DRV_SPI_TX_DMA_THRESHOLD_IDX0    16
#define DRV_SPI_RX_DMA_CHANNEL_IDX0      DMA_CHANNEL_0
#define DRV_SPI_RX_DMA_THRESHOLD_IDX0    16 Driver Library
```

Configuring the Library

The configuration of the ENCx24J600 Driver Library is based on the file `sys_config.h`.

This header file contains the configuration selection for the ENCX24J600 Driver Library. Based on the selections made, the ENCx24J600 Driver Library may support the selected features. These configuration settings will apply to all instances of the ENCx24J600 Driver Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Building the Library

This section lists the files that are available in the ENCx24J600 Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/encx24j600`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source Folder Name	Description
/drv_encx24j600.h	This file provides the interface definitions of the ENCx24J600 Driver.

Required File(s)

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

Source Folder Name	Description
/src/dynamic/drv_drv_encx24J600_api.c	This file contains the API function implementations.
/src/dynamic/drv_encx24J600_main_state.c	This file contains the main state machine functions.
/src/dynamic/drv_encx24J600_utils.c	This file contains functions that are used throughout the driver.
/src/dynamic/bus/spi/drv_encx24J600_spi_bus.c	This file contains the functions to interface with the SPI bus.
/src/dynamic/closed_state/drv_encx24J600_closed_state.c	This file contains the functions for handling the driver closed state.
/src/dynamic/initialization_state/drv_encx24J600_configure_state.c	This file contains the functions for configuring the ENC hardware.
/src/dynamic/initialization_state/drv_encx24J600_detect_state.c	This file contains the functions for detecting the ENC hardware.
/src/dynamic/initialization_state/drv_encx24J600_initialization_state.c	This file contains the functions for the initialization state machine.
/src/dynamic/initialization_state/drv_encx24J600_reset_state.c	This file contains the functions for resetting the ENC hardware.
/src/dynamic/packet/drv_encx24J600_rx_packet.c	This file contains the functions for receiving a packet from the ENC hardware.
/src/dynamic/packet/drv_encx24J600_tx_packet.c	This file contains the functions for sending a packet to the ENC hardware.
/src/dynamic/running_state/drv_encx24J600_change_duplex_state.c	This file contains the functions for configuring the duplex mode of the ENC hardware.
/src/dynamic/running_state/drv_encx24J600_check_int_state.c	This file contains the functions for checking and processing the ENC hardware interrupts.
/src/dynamic/running_state/drv_encx24J600_check_status_state.c	This file contains the functions for checking the status of the ENC hardware.
/src/dynamic/running_state/drv_encx24J600_check_tx_status_state.c	This file contains the functions for checking the status of a transmitted packet.
/src/dynamic/running_state/drv_encx24J600_running_state.c	This file contains the functions for managing the running state machine.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source Folder Name	Description
N/A	No optional files exist for this library.

Module Dependencies

The ENCx24J600 Driver Library depends on the following modules:

- SPI Driver Library
- TCP/IP Stack Library
- TCP/IP Stack MAC Driver Module

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_ENCX24J600_Deinitialize	Deinitializes the ENCx24J600 Driver Instance. **Implementation:** Dynamic
	DRV_ENCX24J600_Initialize	Initializes the ENCx24J600 Driver Instance, with the configuration data. **Implementation:** Dynamic
	DRV_ENCX24J600_Reinitialize	Reinitializes the instance of the ENCX24J600 driver. **Implementation:** Dynamic
	DRV_ENCX24J600_Tasks	Main task function for the driver. **Implementation:** Dynamic
	DRV_ENCX24J600_SetMacCtrlInfo	This function sets the MAC control information for the driver. **Implementation:** Dynamic
	DRV_ENCX24J600_StackInitialize	This function initializes the driver with a TCPIP_MAC_INIT object. **Implementation:** Dynamic
	DRV_ENCX24J600_Process	Additional processing that happens outside the tasks function. **Implementation:** Dynamic

b) Client Level Functions

	Name	Description
	DRV_ENCX24J600_Close	Closes a client handle to the driver. **Implementation:** Dynamic
	DRV_ENCX24J600_ConfigGet	Gets the current configuration. **Implementation:** Dynamic
	DRV_ENCX24J600_LinkCheck	This function returns the status of the link. **Implementation:** Dynamic
	DRV_ENCX24J600_Open	This function is called by the client to open a handle to a driver instance. **Implementation:** Dynamic
	DRV_ENCX24J600_ParametersGet	Get the parameters of the device. **Implementation:** Dynamic
	DRV_ENCX24J600_PowerMode	This function sets the power mode of the device. **Implementation:** Dynamic
	DRV_ENCX24J600_RegisterStatisticsGet	Get the register statistics. **Implementation:** Dynamic
	DRV_ENCX24J600_StatisticsGet	Retrieve the devices statistics. **Implementation:** Dynamic
	DRV_ENCX24J600_Status	Gets the current status of the driver. **Implementation:** Dynamic

c) Receive Functions

	Name	Description
	DRV_ENCX24J600_PacketRx	Receive a packet from the driver. **Implementation:** Dynamic
	DRV_ENCX24J600_RxFilterHashTableEntrySet	This function adds an entry to the hash table. **Implementation:** Dynamic

d) Transmit Functions

	Name	Description
	DRV_ENCX24J600_PacketTx	This function queues a packet for transmission. **Implementation:** Dynamic

e) Event Functions

	Name	Description
	DRV_ENCX24J600_EventAcknowledge	Acknowledges an event. **Implementation:** Dynamic
	DRV_ENCX24J600_EventMaskSet	Sets the event mask. **Implementation:** Dynamic
	DRV_ENCX24J600_EventPendingGet	Gets the current events. **Implementation:** Dynamic

f) Data Types and Constants

	Name	Description
	_DRV_ENCX24J600_Configuration	Defines the data required to initialize or reinitialize the ENCX24J600 Driver.
	DRV_ENCX24J600_Configuration	Defines the data required to initialize or reinitialize the ENCX24J600 Driver.
	DRV_ENCX24J600_MDIX_TYPE	Defines the enumeration for controlling the MDIX select.

Description

This section describes the Application Programming Interface (API) functions of the ENCx24J600 Driver Library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_ENCX24J600_Deinitialize Function

Deinitializes the ENCx24J600 Driver Instance.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
void DRV_ENCX24J600_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

ENCX24J600 Deinitialization

This function deallocates any resources allocated by the initialization function.

Preconditions

The driver had to be successfully initialized with DRV_ENCX24J600_Initialize.

Parameters

Parameters	Description
Object	the valid object returned from DRV_ENCX24J600_Initialize

DRV_ENCX24J600_Initialize Function

Initializes the ENCx24J600 Driver Instance, with the configuration data.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
SYS_MODULE_OBJ DRV_ENCX24J600_Initialize(SYS_MODULE_INDEX index, SYS_MODULE_INIT * init);
```

Returns

- Valid handle to the driver instance - If successful
- SYS_MODULE_OBJ_INVALID - If unsuccessful

Description

ENCX24J600 Initialization

This function initializes the ENCx24J600 Driver with configuration data passed into it by either the system_init function or by the DRV_ENCX24J600_StackInitialize function. Calling this function alone is not enough to initialize the driver, DRV_ENCX24J600_SetMacCtrlInfo must be called with valid data before the driver is ready to be opened.

Preconditions

None.

Parameters

Parameters	Description
index	This is the index of the driver instance to be initialized. The definition DRV_ENCX24J600_NUM_DRV_INSTANCES controls how many instances are available.
init	This is a pointer to a DRV_ENX24J600_CONFIG structure.

DRV_ENCX24J600_Reinitialize Function

Reinitializes the instance of the ENCX24J600 driver.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
void DRV_ENCX24J600_Reinitialize(SYS_MODULE_OBJ object, const SYS_MODULE_INIT * const init);
```

Returns

None

Description

ENCX24J600 Reinitialization

This function will deinitialize and initialize the driver instance. As with DRV_ENCX24J600_Initialize DRV_ENCX24J600_SetMacCtrlInfo must be called for the driver to be useful.

Remarks

This function is not planned to be implemented for the first release.

Preconditions

The driver had to be successfully initialized with DRV_ENCX24J600_Initialize.

DRV_ENCX24J600_Tasks Function

Main task function for the driver.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
void DRV_ENCX24J600_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

ENCX24J600 Tasks

This function will execute the main state machine for the ENCX24J600 driver.

Preconditions

The driver had to be successfully initialized with DRV_ENCX24J600_Initialize.

Parameters

Parameters	Description
object	The object valid passed back to DRV_ENCX24J600_Initialize

DRV_ENCX24J600_SetMacCtrlInfo Function

This function sets the MAC control information for the driver.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
void DRV_ENCX24J600_SetMacCtrlInfo(SYS_MODULE_OBJ object, TCPIP_MAC_MODULE_CTRL * init);
```

Returns

None.

Description

ENCX24J600 Set MAC Control Information

This function is used to pass in the TCPIP_MAC_CONTROL_INIT information that is used for allocation and deallocation of memory, event signaling, etc. This function is needed to be called so that the driver can enter initialization state when the tasks function is called.

Preconditions

The driver had to be successfully initialized with DRV_ENCX24J600_Initialize.

DRV_ENCX24J600_StackInitialize Function

This function initializes the driver with a TCPIP_MAC_INIT object.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
SYS_MODULE_OBJ DRV_ENCX24J600_StackInitialize(SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

Returns a valid handle to the driver instance - If successful SYS_MODULE_OBJ_INVALID - If unsuccessful

Description

ENCX24J600 Stack Initialization

This function is used by the TCP/IP stack to fully initialize the driver with both the ENCX24J600 specific configuration and the MAC control information. With this function there is no need to call DRV_ENCX24J600_SetMacCtrlInfo.

Preconditions

None.

Parameters

Parameters	Description
index	This is the index of the driver instance to be initialized. The definition DRV_ENCX24J600_NUM_DRV_INSTANCES controls how many instances are available.
init	This is a pointer to a TCPIP_MAC_INIT structure.

DRV_ENCX24J600_Process Function

Additional processing that happens outside the tasks function.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
TCPIP_MAC_RES DRV_ENCX24J600_Process(DRV_HANDLE hMac);
```

Returns

- TCPIP_MAC_RES_TYPE_ERR - if the hMac is invalid
- TCPIP_MAC_RES_OP_ERR - if the hMac is valid

Description

ENCX24J600 Process

This function does additional processing that is not done inside the tasks function.

Remarks

This function does nothing in the first release.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle

b) Client Level Functions

DRV_ENCX24J600_Close Function

Closes a client handle to the driver.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
void DRV_ENCX24J600_Close(DRV_HANDLE handle);
```

Returns

None.

Description

ENCX24J600 Close

This function closes a handle to the driver. If it is the last client open, the driver will send an RX Disable command to the ENC hardware and move to the closed state.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
handle	The successfully opened handle

DRV_ENCX24J600_ConfigGet Function

Gets the current configuration.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
size_t DRV_ENCX24J600_ConfigGet(DRV_HANDLE hMac, void* configBuff, size_t buffSize, size_t* pConfigSize);
```

Returns

Number of bytes copied to the buffer

Description

ENCX24J600 Get Configuration

Gets the current configuration.

Remarks

This function does nothing in the first release.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
configBuff	location to copy the configuration too
buffSize	buffer size
pConfigSize	configuration size needed

DRV_ENCX24J600_LinkCheck Function

This function returns the status of the link.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
bool DRV_ENCX24J600_LinkCheck(DRV_HANDLE hMac);
```

Returns

- true - if the link is active
- false - all other times

Description

ENCX24J600 Link Check

This function checks the status of the link and returns it to the caller.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle

DRV_ENCX24J600_Open Function

This function is called by the client to open a handle to a driver instance.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
DRV_HANDLE DRV_ENCX24J600_Open(SYS_MODULE_INDEX index, DRV_IO_INTENT intent);
```

Returns

Returns a valid handle - If successful INVALID_HANDLE - If unsuccessful

Description

ENCX24J600 Open

The client will call this function to open a handle to the driver. When the first instance is opened than the driver will send the RX enabled command to the ENC hardware.

Preconditions

The driver had to be successfully initialized with DRV_ENCX24J600_Initialize.

Parameters

Parameters	Description
index	This is the index of the driver instance to be initialized. The definition DRV_ENCX24J600_NUM_DRV_INSTANCES controls how many instances are available.
intent	The intent to use when opening the driver. Only exclusive is supported

DRV_ENCX24J600_ParametersGet Function

Get the parameters of the device.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
TCPIP_MAC_RES DRV_ENCX24J600_ParametersGet(DRV_HANDLE hMac, TCPIP_MAC_PARAMETERS* pMacParams);
```

Returns

- TCPIP_MAC_RES_TYPE_ERR - if the hMac is invalid
- TCPIP_MAC_RES_OK - if the hMac is valid

Description

ENCX24J600 Get Parameters

Get the parameters of the device, which includes that it is an Ethernet device and what it's MAC address is.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
pMacParams	pointer to put the parameters

DRV_ENCX24J600_PowerMode Function

This function sets the power mode of the device.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
bool DRV_ENCX24J600_PowerMode(DRV_HANDLE hMac, TCPIP_MAC_POWER_MODE pwrMode);
```

Returns

- false - This functionality is not supported in this version of the driver

Description

ENCX24J600 Power Mode

This function sets the power mode of the ENCX24J600.

Remarks

This functionality is not implemented in the first release.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
pwrMode	the power mode to set

DRV_ENCX24J600_RegisterStatisticsGet Function

Get the register statistics.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
TCPIP_MAC_RES DRV_ENCX24J600_RegisterStatisticsGet(DRV_HANDLE hMac, TCPIP_MAC_STATISTICS_REG_ENTRY*
pRegEntries, int nEntries, int* pHwEntries);
```

Returns

- TCPIP_MAC_RES_TYPE_ERR - if the hMac is invalid
- TCPIP_MAC_RES_OP_ERR - if the hMac is valid

Description

ENCX24J600 Get Register Statistics

Get the device specific statistics.

Remarks

Statistics are not planned for the first release

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
pRegEntries	

nEntries	
pHwEntries	

DRV_ENCX24J600_StatisticsGet Function

Retrieve the devices statistics.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
TCPIP_MAC_RES DRV_ENCX24J600_StatisticsGet(DRV_HANDLE hMac, TCPIP_MAC_RX_STATISTICS* pRxStatistics,
TCPIP_MAC_TX_STATISTICS* pTxStatistics);
```

Returns

- TCPIP_MAC_RES_TYPE_ERR - if the hMac is invalid
- TCPIP_MAC_RES_OP_ERR - if the hMac is valid

Description

ENCX24J600 Get Statistics

Get the current statistics stored in the driver.

Remarks

Statistics are not planned for the first release.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle

DRV_ENCX24J600_Status Function

Gets the current status of the driver.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
SYS_STATUS DRV_ENCX24J600_Status(SYS_MODULE_OBJ obect);
```

Returns

- SYS_STATUS_ERROR - if an invalid handle has been passed in
- SYS_STATUS_UNINITIALIZED - if the driver has not completed initialization
- SYS_STATUS_BUSY - if the driver is closing and moving to the closed state
- SYS_STATUS_READY - if the driver is ready for client commands

Description

ENCX24J600 Status

This function will get the status of the driver instance.

Preconditions

The driver had to be successfully initialized with DRV_ENCX24J600_Initialize().

Parameters

Parameters	Description
object	The object valid passed back to DRV_ENCX24J600_Initialize()

c) Receive Functions

DRV_ENCX24J600_PacketRx Function

Receive a packet from the driver.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
TCPIP_MAC_PACKET* DRV_ENCX24J600_PacketRx(DRV_HANDLE hMac, TCPIP_MAC_RES* pRes, const
TCPIP_MAC_PACKET_RX_STAT** ppPktStat);
```

Returns

- Pointer to a valid packet - if successful
- NULL - if unsuccessful

Description

ENCX24J600 Receive Packet

This function retrieves a packet from the driver. The packet needs to be acknowledged with the linked acknowledge function so it can be reused.

Remarks

ppPktStat is ignored in the first release.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
pRes	the result of the operation
ppPktStat	pointer to the receive statistics

DRV_ENCX24J600_RxFilterHashTableEntrySet Function

This function adds an entry to the hash table.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
TCPIP_MAC_RES DRV_ENCX24J600_RxFilterHashTableEntrySet(DRV_HANDLE hMac, TCPIP_MAC_ADDR* DestMACAddr);
```

Returns

- TCPIP_MAC_RES_TYPE_ERR - if the hMac is invalid
- TCPIP_MAC_RES_OP_ERR - if the hMac is valid

Description

ENCX24J600 Receive Filter Hash Table Entry Set

This function adds to the MAC's hash table for hash table matching.

Remarks

This functionality is not implemented in the first release.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
DestMACAddr	MAC address to add to the hash table

d) Transmit Functions

DRV_ENCX24J600_PacketTx Function

This function queues a packet for transmission.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
TCPIP_MAC_RES DRV_ENCX24J600_PacketTx(DRV_HANDLE hMac, TCPIP_MAC_PACKET * ptrPacket);
```

Returns

- TCPIP_MAC_RES_OP_ERR - if the client handle is invalid
- TCPIP_MAC_RES_IS_BUSY - if the driver is not in the run state
- TCPIP_MAC_RES_QUEUE_TX_FULL - if there are no free descriptors
- TCPIP_MAC_RES_OK - on successful queuing of the packet

Description

ENCX24J600 Packet Transmit

This function will take a packet and add it to the queue for transmission. When the packet has finished transmitting the driver will call the packets acknowledge function. When that acknowledge function is complete the driver will forget about the packet.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
ptrPacket	pointer to the packet

e) Event Functions

DRV_ENCX24J600_EventAcknowledge Function

Acknowledges an event.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
bool DRV_ENCX24J600_EventAcknowledge(DRV_HANDLE hMac, TCPIP_MAC_EVENT macEvents);
```

Returns

- true - if successful
- false - if not successful

Description

ENCX24J600 Acknowledge Event

This function acknowledges an event.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
macEvents	the events to acknowledge

DRV_ENCX24J600_EventMaskSet Function

Sets the event mask.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
bool DRV_ENCX24J600_EventMaskSet(DRV_HANDLE hMac, TCPIP_MAC_EVENT macEvents, bool enable);
```

Returns

- true - if the mask could be set
- false - if the mast could not be set

Description

ENCX24J600 Set Event Mask

Sets the event mask to what is passed in.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle
macEvents	the mask to enable or disable
enable	to enable or disable events

DRV_ENCX24J600_EventPendingGet Function

Gets the current events.

Implementation: Dynamic

File

drv_encx24j600.h

C

```
TCPIP_MAC_EVENT DRV_ENCX24J600_EventPendingGet(DRV_HANDLE hMac);
```

Returns

- TCPIP_MAC_EV_NONE - Returned on an error
- List of events - Returned on event other than an error

Description

ENCX24J600 Get Events

This function gets the current events.

Preconditions

The client had to be successfully opened with DRV_ENCX24J600_Open.

Parameters

Parameters	Description
hMac	the successfully opened handle

f) Data Types and Constants

DRV_ENCX24J600_Configuration Structure

Defines the data required to initialize or reinitialize the ENCX24J600 Driver.

File

drv_encx24j600.h

C

```
typedef struct _DRV_ENCX24J600_Configuration {
  uint16_t txDescriptors;
  uint16_t rxDescriptors;
  uint16_t rxDescBufferSize;
  SYS_MODULE_INDEX spiDrvIndex;
  uint32_t spiBps;
  uint16_t rxBufferSize;
  uint16_t maxFrameSize;
  PORTS_MODULE_ID spiSSPortModule;
  PORTS_CHANNEL spiSSPortChannel;
  PORTS_BIT_POS spiSSPortPin;
  bool intEnable;
  PORTS_MODULE_ID intPortModule;
  PORTS_CHANNEL intPortChannel;
  PORTS_BIT_POS intPortPin;
  DRV_ENCX24J600_MDIX_TYPE mdixControl;
  PORTS_MODULE_ID mdixPortModule;
  PORTS_CHANNEL mdixPortChannel;
  PORTS_BIT_POS mdixPortPin;
} DRV_ENCX24J600_Configuration;
```

Members

Members	Description
uint16_t txDescriptors;	Number of TX Descriptors to Allocate
uint16_t rxDescriptors;	Number of RX Descriptors to Allocate
uint16_t rxDescBufferSize;	Size of the buffer each RX Descriptor will use. Make sure its not smaller that maxFrameSize
SYS_MODULE_INDEX spiDrvIndex;	Index of the SPI driver to use
uint32_t spiBps;	Bus speed to use for the SPI interface. Section 1.0 of the ENCX24J600 data sheets says the maximum is 14000000 Hz. It is not recommended to go above this value.
uint16_t rxBufferSize;	The ENCX24J600 hardware has a 22 k dram. rxBufferSize defines how much of that memory is used by the rxBuffer
uint16_t maxFrameSize;	The maximum frame size to be supported by the hardware. 1536 is the default
PORTS_MODULE_ID spiSSPortModule;	Port Module of the GPIO pin hooked up to the CS/SS pin of the ENCX24J600
PORTS_CHANNEL spiSSPortChannel;	Port Channel of the GPIO pin hooked up to the CS/SS pin of the ENCX24J600
PORTS_BIT_POS spiSSPortPin;	Pin position of the GPIO pin hooked up to the CS/SS pin of the ENCX24J600
bool intEnable;	Use Interrupts or not.
PORTS_MODULE_ID intPortModule;	Port Module of the GPIO pin hooked up to the INT pin of the ENCX24J600
PORTS_CHANNEL intPortChannel;	Port Channel of the GPIO pin hooked up to the INT pin of the ENCX24J600
PORTS_BIT_POS intPortPin;	Pin Position of the GPIO pin hooked up to the INT pin of the ENCX24J600
DRV_ENCX24J600_MDIX_TYPE mdixControl;	To select the control type of the MDIX. This is only needed for hooking up to switches that don't have auto-mdix.
PORTS_MODULE_ID mdixPortModule;	Port Module of the GPIO pin hooked up to the MDIX select pin
PORTS_CHANNEL mdixPortChannel;	Port Channel of the GPIO pin hooked up to the MDIX select pin
PORTS_BIT_POS mdixPortPin;	Pin Position of the GPIO pin hooked up to the MDIX select pin

Description

ENCX24J600 Driver Initialization Data

This data type defines the data required to initialize or reinitialize the ENCX24J600 driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

DRV_ENCX24J600_MDIX_TYPE Enumeration

Defines the enumeration for controlling the MDIX select.

File

drv_encx24j600.h

C

```
typedef enum {
  DRV_ENCX24J600_NO_CONTROL = 0,
  DRV_ENCX24J600_NORMAL,
  DRV_ENCX24J600_REVERSE = 0
} DRV_ENCX24J600_MDIX_TYPE;
```

Members

Members	Description
DRV_ENCX24J600_NO_CONTROL = 0	No Control
DRV_ENCX24J600_NORMAL	Normal MDIX
DRV_ENCX24J600_REVERSE = 0	Reverse MDIX

Description

ENCX24J600 Driver MDIX Control type

This type defines the enumeration for controlling the MDIX select.

Remarks

None.

Files

Files

Name	Description
drv_encx24j600.h	ENCx24J600 Driver interface definition.

Description

drv_encx24j600.h

ENCx24J600 Driver interface definition.

Enumerations

	Name	Description
	DRV_ENCX24J600_MDIX_TYPE	Defines the enumeration for controlling the MDIX select.

Functions

	Name	Description
	DRV_ENCX24J600_Close	Closes a client handle to the driver. **Implementation:** Dynamic
	DRV_ENCX24J600_ConfigGet	Gets the current configuration. **Implementation:** Dynamic

	DRV_ENCX24J600_Deinitialize	Deinitializes the ENCx24J600 Driver Instance. **Implementation:** Dynamic
	DRV_ENCX24J600_EventAcknowledge	Acknowledges an event. **Implementation:** Dynamic
	DRV_ENCX24J600_EventMaskSet	Sets the event mask. **Implementation:** Dynamic
	DRV_ENCX24J600_EventPendingGet	Gets the current events. **Implementation:** Dynamic
	DRV_ENCX24J600_Initialize	Initializes the ENCx24J600 Driver Instance, with the configuration data. **Implementation:** Dynamic
	DRV_ENCX24J600_LinkCheck	This function returns the status of the link. **Implementation:** Dynamic
	DRV_ENCX24J600_Open	This function is called by the client to open a handle to a driver instance. **Implementation:** Dynamic
	DRV_ENCX24J600_PacketRx	Receive a packet from the driver. **Implementation:** Dynamic
	DRV_ENCX24J600_PacketTx	This function queues a packet for transmission. **Implementation:** Dynamic
	DRV_ENCX24J600_ParametersGet	Get the parameters of the device. **Implementation:** Dynamic
	DRV_ENCX24J600_PowerMode	This function sets the power mode of the device. **Implementation:** Dynamic
	DRV_ENCX24J600_Process	Additional processing that happens outside the tasks function. **Implementation:** Dynamic
	DRV_ENCX24J600_RegisterStatisticsGet	Get the register statistics. **Implementation:** Dynamic
	DRV_ENCX24J600_Reinitialize	Reinitializes the instance of the ENCX24J600 driver. **Implementation:** Dynamic
	DRV_ENCX24J600_RxFilterHashTableEntrySet	This function adds an entry to the hash table. **Implementation:** Dynamic
	DRV_ENCX24J600_SetMacCtrlInfo	This function sets the MAC control information for the driver. **Implementation:** Dynamic
	DRV_ENCX24J600_StackInitialize	This function initializes the driver with a TCPIP_MAC_INIT object. **Implementation:** Dynamic
	DRV_ENCX24J600_StatisticsGet	Retrieve the devices statistics. **Implementation:** Dynamic
	DRV_ENCX24J600_Status	Gets the current status of the driver. **Implementation:** Dynamic
	DRV_ENCX24J600_Tasks	Main task function for the driver. **Implementation:** Dynamic

Structures

	Name	Description
	_DRV_ENCX24J600_Configuration	Defines the data required to initialize or reinitialize the ENCX24J600 Driver.

Ethernet MAC Driver Library

This section describes the Ethernet MAC Driver Library.

Introduction

This library provides a driver-level abstraction of the on-chip Ethernet Controller found on many PIC32 devices. The driver implements the virtual MAC driver model that the MPLAB Harmony TCP/IP Stack requires. Please see the TCP/IP Stack Library MAC Driver Module help for details.

The "Host-To-Network" layer of a TCP/IP stack organization covers the Data Link and Physical Layers of the standard OSI stack. The Ethernet Controller provides the Data Link or Media Access Control Layer, in addition to other functions discussed in this section. An external Ethernet "PHY" provides the Physical layer, providing conversion between the digital and analog.

Description

The PIC32 Ethernet Controller is a bus master module that interfaces with an off-chip PHY to implement a complete Ethernet node in a system. The following are some of the key features of this module:

- Supports 10/100 Ethernet
- Full-Duplex and Half-Duplex operation
- Broadcast, Multicast and Unicast packets
- Manual and automatic flow control
- Supports Auto-MDIX enabled PHYs
- Reduced Media Independent Interface (RMII) and Media Independent Interface (MII) PHY data interfaces
- Performance statistics metrics in hardware.
- RAM descriptor based DMA operation for both receive and transmit path
- Fully configurable interrupts
- Configurable receive packet filtering using:
- 64-bit Hash Table
- 64-byte Pattern Match
- Magic Packet™ Filtering
- Runt Packet Detection and Filtering
- Supports Packet Payload Checksum calculation
- CRC Check

Support for the Serial Management Interface (SMI) (also known as the MIIM interface) is provided by the Ethernet PHY Driver Library.

Using the Library

The user of this driver is the MPLAB Harmony TCP/IP stack. This Ethernet driver is not intended as a system wide driver that the application or other system modules may use. It is intended for the sole use of the MPLAB Harmony TCP/IP stack and implements the virtual MAC model required by the stack.

This topic describes the basic architecture and functionality of the Ethernet MAC driver and is meant for advanced users or TCP/IP stack driver developers.

Interface Header File: `drv_ethmac.h`

The interface to the Ethernet MAC library is defined in the `drv_ethmac.h` header file, which is included by the MPLAB Harmony TCP/IP stack.

Please refer to the What is MPLAB Harmony? section for how the library interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the Ethernet MAC Driver Library on Microchip's microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

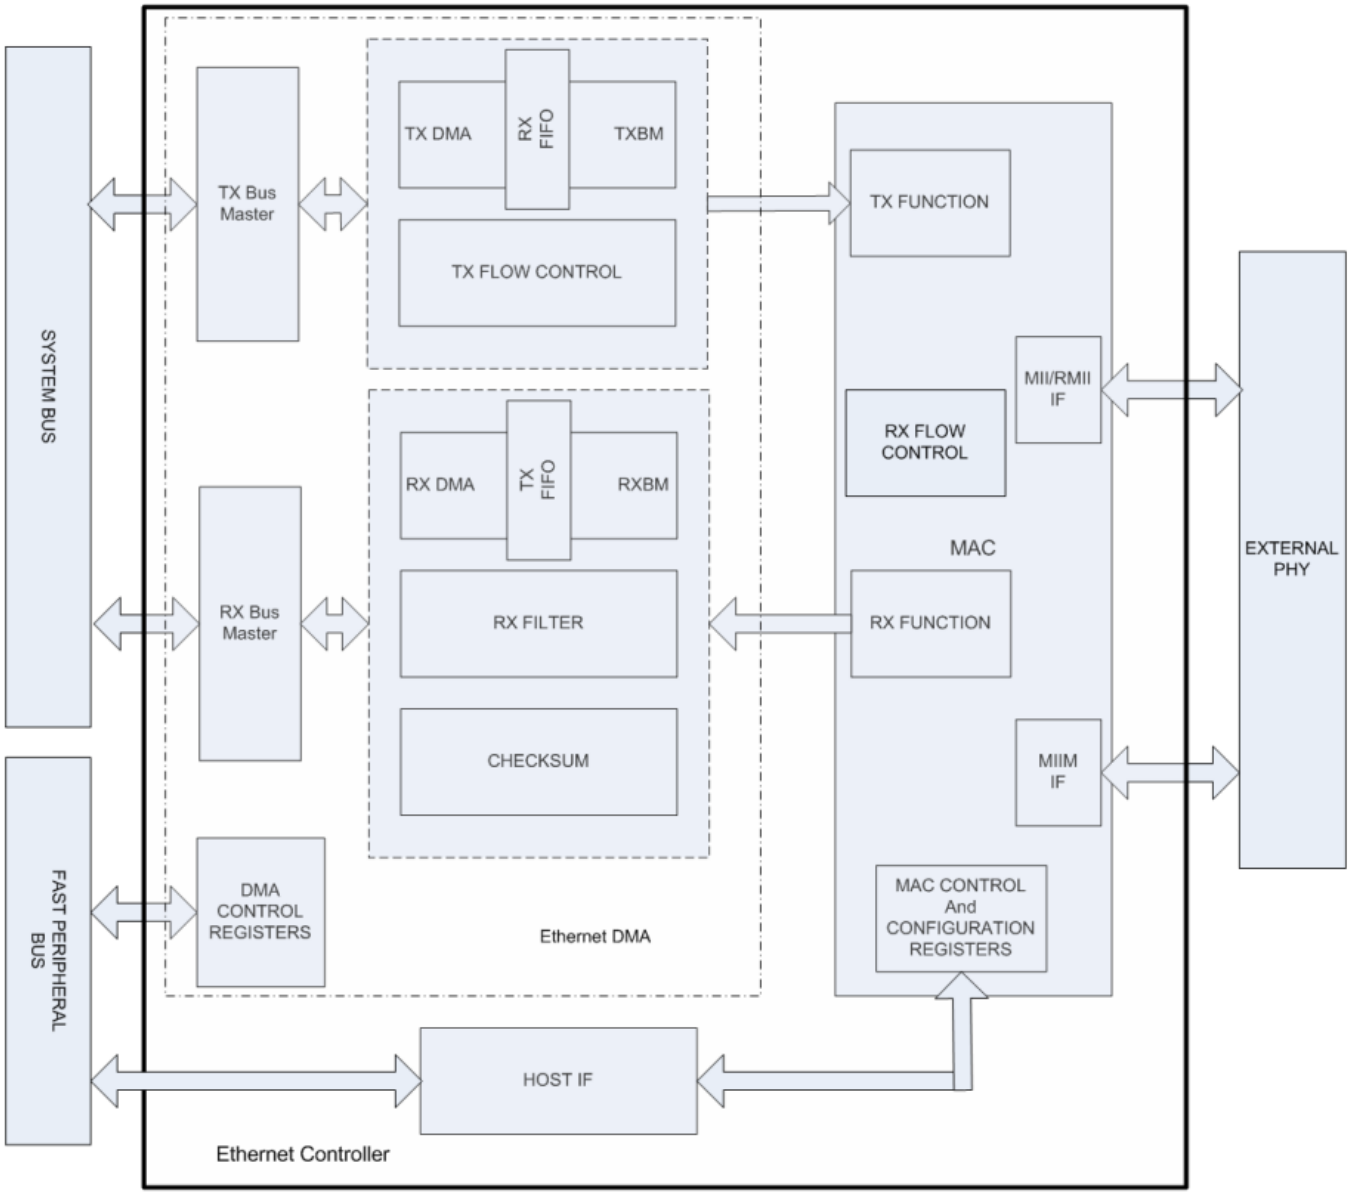
The Ethernet Controller provides the modules needed to implement a 10/100 Mbps Ethernet node using an external Ethernet PHY chip. The PHY chip provides a digital-analog interface as part of the Physical Layer and the controller provides the Media Access Controller (MAC) layer above the PHY.

As shown in Figure 1, the Ethernet Controller consists of the following modules:

- Media Access Control (MAC) block: Responsible for implementing the MAC functions of the Ethernet IEEE 802.3 Specification
- Flow Control (FC) block: Responsible for control of the transmission of PAUSE frames. (Reception of PAUSE frames is handled within the MAC.)
- RX Filter (RXF) block: This module performs filtering on every receive packet to determine whether each packet should be accepted or rejected

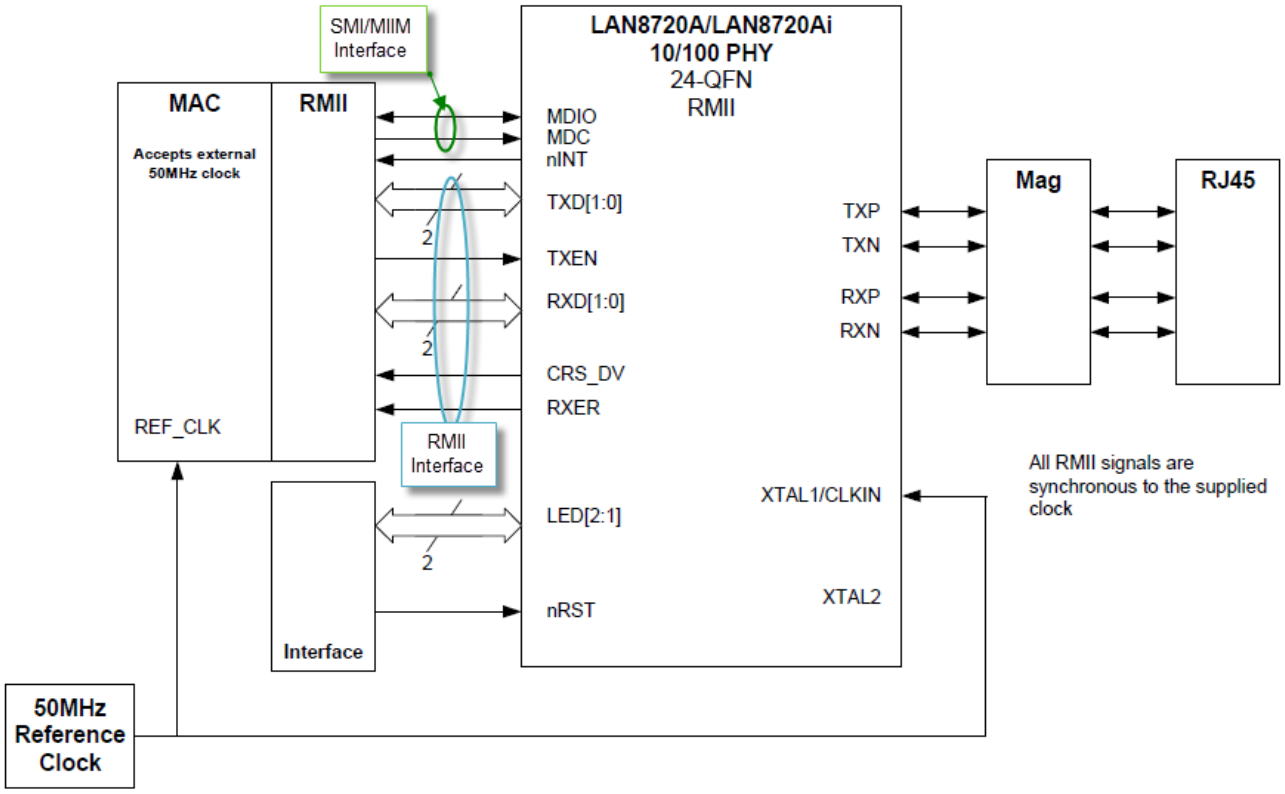
- TX DMA/TX Buffer Management Engine: The TX DMA and TX Buffer Management engines perform data transfers from the memory (using descriptor tables) to the MAC Transmit Interface
- RX DMA/RX Buffer Management Engine: The RX DMA and RX Buffer Management engines transfer receive packets from the MAC to the memory (using descriptor tables)

Figure 1: Ethernet Controller Block Diagram



For completeness, we also need to look at the interface diagram of a representative Ethernet PHY. As shown in Figure 2, the PHY has two interfaces, one for configuring and managing the PHY (SMI/MIIM) and another for transmit and receive data (RMII or MII). The SMI/MIIM interface is the responsibility of the Ethernet PHY Driver Library. When setting up the Ethernet PHY, this Ethernet driver calls primitives from the Ethernet PHY Driver library. The RMII/MII data interface is the responsibility of the Ethernet MAC Driver Library (this library).

Figure 2: Ethernet PHY Interfaces



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system. Refer to the TCP/IP Stack Library MAC Driver Module help for the interface that the Ethernet driver has to implement in a MPLAB Harmony system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Ethernet MAC Driver Library.

Library Interface Section	Description
Client Level Functions	DRV_ETHMAC_PIC32MACOpen, DRV_ETHMAC_PIC32MACClose, and DRV_ETHMAC_PIC32MACSetup to support the TCP/IP Stack. Plus link status and power options.
Receive Functions	Receive routines.
Transmit Functions	Transmit routines.
Event Functions	Ethernet event support routines.
Other Functions	Additional routines.
Data Types and Constants	Typedefs and #defines.

Configuring the Library

Macros

	Name	Description
	DRV_ETHMAC_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_ETHMAC_INDEX	Ethernet MAC static index selection.
	DRV_ETHMAC_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_ETHMAC_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_ETHMAC_INTERRUPT_SOURCE	Defines an override of the interrupt source in case of static driver.
	DRV_ETHMAC_PERIPHERAL_ID	Defines an override of the peripheral ID.
	DRV_ETHMAC_POWER_STATE	Defines an override of the power state of the Ethernet MAC driver.

Description

The configuration of the Ethernet MAC driver is done as part of the MPLAB Harmony TCP/IP Stack configuration and is based on the `system_config.h` file, which may include the `tcpip_mac_config.h`. See the TCP/IP Stack Library MAC Driver Module help file for configuration options.

This header file contains the configuration selection for the Ethernet MAC Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_ETHMAC_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_ethmac_config.h

C

```
#define DRV_ETHMAC_CLIENTS_NUMBER 1
```

Description

Ethernet MAC Maximum Number of Clients

This definition select the maximum number of clients that the Ethernet MAC driver can support at run time.

Remarks

The MAC driver is not a true multi-client driver. Under normal usage, the only client of the MAC driver is the TCP/IP stack. After the MAC driver provided an DRV_HANDLE as a result of an Open operation, any other attempt to call Open will return a invalid handle. Default value should be 1.

However, for allowing other modules to interface directly with the MAC driver while the TCP/IP stack currently uses the the MAC driver this symbol can have a value greater than 1. But the returned handle is the same one as the TCP/IP stack uses.

DRV_ETHMAC_INDEX Macro

Ethernet MAC static index selection.

File

drv_ethmac_config.h

C

```
#define DRV_ETHMAC_INDEX DRV_ETHMAC_INDEX_1
```

Description

Ethernet MAC Static Index Selection

This definition selects the Ethernet MAC static index for the driver object reference

Remarks

This index is required to make a reference to the driver object.

DRV_ETHMAC_INSTANCES_NUMBER Macro

Selects the maximum number of hardware instances that can be supported by the dynamic driver.

File

drv_ethmac_config.h

C

```
#define DRV_ETHMAC_INSTANCES_NUMBER 1
```

Description

Ethernet MAC hardware instance configuration

This definition selects the maximum number of hardware instances that can be supported by the dynamic driver. Not defining it means using a static driver.

Remarks

None.

DRV_ETHMAC_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_ethmac_config.h

C

```
#define DRV_ETHMAC_INTERRUPT_MODE true
```

Description

Ethernet MAC Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of timer operation is desired
- false - Select if polling mode of timer operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

DRV_ETHMAC_INTERRUPT_SOURCE Macro

Defines an override of the interrupt source in case of static driver.

File

drv_ethmac_config.h

C

```
#define DRV_ETHMAC_INTERRUPT_SOURCE INT_SOURCE_ETH_1
```

Description

Ethernet MAC Interrupt Source

Defines an override of the interrupt source in case of static driver.

Remarks

Refer to the INT PLIB document for more information on INT_SOURCE enumeration.

DRV_ETHMAC_PERIPHERAL_ID Macro

Defines an override of the peripheral ID.

File

drv_ethmac_config.h

C

```
#define DRV_ETHMAC_PERIPHERAL_ID ETHMAC_ID_1
```

Description

Ethernet MAC Peripheral ID Selection

Defines an override of the peripheral ID, using macros.

Remarks

Some devices also support ETHMAC_ID_0

DRV_ETHMAC_POWER_STATE Macro

Defines an override of the power state of the Ethernet MAC driver.

File

drv_ethmac_config.h

C

```
#define DRV_ETHMAC_POWER_STATE SYS_MODULE_POWER_IDLE_STOP
```

Description

Ethernet MAC power state configuration

Defines an override of the power state of the Ethernet MAC driver.

Remarks

This feature may not be available in the device or the Ethernet MAC module selected.

Building the Library

This section lists the files that are available in the Ethernet MAC Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/ethmac`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_ethmac.h`	Header file that exports the driver API.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_ethmac.c`	PIC32 internal Ethernet driver virtual MAC implementation file.
`/src/dynamic/drv_ethmac_lib.c`	PIC32 internal Ethernet driver controller implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library

Module Dependencies

The Ethernet MAC Driver Library depends on the following modules:

- Ethernet PHY Driver Library
- Interrupt System Service Library
- Timer System Service Library
- Ethernet Peripheral Library

Library Interface

a) Client Level Functions

	Name	Description
	DRV_ETHMAC_PIC32MACClose	Closes a client instance of the PIC32 MAC Driver. **Implementation:** Dynamic

	DRV_ETHMAC_PIC32MACDeinitialize	Deinitializes the PIC32 Ethernet MAC. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACInitialize	Initializes the PIC32 Ethernet MAC. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACLinkCheck	Checks current link status. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACOpen	Opens a client instance of the PIC32 MAC Driver. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACParametersGet	MAC parameter get function. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACPowerMode	Selects the current power mode for the Ethernet MAC. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACProcess	MAC periodic processing function. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACStatisticsGet	Gets the current MAC statistics. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACStatus	Provides the current status of the MAC driver module. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACConfigGet	Gets the current MAC driver configuration. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACRegisterStatisticsGet	Gets the current MAC hardware statistics registers. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACReinitialize	Reinitializes the PIC32 Ethernet MAC. **Implementation:** Dynamic

b) Receive Functions

	Name	Description
	DRV_ETHMAC_PIC32MACPacketRx	This is the MAC receive function. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet	Sets the current MAC hash table receive filter. **Implementation:** Dynamic

c) Transmit Functions

	Name	Description
	DRV_ETHMAC_PIC32MACPacketTx	MAC driver transmit function. **Implementation:** Dynamic

d) Event Functions

	Name	Description
	DRV_ETHMAC_PIC32MACEventAcknowledge	Acknowledges and re-enables processed events. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACEventMaskSet	Enables/disables the MAC events. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACEventPendingGet	Returns the currently pending events. **Implementation:** Dynamic

e) Other Functions

	Name	Description
	DRV_ETHMAC_Tasks_ISR	Ethernet MAC driver interrupt function. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACTasks	Maintains the EThernet MAC driver's state machine. **Implementation:** Dynamic

f) Data Types and Constants

	Name	Description
	DRV_ETHMAC_INDEX_1	This is macro DRV_ETHMAC_INDEX_1.
	DRV_ETHMAC_INDEX_0	Ethernet driver index definitions.
	DRV_ETHMAC_INDEX_COUNT	Number of valid Ethernet driver indices.

Description

This section lists the interface routines, data types, constants and macros for the library.

a) Client Level Functions

DRV_ETHMAC_PIC32MACClose Function

Closes a client instance of the PIC32 MAC Driver.

Implementation: Dynamic

File

drv_ethmac.h

C

```
void DRV_ETHMAC_PIC32MACClose(DRV_HANDLE hMac);
```

Returns

None

Description

This function closes a client instance of the PIC32 MAC Driver.

Remarks

None

Preconditions

DRV_ETHMAC_PIC32MACOpen() should have been called.

Example

Parameters

Parameters	Description
hMac	valid MAC handle, obtained by a call to DRV_ETHMAC_PIC32MACOpen

Function

void DRV_ETHMAC_PIC32MACClose(DRV_HANDLE hMac)

DRV_ETHMAC_PIC32MACDeinitialize Function

Deinitializes the PIC32 Ethernet MAC.

Implementation: Dynamic

File

drv_ethmac.h

C

```
void DRV_ETHMAC_PIC32MACDeinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function supports teardown of the PIC32 Ethernet MAC (opposite of set up). Used by tcpip_module_manager.

Remarks

This function deinitializes the Ethernet controller, the MAC and the associated PHY. It should be called to be release any resources allocated by the initialization and return the MAC and the PHY to the idle/power down state.

Preconditions

DRV_ETHMAC_PIC32MACInitialize must have been called to set up the driver.

Example

Function

void DRV_ETHMAC_PIC32MACDeinitialize(SYS_MODULE_OBJ object);

DRV_ETHMAC_PIC32MACInitialize Function

Initializes the PIC32 Ethernet MAC.

Implementation: Dynamic

File

drv_ethmac.h

C

```
SYS_MODULE_OBJ DRV_ETHMAC_PIC32MACInitialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const
init);
```

Returns

- a valid handle to a driver object, if successful.
- SYS_MODULE_OBJ_INVALID if initialization failed.

Description

This function supports the initialization of the PIC32 Ethernet MAC. Used by tcpip_module_manager.

Remarks

This function initializes the Ethernet controller, the MAC and the associated PHY. It should be called to be able to schedule any Ethernet transmit or receive operation.

Preconditions

None

Example

Function

SYS_MODULE_OBJ DRV_ETHMAC_PIC32MACInitialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);

DRV_ETHMAC_PIC32MACLinkCheck Function

Checks current link status.

Implementation: Dynamic

File

drv_ethmac.h

C

```
bool DRV_ETHMAC_PIC32MACLinkCheck(DRV_HANDLE hMac);
```

Returns

- true - If the link is up
- false - If the link is not up

Description

This function checks the link status of the associated network interface.

Remarks

The function will automatically perform a MAC reconfiguration if the link went up after being down and the PHY auto negotiation is enabled.

Preconditions

DRV_ETHMAC_PIC32MACInitialize must have been called to set up the driver. DRV_ETHMAC_PIC32MACOpen() should have been called to

obtain a valid handle.

Example

Parameters

Parameters	Description
hMac	Ethernet MAC client handle

Function

bool DRV_ETHMAC_PIC32MACLinkCheck(DRV_HANDLE hMac)

DRV_ETHMAC_PIC32MACOpen Function

Opens a client instance of the PIC32 MAC Driver.

Implementation: Dynamic

File

drv_ethmac.h

C

```
DRV_HANDLE DRV_ETHMAC_PIC32MACOpen(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

- DRV_HANDLE - handle (pointer) to MAC client
- 0 if call failed

Description

This function opens a client instance of the PIC32 MAC Driver. Used by tcpip_module_manager.

Remarks

The intent parameter is not used in the current implementation and is maintained only for compatibility with the generic driver Open function signature.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called.

Example

Function

DRV_HANDLE DRV_ETHMAC_PIC32MACOpen(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);

DRV_ETHMAC_PIC32MACParametersGet Function

MAC parameter get function.

Implementation: Dynamic

File

drv_ethmac.h

C

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACParametersGet(DRV_HANDLE hMac, TCPIP_MAC_PARAMETERS* pMacParams);
```

Returns

- TCPIP_MAC_RES_OK if pMacParams updated properly
- a TCPIP_MAC_RES error code if processing failed for some reason

Description

MAC Parameter Get function TCPIP_MAC_RES DRV_ETHMAC_PIC32MACParametersGet(DRV_HANDLE hMac, TCPIP_MAC_PARAMETERS* pMacParams);

This is a function that returns the run time parameters of the MAC driver.

Remarks

None.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

DRV_ETHMAC_PIC32MACPowerMode Function

Selects the current power mode for the Ethernet MAC.

Implementation: Dynamic

File

drv_ethmac.h

C

```
bool DRV_ETHMAC_PIC32MACPowerMode(DRV_HANDLE hMac, TCPIP_MAC_POWER_MODE pwrMode);
```

Returns

- true if the call succeeded.
- false if the call failed

Description

This function sets the power mode for the Ethernet MAC.

Remarks

This function is not currently supported by the Ethernet MAC and will always return true.

Preconditions

DRV_ETHMAC_PIC32MACInitialize must have been called to set up the driver. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

Function

bool DRV_ETHMAC_PIC32MACPowerMode(DRV_HANDLE hMac, TCPIP_MAC_POWER_MODE pwrMode)

DRV_ETHMAC_PIC32MACProcess Function

MAC periodic processing function.

Implementation: Dynamic

File

drv_ethmac.h

C

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACProcess(DRV_HANDLE hMac);
```

Returns

- TCPIP_MAC_RES_OK if all processing went on OK
- a TCPIP_MAC_RES error code if processing failed for some reason

Description

This is a function that allows for internal processing by the MAC driver. It is meant for processing that cannot be done from within ISR.

Normally this function will be called in response to an TX and/or RX event signaled by the driver. This is specified by the MAC driver at initialization time using TCPIP_MAC_MODULE_CTRL.

Remarks

- The MAC driver may use the DRV_ETHMAC_PIC32MACProcess() for:
- Processing its pending TX queues
- RX buffers replenishing functionality. If the number of packets in the RX queue falls below a specified limit, the MAC driver may use this

function to allocate some extra RX packets. Similarly, if there are too many allocated RX packets, the MAC driver can free some of them.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

Parameters

Parameters	Description
hMac	Ethernet MAC client handle

Function

TCPIP_MAC_RES DRV_ETHMAC_PIC32MACProcess(DRV_HANDLE hMac);

DRV_ETHMAC_PIC32MACStatisticsGet Function

Gets the current MAC statistics.

Implementation: Dynamic

File

drv_ethmac.h

C

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACStatisticsGet(DRV_HANDLE hMac, TCPIP_MAC_RX_STATISTICS* pRxStatistics,
TCPIP_MAC_TX_STATISTICS* pTxStatistics);
```

Returns

- TCPIP_MAC_RES_OK if all processing went on OK.
- TCPIP_MAC_RES_OP_ERR error code if function not supported by the driver.

Description

This function will get the current value of the statistic counters maintained by the MAC driver.

Remarks

- The reported values are info only and change dynamically.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

Function

TCPIP_MAC_RES DRV_ETHMAC_PIC32MACStatisticsGet(DRV_HANDLE hMac, TCPIP_MAC_RX_STATISTICS* pRxStatistics, TCPIP_MAC_TX_STATISTICS* pTxStatistics);

DRV_ETHMAC_PIC32MACStatus Function

Provides the current status of the MAC driver module.

Implementation: Dynamic

File

drv_ethmac.h

C

```
SYS_STATUS DRV_ETHMAC_PIC32MACStatus(SYS_MODULE_OBJ object);
```

Returns

- SYS_STATUS_READY - Indicates that any previous module operation for the specified module has completed
- SYS_STATUS_BUSY - Indicates that a previous module operation for the specified module has not yet completed
- SYS_STATUS_ERROR - Indicates that the specified module is in an error state

Description

This function provides the current status of the MAC driver module.

Remarks

None.

Preconditions

The DRV_ETHMAC_PIC32MACInitialize function must have been called before calling this function.

Example

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_ETHMAC_PIC32MACInitialize

Function

SYS_STATUS DRV_ETHMAC_PIC32MACStatus (SYS_MODULE_OBJ object)

DRV_ETHMAC_PIC32MACConfigGet Function

Gets the current MAC driver configuration.

Implementation: Dynamic

File

drv_ethmac.h

C

```
size_t DRV_ETHMAC_PIC32MACConfigGet(DRV_HANDLE hMac, void* configBuff, size_t buffSize, size_t*
pConfigSize);
```

Returns

- number of bytes copied into the supplied storage buffer

Description

This function will get the current MAC driver configuration and store it into a supplied buffer.

Remarks

- None

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

Function

size_t DRV_ETHMAC_PIC32MACConfigGet(DRV_HANDLE hMac, void* configBuff, size_t buffSize, size_t* pConfigSize);

DRV_ETHMAC_PIC32MACRegisterStatisticsGet Function

Gets the current MAC hardware statistics registers.

Implementation: Dynamic

File

drv_ethmac.h

C

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACRegisterStatisticsGet(DRV_HANDLE hMac, TCPIP_MAC_STATISTICS_REG_ENTRY*
pRegEntries, int nEntries, int* pHwEntries);
```

Returns

- TCPIP_MAC_RES_OK if all processing went on OK.
- TCPIP_MAC_RES_OP_ERR error code if function not supported by the driver.

Description

This function will get the current value of the statistic registers of the associated MAC controller.

Remarks

- The reported values are info only and change dynamically.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

Function

TCPIP_MAC_RES DRV_ETHMAC_PIC32MACRegisterStatisticsGet(DRV_HANDLE hMac, TCPIP_MAC_STATISTICS_REG_ENTRY* pRegEntries, int nEntries, int* pHwEntries);

DRV_ETHMAC_PIC32MACReinitialize Function

Reinitializes the PIC32 Ethernet MAC.

Implementation: Dynamic

File

drv_ethmac.h

C

```
void DRV_ETHMAC_PIC32MACReinitialize(SYS_MODULE_OBJ object, const SYS_MODULE_INIT * const init);
```

Returns

None.

Description

This function supports re-initialization of the PIC32 Ethernet MAC (opposite of set up).

Remarks

This function is not supported yet.

Preconditions

DRV_ETHMAC_PIC32MACInitialize must have been called to set up the driver.

Example

Function

void DRV_ETHMAC_PIC32MACReinitialize(SYS_MODULE_OBJ object, const SYS_MODULE_INIT * const init);

b) Receive Functions

DRV_ETHMAC_PIC32MACPacketRx Function

This is the MAC receive function.

Implementation: Dynamic

File

drv_ethmac.h

C

```
TCPIP_MAC_PACKET* DRV_ETHMAC_PIC32MACPacketRx(DRV_HANDLE hMac, TCPIP_MAC_RES* pRes, const
TCPIP_MAC_PACKET_RX_STAT** ppPktStat);
```

Returns

- a valid pointer to an available RX packet
- 0 if no packet pending/available

Description

This function will return a packet if such a pending packet exists.

Additional information about the packet is available by providing the pRes and ppPktStat fields.

Remarks

- Once a pending packet is available in the MAC driver internal RX queues this function will dequeue the packet and hand it over to the MAC driver's client - i.e., the stack - for further processing.
- The flags for a RX packet are updated by the MAC driver:
- TCPIP_MAC_PKT_FLAG_RX will be set
- TCPIP_MAC_PKT_FLAG_UNICAST is set if that packet is a unicast packet
- TCPIP_MAC_PKT_FLAG_BCAST is set if that packet is a broadcast packet
- TCPIP_MAC_PKT_FLAG_MCAST is set if that packet is a multicast packet
- TCPIP_MAC_PKT_FLAG_QUEUED is set
- TCPIP_MAC_PKT_FLAG_SPLIT is set if the packet has multiple data segments
- The MAC driver dequeues and return to the caller just one single packet. That is the packets are not chained.
- The packet buffers are allocated by the Ethernet MAC driver itself, Once the higher level layers in the stack are done with processing the RX packet, they have to call the corresponding packet acknowledgment function that tells the MAC driver that it can resume control of that packet.
- Once the stack modules are done processing the RX packets and the acknowledge function is called the MAC driver will reuse the RX packets.
- The MAC driver may use the DRV_ETHMAC_PIC32MACProcess() for obtaining new RX packets if needed.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

Function

TCPIP_MAC_PACKET* DRV_ETHMAC_PIC32MACPacketRx (DRV_HANDLE hMac, TCPIP_MAC_RES* pRes, const TCPIP_MAC_PACKET_RX_STAT** ppPktStat);

DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet Function

Sets the current MAC hash table receive filter.

Implementation: Dynamic

File

drv_ethmac.h

C

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet(DRV_HANDLE hMac, TCPIP_MAC_ADDR* DestMACAddr);
```

Returns

- TCPIP_MAC_RES_OK if success
- a TCPIP_MAC_RES error value if failed

Description

This function sets the MAC hash table filtering to allow packets sent to DestMACAddr to be received. It calculates a CRC-32 using polynomial 0x4C11DB7 over the 6 byte MAC address and then, using bits 28:23 of the CRC, will set the appropriate bits in the hash table filter registers (ETHHT0-ETHHT1).

The function will enable/disable the Hash Table receive filter if needed.

Remarks

- Sets the appropriate bit in the ETHHT0/1 registers to allow packets sent to DestMACAddr to be received and enabled the Hash Table receive filter.
- There is no way to individually remove destination MAC addresses from the hash table since it is possible to have a hash collision and therefore multiple MAC addresses relying on the same hash table bit.
- A workaround is to have the stack store each enabled MAC address and to perform the comparison at run time.

- A call to DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet() using a 00-00-00-00-00-00 destination MAC address, which will clear the entire hash table and disable the hash table filter. This will allow the receive of all packets, regardless of their destination

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

Function

TCPIP_MAC_RES DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet(DRV_HANDLE hMac, TCPIP_MAC_ADDR* DestMACAddr)

c) Transmit Functions

DRV_ETHMAC_PIC32MACPacketTx Function

MAC driver transmit function.

Implementation: Dynamic

File

drv_ethmac.h

C

```
TCPIP_MAC_RES DRV_ETHMAC_PIC32MACPacketTx(DRV_HANDLE hMac, TCPIP_MAC_PACKET * ptrPacket);
```

Returns

- TCPIP_MAC_RES_OK if success
- a TCPIP_MAC_RES error value if failed

Description

This is the MAC transmit function. Using this function a packet is submitted to the MAC driver for transmission.

Remarks

- The MAC driver supports internal queuing. A packet is rejected only if it's not properly formatted. Otherwise it will be scheduled for transmission and queued internally if needed.
- Once the packet is scheduled for transmission the MAC driver will set the TCPIP_MAC_PKT_FLAG_QUEUED flag so that the stack is aware that this packet is under processing and cannot be modified.
- Once the packet is transmitted, the TCPIP_MAC_PKT_FLAG_QUEUED will be cleared, the proper packet acknowledgment result (ackRes) will be set and the packet acknowledgment function (ackFunc) will be called.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

Function

TCPIP_MAC_RES DRV_ETHMAC_PIC32MACPacketTx(DRV_HANDLE hMac, TCPIP_MAC_PACKET * ptrPacket);

d) Event Functions

DRV_ETHMAC_PIC32MACEventAcknowledge Function

Acknowledges and re-enables processed events.

Implementation: Dynamic

File

drv_ethmac.h

C

```
bool DRV_ETHMAC_PIC32MACEventAcknowledge(DRV_HANDLE hMac, TCPIP_MAC_EVENT tcpAckEv);
```

Returns

- true if events acknowledged
- false if no events to be acknowledged

Description

This function acknowledges and re-enables processed events. Multiple events can be ORed together as they are processed together. The events acknowledged by this function should be the events that have been retrieved from the stack by calling DRV_ETHMAC_PIC32MACEventPendingGet() or have been passed to the stack by the driver using the registered notification handler and have been processed and have to be re-enabled.

Remarks

- All events should be acknowledged, in order to be re-enabled.
- Some events are fatal errors and should not be acknowledged (TCPIP_MAC_EV_RX_BUSERR, TCPIP_MAC_EV_TX_BUSERR). Driver/stack re-initialization is needed under such circumstances.
- Some events are just system/application behavior and they are intended only as simple info (TCPIP_MAC_EV_RX_OVFLOW, TCPIP_MAC_EV_RX_BUFNA, TCPIP_MAC_EV_TX_ABORT, TCPIP_MAC_EV_RX_ACT).
- The TCPIP_MAC_EV_RX_FWMARK and TCPIP_MAC_EV_RX_EWMARK events are part of the normal flow control operation (if auto flow control was enabled). They should be enabled alternatively, if needed.
- The events are persistent. They shouldn't be re-enabled unless they have been processed and the condition that generated them was removed. Re-enabling them immediately without proper processing will have dramatic effects on system performance.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

```
DRV_ETHMAC_PIC32MACEventAcknowledge( hMac, stackNewEvents );
```

Function

bool DRV_ETHMAC_PIC32MACEventAcknowledge(DRV_HANDLE hMac, TCPIP_MAC_EVENT tcpAckEv);

DRV_ETHMAC_PIC32MACEventMaskSet Function

Enables/disables the MAC events.

Implementation: Dynamic

File

drv_ethmac.h

C

```
bool DRV_ETHMAC_PIC32MACEventMaskSet(DRV_HANDLE hMac, TCPIP_MAC_EVENT macEvents, bool enable);
```

Returns

always true, operation succeeded.

Description

This is a function that enables or disables the events to be reported to the Ethernet MAC client (TCP/IP stack).

All events that are to be enabled will be added to the notification process. All events that are to be disabled will be removed from the notification process. The stack has to catch the events that are notified and process them. After that the stack should call DRV_ETHMAC_PIC32MACEventAcknowledge() so that the events can be re-enable

The stack should process at least the following transfer events:

- TCPIP_MAC_EV_RX_PKTPEND
- TCPIP_MAC_EV_RX_DONE
- TCPIP_MAC_EV_TX_DONE

Remarks

- The event notification system enables the user of the TCP/IP stack to call into the stack for processing only when there are relevant events rather than being forced to periodically call from within a loop.

- If the notification events are nil, the interrupt processing will be disabled. Otherwise, the event notification will be enabled and the interrupts relating to the requested events will be enabled.
- Note that once an event has been caught by the stack ISR (and reported if a notification handler is in place) it will be disabled until the DRV_ETHMAC_PIC32MACEventAcknowledge() is called.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

```
DRV_ETHMAC_PIC32MACEventMaskSet( hMac, TCPIP_MAC_EV_RX_OVFLOW | TCPIP_MAC_EV_RX_BUFNA, true );
```

Function

bool DRV_ETHMAC_PIC32MACEventMaskSet(DRV_HANDLE hMac, TCPIP_MAC_EVENT macEvents, bool enable);

DRV_ETHMAC_PIC32MACEventPendingGet Function

Returns the currently pending events.

Implementation: Dynamic

File

drv_ethmac.h

C

```
TCPIP_MAC_EVENT DRV_ETHMAC_PIC32MACEventPendingGet(DRV_HANDLE hMac);
```

Returns

The currently stack pending events.

Description

This function returns the currently pending Ethernet MAC events. Multiple events will be ORed together as they accumulate. The stack should perform processing whenever a transmission related event (TCPIP_MAC_EV_RX_PKTPEND, TCPIP_MAC_EV_TX_DONE) is present. The other, non critical events, may not be managed by the stack and passed to an user. They will have to be eventually acknowledged if re-enabling is needed.

Remarks

- This is the preferred method to get the current pending MAC events. The stack maintains a proper image of the events from their occurrence to their acknowledgment.
- Even with a notification handler in place it's better to use this function to get the current pending events rather than using the events passed by the notification handler which could be stale.
- The events are persistent. They shouldn't be re-enabled unless they have been processed and the condition that generated them was removed. Re-enabling them immediately without proper processing will have dramatic effects on system performance.
- The returned value is just a momentary value. The pending events can change any time.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. DRV_ETHMAC_PIC32MACOpen() should have been called to obtain a valid handle.

Example

```
TCPIP_MAC_EVENT currEvents = DRV_ETHMAC_PIC32MACEventPendingGet( hMac);
```

Function

TCPIP_MAC_EVENT DRV_ETHMAC_PIC32MACEventPendingGet(DRV_HANDLE hMac)

e) Other Functions

DRV_ETHMAC_Tasks_ISR Function

Ethernet MAC driver interrupt function.

Implementation: Dynamic

File

drv_ethmac.h

C

```
void DRV_ETHMAC_Tasks_ISR(SYS_MODULE_OBJ macIndex);
```

Returns

None.

Description

This is the Ethernet MAC driver interrupt service routine. It processes the Ethernet related interrupts and notifies the events to the driver user (the TCP/IP stack).

Remarks

None.

Preconditions

DRV_ETHMAC_PIC32MACInitialize() should have been called. The TCP/IP stack event notification should be enabled.

Function

void DRV_ETHMAC_Tasks_ISR(SYS_MODULE_OBJ macIndex)

DRV_ETHMAC_PIC32MACTasks Function

Maintains the EThernet MAC driver's state machine.

Implementation: Dynamic

File

drv_ethmac.h

C

```
void DRV_ETHMAC_PIC32MACTasks(SYS_MODULE_OBJ object);
```

Returns

None

Description

This function is used to maintain the driver's internal state machine

Remarks

None.

Preconditions

The DRV_ETHMAC_PIC32MACInitialize routine must have been called for the specified MAC driver instance.

Example

Function

void DRV_ETHMAC_PIC32MACTasks(SYS_MODULE_OBJ object)

f) Data Types and Constants

DRV_ETHMAC_INDEX_1 Macro

File

drv_ethmac.h

C

```
#define DRV_ETHMAC_INDEX_1 1
```

Description

This is macro DRV_ETHMAC_INDEX_1.

DRV_ETHMAC_INDEX_0 Macro

Ethernet driver index definitions.

File

drv_ethmac.h

C

```
#define DRV_ETHMAC_INDEX_0 0
```

Description

Ethernet Driver Module Index Numbers

These constants provide Ethernet driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the MAC initialization routines to identify the driver instance in use.

DRV_ETHMAC_INDEX_COUNT Macro

Number of valid Ethernet driver indices.

File

drv_ethmac.h

C

```
#define DRV_ETHMAC_INDEX_COUNT ETH_NUMBER_OF_MODULES
```

Description

Ethernet Driver Module Index Count

This constant identifies number of valid Ethernet driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from part-specific header files defined as part of the peripheral libraries.

Files

Files

Name	Description
drv_ethmac.h	Ethernet MAC device driver interface file
drv_ethmac_config.h	Ethernet MAC driver configuration definitions template.

Description

This section lists the source and header files used by the Ethernet MAC Driver Library.

drv_ethmac.h

Ethernet MAC device driver interface file

Functions

	Name	Description
	DRV_ETHMAC_PIC32MACClose	Closes a client instance of the PIC32 MAC Driver. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACConfigGet	Gets the current MAC driver configuration. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACDeinitialize	Deinitializes the PIC32 Ethernet MAC. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACEventAcknowledge	Acknowledges and re-enables processed events. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACEventMaskSet	Enables/disables the MAC events. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACEventPendingGet	Returns the currently pending events. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACInitialize	Initializes the PIC32 Ethernet MAC. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACLinkCheck	Checks current link status. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACOpen	Opens a client instance of the PIC32 MAC Driver. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACPacketRx	This is the MAC receive function. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACPacketTx	MAC driver transmit function. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACParametersGet	MAC parameter get function. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACPowerMode	Selects the current power mode for the Ethernet MAC. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACProcess	MAC periodic processing function. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACRegisterStatisticsGet	Gets the current MAC hardware statistics registers. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACReinitialize	Reinitializes the PIC32 Ethernet MAC. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACRxFilterHashTableEntrySet	Sets the current MAC hash table receive filter. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACStatisticsGet	Gets the current MAC statistics. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACStatus	Provides the current status of the MAC driver module. **Implementation:** Dynamic
	DRV_ETHMAC_PIC32MACTasks	Maintains the EThernet MAC driver's state machine. **Implementation:** Dynamic
	DRV_ETHMAC_Tasks_ISR	Ethernet MAC driver interrupt function. **Implementation:** Dynamic

Macros

	Name	Description
	DRV_ETHMAC_INDEX_0	Ethernet driver index definitions.
	DRV_ETHMAC_INDEX_1	This is macro DRV_ETHMAC_INDEX_1.
	DRV_ETHMAC_INDEX_COUNT	Number of valid Ethernet driver indices.

Description

Ethernet MAC Device Driver Interface

The Ethernet MAC device driver provides a simple interface to manage the Ethernet peripheral. This file defines the interface definitions and prototypes for the Ethernet MAC driver.

File Name

drv_ethmac.h

Company

Microchip Technology Inc.

drv_ethmac_config.h

Ethernet MAC driver configuration definitions template.

Macros

	Name	Description
	DRV_ETHMAC_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_ETHMAC_INDEX	Ethernet MAC static index selection.
	DRV_ETHMAC_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_ETHMAC_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_ETHMAC_INTERRUPT_SOURCE	Defines an override of the interrupt source in case of static driver.
	DRV_ETHMAC_PERIPHERAL_ID	Defines an override of the peripheral ID.
	DRV_ETHMAC_POWER_STATE	Defines an override of the power state of the Ethernet MAC driver.

Description

ETHMAC Driver Configuration Definitions for the template version

These definitions statically define the driver's mode of operation.

File Name

drv_ethmac_config.h

Microchip Technology Inc.

Ethernet PHY Driver Library

This section describes the Ethernet PHY Driver Library.

Introduction

This library provides a low-level abstraction of the Ethernet PHY Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

This library provides a software abstraction for configuring external Ethernet PHY devices for use with the on-chip PIC32 Ethernet Controller.

Using the Library

The user of this driver is the MPLAB Harmony TCP/IP Stack through its Ethernet MAC driver. This Ethernet PHY driver is not intended as a system wide driver that the application or other system modules may use. It is intended for the sole use of the MPLAB Harmony TCP/IP stack and implements the PHY driver required by the Ethernet MAC.

This topic describes the basic architecture and functionality of the Ethernet PHY driver and is meant for advanced users or TCP/IP Stack driver developers.

Interface Header File: `drv_ethphy.h`

The interface to the Ethernet PHY library is defined in the `drv_ethphy.h` header file, which is included by the MPLAB Harmony TCP/IP stack.

Please refer to the What is MPLAB Harmony? section for how the library interacts with the framework.

Abstraction Model

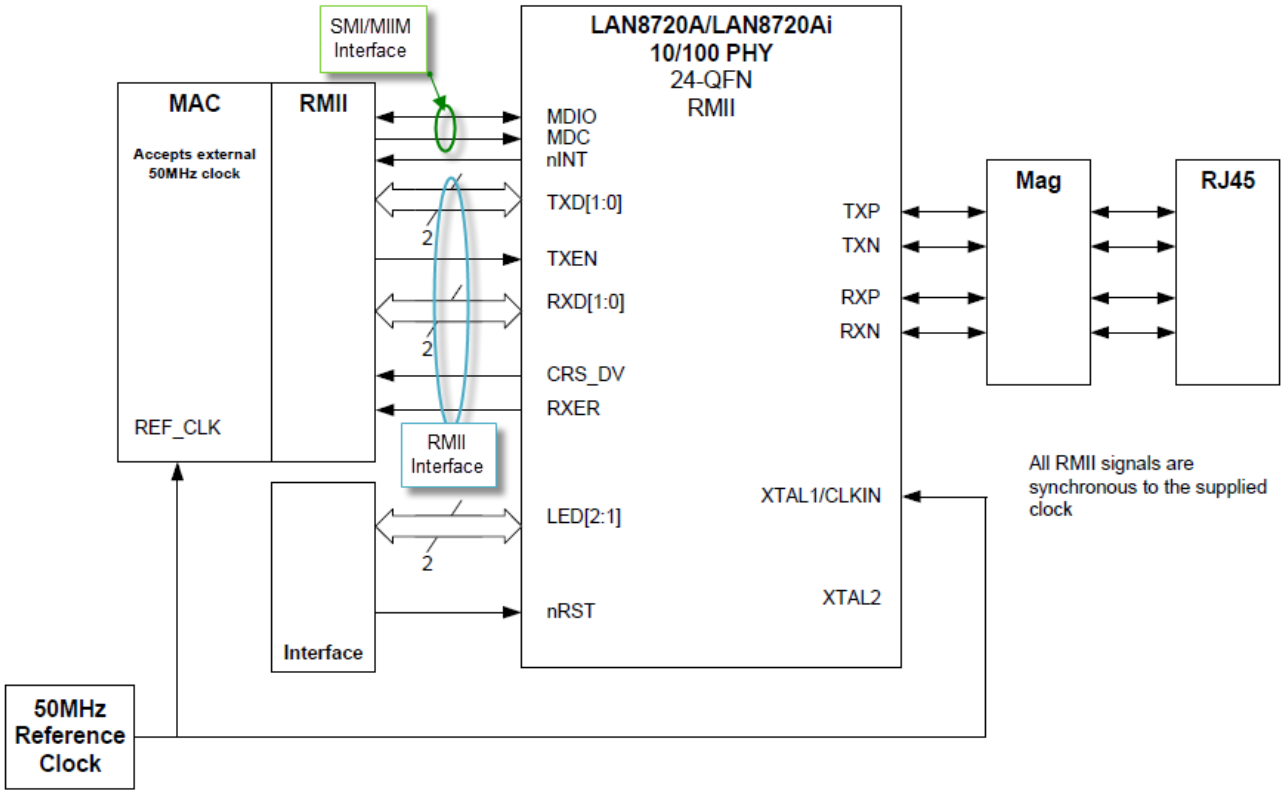
This library provides a low-level abstraction of the Ethernet PHY Driver Library on Microchip's microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

To understand how this library works you must first understand how an external Ethernet PHY interfaces with the Ethernet Controller. As shown in

Figure 1, the PHY has two interfaces, one for managing the PHY, known as the Serial Management Interface (SMI), for configuring the device and a second, known as the Reduced Media Independent Interface (RMII), for transmit and receive data.

Figure 1: Typical External PHY Interface



The block diagram also shows an interrupt signal (nINT) going to a external interrupt pin on the host device and signals going to on-board LEDs to show link state and link activity.

The SMI interface is also known as the MII Management (MIIM) interface. This control interface is standardized for all PHYs by Clause 22 of the 802.3 standard. It provides up to 32 16-bit registers on the PHY. The following table provides a summary of all 32 registers. Consult the data sheet for the PHY device for the specific bit fields in each register.

Register Address	Register Name	Register Type
0	Control	Basic
1	Status	Basic
2, 3	PHY Identifier	Extended
4	Auto-Negotiation Advertisement	Extended
5	Auto-Negotiation Link Partner Base Page Ability	Extended
6	Auto-Negotiation Expansion	Extended
7	Auto-Negotiation Next Page Transmit	Extended
8	Auto-Negotiation Link Partner Received Next Page	Extended
9	MASTER-SLAVE Control Register	Extended
10	MASTER-SLAVE Status Register	Extended
11-14	Reserved	Extended
15	Extended Status	Reserved

16-31	Vendor Specific	Extended

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Ethernet PHY Driver Library

Library Interface Section	Description
System Level Functions	Routines that integrate the driver into the MPLAB Harmony framework.
Client Level Functions	Open, Close, Link Status, Auto Negotiation.
SMI/MIIM Functions	SMI/MIIM Management Interface.
External PHY Support Functions	Provides the API for PHY support routines that the driver will call when setting up the PHY. The driver library provides support for four PHYs.
Other Functions	Functions that provide software version information.
Data Types and Constants	C language typedefs and enums used by this library.

Configuring the Library

Macros

	Name	Description
	DRV_ETHPHY_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_ETHPHY_INDEX	Ethernet PHY static index selection.
	DRV_ETHPHY_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_ETHPHY_PERIPHERAL_ID	Defines an override of the peripheral ID.
	DRV_ETHPHY_NEG_DONE_TMO	Value of the PHY negotiation complete time out as per IEEE 802.3 spec.
	DRV_ETHPHY_NEG_INIT_TMO	Value of the PHY negotiation initiation time out as per IEEE 802.3 spec.
	DRV_ETHPHY_RESET_CLR_TMO	Value of the PHY Reset self clear time out as per IEEE 802.3 spec.

Description

The configuration of the Ethernet PHY Driver Library is based on the file `system_config.h`.

This header file contains the configuration selection for the Ethernet PHY Driver Library. Based on the selections made, the Ethernet PHY Driver Library may support the selected features.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_ETHPHY_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_ethphy_config.h

C

```
#define DRV_ETHPHY_CLIENTS_NUMBER 1
```

Description

Ethernet PHY Maximum Number of Clients This definition select the maximum number of clients that the Ethernet PHY driver can support at run time. Not defining it means using a single client.

Remarks

None.

DRV_ETHPHY_INDEX Macro

Ethernet PHY static index selection.

File

drv_ethphy_config.h

C

```
#define DRV_ETHPHY_INDEX DRV_ETHPHY_INDEX_1
```

Description

Ethernet PHY Static Index Selection

This definition selects the Ethernet PHY static index for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

DRV_ETHPHY_INSTANCES_NUMBER Macro

Selects the maximum number of hardware instances that can be supported by the dynamic driver.

File

drv_ethphy_config.h

C

```
#define DRV_ETHPHY_INSTANCES_NUMBER 1
```

Description

Ethernet PHY hardware instance configuration

This definition selects the maximum number of hardware instances that can be supported by the dynamic driver. Not defining it means using a static driver.

Remarks

None.

DRV_ETHPHY_PERIPHERAL_ID Macro

Defines an override of the peripheral ID.

File

drv_ethphy_config.h

C

```
#define DRV_ETHPHY_PERIPHERAL_ID ETHPHY_ID_1
```

Description

Ethernet PHY Peripheral ID Selection

Defines an override of the peripheral ID, using macros.

Remarks

Some devices also support ETHPHY_ID_0

DRV_ETHPHY_NEG_DONE_TMO Macro

Value of the PHY negotiation complete time out as per IEEE 802.3 spec.

File

drv_ethphy_config.h

C

```
#define DRV_ETHPHY_NEG_DONE_TMO (2000)
```

Description

Ethernet PHY Negotiation Complete time out

This definition sets the time out of the PHY negotiation complete, in ms.

Remarks

See IEEE 802.3 Clause 28 Table 28-9 autoneg_wait_timer value (max 1s).

DRV_ETHPHY_NEG_INIT_TMO Macro

Value of the PHY negotiation initiation time out as per IEEE 802.3 spec.

File

drv_ethphy_config.h

C

```
#define DRV_ETHPHY_NEG_INIT_TMO (1)
```

Description

Ethernet PHY Negotiation Initiation time out

This definition sets the time out of the PHY negotiation initiation, in ms.

Remarks

None.

DRV_ETHPHY_RESET_CLR_TMO Macro

Value of the PHY Reset self clear time out as per IEEE 802.3 spec.

File

drv_ethphy_config.h

C

```
#define DRV_ETHPHY_RESET_CLR_TMO (500)
```

Description

Ethernet PHY Reset self clear time out

This definition sets the time out of the PHY Reset self clear, in ms.

Remarks

See IEEE 802.3 Clause 22 Table 22-7 and paragraph "22.2.4.1.1 Reset" (max 0.5s)

Building the Library

This section lists the files that are available in the Ethernet PHY Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/ethphy`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_ethphy.h`	Header file that exports the driver API.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/dynamic/drv_extphy.c	Basic PHY driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
/src/dynamic/drv_extphy_smsc8700.c	SMSC 8700 PHY implementation file.
/src/dynamic/drv_extphy_smsc8720.c	SMSC 8720 PHY implementation file.
/src/dynamic/drv_extphy_smsc8720.c	SMSC 8740 PHY implementation file.
/src/dynamic/drv_extphy_ip101gr.c	IP101GR PHY implementation file.
/src/dynamic/drv_extphy_dp83640.c	National DP83640 PHY implementation file.
/src/dynamic/drv_extphy_dp83848.c	National DP83848 PHY implementation file.

Module Dependencies

The Ethernet MAC Driver Library depends on the following modules:

- Ethernet MAC Driver Library
- Clock System Service Library
- Ports System Service Library
- Timer System Service Library
- Ethernet Peripheral Library

Library Interface

a) System Level Functions

	Name	Description
	DRV_ETHPHY_Initialize	Initializes the Ethernet PHY driver. **Implementation:** Dynamic
	DRV_ETHPHY_Deinitialize	Deinitializes the specified instance of the Ethernet PHY driver module. **Implementation:** Dynamic
	DRV_ETHPHY_NegotiationResultGet	Returns the result of a completed negotiation. **Implementation:** Dynamic
	DRV_ETHPHY_PhyAddressGet	Returns the PHY address. **Implementation:** Dynamic
	DRV_ETHPHY_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings. **Implementation:** Dynamic
	DRV_ETHPHY_Status	Provides the current status of the Ethernet PHY driver module. **Implementation:** Dynamic
	DRV_ETHPHY_Tasks	Maintains the driver's state machine and implements its ISR. **Implementation:** Dynamic
	DRV_ETHPHY_HWConfigFlagsGet	Returns the current Ethernet PHY hardware MII/RMII and ALTERNATE/DEFAULT configuration flags. **Implementation:** Dynamic
	DRV_ETHPHY_Setup	Initializes Ethernet PHY configuration and set up procedure. **Implementation:** Dynamic

b) Client Level Functions

	Name	Description
	DRV_ETHPHY_ClientStatus	Gets the current client-specific status the Ethernet PHY driver. **Implementation:** Dynamic
	DRV_ETHPHY_Close	Closes an opened instance of the Ethernet PHY driver. **Implementation:** Dynamic
	DRV_ETHPHY_NegotiationIsComplete	Returns the results of a previously initiated Ethernet PHY negotiation. **Implementation:** Dynamic
	DRV_ETHPHY_Open	Opens the specified Ethernet PHY driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_ETHPHY_Reset	Immediately resets the Ethernet PHY. **Implementation:** Dynamic
	DRV_ETHPHY_RestartNegotiation	Restarts auto-negotiation of the Ethernet PHY link. **Implementation:** Dynamic
	DRV_ETHPHY_ClientOperationAbort	Aborts a current client operation initiated by the Ethernet PHY driver. **Implementation:** Dynamic
	DRV_ETHPHY_ClientOperationResult	Gets the result of a client operation initiated by the Ethernet PHY driver. **Implementation:** Dynamic

c) SMI/MIIM Functions

	Name	Description
	DRV_ETHPHY_SMIScanStatusGet	Gets the status of the SMI/MIIM scan data. **Implementation:** Dynamic
	DRV_ETHPHY_SMIScanStop	Stops the scan of a previously requested SMI/MIIM register. **Implementation:** Dynamic
	DRV_ETHPHY_SMIClockSet	Sets the SMI/MIIM interface clock. **Implementation:** Dynamic
	DRV_ETHPHY_SMIScanStart	Starts the scan of a requested SMI/MIIM register. **Implementation:** Dynamic
	DRV_ETHPHY_SMIRead	Initiates a SMI/MIIM read transaction. **Implementation:** Dynamic
	DRV_ETHPHY_SMIScanDataGet	Gets the latest SMI/MIIM scan data result. **Implementation:** Dynamic
	DRV_ETHPHY_SMIStatus	Returns the current status of the SMI/MIIM interface. **Implementation:** Dynamic
	DRV_ETHPHY_SMIWrite	Initiates a SMI/MIIM write transaction. **Implementation:** Dynamic

d) Vendor Functions

	Name	Description
	DRV_ETHPHY_VendorDataGet	Returns the current value of the vendor data. **Implementation:** Dynamic
	DRV_ETHPHY_VendorDataSet	Returns the current value of the vendor data. **Implementation:** Dynamic
	DRV_ETHPHY_VendorSMIReadResultGet	Reads the result of a previous vendor initiated SMI read transfer with DRV_ETHPHY_VendorSMIReadStart. **Implementation:** Dynamic
	DRV_ETHPHY_VendorSMIReadStart	Starts a vendor SMI read transfer. Data will be available with DRV_ETHPHY_VendorSMIReadResultGet. **Implementation:** Dynamic
	DRV_ETHPHY_VendorSMIWriteStart	Starts a vendor SMI write transfer. **Implementation:** Dynamic

f) Data Types and Constants

	Name	Description
	DRV_ETHPHY_CLIENT_STATUS	Identifies the client-specific status of the Ethernet PHY driver.
	DRV_ETHPHY_INIT	Contains all the data necessary to initialize the Ethernet PHY device.

	DRV_ETHPHY_NEGOTIATION_RESULT	Contains all the data necessary to get the Ethernet PHY negotiation result
	DRV_ETHPHY_SETUP	Contains all the data necessary to set up the Ethernet PHY device.
	DRV_ETHPHY_VENDOR_MDIX_CONFIGURE	Pointer to function that configures the MDIX mode for the Ethernet PHY.
	DRV_ETHPHY_VENDOR_MII_CONFIGURE	Pointer to function to configure the Ethernet PHY in one of the MII/RMII operation modes.
	DRV_ETHPHY_VENDOR_SMI_CLOCK_GET	Pointer to a function to return the SMI/MIIM maximum clock speed in Hz of the Ethernet PHY.
	DRV_ETHPHY_INDEX_0	Ethernet PHY driver index definitions.
	DRV_ETHPHY_INDEX_1	This is macro DRV_ETHPHY_INDEX_1.
	DRV_ETHPHY_INDEX_COUNT	Number of valid Ethernet PHY driver indices.
	DRV_ETHPHY_LinkStatusGet	Returns the current link status. **Implementation:** Dynamic
	DRV_ETHPHY_LINK_STATUS	Defines the possible status flags of PHY Ethernet link.
	DRV_ETHPHY_CONFIG_FLAGS	Defines the possible results of Ethernet operations that can succeed or fail
	DRV_ETHPHY_OBJECT	Identifies the interface of a Ethernet PHY vendor driver.
	DRV_ETHPHY_VENDOR_WOL_CONFIGURE	Pointer to a function to configure the PHY WOL functionality
	DRV_ETHPHY_OBJECT_BASE_TYPE	Identifies the base interface of a Ethernet PHY driver.
	DRV_ETHPHY_OBJECT_BASE	Identifies the base interface of a Ethernet PHY driver.

Description

This section describes the Application Programming Interface (API) functions of the Ethernet PHY Driver Library.

Refer to each section for a detailed description.

a) System Level Functions

DRV_ETHPHY_Initialize Function

Initializes the Ethernet PHY driver.

Implementation: Dynamic

File

drv_ethphy.h

C

```
SYS_MODULE_OBJ DRV_ETHPHY_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

- a valid handle to a driver object, if successful.
- SYS_MODULE_OBJ_INVALID if initialization failed.

Description

This function initializes the Ethernet PHY driver, making it ready for clients to open and use it.

Remarks

- This function must be called before any other Ethernet PHY routine is called.
- This function should only be called once during system initialization unless DRV_ETHPHY_Deinitialize is called to deinitialize the driver instance.
- The returned object must be passed as argument to DRV_ETHPHY_Reinitialize, DRV_ETHPHY_Deinitialize, DRV_ETHPHY_Tasks and DRV_ETHPHY_Status routines.

Preconditions

None.

Example

```
DRV_ETHPHY_INIT    init;
SYS_MODULE_OBJ  objectHandle;

// Populate the Ethernet PHY initialization structure
init.phyId  = ETHPHY_ID_0;
```

```
// Populate the Ethernet PHY initialization structure
init.phyId  = ETHPHY_ID_2;
init.pPhyObject  = &DRV_ETHPHY_OBJECT_SMSC_LAN8720;

// Do something

objectHandle = DRV_ETHPHY_Initialize(DRV_ETHPHY_INDEX_0, (SYS_MODULE_INIT*)&init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Function

SYS_MODULE_OBJ DRV_ETHPHY_Initialize(const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init)

DRV_ETHPHY_Deinitialize Function

Deinitializes the specified instance of the Ethernet PHY driver module.

Implementation: Dynamic

File

drv_ethphy.h

C

```
void DRV_ETHPHY_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function deinitializes the specified instance of the Ethernet PHY driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

- Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

Preconditions

The DRV_ETHPHY_Initialize function must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_ETHPHY_Initialize
SYS_STATUS          status;

DRV_ETHPHY_Deinitialize(object);

status = DRV_ETHPHY_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Function

void DRV_ETHPHY_Deinitialize (SYS_MODULE_OBJ object)

DRV_ETHPHY_NegotiationResultGet Function

Returns the result of a completed negotiation.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_NegotiationResultGet(DRV_HANDLE handle, DRV_ETHPHY_NEGOTIATION_RESULT*
pNegResult);
```

Returns

- DRV_ETHPHY_RES_PENDING operation is ongoing
- an DRV_ETHPHY_RESULT error code if the procedure failed.

Description

This function returns the PHY negotiation data gathered after a completed negotiation.

Remarks

Use DRV_ETHPHY_ClientStatus() and DRV_ETHPHY_ClientOperationResult() to check when the operation was completed and its outcome.

When operation is completed but negotiation has failed, DRV_ETHPHY_ClientOperationResult will return:

- DRV_ETHPHY_RES_NEGOTIATION_INACTIVE if no negotiation in progress
- DRV_ETHPHY_RES_NEGOTIATION_NOT_STARTED if negotiation not yet started yet (means time out if waitComplete was requested)
- DRV_ETHPHY_RES_NEGOTIATION_ACTIVE if negotiation ongoing

The returned value for the negotiation flags is valid only if the negotiation was completed successfully.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY
- DRV_ETHPHY_RestartNegotiation, and DRV_ETHPHY_NegotiationIsComplete should have been called.

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_NegotiationResultGet(DRV_HANDLE handle, DRV_ETHPHY_NEGOTIATION_RESULT* pNegResult)

DRV_ETHPHY_PhyAddressGet Function

Returns the PHY address.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_PhyAddressGet(DRV_HANDLE handle, int* pPhyAddress);
```

Returns

DRV_ETHPHY_RES_OK - operation successful and the PHY address stored at

DRV_ETHPHY_RES_HANDLE_ERR - passed in handle was invalid pPhyAddress

Description

This function returns the current PHY address as set by the DRV_ETHPHY_Setup procedure.

Remarks

None.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_PhyAddressGet(DRV_HANDLE handle, int* pPhyAddress);

DRV_ETHPHY_Reinitialize Function

Reinitializes the driver and refreshes any associated hardware settings.

Implementation: Dynamic

File

drv_ethphy.h

C

```
void DRV_ETHPHY_Reinitialize(SYS_MODULE_OBJ object, const SYS_MODULE_INIT * const init);
```

Returns

None.

Description

This function reinitializes the driver and refreshes any associated hardware settings using the initialization data given, but it will not interrupt any ongoing operations.

Remarks

- This function can be called multiple times to reinitialize the module.
- This operation can be used to refresh any supported hardware registers as specified by the initialization data or to change the power state of the module.

Preconditions

The DRV_ETHPHY_Initialize function must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Example

```
DRV_ETHPHY_INIT    init;
SYS_MODULE_OBJ  objectHandle;

// Populate the Ethernet PHY initialization structure
init.phyId  = ETHPHY_ID_2;
init.pPhyObject  = &DRV_ETHPHY_OBJECT_SMSC_LAN8720;

DRV_ETHPHY_Reinitialize(objectHandle, (SYS_MODULE_INIT*)&init);

phyStatus = DRV_ETHPHY_Status(objectHandle);
if (SYS_STATUS_BUSY == phyStatus)
{
    // Check again later to ensure the driver is ready
}
else if (SYS_STATUS_ERROR >= phyStatus)
{
    // Handle error
}
```

Function

void DRV_ETHPHY_Reinitialize(SYS_MODULE_OBJ object,
const SYS_MODULE_INIT * const init)

DRV_ETHPHY_Status Function

Provides the current status of the Ethernet PHY driver module.

Implementation: Dynamic

File

drv_ethphy.h

C

```
SYS_STATUS DRV_ETHPHY_Status(SYS_MODULE_OBJ object);
```

Returns

- SYS_STATUS_READY - Indicates that any previous module operation for the specified module has completed
- SYS_STATUS_BUSY - Indicates that a previous module operation for the specified module has not yet completed
- SYS_STATUS_ERROR - Indicates that the specified module is in an error state

Description

This function provides the current status of the Ethernet PHY driver module.

Remarks

- Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.
- SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another
- SYS_STATUS_ERROR - Indicates that the driver is in an error state
- Any value less than SYS_STATUS_ERROR is also an error state.
- SYS_MODULE_DEINITIALIZED - Indicates that the driver has been deinitialized
- The this operation can be used to determine when any of the driver's module level operations has completed.
- If the status operation returns SYS_STATUS_BUSY, the a previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.
- The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.
- This function will NEVER block waiting for hardware.
- If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

The DRV_ETHPHY_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_ETHPHY_Initialize
SYS_STATUS          status;

status = DRV_ETHPHY_Status(object);
if (SYS_STATUS_ERROR >= status)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_ETHPHY_Initialize

Function

SYS_STATUS DRV_ETHPHY_Status (SYS_MODULE_OBJ object)

DRV_ETHPHY_Tasks Function

Maintains the driver's state machine and implements its ISR.

Implementation: Dynamic

File

drv_ethphy.h

C

```
void DRV_ETHPHY_Tasks(SYS_MODULE_OBJ object);
```

Returns

None

Description

This function is used to maintain the driver's internal state machine and implement its ISR for interrupt-driven implementations.

Remarks

- This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks)
- This function will never block or access any resources that may cause it to block.

Preconditions

The DRV_ETHPHY_Initialize routine must have been called for the specified Ethernet PHY driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_ETHPHY_Initialize

while (true)
{
    DRV_ETHPHY_Tasks (object);

    // Do other tasks
}
```

Function

void DRV_ETHPHY_Tasks(SYS_MODULE_OBJ object)

DRV_ETHPHY_HWConfigFlagsGet Function

Returns the current Ethernet PHY hardware MII/RMII and ALTERNATE/DEFAULT configuration flags.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_HWConfigFlagsGet(DRV_HANDLE handle, DRV_ETHPHY_CONFIG_FLAGS* pFlags);
```

Returns

DRV_ETHPHY_RES_OK - if the configuration flags successfully stored at pFlags DRV_ETHPHY_RESULT error code otherwise

Description

This function returns the current Ethernet PHY hardware MII/RMII and ALTERNATE/DEFAULT configuration flags from the Device Configuration Fuse bits.

Remarks

None.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_ETHPHY_Open)
pFlags	address to store the hardware configuration

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_HWConfigFlagsGet(DRV_HANDLE handle, DRV_ETHPHY_CONFIG_FLAGS* pFlags)

DRV_ETHPHY_Setup Function

Initializes Ethernet PHY configuration and set up procedure.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_Setup(DRV_HANDLE handle, DRV_ETHPHY_SETUP* pSetUp, TCPIP_ETH_OPEN_FLAGS*
pSetupFlags);
```

Returns

- DRV_ETHPHY_RES_PENDING operation has been scheduled successfully
- an DRV_ETHPHY_RESULT error code if the set up procedure failed.

Description

This function initializes the Ethernet PHY communication. It tries to detect the external Ethernet PHY, to read the capabilities and find a match with the requested features. Then, it programs the Ethernet PHY accordingly.

Remarks

PHY configuration may be a lengthy operation due to active negotiation that the PHY has to perform with the link party. The DRV_ETHPHY_ClientStatus will repeatedly return DRV_ETHPHY_CLIENT_STATUS_BUSY until the set up procedure is complete (unless an error detected at which an error code will be returned immediately).

Use DRV_ETHPHY_ClientStatus() and DRV_ETHPHY_ClientOperationResult() to check when the operation was completed and its outcome.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_Setup(DRV_HANDLE handle, DRV_ETHPHY_SETUP* pSetUp, TCPIP_ETH_OPEN_FLAGS* pSetupFlags)

b) Client Level Functions

DRV_ETHPHY_ClientStatus Function

Gets the current client-specific status the Ethernet PHY driver.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_CLIENT_STATUS DRV_ETHPHY_ClientStatus(DRV_HANDLE handle);
```

Returns

- DRV_ETHPHY_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the Ethernet PHY driver associated with the given handle.

Remarks

This function will not block for hardware access and will immediately return the current status.

This function has to be used to check that a driver operation has completed. It will return DRV_ETHPHY_CLIENT_STATUS_BUSY when an operation is in progress. It will return DRV_ETHPHY_CLIENT_STATUS_READY when the operation has completed.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE phyHandle;  // Returned from DRV_ETHPHY_Open
DRV_ETHPHY_CLIENT_STATUS phyClientStatus;

phyClientStatus = DRV_ETHPHY_ClientStatus(phyHandle);
if(DRV_ETHPHY_CLIENT_STATUS_ERROR >= phyClientStatus)
{
    // Handle the error
}
```

Function

DRV_ETHPHY_CLIENT_STATUS DRV_ETHPHY_ClientStatus(DRV_HANDLE handle)

DRV_ETHPHY_Close Function

Closes an opened instance of the Ethernet PHY driver.

Implementation: Dynamic

File

drv_ethphy.h

C

```
void DRV_ETHPHY_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the Ethernet PHY driver, invalidating the handle.

Remarks

- After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_ETHPHY_Open before the caller may use the driver again.
- Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_ETHPHY_Initialize routine must have been called for the specified Ethernet PHY driver instance.

DRV_ETHPHY_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_ETHPHY_Open

DRV_ETHPHY_Close(handle);
```

Function

void DRV_ETHPHY_Close(DRV_HANDLE handle)

DRV_ETHPHY_NegotiationIsComplete Function

Returns the results of a previously initiated Ethernet PHY negotiation.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_NegotiationIsComplete(DRV_HANDLE handle, bool waitComplete);
```

Returns

- DRV_ETHPHY_RES_PENDING operation is ongoing
- an DRV_ETHPHY_RESULT error code if the procedure failed.

Description

This function returns the results of a previously initiated Ethernet PHY negotiation.

Remarks

Use DRV_ETHPHY_ClientStatus() and DRV_ETHPHY_ClientOperationResult() to check when the operation was completed and its outcome.

When operation is completed but negotiation has failed, DRV_ETHPHY_ClientOperationResult will return:

- DRV_ETHPHY_RES_NEGOTIATION_INACTIVE if no negotiation in progress
- DRV_ETHPHY_RES_NEGOTIATION_NOT_STARTED if negotiation not yet started yet (means time out if waitComplete was requested)
- DRV_ETHPHY_RES_NEGOTIATION_ACTIVE if negotiation ongoing

(means time out if waitComplete was requested).

See also DRV_ETHPHY_NegotiationResultGet.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY
- DRV_ETHPHY_RestartNegotiation should have been called.

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_NegotiationIsComplete(DRV_HANDLE handle, bool waitComplete)

DRV_ETHPHY_Open Function

Opens the specified Ethernet PHY driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_HANDLE DRV_ETHPHY_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

- valid open-instance handle if successful (a number identifying both the caller and the module instance).
- DRV_HANDLE_INVALID if an error occurs

Description

This function opens the specified Ethernet PHY driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The handle returned is valid until the DRV_ETHPHY_Close routine is called.

This function will NEVER block waiting for hardware.

The intent parameter is not used. The PHY driver implements a non-blocking behavior.

Preconditions

The DRV_ETHPHY_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_ETHPHY_Open(DRV_ETHPHY_INDEX_0, 0);
```

```
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Function

DRV_HANDLE DRV_ETHPHY_Open(const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent)

DRV_ETHPHY_Reset Function

Immediately resets the Ethernet PHY.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_Reset(DRV_HANDLE handle, bool waitComplete);
```

Returns

- DRV_ETHPHY_RES_PENDING for ongoing, in progress operation
- DRV_ETHPHY_RES_OPERATION_ERR - invalid parameter or operation in the current context

Description

This function immediately resets the Ethernet PHY, optionally waiting for a reset to complete.

Remarks

Use DRV_ETHPHY_ClientStatus() and DRV_ETHPHY_ClientOperationResult() to check when the operation was completed and its outcome.

When operation is completed but failed, DRV_ETHPHY_ClientOperationResult will return:

- DRV_ETHPHY_RES_DTCT_ERR if the PHY failed to respond

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_Reset(DRV_HANDLE handle, bool waitComplete)

DRV_ETHPHY_RestartNegotiation Function

Restarts auto-negotiation of the Ethernet PHY link.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_RestartNegotiation(DRV_HANDLE handle);
```

Returns

- DRV_ETHPHY_RES_PENDING operation has been scheduled successfully
- an DRV_ETHPHY_RESULT error code if the procedure failed.

Description

This function restarts auto-negotiation of the Ethernet PHY link.

Remarks

Use DRV_ETHPHY_ClientStatus() and DRV_ETHPHY_ClientOperationResult() to check when the operation was completed and its outcome.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_RestartNegotiation(DRV_HANDLE handle)

DRV_ETHPHY_ClientOperationAbort Function

Aborts a current client operation initiated by the Ethernet PHY driver.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_ClientOperationAbort(DRV_HANDLE handle);
```

Returns

- DRV_ETHPHY_RESULT value describing the current operation result: DRV_ETHPHY_RES_OK for success; operation has been aborted an DRV_ETHPHY_RESULT error code if the operation failed.

Description

Aborts a current client operation initiated by the Ethernet PHY driver.

Remarks

None

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid opened device handle.
- A driver operation was started

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_ClientOperationAbort(DRV_HANDLE handle)

DRV_ETHPHY_ClientOperationResult Function

Gets the result of a client operation initiated by the Ethernet PHY driver.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_ClientOperationResult(DRV_HANDLE handle);
```

Returns

- DRV_ETHPHY_RESULT value describing the current operation result: DRV_ETHPHY_RES_OK for success; operation has been completed successfully DRV_ETHPHY_RES_PENDING operation is in progress an DRV_ETHPHY_RESULT error code if the operation failed.

Description

Returns the result of a client operation initiated by the Ethernet PHY driver.

Remarks

This function will not block for hardware access and will immediately return the current status.

This function returns the result of the last driver operation. It will return DRV_ETHPHY_RES_PENDING if an operation is still in progress. Otherwise a DRV_ETHPHY_RESULT describing the operation outcome.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid opened device handle.
- A driver operation was started and completed

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_ClientOperationResult(DRV_HANDLE handle)

c) SMI/MIIM Functions

DRV_ETHPHY_SMIScanStatusGet Function

Gets the status of the SMI/MIIM scan data.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_SMIScanStatusGet(DRV_HANDLE handle);
```

Returns

DRV_ETHPHY_RES_OPERATION_ERR - no scan operation currently in progress

DRV_ETHPHY_RES_OK - scan data is available

DRV_ETHPHY_RES_PENDING - scan data is not yet available

< 0 - an error has occurred and the operation could not be completed

Description

This function gets the status of the SMI/MIIM scan data.

Remarks

None.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY
- DRV_ETHPHY_SMIScanStart() has been called.

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_SMIScanStatusGet(DRV_HANDLE handle)

DRV_ETHPHY_SMIScanStop Function

Stops the scan of a previously requested SMI/MIIM register.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_SMIScanStop(DRV_HANDLE handle);
```

Returns

DRV_ETHPHY_RES_OPERATION_ERR - no scan operation currently in progress

DRV_ETHPHY_RES_OK - the scan transaction has been stopped successfully < 0 - an error has occurred and the operation could not be completed

Description

This function stops the current scan of a SMI/MIIM register.

Remarks

None.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY
- DRV_ETHPHY_SMIScanStart was called to start a scan

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_SMIScanStop(DRV_HANDLE handle)

DRV_ETHPHY_SMIClockSet Function

Sets the SMI/MIIM interface clock.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_SMIClockSet(DRV_HANDLE handle, uint32_t hostClock, uint32_t maxSMIClock);
```

Returns

DRV_ETHPHY_RES_HANDLE_ERR - passed in handle was invalid

DRV_ETHPHY_RES_OK - operation successful

Description

This function sets SMI/MIIM interface clock base on host clock and maximum supported SMI/MIIM interface clock speed.

Remarks

None.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_SMIClockSet(DRV_HANDLE handle,

uint32_t hostClock,

uint32_t maxSMIClock)

DRV_ETHPHY_SMIScanStart Function

Starts the scan of a requested SMI/MIIM register.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_SMIScanStart(DRV_HANDLE handle, unsigned int rIx);
```

Returns

DRV_ETHPHY_RES_PENDING - the scan transaction was initiated and is ongoing < 0 - an error has occurred and the operation could not be completed

Description

This function starts the scan of a requested SMI/MIIM register.

Remarks

Use DRV_ETHPHY_ClientStatus() and DRV_ETHPHY_ClientOperationResult() to check when the operation was completed and its outcome.

However, the client status will always be DRV_ETHPHY_CLIENT_STATUS_BUSY and the client result will always show DRV_ETHPHY_RES_PENDING for as long as the scan is active. Use DRV_ETHPHY_SMIScanStop() to stop a scan in progress. Use DRV_ETHPHY_SMIScanStatusGet() to check is there is scan data available. Use DRV_ETHPHY_SMIScanDataGet() to retrieve the scan data.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_SMIScanStart(DRV_HANDLE handle,

unsigned int rIx)

DRV_ETHPHY_SMIRead Function

Initiates a SMI/MIIM read transaction.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_SMIRead(DRV_HANDLE handle, unsigned int rIx, uint16_t* pSmiRes, int phyAdd);
```

Returns

DRV_ETHPHY_RES_PENDING - the transaction was initiated and is ongoing < 0 - an error has occurred and the operation could not be completed

Description

This function initiates a SMI/MIIM read transaction for a given PHY register.

Remarks

In most situations the PHY address to be used for this function should be the one returned by DRV_ETHPHY_PhyAddressGet(). However this function allows using a different PHY address for advanced operation.

Use DRV_ETHPHY_ClientStatus() and DRV_ETHPHY_ClientOperationResult() to check when the operation was completed and its outcome.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid opened device handle.

- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_SMIRead(DRV_HANDLE handle, unsigned int rIx, uint16_t* pSmiRes, int phyAdd)

DRV_ETHPHY_SMIScanDataGet Function

Gets the latest SMI/MIIM scan data result.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_SMIScanDataGet(DRV_HANDLE handle, uint16_t* pScanRes);
```

Returns

DRV_ETHPHY_RES_OPERATION_ERR - no scan operation currently in progress

DRV_ETHPHY_RES_OK - scan data is available and stored at pScanRes DRV_ETHPHY_RES_PENDING - scan data is not yet available

< 0 - an error has occurred and the operation could not be completed

Description

This function gets the latest SMI/MIIM scan data result.

Remarks

None.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY
- DRV_ETHPHY_SMIScanStart() has been called
- Data is available if DRV_ETHPHY_SMIScanStatusGet() previously returned DRV_ETHPHY_RES_OK

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_SMIScanDataGet(DRV_HANDLE handle, uint16_t* pScanRes)

DRV_ETHPHY_SMIStatus Function

Returns the current status of the SMI/MIIM interface.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_SMIStatus(DRV_HANDLE handle);
```

Returns

- DRV_ETHPHY_RES_BUSY - if the SMI/MIIM interface is busy
- DRV_ETHPHY_RES_OK - if the SMI/MIIM is not busy

< 0 - an error has occurred and the operation could not be completed

Description

This function checks if the SMI/MIIM interface is busy with a transaction.

Remarks

This function is info only and returns the momentary status of the SMI bus. Even if the bus is free there is no guarantee it will be free later on especially if the driver is on going some operation.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_SMIStatus(DRV_HANDLE handle)

DRV_ETHPHY_SMIWrite Function

Initiates a SMI/MIIM write transaction.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_SMIWrite(DRV_HANDLE handle, unsigned int rIx, uint16_t wData, int phyAdd, bool waitComplete);
```

Returns

DRV_ETHPHY_RES_OK - the write transaction has been scheduled/completed successfully DRV_ETHPHY_RES_PENDING - the transaction was initiated and is ongoing < 0 - an error has occurred and the operation could not be completed

Description

This function initiates a SMI/MIIM write transaction for a given PHY register.

Remarks

In most situations the PHY address to be used for this function should be the one returned by DRV_ETHPHY_PhyAddressGet(). However this function allows using a different PHY address for advanced operation.

Use DRV_ETHPHY_ClientStatus() and DRV_ETHPHY_ClientOperationResult() to check when the operation was completed and its outcome.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_SMIWrite(DRV_HANDLE handle, unsigned int rIx, uint16_t wData, int phyAdd, bool waitComplete)

d) Vendor Functions

DRV_ETHPHY_VendorDataGet Function

Returns the current value of the vendor data.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_VendorDataGet(DRV_HANDLE handle, uint32_t* pVendorData);
```

Returns

DRV_ETHPHY_RES_OK - if the vendor data is stored at the pVendorData address

DRV_ETHPHY_RES_HANDLE_ERR - handle error

Description

This function returns the current value of the vendor data. Each DRV_ETHPHY client object maintains data that could be used for vendor specific operations. This routine allows retrieving of the vendor specific data.

Remarks

The PHY driver will clear the vendor specific data before any call to a vendor specific routine. Otherwise the PHY driver functions do not touch this value.

The DRV_ETHPHY_VendorDataSet can be used for writing data into this field.

Currently only a 32 bit value is supported.

The function is intended for implementing vendor specific functions, like DRV_EXTPHY_MIIConfigure and DRV_EXTPHY_MDIXConfigure, that need a way of maintaining their own data and state machine.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_VendorDataGet(DRV_HANDLE handle, uint32_t* pVendorData)

DRV_ETHPHY_VendorDataSet Function

Returns the current value of the vendor data.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_VendorDataSet(DRV_HANDLE handle, uint32_t vendorData);
```

Returns

DRV_ETHPHY_RES_OK - if the vendor data is stored in the client object

DRV_ETHPHY_RES_HANDLE_ERR - handle error

Description

This function returns the current value of the vendor data. Each DRV_ETHPHY client object maintains data that could be used for vendor specific operations. This routine allows retrieving of the vendor specific data.

Remarks

The PHY driver will clear the vendor specific data before any call to a vendor specific routine. Otherwise the PHY driver functions do not touch this value.

The DRV_ETHPHY_VendorDataGet can be used for reading data into this field.

Currently only a 32 bit value is supported.

The function is intended for implementing vendor specific functions, like DRV_EXTPHY_MIIConfigure and DRV_EXTPHY_MDIXConfigure, that need a way of maintaining their own data and state machine.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_VendorDataSet(DRV_HANDLE handle, uint32_t vendorData)

DRV_ETHPHY_VendorSMIReadResultGet Function

Reads the result of a previous vendor initiated SMI read transfer with DRV_ETHPHY_VendorSMIReadStart.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_VendorSMIReadResultGet(DRV_HANDLE handle, uint16_t* pSmiRes);
```

Returns

DRV_ETHPHY_RES_OK - transaction complete and result deposited at pSmiRes.

DRV_ETHPHY_RES_PENDING - if the vendor transaction is still ongoing The call needs to be retried.

< 0 - some error and the DRV_EXTPHY_MIIConfigure/DRV_EXTPHY_MDIXConfigure has to return error to be aborted by the DRV_ETHPHY_Setup

Description

This function will return the data of a SMI read transfer.

Remarks

The function is intended for implementing vendor SMI transfers within DRV_EXTPHY_MIIConfigure and DRV_EXTPHY_MDIXConfigure.

It has to be called from within the DRV_EXTPHY_MIIConfigure or DRV_EXTPHY_MDIXConfigure functions (which are called, in turn, by the DRV_ETHPHY_Setup procedure) otherwise the call will fail.

The DRV_ETHPHY_RES_OK and DRV_ETHPHY_RES_PENDING significance is changed from the general driver API.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup is in progress and configures the PHY
- The vendor implementation of the DRV_EXTPHY_MIIConfigure/DRV_EXTPHY_MDIXConfigure is running and a SMI transfer is needed
- DRV_ETHPHY_VendorSMIReadStart should have been called to initiate a transfer

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_VendorSMIReadResultGet(DRV_HANDLE handle, uint16_t* pSmiRes)

DRV_ETHPHY_VendorSMIReadStart Function

Starts a vendor SMI read transfer. Data will be available with DRV_ETHPHY_VendorSMIReadResultGet.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_VendorSMIReadStart(DRV_HANDLE handle, uint16_t rIx, int phyAddress);
```

Returns

DRV_ETHPHY_RES_OK - the vendor transaction is started DRV_ETHPHY_VendorSMIReadResultGet() needs to be called for the transaction to complete and to retrieve the result

DRV_ETHPHY_RES_PENDING - the SMI bus is busy and the call needs to be retried

< 0 - some error and the DRV_EXTPHY_MIIConfigure/DRV_EXTPHY_MDIXConfigure has to return error to be aborted by the DRV_ETHPHY_Setup

Description

This function will start a SMI read transfer.

Remarks

The function is intended for implementing vendor SMI transfers within DRV_EXTPHY_MIIConfigure and DRV_EXTPHY_MDIXConfigure.

It has to be called from within the DRV_EXTPHY_MIIConfigure or DRV_EXTPHY_MDIXConfigure functions (which are called, in turn, by the DRV_ETHPHY_Setup procedure) otherwise the call will fail.

The DRV_ETHPHY_RES_OK and DRV_ETHPHY_RES_PENDING significance is changed from the general driver API.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup is in progress and configures the PHY
- The vendor implementation of the DRV_EXTPHY_MIIConfigure/DRV_EXTPHY_MDIXConfigure is running and a SMI transfer is needed

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_VendorSMIReadStart(DRV_HANDLE handle, uint16_t rIx, int phyAddress)

DRV_ETHPHY_VendorSMIWriteStart Function

Starts a vendor SMI write transfer.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_VendorSMIWriteStart(DRV_HANDLE handle, uint16_t rIx, uint16_t wData, int phyAddress);
```

Returns

DRV_ETHPHY_RES_OK - if the vendor SMI write transfer is started

DRV_ETHPHY_RES_PENDING - the SMI bus was busy and the call needs to be retried

< 0 - some error and the DRV_EXTPHY_MIIConfigure/DRV_EXTPHY_MDIXConfigure has to return error to be aborted by the DRV_ETHPHY_Setup

Description

This function will start a SMI write transfer.

Remarks

The function is intended for implementing vendor SMI transfers within DRV_EXTPHY_MIIConfigure and DRV_EXTPHY_MDIXConfigure.

It has to be called from within the DRV_EXTPHY_MIIConfigure or DRV_EXTPHY_MDIXConfigure functions (which are called, in turn, by the DRV_ETHPHY_Setup procedure) otherwise the call will fail.

The DRV_ETHPHY_RES_OK and DRV_ETHPHY_RES_PENDING significance is changed from the general driver API.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup is in progress and configures the PHY
- The vendor implementation of the DRV_EXTPHY_MIIConfigure/DRV_EXTPHY_MDIXConfigure is running and a SMI transfer is needed

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_VendorSMIWriteStart(DRV_HANDLE handle, uint16_t rIx, uint16_t wData, int phyAddress)

e) Other Functions

f) Data Types and Constants

DRV_ETHPHY_CLIENT_STATUS Enumeration

Identifies the client-specific status of the Ethernet PHY driver.

File

drv_ethphy.h

C

```
typedef enum {
  DRV_ETHPHY_CLIENT_STATUS_ERROR,
  DRV_ETHPHY_CLIENT_STATUS_CLOSED,
  DRV_ETHPHY_CLIENT_STATUS_BUSY,
  DRV_ETHPHY_CLIENT_STATUS_READY
} DRV_ETHPHY_CLIENT_STATUS;
```

Members

Members	Description
DRV_ETHPHY_CLIENT_STATUS_ERROR	Unspecified error condition
DRV_ETHPHY_CLIENT_STATUS_CLOSED	Client is not open
DRV_ETHPHY_CLIENT_STATUS_BUSY	An operation is currently in progress
DRV_ETHPHY_CLIENT_STATUS_READY	Up and running, no operations running

Description

Ethernet PHY Driver Client Status

This enumeration identifies the client-specific status of the Ethernet PHY driver.

Remarks

None.

DRV_ETHPHY_INIT Structure

Contains all the data necessary to initialize the Ethernet PHY device.

File

drv_ethphy.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  ETH_MODULE_ID ethphyId;
  const DRV_ETHPHY_OBJECT* pPhyObject;
} DRV_ETHPHY_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
ETH_MODULE_ID ethphyId;	Identifies peripheral (PLIB-level) ID
const DRV_ETHPHY_OBJECT* pPhyObject;	Non-volatile pointer to the PHY object providing vendor functions for this PHY

Description

Ethernet PHY Device Driver Initialization Data

This data structure contains all the data necessary to initialize the Ethernet PHY device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the DRV_ETHPHY_Initialize routine.

DRV_ETHPHY_NEGOTIATION_RESULT Structure

Contains all the data necessary to get the Ethernet PHY negotiation result

File

drv_ethphy.h

C

```
typedef struct {
  DRV_ETHPHY_LINK_STATUS linkStatus;
  TCPIP_ETH_OPEN_FLAGS linkFlags;
  TCPIP_ETH_PAUSE_TYPE pauseType;
} DRV_ETHPHY_NEGOTIATION_RESULT;
```

Members

Members	Description
DRV_ETHPHY_LINK_STATUS linkStatus;	link status after a completed negotiation
TCPIP_ETH_OPEN_FLAGS linkFlags;	the negotiation result flags
TCPIP_ETH_PAUSE_TYPE pauseType;	pause type supported by the link partner

Description

Ethernet PHY Device Driver Negotiation result Data

Contains all the data necessary to get the Ethernet PHY negotiation result

Remarks

A pointer to a structure of this format must be passed into the DRV_ETHPHY_NegotiationResultGet routine.

DRV_ETHPHY_SETUP Structure

Contains all the data necessary to set up the Ethernet PHY device.

File

drv_ethphy.h

C

```
typedef struct {
  int phyAddress;
  TCPIP_ETH_OPEN_FLAGS openFlags;
  DRV_ETHPHY_CONFIG_FLAGS configFlags;
  TCPIP_ETH_PAUSE_TYPE macPauseType;
} DRV_ETHPHY_SETUP;
```

Members

Members	Description
int phyAddress;	the address the PHY is configured for
TCPIP_ETH_OPEN_FLAGS openFlags;	the capability flags: FD/HD, 100/100Mbps, etc.
DRV_ETHPHY_CONFIG_FLAGS configFlags;	configuration flags: MII/RMII, I/O setup
TCPIP_ETH_PAUSE_TYPE macPauseType;	MAC requested pause type

Description

Ethernet PHY Device Driver Set up Data

This data structure contains all the data necessary to configure the Ethernet PHY device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the DRV_ETHPHY_Setup routine.

DRV_ETHPHY_VENDOR_MDIX_CONFIGURE Type

Pointer to function that configures the MDIX mode for the Ethernet PHY.

File

drv_ethphy.h

C

```
typedef DRV_ETHPHY_RESULT (* DRV_ETHPHY_VENDOR_MDIX_CONFIGURE)(const struct DRV_ETHPHY_OBJECT_BASE_TYPE*
pBaseObj, DRV_HANDLE handle, TCPIP_ETH_OPEN_FLAGS oFlags);
```

Returns

- DRV_ETHPHY_RES_OK - if success, operation complete
- DRV_ETHPHY_RES_PENDING - if function needs to be called again

< 0 - on failure: configuration not supported or some other error

Description

Pointer To Function: typedef DRV_ETHPHY_RESULT (* DRV_ETHPHY_VENDOR_MDIX_CONFIGURE) (const struct DRV_ETHPHY_OBJECT_BASE_TYPE* pBaseObj, DRV_HANDLE handle, TCPIP_ETH_OPEN_FLAGS oFlags);

This type describes a pointer to a function that configures the MDIX mode for the Ethernet PHY. This configuration function is PHY specific and every PHY driver has to provide their own implementation.

Remarks

The PHY driver consists of 2 modules:

- the main/base PHY driver which uses standard IEEE PHY registers
- the vendor specific functionality

This function provides vendor specific functionality. Every PHY driver has to expose this vendor specific function as part of its interface.

Traditionally the name used for this function is DRV_EXTPHY_MDIXConfigure but any name can be used.

The function can use all the vendor specific functions to store/retrieve specific data or start SMI transactions (see Vendor Interface Routines).

The function should not block but return DRV_ETHPHY_RES_PENDING if waiting for SMI transactions.

Preconditions

Communication to the PHY should have been established.

DRV_ETHPHY_VENDOR_MII_CONFIGURE Type

Pointer to function to configure the Ethernet PHY in one of the MII/RMII operation modes.

File

drv_ethphy.h

C

```
typedef DRV_ETHPHY_RESULT (* DRV_ETHPHY_VENDOR_MII_CONFIGURE)(const struct DRV_ETHPHY_OBJECT_BASE_TYPE*
pBaseObj, DRV_HANDLE handle, DRV_ETHPHY_CONFIG_FLAGS cFlags);
```

Returns

- DRV_ETHPHY_RES_OK - if success, operation complete
- DRV_ETHPHY_RES_PENDING - if function needs to be called again

< 0 - on failure: configuration not supported or some other error

Description

Pointer To Function: typedef DRV_ETHPHY_RESULT (* DRV_ETHPHY_VENDOR_MII_CONFIGURE) (const struct DRV_ETHPHY_OBJECT_BASE_TYPE* pBaseObj, DRV_HANDLE handle, DRV_ETHPHY_CONFIG_FLAGS cFlags);

This type describes a pointer to a function that configures the Ethernet PHY in one of the MII/RMII operation modes. This configuration function is PHY specific and every PHY driver has to provide their own implementation.

Remarks

The PHY driver consists of 2 modules:

- the main/base PHY driver which uses standard IEEE PHY registers
- the vendor specific functionality

This function provides vendor specific functionality. Every PHY driver has to expose this vendor specific function as part of its interface.

Traditionally the name used for this function is DRV_EXTPHY_MIIConfigure but any name can be used.

The PHY driver will call the vendor set up functions after the communication to the PHY has been established.

The function can use all the vendor specific functions to store/retrieve specific data or start SMI transactions (see Vendor Interface Routines).

The function should not block but return DRV_ETHPHY_RES_PENDING if waiting for SMI transactions.

Preconditions

Communication to the PHY should have been established.

DRV_ETHPHY_VENDOR_SMI_CLOCK_GET Type

Pointer to a function to return the SMI/MIIM maximum clock speed in Hz of the Ethernet PHY.

File

drv_ethphy.h

C

```
typedef unsigned int (* DRV_ETHPHY_VENDOR_SMI_CLOCK_GET)(const struct DRV_ETHPHY_OBJECT_BASE_TYPE*
pBaseObj, DRV_HANDLE handle);
```

Returns

The maximum SMI/MIIM clock speed as an unsigned integer.

Description

Pointer to Function: typedef unsigned int (* DRV_ETHPHY_VENDOR_SMI_CLOCK_GET) (const struct DRV_ETHPHY_OBJECT_BASE_TYPE* pBaseObj, DRV_HANDLE handle);

This type describes a pointer to a function that returns the SMI/MIIM maximum clock speed in Hz of the Ethernet PHY. This configuration function is PHY specific and every PHY driver has to provide their own implementation.

Remarks

The PHY driver consists of 2 modules:

- the main/base PHY driver which uses standard IEEE PHY registers
- the vendor specific functionality

This function provides vendor specific functionality. Every PHY driver has to expose this vendor specific function as part of its interface.

This value is PHY specific. All PHYs are requested to support 2.5 MHz.

Traditionally the name used for this function is DRV_EXTPHY_SMIClockGet but any name can be used.

The PHY driver will call the vendor set up functions after the communication to the PHY has been established.

The function should not block but return immediately. The function cannot start SMI transactions and cannot use the vendor specific functions to store/retrieve specific data (see Vendor Interface Routines).

Preconditions

Communication to the PHY should have been established.

DRV_ETHPHY_INDEX_0 Macro

Ethernet PHY driver index definitions.

File

drv_ethphy.h

C

```
#define DRV_ETHPHY_INDEX_0 0
```

Description

Ethernet PHY Driver Module Index Numbers

These constants provide the Ethernet PHY driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_ETHPHY_Initialize and DRV_ETHPHY_Open routines to identify the driver instance in use.

DRV_ETHPHY_INDEX_1 Macro

File

drv_ethphy.h

C

```
#define DRV_ETHPHY_INDEX_1 1
```

Description

This is macro DRV_ETHPHY_INDEX_1.

DRV_ETHPHY_INDEX_COUNT Macro

Number of valid Ethernet PHY driver indices.

File

drv_ethphy.h

C

```
#define DRV_ETHPHY_INDEX_COUNT 1
```

Description

Ethernet PHY Driver Module Index Count

This constant identifies the number of valid Ethernet PHY driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from part-specific header files defined as part of the peripheral libraries.

DRV_ETHPHY_LinkStatusGet Function

Returns the current link status.

Implementation: Dynamic

File

drv_ethphy.h

C

```
DRV_ETHPHY_RESULT DRV_ETHPHY_LinkStatusGet(DRV_HANDLE handle, DRV_ETHPHY_LINK_STATUS* pLinkStat, bool
refresh);
```

Returns

- DRV_ETHPHY_RES_PENDING for ongoing, in progress operation
- an DRV_ETHPHY_RESULT error code if the link status get procedure failed.

Description

This function returns the current link status.

Remarks

This function reads the Ethernet PHY to get current link status. If refresh is specified then, if the link is down a second read will be performed to return the current link status.

Use DRV_ETHPHY_ClientStatus() and DRV_ETHPHY_ClientOperationResult() to check when the operation was completed and its outcome.

Preconditions

- The DRV_ETHPHY_Initialize routine must have been called.
- DRV_ETHPHY_Open must have been called to obtain a valid device handle.
- DRV_ETHPHY_Setup must have been called to properly configure the PHY

Example

Function

DRV_ETHPHY_RESULT DRV_ETHPHY_LinkStatusGet(DRV_HANDLE handle, DRV_ETHPHY_LINK_STATUS* pLinkStat, bool refresh)

DRV_ETHPHY_LINK_STATUS Enumeration

Defines the possible status flags of PHY Ethernet link.

File

drv_ethphy.h

C

```
typedef enum {
  DRV_ETHPHY_LINK_ST_DOWN,
  DRV_ETHPHY_LINK_ST_UP,
  DRV_ETHPHY_LINK_ST_LP_NEG_UNABLE,
  DRV_ETHPHY_LINK_ST_REMOTE_FAULT,
  DRV_ETHPHY_LINK_ST_PDF,
  DRV_ETHPHY_LINK_ST_LP_PAUSE,
  DRV_ETHPHY_LINK_ST_LP_ASM_DIR,
  DRV_ETHPHY_LINK_ST_NEG_TMO,
  DRV_ETHPHY_LINK_ST_NEG_FATAL_ERR
} DRV_ETHPHY_LINK_STATUS;
```

Members

Members	Description
DRV_ETHPHY_LINK_ST_DOWN	No connection to the LinkPartner
DRV_ETHPHY_LINK_ST_UP	Link is up
DRV_ETHPHY_LINK_ST_LP_NEG_UNABLE	LP non negotiation able
DRV_ETHPHY_LINK_ST_REMOTE_FAULT	LP fault during negotiation
DRV_ETHPHY_LINK_ST_PDF	Parallel Detection Fault encountered (when DRV_ETHPHY_LINK_ST_LP_NEG_UNABLE)
DRV_ETHPHY_LINK_ST_LP_PAUSE	LP supports symmetric pause
DRV_ETHPHY_LINK_ST_LP_ASM_DIR	LP supports asymmetric TX/RX pause operation
DRV_ETHPHY_LINK_ST_NEG_TMO	LP not there
DRV_ETHPHY_LINK_ST_NEG_FATAL_ERR	An unexpected fatal error occurred during the negotiation

Description

Ethernet PHY Device Link Status Codes

This enumeration defines the flags describing the status of the PHY Ethernet link.

Remarks

Multiple flags can be set.

DRV_ETHPHY_CONFIG_FLAGS Enumeration

Defines the possible results of Ethernet operations that can succeed or fail

File

drv_ethphy.h

C

```
typedef enum {
  DRV_ETHPHY_CFG_RMII,
  DRV_ETHPHY_CFG_MII,
  DRV_ETHPHY_CFG_ALTERNATE,
  DRV_ETHPHY_CFG_DEFAULT,
  DRV_ETHPHY_CFG_AUTO
} DRV_ETHPHY_CONFIG_FLAGS;
```

Members

Members	Description
DRV_ETHPHY_CFG_RMII	RMII data interface in configuration fuses.
DRV_ETHPHY_CFG_MII	MII data interface in configuration fuses.
DRV_ETHPHY_CFG_ALTERNATE	Configuration fuses is ALT
DRV_ETHPHY_CFG_DEFAULT	Configuration fuses is DEFAULT

DRV_ETHPHY_CFG_AUTO	Use the fuses configuration to detect if you are RMII/MII and ALT/DEFAULT configuration

Description

Ethernet PHY Driver Operation Result *

PHY Driver Operation Result Codes

This enumeration defines the possible results of any of the PHY driver operations that have the possibility of failing. This result should be checked to ensure that the operation achieved the desired result.

DRV_ETHPHY_OBJECT Structure

Identifies the interface of a Ethernet PHY vendor driver.

File

drv_ethphy.h

C

```
typedef struct {
  DRV_ETHPHY_VENDOR_MII_CONFIGURE miiConfigure;
  DRV_ETHPHY_VENDOR_MDIX_CONFIGURE mdixConfigure;
  DRV_ETHPHY_VENDOR_SMI_CLOCK_GET smiClockGet;
  DRV_ETHPHY_VENDOR_WOL_CONFIGURE wolConfigure;
} DRV_ETHPHY_OBJECT;
```

Members

Members	Description
DRV_ETHPHY_VENDOR_MII_CONFIGURE miiConfigure;	PHY driver function to configure the operation mode: MII/RMII
DRV_ETHPHY_VENDOR_MDIX_CONFIGURE mdixConfigure;	PHY driver function to configure the MDIX mode
DRV_ETHPHY_VENDOR_SMI_CLOCK_GET smiClockGet;	PHY driver function to get the SMI clock rate
DRV_ETHPHY_VENDOR_WOL_CONFIGURE wolConfigure;	PHY driver function to configure the WOL functionality

Description

Ethernet PHY Driver Vendor Object

This data structure identifies the required interface of the Ethernet PHY driver. Any PHY vendor driver has to export this interface.

Remarks

The PHY driver consists of 2 modules:

- the main/base PHY driver which uses standard IEEE PHY registers
- the vendor specific functionality

This object provides vendor specific functionality. Every PHY driver has to expose this vendor specific functionality as part of its interface.

DRV_ETHPHY_VENDOR_WOL_CONFIGURE Type

Pointer to a function to configure the PHY WOL functionality

File

drv_ethphy.h

C

```
typedef void (* DRV_ETHPHY_VENDOR_WOL_CONFIGURE)(const struct DRV_ETHPHY_OBJECT_BASE_TYPE* pBaseObj,
DRV_HANDLE handle, unsigned char bAddr[]);
```

Returns

None

Description

Pointer to Function: typedef void (* DRV_ETHPHY_VENDOR_WOL_CONFIGURE) (const struct DRV_ETHPHY_OBJECT_BASE_TYPE* pBaseObj, DRV_HANDLE handle, unsigned char bAddr[]);

This type describes a pointer to a function that configures the PHY WOL functionality of the Ethernet PHY. Configures the WOL of the PHY with a

Source MAC address or a 6 byte magic packet mac address.

This configuration function is PHY specific and every PHY driver has to provide their own implementation.

Remarks

The PHY driver consists of 2 modules:

- the main/base PHY driver which uses standard IEEE PHY registers
- the vendor specific functionality

This function provides vendor specific functionality. Every PHY driver has to expose this vendor specific function as part of its interface.

Traditionally the name used for this function is DRV_EXTPHY_WOLConfiguration but any name can be used.

The PHY driver will call the vendor set up functions after the communication to the PHY has been established.

The function can use all the vendor specific functions to store/retrieve specific data or start SMI transactions (see Vendor Interface Routines).

The function should not block but return DRV_ETHPHY_RES_PENDING if waiting for SMI transactions.

This feature is not currently supported for all PHYs.

Preconditions

Communication to the PHY should have been established.

DRV_ETHPHY_OBJECT_BASE Structure

Identifies the base interface of a Ethernet PHY driver.

File

drv_ethphy.h

C

```
typedef struct DRV_ETHPHY_OBJECT_BASE_TYPE {
  SYS_MODULE_OBJ (* DRV_ETHPHY_Initialize)(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const
init);
  void (* DRV_ETHPHY_Reinitialize)(SYS_MODULE_OBJ object, const SYS_MODULE_INIT * const init);
  void (* DRV_ETHPHY_Deinitialize)(SYS_MODULE_OBJ object);
  SYS_STATUS (* DRV_ETHPHY_Status)(SYS_MODULE_OBJ object);
  void (* DRV_ETHPHY_Tasks)(SYS_MODULE_OBJ object);
  DRV_HANDLE (* DRV_ETHPHY_Open)(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
  void (* DRV_ETHPHY_Close)(DRV_HANDLE handle);
  DRV_ETHPHY_CLIENT_STATUS (* DRV_ETHPHY_ClientStatus)(DRV_HANDLE handle);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_ClientOperationResult)(DRV_HANDLE handle);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_ClientOperationAbort)(DRV_HANDLE handle);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_SMIRead)(DRV_HANDLE handle, unsigned int rIx, uint16_t* pSmiRes, int
phyAdd);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_SMIWrite)(DRV_HANDLE handle, unsigned int rIx, uint16_t wData, int
phyAdd, bool waitComplete);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_SMIScanStart)(DRV_HANDLE handle, unsigned int rIx);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_SMIScanStop)(DRV_HANDLE handle);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_SMIScanStatusGet)(DRV_HANDLE handle);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_SMIScanDataGet)(DRV_HANDLE handle, uint16_t* pScanRes);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_SMIStatus)(DRV_HANDLE handle);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_SMIClockSet)(DRV_HANDLE handle, uint32_t hostClock, uint32_t maxSMIClock);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_PhyAddressGet)(DRV_HANDLE handle, int* pPhyAddress);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_Setup)(DRV_HANDLE handle, DRV_ETHPHY_SETUP* pSetUp, TCPIP_ETH_OPEN_FLAGS*
pSetupFlags);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_RestartNegotiation)(DRV_HANDLE handle);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_HWConfigFlagsGet)(DRV_HANDLE handle, DRV_ETHPHY_CONFIG_FLAGS* pFlags);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_NegotiationIsComplete)(DRV_HANDLE handle, bool waitComplete);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_NegotiationResultGet)(DRV_HANDLE handle, DRV_ETHPHY_NEGOTIATION_RESULT*
pNegResult);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_LinkStatusGet)(DRV_HANDLE handle, DRV_ETHPHY_LINK_STATUS* pLinkStat, bool
refresh);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_Reset)(DRV_HANDLE handle, bool waitComplete);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_VendorDataGet)(DRV_HANDLE handle, uint32_t* pVendorData);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_VendorDataSet)(DRV_HANDLE handle, uint32_t vendorData);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_VendorSMIReadStart)(DRV_HANDLE handle, uint16_t rIx, int phyAddress);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_VendorSMIReadResultGet)(DRV_HANDLE handle, uint16_t* pSmiRes);
  DRV_ETHPHY_RESULT (* DRV_ETHPHY_VendorSMIWriteStart)(DRV_HANDLE handle, uint16_t rIx, uint16_t wData, int
phyAddress);
} DRV_ETHPHY_OBJECT_BASE;
```

Description

Ethernet PHY Driver Base Object

This data structure identifies the required interface of the Ethernet PHY driver. Any dynamic PHY driver has to export this interface.

Remarks

The PHY driver consists of 2 modules:

- the main/base PHY driver which uses standard IEEE PHY registers
- the vendor specific functionality

This object provides the base functionality. Every dynamic PHY driver has to expose this basic functionality as part of its interface.

See above the description of each function that's part of the base PHY driver.

Enumerations

	Name	Description
	DRV_ETHPHY_CLIENT_STATUS	Identifies the client-specific status of the Ethernet PHY driver.
	DRV_ETHPHY_CONFIG_FLAGS	Defines the possible results of Ethernet operations that can succeed or fail
	DRV_ETHPHY_LINK_STATUS	Defines the possible status flags of PHY Ethernet link.

Functions

	Name	Description
	DRV_ETHPHY_ClientOperationAbort	Aborts a current client operation initiated by the Ethernet PHY driver. **Implementation:** Dynamic
	DRV_ETHPHY_ClientOperationResult	Gets the result of a client operation initiated by the Ethernet PHY driver. **Implementation:** Dynamic
	DRV_ETHPHY_ClientStatus	Gets the current client-specific status the Ethernet PHY driver. **Implementation:** Dynamic
	DRV_ETHPHY_Close	Closes an opened instance of the Ethernet PHY driver. **Implementation:** Dynamic
	DRV_ETHPHY_Deinitialize	Deinitializes the specified instance of the Ethernet PHY driver module. **Implementation:** Dynamic
	DRV_ETHPHY_HWConfigFlagsGet	Returns the current Ethernet PHY hardware MII/RMII and ALTERNATE/DEFAULT configuration flags. **Implementation:** Dynamic
	DRV_ETHPHY_Initialize	Initializes the Ethernet PHY driver. **Implementation:** Dynamic
	DRV_ETHPHY_LinkStatusGet	Returns the current link status. **Implementation:** Dynamic
	DRV_ETHPHY_NegotiationIsComplete	Returns the results of a previously initiated Ethernet PHY negotiation. **Implementation:** Dynamic
	DRV_ETHPHY_NegotiationResultGet	Returns the result of a completed negotiation. **Implementation:** Dynamic
	DRV_ETHPHY_Open	Opens the specified Ethernet PHY driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_ETHPHY_PhyAddressGet	Returns the PHY address. **Implementation:** Dynamic
	DRV_ETHPHY_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings. **Implementation:** Dynamic

	DRV_ETHPHY_Reset	Immediately resets the Ethernet PHY. **Implementation:** Dynamic
	DRV_ETHPHY_RestartNegotiation	Restarts auto-negotiation of the Ethernet PHY link. **Implementation:** Dynamic
	DRV_ETHPHY_Setup	Initializes Ethernet PHY configuration and set up procedure. **Implementation:** Dynamic
	DRV_ETHPHY_SMIClockSet	Sets the SMI/MIIM interface clock. **Implementation:** Dynamic
	DRV_ETHPHY_SMIRead	Initiates a SMI/MIIM read transaction. **Implementation:** Dynamic
	DRV_ETHPHY_SMIScanDataGet	Gets the latest SMI/MIIM scan data result. **Implementation:** Dynamic
	DRV_ETHPHY_SMIScanStart	Starts the scan of a requested SMI/MIIM register. **Implementation:** Dynamic
	DRV_ETHPHY_SMIScanStatusGet	Gets the status of the SMI/MIIM scan data. **Implementation:** Dynamic
	DRV_ETHPHY_SMIScanStop	Stops the scan of a previously requested SMI/MIIM register. **Implementation:** Dynamic
	DRV_ETHPHY_SMIStatus	Returns the current status of the SMI/MIIM interface. **Implementation:** Dynamic
	DRV_ETHPHY_SMIWrite	Initiates a SMI/MIIM write transaction. **Implementation:** Dynamic
	DRV_ETHPHY_Status	Provides the current status of the Ethernet PHY driver module. **Implementation:** Dynamic
	DRV_ETHPHY_Tasks	Maintains the driver's state machine and implements its ISR. **Implementation:** Dynamic
	DRV_ETHPHY_VendorDataGet	Returns the current value of the vendor data. **Implementation:** Dynamic
	DRV_ETHPHY_VendorDataSet	Returns the current value of the vendor data. **Implementation:** Dynamic
	DRV_ETHPHY_VendorSMIReadResultGet	Reads the result of a previous vendor initiated SMI read transfer with DRV_ETHPHY_VendorSMIReadStart. **Implementation:** Dynamic
	DRV_ETHPHY_VendorSMIReadStart	Starts a vendor SMI read transfer. Data will be available with DRV_ETHPHY_VendorSMIReadResultGet. **Implementation:** Dynamic
	DRV_ETHPHY_VendorSMIWriteStart	Starts a vendor SMI write transfer. **Implementation:** Dynamic

Macros

	Name	Description
	DRV_ETHPHY_INDEX_0	Ethernet PHY driver index definitions.
	DRV_ETHPHY_INDEX_1	This is macro DRV_ETHPHY_INDEX_1.
	DRV_ETHPHY_INDEX_COUNT	Number of valid Ethernet PHY driver indices.

Structures

	Name	Description
	DRV_ETHPHY_OBJECT_BASE_TYPE	Identifies the base interface of a Ethernet PHY driver.
	DRV_ETHPHY_INIT	Contains all the data necessary to initialize the Ethernet PHY device.
	DRV_ETHPHY_NEGOTIATION_RESULT	Contains all the data necessary to get the Ethernet PHY negotiation result
	DRV_ETHPHY_OBJECT	Identifies the interface of a Ethernet PHY vendor driver.
	DRV_ETHPHY_OBJECT_BASE	Identifies the base interface of a Ethernet PHY driver.
	DRV_ETHPHY_SETUP	Contains all the data necessary to set up the Ethernet PHY device.

Types

	Name	Description
	DRV_ETHPHY_VENDOR_MDIX_CONFIGURE	Pointer to function that configures the MDIX mode for the Ethernet PHY.

	DRV_ETHPHY_VENDOR_MII_CONFIGURE	Pointer to function to configure the Ethernet PHY in one of the MII/RMII operation modes.
	DRV_ETHPHY_VENDOR_SMI_CLOCK_GET	Pointer to a function to return the SMI/MIIM maximum clock speed in Hz of the Ethernet PHY.
	DRV_ETHPHY_VENDOR_WOL_CONFIGURE	Pointer to a function to configure the PHY WOL functionality

Description

Ethernet ETHPHY Device Driver Interface

The Ethernet ETHPHY device driver provides a simple interface to manage an Ethernet ETHPHY peripheral using MIIM (or SMI) interface. This file defines the interface definitions and prototypes for the Ethernet ETHPHY driver.

File Name

drv_ethphy.h

Company

Microchip Technology Inc.

drv_ethphy_config.h

Ethernet PHY driver configuration definitions template.

Macros

	Name	Description
	DRV_ETHPHY_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_ETHPHY_INDEX	Ethernet PHY static index selection.
	DRV_ETHPHY_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_ETHPHY_NEG_DONE_TMO	Value of the PHY negotiation complete time out as per IEEE 802.3 spec.
	DRV_ETHPHY_NEG_INIT_TMO	Value of the PHY negotiation initiation time out as per IEEE 802.3 spec.
	DRV_ETHPHY_PERIPHERAL_ID	Defines an override of the peripheral ID.
	DRV_ETHPHY_RESET_CLR_TMO	Value of the PHY Reset self clear time out as per IEEE 802.3 spec.

Flash Driver Library

This section describes the Flash Driver Library.

Introduction

The Flash Driver Library provides functions that allow low-level interface with the on-chip Flash.

Description

Through MHC, this driver provides low-level functions for writing and erasing sections of the Flash memory.

Flash Program Memory

The Flash Program Memory is readable, writeable, and erasable during normal operation over the entire operating voltage range.

A read from program memory is executed at one byte/word at a time depending on the width of the data bus.

A write to the program memory is executed in either blocks of specific sizes or a single word depending on the type of processor used.

An erase is performed in blocks. A bulk erase may be performed from user code depending on the type of processor supporting the operation.

Writing or erasing program memory will cease instruction fetches until the operation is complete, restricting memory access, and therefore

preventing code execution. This is controlled by an internal programming timer.

Library Interface

Functions

	Name	Description
	DRV_FLASH_ErasePage	Erases a page of Flash. **Implementation:** Static
	DRV_FLASH_GetPageSize	Returns the size in bytes of a single "Page" which can be erased in the flash. **Implementation:** Static
	DRV_FLASH_GetRowSize	Returns the size in bytes of a single "Row" which can be written to the flash. **Implementation:** Static
	DRV_FLASH_Initialize	Initializes the Flash instance for the specified driver index. **Implementation:** Static
	DRV_FLASH_IsBusy	Returns true if the Flash device is still busy writing or is erasing. **Implementation:** Static
	DRV_FLASH_Open	Initializes a channel to the appropriate flash device.
	DRV_FLASH_WriteQuadWord	Writes four 4-byte words to the Flash at the (word-aligned) flashAddr. **Implementation:** Static
	DRV_FLASH_WriteRow	Writes an DRV_FLASH_ROW_SIZE bytes to the Flash at the (word-aligned) flashAddr. **Implementation:** Static
	DRV_FLASH_WriteWord	Writes a 4-byte Word to the Flash at the (word-aligned) flashAddr. **Implementation:** Static

Data Types and Constants

	Name	Description
	DRV_FLASH_INDEX_0	FLASH driver index definitions
	DRV_FLASH_PAGE_SIZE	Specifies the FLASH Driver Program Page Size in bytes.
	DRV_FLASH_ROW_SIZE	Specifies the FLASH Driver Program Row Size in bytes.

Description

This section describes the Application Programming Interface (API) functions of the Flash Driver Library.

Refer to each section for a detailed description.

Functions

DRV_FLASH_ErasePage Function

Erases a page of Flash.

Implementation: Static

File

drv_flash.h

C

```
void DRV_FLASH_ErasePage(const DRV_HANDLE handle, uint32_t flashAddr);
```

Returns

None.

Description

This function starts the process of erasing a page of Flash. It does not wait for the erase operation to be done. That is left to the user. It does not verify that the erase was successful. That is left to the user. It always erases a single page. The size of a page in bytes will vary by device. It will be available in the DRV_FLASH_PAGE_SIZE parameter.

Remarks

Most devices will be running for code stored in the Flash. This means that any erases of the Flash will necessarily be writes to program space. As such, they will prevent the CPU from reading further instructions until the write is done. However, some devices may have more than one Flash

such that it can run from one while writing to another. Additionally, if the application is small enough, it may run out of a cache. In any case, it is up to the user to wait for an operation to complete and or to decide that such a wait is unnecessary.

Preconditions

The flashAddr is taken as a valid Flash address. No range checking occurs. Any previous Flash operations (write or erase) must be completed or this will fail silently. The Flash must be correctly erased at flashAddr.

Example

```
flashAddr = 0x9d008000;
DRV_FLASH_Erase_Page(handle, flashAddr);
```

Function

void DRV_FLASH_Erase_Page(uint32_t flashAddr);

DRV_FLASH_GetPageSize Function

Returns the size in bytes of a single "Page" which can be erased in the flash.

Implementation: Static

File

drv_flash.h

C

```
uint32_t DRV_FLASH_GetPageSize(const DRV_HANDLE handle);
```

Returns

None.

Description

This function allows the user to get the size of a flash Page.

Remarks

None.

Preconditions

None

Function

uint32_t DRV_FLASH_GetPageSize(const DRV_HANDLE handle)

DRV_FLASH_GetRowSize Function

Returns the size in bytes of a single "Row" which can be written to the flash.

Implementation: Static

File

drv_flash.h

C

```
uint32_t DRV_FLASH_GetRowSize(const DRV_HANDLE handle);
```

Returns

None.

Description

This function allows the user to get the size of a flash Row.

Remarks

None.

Preconditions

None

Function

uint32_t DRV_FLASH_GetRowSize(const DRV_HANDLE handle)

DRV_FLASH_Initialize Function

Initializes the Flash instance for the specified driver index.

Implementation: Static

File

drv_flash.h

C

```
SYS_MODULE_OBJ DRV_FLASH_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the Flash Driver instance for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters.

Remarks

This function must be called before any other Flash function is called. This function should only be called once during system initialization.

Preconditions

None.

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_FLASH_Initialize(
const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init
)

DRV_FLASH_IsBusy Function

Returns true if the Flash device is still busy writing or is erasing.

Implementation: Static

File

drv_flash.h

C

```
bool DRV_FLASH_IsBusy(const DRV_HANDLE handle);
```

Returns

- true - Indicates the Flash is busy
- false - Indicates the Flash is not busy

Description

This function checks whether the process of programming a Word into the Flash is still operating.

Remarks

Most devices will be running for code stored in the Flash. This means that any writes to the Flash will necessarily be writes to program space. As such, they will prevent the CPU from reading further instructions until the write is done. However, some devices may have more than one Flash such that it can run from one while writing to another. Additionally, if the application is small enough, it may run out of a cache. In any case, it is up

to the user to wait for an operation to complete and or to decide that such a wait is unnecessary.

Preconditions

None.

Example

```
flashAddr = 0x9d008000;
sourceData = 0x12345678;
DRV_FLASH_Write_Word(flashAddr,  sourceData);
DRV_FLASH_IsBusy( void );
```

Function

bool DRV_FLASH_IsBusy(void)

DRV_FLASH_Open Function

Initializes a channel to the appropriate flash device.

File

drv_flash.h

C

```
DRV_HANDLE DRV_FLASH_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT ioIntent);
```

Returns

Handle for future calls to the driver's operations.

Preconditions

None

Function

DRV_HANDLE DRV_FLASH_Open(
const SYS_MODULE_INDEX index,
const DRV_IO_INTENT ioIntent
);

DRV_FLASH_WriteQuadWord Function

Writes four 4-byte words to the Flash at the (word-aligned) flashAddr.

Implementation: Static

File

drv_flash.h

C

```
void DRV_FLASH_WriteQuadWord(const DRV_HANDLE handle, uint32_t flashAddr, uint32_t * sourceData);
```

Returns

None.

Description

This function starts the process of programming a word into the Flash. It does not wait for the write operation to be done, which is left to the user. It does not verify that the write was successful, which is left to the user.

Remarks

Most devices will be running for code stored in the Flash. This means that any writes to the Flash will necessarily be writes to program space. As such, they will prevent the CPU from reading further instructions until the write is done. However, some devices may have more than one Flash such that it can run from one while writing to another. Additionally, if the application is small enough, it may run out of a cache. In any case, it is up to the user to wait for an operation to complete and or to decide that such a wait is unnecessary.

Preconditions

The flashAddr is taken as a valid Flash address. No range checking occurs. Any previous Flash operations (write or erase) must be completed or

this will fail silently. The Flash must be correctly erased at flashAddr.

Example

```
flashAddr = 0x9d008000;
sourceData[4] = {0x12345678,0x9ABCDEF0,0x55AAAA55,0x11111111};
DRV_FLASH_WriteQuadWord(handle, flashAddr,  sourceData);
```

Function

void DRV_FLASH_WriteQuadWord(const DRV_HANDLE handle, uint32_t flashAddr, uint32_t sourceData)

DRV_FLASH_WriteRow Function

Writes an DRV_FLASH_ROW_SIZE bytes to the Flash at the (word-aligned) flashAddr.

Implementation: Static

File

drv_flash.h

C

```
void DRV_FLASH_WriteRow(const DRV_HANDLE handle, uint32_t flashAddr, uint32_t sourceData);
```

Returns

None.

Description

This function starts the process of programming a buffer into the Flash. It does not wait for the write operation to be done, which is left to the user. It does not verify that the write was successful, which is left to the user.

Remarks

Most devices will be running for code stored in the Flash. This means that any writes to the Flash will necessarily be writes to program space. As such, they will prevent the CPU from reading further instructions until the write is done. However, some devices may have more than one Flash such that it can run from one while writing to another. Additionally, if the application is small enough, it may run out of a cache. In any case, it is up to the user to wait for an operation to complete and or to decide that such a wait is unnecessary.

Preconditions

The flashAddr is taken as a valid Flash address. No range checking occurs. The memory pointed to by sourceData must be valid memory for at least DRV_FLASH_ROW_SIZE bytes. Any previous Flash operations (write or erase) must be completed or this will fail silently. The Flash must be correctly erased at flashAddr.

Example

```
flashAddr = 0x9d008000;
uint32_t dataStore[DRV_FLASH_ROW_SIZE] = {0,1,2,3,4,5};
DRV_FLASH_Write_Row( const DRV_HANDLE handle, flashAddr,  dataStore);
```

Function

void DRV_FLASH_WriteRow(const DRV_HANDLE handle, uint32_t flashAddr, uint32_t sourceData)

DRV_FLASH_WriteWord Function

Writes a 4-byte Word to the Flash at the (word-aligned) flashAddr.

Implementation: Static

File

drv_flash.h

C

```
void DRV_FLASH_WriteWord(const DRV_HANDLE handle, uint32_t flashAddr, uint32_t sourceData);
```

Returns

None.

Description

This function starts the process of programming a Word into the Flash. It does not wait for the write operation to be done, which is left to the user.

It does not verify that the write was successful, which is left to the user.

Remarks

Most devices will be running for code stored in the Flash. This means that any writes to the Flash will necessarily be writes to program space. As such, they will prevent the CPU from reading further instructions until the write is done. However, some devices may have more than one Flash such that it can run from one while writing to another. Additionally, if the application is small enough, it may run out of a cache. In any case, it is up to the user to wait for an operation to complete and or to decide that such a wait is unnecessary.

Preconditions

The flashAddr is taken as a valid Flash address. No range checking occurs. Any previous Flash operations (write or erase) must be completed or this will fail silently. The Flash must be correctly erased at flashAddr.

Example

```
flashAddr = 0x9d008000;
sourceData = 0x12345678;
DRV_FLASH_WriteWord(handle, flashAddr,  sourceData);
```

Function

void DRV_FLASH_WriteWord(const DRV_HANDLE handle, uint32_t flashAddr, uint32_t sourceData)

Data Types and Constants

DRV_FLASH_INDEX_0 Macro

FLASH driver index definitions

File

drv_flash.h

C

```
#define DRV_FLASH_INDEX_0 0
```

Description

These constants provide FLASH driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_FLASH_Initialize and DRV_FLASH_Open routines to identify the driver instance in use.

Section

Driver FLASH Module Index

DRV_FLASH_PAGE_SIZE Macro

Specifies the FLASH Driver Program Page Size in bytes.

File

drv_flash.h

C

```
#define DRV_FLASH_PAGE_SIZE (NVM_PAGE_SIZE)
```

Description

FLASH Driver Program Page Size.

This definition specifies the FLASH Driver Program Page Size in bytes. This parameter is device specific and is obtained from the device specific processor header file.

Remarks

None

DRV_FLASH_ROW_SIZE Macro

Specifies the FLASH Driver Program Row Size in bytes.

File

drv_flash.h

C

```
#define DRV_FLASH_ROW_SIZE (NVM_ROW_SIZE)
```

Description

FLASH Driver Program Row Size.

This definition specifies the FLASH Driver Program Row Size in bytes. This parameter is device specific and is obtained from the device specific processor header file. The Program Row Size is the maximum block size that can be programmed in one program operation.

Remarks

None

Description

Flash Driver Interface Declarations for Static Single Instance Driver

The Flash device driver provides a simple interface to manage the Flash Controller on Microchip microcontrollers. This file defines the interface Declarations for the Flash driver.

Remarks

Static interfaces incorporate the driver instance number within the names of the routines, eliminating the need for an object ID or object handle.

Static single-open interfaces also eliminate the need for the open handle.

Microchip Technology Inc.

Graphics Driver Library

This section describes the Graphics (GFX) Driver Library.

Introduction

The Graphics (GFX) Driver Layer Library is the GFX library stack available for the Microchip family of microcontrollers.

Description

The Microchip Graphics (GFX) Library is a free, modular library optimized for Microchip Microcontrollers.

- Graphics Object Layer - This layer renders the control objects such as button, list box, progress bar, meter, and so on
- Graphics Primitives Layer - This layer implements the primitive rendering functions
- Graphics Display Driver Layer - This layer is the graphics display driver component that is optimized to the actual display module used

The library comes with features such as alpha blending, gradient fills, and anti-aliased fonts. These features can be enabled or disabled through build configurations. Applications can take advantage of these features to enhance the user experience while delivering performance required by the application.

This help provides information on the Graphics Display Driver Layer. This layer is the interface between the Graphics Core Library and the hardware, which may include a display controller or directly to the display device.

Using the Library

This topic describes the basic architecture of the Graphics Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_gfx_display.h`

The interface to the Graphics Driver Library is defined in the `drv_gfx_display.h` header file.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Library Overview

This topic provides and overview of the Graphics Driver Library.

Description

The driver library API is described in three groups.

- Initialization - provides system level initialization support
- Operations - provides application level run-time support
- Rendering - provides core library level display drawing support

System and Application functions are accessed by system and application routines without using the graphics core library. Rendering function

(Library Functions) are intended be used by the Graphics Primitive Layer only to render pixel data to the actual display.

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The Library Interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Graphics Driver Library.

Section	Description
Graphics Driver Library Functions	Provides general interface functions specific to the Graphics Driver Library.
GLCD Driver Functions	Provides interface functions specific to the GLCD Graphics Driver Library.
LCC Graphics Driver Functions	Provides interface functions specific to the Low-Cost Controllerless (LCC) Graphics Driver Library.
OTM2201A Graphics Driver Functions	Provides interface functions specific to the OTM2201A Graphics Driver Library.
S1D13517 Graphics Driver Functions	Provides interface functions specific to the S1D13517 Graphics Driver Library.
SSD1289 Graphics Driver Functions	Provides interface functions specific to the SSD1289 Graphics Driver Library.
SSD1926 Graphics Driver Functions	Provides interface functions specific to the SSD1926 Graphics Driver Library.
tft002 Graphics Driver Functions	Provides interface functions specific to the tft002 Graphics Driver Library.

How the Library Works

The library provides interfaces to support:

- Initialization
- Operations
- Rendering

Initialization

This topic provides information for initializing the Graphics Driver Library.

Description

The Graphics Library Driver Layer provides application routines to open and configure an instance of the driver.

The application prototypes are generic to all drivers. The user is required to supply the appropriate configuration in the arguments.

```
DRV_HANDLE DRV_GFX_<driver>_Initialize( const SYS_MODULE_INDEX  drvIndex,
                                        const * SYS_MODULE_INIT drvInit)
```

Operations

This topic provides operations information for the Graphics Driver Library.

Description

The Graphics Library Driver Layer provides application routines to open and configure an instance of the driver.

The application prototypes are generic to all drivers. The user is required to supply the appropriate configuration in the arguments.

```
DRV_HANDLE DRV_GFX_<driver>_Open( const SYS_MODULE_INDEX drvIndex,
                                  const DRV_IO_INTENT ioIntent )
```

Rendering

This topic provides information on rendering functions.

Description

The Graphics library driver layer provides basic rendering routines to draw pixels on a specific display.

More information on these interfaces can be found in the Library Interface section.

Creating a New Graphics Driver

This topic provides information for creating a new graphics driver.

Description

The display driver layer provides a generic programming interface to the Graphics Library code allowing it to draw actual pixels on the display.

This interface is adopted by all supported drivers in the graphics library. Each driver is not required to implement all functions. The interface defines the necessary functions required to support the core library.

The display driver API includes the following basic functions defined in the `drv_gfx_display.h` file:

Return type	Function Name	Description
uint16_t	PixelsPut	Sends pixels to the display
uint16_t	BarFill	Renders a bar to the display
uint16_t*	PixelArrayPut	Sends an array of pixels to the display
uint16_t*	PixelArraryGet	Returns an array of pixels from the display
uint16_t	PixelPut	Sends a pixel to the display.
void	ColorSet	Sets the pixel color.
void	InstanceSet	Sets the instance.
uint16_t	PageSet	Sets a page according to the enum PAGE_TYPE.
uint16_t*	Layer	
uint16_t	PixelGet	Returns a pixel.
uint16_t*	AlphaBlendWindow	Alpha window
GFX_STATUS	Status	Returns the status of the driver.

When creating a new driver, the developer will need to provide to the Graphics Library the set of function by means of the function pointer table structure defined in `gfx_driver_display.h`.

The main application code examples poll the DRV_GFX_XXX_InterfaceSet functions to recall which functions are available from a given driver. For faster throughput, DRV_GFX macros can be created (refer to `gfx_driver_display.h` for examples).

Not all rendering functions are needed to for a graphics controller driver to be usable with the library. The inclusion of the functions are dependant on application requirements. For example, if the controller does not have alpha blending, the primitive layer can perform this task. When the initial driver structure is created these functions need to be set as NULL. Any of the "put" functions need to be defined by the controller driver.

Configuring the Library

LCC Driver Configuration Functions

	Name	Description
	DRV_GFX_CONFIG_LCC_EXTERNAL_MEMORY	Macro that enables external memory framebuffer.
	DRV_GFX_CONFIG_LCC_INTERNAL_MEMORY	Macro that enables internal memory framebuffer.
	DRV_GFX_CONFIG_LCC_PALETTE	Macro that disables internal palette memory framebuffer.
	DRV_GFX_LCC_DMA_CHANNEL_INDEX	Macro that defines the DMA CHANNEL INDEX.

OTM2201A Driver Configuration Functions

	Name	Description
	GFX_CONFIG_OTM2201A_DRIVER_COUNT	Macro sets the number of instances for the driver.

S1D13517 Driver Configuration Functions

	Name	Description
	GFX_CONFIG_S1D13517_DRIVER_COUNT	Macro sets the number of instances for the driver.

SSD1926 Driver Configuration Functions

	Name	Description
	GFX_CONFIG_SSD1926_DRIVER_COUNT	Macro sets the number of instances for the driver.

Description

The configuration of the GFX driver is based on the file `drv_gfx_config.h`.

This header file contains the configuration selection for the Graphics Driver. Based on the selections made, the Graphics Driver may support the selected features. These configuration settings will apply to all instances of the Graphics Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

The configuration of the Graphics Driver layer is mainly dependent on making sure the needed driver has the core driver functions inside of it. The main rendering one being a `PixelPut` type function for the Graphics primitive layer.

Once the Graphics Driver structure (GFX_DRV_DATA) is defined along with its primitive function rendering structure (GFX_DRV_FUNCTIONS) it

can be used by the Graphics Primitive Layer.

GLCD Driver Configuration Functions

The GLCD Driver is a static driver and is established from MHC selections and a generation process. MHC provides the configuration interface for this driver. Refer to the Library Interface section for information on these functions.

LCC Driver Configuration Functions

DRV_GFX_CONFIG_LCC_EXTERNAL_MEMORY Macro

Macro that enables external memory framebuffer.

File

drv_gfx_lcc_config_template.h

C

```
#define DRV_GFX_CONFIG_LCC_EXTERNAL_MEMORY
```

Description

Macro: DRV_GFX_CONFIG_LCC_EXTERNAL_MEMORY

This macro enables the use of off-chip memory for the graphic framebuffer.

To enable external framebuffer, add this macro in the configuration and delete DRV_GFX_CONFIG_LCC_INTERNAL_MEMORY if defined.

Remarks

Mandatory definition if DRV_GFX_CONFIG_LCC_INTERNAL_MEMORY is not set.

DRV_GFX_CONFIG_LCC_INTERNAL_MEMORY Macro

Macro that enables internal memory framebuffer.

File

drv_gfx_lcc_config_template.h

C

```
#define DRV_GFX_CONFIG_LCC_INTERNAL_MEMORY
```

Description

Macro: DRV_GFX_CONFIG_LCC_EXTERNAL_MEMORY

This macro enables the use of on-chip memory for the graphic framebuffer.

To enable internal framebuffer, add this macro in the configuration and delete DRV_GFX_CONFIG_LCC_EXTERNAL_MEMORY if defined.

Remarks

Mandatory definition if DRV_GFX_CONFIG_LCC_EXTERNAL_MEMORY is not set.

DRV_GFX_CONFIG_LCC_PALETTE Macro

Macro that disables internal palette memory framebuffer.

File

drv_gfx_lcc_config_template.h

C

```
#define DRV_GFX_CONFIG_LCC_PALETTE
```

Description

/////////////////// COMPILE OPTIONS ////////////////////

****

Macro: DRV_GFX_LCC_PALETTE_DISABLE

This macro disables the use color lookup palette.

To disable palette internal framebuffer, add this macro in the configuration.

Remarks

Optional definition.

DRV_GFX_LCC_DMA_CHANNEL_INDEX Macro

Macro that defines the DMA CHANNEL INDEX.

File

drv_gfx_lcc_config_template.h

C

```
#define DRV_GFX_LCC_DMA_CHANNEL_INDEX
```

Description

Macro: DRV_GFX_LCC_DMA_CHANNEL_INDEX

This macro defines the DMA CHANNEL to be used for LCC display controller operations.

Remarks

Mandatory definition.

S1D13517 Driver Configuration Functions

GFX_CONFIG_S1D13517_DRIVER_COUNT Macro

Macro sets the number of instances for the driver.

File

drv_gfx_s1d13517_config_template.h

C

```
#define GFX_CONFIG_S1D13517_DRIVER_COUNT
```

Description

////////////////// COMPILE OPTIONS ////////////////////

****

Macro: GFX_CONFIG_S1D13517_DRIVER_COUNT

This macro sets the number of instances the driver will support.

Remarks

None.

SSD1926 Driver Configuration Functions

GFX_CONFIG_SSD1926_DRIVER_COUNT Macro

Macro sets the number of instances for the driver.

File

drv_gfx_ssd1926_config_template.h

C

```
#define GFX_CONFIG_SSD1926_DRIVER_COUNT
```

Description

////////////////// COMPILE OPTIONS ////////////////////

****

Macro: GFX_CONFIG_SSD1926_DRIVER_COUNT

This macro sets the number of instances the driver will support.

Remarks

None.

OTM2201A Driver Configuration Functions

GFX_CONFIG_OTM2201A_DRIVER_COUNT Macro

Macro sets the number of instances for the driver.

File

drv_gfx_otm2201a_config_template.h

C

```
#define GFX_CONFIG_OTM2201A_DRIVER_COUNT
```

Description

////////////////// COMPILE OPTIONS ////////////////////

****

Macro: GFX_CONFIG_OTM2201A_DRIVER_COUNT

This macro sets the number of instances the driver will support.

Remarks

None.

tft002 Driver Configuration Functions

Configuring the Display

Provides display configuration information.

Description

With the exception of the GLCD Graphics Driver, which is configured through MHC, each Graphics Controller Driver can support different LCD displays. Each display has its own configuration parameters to correctly display the rendered data. Configuration parameters are located in the file `<install-dir>/framework/driver/gfx/controller/display>/drv_gfx_<display>.h`, where `<display>` indicates the display type. The `drv_gfx_<display>.h` file needs to be included and the configuration parameters are to be passed to the driver initialization structure DRV_GFX_INIT.

Building the Library

This section lists the files that are available in the Graphics Driver Library.

Description

The Graphics Driver is part of the core functionality of the Graphics Library. Please refer to the Building the Library topic in the Graphics Library section for build information.

Library Interface

GLCD Driver Data Types and Constants

	Name	Description
	GLCD_LAYER_CONTROL	Structure holding the layer control definitions

GLCD Driver Functions

	Name	Description
	DRV_GFX_GLCD_BarFill	Outputs a rectangle filled with the global color. **Implementation:** Static
	DRV_GFX_GLCD_CursorImageSet	Sets the cursor image to the image specified. **Implementation:** Static
	DRV_GFX_GLCD_CursorPaletteSet	Sets the Cursor Palette to the given cursor palette. **Implementation:** Static
	DRV_GFX_GLCD_GammaPaletteSet	Sets the global gamma/palette to the given cursor palette. **Implementation:** Static
	DRV_GFX_GLCD_Initialize	Initializes the GLCD driver instance for the specified module index.
	DRV_GFX_GLCD_InterfaceSet	Sets the driver run-time functions for the specified driver index. **Implementation:** Static
	DRV_GFX_GLCD_MaxXGet	Returns the maximum X coordinate value for the specified layer index. **Implementation:** Static
	DRV_GFX_GLCD_MaxYGet	Returns the maximum Y coordinate value for the specified layer index. **Implementation:** Static
	DRV_GFX_GLCD_Open	Opens a GLCD Layer instance for the specified driver index. **Implementation:** Static
	DRV_GFX_GLCD_PixelArrayPut	Outputs an array of pixels of length count starting at *color **Implementation:** Static
	DRV_GFX_GLCD_PixelPut	Outputs one pixel into the frame buffer at the specified position. **Implementation:** Static
	DRV_GFX_GLCD_SetColor	Sets the global pixel color used for PixelPut operations for the specified layer index. **Implementation:** Static
	DRV_GFX_GLCD_BackgroundColorSet	Sets the background color to the specified RGBA value. **Implementation:** Static
	DRV_GFX_GLCD_Close	Closes the GLCD instance for the specified driver index. **Implementation:** Static
	DRV_GFX_GLCD_CursorSetPosition	Sets the position and enable state of the cursor. **Implementation:** Static
	DRV_GFX_GLCD_LayerFrameBufferSet	Sets the base address of the layer to the specific memory location. **Implementation:** Static
	DRV_GFX_GLCD_LayerModeSet	Sets the mode state for the specified layer index. **Implementation:** Static

Graphics Driver Library Functions

	Name	Description
	DRV_GFX_PaletteSet	returns address to the framebuffer.

LCC Driver Data Types and Constants

	Name	Description
	PIP_BUFFER	This is macro PIP_BUFFER.
	DMA_ISR_TASK	This is type DMA_ISR_TASK.
	DRV_GFX_LCC_INDEX_COUNT	Number of valid LCC driver indices.
	DRV_GFX_LCC_DISPLAY_WRITE_BUS_TYPE	
	DRV_GFX_LCC_FB_WRITE_BUS_TYPE	
	LCC_VSYNC_Callback_FnPtr	function pointer definition for VSYNC callback
	LCC_VSYNC_STATE	This is type LCC_VSYNC_STATE.

LCC Driver Functions

	Name	Description
	GFX_PRIM_SetPIPWindow	returns address to the framebuffer.
	DRV_GFX_LCC_DisplayRefresh	LCD refresh handler
	DRV_GFX_LCC_Close	closes an instance of the graphics controller
	DRV_GFX_LCC_SetColor	Sets the color for the driver instance

	DRV_GFX_LCC_GetBuffer	DOM-IGNORE-END
	DRV_GFX_LCC_Initialize	resets LCD, initializes PMP
	DRV_GFX_LCC_SetPage	DOM-IGNORE-START
	DRV_GFX_LCC_AlphaBlendWindow	DOM-IGNORE-END
	DRV_GFX_LCC_Open	opens an instance of the graphics controller
	DRV_GFX_LCC_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer
	DRV_GFX_LCC_FrameBufferAddressSet	Sets address of the framebuffer
	DRV_GFX_LCC_InterfaceSet	Returns the API of the graphics controller
	DRV_GFX_LCC_MaxXGet	Returns x extent of the display.
	DRV_GFX_LCC_MaxYGet	Returns y extent of the display.
	DRV_GFX_LCC_BarFill	outputs one pixel into the frame buffer at the x,y coordinate given
	DRV_GFX_LCC_PixelArrayGet	gets an array of pixels of length count starting at *color
	DRV_GFX_LCC_PixelArrayPut	outputs an array of pixels of length count starting at *color
	DRV_GFX_LCC_PixelPut	outputs one pixel into the frame buffer at the x,y coordinate given
	DRV_GFX_LCC_VSYNC_CallbackSet	Sets a callback function pointer for notification of VSYNC state
	DRV_GFX_LCC_VSYNC_GetState	Gets the state of the current VSYNC mode

OTM2201A Driver Data Types and Constants

	Name	Description
	OTM2201A_TASK	Enumeration for command type.
	DRV_GFX_OTM2201A_COMMAND	Structure for the commands in the driver queue.
	DRV_GFX_OTM2201A_INDEX_COUNT	Number of valid OTM2201A driver indices.

OTM2201A Driver Functions

	Name	Description
	DRV_GFX_OTM2201A_AddressSet	Sets the start GRAM address where pixel data to be written
	DRV_GFX_OTM2201A_BrightnessSet	Sets the brightness of the display backlight.
	DRV_GFX_OTM2201A_RegGet	Returns graphics controller register value (byte access)
	DRV_GFX_OTM2201A_Busy	Returns non-zero value if LCD controller is busy (previous drawing operation is not completed).
	DRV_GFX_OTM2201A_Close	closes an instance of the graphics controller
	DRV_GFX_OTM2201A_ColorSet	Sets the color for the driver instance
	DRV_GFX_OTM2201A_Initialize	resets LCD, initializes PMP
	DRV_GFX_OTM2201A_InstanceSet	Sets the instance for the driver
	DRV_GFX_OTM2201A_Open	opens an instance of the graphics controller
	DRV_GFX_OTM2201A_RegSet	Updates graphics controller register value (byte access)
	DRV_GFX_OTM2201A_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer
	DRV_GFX_OTM2201A_InterfaceSet	Returns the API of the graphics controller
	DRV_GFX_OTM2201A_MaxXGet	Returns x extent of the display.
	DRV_GFX_OTM2201A_MaxYGet	Returns y extent of the display.
	DRV_GFX_OTM2201A_BarFill	Outputs count number of pixels into the frame buffer from the given x,y coordinate.
	DRV_GFX_OTM2201A_PixelArrayGet	Gets an array of pixels of length count into an array starting at *color
	DRV_GFX_OTM2201A_PixelArrayPut	Outputs an array of pixels of length count starting at *color
	DRV_GFX_OTM2201A_PixelPut	Outputs one pixel into the frame buffer at the x,y coordinate given

S1D13517 Driver Data Types and Constants

	Name	Description
	LAYER_REGISTERS	This structure is used to describe layerS1D13517_REGisters.
	DRV_GFX_S1D13517_INDEX_COUNT	Number of valid S1D13517 driver indices.

S1D13517 Driver Functions

	Name	Description
	DRV_GFX_S1D13517_AlphaBlendWindow	SEE primitive layer alphablendWindow definition
	DRV_GFX_S1D13517_GetReg	returns graphics controllerS1D13517_REGister value (byte access)

	DRV_GFX_S1D13517_SetInstance	Sets the instance for the driver
	DRV_GFX_S1D13517_SetReg	updates graphics controllerS1D13517_REGister value (byte access)
	DRV_GFX_S1D13517_Close	closes an instance of the graphics controller
	DRV_GFX_S1D13517_Layer	Updates a Layer depending on the layer parameters.
	DRV_GFX_S1D13517_Initialize	resets LCD, initializes PMP
	DRV_GFX_S1D13517_Open	opens an instance of the graphics controller
	DRV_GFX_S1D13517_SetColor	Sets the color for the driver instance
	DRV_GFX_S1D13517_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer
	DRV_GFX_S1D13517_SetPage	Sets the page of a certain page type
	DRV_GFX_S1D13517_InterfaceSet	Returns the API of the graphics controller
	DRV_GFX_S1D13517_MaxXGet	Returns x extent of the display.
	DRV_GFX_S1D13517_MaxYGet	Returns y extent of the display.
	DRV_GFX_S1D13517_BarFill	outputs one pixel into the frame buffer at the x,y coordinate given
	DRV_GFX_S1D13517_BrightnessSet	Sets the brightness of the display backlight.
	DRV_GFX_S1D13517_PixelPut	outputs one pixel into the frame buffer at the x,y coordinate given
	DRV_GFX_S1D13517_PixelArrayPut	outputs an array of pixels of length count starting at *color

SSD1289 Driver Functions

	Name	Description
	GFX_TCON_SSD1289Init	Initialize the Solomon Systech SSD1289 Timing Controller.

SSD1926 Driver Data Types and Constants

	Name	Description
	DRV_GFX_SSD1926_INDEX_COUNT	Number of valid SSD1926 driver indices.
	DRV_GFX_SSD1926_COMMAND	Structure for the commands in the driver queue.

SSD1926 Driver Functions

	Name	Description
	DRV_GFX_SSD1926_Busy	Returns non-zero if LCD controller is busy (previous drawing operation is not completed).
	DRV_GFX_SSD1926_GetReg	returns graphics controller register value (byte access)
	DRV_GFX_SSD1926_SetReg	updates graphics controller register value (byte access)
	DRV_GFX_SSD1926_Close	closes an instance of the graphics controller
	DRV_GFX_SSD1926_Initialize	resets LCD, initializes PMP
	DRV_GFX_SSD1926_Open	opens an instance of the graphics controller
	DRV_GFX_SSD1926_SetColor	Sets the color for the driver instance
	DRV_GFX_SSD1926_Status	Provides the current status of the SSD1926 driver module.
	DRV_GFX_SSD1926_SetInstance	Sets the instance for the driver
	DRV_GFX_SSD1926_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer
	DRV_GFX_SSD1926_InterfaceSet	Returns the API of the graphics controller
	DRV_GFX_SSD1926_MaxXGet	Returns x extent of the display.
	DRV_GFX_SSD1926_MaxYGet	Returns y extent of the display.
	DRV_GFX_SSD1926_BarFill	Hardware accelerated barfill function
	DRV_GFX_SSD1926_PixelArrayGet	gets an array of pixels of length count starting at *color
	DRV_GFX_SSD1926_PixelArrayPut	outputs an array of pixels of length count starting at *color
	DRV_GFX_SSD1926_PixelPut	outputs one pixel into the frame buffer at the x,y coordinate given

Description

Graphics Driver Library Application Programming Interface (API).

Graphics Driver Library Functions

DRV_GFX_PaletteSet Function

returns address to the framebuffer.

File

drv_gfx_lcc.h

C

```
uint8_t DRV_GFX_PaletteSet(uint16_t * pPaletteEntry, uint16_t startEntry, uint16_t length);
```

Description

none.

GLCD Driver Functions

DRV_GFX_GLCD_BarFill Function

Outputs a rectangle filled with the global color.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_BarFill(const SYS_MODULE_INDEX index, uint16_t left, uint16_t top, uint16_t right,
uint16_t bottom);
```

Returns

None.

Description

This function outputs a rectangle of pixels into the framebuffer at the specified position, width, and height.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
SYS_MODULE_INDEX index	layer to use
left, top	pixel coordinates
right, bottom	pixel coordinates

Function

void DRV_GFX_GLCD_BarFill(const SYS_MODULE_INDEX index, uint16_t left, uint16_t top,
uint16_t right, uint16_t bottom)

DRV_GFX_GLCD_CursorImageSet Function

Sets the cursor image to the image specified.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_CursorImageSet(const SYS_MODULE_INDEX index, uint32_t * cursorImage);
```

Returns

None.

Description

This functions sets the cursor image to the image specified.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
uint32_t * cursorImage	32x32 palette image

Function

void DRV_GFX_GLCD_CursorImageSet(const SYS_MODULE_INDEX index, uint32_t * cursorImage)

DRV_GFX_GLCD_CursorPaletteSet Function

Sets the Cursor Palette to the given cursor palette.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_CursorPaletteSet(const SYS_MODULE_INDEX index, uint32_t * gammaPalette);
```

Returns

None.

Description

This functions sets the cursor image to the image specified.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
uint32_t * cursorImage	32x32 palette image

Function

void DRV_GFX_GLCD_CursorPaletteSet(uint32_t * cursorPalette)

DRV_GFX_GLCD_GammaPaletteSet Function

Sets the global gamma/palette to the given cursor palette.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_GammaPaletteSet(const SYS_MODULE_INDEX index, uint32_t * gammaPalette);
```

Returns

None.

Description

This function sets the global gamma/platform image.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
uint32_t * cursorImage	32x32 palette image

Function

void DRV_GFX_GLCD_GammaPaletteSet(const SYS_MODULE_INDEX index, uint32_t * cursorPalette)

DRV_GFX_GLCD_Initialize Function

Initializes the GLCD driver instance for the specified module index.

File

help_drv_gfx_glcd.h

C

```
SYS_MODULE_OBJ DRV_GFX_GLCD_Initialize(const SYS_MODULE_INDEX moduleIndex, const SYS_MODULE_INIT * const moduleInit);
```

Returns

None.

Description

This function initializes the GLCD Driver instance for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters.

Remarks

This function must be called before any other GLCD function is called. This function should only be called once during system initialization.

Preconditions

None.

Function

SYS_MODULE_OBJ DRV_GFX_GLCD_Initialize(const SYS_MODULE_INDEX moduleIndex,
const SYS_MODULE_INIT * const moduleInit)

DRV_GFX_GLCD_InterfaceSet Function

Sets the driver run-time functions for the specified driver index.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_InterfaceSet(const SYS_MODULE_INDEX index, DRV_HANDLE handle, DRV_GFX_INTERFACE * interface);
```

Returns

None.

Description

This function sets implementation function function applicable to the Graphics Driver interface.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Initialize has been called.

Parameters

Parameters	Description
SYS_MODULE_INDEX index	layer to use
DRV_HANDLE handle	driver handle
DRV_GFX_INTERFACE * interface	pointer to interface structure

Function

void DRV_GFX_GLCD_InterfaceSet(const SYS_MODULE_INDEX index,
DRV_HANDLE handle,
DRV_GFX_INTERFACE * interface)

DRV_GFX_GLCD_MaxXGet Function

Returns the maximum X coordinate value for the specified layer index.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
uint16_t DRV_GFX_GLCD_MaxXGet(const SYS_MODULE_INDEX index);
```

Returns

- x position - When a message has been received

Description

This function returns the maximum X coordinate value for the specified layer index.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
SYS_MODULE_INDEX index	layer to use

Function

uint16_t DRV_GFX_GLCD_MaxXGet(const SYS_MODULE_INDEX index)

DRV_GFX_GLCD_MaxYGet Function

Returns the maximum Y coordinate value for the specified layer index.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
uint16_t DRV_GFX_GLCD_MaxYGet(const SYS_MODULE_INDEX index);
```

Returns

- y position - When a message has been received

Description

This function returns the maximum Y coordinate value for the specified layer index.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
SYS_MODULE_INDEX index	layer to use

Function

uint16_t DRV_GFX_GLCD_MaxYGet(const SYS_MODULE_INDEX index)

DRV_GFX_GLCD_Open Function

Opens a GLCD Layer instance for the specified driver index.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
DRV_HANDLE DRV_GFX_GLCD_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Returns

None.

Description

This function opens the GLCD Driver instance for the specified driver instance, making it ready for clients to use it.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Initialize has been called.

Function

void DRV_GFX_GLCD_Open(const SYS_MODULE_INDEX index,
const DRV_IO_INTENT intent)

DRV_GFX_GLCD_PixelArrayPut Function

Outputs an array of pixels of length count starting at *color

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_PixelArrayPut(const SYS_MODULE_INDEX index, GFX_COLOR * color, uint16_t x, uint16_t y,
```

```
uint16_t count, uint16_t lineCount);
```

Returns

None.

Description

This function outputs an array of pixels of length count starting at *color.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
SYS_MODULE_INDEX index	layer to use
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels
lineCount	number of lines

Function

void DRV_GFX_GLCD_PixelArrayPut(const SYS_MODULE_INDEX index, GFX_COLOR *color,
uint16_t x, uint16_t y, uint16_t count, uint16_t lineCount)

DRV_GFX_GLCD_PixelPut Function

Outputs one pixel into the frame buffer at the specified position.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_PixelPut(const SYS_MODULE_INDEX index, uint16_t x, uint16_t y);
```

Returns

None.

Description

This function outputs one pixel into the frame buffer at the specified x,y coordinate.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
SYS_MODULE_INDEX index	layer to use
uint16_t x,y	pixel coordinates

Function

void DRV_GFX_GLCD_PixelPut(const SYS_MODULE_INDEX index, uint16_t x, uint16_t y)

DRV_GFX_GLCD_SetColor Function

Sets the global pixel color used for PixelPut operations for the specified layer index.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_SetColor(const SYS_MODULE_INDEX index, GFX_COLOR color);
```

Returns

None.

Description

This function sets the global pixel color used for PixelPut operations using the specified color.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
SYS_MODULE_INDEX index	layer to use
GFX_COLOR color	color to use

Function

void DRV_GFX_GLCD_SetColor(const SYS_MODULE_INDEX index, GFX_COLOR color)

DRV_GFX_GLCD_BackgroundColorSet Function

Sets the background color to the specified RGBA value.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_BackgroundColorSet(const SYS_MODULE_INDEX index, uint32_t bgColor);
```

Returns

- none

Description

This function sets the background color to the specified RGBA value.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
bgColor	RGBA color

Function

void void DRV_GFX_GLCD_BackgroundColorSet(const SYS_MODULE_INDEX index,

uint32_t bgColor)

DRV_GFX_GLCD_Close Function

Closes the GLCD instance for the specified driver index.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_Close(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

This function closes the GLCD driver instance for the specified driver instance, making it ready for clients to use it.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Initialize has been called.

Function

void DRV_GFX_GLCD_Close(const SYS_MODULE_INDEX index)

DRV_GFX_GLCD_CursorSetPosition Function

Sets the position and enable state of the cursor.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_CursorSetPosition(const SYS_MODULE_INDEX index, uint32_t x, uint32_t y, bool enable);
```

Returns

None.

Description

This function sets the x, y position of the cursor and its enable state.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Parameters

Parameters	Description
x	x coordinate of the start point.
y	y coordinate of the end point.
enable	enable cursor on or off

Function

void DRV_GFX_GLCD_CursorSetPosition(const SYS_MODULE_INDEX index, uint32_t x, uint32_t y, bool enable)

DRV_GFX_GLCD_LayerFrameBufferSet Function

Sets the base address of the layer to the specific memory location.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_LayerFrameBufferSet(const SYS_MODULE_INDEX index, uint32_t * frame);
```

Returns

None.

Description

This function sets the base address of the layer to the specific memory location.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Function

void DRV_GFX_GLCD_LayerFrameBufferSet(const SYS_MODULE_INDEX index, uint32_t * frame)

DRV_GFX_GLCD_LayerModeSet Function

Sets the mode state for the specified layer index.

Implementation: Static

File

help_drv_gfx_glcd.h

C

```
void DRV_GFX_GLCD_LayerModeSet(const SYS_MODULE_INDEX index, uint32_t layerMode);
```

Returns

None.

Description

This function sets the mode state of the layer to either show or not show the layer.

Remarks

None.

Preconditions

DRV_GFX_GLCD_Open has been called.

Function

void DRV_GFX_GLCD_LayerModeSet(const SYS_MODULE_INDEX index, uint32_t layerMode)

GLCD Driver Data Types and Constants

GLCD_LAYER_CONTROL Enumeration

Structure holding the layer control definitions

File

help_drv_gfx_glcd.h

C

```
typedef enum {
  GLCD_LAYER_DISABLE = 0,
  GLCD_LAYER_AHBLOCK = 1<<27,
  GLCD_LAYER_ENABLE = 1<<31,
  GLCD_FORCE_A = 1<<30,
  GLCD_SCALE_NN = 1<<29,
  GLCD_MODULATE_A = 1<<28
} GLCD_LAYER_CONTROL;
```

Description

GLCD Layer Control Definitions

This structure contains the layer control definitions.

LCC Driver Functions

GFX_PRIM_SetPIPWindow Function

returns address to the framebuffer.

File

drv_gfx_lcc.h

C

```
void GFX_PRIM_SetPIPWindow(uint16_t left, uint16_t top, uint16_t hlength, uint16_t vlength, uint16_t pipx,
uint16_t pipy);
```

Description

none.

DRV_GFX_LCC_DisplayRefresh Function

LCD refresh handler

File

drv_gfx_lcc.h

C

```
void DRV_GFX_LCC_DisplayRefresh();
```

Returns

none

Description

This routine is called from the timer interrupt, resulting in a complete LCD update.

Function

void DRV_GFX_LCC_DisplayRefresh(void)

DRV_GFX_LCC_Close Function

closes an instance of the graphics controller

File

drv_gfx_lcc.h

C

```
void DRV_GFX_LCC_Close(DRV_HANDLE handle);
```

Description

none

Function

void DRV_GFX_LCC_Close(DRV_HANDLE handle)

DRV_GFX_LCC_SetColor Function

Sets the color for the driver instance

File

drv_gfx_lcc.h

C

```
void DRV_GFX_LCC_SetColor(GFX_COLOR color);
```

Returns

none

Function

void DRV_GFX_LCC_SetColor(uint8_t instance, GFX_COLOR color)

DRV_GFX_LCC_GetBuffer Function

File

drv_gfx_lcc.h

C

```
unsigned short * DRV_GFX_LCC_GetBuffer();
```

Description

DOM-IGNORE-END

DRV_GFX_LCC_Initialize Function

resets LCD, initializes PMP

File

drv_gfx_lcc.h

C

```
SYS_MODULE_OBJ DRV_GFX_LCC_Initialize(const SYS_MODULE_INDEX moduleIndex, const SYS_MODULE_INIT * const
moduleInit);
```

Returns

1 - call not successful (PMP driver busy) 0 - call successful

Description

none

Parameters

Parameters	Description
instance	driver instance

Function

SYS_MODULE_OBJ DRV_GFX_LCC_Initialize(const SYS_MODULE_INDEX moduleIndex,
const SYS_MODULE_INIT * const moduleInit)

DRV_GFX_LCC_SetPage Function

File

drv_gfx_lcc.h

C

```
uint16_t DRV_GFX_LCC_SetPage(uint8_t pageType, uint8_t page);
```

Description

DOM-IGNORE-START

DRV_GFX_LCC_AlphaBlendWindow Function

File

drv_gfx_lcc.h

C

```
uint16_t* DRV_GFX_LCC_AlphaBlendWindow(GFX_ALPHA_PARAMS* alphaParams, uint16_t width, uint16_t height,
uint8_t alpha);
```

Description

DOM-IGNORE-END

DRV_GFX_LCC_Open Function

opens an instance of the graphics controller

File

drv_gfx_lcc.h

C

```
DRV_HANDLE DRV_GFX_LCC_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Description

none

Function

DRV_GFX_LCC_Open(uint8_t instance)

DRV_GFX_LCC_Tasks Function

Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer

File

drv_gfx_lcc.h

C

```
void DRV_GFX_LCC_Tasks(SYS_MODULE_OBJ object);
```

Function

void DRV_GFX_LCC_Tasks(void)

DRV_GFX_LCC_FrameBufferAddressSet Function

Sets address of the framebuffer

File

drv_gfx_lcc.h

C

```
uint16_t DRV_GFX_LCC_FrameBufferAddressSet(void * address);
```

Returns

Sets address of the framebuffer

Description

none

Function

DRV_GFX_LCC_FrameBufferAddressSet(void * address)

DRV_GFX_LCC_InterfaceSet Function

Returns the API of the graphics controller

File

drv_gfx_lcc.h

C

```
void DRV_GFX_LCC_InterfaceSet(DRV_HANDLE handle, DRV_GFX_INTERFACE * interface);
```

Description

none

Function

DRV_GFX_INTEFACE DRV_GFX_LCC_InterfaceGet(DRV_HANDLE handle)

DRV_GFX_LCC_MaxXGet Function

Returns x extent of the display.

File

drv_gfx_lcc.h

C

```
uint16_t DRV_GFX_LCC_MaxXGet();
```

Example

```
Remarks:
```

Function

void DRV_GFX_LCC_MaxXGet()

DRV_GFX_LCC_MaxYGet Function

Returns y extent of the display.

File

drv_gfx_lcc.h

C

```
uint16_t DRV_GFX_LCC_MaxYGet();
```

Example

```
Remarks:
```

Function

void DRV_GFX_LCC_MaxYGet()

DRV_GFX_LCC_BarFill Function

outputs one pixel into the frame buffer at the x,y coordinate given

File

drv_gfx_lcc.h

C

```
void DRV_GFX_LCC_BarFill(uint16_t left, uint16_t top, uint16_t right, uint16_t bottom);
```

Returns

1 - call not successful (LCC driver busy) 0 - call successful

Description

none

Parameters

Parameters	Description
left,top	pixel coordinates
right, bottom	pixel coordinates

Function

void DRV_GFX_LCC_BarFill(uint16_t left, uint16_t top, uint16_t right, uint16_t bottom)

DRV_GFX_LCC_PixelArrayGet Function

gets an array of pixels of length count starting at *color

File

drv_gfx_lcc.h

C

```
uint16_t* DRV_GFX_LCC_PixelArrayGet(GFX_COLOR * color, uint16_t x, uint16_t y, uint16_t count);
```

Returns

ignore

Description

none

Parameters

Parameters	Description
instance	driver instance
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels

Function

uint16_t* DRV_GFX_LCC_PixelArrayGet(uint16_t *color, uint16_t x, uint16_t y, uint16_t count)

DRV_GFX_LCC_PixelArrayPut Function

outputs an array of pixels of length count starting at *color

File

drv_gfx_lcc.h

C

```
void DRV_GFX_LCC_PixelArrayPut(GFX_COLOR * color, uint16_t x, uint16_t y, uint16_t count, uint16_t
```

```
lineCount);
```

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

Description

none

Parameters

Parameters	Description
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels
lineCount	number of lines

Function

void DRV_GFX_LCC_PixelArrayPut(uint16_t *color, uint16_t x, uint16_t y, uint16_t count)

DRV_GFX_LCC_PixelPut Function

outputs one pixel into the frame buffer at the x,y coordinate given

File

drv_gfx_lcc.h

C

```
void DRV_GFX_LCC_PixelPut(uint16_t x, uint16_t y);
```

Returns

1 - call not successful (LCC driver busy) 0 - call successful

Description

none

Parameters

Parameters	Description
x,y	pixel coordinates

Function

void DRV_GFX_LCC_PixelPut(uint16_t x, uint16_t y)

DRV_GFX_LCC_VSYNC_CallbackSet Function

Sets a callback function pointer for notification of VSYNC state

File

drv_gfx_lcc.h

C

```
void DRV_GFX_LCC_VSYNC_CallbackSet(LCC_VSYNC_Callback_FnPtr cb);
```

Function

void DRV_GFX_LCC_VSYNC_CallbackSet(LCC_VSYNC_Callback_FnPtr)

DRV_GFX_LCC_VSYNC_GetState Function

Gets the state of the current VSYNC mode

File

drv_gfx_lcc.h

C

```
LCC_VSYNC_STATE DRV_GFX_LCC_VSYNC_GetState();
```

Function

int32_t DRV_GFX_LCC_VSYNC_GetState(void)

LCC Driver Data Types and Constants

PIP_BUFFER Macro

File

drv_gfx_lcc.h

C

```
#define PIP_BUFFER (3)
```

Description

This is macro PIP_BUFFER.

DMA_ISR_TASK Enumeration

File

drv_gfx_lcc.h

C

```
typedef enum {
  ACTIVE_PERIOD = 0,
  BLANKING_PERIOD,
  FINISH_LINE,
  OVERFLOW,
  PIP,
  SCROLL
} DMA_ISR_TASK;
```

Description

This is type DMA_ISR_TASK.

DRV_GFX_LCC_INDEX_COUNT Macro

Number of valid LCC driver indices.

File

drv_gfx_lcc.h

C

```
#define DRV_GFX_LCC_INDEX_COUNT DRV_GFX_LCC_NUMBER_OF_MODULES
```

Description

LCC Driver Module Index Count

This constant identifies LCC driver index definitions.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is device-specific.

DRV_GFX_LCC_DISPLAY_WRITE_BUS_TYPE Enumeration

File

drv_gfx_lcc.h

C

```
typedef enum {
  DRV_GFX_LCC_DISPLAY_WRITE_BUS_TYPE_NONE = 0,
  DRV_GFX_LCC_DISPLAY_WRITE_BUS_TYPE_PMP,
  DRV_GFX_LCC_DISPLAY_WRITE_BUS_TYPE_EBI
} DRV_GFX_LCC_DISPLAY_WRITE_BUS_TYPE;
```

Description

LCC Driver Module Index Count

DRV_GFX_LCC_FB_WRITE_BUS_TYPE Enumeration

File

drv_gfx_lcc.h

C

```
typedef enum {
  DRV_GFX_LCC_FB_WRITE_BUS_TYPE_NONE = 0,
  DRV_GFX_LCC_FB_WRITE_BUS_TYPE_PMP,
  DRV_GFX_LCC_FB_WRITE_BUS_TYPE_EBI
} DRV_GFX_LCC_FB_WRITE_BUS_TYPE;
```

Description

LCC Driver Module Index Count

LCC_VSYNC_Callback_FnPtr Type

File

drv_gfx_lcc.h

C

```
typedef void (* LCC_VSYNC_Callback_FnPtr)(void);
```

Description

function pointer definition for VSYNC callback

LCC_VSYNC_STATE Enumeration

File

drv_gfx_lcc.h

C

```
typedef enum {
  LCC_VSYNC_TRUE = 0,
  LCC_VSYNC_FALSE
} LCC_VSYNC_STATE;
```

Description

This is type LCC_VSYNC_STATE.

S1D13517 Driver Functions

DRV_GFX_S1D13517_AlphaBlendWindow Function

SEE primitive layer alphablendWindow definition

File

drv_gfx_s1d13517.h

C

```
uint16_t* DRV_GFX_S1D13517_AlphaBlendWindow(GFX_ALPHA_PARAMS* alphaParams, uint16_t width, uint16_t height,
uint8_t alpha);
```

Function

void DRV_GFX_S1D13517_AlphaBlendWindow(uint8_t pageType, uint8_t page)

DRV_GFX_S1D13517_GetReg Function

returns graphics controllerS1D13517_REGister value (byte access)

File

drv_gfx_s1d13517.h

C

```
uint8_t DRV_GFX_S1D13517_GetReg(uint8_t index);
```

Returns

0 - when call was passed

Description

none

Function

uint8_t DRV_GFX_S1D13517_GetReg(uint8_t index)

DRV_GFX_S1D13517_SetInstance Function

Sets the instance for the driver

File

drv_gfx_s1d13517.h

C

```
void DRV_GFX_S1D13517_SetInstance(uint8_t instance);
```

Returns

none

Function

void DRV_GFX_S1D13517_SetInstance(uint8_t instance)

DRV_GFX_S1D13517_SetReg Function

updates graphics controllerS1D13517_REGister value (byte access)

File

drv_gfx_s1d13517.h

C

```
uint16_t DRV_GFX_S1D13517_SetReg(uint8_t index, uint8_t value);
```

Returns

1 - call was not passed 0 - call was passed

Description

none

Parameters

Parameters	Description
value	value to write toS1D13517_REGister

Function

uint8_t DRV_GFX_S1D13517_SetReg(uint8_t index, uint8_t value)

DRV_GFX_S1D13517_Close Function

closes an instance of the graphics controller

File

drv_gfx_s1d13517.h

C

```
void DRV_GFX_S1D13517_Close(DRV_HANDLE handle);
```

Returns

0 - instance closed 2 - instance doesn't exist 3 - instance already closed

Description

none

Function

DRV_GFX_S1D13517_Close(uint8_t instance)

DRV_GFX_S1D13517_Layer Function

Updates a Layer depending on the layer parameters.

File

drv_gfx_s1d13517.h

C

```
uint16_t* DRV_GFX_S1D13517_Layer(uint8_t type, GFX_LAYER_PARAMS* layer);
```

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

Description

none

Parameters

Parameters	Description
type	layer type
layer	parameters for Layer function call

Function

uint16_t* DRV_GFX_S1D13517_Layer(uint8_t type, GFX_LAYER_PARAMS* layer)

DRV_GFX_S1D13517_Initialize Function

resets LCD, initializes PMP

File

drv_gfx_s1d13517.h

C

```
SYS_MODULE_OBJ DRV_GFX_S1D13517_Initialize(const SYS_MODULE_INDEX moduleIndex, const SYS_MODULE_INIT *
const moduleInit);
```

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

Description

none

Parameters

Parameters	Description
instance	driver instance

Function

uint16_t DRV_GFX_S1D13517_Initialize(uint8_t instance)

DRV_GFX_S1D13517_Open Function

opens an instance of the graphics controller

File

drv_gfx_s1d13517.h

C

```
DRV_HANDLE DRV_GFX_S1D13517_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Returns

1 - driver not initialized 2 - instance doesn't exist 3 - instance already open instance to driver when successful

Description

none

Function

DRV_GFX_S1D13517_Open(uint8_t instance)

DRV_GFX_S1D13517_SetColor Function

Sets the color for the driver instance

File

drv_gfx_s1d13517.h

C

```
void DRV_GFX_S1D13517_SetColor(GFX_COLOR color);
```

Returns

none

Function

void DRV_GFX_S1D13517_SetColor(GFX_COLOR color)

DRV_GFX_S1D13517_Tasks Function

Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer

File

drv_gfx_s1d13517.h

C

```
void DRV_GFX_S1D13517_Tasks(SYS_MODULE_OBJ object);
```

Function

void DRV_GFX_SSD1926_Tasks(void)

DRV_GFX_S1D13517_SetPage Function

Sets the page of a certain page type

File

drv_gfx_s1d13517.h

C

```
uint16_t DRV_GFX_S1D13517_SetPage(uint8_t pageType, uint8_t page);
```

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

Description

none

Parameters

Parameters	Description
instance	driver instance

Function

void DRV_GFX_S1D13517_SetPage(uint8_t pageType, uint8_t page)

DRV_GFX_S1D13517_InterfaceSet Function

Returns the API of the graphics controller

File

drv_gfx_s1d13517.h

C

```
void DRV_GFX_S1D13517_InterfaceSet(DRV_HANDLE handle, DRV_GFX_INTERFACE * interface);
```

Description

none

Function

void DRV_GFX_S1D13517_InterfaceSet(DRV_HANDLE handle, DRV_GFX_INTERFACE * interface)

DRV_GFX_S1D13517_MaxXGet Function

Returns x extent of the display.

File

drv_gfx_s1d13517.h

C

```
uint16_t DRV_GFX_S1D13517_MaxXGet();
```

Example

```
Remarks:
```

Function

void DRV_GFX_S1D13517_MaxXGet()

DRV_GFX_S1D13517_MaxYGet Function

Returns y extent of the display.

File

drv_gfx_s1d13517.h

C

```
uint16_t DRV_GFX_S1D13517_MaxYGet();
```

Example

```
Remarks:
```

Function

void DRV_GFX_S1D13517_MaxYGet()

DRV_GFX_S1D13517_BarFill Function

outputs one pixel into the frame buffer at the x,y coordinate given

File

drv_gfx_s1d13517.h

C

```
void DRV_GFX_S1D13517_BarFill(uint16_t left, uint16_t top, uint16_t right, uint16_t bottom);
```

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

Description

none

Parameters

Parameters	Description
left, top	pixel coordinates
right, bottom	pixel coordinates

Function

void DRV_GFX_S1D13517_BarFill(uint16_t left, uint16_t top, uint16_t right, uint16_t bottom)

DRV_GFX_S1D13517_BrightnessSet Function

Sets the brightness of the display backlight.

File

drv_gfx_s1d13517.h

C

```
void DRV_GFX_S1D13517_BrightnessSet(uint16_t level);
```

Returns

none

Description

none

Parameters

Parameters	Description
level	Brightness level. Valid values are 0 to 100. • 0: brightness level is zero or display is turned off • 100: brightness level is maximum

Function

uint8_t DRV_GFX_S1D13517_BrightnessSet(uint16_t level)

DRV_GFX_S1D13517_PixelPut Function

outputs one pixel into the frame buffer at the x,y coordinate given

File

drv_gfx_s1d13517.h

C

```
void DRV_GFX_S1D13517_PixelPut(uint16_t x, uint16_t y);
```

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

Description

none

Parameters

Parameters	Description
instance	driver instance
color	color to output
x,y	pixel coordinates

Function

uint16_t DRV_GFX_S1D13517_PixelPut(uint16_t x, uint16_t y)

DRV_GFX_S1D13517_PixelArrayPut Function

outputs an array of pixels of length count starting at *color

File

drv_gfx_s1d13517.h

C

```
void DRV_GFX_S1D13517_PixelArrayPut(GFX_COLOR * color, uint16_t x, uint16_t y, uint16_t count, uint16_t
lineCount);
```

Returns

NULL - call not successful (PMP driver busy) !NULL - address to the number of pixels yet to be serviced

Description

none

Parameters

Parameters	Description
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels
lineCount	number of lines

Function

void DRV_GFX_S1D13517_PixelArrayPut(uint16_t *color, uint16_t x, uint16_t y, uint16_t count, uint16_t lineCount)

S1D13517 Driver Data Types and Constants

LAYER_REGISTERS Structure

File

drv_gfx_s1d13517.h

C

```
typedef struct {
  uint8_t XStart;
  uint8_t XEnd;
  uint8_t YStart0;
  uint8_t YStart1;
  uint8_t YEnd0;
  uint8_t YEnd1;
  uint8_t StartAddress0;
  uint8_t StartAddress1;
  uint8_t StartAddress2;
} LAYER_REGISTERS;
```

Description

This structure is used to describe layerS1D13517_REGisters.

DRV_GFX_S1D13517_INDEX_COUNT Macro

Number of valid S1D13517 driver indices.

File

drv_gfx_s1d13517.h

C

```
#define DRV_GFX_S1D13517_INDEX_COUNT DRV_GFX_S1D13517_NUMBER_OF_MODULES
```

Description

This constant identifies S1D13517 driver index definitions.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is device-specific.

Section

Data Types and Constants

****

****

****

SSD1926 Driver Module Index Count

SSD1289 Driver Functions

GFX_TCON_SSD1289Init Function

Initialize the Solomon Systech SSD1289 Timing Controller.

File

drv_gfx_ssd1289.h

C

```
void GFX_TCON_SSD1289Init();
```

Returns

None.

Description

Initialize the I/Os to implement a bit-banged SPI interface to connect to the Timing Controller through the SPI.

Function

void GfxTconInit(void)

SSD1926 Driver Functions

DRV_GFX_SSD1926_Busy Function

Returns non-zero if LCD controller is busy (previous drawing operation is not completed).

File

drv_gfx_ssd1926.h

C

```
uint16_t DRV_GFX_SSD1926_Busy(uint8_t instance);
```

Returns

1 - busy 0 - not busy

Description

none

Parameters

Parameters	Description
instance	driver instance

Function

uint16_t DRV_GFX_SSD1926_Busy(uint8_t instance)

DRV_GFX_SSD1926_GetReg Function

returns graphics controller register value (byte access)

File

drv_gfx_ssd1926.h

C

```
uint8_t DRV_GFX_SSD1926_GetReg(uint16_t index, uint8_t * data);
```

Returns

0 - when call was passed

Description

none

Parameters

Parameters	Description
index	register number
*data	array to store data

Function

uint8_t DRV_GFX_SSD1926_GetReg(uint16_t index, uint8_t *data)

DRV_GFX_SSD1926_SetReg Function

updates graphics controller register value (byte access)

File

drv_gfx_ssd1926.h

C

```
uint16_t DRV_GFX_SSD1926_SetReg(uint16_t index, uint8_t value);
```

Returns

1 - call was not passed 0 - call was passed

Description

none

Parameters

Parameters	Description
index	register number
value	value to write to register

Function

uint8_t DRV_GFX_SSD1926_SetReg(uint16_t index, uint8_t value)

DRV_GFX_SSD1926_Close Function

closes an instance of the graphics controller

File

drv_gfx_ssd1926.h

C

```
void DRV_GFX_SSD1926_Close(DRV_HANDLE handle);
```

Description

none

Function

void DRV_GFX_SSD1926_Close(DRV_HANDLE handle)

DRV_GFX_SSD1926_Initialize Function

resets LCD, initializes PMP

File

drv_gfx_ssd1926.h

C

```
SYS_MODULE_OBJ DRV_GFX_SSD1926_Initialize(const SYS_MODULE_INDEX moduleIndex, const SYS_MODULE_INIT * const moduleInit);
```

Returns

1 - call not successful (PMP driver busy) 0 - call successful

Description

none

Parameters

Parameters	Description
instance	driver instance

Function

SYS_MODULE_OBJ DRV_GFX_SSD1926_Initialize(const SYS_MODULE_INDEX moduleIndex,
const SYS_MODULE_INIT * const moduleInit)

DRV_GFX_SSD1926_Open Function

opens an instance of the graphics controller

File

drv_gfx_ssd1926.h

C

```
DRV_HANDLE DRV_GFX_SSD1926_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Description

none

Function

DRV_GFX_SSD1926_Open(uint8_t instance)

DRV_GFX_SSD1926_SetColor Function

Sets the color for the driver instance

File

drv_gfx_ssd1926.h

C

```
void DRV_GFX_SSD1926_SetColor(GFX_COLOR color);
```

Returns

none

Function

void DRV_GFX_SSD1926_SetColor(GFX_COLOR color)

DRV_GFX_SSD1926_Status Function

Provides the current status of the SSD1926 driver module.

File

drv_gfx_ssd1926.h

C

```
SYS_STATUS DRV_GFX_SSD1926_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Description

This function provides the current status of the SSD1926 driver module.

Preconditions

The DRV_GFX_SSD1926_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_GFX_SSD1926_Initialize
SYS_STATUS          status;

status = DRV_GFX_SSD1926_Status( object );
```

```
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_GFX_SSD1926_Initialize

Function

SYS_STATUS DRV_GFX_SSD1926_Status (SYS_MODULE_OBJ object)

DRV_GFX_SSD1926_SetInstance Function

Sets the instance for the driver

File

drv_gfx_ssd1926.h

C

```
void DRV_GFX_SSD1926_SetInstance(uint8_t instance);
```

Returns

none

Function

void DRV_GFX_SSD1926_SetInstance(uint8_t instance)

DRV_GFX_SSD1926_Tasks Function

Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer

File

drv_gfx_ssd1926.h

C

```
void DRV_GFX_SSD1926_Tasks(SYS_MODULE_OBJ object);
```

Function

void DRV_GFX_SSD1926_Tasks(void)

DRV_GFX_SSD1926_InterfaceSet Function

Returns the API of the graphics controller

File

drv_gfx_ssd1926.h

C

```
void DRV_GFX_SSD1926_InterfaceSet(DRV_HANDLE handle, DRV_GFX_INTERFACE * interface);
```

Description

none

Function

void DRV_GFX_SSD1926_InterfaceSet(DRV_HANDLE handle, DRV_GFX_INTERFACE * interface)

DRV_GFX_SSD1926_MaxXGet Function

Returns x extent of the display.

File

drv_gfx_ssd1926.h

C

```
uint16_t DRV_GFX_SSD1926_MaxXGet();
```

Example

```
Remarks:
```

Function

void DRV_GFX_SSD1926_MaxXGet()

DRV_GFX_SSD1926_MaxYGet Function

Returns y extent of the display.

File

drv_gfx_ssd1926.h

C

```
uint16_t DRV_GFX_SSD1926_MaxYGet();
```

Example

```
Remarks:
```

Function

void GFX_MaxYGet()

DRV_GFX_SSD1926_BarFill Function

Hardware accelerated barfill function

File

drv_gfx_ssd1926.h

C

```
void DRV_GFX_SSD1926_BarFill(uint16_t left, uint16_t top, uint16_t right, uint16_t bottom);
```

Returns

1 - call not successful (PMP driver busy) 0 - call successful

Description

see primitive BarFill

Function

void DRV_GFX_SSD1926_BarFill(uint16_t left, uint16_t top, uint16_t right, uint16_t bottom)

DRV_GFX_SSD1926_PixelArrayGet Function

gets an array of pixels of length count starting at *color

File

drv_gfx_ssd1926.h

C

```
uint16_t* DRV_GFX_SSD1926_PixelArrayGet(uint16_t * color, uint16_t x, uint16_t y, uint16_t count);
```

Returns

NULL - call not successful !NULL - address of the display driver queue command

Description

none

Parameters

Parameters	Description
instance	driver instance
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels

Function

uint16_t DRV_GFX_SSD1926_PixelArrayGet(uint16_t *color, short x, short y, uint16_t count)

DRV_GFX_SSD1926_PixelArrayPut Function

outputs an array of pixels of length count starting at *color

File

drv_gfx_ssd1926.h

C

```
void DRV_GFX_SSD1926_PixelArrayPut(uint16_t * color, uint16_t x, uint16_t y, uint16_t count, uint16_t
lineCount);
```

Returns

NULL - call not successful !NULL - handle to the number of pixels remaining

Description

none

Parameters

Parameters	Description
*color	start of the array
x	x coordinate of the start point.
y	y coordinate of the end point.
count	number of pixels
lineCount	number of lines

Function

void DRV_GFX_SSD1926_PixelArrayPut(uint16_t *color, uint16_t x, uint16_t y, uint16_t count, uint16_t lineCount)

DRV_GFX_SSD1926_PixelPut Function

outputs one pixel into the frame buffer at the x,y coordinate given

File

drv_gfx_ssd1926.h

C

```
void DRV_GFX_SSD1926_PixelPut(uint16_t x, uint16_t y);
```

Returns

NULL - call not successful !NULL - address of the display driver queue command

Description

none

Parameters

Parameters	Description
x,y	pixel coordinates

Function

uint16_t DRV_GFX_SSD1926_PixelPut(short x, short y)

SSD1926 Driver Data Types and Constants

DRV_GFX_SSD1926_INDEX_COUNT Macro

Number of valid SSD1926 driver indices.

File

drv_gfx_ssd1926.h

C

```
#define DRV_GFX_SSD1926_INDEX_COUNT DRV_GFX_SSD1926_NUMBER_OF_MODULES
```

Description

SSD1926 Driver Module Index Count

This constant identifies SSD1926 driver index definitions.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is device-specific.

DRV_GFX_SSD1926_COMMAND Structure

Structure for the commands in the driver queue.

File

drv_gfx_ssd1926.h

C

```
typedef struct {
  uint32_t address;
  uint16_t * array;
  uint16_t data;
} DRV_GFX_SSD1926_COMMAND;
```

Members

Members	Description
uint32_t address;	whether or not the task is complete

Description

Structure: DRV_GFX_SSD1926_COMMAND

Structure for the commands in the driver queue.

Parameters

Parameters	Description
address	pixel address
array	pointer to array of pixel data
data	pixel color

OTM2201A Driver Functions

DRV_GFX_OTM2201A_AddressSet Function

Sets the start GRAM address where pixel data to be written

File

drv_gfx_otm2201a.h

C

```
uint16_t DRV_GFX_OTM2201A_AddressSet(uint32_t address);
```

Returns

DRV_OTM2201A_ERROR_PMP_WRITE - returns error during PMP Write, DRV_OTM2201A_ERROR_NO_ERROR - returns success without any error.

Description

Address consists of Lower 8 bit at Register REG_RAM_ADDR_LOW and Higher 8 bit at Register REG_RAM_ADDR_HIGH

Parameters

Parameters	Description
address	pixel address

Function

uint16_t DRV_GFX_OTM2201A_AddressSet(uint32_t address)

DRV_GFX_OTM2201A_BrightnessSet Function

Sets the brightness of the display backlight.

File

drv_gfx_otm2201a.h

C

```
void DRV_GFX_OTM2201A_BrightnessSet(uint8_t instance, uint16_t level);
```

Returns

none

Description

Sets the brightness of the display backlight.

Parameters

Parameters	Description
instance	instance of the driver
level	Brightness level. Valid values are 0 to 100. 0 = brightness level is zero or display is turned off. 100 = brightness level is maximum.

Function

uint8_t DRV_GFX_OTM2201A_BrightnessSet(

uint8_t instance,

uint16_t level

)

DRV_GFX_OTM2201A_RegGet Function

Returns graphics controller register value (byte access)

File

drv_gfx_otm2201a.h

C

```
uint8_t DRV_GFX_OTM2201A_RegGet(uint16_t index, uint16_t * data);
```

Returns

DRV_OTM2201A_ERROR_PMP_WRITE - returns error during PMP Write, DRV_OTM2201A_ERROR_PMP_READ - returns error during PMP Read, DRV_OTM2201A_ERROR_NO_ERROR - returns success without any error.

Description

Returns graphics controller register value (byte access)

Parameters

Parameters	Description
index	register number
*data	array to store register data

Function

uint8_t DRV_GFX_OTM2201A_RegGet(

uint16_t index,

uint8_t *data

)

DRV_GFX_OTM2201A_Busy Function

Returns non-zero value if LCD controller is busy (previous drawing operation is not completed).

File

drv_gfx_otm2201a.h

C

```
uint16_t DRV_GFX_OTM2201A_Busy(uint8_t instance);
```

Returns

DRV_OTM2201A_ERROR_DEVICE_BUSY - Device is busy, DRV_OTM2201A_ERROR_NO_ERROR - Success, driver is not busy.

Description

Returns non-zero value if LCD controller is busy (previous drawing operation is not completed).

Parameters

Parameters	Description
instance	driver instance

Function

uint16_t DRV_GFX_OTM2201A_Busy(uint8_t instance)

DRV_GFX_OTM2201A_Close Function

closes an instance of the graphics controller

File

drv_gfx_otm2201a.h

C

```
void DRV_GFX_OTM2201A_Close(DRV_HANDLE handle);
```

Returns

0 - instance closed 2 - instance doesn't exist 3 - instance already closed

Description

none

Function

DRV_GFX_OTM2201A_Close(uint8_t instance)

DRV_GFX_OTM2201A_ColorSet Function

Sets the color for the driver instance

File

drv_gfx_otm2201a.h

C

```
void DRV_GFX_OTM2201A_ColorSet(GFX_COLOR color);
```

Returns

none

Description

Sets the color for the driver instance

Parameters

Parameters	Description
color	16 bit 565 format color value

Function

void DRV_GFX_OTM2201A_ColorSet(GFX_COLOR color)

DRV_GFX_OTM2201A_Initialize Function

resets LCD, initializes PMP

File

drv_gfx_otm2201a.h

C

```
SYS_MODULE_OBJ DRV_GFX_OTM2201A_Initialize(const SYS_MODULE_INDEX moduleIndex, const SYS_MODULE_INIT *
const moduleInit);
```

Returns

NULL - call not successful (PMP driver busy) !NULL - address of the display driver queue command

Description

none

Parameters

Parameters	Description
instance	driver instance

Function

uint16_t DRV_GFX_OTM2201A_Initialize(uint8_t instance)

DRV_GFX_OTM2201A_InstanceSet Function

Sets the instance for the driver

File

drv_gfx_otm2201a.h

C

```
void DRV_GFX_OTM2201A_InstanceSet(uint8_t instance);
```

Returns

none

Description

Sets the instance for the driver

Parameters

Parameters	Description
instance	driver instance

Function

void DRV_GFX_OTM2201A_InstanceSet(uint8_t instance)

DRV_GFX_OTM2201A_Open Function

opens an instance of the graphics controller

File

drv_gfx_otm2201a.h

C

```
DRV_HANDLE DRV_GFX_OTM2201A_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Returns

1 - driver not initialized 2 - instance doesn't exist 3 - instance already open instance to driver when successful

Description

none

Function

DRV_GFX_OTM2201A_Open(uint8_t instance)

DRV_GFX_OTM2201A_RegSet Function

Updates graphics controller register value (byte access)

File

drv_gfx_otm2201a.h

C

```
uint16_t DRV_GFX_OTM2201A_RegSet(uint16_t index, uint16_t value);
```

Returns

DRV_OTM2201A_ERROR_PMP_WRITE - returns error during PMP Write, DRV_OTM2201A_ERROR_NO_ERROR - returns success without any error.

Description

This call can set "value" of the register accessed by its "index" and can repeat the same by number of times mentioned in "repeatCount"

Parameters

Parameters	Description
index	register number
value	value to write to register
repeatCount	repeatCount number of times value is to be written to the register.

Function

uint8_t DRV_GFX_OTM2201A_RegSet(

uint16_t index,

uint8_t value,

uint32_t repeatCount

)

DRV_GFX_OTM2201A_Tasks Function

Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer

File

drv_gfx_otm2201a.h

C

```
void DRV_GFX_OTM2201A_Tasks(SYS_MODULE_OBJ object);
```

Function

void DRV_GFX_OTM2201A_Tasks(void)

DRV_GFX_OTM2201A_InterfaceSet Function

Returns the API of the graphics controller

File

drv_gfx_otm2201a.h

C

```
void DRV_GFX_OTM2201A_InterfaceSet(DRV_HANDLE handle, DRV_GFX_INTERFACE * interface);
```

Description

none

Function

void DRV_GFX_OTM2201A_InterfaceSet(DRV_HANDLE handle, DRV_GFX_INTERFACE * interface)

DRV_GFX_OTM2201A_MaxXGet Function

Returns x extent of the display.

File

drv_gfx_otm2201a.h

C

```
uint16_t DRV_GFX_OTM2201A_MaxXGet();
```

Example

```
Remarks:
```

Function

void DRV_GFX_OTM2201A_MaxXGet(void)

DRV_GFX_OTM2201A_MaxYGet Function

Returns y extent of the display.

File

drv_gfx_otm2201a.h

C

```
uint16_t DRV_GFX_OTM2201A_MaxYGet();
```

Example

```
Remarks:
```

Function

void DRV_GFX_OTM2201A_MaxYGet(void)

DRV_GFX_OTM2201A_BarFill Function

Outputs count number of pixels into the frame buffer from the given x,y coordinate.

File

drv_gfx_otm2201a.h

C

```
void DRV_GFX_OTM2201A_BarFill(uint16_t left, uint16_t top, uint16_t right, uint16_t bottom);
```

Returns

DRV_OTM2201A_ERROR_QUEUE_FULL - OTM2201A command queue is full, DRV_OTM2201A_ERROR_NO_ERROR - Success without any error.

Description

Outputs count number of pixels into the frame buffer from the given x,y coordinate.

Parameters

Parameters	Description
left	pixel coordinate on x axis
top	pixel coordinate on y axis
right	pixel coordinate on x axis
bottom	pixel coordinate on y axis

Function

uint16_t DRV_GFX_OTM2201A_BarFill(

short left,

short top,

short right,

short bottom

)

DRV_GFX_OTM2201A_PixelArrayGet Function

Gets an array of pixels of length count into an array starting at *color

File

drv_gfx_otm2201a.h

C

```
uint16_t* DRV_GFX_OTM2201A_PixelArrayGet(uint16_t * color, uint16_t x, uint16_t y, uint16_t count);
```

Returns

DRV_OTM2201A_ERROR_QUEUE_FULL - OTM2201A command queue is full, DRV_OTM2201A_ERROR_NO_ERROR - Success without any error.

Description

Gets an array of pixels of length count into an array starting at *color

Parameters

Parameters	Description
color	Pointer to array where color data is to be loaded
x	pixel coordinate on x axis
y	pixel coordinate on y axis
count	count number of pixels

Function

uint16_t DRV_GFX_OTM2201A_PixelArrayGet(uint16_t *color,

short x,

short y,
uint16_t count)

DRV_GFX_OTM2201A_PixelArrayPut Function

Outputs an array of pixels of length count starting at *color

File

drv_gfx_otm2201a.h

C

```
void DRV_GFX_OTM2201A_PixelArrayPut(uint16_t * color, uint16_t x, uint16_t y, uint16_t count, uint16_t
lineCount);
```

Returns

handle - handle to the number of pixels remaining, DRV_OTM2201A_ERROR_QUEUE_FULL - OTM2201A command queue is full.

Description

Outputs an array of pixels of length count starting at *color

Parameters

Parameters	Description
color	pointer to array of color of pixels
x	pixel coordinate on x axis.
y	pixel coordinate on y axis.
count	count number of pixels
lineCount	lineCount number of display lines

Function

void DRV_GFX_OTM2201A_PixelArrayPut(
uint16_t *color,
uint16_t x,
uint16_t y,
uint16_t count,
uint16_t lineCount
)

DRV_GFX_OTM2201A_PixelPut Function

Outputs one pixel into the frame buffer at the x,y coordinate given

File

drv_gfx_otm2201a.h

C

```
void DRV_GFX_OTM2201A_PixelPut(uint16_t x, uint16_t y);
```

Returns

DRV_OTM2201A_ERROR_QUEUE_FULL - OTM2201A command queue is full, DRV_OTM2201A_ERROR_NO_ERROR - Success without any error.

Description

Outputs one pixel into the frame buffer at the x,y coordinate given

Parameters

Parameters	Description
x	pixel coordinate on x axis
y	pixel coordinate on y axis

Function

void DRV_GFX_OTM2201A_PixelPut(uint16_t x, uint16_t y)

OTM2201A Driver Data Types and Constants

OTM2201A_TASK Enumeration

Enumeration for command type.

File

drv_gfx_otm2201a.h

C

```
typedef enum {
  INITIALIZE = 0,
  BUSY,
  PUT_ARRAY,
  PUT_PIXELS
} OTM2201A_TASK;
```

Description

Enum: OTM2201A_TASK

Enumeration for command type.

Parameters

Parameters	Description
INITIALIZE	driver initialization task
BUSY	driver busy task
PUT_ARRAY	driver put array task
PUT_PIXELS	driver put pixels task

DRV_GFX_OTM2201A_COMMAND Structure

Structure for the commands in the driver queue.

File

drv_gfx_otm2201a.h

C

```
typedef struct {
  uint8_t instance;
  uint32_t address;
  uint16_t * array;
  uint16_t data;
  uint16_t count;
  uint16_t lineCount;
  OTM2201A_TASK task;
} DRV_GFX_OTM2201A_COMMAND;
```

Description

Structure: DRV_GFX_OTM2201A_COMMAND

Structure for the commands in the driver queue.

Parameters

Parameters	Description
instance	instance of the driver
address	pixel address
array	pointer to array of pixel data
data	pixel color
count	count number of pixels in one line

lineCount	lineCount number of lines of display
task	Type of task (OTM2201A_TASK enum)

DRV_GFX_OTM2201A_INDEX_COUNT Macro

Number of valid OTM2201A driver indices.

File

drv_gfx_otm2201a.h

C

```
#define DRV_GFX_OTM2201A_INDEX_COUNT DRV_GFX_OTM2201A_NUMBER_OF_MODULES
```

Description

This constant identifies OTM2201A driver index definitions.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is device-specific.

Description

This section lists the source and header files used by the Graphics Driver Library.

drv_gfx_lcc.h

Interface for the graphics library where the primitives are rendered and sent to the graphics controller either external or internal

Enumerations

	Name	Description
	DMA_ISR_TASK	This is type DMA_ISR_TASK.
	DRV_GFX_LCC_DISPLAY_WRITE_BUS_TYPE	
	DRV_GFX_LCC_FB_WRITE_BUS_TYPE	
	LCC_VSYNC_STATE	This is type LCC_VSYNC_STATE.

Functions

	Name	Description
	DRV_GFX_LCC_AlphaBlendWindow	DOM-IGNORE-END
	DRV_GFX_LCC_BarFill	outputs one pixel into the frame buffer at the x,y coordinate given
	DRV_GFX_LCC_Close	closes an instance of the graphics controller
	DRV_GFX_LCC_DisplayRefresh	LCD refresh handler
	DRV_GFX_LCC_FrameBufferAddressSet	Sets address of the framebuffer
	DRV_GFX_LCC_GetBuffer	DOM-IGNORE-END
	DRV_GFX_LCC_Initialize	resets LCD, initializes PMP
	DRV_GFX_LCC_InterfaceSet	Returns the API of the graphics controller
	DRV_GFX_LCC_MaxXGet	Returns x extent of the display.
	DRV_GFX_LCC_MaxYGet	Returns y extent of the display.
	DRV_GFX_LCC_Open	opens an instance of the graphics controller
	DRV_GFX_LCC_PixelArrayGet	gets an array of pixels of length count starting at *color
	DRV_GFX_LCC_PixelArrayPut	outputs an array of pixels of length count starting at *color
	DRV_GFX_LCC_PixelPut	outputs one pixel into the frame buffer at the x,y coordinate given
	DRV_GFX_LCC_SetColor	Sets the color for the driver instance
	DRV_GFX_LCC_SetPage	DOM-IGNORE-START
	DRV_GFX_LCC_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer
	DRV_GFX_LCC_VSYNC_CallbackSet	Sets a callback function pointer for notification of VSYNC state
	DRV_GFX_LCC_VSYNC_GetState	Gets the state of the current VSYNC mode
	DRV_GFX_PaletteSet	returns address to the framebuffer.
	GFX_PRIM_SetPIPWindow	returns address to the framebuffer.

Macros

	Name	Description
	DRV_GFX_LCC_INDEX_COUNT	Number of valid LCC driver indices.
	PIP_BUFFER	This is macro PIP_BUFFER.

Types

	Name	Description
	LCC_VSYNC_Callback_FnPtr	function pointer definition for VSYNC callback

Description

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Low-Cost Controllerless (LCC) Graphics Controller.

File Name

drv_gfx_lcc.h

Company

Microchip Technology Inc.

drv_gfx_s1d13517.h

Interface for the graphics library where the primitives are rendered and sent to the graphics controller either external or internal

Functions

	Name	Description
	DRV_GFX_S1D13517_AlphaBlendWindow	SEE primitive layer alphablendWindow definition
	DRV_GFX_S1D13517_BarFill	outputs one pixel into the frame buffer at the x,y coordinate given
	DRV_GFX_S1D13517_BrightnessSet	Sets the brightness of the display backlight.
	DRV_GFX_S1D13517_Close	closes an instance of the graphics controller
	DRV_GFX_S1D13517_GetReg	returns graphics controllerS1D13517_REGister value (byte access)
	DRV_GFX_S1D13517_Initialize	resets LCD, initializes PMP
	DRV_GFX_S1D13517_InterfaceSet	Returns the API of the graphics controller
	DRV_GFX_S1D13517_Layer	Updates a Layer depending on the layer parameters.
	DRV_GFX_S1D13517_MaxXGet	Returns x extent of the display.
	DRV_GFX_S1D13517_MaxYGet	Returns y extent of the display.
	DRV_GFX_S1D13517_Open	opens an instance of the graphics controller
	DRV_GFX_S1D13517_PixelArrayPut	outputs an array of pixels of length count starting at *color
	DRV_GFX_S1D13517_PixelPut	outputs one pixel into the frame buffer at the x,y coordinate given
	DRV_GFX_S1D13517_SetColor	Sets the color for the driver instance
	DRV_GFX_S1D13517_SetInstance	Sets the instance for the driver
	DRV_GFX_S1D13517_SetPage	Sets the page of a certain page type
	DRV_GFX_S1D13517_SetReg	updates graphics controllerS1D13517_REGister value (byte access)
	DRV_GFX_S1D13517_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer

Macros

	Name	Description
	DRV_GFX_S1D13517_INDEX_COUNT	Number of valid S1D13517 driver indices.

Structures

	Name	Description
	LAYER_REGISTERS	This structure is used to describe layerS1D13517_REGisters.

Description

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the S1D13517 Graphics Controller.

File Name

drv_gfx_s1d13517.c

Company

Microchip Technology Inc.

drv_gfx_ssd1289.h

Interface for the graphics library, which initializes the SYSTECH SSD1289 Timing Controller.

Functions

	Name	Description
	GFX_TCON_SSD1289Init	Initialize the Solomon Systech SSD1289 Timing Controller.

Description

Module for Microchip Graphics Library

This header file contains the function definition for the interface to the SYSTECH SSD1289 Timing Controller.

File Name

drv_gfx_ssd1289.h

Company

Microchip Technology Inc.

drv_gfx_ssd1926.h

Interface for the graphics library where the primitives are rendered and sent to the graphics controller either external or internal

Functions

	Name	Description
	DRV_GFX_SSD1926_BarFill	Hardware accelerated barfill function
	DRV_GFX_SSD1926_Busy	Returns non-zero if LCD controller is busy (previous drawing operation is not completed).
	DRV_GFX_SSD1926_Close	closes an instance of the graphics controller
	DRV_GFX_SSD1926_GetReg	returns graphics controller register value (byte access)
	DRV_GFX_SSD1926_Initialize	resets LCD, initializes PMP
	DRV_GFX_SSD1926_InterfaceSet	Returns the API of the graphics controller
	DRV_GFX_SSD1926_MaxXGet	Returns x extent of the display.
	DRV_GFX_SSD1926_MaxYGet	Returns y extent of the display.
	DRV_GFX_SSD1926_Open	opens an instance of the graphics controller
	DRV_GFX_SSD1926_PixelArrayGet	gets an array of pixels of length count starting at *color
	DRV_GFX_SSD1926_PixelArrayPut	outputs an array of pixels of length count starting at *color
	DRV_GFX_SSD1926_PixelPut	outputs one pixel into the frame buffer at the x,y coordinate given
	DRV_GFX_SSD1926_SetColor	Sets the color for the driver instance
	DRV_GFX_SSD1926_SetInstance	Sets the instance for the driver
	DRV_GFX_SSD1926_SetReg	updates graphics controller register value (byte access)
	DRV_GFX_SSD1926_Status	Provides the current status of the SSD1926 driver module.
	DRV_GFX_SSD1926_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer

Macros

	Name	Description
	DRV_GFX_SSD1926_INDEX_COUNT	Number of valid SSD1926 driver indices.

Structures

	Name	Description
	DRV_GFX_SSD1926_COMMAND	Structure for the commands in the driver queue.

Description

None

File Name

drv_gfx_ssd1926.h

Microchip Technology Inc.

drv_gfx_otm2201a.h

Interface for the graphics library where the primitives are rendered and sent to the graphics controller either external or internal

Enumerations

	Name	Description
	OTM2201A_TASK	Enumeration for command type.

Functions

	Name	Description
	DRV_GFX_OTM2201A_AddressSet	Sets the start GRAM address where pixel data to be written
	DRV_GFX_OTM2201A_BarFill	Outputs count number of pixels into the frame buffer from the given x,y coordinate.
	DRV_GFX_OTM2201A_BrightnessSet	Sets the brightness of the display backlight.
	DRV_GFX_OTM2201A_Busy	Returns non-zero value if LCD controller is busy (previous drawing operation is not completed).
	DRV_GFX_OTM2201A_Close	closes an instance of the graphics controller
	DRV_GFX_OTM2201A_ColorSet	Sets the color for the driver instance
	DRV_GFX_OTM2201A_Initialize	resets LCD, initializes PMP
	DRV_GFX_OTM2201A_InstanceSet	Sets the instance for the driver
	DRV_GFX_OTM2201A_InterfaceSet	Returns the API of the graphics controller
	DRV_GFX_OTM2201A_MaxXGet	Returns x extent of the display.
	DRV_GFX_OTM2201A_MaxYGet	Returns y extent of the display.
	DRV_GFX_OTM2201A_Open	opens an instance of the graphics controller
	DRV_GFX_OTM2201A_PixelArrayGet	Gets an array of pixels of length count into an array starting at *color
	DRV_GFX_OTM2201A_PixelArrayPut	Outputs an array of pixels of length count starting at *color
	DRV_GFX_OTM2201A_PixelPut	Outputs one pixel into the frame buffer at the x,y coordinate given
	DRV_GFX_OTM2201A_RegGet	Returns graphics controller register value (byte access)
	DRV_GFX_OTM2201A_RegSet	Updates graphics controller register value (byte access)
	DRV_GFX_OTM2201A_Tasks	Task machine that renders the driver calls for the graphics library it must be called periodically to output the contents of its circular buffer

Macros

	Name	Description
	DRV_GFX_OTM2201A_INDEX_COUNT	Number of valid OTM2201A driver indices.

Structures

	Name	Description
	DRV_GFX_OTM2201A_COMMAND	Structure for the commands in the driver queue.

Description

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the OTM2201A Graphics Controller.

File Name

drv_gfx_otm2201a.h

Company

Microchip Technology Inc.

drv_gfx_tft002.h

This is file drv_gfx_tft002.h.

drv_gfx_lcc_config_template.h

This header file template defines the configurations for Graphics Library Driver LCC.

Macros

	Name	Description
	DRV_GFX_CONFIG_LCC_EXTERNAL_MEMORY	Macro that enables external memory framebuffer.
	DRV_GFX_CONFIG_LCC_INTERNAL_MEMORY	Macro that enables internal memory framebuffer.
	DRV_GFX_CONFIG_LCC_PALETTE	Macro that disables internal palette memory framebuffer.
	DRV_GFX_LCC_DMA_CHANNEL_INDEX	Macro that defines the DMA CHANNEL INDEX.

Description

This is file drv_gfx_tft002_config_template.h.

I2C Driver Library Help

This section describes the I2C Driver Library.

Introduction

This library provides an interface to manage the data transfer operations using the I2C module on the Microchip family of microcontrollers.

Description

The driver communicates using the concept of *transactions*. In instances where the I2C operates in Master mode, the driver sends the start signal, followed by a slave device address (including a Read/Write bit), followed by a number of bytes written to or read from the slave. The *transaction* is completed by sending the stop signal. When the driver operates in the Slave mode, it will either read data or write data to the master.

This driver library provides application ready routines to read and write data using the I2C protocol, thus minimizing developer's awareness of the working of the I2C protocol.

- Provides read/write and buffer data transfer models
- Supports interrupt and Polled modes of operation
- Support multi-client and multi-instance operation
- Provides data transfer events
- Supports blocking and non-blocking operation
- Supports baud rate setting

Using the Library

This topic describes the basic architecture of the I2C Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_i2c.h`

The interface to the I2C Driver Library is defined in the `drv_i2c.h` header file. Any C language source (`.c`) file that uses the I2C Driver Library should include `drv_i2c.h`.

Library File: The I2C Driver Library archive (`.a`) file is installed with MPLAB Harmony.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

The I2C Driver Library provides the low-level abstraction of the I2C module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the I2C Driver Library interface.

Description

The I2C Driver Library features routines to perform two functions, driver maintenance and data transfer:

Driver Maintenance

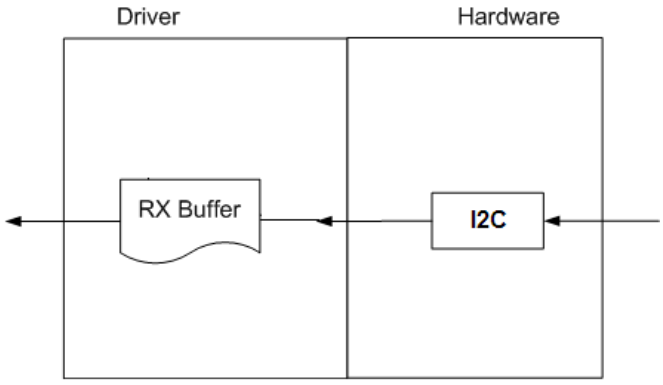
The Driver initialization routines allow the application to initialize the driver. The initialization data configures the I2C module as a Master or a Slave and sets the necessary parameters required for operation in the particular mode. The driver must be initialized before it can be used by the application. After the end of operation, the driver can be deinitialized.

Data Transfer

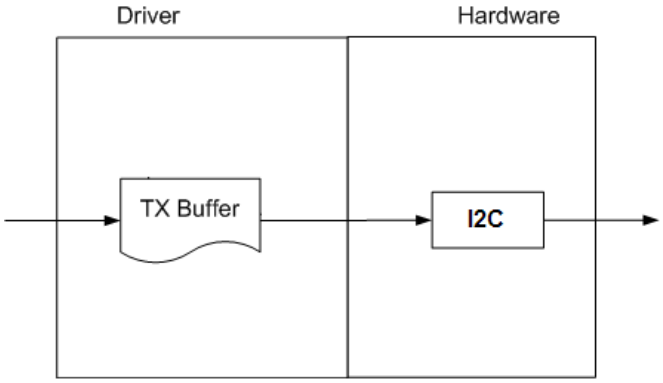
Data transfer is accomplished by separate Write and Read functions through a data buffer. The read and write function makes the user transparent to the internal working of the I2C protocol. The user can use callback mechanisms or use polling to check status of transfer.

The following diagrams illustrate the model used by the I2C Driver for transmitter and receiver.

Receiver Abstraction Model



Transmitter Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the I2C Driver Library.

Library Interface Section	Description
System Interaction Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Client Setup Functions	Provides open, close, status and other setup functions.
Data Transfer Functions	Provides data transfer functions available in the configuration.
Miscellaneous Functions	Provides miscellaneous driver functions.

How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality

System Access

This section provides information on system access.

Description

System Access

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During

system initialization, each instance of the I2C module would be initialized with the following configuration settings (either passed dynamically at run-time using DRV_I2C_INIT or by using initialization overrides) that are supported by the specific I2C device hardware:

- Device requested power state: one of the System Module Power States. For specific details please refer to **Data Types and Constants** in the Library Interface section.
- The actual peripheral ID enumerated as the PLIB level module ID (e.g., I2C_ID_2)
- Master or Slave mode of operation and their associated parameters
- Defining the respective interrupt sources for Master, Slave, and Error Interrupt

The DRV_I2C_Initialize API returns an object handle of the type SYS_MODULE_OBJ. After this, the object handle returned by the Initialize interface would be used by the other system interfaces like DRV_I2C_Deinitialize, DRV_I2C_Status, and DRV_I2C_Tasks.

Note: The system initialization settings, only affect the instance of the peripheral that is being initialized.

Example:

```
DRV_I2C_INIT        i2c_init_data;
SYS_MODULE_OBJ      objectHandle;

i2c_init_data.i2cId = DRV_I2C_PERIPHERAL_ID_IDX0,
i2c_init_data.i2cMode = DRV_I2C_MODE_MASTER,
OR
i2c_init_data.i2cMode = DRV_I2C_MODE_SLAVE,

/*    Master mode parameters */
i2c_init_data.baudRate = 100000,

objectHandle = DRV_I2C_Initialize(DRV_I2C_INDEX_0, (SYS_MODULE_INIT *)&drvI2C0InitData)
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
   // Handle error
}
```

Since the I2C bus is controlled by the Master, the Slave should respond to a read or write request whenever the Master makes the request. Thus, the slave does not have driver states like the Master. The operation of the I2C Driver when used in Slave mode is handled using callbacks. The callback, OperationStarting, must be configured during system initialization when in Slave mode. This callback is provided so that the application can respond appropriately when a read or write request is received from the Master.

Client Access

This section provides information on client access.

Description

For the application to start using an instance of the module, it must call the DRV_I2C_Open function. This provides the configuration required to open the I2C instance for operation. If the driver is deinitialized using the function DRV_I2C_Deinitialize, the application must call the DRV_I2C_Open function again to set up the instance of the I2C.

For the various options available for IO_INTENT, please refer to **Data Types and Constants** in the Library Interface section.

After a client instance is opened, DRV_I2C_ClientSetup can be called to set up client-specific parameters. In I2C Slave mode, this is used to set-up the IRQ logic so that the slave can toggle this line to request Master to send a Read command.

As during initialization, when the I2C module operates in the Slave mode, only the Master can terminate a transaction with the Slave. In this case,

the driver provides a callback to the application after the reception of each byte from the Master or after transmission of a byte to the Master.

Example:

```
/* I2C Driver Handle  */
DRV_HANDLE  drvI2CHandle;

/* Open the I2C Driver */
appData.drvI2CHandle = DRV_I2C_Open( DRV_I2C_INDEX_0,DRV_IO_INTENT_WRITE );

if (drvI2CHandle != DRV_HANDLE_VALID)
{
     //Client cannot open instance
}
```

Client Transfer

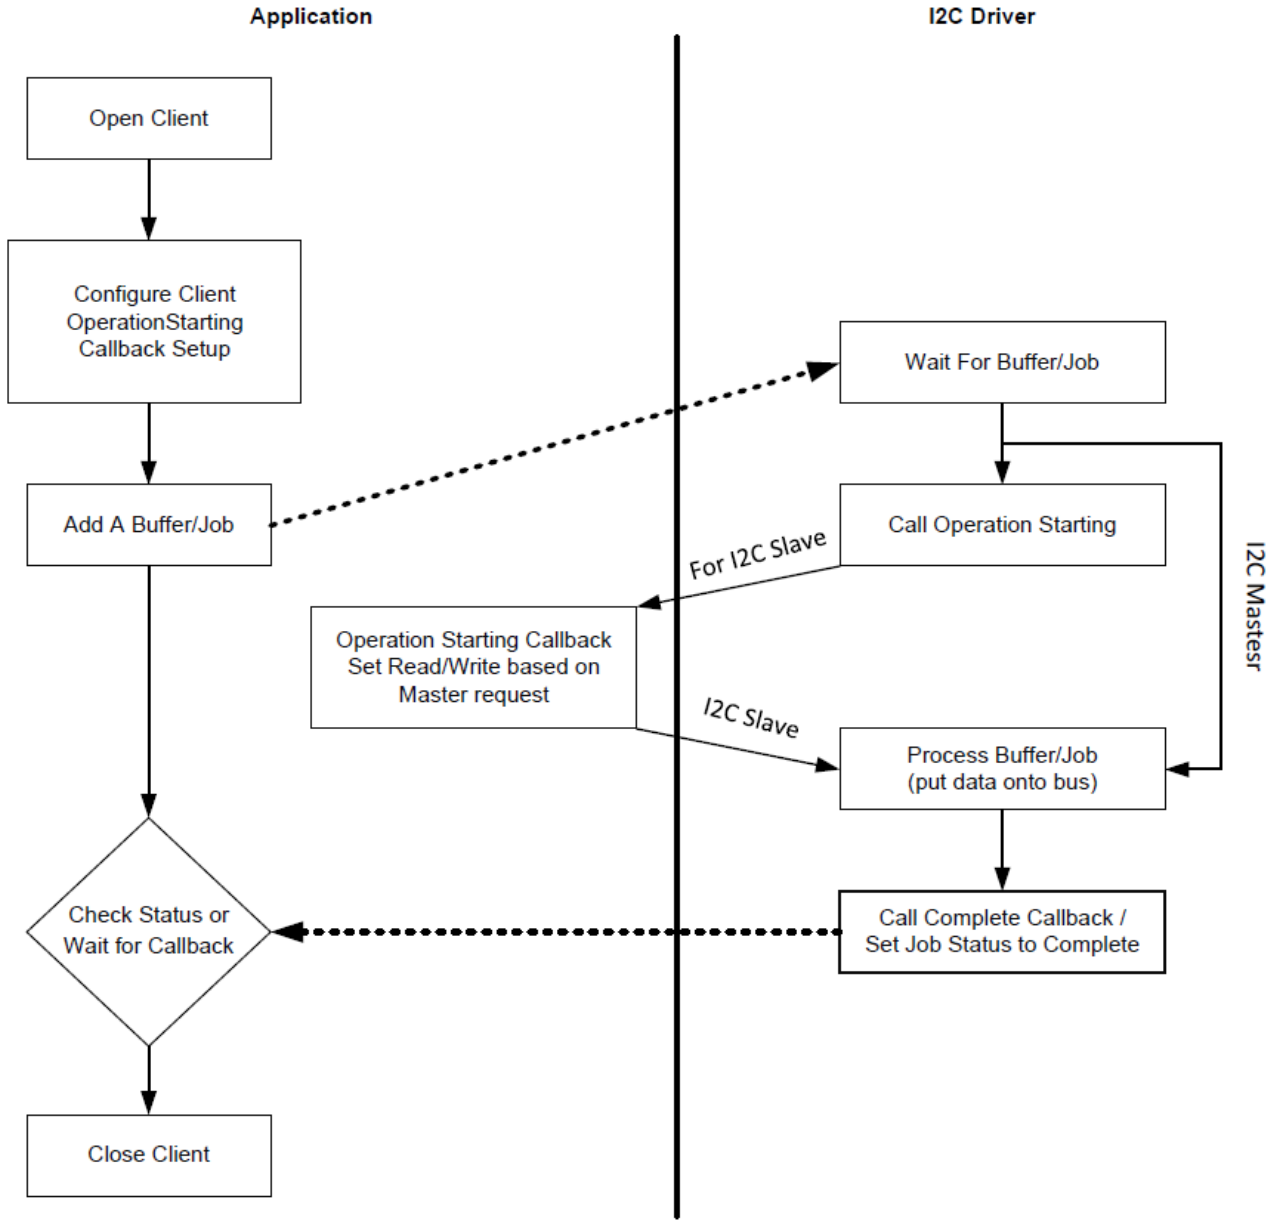
This section provides information on client transfer functionality.

Description

Core Functionality

Client basic functionality provides an extremely basic interface for the driver operation.

The following diagram illustrates the byte/word model used for the data transfer.



Client Data Transfer Functionality

Applications using the I2C driver need to perform the following:

1. The system should have completed necessary initialization and the DRV_I2C_Tasks should either be running in polled environment, or in an interrupt environment.
2. Open the driver using DRV_I2C_Open with the necessary intent.
3. Add a buffer using the DRV_I2C_Receive, DRV_I2C_Transmit, and DRV_I2C_TransmitThenReceive functions. An optional callback can be provided that will be called when the buffer/job is complete using DRV_I2C_BufferEventHandlerSet.
4. Check for the current transfer status using DRV_I2C_TransferStatusGet or wait for the callback to be called with buffer transfer status set to DRV_I2C_BUFFER_EVENT_COMPLETE or DRV_I2C_BUFFER_EVENT_ERROR.
5. Buffer status DRV_I2C_BUFFER_EVENT_COMPLETE implies that the I2C transaction has been completed without any errors. Buffer status DRV_I2C_BUFFER_EVENT_ERROR indicates that the I2C transaction was aborted and the entire contents of the buffer were not transferred.
6. In Master mode, common cases for DRV_I2C_BUFFER_EVENT_ERROR to be set are:

- Slave is non-operational
- Slave is performing an internal operation and cannot accept any more I2C messages from the Master until the operation completes. In such a case, if the Master tries to address the Slave and is attempting to transfer data, the Slave NACKs the transfer. This will result in the Master prematurely terminating the transaction and setting the DRV_I2C_BUFFER_EVENT_FLAG. In the application level, the Master can continuously attempt to send the transaction until transfer status changes from for DRV_I2C_BUFFER_EVENT_ERROR to DRV_I2C_BUFFER_EVENT_COMPLETE. This will in effect perform the so-called "Acknowledge Polling". An example of a Slave device that depicts this behavior is an EEPROM.

7. The client will be able to close the driver using DRV_I2C_Close when required.

Example:

```
/*  This example demonstrates the I2C driver setup of one instance of I2C acting
    as a Master to another instance of the I2C Driver acting as a Slave.
    In the Slave initialization data structure in system_init.c, the member
    operationStarting should be assigned a function pointer. This function will
    be called when the Slave receives an address match. Based on the R/W bit in
    the address, the transmit or receive function will be called by the Slave
    (e.g., .operationStarting = APP_SlaveDataforMaster) */

SYS_MODULE_OBJ i2cMasterObject;

SYS_MODULE_OBJ i2cSlaveObject;

/* function prototype of callback function */

Configuring the Library

Macros

	Name	Description
	DRV_DYNAMIC_BUILD	Dynamic driver build, dynamic device instance parameters.
	DRV_I2C_CONFIG_BUILD_TYPE	Selects static or dynamic driver build configuration.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_BASIC	Enables the device driver to support basic transfer mode.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_BLOCKING	Enables the device driver to support blocking operations.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_EXCLUSIVE	Enables the device driver to support operation in Exclusive mode.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_MASTER	Enables the device driver to support operation in Master mode.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_NON_BLOCKING	Enables the device driver to support non-blocking during operations
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_READ	Enables the device driver to support read operations.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_SLAVE	Enables the device driver to support operation in Slave mode.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_WRITE	Enables the device driver to support write operations.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_WRITE_READ	Enables the device driver to support write followed by read.
	DRV_STATIC_BUILD	Static driver build, static device instance parameters.
	DRV_I2C_FORCED_WRITE	Includes function that writes to slave irrespective of whether receiving a ACK or NACK from slave
	I2C_STATIC_DRIVER_MODE	Selects the type of STATIC driver

Description

The configuration of the I2C Driver Library is based on the file `sys_config.h`.

This header file contains the configuration selection for the I2C Driver Library. Based on the selections made, the I2C Driver Library may support the selected features. These configuration settings will apply to all instances of the I2C Driver Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_DYNAMIC_BUILD Macro

Dynamic driver build, dynamic device instance parameters.

File

drv_i2c_config_template.h

C

```
#define DRV_DYNAMIC_BUILD 1
```

Description

Dynamic Driver Build Configuration

This value, if used to identify the build type for a driver, will cause the driver to be built to dynamically, identify the instance of the peripheral at run-time using the parameter passed into its API routines.

DRV_I2C_CONFIG_BUILD_TYPE Macro

Selects static or dynamic driver build configuration.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_CONFIG_BUILD_TYPE DRV_DYNAMIC_BUILD
```

Description

I2C Driver Build Configuration Type

This definition selects if I2C device driver is to be used with static or dynamic build parameters. Must be equated to one of the following values:

- DRV_STATIC_BUILD - Build the driver using static accesses to the peripheral identified by the DRV_I2C_INSTANCE macro
- DRV_DYNAMIC_BUILD - Build the driver using dynamic accesses to the peripherals

Affects all the drv_i2c.h driver functions.

DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_BASIC Macro

Enables the device driver to support basic transfer mode.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_BASIC
```

Description

Support Basic Transfer Mode

This definition enables the device driver to support basic transfer mode.

Remarks

The device driver can support multiple modes within a single build.

This definition affects the following functions:

- DRV_I2C_BufferAddReadRead
- DRV_I2C_BufferAddReadWrite

Refer to the description of each function in the corresponding help file for details.

DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_BLOCKING Macro

Enables the device driver to support blocking operations.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_BLOCKING
```

Description

Support Blocking Operations

This definition enables the device driver to support blocking operations.

Remarks

The device driver can support multiple modes within a single build.

This definition affects the following functions:

- DRV_I2C_Open
- DRV_I2C_Close
- DRV_I2C_BufferAddRead
- DRV_I2C_BufferAddWrite

- DRV_I2C_BufferAddWriteRead

Refer to the description of each function in the corresponding help file for details.

DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_EXCLUSIVE Macro

Enables the device driver to support operation in Exclusive mode.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_EXCLUSIVE
```

Description

Support Exclusive Mode

This definition enables the device driver to support operation in Exclusive mode.

Remarks

The device driver can support multiple modes within a single build.

This definition affects the following functions:

- DRV_I2C_Open

Refer to the description of each function in the corresponding help file for details.

DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_MASTER Macro

Enables the device driver to support operation in Master mode.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_MASTER
```

Description

Support Master Mode

This definition enables the device driver to support operation in Master mode.

Remarks

During the configuration phase, the driver selects a list of operation modes that can be supported. While initializing a hardware instance, the device driver will properly perform the initialization base on the selected modes.

The device driver can support multiple modes within a single build.

Refer to the description of each function in the corresponding help file for details.

DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_NON_BLOCKING Macro

Enables the device driver to support non-blocking during operations

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_NON_BLOCKING
```

Description

Support Non-Blocking Operations

This definition enables the device driver to support non-blocking operations.

Remarks

The device driver can support multiple modes within a single build.

This definition affects the following functions:

- DRV_I2C_Open
- DRV_I2C_Close

Refer to the description of each function in the corresponding help file for details.

DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_READ Macro

Enables the device driver to support read operations.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_READ
```

Description

Support Read Mode

This definition enables the device driver to support read operations.

Remarks

The device driver can support multiple modes within a single build.

This definition affects the following functions:

- DRV_I2C_BufferAddRead

Refer to the description of each function in the corresponding help file for details.

DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_SLAVE Macro

Enables the device driver to support operation in Slave mode.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_SLAVE
```

Description

Support Slave Mode

This definition enables the device driver to support operation in Slave mode.

Remarks

During the configuration phase, the driver selects a list of operation modes that can be supported. While initializing a hardware instance, the device driver will properly perform the initialization base on the selected modes.

The device driver can support multiple modes within a single build.

Refer to the description of each function in the corresponding help file for details.

DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_WRITE Macro

Enables the device driver to support write operations.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_WRITE
```

Description

Support Write Mode

This definition enables the device driver to support write operations.

Remarks

The device driver can support multiple modes within a single build.

This definition affects the following functions:

- DRV_I2C_BufferAddWrite

Refer to the description of each function in the corresponding help file for details.

DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_WRITE_READ Macro

Enables the device driver to support write followed by read.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_WRITE_READ
```

Description

Support Write followed by a Read using Restart

This definition enables the device driver to support write followed by read without relinquishing control of the bus. Restart is issued instead of Stop at the end of write. Stop is issued after read operation.

Remarks

The device driver can support multiple modes within a single build.

This definition affects the following functions:

- DRV_I2C_BufferAddWriteRead

Refer to the description of each function in the corresponding help file for details.

DRV_STATIC_BUILD Macro

Static driver build, static device instance parameters.

File

drv_i2c_config_template.h

C

```
#define DRV_STATIC_BUILD 0
```

Description

Static Driver Build Configuration

This value, if used to identify the build type for a driver, will cause the driver to be built using a specific statically identified instance of the peripheral.

DRV_I2C_FORCED_WRITE Macro

Includes function that writes to slave irrespective of whether receiving a ACK or NACK from slave

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_FORCED_WRITE true
```

Description

I2C driver objects configuration

When this option is checked, this will include Forced Write function. The Force Write function will send all data bytes to the slave irrespective of receiving ACK or NACK from slave. If writing data to the slave is invoked using DRV_I2C_Transfer, the transaction will be aborted if the Slave NACKs address or any data byte and a STOP condition will be send. This function is typically included for Slaves that require a special reset sequence.

Remarks

None

I2C_STATIC_DRIVER_MODE Macro

Selects the type of STATIC driver

File

drv_i2c_config_template.h

C

```
#define I2C_STATIC_DRIVER_MODE BUFFER_MODEL_STATIC
```

Description

I2C Static Driver type

This selects either the BYTE_MODEL_STATIC or BUFFER_MODEL_STATIC version of I2C driver. The BYTE_MODEL_STATIC version is equivalent to and is referred to as STATIC driver implementation in Harmony Versions 1.06.02 and below. This version of STATIC driver is not recommended for new design and will be deprecated in future release. The BUFFER_MODEL_STATIC supports transfer of buffers and is API compatible with the DYNAMIC implementation of I2C.

Building the Library

This section lists the files that are available in the I2C Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/i2c`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_i2c.h`	This file provides the interface definitions of the I2C driver.
`/drv_i2c_bb.h`	This file provides interface definitions that are transparent to the user when the I2C Driver is used in Bit-bang mode.
`/src/drv_i2c_local.h`	This file provides definitions of the data types that are used in the driver object.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_i2c.c`	This file contains the core implementation of the I2C driver.
`/src/dynamic/drv_i2c_bb.c`	This file implements the I2C Driver in Bit-bang mode.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files exist for this library.

Module Dependencies

The I2C Driver Library depends on the following modules:

- Clock System Service Library

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_I2C_Deinitialize	Deinitializes the index instance of the I2C module. **Implementation:** Static/Dynamic
	DRV_I2C_Initialize	Initializes hardware and data for the index instance of the I2C module. **Implementation:** Static/Dynamic
	DRV_I2C_Tasks	Maintains the State Machine of the I2C driver and performs all the protocol level actions. **Implementation:** Dynamic

b) Client Setup Functions

	Name	Description
	DRV_I2C_Close	Closes an opened instance of an I2C module driver. **Implementation:** Dynamic
	DRV_I2C_Open	Opens the specified instance of the I2C driver for use and provides an "open-instance" handle. **Implementation:** Dynamic

c) Data Transfer Functions

	Name	Description
	DRV_I2C_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. **Implementation:** Dynamic
	DRV_I2C_BytesTransferred	Returns the number of bytes transmitted or received in a particular I2C transaction. The transaction is identified by the handle.
	DRV_I2C_Receive	This function reads data written from either Master or Slave. **Implementation:** Dynamic
	DRV_I2C_Transmit	This function writes data to Master or Slave. **Implementation:** Dynamic
	DRV_I2C_TransmitThenReceive	This function writes data to Slave, inserts restart and requests read from slave. **Implementation:** Dynamic
	DRV_I2C_TransmitForced	This function writes data to Master or Slave. **Implementation:** Dynamic

d) Status Functions

	Name	Description
	DRV_I2C_TransferStatusGet	Returns status of data transfer when Master or Slave acts either as a transmitter or a receiver. **Implementation:** Dynamic
	DRV_I2C_Status	Provides the current status of the index instance of the I2C module. **Implementation:** Dynamic

e) Miscellaneous Functions

	Name	Description
	DRV_I2C_QueueFlush	The existing transactions in the queue are voided and the queue pointers are reset to their initial state. This renders the queue empty.

f) Data Types and Constants

	Name	Description
	_DRV_I2C_INIT	Identifies the initialization values that are passed as parameters to the initialize and reinitialize routines of the I2C module.
	DRV_I2C_ADDRESS_WIDTH	Lists the Address Width of the Slave.
	DRV_I2C_BUFFER_HANDLE	Handle to an I2C data buffer.
	DRV_I2C_BUS_LEVEL	Lists the Operational Voltage level of I2C.
	DRV_I2C_BUS_SPEED	Lists the I2C Bus speed mode.
	DRV_I2C_BUFFER_EVENT	Lists the different conditions that happens during a buffer transfer.

	DRV_I2C_INIT	Identifies the initialization values that are passed as parameters to the initialize and reinitialize routines of the I2C module.
	DRV_I2C_BUFFER_EVENT_HANDLER	Points to a callback after completion of an I2C transfer.
	DRV_I2C_MODE	Lists the operation mode of I2C module.
	DRV_I2C_SLAVE_ADDRESS_MASK	Data type for a slave device address bit-mask.
	I2C_DATA_TYPE	This is type I2C_DATA_TYPE.
	DRV_I2C_PERPH	Lists the operation mode of I2C module.
	I2C_SLAVE_ADDRESS_7bit	Data type for a slave device address.
	DRV_I2C_CallBack	Points to a callback to initiate a particular function.
	I2C_SLAVE_ADDRESS_VALUE	This is type I2C_SLAVE_ADDRESS_VALUE.
	DRV_I2C_INDEX_0	Identifies the instance of the I2C driver.
	DRV_I2C_INDEX_1	Identifies the instance of the I2C driver.
	DRV_I2C_INDEX_2	Identifies the instance of the I2C driver.
	DRV_I2C_INDEX_3	Identifies the instance of the I2C driver.
	DRV_I2C_INDEX_4	Identifies the instance of the I2C driver.
	DRV_I2C_INDEX_5	Identifies the instance of the I2C driver.
	DRV_I2C_BUFFER_QUEUE_SUPPORT	Specifies if the Buffer Queue support should be enabled.
	DRV_I2C_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_I2C_INTERRUPT_MODE	Macro controls interrupt based operation of the driver
	DRV_I2C_QUEUE_DEPTH_COMBINED	Number of entries of all queues in all instances of the driver.
	DRV_I2C_BB_H	This is macro DRV_I2C_BB_H.
	DRV_I2C_BUS_ERROR_EVENT	This is type DRV_I2C_BUS_ERROR_EVENT.

Description

This section describes the Application Programming Interface (API) functions of the I2C Driver Library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_I2C_Deinitialize Function

Deinitializes the index instance of the I2C module.

Implementation: Static/Dynamic

File

drv_i2c.h

C

```
void DRV_I2C_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function deinitializes the index instance of the I2C module, disabling its operation (and any hardware for driver modules). It deinitializes only the specified module instance. It also resets all the internal data structures and fields for the specified instance to the default settings.

Remarks

If the module instance has to be used again, DRV_I2C_Initialize should be called again to initialize the module instance structures.

This function may block if the driver is running in an OS environment that supports blocking operations and the driver requires system resources access. However, the routine will NEVER block for hardware I2C access. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_I2C_Status operation. The driver client must always use DRV_I2C_Status to find out when the module is in the ready state.

Preconditions

The DRV_I2C_Initialize function should have been called before calling this function.

Example

```
SYS_STATUS   i2c_status;

DRV_I2C_Deinitialize(I2C_ID_1);

i2c_status = DRV_I2C_Status(I2C_ID_1);
if (SYS_STATUS_BUSY == i2c_status)
{
    // Do something else and check back later
}
else if (SYS_STATUS_ERROR >= i2c_status)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Index, identifying the instance of the I2C module to be deinitialized

Function

void DRV_I2C_Deinitialize (SYS_MODULE_OBJ object)

DRV_I2C_Initialize Function

Initializes hardware and data for the index instance of the I2C module.

Implementation: Static/Dynamic

File

drv_i2c.h

C

```
SYS_MODULE_OBJ DRV_I2C_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

None.

Description

This function initializes hardware for the index instance of the I2C module, using the hardware initialization given data. It also initializes any internal driver data structures making the driver ready to be opened.

Remarks

This function must be called before any other I2C function is called.

This function should only be called once during system initialization unless DRV_I2C_Deinitialize is first called to deinitialize the device instance before reinitializing it.

This function may block if the driver is running in an OS environment that supports blocking operations and the driver requires system resources access. However, the routine will NEVER block for hardware I2C access. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_I2C_Status operation. The driver client must always use DRV_I2C_Status to find out when the module is in the ready state.

Whenever a call to DRV_I2C_Initialize is made with a SYS_MODULE_INIT* data == 0 the following default configuration will be used. Adjust this configuration at build time as needed.

Preconditions

None.

Example

```
DRV_I2C_INIT        i2c_init_data;
SYS_MODULE_OBJ      objectHandle;

i2c_init_data.i2cId = DRV_I2C_PERIPHERAL_ID_IDX0,
i2c_init_data.i2cMode = DRV_I2C_MODE_MASTER,

OR
```

```
i2c_init_data.i2cMode = DRV_I2C_MODE_SLAVE,
//Master mode parameters
i2c_init_data.baudRate = 100000,
i2c_init_data.busspeed = DRV_I2C_SLEW_RATE_CONTROL_IDX0,
i2c_init_data.buslevel = DRV_I2C_SMBus_SPECIFICATION_IDX0,

//Slave mode parameters
i2c_init_data.addWidth = DRV_I2C_7BIT_SLAVE,
i2c_init_data.reservedaddenable  = false,
i2c_init_data.generalcalladdress = false,
i2c_init_data.slaveaddvalue = 0x0060,

//interrupt sources
i2c_init_data.mstrInterruptSource = INT_SOURCE_I2C_2_MASTER,
i2c_init_data.slaveInterruptSource = INT_SOURCE_I2C_2_ERROR,
i2c_init_data.errInterruptSource = INT_SOURCE_I2C_2_ERROR,
i2c_init_data.queueSize = 1,

//callback for Master (Master mode can use callbacks if needed)
i2c_init_data.operationStarting = NULL,
// Slave mode callbacks needed
i2c_init_data.operationStarting = APP_I2CSlaveFunction(),
i2c_init_data.operationEnded = NULL

objectHandle = DRV_I2C_Initialize(DRV_I2C_INDEX_0, (SYS_MODULE_INIT *)&drvI2C0InitData)
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Index, identifying the instance of the I2C module to be initialized
data	Pointer to the data structure containing any data necessary to initialize the hardware. This pointer may be null if no data is required and the default initialization is to be used.

Function

void DRV_I2C_Initialize (const I2C_MODULE_ID index,
const SYS_MODULE_INIT *const data)

DRV_I2C_Tasks Function

Maintains the State Machine of the I2C driver and performs all the protocol level actions.

Implementation: Dynamic

File

drv_i2c.h

C

```
void DRV_I2C_Tasks(SYS_MODULE_OBJ object);
```

Description

This functions maintains the internal state machine of the I2C driver. This function acts as the I2C Master or Slave ISR. When used in polling mode, this function needs to be called repeatedly to achieve I2C data transfer. This function implements all the protocol level details like setting the START condition, sending the address with with R/W request, writing data to the SFR, checking for acknowledge and setting the STOP condition.

Preconditions

The DRV_I2C_Initialize routine must have been called for the specified I2C device instance.

Example

SYS_MODULE_OBJ object;
while (true) { DRV_I2C_Tasks (object);

Function

void DRV_I2C_Tasks (SYS_MODULE_OBJ object)

b) Client Setup Functions

DRV_I2C_Close Function

Closes an opened instance of an I2C module driver.

Implementation: Dynamic

File

drv_i2c.h

C

```
void DRV_I2C_Close(DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened instance of an I2C module driver, making the specified handle invalid.

Remarks

After calling This function, the handle passed into drvHandle must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_I2C_Open before the caller may use the driver again.

Preconditions

The DRV_I2C_Initialize routine must have been called for the specified I2C device instance and the DRV_I2C_Status must have returned SYS_STATUS_READY.

DRV_I2C_Open must have been called to obtain a valid opened device handle.

Example

```
myI2CHandle = DRV_I2C_Open(I2C_ID_1, DRV_IO_INTENT_NONBLOCKING|DRV_IO_INTENT_READWRITE);

// Perform data transfer operations

DRV_I2C_Close(myI2CHandle);
```

Parameters

Parameters	Description
drvHandle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_I2C_Close (const DRV_HANDLE drvHandle)

DRV_I2C_Open Function

Opens the specified instance of the I2C driver for use and provides an "open-instance" handle.

Implementation: Dynamic

File

drv_i2c.h

C

```
DRV_HANDLE DRV_I2C_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a value identifying both the caller and the module instance). If an error occurs, the returned value is DRV_HANDLE_INVALID.

If an error occurs, the return value is DRV_HANDLE_INVALID. An error can occur when the following is true:

- if the number of client objects allocated via DRV_I2C_INSTANCES_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid

Description

This function opens the specified instance of the I2C module for use and provides a handle that is required to use the remaining driver routines.

This function opens a specified instance of the I2C module driver for use by any client module and provides an "open-instance" handle that must be provided to any of the other I2C driver operations to identify the caller and the instance of the I2C driver/hardware module.

Remarks

The handle returned is valid until the DRV_I2C_Close routine is called.

This function may block if the driver is running in an OS environment that supports blocking operations and the driver requires system resources access. Regarding the hardware I2C access the operation will behave as instructed by the DRV_IO_INTENT parameter.

Preconditions

The DRV_I2C_Initialize routine must have been called for the specified I2C device instance and the DRV_I2C_Status must have returned SYS_STATUS_READY.

Example

```
DRV_HANDLE              i2c_handle;

i2c_handle = DRV_I2C_Open(I2C_ID_1, DRV_IO_INTENT_NONBLOCKING|DRV_IO_INTENT_READWRITE);
if (DRV_HANDLE_INVALID == i2c_handle)
{
    // Handle open error
}

// Close the device when it is no longer needed.
DRV_I2C_Close(i2c_handle);
```

Parameters

Parameters	Description
index	Index, identifying the instance of the I2C module to be opened.
intent	Flags parameter identifying the intended usage and behavior of the driver. Multiple flags may be ORed together to specify the intended usage of the device. See the DRV_IO_INTENT definition.

Function

DRV_HANDLE DRV_I2C_Open (const I2C_MODULE_ID index,
const DRV_IO_INTENT intent)

c) Data Transfer Functions

DRV_I2C_BufferEventHandlerSet Function

Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

Implementation: Dynamic

File

drv_i2c.h

C

```
void DRV_I2C_BufferEventHandlerSet(const DRV_HANDLE handle, const DRV_I2C_BUFFER_EVENT_HANDLER
eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. When

a client calls either the DRV_I2C_BufferAddRead, DRV_I2C_BufferAddWrite or DRV_I2C_BufferAddWriteRead function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "buffer add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

When in Master mode, a callback event is registered when to let the application know that the buffer has been transmitted. DRV_I2C_BUFFER_EVENT_COMPLETE is set when the buffer has been transmitted without any errors. DRV_I2C_BUFFER_EVENT_ERROR is set when buffer transmission or reception has been aborted.

When in Slave mode, since the Master controls when a transmit or receive operation is terminated, a callback is registered every time a byte is written or read from the slave.

Remarks

If the client does not want to be notified when the queued buffer transfer has completed, it does not need to register a callback. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_I2C_Initialize routine must have been called for the specified I2C driver instance.

DRV_I2C_Open must have been called to obtain a valid opened device handle.

Example

```
#define MY_BUFFER_SIZE  10

// function prototype of Event Handler Function
void APP_I2CBufferEventFunction ( DRV_I2C_BUFFER_EVENT event,
                                  DRV_I2C_BUFFER_HANDLE bufferHandle,
                                  uintptr_t context );

//Returned from DRV_I2C_Open
DRV_HANDLE drvI2Chandle;

// myAppObj is an application specific state data object.
DRV_I2C_BUFFER_EVENT operationStatus;

uint8_t appBuffer[MY_BUFFER_SIZE];

DRV_I2C_BUFFER_HANDLE drvI2CRDBUFHandle

// Opens an instance of I2C driver
drvI2Chandle = DRV_I2C_Open( DRV_I2C_INDEX_0,DRV_IO_INTENT_WRITE );

// Client registers an event handler with driver. This is done once.
DRV_I2C_BufferEventHandlerSet( drvI2Chandle,
                               APP_I2CBufferEventFunction,
                               operationStatus );

drvI2CRDBUFHandle = DRV_I2C_Receive (   drvI2CHandle,
                                        slaveaddress
                                        &appBuffer[],
                                        MY_BUFFER_SIZE,
                                        NULL );

if(NULL == drvI2CRDBUFHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_I2CBufferEventFunction( DRV_I2C_BUFFER_EVENT event,
                                 DRV_I2C_BUFFER_HANDLE handle,
                                 uintptr_t context)
{

    switch(event)
    {
        case DRV_I2C_BUFFER_EVENT_COMPLETE:
```

```
            //perform appropriate action
            break;

            case DRV_I2C_BUFFER_EVENT_ERROR:
                // Error handling here.
            break;

            default:
                break;
        }
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_I2C_BufferEventHandlerSet (
const DRV_HANDLE handle,
const DRV_I2C_BUFFER_EVENT_HANDLER eventHandler,
const uintptr_t context)

DRV_I2C_BytesTransferred Function

Returns the number of bytes transmitted or received in a particular I2C transaction. The transaction is identified by the handle.

File

drv_i2c.h

C

```
uint32_t DRV_I2C_BytesTransferred(DRV_HANDLE handle, DRV_I2C_BUFFER_HANDLE bufferHandle);
```

Returns

The number of bytes transferred in a particular I2C transaction.
`numOfBytes = DRV_I2C_BytesTransferred (drvI2CHandle_Master,drvBufferHandle);`

Description

This returns the transmitter and receiver transfer status.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
bufferHandle	A valid buffer handle obtained when calling Transmit/Receive/TransmitThenReceive/TransmitForced or BufferAddRead/BufferAddWrite/BufferAddReadWrite function

Function

uint32_t DRV_I2C_BytesTransferred (DRV_I2C_BUFFER_HANDLE bufferHandle)

DRV_I2C_Receive Function

This function reads data written from either Master or Slave.

Implementation: Dynamic

File

drv_i2c.h

C

```
DRV_I2C_BUFFER_HANDLE DRV_I2C_Receive(DRV_HANDLE handle, uint16_t address, void * buffer, size_t size, void
* callbackContext);
```

Returns

A valid BUFFER HANDLE, NULL if the handle is not obtained.

Description

Master calls this function to read data send by Slave. The Slave calls this function to read data send by Master. In case of Master, a START condition is initiated on the I2C bus.

Remarks

The handle that is passed into the function, drvI2CHandle is obtained by calling the DRV_I2C_OPEN function. If the function could not return a valid buffer handle, then a NULL value is returned. If the slave NACKs the address byte, then further read is not attempted. Master asserts STOP condition and DRV_I2C_BUFFER_EVENT_ERROR is set as the buffer-status. If all the requisite number of bytes have been read then DRV_I2C_BUFFER_EVENT_COMPLETE is set as the buffer status.

Preconditions

The DRV_I2C_Initialize routine must have been called for the specified I2C device instance and the DRV_I2C_Status must have returned SYS_STATUS_READY.

DRV_I2C_Open must have been called to obtain a valid opened device handle.

Example

```
drvI2CRDBUFHandle = DRV_I2C_Receive( drvI2CHandle,
                                     deviceaddress,
                                     &rxbuffer[0],
                                     num_of_bytes,
                                     NULL );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
address	Device address of slave. If this API is used in Slave mode, then a dummy value can be used
buffer	This buffer holds data is received
size	The number of bytes that the Master expects to read from Slave. This value can be kept as the MAX BUFFER SIZE for slave. This is because the Master controls when the READ operation is terminated.
callbackContext	Not implemented, future expansion

Function

DRV_I2C_BUFFER_HANDLE DRV_I2C_Receive (DRV_HANDLE handle,

uint16_t slaveaddress,

void *rxBuffer,

size_t size,

void * callbackContext)

DRV_I2C_Transmit Function

This function writes data to Master or Slave.

Implementation: Dynamic

File

drv_i2c.h

C

```
DRV_I2C_BUFFER_HANDLE DRV_I2C_Transmit(DRV_HANDLE handle, uint16_t slaveaddress, void * buffer, size_t
size, void * context);
```

Returns

A valid BUFFER HANDLE, NULL if the handle is not obtained.

Description

Master calls this function to write data to Slave. The Slave calls this function to write data to Master.

Remarks

The handle that is passed into the function, drvI2CHandle is obtained by calling the DRV_I2C_OPEN function. If the function could not return a valid buffer handle, then a NULL value is returned. If the slave NACKs the address byte or any data bytes, then further write is not attempted. Master asserts STOP condition and DRV_I2C_BUFFER_EVENT_ERROR is set as the buffer-status. If all the requisite number of bytes have been transmitted to the Slave, then DRV_I2C_BUFFER_EVENT_COMPLETE is set as the buffer status.

Preconditions

The DRV_I2C_Initialize routine must have been called for the specified I2C device instance and the DRV_I2C_Status must have returned SYS_STATUS_READY.

DRV_I2C_Open must have been called to obtain a valid opened device handle.

Example

```
drvI2CWRBUFHandle = DRV_I2C_Transmit( drvI2CHandle,
                                      deviceaddress,
                                      &txBuffer[0],
                                      num_of_bytes,
                                      NULL);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
address	Device address of slave. If this API is used in Slave mode, then a dummy value can be used
buffer	Contains data to be transferred
size	The number of bytes that the Master expects to write to Slave. This value can be kept as the MAX BUFFER SIZE for slave. This is because the Master controls when the WRITE operation is terminated.
callbackContext	Not implemented, future expansion

Function

DRV_I2C_BUFFER_HANDLE DRV_I2C_Transmit(DRV_HANDLE handle,
uint16_t slaveaddress,
void *txBuffer,
size_t size,
void *context);

DRV_I2C_TransmitThenReceive Function

This function writes data to Slave, inserts restart and requests read from slave.

Implementation: Dynamic

File

drv_i2c.h

C

```
DRV_I2C_BUFFER_HANDLE DRV_I2C_TransmitThenReceive(DRV_HANDLE handle, uint16_t address, void * writeBuffer,
size_t writeSize, void * readBuffer, size_t readSize, void * callbackContext);
```

Returns

A valid BUFFER HANDLE, NULL if the handle is not obtained.

Description

Master calls this function to send a register address value to the slave and then queries the slave with a read request to read the contents indexed by the register location. The Master sends a restart condition after the initial write before sending the device address with R/W = 1. The restart condition prevents the Master from relinquishing the control of the bus. The slave should not use this function.

Remarks

The handle that is passed into the function, drvI2CHandle is obtained by calling the DRV_I2C_OPEN function. If the function could not return a valid buffer handle, then a NULL value is returned. If there is any error condition during transmission then further transmission or reception is not

attempted and STOP condition is asserted on the bus. In case of error condition, DRV_I2C_BUFFER_EVENT_ERROR is set as the buffer-status. If the I2C bus transaction is completed as requested then the buffer status, is set as DRV_I2C_BUFFER_EVENT_COMPLETE.

Preconditions

The DRV_I2C_Initialize routine must have been called for the specified I2C device instance and the DRV_I2C_Status must have returned SYS_STATUS_READY.

DRV_I2C_Open must have been called to obtain a valid opened device handle.

Example

```
drvI2CRDBUFHandle = DRV_I2C_TransmiThenReceive( appData.drvI2CHandle,
                                                deviceaddress,
                                                &drvI2CTXbuffer[0],
                                                registerbytesize,
                                                rxbuffer,
                                                num_of_bytes,
                                                NULL );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
address	Device address of slave. If this API is used in Slave mode, then a dummy value can be used
writeBuffer	Contains data to be transferred
writeSize	The number of bytes that the Master expects to write to Slave. This value can be kept as the MAX BUFFER SIZE for slave. This is because the Master controls when the WRITE operation is terminated.
readBuffer	This buffer holds data that is send back from slave after read operation.
readSize	The number of bytes the Master expects to be read from the slave
callbackContext	Not implemented, future expansion

Function

DRV_I2C_BUFFER_HANDLE DRV_I2C_TransmiThenReceive (DRV_HANDLE handle,
uint16_t deviceaddress,
void *txBuffer,
size_t writeSize,
void *rxBuffer,
size_t readSize,
void *context)

DRV_I2C_TransmitForced Function

This function writes data to Master or Slave.

Implementation: Dynamic

File

drv_i2c.h

C

```
DRV_I2C_BUFFER_HANDLE DRV_I2C_TransmitForced(DRV_HANDLE handle, uint16_t deviceaddress, void* txBuffer,
size_t txbuflen, DRV_I2C_BUS_ERROR_EVENT eventFlag, void * calbackContext);
```

Returns

A valid BUFFER HANDLE, NULL if the handle is not obtained.

Description

Master calls this function to transmit the entire buffer to the slave even if the slave ACKs or NACKs the address or any of the data bytes. This is typically used for slaves that have to initiate a reset sequence by sending a dummy I2C transaction. Since the slave is still in reset, any or all the bytes can be NACKed. In the normal operation of the driver if the address or data byte is NACKed, then the transmission is aborted and a STOP condition is asserted on the bus.

Remarks

The handle that is passed into the function, drvI2CHandle is obtained by calling the DRV_I2C_OPEN function. If the function could not return a valid buffer handle, then a NULl value is returned. Once all the bytes are transferred the buffer status is set as then

DRV_I2C_BUFFER_EVENT_COMPLETE .

Preconditions

The DRV_I2C_Initialize routine must have been called for the specified I2C device instance and the DRV_I2C_Status must have returned SYS_STATUS_READY.

DRV_I2C_Open must have been called to obtain a valid opened device handle.

Example

```
drvI2CWRBUFHandle = DRV_I2C_TransmitForced ( handle,
                                             deviceaddress,
                                             &txBuffer[0],
                                             txbuflen,
                                             NULL,
                                             NULL)
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
address	Device address of slave. If this API is used in Slave mode, then a dummy value can be used
buffer	Contains data to be transferred
size	The number of bytes that the Master expects to write to Slave. This value can be kept as the MAX BUFFER SIZE for slave. This is because the Master controls when the WRITE operation is terminated.
eventFlag	This field is left for future implementation
callbackContext	Not implemented, future expansion

Function

DRV_I2C_BUFFER_HANDLE DRV_I2C_TransmitForced (DRV_HANDLE handle,

uint16_t deviceaddress,

uint8_t* txBuffer,

uint16_t txbuflen,

DRV_I2C_BUS_ERROR_EVENT eventFlag,

void * calbackContext)

d) Status Functions

DRV_I2C_TransferStatusGet Function

Returns status of data transfer when Master or Slave acts either as a transmitter or a receiver.

Implementation: Dynamic

File

drv_i2c.h

C

```
DRV_I2C_BUFFER_EVENT DRV_I2C_TransferStatusGet(DRV_HANDLE handle, DRV_I2C_BUFFER_HANDLE bufferHandle);
```

Returns

A DRV_I2C_TRANSFER_STATUS value describing the current status of the transfer.

Description

The bufferHandle parameter contains the buffer handle of the buffer that associated with the event. If the event is DRV_I2C_BUFFER_EVENT_COMPLETE, it means that the data was transferred successfully. If the event is DRV_I2C_BUFFER_EVENT_ERROR, it means that the data was not transferred successfully.

Remarks

The handle that is passed into the function, drvI2CBUFHandle is obtained by calling one of the data transfer functions. The drvI2CBUFHandle should be a valid handle and not a NULL value. The DRV_I2C_BufferStatus can be called to check the progress of the data transfer operation. If the buffer is transferred without any error, then DRV_I2C_BUFFER_EVENT_COMPLETE is returned. If an error condition is present, then DRV_I2C_BUFFER_EVENT_ERROR is returned.

Example

```
if(DRV_I2C_BUFFER_EVENT_COMPLETE == DRV_I2C_TransferStatusGet ( handle,
                                                                bufferHandle ))
{
        //perform action
        return true;
}
else
{
        //perform action
        return false;
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
bufferHandle	A valid buffer handle obtained when calling Transmit/Receive/TransmitThenReceive/TransmitForced or BufferAddRead/BufferAddWrite/BufferAddReadWrite function

Function

DRV_I2C_BUFFER_EVENT DRV_I2C_TransferStatusGet (DRV_HANDLE handle,
DRV_I2C_BUFFER_HANDLE bufferHandle)

DRV_I2C_Status Function

Provides the current status of the index instance of the I2C module.

Implementation: Dynamic

File

drv_i2c.h

C

```
SYS_STATUS DRV_I2C_Status(SYS_MODULE_OBJ object);
```

Returns

- SYS_STATUS_READY - Indicates that any previous module operation for the specified I2Cmodule has completed.
- SYS_STATUS_BUSY - Indicates that a previous module operation for the specified I2C module has not yet completed
- SYS_STATUS_ERROR - Indicates that the specified I2C module is in an error state

Description

This function provides the current status of the index instance of the I2C module.

Remarks

The DRV_I2C_Status operation can be used to determine when any of the I2C module level operations has completed. The value returned by the DRV_I2C_Status routine hast to be checked after calling any of the I2C module operations to find out when they have completed.

If the DRV_I2C_Status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the DRV_I2C_Status operation return SYS_STATUS_READY, any previous operations have completed.

The DRV_I2C_Status function will NEVER block.

If the DRV_I2C_Status operation returns an error value, the error may be cleared by calling the DRV_I2C_Initialize operation. If that fails, the DRV_I2C_Deinitialize operation will need to be called, followed by the DRV_I2C_Initialize operation to return to normal operations.

Preconditions

The DRV_I2C_Initialize function should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;
SYS_STATUS          i2c_status;

i2c_status = DRV_I2C_Status(object);
if (SYS_STATUS_BUSY == i2c_status)
{
```

```
    // Do something else and check back later
}
else if (SYS_STATUS_ERROR >= status)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Index, identifying the instance of the I2C module to get status for.

Function

SYS_STATUS DRV_I2C_Status (SYS_MODULE_OBJ object)

e) Miscellaneous Functions

DRV_I2C_QueueFlush Function

The existing transactions in the queue are voided and the queue pointers are reset to their initial state. This renders the queue empty.

File

drv_i2c.h

C

```
void DRV_I2C_QueueFlush(DRV_HANDLE handle);
```

Returns

None

```
    //Opens an instance of I2C driver
 drvI2Chandle = DRV_I2C_Open( DRV_I2C_INDEX_0,DRV_IO_INTENT_WRITE );

 DRV_I2C_QueueFlush ( drvI2CHandle );
```

Description

The existing transactions in the queue are voided and the queue pointers are reset to their initial state. This renders the queue empty.

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_I2C_QueueFlush (DRV_HANDLE handle)

f) Data Types and Constants

DRV_I2C_ADDRESS_WIDTH Enumeration

Lists the Address Width of the Slave.

File

drv_i2c.h

C

```
typedef enum {
  DRV_I2C_7BIT_SLAVE,
  DRV_I2C_10BIT_SLAVE
} DRV_I2C_ADDRESS_WIDTH;
```

Members

Members	Description
DRV_I2C_7BIT_SLAVE	I2C Slave 7 bit
DRV_I2C_10BIT_SLAVE	I2C Slave 10 bit

Description

I2C Slave Address Width

This enumeration lists if the I2C module is configured as a 7-bit Slave or a 10-bit Slave.

Remarks

None.

DRV_I2C_BUFFER_HANDLE Type

Handle to an I2C data buffer.

File

drv_i2c.h

C

```
typedef uintptr_t DRV_I2C_BUFFER_HANDLE;
```

Description

I2C Buffer Handle

This data type provides a handle to an I2C buffer that has been passed to the driver for processing.

Remarks

This handle is provided by one of the data transfer functions (DRV_I2C_Receive, DRV_I2C_Transmit, DRV_I2C_TransmitThenReceive) and is used by the buffer event-handler (DRV_I2C_BUFFER_EVENT_HANDLER) call-back function and buffer status functions (DRV_I2C_TransferStatusGet, DRV_I2C_BytesTransferred).

DRV_I2C_BUS_LEVEL Enumeration

Lists the Operational Voltage level of I2C.

File

drv_i2c.h

C

```
typedef enum {
  DRV_I2C_OPEN_COLLECTOR_LEVEL,
  DRV_I2C_SMBus_LEVEL
} DRV_I2C_BUS_LEVEL;
```

Members

Members	Description
DRV_I2C_OPEN_COLLECTOR_LEVEL	I2C BUS LEVEL
DRV_I2C_SMBus_LEVEL	SMBus level

Description

I2C Bus Levels

This enumeration lists if the I2C is configured to operate in the traditional I2C mode or the SMBus mode.

Remarks

None.

DRV_I2C_BUS_SPEED Enumeration

Lists the I2C Bus speed mode.

File

drv_i2c.h

C

```
typedef enum {
  DRV_I2C_NORMAL_SPEED,
  DRV_I2C_HIGH_SPEED
} DRV_I2C_BUS_SPEED;
```

Description

I2C Bus Speed

This enumeration lists if the I2C is configured to operate at High-Speed or Normal Speed.

Remarks

None.

DRV_I2C_BUFFER_EVENT Enumeration

Lists the different conditions that happens during a buffer transfer.

File

drv_i2c.h

C

```
typedef enum {
  DRV_I2C_BUFFER_EVENT_PENDING,
  DRV_I2C_BUFFER_EVENT_COMPLETE,
  DRV_I2C_BUFFER_EVENT_ERROR,
  DRV_I2C_SEND_STOP_EVENT,
  DRV_I2C_SEND_RESTART_EVENT,
  DRV_I2C_BUFFER_SLAVE_READ_REQUESTED,
  DRV_I2C_BUFFER_SLAVE_WRITE_REQUESTED,
  DRV_I2C_BUFFER_SLAVE_READ_BYTE,
  DRV_I2C_BUFFER_MASTER_ACK_SEND,
  DRV_I2C_BUFFER_MASTER_NACK_SEND,
  DRV_I2C_BUFFER_SLAVE_WRITE_BYTE
} DRV_I2C_BUFFER_EVENT;
```

Members

Members	Description
DRV_I2C_BUFFER_EVENT_PENDING	Buffer is pending to get processed
DRV_I2C_BUFFER_EVENT_COMPLETE	All data from or to the buffer was transferred successfully.
DRV_I2C_BUFFER_EVENT_ERROR	There was an error while processing the buffer transfer request.
DRV_I2C_SEND_STOP_EVENT	Send Stop by Master
DRV_I2C_SEND_RESTART_EVENT	Send Restart Event by Master
DRV_I2C_BUFFER_SLAVE_READ_REQUESTED	Master sends data to slave
DRV_I2C_BUFFER_SLAVE_WRITE_REQUESTED	Master requests data from slave
DRV_I2C_BUFFER_SLAVE_READ_BYTE	Slave read byte send by Master
DRV_I2C_BUFFER_MASTER_ACK_SEND	sending ACK to Slave for more bytes
DRV_I2C_BUFFER_MASTER_NACK_SEND	sending ACK to Slave for more bytes
DRV_I2C_BUFFER_SLAVE_WRITE_BYTE	Slave send byte to Master

Description

I2C Buffer Events

This enumeration identifies the different conditions that can happen during a buffer transaction. Callbacks can be made with the appropriate buffer condition passed as a parameter to execute the desired action. The application can also poll the BufferStatus flag to check the status of transfer.

The values act like flags and multiple flags can be set.

Remarks

None.

DRV_I2C_INIT Structure

Identifies the initialization values that are passed as parameters to the initialize and reinitialize routines of the I2C module.

File

drv_i2c.h

C

```
typedef struct _DRV_I2C_INIT {
  SYS_MODULE_INIT moduleInit;
  I2C_MODULE_ID i2cId;
  DRV_I2C_MODE i2cMode;
  DRV_I2C_PERPH i2cPerph;
  PORTS_CHANNEL portSCL;
  PORTS_BIT_POS pinSCL;
  PORTS_CHANNEL portSDA;
  PORTS_BIT_POS pinSDA;
  DRV_I2C_ADDRESS_WIDTH addWidth;
  bool reservedaddenable;
  bool generalcalladdress;
  I2C_SLAVE_ADDRESS_VALUE slaveaddvalue;
  uint32_t baudRate;
  DRV_I2C_BUS_LEVEL buslevel;
  DRV_I2C_BUS_SPEED busspeed;
  INT_SOURCE mstrInterruptSource;
  INT_SOURCE slaveInterruptSource;
  INT_SOURCE errInterruptSource;
  unsigned int queueSize;
  DRV_I2C_CallBack operationStarting;
  DRV_I2C_SLAVE_ADDRESS_MASK maskslaveaddress;
} DRV_I2C_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
I2C_MODULE_ID i2cId;	Identifies peripheral (PLIB-level) ID
DRV_I2C_MODE i2cMode;	I2C Usage Mode Type
DRV_I2C_PERPH i2cPerph;	I2C Peripheral or not usage
PORTS_CHANNEL portSCL;	PORT which SCL belongs
PORTS_BIT_POS pinSCL;	Bit position in the port for SCL
PORTS_CHANNEL portSDA;	PORT which SDA belongs
PORTS_BIT_POS pinSDA;	Bit position in the port for SDA
DRV_I2C_ADDRESS_WIDTH addWidth;	Communication Width
bool reservedaddenable;	Reserved Address rule enable
bool generalcalladdress;	General Call address enable
I2C_SLAVE_ADDRESS_VALUE slaveaddvalue;	Slave address value
uint32_t baudRate;	Baud Rate Value
DRV_I2C_BUS_LEVEL buslevel;	I2C Clock mode
DRV_I2C_BUS_SPEED busspeed;	I2C Bus Speed
INT_SOURCE mstrInterruptSource;	Master Interrupt Source for I2C module
INT_SOURCE slaveInterruptSource;	Slave Interrupt Source for I2C module
INT_SOURCE errInterruptSource;	Error Interrupt Source for I2C module
unsigned int queueSize;	This is the buffer queue size. This is the maximum number of transfer requests that driver will queue. For a static build of the driver, this is overridden by the DRV_I2C_QUEUE_SIZE macro in system_config.h
DRV_I2C_CallBack operationStarting;	This callback is fired when an operation needs to be initiated on the I2C bus. This callback is mainly intended when the driver is used in SLAVE mode and is required to send data to the Master. The callback signals the application to prepare data for transfer to Master. This callback may be called from an ISR so should not include OSAL calls. The context parameter is the same one passed into the BufferAddRead, BufferAddWrite, BufferAddWriteRead function.
DRV_I2C_SLAVE_ADDRESS_MASK maskslaveaddress;	Slave address Mask value, the I2C slave address match ignored for the bit fields that the mask is set

Description

I2C Initialization Values

This enumeration identifies the values that are passed as parameters to the initialize and reinitialize routines of the I2C module.

These values specify different I2C module initialization parameters.

DRV_I2C_BUFFER_EVENT_HANDLER Type

Points to a callback after completion of an I2C transfer.

File

drv_i2c.h

C

```
typedef void (* DRV_I2C_BUFFER_EVENT_HANDLER)(DRV_I2C_BUFFER_EVENT event, DRV_I2C_BUFFER_HANDLE
bufferHandle, uintptr_t context);
```

Description

I2C Buffer Event Callback

This type identifies the I2C Buffer Event. It allows the client driver to register a callback using DRV_I2C_BUFFER_EVENT_HANDLER. By using this mechanism, the driver client will be notified at the completion of the corresponding transfer.

Remarks

A transfer can be composed of various transfer segments. Once a transfer is completed the driver will call the client registered transfer callback.

The callback could be called from ISR context and should be kept as short as possible. It is meant for signaling and it should not be blocking.

Parameters

Parameters	Description
DRV_I2C_BUFFER_EVENT	Status of I2C transfer
bufferHandle	Handle that identifies that identifies the particular Buffer Object
context	For future implementation

Function

void (*DRV_I2C_BUFFER_EVENT_HANDLER) (DRV_I2C_BUFFER_EVENT event,
DRV_I2C_BUFFER_HANDLE bufferHandle, uintptr_t context)

DRV_I2C_MODE Enumeration

Lists the operation mode of I2C module.

File

drv_i2c.h

C

```
typedef enum {
  DRV_I2C_MODE_MASTER,
  DRV_I2C_MODE_SLAVE
} DRV_I2C_MODE;
```

Members

Members	Description
DRV_I2C_MODE_MASTER	I2C Mode Master
DRV_I2C_MODE_SLAVE	I2C Mode Slave

Description

I2C Operation Mode

This enumeration lists if the I2C module is configured as a Master or a Slave.

Remarks

None.

DRV_I2C_SLAVE_ADDRESS_MASK Type

Data type for a slave device address bit-mask.

File

drv_i2c.h

C

```
typedef uint8_t DRV_I2C_SLAVE_ADDRESS_MASK;
```

Description

I2C Slave Device Address Mask

This is the data type for an I2C slave device address bit-mask. It can hold both 7-bit and 10-bit slave addresses masks.

Remarks

A slave address mask is used in slave mode to identify "don't care" bits in the base slave address to which the I2C interface will respond..

I2C_DATA_TYPE Type

File

drv_i2c.h

C

```
typedef unsigned char I2C_DATA_TYPE;
```

Description

This is type I2C_DATA_TYPE.

DRV_I2C_PERPH Enumeration

Lists the operation mode of I2C module.

File

drv_i2c.h

C

```
typedef enum {
  DRV_I2C_PERIPHERAL,
  DRV_I2C_BIT_BANG
} DRV_I2C_PERPH;
```

Members

Members	Description
DRV_I2C_PERIPHERAL	Make use of the I2C Peripheral.
DRV_I2C_BIT_BANG	Make use of the I2C Bit Bang Algorithm

Description

I2C Configuration Choice

This enumeration lists if the I2C module is configured to use I2C peripheral or use Bit-Bang implementation.

Remarks

None.

I2C_SLAVE_ADDRESS_7bit Type

Data type for a slave device address.

File

drv_i2c.h

C

```
typedef uint8_t I2C_SLAVE_ADDRESS_7bit;
```

Description

need to type cast 10-bit slave address into 8 bit mode

****

I2C Slave Device Address

This is the data type for an I2C slave device address. It can hold both 7-bit and 10-bit slave addresses.

Remarks

None.

DRV_I2C_CallBack Type

Points to a callback to initiate a particular function.

File

drv_i2c.h

C

```
typedef void (* DRV_I2C_CallBack)(DRV_I2C_BUFFER_EVENT event, void * context);
```

Description

I2C Buffer Event Callback

This type identifies the I2C Buffer Event. It allows the client driver to register a callback using DRV_I2C_BUFFER_EVENT. By using this mechanism, the driver client will can initiate an operation. This is intended to be used for SLAVE mode because the Master drives the I2C bus and through this the Slave can issue a READ or WRITE based on the status of R/W bit received from the Master

Remarks

A transfer can be composed of various transfer segments. Once a transfer is completed the driver will call the client registered transfer callback.

The callback could be called from ISR context and should be kept as short as possible. It is meant for signaling and it should not be blocking.

Parameters

Parameters	Description
DRV_I2C_BUFFER_EVENT	Status of I2C transfer
context	This is left for future implementation

Function

typedef void (*DRV_I2C_CallBack) (DRV_I2C_BUFFER_EVENT event,

void * context)

I2C_SLAVE_ADDRESS_VALUE Type

File

drv_i2c.h

C

```
typedef uint16_t I2C_SLAVE_ADDRESS_VALUE;
```

Description

This is type I2C_SLAVE_ADDRESS_VALUE.

DRV_I2C_INDEX_0 Macro

Identifies the instance of the I2C driver.

File

drv_i2c.h

C

```
#define DRV_I2C_INDEX_0 0
```

Description

Driver Instance Index 0

This value identifies the instance of the I2C driver. It is a zero-based index.

Remarks

This number is not directly related to the peripheral hardware instance. The peripehral hardware instances is associated with the driver instance by the DRV_I2C_Initialize function.

DRV_I2C_INDEX_1 Macro

Identifies the instance of the I2C driver.

File

drv_i2c.h

C

```
#define DRV_I2C_INDEX_1 1
```

Description

Driver Instance Index 1

This value identifies the instance of the I2C driver. It is a zero-based index.

Remarks

This number is not directly related to the peripheral hardware instance. The peripheral hardware instances is associated with the driver instance by the DRV_I2C_Initialize function.

DRV_I2C_INDEX_2 Macro

Identifies the instance of the I2C driver.

File

drv_i2c.h

C

```
#define DRV_I2C_INDEX_2 2
```

Description

Driver Instance Index 2

This value identifies the instance of the I2C driver. It is a zero-based index.

Remarks

This number is not directly related to the peripheral hardware instance. The peripheral hardware instances is associated with the driver instance by the DRV_I2C_Initialize function.

DRV_I2C_INDEX_3 Macro

Identifies the instance of the I2C driver.

File

drv_i2c.h

C

```
#define DRV_I2C_INDEX_3 3
```

Description

Driver Instance Index 3

This value identifies the instance of the I2C driver. It is a zero-based index.

Remarks

This number is not directly related to the peripheral hardware instance. The peripheral hardware instances is associated with the driver instance by the DRV_I2C_Initialize function.

DRV_I2C_INDEX_4 Macro

Identifies the instance of the I2C driver.

File

drv_i2c.h

C

```
#define DRV_I2C_INDEX_4 4
```

Description

Driver Instance Index 4

This value identifies the instance of the I2C driver. It is a zero-based index.

Remarks

This number is not directly related to the peripheral hardware instance. The peripheral hardware instances is associated with the driver instance by the DRV_I2C_Initialize function.

DRV_I2C_INDEX_5 Macro

Identifies the instance of the I2C driver.

File

drv_i2c.h

C

```
#define DRV_I2C_INDEX_5 5
```

Description

Driver Instance Index 5

This value identifies the instance of the I2C driver. It is a zero-based index.

Remarks

This number is not directly related to the peripheral hardware instance. The peripehral hardware instances is associated with the driver instance by the DRV_I2C_Initialize function.

DRV_I2C_BUFFER_QUEUE_SUPPORT Macro

Specifies if the Buffer Queue support should be enabled.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_BUFFER_QUEUE_SUPPORT false
```

Description

I2C Driver Buffer Queue Support

This macro defines if Buffer Queue support should be enabled. Setting this macro to true will enable buffer queue support and all buffer related driver function.

Remarks

None

DRV_I2C_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_INSTANCES_NUMBER 5
```

Description

I2C driver objects configuration

Sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of I2C modules that are needed by the application. Hardware Instance support consumes RAM memory space. If this macro is not defined, then the driver will be built statically.

Remarks

None

DRV_I2C_INTERRUPT_MODE Macro

Macro controls interrupt based operation of the driver

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_INTERRUPT_MODE true
```

Description

I2C Interrupt Mode Operation Control

This macro controls the interrupt based operation of the driver. The possible values it can take are

- true - Enables the interrupt mode
- false - Enables the polling mode

If the macro value is true, then Interrupt Service Routine for the interrupt should be defined in the application. The DRV_I2C_Tasks() routine should be called in the ISR.

Remarks

None

DRV_I2C_QUEUE_DEPTH_COMBINED Macro

Number of entries of all queues in all instances of the driver.

File

drv_i2c_config_template.h

C

```
#define DRV_I2C_QUEUE_DEPTH_COMBINED 7
```

Description

I2C Driver Instance combined queue depth.

This macro defines the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for transmit and receive operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build). The hardware instance transmit buffer queue will queue transmit buffers submitted by the DRV_I2C_BufferAddWrite() function. The hardware instance receive buffer queue will queue receive buffers submitted by the DRV_I2C_BufferAddRead() function.

A buffer queue will contain buffer queue entries, each related to a BufferAdd request. This configuration macro defines total number of buffer entries that will be available for use between all I2C driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking read and write requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. More the number of buffer entries, greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its transmit and receive buffer queue size.

As an example, consider the case of static single client driver application where full duplex non blocking operation is desired without queuing, the

minimum transmit queue depth and minimum receive queue depth should be 1. Hence the total number of buffer entries should be 2.

In the current implementation of I2C driver, queueing of Buffers is not supported. This will be added in a future release.

Remarks

None

DRV_I2C_BB_H Macro

File

drv_i2c_bb.h

C

```
#define DRV_I2C_BB_H
```

Description

This is macro DRV_I2C_BB_H.

DRV_I2C_BUS_ERROR_EVENT Enumeration

File

drv_i2c.h

C

```
typedef enum {
  DRV_I2C_HALT_ON_ERROR = 0x00,
  DRV_I2C_BUS_IGNORE_COLLISION_ERROR = 0x01,
  DRV_I2C_BUS_IGNORE_OVERFLOW_ERROR = 0x02
} DRV_I2C_BUS_ERROR_EVENT;
```

Members

Members	Description
DRV_I2C_HALT_ON_ERROR = 0x00	normal I2C with not ignoring any error
DRV_I2C_BUS_IGNORE_COLLISION_ERROR = 0x01	ignore bus collision error
DRV_I2C_BUS_IGNORE_OVERFLOW_ERROR = 0x02	ignore overflow error

Description

This is type DRV_I2C_BUS_ERROR_EVENT.

Files

I2C module driver interface header.

Enumerations

	Name	Description
	DRV_I2C_ADDRESS_WIDTH	Lists the Address Width of the Slave.
	DRV_I2C_BUFFER_EVENT	Lists the different conditions that happens during a buffer transfer.

	DRV_I2C_BUS_ERROR_EVENT	This is type DRV_I2C_BUS_ERROR_EVENT.
	DRV_I2C_BUS_LEVEL	Lists the Operational Voltage level of I2C.
	DRV_I2C_BUS_SPEED	Lists the I2C Bus speed mode.
	DRV_I2C_MODE	Lists the operation mode of I2C module.
	DRV_I2C_PERPH	Lists the operation mode of I2C module.

Functions

	Name	Description
	DRV_I2C_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. **Implementation:** Dynamic
	DRV_I2C_BytesTransferred	Returns the number of bytes transmitted or received in a particular I2C transaction. The transaction is identified by the handle.
	DRV_I2C_Close	Closes an opened instance of an I2C module driver. **Implementation:** Dynamic
	DRV_I2C_Deinitialize	Deinitializes the index instance of the I2C module. **Implementation:** Static/Dynamic
	DRV_I2C_Initialize	Initializes hardware and data for the index instance of the I2C module. **Implementation:** Static/Dynamic
	DRV_I2C_Open	Opens the specified instance of the I2C driver for use and provides an "open-instance" handle. **Implementation:** Dynamic
	DRV_I2C_QueueFlush	The existing transactions in the queue are voided and the queue pointers are reset to their initial state. This renders the queue empty.
	DRV_I2C_Receive	This function reads data written from either Master or Slave. **Implementation:** Dynamic
	DRV_I2C_Status	Provides the current status of the index instance of the I2C module. **Implementation:** Dynamic
	DRV_I2C_Tasks	Maintains the State Machine of the I2C driver and performs all the protocol level actions. **Implementation:** Dynamic
	DRV_I2C_TransferStatusGet	Returns status of data transfer when Master or Slave acts either as a transmitter or a receiver. **Implementation:** Dynamic
	DRV_I2C_Transmit	This function writes data to Master or Slave. **Implementation:** Dynamic
	DRV_I2C_TransmitForced	This function writes data to Master or Slave. **Implementation:** Dynamic
	DRV_I2C_TransmitThenReceive	This function writes data to Slave, inserts restart and requests read from slave. **Implementation:** Dynamic

Macros

	Name	Description
	DRV_I2C_INDEX_0	Identifies the instance of the I2C driver.
	DRV_I2C_INDEX_1	Identifies the instance of the I2C driver.
	DRV_I2C_INDEX_2	Identifies the instance of the I2C driver.
	DRV_I2C_INDEX_3	Identifies the instance of the I2C driver.
	DRV_I2C_INDEX_4	Identifies the instance of the I2C driver.
	DRV_I2C_INDEX_5	Identifies the instance of the I2C driver.

Structures

	Name	Description
	_DRV_I2C_INIT	Identifies the initialization values that are passed as parameters to the initialize and reinitialize routines of the I2C module.
	DRV_I2C_INIT	Identifies the initialization values that are passed as parameters to the initialize and reinitialize routines of the I2C module.

Types

	Name	Description
	DRV_I2C_BUFFER_EVENT_HANDLER	Points to a callback after completion of an I2C transfer.

	DRV_I2C_BUFFER_HANDLE	Handle to an I2C data buffer.
	DRV_I2C_CallBack	Points to a callback to initiate a particular function.
	DRV_I2C_SLAVE_ADDRESS_MASK	Data type for a slave device address bit-mask.
	I2C_DATA_TYPE	This is type I2C_DATA_TYPE.
	I2C_SLAVE_ADDRESS_7bit	Data type for a slave device address.
	I2C_SLAVE_ADDRESS_VALUE	This is type I2C_SLAVE_ADDRESS_VALUE.

Description

I2C device driver configuration file.

Macros

	Name	Description
	DRV_DYNAMIC_BUILD	Dynamic driver build, dynamic device instance parameters.
	DRV_I2C_BUFFER_QUEUE_SUPPORT	Specifies if the Buffer Queue support should be enabled.
	DRV_I2C_CONFIG_BUILD_TYPE	Selects static or dynamic driver build configuration.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_BASIC	Enables the device driver to support basic transfer mode.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_BLOCKING	Enables the device driver to support blocking operations.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_EXCLUSIVE	Enables the device driver to support operation in Exclusive mode.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_MASTER	Enables the device driver to support operation in Master mode.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_NON_BLOCKING	Enables the device driver to support non-blocking during operations
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_READ	Enables the device driver to support read operations.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_SLAVE	Enables the device driver to support operation in Slave mode.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_WRITE	Enables the device driver to support write operations.
	DRV_I2C_CONFIG_SUPPORT_OPERATION_MODE_WRITE_READ	Enables the device driver to support write followed by read.

	DRV_I2C_FORCED_WRITE	Includes function that writes to slave irrespective of whether receiving a ACK or NACK from slave
	DRV_I2C_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_I2C_INTERRUPT_MODE	Macro controls interrupt based operation of the driver
	DRV_I2C_QUEUE_DEPTH_COMBINED	Number of entries of all queues in all instances of the driver.
	DRV_STATIC_BUILD	Static driver build, static device instance parameters.
	I2C_STATIC_DRIVER_MODE	Selects the type of STATIC driver

I2S Driver Library Help

This section describes the I2S Driver Library.

Introduction

This library provides an interface to manage the Audio Protocol Interface Modes of the Serial Peripheral Interface (SPI) module on the Microchip family of microcontrollers.

Description

The SPI module can be interfaced to most available codec devices to provide microcontroller-based audio solutions. The SPI module provides support to the audio protocol functionality via four standard I/O pins. The four pins that make up the audio protocol interface modes are:

- SDIx: Serial Data Input for receiving sample digital audio data (ADCDAT)
- SDOx: Serial Data Output for transmitting digital audio data (DACDAT)
- SCKx: Serial Clock, also known as bit clock (BCLK)
- /SSx: Left/Right Channel Clock (LRCK)

BCLK provides the clock required to drive the data out or into the module, while LRCK provides the synchronization of the frame based on the protocol mode selected.

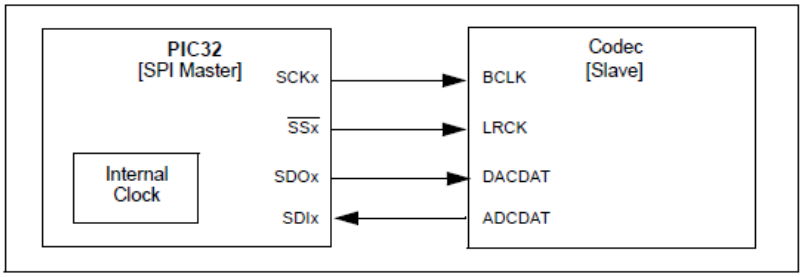
In Master mode, the module generates both the BCLK on the SCKx pin and the LRCK on the /SSx pin. In certain devices, while in Slave mode, the module receives these two clocks from its I2S partner, which is operating in Master mode.

When configured in Master mode, the leading edge of SCK and the LRCK are driven out within one SCK period of starting the audio protocol. Serial data is shifted in or out with timings determined by the protocol mode set.

In Slave mode, the peripheral drives zeros out SDO, but does not transmit the contents of the transmit FIFO until it sees the leading edge of the LRCK, after which time it starts receiving data.

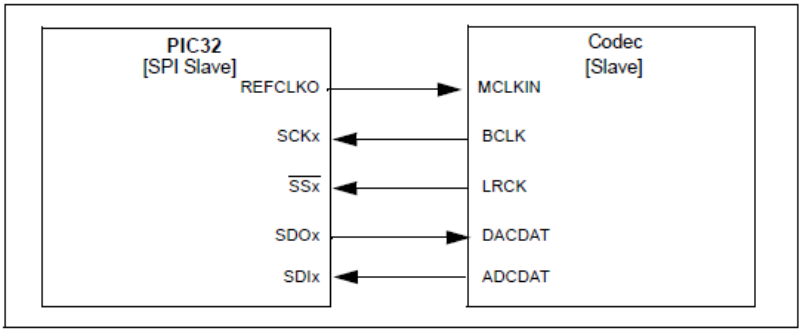
Master Mode

Master Generating its Own Clock – Output BCLK and LRCK



Slave Mode

Codec Device as Master Derives MCLK from PIC32 Reference Clock Out



Audio Protocol Modes

The SPI module supports four audio protocol modes and can be operated in any one of these modes:

- I2S mode
- Left-Justified mode
- Right-Justified mode
- PCM/DSP mode

Using the Library

This topic describes the basic architecture of the I2S Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_i2s.h`

The interface to the I2S Driver Library is defined in the `drv_i2s.h` header file. Any C language source (`.c`) file that uses the I2S Driver Library should include `drv_i2s.h`.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

The SPI Peripheral Library provides the low-level abstraction of the SPI module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in the software and introduces the I2S Driver Library interface.

Description

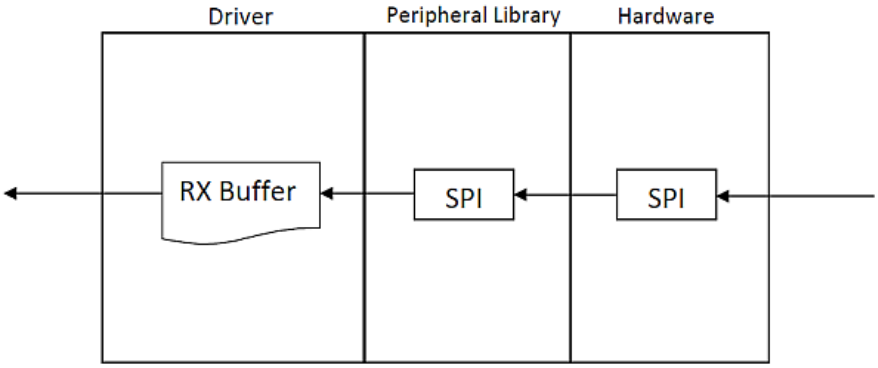
I2S Software Abstraction Block Diagram

Different types of SPIs are available on Microchip microcontrollers. Some have an internal buffer mechanism and some do not. The buffer depth varies across part families. The SPI Peripheral Library provides the ability to access these buffers. The I2S Driver Library abstracts out these differences and provides a unified model for audio data transfer across different types of SPI modules.

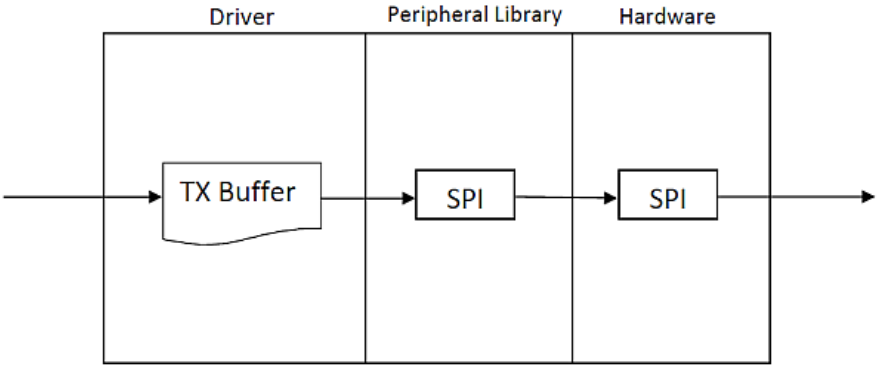
Both the transmitter and receiver provide a buffer in the driver, which transmits and receives data to/from the hardware. The I2S Driver Library provides a set of interfaces to perform the read and the write.

The following diagrams illustrate the model used by the I2S Driver Library for the transmitter and receiver.

Receiver Abstraction Model



Transmitter Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The I2S driver library provides an API interface to transfer/receive digital audio data using supported Audio protocols. The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the I2S Driver Library.

Library Interface Section	Description
System Interaction Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Client Setup Functions	Provides open and close functions.
Data Transfer Functions	Provides data transfer functions.
Miscellaneous Functions	Provides driver miscellaneous functions such as baud rate setting, get error functions, etc.
Data Types and Constants	These data types and constants are required while interacting and setting up the I2S Driver Library.

How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

System Access

This section provides information on system access.

Description

System Initialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization, each instance of the I2S module would be initialized with the following configuration settings (either passed dynamically at run time using DRV_I2S_INIT or by using Initialization Overrides) that are supported by the specific I2S device hardware:

- Device requested power state: one of the System Module Power States. For specific details please refer to **Data Types and Constants** in the Library Interface section.
- The actual peripheral ID enumerated as the PLIB level module ID (e.g., SPI_ID_2)
- Defining the respective interrupt sources for TX, RX, DMA TX Channel, DMA RX Channel and Error Interrupt

The DRV_I2S_Initialize API returns an object handle of the type SYS_MODULE_OBJ. The object handle returned by the Initialize interface would be used by the other system interfaces such as DRV_I2S_Deinitialize, DRV_I2S_Status, DRV_I2S_Tasks, and DRV_I2S_TasksError.

Notes:

1. The system initialization setting only effect the instance of the peripheral that is being initialized.
2. Configuration of the dynamic driver for DMA mode(uses DMA channel for data transfer) or Non DMA mode can be performed by appropriately setting the 'dmaChannelTransmit' and 'dmaChannelReceive' variables of the DRV_I2S_INIT structure. For example the TX will be in DMA mode when 'dmaChannelTransmit' is initialized to a valid supported channel number from the enum DMA_CHANNEL. TX will be in Non DMA mode when 'dmaChannelTransmit' is initialized to 'DMA_CHANNEL_NONE'.

Example:

```
    DRV_I2S_INIT                  init;
    SYS_MODULE_OBJ              objectHandle;

    init.moduleInit.value           = SYS_MODULE_POWER_RUN_FULL;
    init.spiID                      = SPI_ID_1;
    init.usageMode                  = DRV_I2S_MODE_MASTER;
    init.baudClock                  = SPI_BAUD_RATE_MCLK_CLOCK;
    init.baud                       = 48000;
    init.clockMode                  = DRV_I2S_CLOCK_MODE_IDLE_HIGH_EDGE_FALL;
    init.audioCommWidth             = SPI_AUDIO_COMMUNICATION_24DATA_32FIFO_32CHANNEL;
    init.audioTransmitMode          = SPI_AUDIO_TRANSMIT_STEREO;
    init.inputSamplePhase           = SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE;
    init.protocolMode               = DRV_I2S_AUDIO_I2S;
    init.txInterruptSource          = INT_SOURCE_SPI_1_TRANSMIT;
    init.rxInterruptSource          = INT_SOURCE_SPI_1_RECEIVE;
    init.errorInterruptSource       = INT_SOURCE_SPI_1_ERROR;
    init.queueSizeTransmit          = 3;
    init.queueSizeReceive           = 2;
    init.dmaChannelTransmit         = DMA_CHANNEL_NONE;
    init.dmaChannelReceive          = DMA_CHANNEL_NONE;

  objectHandle = DRV_I2S_Initialize(DRV_I2S_INDEX_1, (SYS_MODULE_INIT*)init);
    if (SYS_MODULE_OBJ_INVALID == objectHandle)
    {
        // Handle error
    }
```

Task Routine

In a polled environment, the system will call DRV_I2S_Tasks and DRV_I2S_TasksError from the System Task Service. In an interrupt-based implementation, DRV_I2S_Tasks and DRV_I2S_TasksError will be called from the Interrupt Service Routine of the I2S. When a DMA channel is used for transmission/reception DRV_I2S_Tasks and DRV_I2S_TasksError will be internally called by the driver from the DMA channel event handler.

Client Access

This section provides information on general client operation.

Description

General Client Operation

For the application to start using an instance of the module, it must call the DRV_I2S_Open function. This provides the settings required to open the I2S instance for operation. If the driver is deinitialized using the function DRV_I2S_Deinitialize, the application must call the DRV_I2S_Open function again to set up the instance of the I2S.

For the various options available for IO_INTENT, please refer to **Data Types and Constants** in the Library Interface section.

Example:

```
    DRV_HANDLE handle;
    handle = DRV_I2S_Open(DRV_I2S_INDEX_0, (DRV_IO_INTENT_WRITE | DRV_IO_INTENT_NONBLOCKING));
    if (DRV_HANDLE_INVALID == handle)
    {
        // Unable to open the driver
        // May be the driver is not initialized or the initialization
        // is not complete.
    }
```

Client Operations - Buffered

This section provides information on buffered client operations.

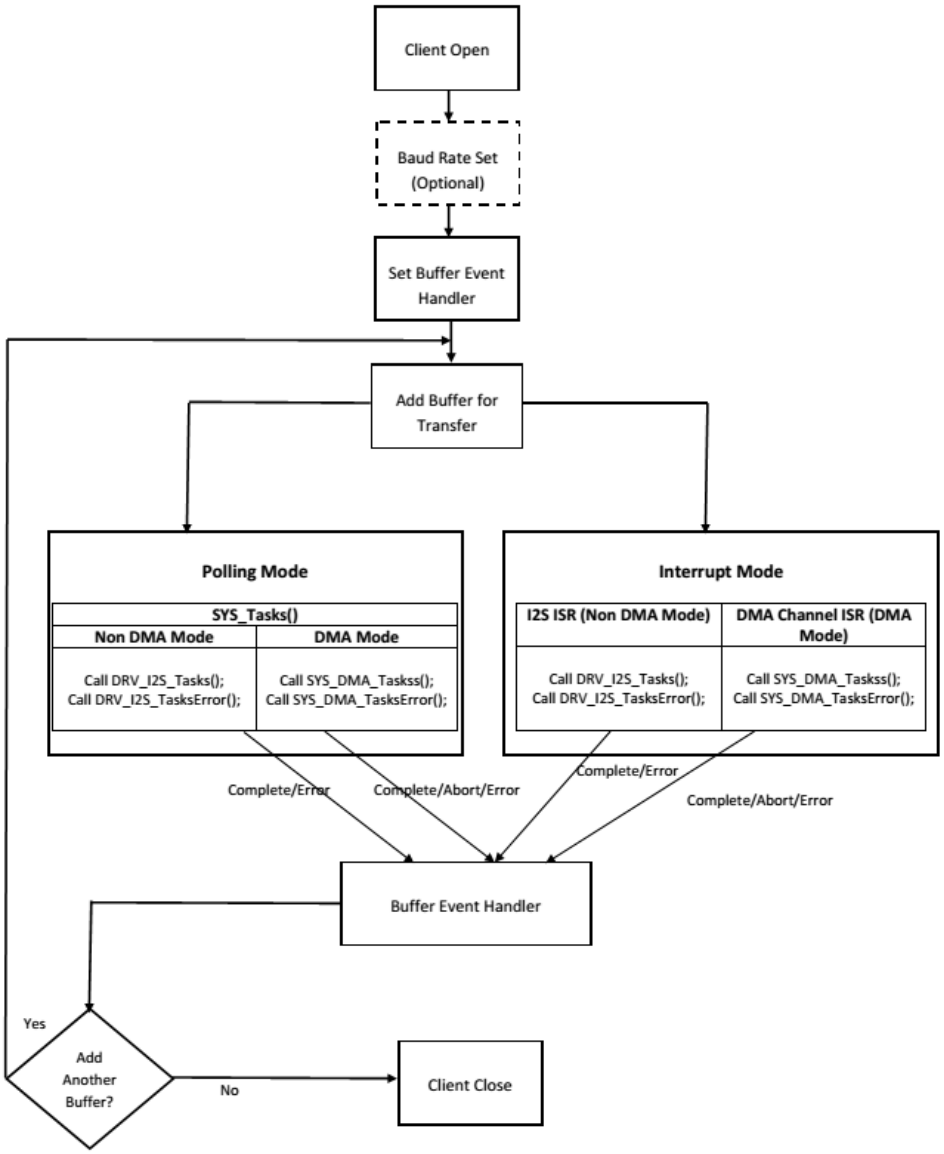
Description

Client Operations - Buffered

Client buffered operations provide a the typical audio interface. The functions DRV_I2S_BufferAddRead, DRV_I2S_BufferAddWrite, and DRV_I2S_BufferAddWriteRead are the buffered data operation functions. The buffered functions schedules non-blocking operations. The function adds the request to the hardware instance queues and returns a buffer handle. The requesting client also registers a callback event with the driver. The driver notifies the client with DRV_I2S_BUFFER_EVENT_COMPLETE, DRV_I2S_BUFFER_EVENT_ERROR or DRV_I2S_BUFFER_EVENT_ABORT events.

The buffer add requests are processed under DRV_I2S_Tasks, DRV_I2S_TasksError functions. These functions are called from the I2S channel ISR in interrupt mode or from SYS_Tasks routine in Polled mode. When a DMA channel is used for transmission/reception DRV_I2S_Tasks and DRV_I2S_TasksError will be internally called by the driver from the DMA channel event handler.

The following diagram illustrates the buffered data operations



Note: It is not necessary to close and reopen the client between multiple transfers.

An application using the buffered functionality needs to perform the following steps:

1. The system should have completed necessary setup and initializations.
2. If DMA mode is desired, the DMA should be initialized by calling SYS_DMA_Initialize.
3. The necessary ports setup and remapping must be done for I2S lines: ADCDAT, DACDAT, BCLK, LRCK and MCLK (if required).

4. The driver object should have been initialized by calling DRV_I2S_Initialize. If DMA mode is desired, related attributes in the init structure must be set.
5. Open the driver using DRV_I2S_Open with the necessary ioIntent to get a client handle.
6. The necessary BCLK, LRCK, and MCLK should be set up so as to generate the required media bit rate.
7. The necessary Baud rate value should be set up by calling DRV_I2S_BaudrateSet.
8. The Register and event handler for the client handle should be set up by calling DRV_I2S_BufferEventHandlerSet.
9. Add a buffer to initiate the data transfer by calling DRV_I2S_BufferAddWrite/DRV_I2S_BufferAddRead/DRV_I2S_BufferAddWriteRead.
10. Based on polling or interrupt mode service the data processing should be set up by calling DRV_I2S_Tasks, DRV_I2S_TasksError from system tasks or I2S ISR. When a DMA channel is used for transmission/reception system calls SYS_DMA_Tasks(), SYS_DMA_TasksError() from the system tasks or DMA channel ISR, DRV_I2S_Tasks and DRV_I2S_TasksError will be internally called by the driver from the DMA channel event handler.
11. Repeat step 9 through step 10 to handle multiple buffer transmission and reception.
12. When the client is done it can use DRV_I2S_Close to close the client handle.

Example 1:

```
// The following is an example for a Polled mode buffered transmit

#define SYS_I2S_DRIVER_INDEX DRV_I2S_1 // I2S Uses SPI Hardware
#define BUFFER_SIZE 1000
// I2S initialization structure.
// This should be populated with necessary settings.
// attributes dmaChannelTransmit/dmaChannelReceive
// and dmaInterruptTransmitSource/dmaInterruptReceiveSource
// must be set if DMA mode of operation is desired.
DRV_I2S_INIT i2sInit;
SYS_MODULE_OBJ sysObj;      //I2S module object
DRV_HANDLE handle;          //Client handle
uint32_t i2sClock;          //BCLK frequency
uint32_t baudrate;          //baudrate
uint16_t myAudioBuffer[BUFFER_SIZE]; //Audio buffer to be transmitted
DRV_I2S_BUFFER_HANDLE bufferHandle;
APP_DATA_S state;           //Application specific state
uintptr_t contextHandle;

void SYS_Initialize ( void* data )
{
    // The system should have completed necessary setup and initializations.
    // Necessary ports setup and remapping must be done for I2S lines ADCDAT,
    // DACDAT, BCLK, LRCK and MCLK

    sysObj = DRV_I2S_Initialize(SYS_I2S_DRIVER_INDEX, (SYS_MODULE_INIT*)&i2sInit);
    if (SYS_MODULE_OBJ_INVALID == sysObj)
    {
        // Handle error
    }
}

void App_Task(void)

Client Operations - Non-buffered

This section provides information on non-buffered client operations.

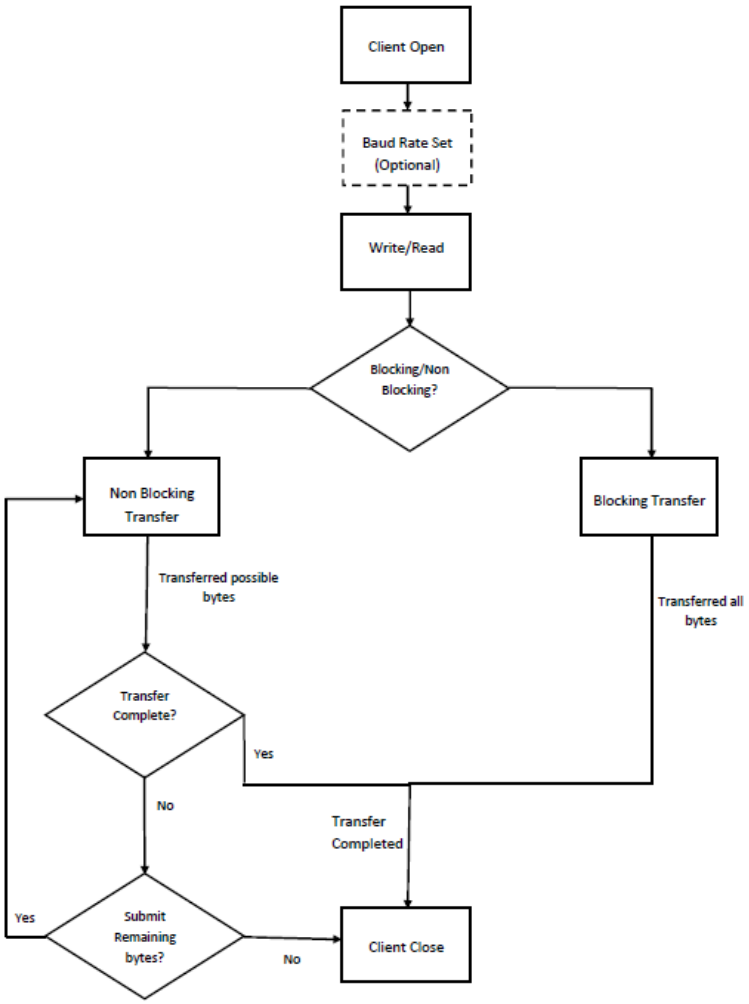
Description

Client Operations - Non-buffered

Client non-buffered operations provide a basic interface for the driver operation. This interface could be used by applications which have do not have buffered data transfer requirements. The functions DRV_I2S_Read and DRV_I2S_Write are the non-buffered data operation functions. The non-buffered functions are blocking/non-blocking depending upon the mode (ioIntent) the client was opened. If the client was opened for blocking mode these functions will only return when (or will block until) the specified data operation is completed or if an error occurred. If the client was opened for non-blocking mode, these functions will return with the number of bytes that were actually accepted for operation. The function will not wait until the data operation has completed.

Note: Non-buffered functions do not support interrupt/DMA mode.

The following diagram illustrates the non-buffered data operations



Note: It is not necessary to close and reopen the client between multiple transfers.

An application using the non-buffered functionality needs to perform the following steps:

1. The system should have completed necessary setup and initializations.
2. The necessary ports setup and remapping must be done for I2S lines: ADCDAT, DACDAT, BCLK, LRCK and MCLK (if required).
3. The driver object should have been initialized by calling DRV_I2S_Initialize.
4. Open the driver using DRV_I2S_Open with the necessary ioIntent to get a client handle.
5. The necessary BCLK, LRCK, and MCLK should be set up so as to generate the required media bit rate.
6. The necessary Baud rate value should be set up by calling DRV_I2S_BaudrateSet.
7. The Transmit/Receive data should be set up by calling DRV_I2S_Write/DRV_I2S_Read.
8. Repeat step 5 through step 7 to handle multiple buffer transmission and reception.
9. When the client is done it can use DRV_I2S_Close to close the client handle.

Example 1:

```
// The following is an example for a blocking transmit
    #define SYS_I2S_DRIVER_INDEX DRV_I2S_1 // I2S Uses SPI Hardware
    #define BUFFER_SIZE 1000
    DRV_I2S_INIT i2sInit; //I2S initialization structure
                          //This should be populated with necessary settings
    SYS_MODULE_OBJ sysObj; //I2S module object
    APP_DATA_S state; //Application specific state
    DRV_HANDLE handle;  //Client handle
    uint32_t i2sClock;   //BCLK frequency
    uint32_t baudrate;   //baudrate
    uint16_t myAudioBuffer[BUFFER_SIZE]; //Audio buffer to be transmitted
    uint32_t count;

    // The system should have completed necessary setup and initializations.
    // Necessary ports setup and remapping must be done for
    // I2S lines ADCDAT, DACDAT, BCLK, LRCK and MCLK

    sysObj = DRV_I2S_Initialize(SYS_I2S_DRIVER_INDEX, (SYS_MODULE_INIT*)&i2sInit);
    if (SYS_MODULE_OBJ_INVALID == sysObj)
    {
        // Handle error
    }
    while(1)
    {
        switch(state)
        {
            case APP_STATE_INIT:
            {
                handle = DRV_I2S_Open(SYS_I2S_DRIVER_INDEX, (DRV_IO_INTENT_WRITE | DRV_IO_INTENT_BLOCKING));
                if(handle != DRV_HANDLE_INVALID )
                {
                    /* Update the state */
                    state = APP_STATE_WAIT_FOR_READY;
                }
            }
            break;
            case  APP_STATE_WAIT_FOR_READY:
            {
                // Necessary clock settings must be done to generate
                // required MCLK, BCLK and LRCK
                DRV_I2S_BaudrateSet(handle, i2sClock, baudrate);
                // Blocks here and transfer the buffer
                count = DRV_I2S_Write(handle, &myAudioBuffer,BUFFER_SIZE);
                if(count == DRV_I2S_WRITE_ERROR)
                {
                    //Handle Error
                } else
                {
                    // Transfer Done
                    state = APP_STATE_DONE;
                }
            }
            break;
            case  APP_STATE_DONE:
            {
                // Close done
```

```
                DRV_I2S_Close(handle);
            }
            break;
            default:
            break;
        }
    }
```

Example 2:

```
// Following is an example for a non blocking transmit
    #define SYS_I2S_DRIVER_INDEX DRV_I2S_1 //I2S Uses SPI Hardware
    #define BUFFER_SIZE 1000
    DRV_I2S_INIT i2sInit; //I2S initialization structure.
                          // This should be populated with necessary settings
    SYS_MODULE_OBJ sysObj; //I2S module object
    APP_DATA_S state; //Application specific state
    DRV_HANDLE handle;  //Client handle
    uint32_t i2sClock;   //BCLK frequency
    uint32_t baudrate;   //baudrate
    uint16_t myAudioBuffer[BUFFER_SIZE]; //Audio buffer to be transmitted
    uint32_t count,total,size;

    total = 0;
    size = BUFFER_SIZE;

    // The system should have completed necessary setup and initializations.
    // Necessary ports setup and remapping must be done for I2S lines ADCDAT,
    // DACDAT, BCLK, LRCK and MCLK

    sysObj = DRV_I2S_Initialize(SYS_I2S_DRIVER_INDEX, (SYS_MODULE_INIT*)&i2sInit);
    if (SYS_MODULE_OBJ_INVALID == sysObj)
    {
        // Handle error
    }

    while(1)
    {
        switch(state)
        {
            case APP_STATE_INIT:
            {
                handle = DRV_I2S_Open(SYS_I2S_DRIVER_INDEX, (DRV_IO_INTENT_WRITE |
DRV_IO_INTENT_NONBLOCKING));
                if(handle != DRV_HANDLE_INVALID )

                }
                else
                {
                    // Close done
                }
            }
            break;
            default:
            break;
        }
    }
```

Configuring the Library

Client Configuration

	Name	Description
	DRV_I2S_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_I2S_QUEUE_DEPTH_COMBINED	Number of entries of all queues in all instances of the driver.

System Configuration

	Name	Description
	DRV_I2S_INDEX	I2S Static Index selection
	DRV_I2S_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_I2S_INTERRUPT_MODE	Macro controls interrupt based operation of the driver
	DRV_I2S_INTERRUPT_SOURCE_ERROR	Defines the interrupt source for the error interrupt
	DRV_I2S_INTERRUPT_SOURCE_RECEIVE	Macro to define the Receive interrupt source in case of static driver
	DRV_I2S_INTERRUPT_SOURCE_TRANSMIT	Macro to define the Transmit interrupt source in case of static driver
	DRV_I2S_PERIPHERAL_ID	Configures the I2S PLIB Module ID
	DRV_I2S_RECEIVE_DMA_CHANNEL	Macro to defines the I2S Driver Receive DMA Channel in case of static driver
	DRV_I2S_STOP_IN_IDLE	Identifies whether the driver should stop operations in stop in Idle mode.
	DRV_I2S_TRANSMIT_DMA_CHANNEL	Macro to defines the I2S Driver Transmit DMA Channel in case of static driver
	DRV_I2S_RECEIVE_DMA_CHAINING_CHANNEL	Macro to defines the I2S Driver Receive DMA Chaining Channel in case of static driver

Description

The configuration of the I2S Driver Library is based on the file `sys_config.h`.

This header file contains the configuration selection for the I2S Driver Library. Based on the selections made, the I2S Driver Library may support the selected features. These configuration settings will apply to all instances of the I2S Driver Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

System Configuration

DRV_I2S_INDEX Macro

I2S Static Index selection

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_INDEX
```

Description

Index - Used for static drivers

I2S Static Index selection for the driver object reference. This macro defines the driver index in case of static and static multi-client build. For example, if this macro is set to DRV_I2S_INDEX_2, then static driver APIs would be DRV_I2S2_Initialize(), DRV_I2S2_Open() etc. When building static drivers, this macro should be different for each static build of the I2S driver that needs to be included in the project.

Remarks

This index is required to make a reference to the driver object

DRV_I2S_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_INSTANCES_NUMBER
```

Description

I2S driver objects configuration

Sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of I2S modules that are needed by the application. Hardware Instance support consumes RAM memory space. If this macro is not defined, then the driver will be built statically.

Remarks

None

DRV_I2S_INTERRUPT_MODE Macro

Macro controls interrupt based operation of the driver

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_INTERRUPT_MODE
```

Description

I2S Interrupt Mode Operation Control

This macro controls the interrupt based operation of the driver. The possible values it can take are

- true - Enables the interrupt mode
- false - Enables the polling mode

If the macro value is true, then Interrupt Service Routine for the interrupt should be defined in the application. The DRV_I2S_Tasks() routine should be called in the ISR.

DRV_I2S_INTERRUPT_SOURCE_ERROR Macro

Defines the interrupt source for the error interrupt

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_INTERRUPT_SOURCE_ERROR
```

Description

Error Interrupt Source

Macro to define the Error interrupt source in case of static driver. The interrupt source defined by this macro will override the errorInterruptSource member of the DRV_I2S_INIT initialization data structure in the driver initialization routine. This value should be set to the I2S module error interrupt enumeration in the Interrupt PLIB for the microcontroller.

DRV_I2S_INTERRUPT_SOURCE_RECEIVE Macro

Macro to define the Receive interrupt source in case of static driver

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_INTERRUPT_SOURCE_RECEIVE
```

Description

Receive Interrupt Source

Macro to define the Receive interrupt source in case of static driver. The interrupt source defined by this macro will override the rxInterruptSource member of the DRV_I2S_INIT initialization data structure in the driver initialization routine. This value should be set to the I2S module receive interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_I2S_INTERRUPT_SOURCE_TRANSMIT Macro

Macro to define the Transmit interrupt source in case of static driver

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_INTERRUPT_SOURCE_TRANSMIT
```

Description

Transmit Interrupt Source

Macro to define the TX interrupt source in case of static driver. The interrupt source defined by this macro will override the txInterruptSource member of the DRV_I2S_INIT initialization data structure in the driver initialization routine. This value should be set to the I2S module transmit interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_I2S_PERIPHERAL_ID Macro

Configures the I2S PLIB Module ID

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_PERIPHERAL_ID
```

Description

I2S Peripheral Library Module ID

This macro configures the PLIB ID if the driver is built statically. This value will override the I2SID member of the DRV_I2S_INIT initialization data structure. In that when the driver is built statically, the I2SID member of the DRV_I2S_INIT data structure will be ignored by the driver initialization routine and this macro will be considered. This should be set to the PLIB ID of I2S module (I2S_ID_1, I2S_ID_2 and so on).

DRV_I2S_RECEIVE_DMA_CHANNEL Macro

Macro to defines the I2S Driver Receive DMA Channel in case of static driver

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_RECEIVE_DMA_CHANNEL
```

Description

I2S Driver Receive DMA Channel

Macro to define the I2S Receive DMA Channel in case of static driver. The DMA channel defined by this macro will override the dmaChannelReceive member of the DRV_I2S_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel in the DMA PLIB for the microcontroller.

Remarks

None.

DRV_I2S_STOP_IN_IDLE Macro

Identifies whether the driver should stop operations in stop in Idle mode.

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_STOP_IN_IDLE
```

Description

I2S driver objects configuration

Identifies whether the driver should stop operations in stop in Idle mode. true - Indicates stop in idle mode. false - Indicates do not stop in Idle mode.

Remarks

None

DRV_I2S_TRANSMIT_DMA_CHANNEL Macro

Macro to defines the I2S Driver Transmit DMA Channel in case of static driver

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_TRANSMIT_DMA_CHANNEL
```

Description

I2S Driver Transmit DMA Channel

Macro to define the I2S Transmit DMA Channel in case of static driver. The DMA channel defined by this macro will override the dmaChannelTransmit member of the DRV_I2S_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel in the DMA PLIB for the microcontroller.

Remarks

None.

DRV_I2S_RECEIVE_DMA_CHAINING_CHANNEL Macro

Macro to defines the I2S Driver Receive DMA Chaining Channel in case of static driver

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_RECEIVE_DMA_CHAINING_CHANNEL
```

Description

I2S Driver Receive DMA Chaining Channel

Macro to define the I2S Receive DMA Chaining Channel in case of static driver. The DMA channel defined by this macro will override the dmaChaningChannelReceive member of the DRV_I2S_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel in the DMA PLIB for the microcontroller.

Remarks

None.

Client Configuration

DRV_I2S_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_CLIENTS_NUMBER
```

Description

I2S Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance. This value represents the total number of clients to be supported across all hardware instances. So if I2S1 will be accessed by 2 clients and I2S2 will accessed by 3 clients, then this number should be 5. It is recommended that this be set exactly equal to the number of expected clients. Client support consumes RAM memory space. If this macro is not defined and the DRV_I2S_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - single client operation. If this macro is defined and the DRV_I2S_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - multi client operation.

Remarks

None

DRV_I2S_QUEUE_DEPTH_COMBINED Macro

Number of entries of all queues in all instances of the driver.

File

drv_i2s_config_template.h

C

```
#define DRV_I2S_QUEUE_DEPTH_COMBINED
```

Description

I2S Driver Buffer Queue Entries

This macro defined the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for transmit and receive operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build). The hardware instance transmit buffer queue will queue transmit buffers submitted by the

DRV_I2S_BufferAddWrite() function. The hardware instance receive buffer queue will queue receive buffers submitted by the DRV_I2S_BufferAddRead() function.

A buffer queue will contains buffer queue entries, each related to a BufferAdd request. This configuration macro defines total number of buffer entries that will be available for use between all I2S driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking read and write requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. More the number of buffer entries, greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its transmit and receive buffer queue size.

As an example, consider the case of static single client driver application where full duplex non blocking operation is desired without queuing, the minimum transmit queue depth and minimum receive queue depth should be 1. Hence the total number of buffer entries should be 2.

As an example, consider the case of a dynamic driver (say 2 instances) where instance 1 will queue up to 3 write requests and up to 2 read requests, and instance 2 will queue up to 2 write requests and up to 6 read requests, the value of this macro should be 13 (2 + 3 + 2 + 6).

Remarks

The maximum combined queue depth should not be greater than 0xFFFF(ie 65535)

Building the Library

This section lists the files that are available in the I2S Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/i2s`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_i2s.h`	This file provides the interface definitions of the I2S driver.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_i2s_dma.c`	This file contains the core implementation of the I2S driver with DMA support.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
`/src/dynamic/drv_i2s_dma_advanced.c`	This file contains the implementation of the I2S driver with DMA support using the channel chaining feature.
`/src/dynamic/drv_i2s.c`	This file contains the implementation of the I2S driver without DMA support.
`/src/dynamic/drv_i2s_read_write.c`	This file contains the basic read/write implementation of the I2S driver.

Module Dependencies

The I2S Driver Library depends on the following modules:

- SPI Peripheral Library
- DMA Peripheral Library

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_I2S_Deinitialize	Deinitializes the specified instance of the I2S driver module. **Implementation:** Dynamic
	DRV_I2S_Initialize	Initializes hardware and data for the instance of the I2S module. **Implementation:** Dynamic
	DRV_I2S_Status	Gets the current status of the I2S driver module. **Implementation:** Dynamic
	DRV_I2S_Tasks	Maintains the driver's receive state machine and implements its ISR. **Implementation:** Dynamic
	DRV_I2S_TasksError	Maintains the driver's error state machine and implements its ISR. **Implementation:** Dynamic

b) Client Setup Functions

	Name	Description
	DRV_I2S_Close	Closes an opened-instance of the I2S driver. **Implementation:** Dynamic
	DRV_I2S_Open	Opens the specified I2S driver instance and returns a handle to it. **Implementation:** Dynamic

c) Data Transfer Functions

	Name	Description
	DRV_I2S_BufferAddRead	Schedule a non-blocking driver read operation. **Implementation:** Dynamic
	DRV_I2S_BufferAddWrite	Schedule a non-blocking driver write operation. **Implementation:** Dynamic
	DRV_I2S_BufferAddWriteRead	Schedule a non-blocking driver write-read operation. **Implementation:** Dynamic
	DRV_I2S_BufferEventHandlerSet	This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. **Implementation:** Dynamic
	DRV_I2S_BufferProcessedSizeGet	This function returns number of bytes that have been processed for the specified buffer. **Implementation:** Dynamic
	DRV_I2S_BufferCombinedQueueSizeGet	This function returns the number of bytes queued (to be processed) in the buffer queue. **Implementation:** Dynamic
	DRV_I2S_BufferQueueFlush	This function flushes off the buffers associated with the client object. **Implementation:** Dynamic
	DRV_I2S_Read	Reads data from the I2S. **Implementation:** Dynamic
	DRV_I2S_Write	Writes data to the I2S. **Implementation:** Dynamic

d) Miscellaneous Functions

	Name	Description
	DRV_I2S_BaudSet	This function sets the baud. **Implementation:** Dynamic
	DRV_I2S_ErrorGet	This function returns the error(if any) associated with the last client request. **Implementation:** Dynamic
	DRV_I2S_ReceiveErrorIgnore	This function enable/disable ignoring of the receive overflow error. **Implementation:** Dynamic
	DRV_I2S_TransmitErrorIgnore	This function enable/disable ignoring of the transmit underrun error. **Implementation:** Dynamic

e) Data Types and Constants

	Name	Description
	DRV_I2S_AUDIO_PROTOCOL_MODE	Identifies the Audio Protocol Mode of the I2S module.
	DRV_I2S_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_I2S_BUFFER_EVENT_HANDLER	Pointer to a I2S Driver Buffer Event handler function
	DRV_I2S_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.
	DRV_I2S_CLOCK_MODE	Identifies the various clock modes of the I2S module.
	DRV_I2S_DATA16	Defines the left and right channel data for 16-bit audio data
	_DRV_I2S_DATA16	Defines the left and right channel data for 16-bit audio data
	DRV_I2S_DATA24	Defines the left and right channel data for 24-bit audio data
	_DRV_I2S_DATA24	Defines the left and right channel data for 24-bit audio data
	DRV_I2S_DATA32	Defines the left and right channel data for 32-bit audio data
	_DRV_I2S_DATA32	Defines the left and right channel data for 32-bit audio data
	DRV_I2S_ERROR	Defines the possible errors that can occur during driver operation.
	DRV_I2S_INIT	Defines the data required to initialize or reinitialize the I2S driver
	DRV_I2S_MODE	Identifies the usage modes of the I2S module.
	DRV_I2S_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_I2S_COUNT	Number of valid I2S driver indices
	DRV_I2S_READ_ERROR	I2S Driver Read Error.
	DRV_I2S_WRITE_ERROR	I2S Driver Write Error.
	DRV_I2S_INDEX_0	I2S driver index definitions
	DRV_I2S_INDEX_1	This is macro DRV_I2S_INDEX_1.
	DRV_I2S_INDEX_2	This is macro DRV_I2S_INDEX_2.
	DRV_I2S_INDEX_3	This is macro DRV_I2S_INDEX_3.
	DRV_I2S_INDEX_4	This is macro DRV_I2S_INDEX_4.
	DRV_I2S_INDEX_5	This is macro DRV_I2S_INDEX_5.

Description

This section describes the Application Programming Interface (API) functions of the I2S Driver Library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_I2S_Deinitialize Function

Deinitializes the specified instance of the I2S driver module.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the I2S driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This routine will NEVER block waiting for hardware.

Preconditions

Function DRV_I2S_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_I2S_Initialize
SYS_STATUS          status;

DRV_I2S_Deinitialize(object);

status = DRV_I2S_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_I2S_Initialize routine

Function

void DRV_I2S_Deinitialize(SYS_MODULE_OBJ object)

DRV_I2S_Initialize Function

Initializes hardware and data for the instance of the I2S module.

Implementation: Dynamic

File

drv_i2s.h

C

```
SYS_MODULE_OBJ DRV_I2S_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT *const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the I2S driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the init parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the I2S module ID. For example, driver instance 0 can be assigned to I2S2. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_I2S_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other I2S routine is called.

This routine should only be called once during system initialization unless DRV_I2S_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

To Enable the DMA mode of operation the init parameters 'dmaChannelTransmit' /'dmaChannelReceive' must be set to valid DMA channel. When DMA mode of operation is enabled, the normal mode(Usual TX and RX) operation is inhibited. When 'dmaChannelTransmit'/'dmaChannelReceive' are set to valid channel numbers the related DMA interrupt source parameters 'dmaInterruptTransmitSource'/ 'dmaInterruptReceiveSource' must be set with appropriate DMA channel interrupt source.

Preconditions

If DMA mode of operation is intended, SYS_DMA_Initialize should have been called before calling this function.

Example

```
DRV_I2S_INIT                init;
SYS_MODULE_OBJ              objectHandle;

init.moduleInit.value           = SYS_MODULE_POWER_RUN_FULL;
init.spiID                      = SPI_ID_1;
init.usageMode                  = DRV_I2S_MODE_MASTER;
init.baudClock                  = SPI_BAUD_RATE_MCLK_CLOCK;
init.baud                       = 48000;
```

```
init.clockMode                  = DRV_I2S_CLOCK_MODE_IDLE_HIGH_EDGE_FALL;
init.audioCommWidth             = SPI_AUDIO_COMMUNICATION_24DATA_32FIFO_32CHANNEL;
init.audioTransmitMode          = SPI_AUDIO_TRANSMIT_STEREO;
init.inputSamplePhase           = SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE;
init.protocolMode               = DRV_I2S_AUDIO_I2S;
init.txInterruptSource          = INT_SOURCE_SPI_1_TRANSMIT;
init.rxInterruptSource          = INT_SOURCE_SPI_1_RECEIVE;
init.errorInterruptSource       = INT_SOURCE_SPI_1_ERROR;
init.queueSizeTransmit          = 3;
init.queueSizeReceive           = 2;
init.dmaChannelTransmit         = DMA_CHANNEL_NONE;
init.dmaChannelReceive          = DMA_CHANNEL_NONE;

objectHandle = DRV_I2S_Initialize(DRV_I2S_INDEX_1, (SYS_MODULE_INIT*)init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the driver instance to be initialized
init	Pointer to the data structure containing any data necessary to initialize the hardware. This pointer may be null if no data is required and default initialization is to be used.

Function

SYS_MODULE_OBJ DRV_I2S_Initialize (const SYS_MODULE_INDEX drvIndex,
const SYS_MODULE_INIT *const init)

DRV_I2S_Status Function

Gets the current status of the I2S driver module.

Implementation: Dynamic

File

drv_i2s.h

C

```
SYS_STATUS DRV_I2S_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_DEINITIALIZED - Indicates that the driver has been deinitialized

SYS_STATUS_READY - Indicates that any previous module operation for the specified module has completed

SYS_STATUS_BUSY - Indicates that a previous module operation for the specified module has not yet completed

SYS_STATUS_ERROR - Indicates that the specified module is in an error state

Description

This routine provides the current status of the I2S driver module.

Remarks

A driver can opened only when its status is SYS_STATUS_READY.

Preconditions

Function DRV_I2S_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_I2S_Initialize
SYS_STATUS          i2sStatus;

i2sStatus = DRV_I2S_Status(object);
if (SYS_STATUS_READY == i2sStatus)
{
    // This means the driver can be opened using the
    // DRV_I2S_Open() function.
```

```
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_I2S_Initialize routine

Function

SYS_STATUS DRV_I2S_Status(SYS_MODULE_OBJ object)

DRV_I2S_Tasks Function

Maintains the driver's receive state machine and implements its ISR.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal receive state machine and implement its transmit and receive ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks function. In interrupt mode, this function should be called from the interrupt service routine of the I2S that is associated with this I2S driver hardware instance. In DMA mode of operation, this function should be called from the interrupt service routine of the channel associated with the transmission/reception of the I2s driver hardware instance.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_I2S_Initialize

while (true)
{
    DRV_I2S_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_I2S_Initialize)

Function

void DRV_I2S_Tasks(SYS_MODULE_OBJ object)

DRV_I2S_TasksError Function

Maintains the driver's error state machine and implements its ISR.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_TasksError(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal error state machine and implement its error ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks() function. In interrupt mode, this function should be called in the error interrupt service routine of the I2S that is associated with this I2S driver hardware instance. In DMA mode of operation, this function should be called from the interrupt service routine of the channel associated with the transmission/reception of the I2s driver hardware instance.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_I2S_Initialize

while (true)
{
    DRV_I2S_TasksError (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_I2S_Initialize)

Function

void DRV_I2S_TasksError (SYS_MODULE_OBJ object)

b) Client Setup Functions

DRV_I2S_Close Function

Closes an opened-instance of the I2S driver.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_Close(const DRV_HANDLE handle);
```

Returns

- None

Description

This routine closes an opened-instance of the I2S driver, invalidating the handle. Any buffers in the driver queue that were submitted by this client will be removed. After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_I2S_Open before the caller may use the driver again

Remarks

Usually there is no need for the driver client to verify that the Close operation has completed. The driver will abort any ongoing operations when this routine is called.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_I2S_Open

DRV_I2S_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_I2S_Close(DRV_Handle handle)

DRV_I2S_Open Function

Opens the specified I2S driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_i2s.h

C

```
DRV_HANDLE DRV_I2S_Open(const SYS_MODULE_INDEX iDriver, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Error can occur

- if the number of client objects allocated via DRV_I2S_CLIENTS_NUMBER is insufficient.
- if the client is trying to open the driver but driver has been opened exclusively by another client.
- if the driver hardware instance being opened is not initialized or is invalid.

Description

This routine opens the specified I2S driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The DRV_IO_INTENT_BLOCKING and DRV_IO_INTENT_NONBLOCKING ioIntent options additionally affect the behavior of the DRV_I2S_Read() and DRV_I2S_Write() functions. If the ioIntent is DRV_IO_INTENT_NONBLOCKING, then these function will not block even if the required amount of data could not be processed. If the ioIntent is DRV_IO_INTENT_BLOCKING, these functions will block until the required amount of data is processed.

If ioIntent is DRV_IO_INTENT_READ, the client will only be read from the driver. If ioIntent is DRV_IO_INTENT_WRITE, the client will only be able to write to the driver. If the ioIntent in DRV_IO_INTENT_READWRITE, the client will be able to do both, read and write.

Specifying a DRV_IO_INTENT_EXCLUSIVE will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Remarks

The handle returned is valid until the DRV_I2S_Close routine is called. This routine will NEVER block waiting for hardware.If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

Function DRV_I2S_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_I2S_Open(DRV_I2S_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
```

```
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver. See function description for details.

Function

DRV_HANDLE DRV_I2S_Open(const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT ioIntent)

c) Data Transfer Functions

DRV_I2S_BufferAddRead Function

Schedule a non-blocking driver read operation.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_BufferAddRead(const DRV_HANDLE handle, DRV_I2S_BUFFER_HANDLE * bufferHandle, void * buffer,
size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_I2S_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking read operation. The function returns with a valid buffer handle in the bufferHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance receive queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_I2S_BUFFER_HANDLE_INVALID:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for write-only
- if the buffer size is 0
- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_I2S_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_I2S_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the I2S Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another I2S driver instance. It should not otherwise be called directly in an ISR.

This function supports DMA mode of operation.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S device instance and the DRV_I2S_Status must have returned SYS_STATUS_READY.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_I2S_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_I2S_BUFFER_HANDLE bufferHandle;
```

```
// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.

// Client registers an event handler with driver

DRV_I2S_BufferEventHandlerSet(myI2SHandle,
                APP_I2SBufferEventHandler, (uintptr_t)&myAppObj);

DRV_I2S_BufferAddRead(myI2Shandle, &bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_I2SBufferEventHandler(DRV_I2S_BUFFER_EVENT event,
        DRV_I2S_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_I2S_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_I2S_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the I2S instance as returned by the DRV_I2S_Open function
buffer	Buffer where the received data will be stored.
size	Buffer size in bytes
bufferHandle	Pointer to an argument that will contain the return buffer handle

Function

void DRV_I2S_BufferAddRead(const DRV_HANDLE handle,
DRV_I2S_BUFFER_HANDLE *bufferHandle,
void * buffer, size_t size)

DRV_I2S_BufferAddWrite Function

Schedule a non-blocking driver write operation.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_BufferAddWrite(const DRV_HANDLE handle, DRV_I2S_BUFFER_HANDLE * bufferHandle, void * buffer,
size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_I2S_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking write operation. The function returns with a valid buffer handle in the bufferHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance transmit queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_I2S_BUFFER_HANDLE_INVALID:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read-only
- if the buffer size is 0
- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_I2S_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_I2S_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the I2S Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another I2S driver instance. It should not otherwise be called directly in an ISR.

This function supports DMA mode of operation.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S device instance and the DRV_I2S_Status must have returned SYS_STATUS_READY.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_I2S_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_I2S_BUFFER_HANDLE bufferHandle;

// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.

// Client registers an event handler with driver

DRV_I2S_BufferEventHandlerSet(myI2SHandle,
                APP_I2SBufferEventHandler, (uintptr_t)&myAppObj);

DRV_I2S_BufferAddWrite(myI2Shandle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_I2SBufferEventHandler(DRV_I2S_BUFFER_EVENT event,
        DRV_I2S_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_I2S_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_I2S_BUFFER_EVENT_ERROR:
```

```
            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the I2S instance as return by the DRV_I2S_Open function
buffer	Data to be transmitted
size	Buffer size in bytes
bufferHandle	Pointer to an argument that will contain the return buffer handle

Function

void DRV_I2S_BufferAddWrite(const DRV_HANDLE handle,
DRV_I2S_BUFFER_HANDLE *bufferHandle,
void * buffer, size_t size);

DRV_I2S_BufferAddWriteRead Function

Schedule a non-blocking driver write-read operation.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_BufferAddWriteRead(const DRV_HANDLE handle, DRV_I2S_BUFFER_HANDLE * bufferHandle, void *
transmitBuffer, void * receiveBuffer, size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_I2S_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking write-read operation. The function returns with a valid buffer handle in the bufferHandle argument if the write-read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_I2S_BUFFER_HANDLE_INVALID:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only or write only
- if the buffer size is 0
- if the queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_I2S_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_I2S_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the I2S Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another I2S driver instance. It should not otherwise be called directly in an ISR.

This function is useful when there is valid read expected for every I2S write. The transmit and receive size must be same.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S device instance and the DRV_I2S_Status must have returned SYS_STATUS_READY.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READWRITE must have been specified in the DRV_I2S_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybufferTx[MY_BUFFER_SIZE];
uint8_t mybufferRx[MY_BUFFER_SIZE];
DRV_I2S_BUFFER_HANDLE bufferHandle;

// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.

// Client registers an event handler with driver

DRV_I2S_BufferEventHandlerSet(myI2SHandle,
                APP_I2SBufferEventHandler, (uintptr_t)&myAppObj);

DRV_I2S_BufferAddWriteRead(myI2Shandle, &bufferHandle,
                                    mybufferTx,mybufferRx,MY_BUFFER_SIZE);

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_I2SBufferEventHandler(DRV_I2S_BUFFER_EVENT event,
        DRV_I2S_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_I2S_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_I2S_BUFFER_EVENT_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the I2S instance as returned by the DRV_I2S_Open function
bufferHandle	Pointer to an argument that will contain the return buffer handle
transmitBuffer	Buffer where the transmit data will be stored
receiveBuffer	Buffer where the received data will be stored
size	Buffer size in bytes

Function

void DRV_I2S_BufferAddWriteRead(const DRV_HANDLE handle,
DRV_I2S_BUFFER_HANDLE *bufferHandle,
void *transmitBuffer, void *receiveBuffer,
size_t size)

DRV_I2S_BufferEventHandlerSet Function

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_BufferEventHandlerSet(DRV_HANDLE handle, const DRV_I2S_BUFFER_EVENT_HANDLER eventHandler,
const uintptr_t contextHandle);
```

Returns

None.

Description

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. When a client calls either the DRV_I2S_BufferAddRead, DRV_I2S_BufferAddWrite or DRV_I2S_BufferAddWriteRead function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "buffer add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued buffer transfer has completed, it does not need to register a callback.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_I2S_BUFFER_HANDLE bufferHandle;

// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.

// Client registers an event handler with driver. This is done once

DRV_I2S_BufferEventHandlerSet(myI2SHandle, APP_I2SBufferEventHandler,
                                (uintptr_t)&myAppObj);

DRV_I2S_BufferAddRead(myI2Shandle,&bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_I2SBufferEventHandler(DRV_I2S_BUFFER_EVENT event,
        DRV_I2S_BUFFER_HANDLE handle, uintptr_t contextHandle)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;

    switch(event)
    {
        case DRV_I2S_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;
```

```
            case DRV_I2S_BUFFER_EVENT_ERROR:

                // Error handling here.
                break;

            default:
                break;
        }
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_I2S_BufferEventHandlerSet(const DRV_HANDLE handle,
DRV_I2S_BUFFER_EVENT_HANDLER eventHandler,
uintptr_t contextHandle)

DRV_I2S_BufferProcessedSizeGet Function

This function returns number of bytes that have been processed for the specified buffer.

Implementation: Dynamic

File

drv_i2s.h

C

```
size_t DRV_I2S_BufferProcessedSizeGet(DRV_I2S_BUFFER_HANDLE bufferHandle);
```

Returns

Returns the number of the bytes that have been processed for this buffer. Returns 0 for an invalid or an expired buffer handle.

Description

This function returns number of bytes that have been processed for the specified buffer. The client can use this function, in a case where the buffer has terminated due to an error, to obtain the number of bytes that have been processed. If this function is called on a invalid buffer handle, or if the buffer handle has expired, the function returns 0.

Remarks

None.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

One of DRV_I2S_BufferAddRead, DRV_I2S_BufferAddWrite or DRV_I2S_BufferAddWriteRead function must have been called and a valid buffer handle returned.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_I2S_BUFFER_HANDLE bufferHandle;

// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.
```

```
// Client registers an event handler with driver. This is done once

DRV_I2S_BufferEventHandlerSet(myI2SHandle, APP_I2SBufferEventHandle,
                                                    (uintptr_t)&myAppObj);

DRV_I2S_BufferAddRead(myI2Shandle,&bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_I2SBufferEventHandler(DRV_I2S_BUFFER_EVENT event,
        DRV_I2S_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;
    size_t processedBytes;

    switch(event)
    {
        case DRV_I2S_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_I2S_BUFFER_EVENT_ERROR:

            // Error handling here.
            // We can find out how many bytes were processed in this
            // buffer before the error occurred.

            processedBytes = DRV_I2S_BufferProcessedSizeGet(bufferHandle);

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferhandle	Handle of the buffer of which the processed number of bytes to be obtained.

Function

size_t DRV_I2S_BufferProcessedSizeGet(DRV_I2S_BUFFER_HANDLE bufferHandle)

DRV_I2S_BufferCombinedQueueSizeGet Function

This function returns the number of bytes queued (to be processed) in the buffer queue.

Implementation: Dynamic

File

drv_i2s.h

C

```
size_t DRV_I2S_BufferCombinedQueueSizeGet(DRV_HANDLE handle);
```

Returns

Returns the number of the bytes that have been processed for this buffer. Returns 0 for an invalid or an expired client handle.

Description

This function returns the number of bytes queued (to be processed) in the buffer queue of the driver instance associated with the calling client. The client can use this function to know number of remaining bytes (from the buffers submitted by it)is in the queue to be transmitted.

Remarks

None.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

One of DRV_I2S_BufferAddRead/DRV_I2S_BufferAddWrite function must have been called and buffers should have been queued for transmission.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;
size_t bufferQueuedSize;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_I2S_BUFFER_HANDLE bufferHandle;

// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.

// Client registers an event handler with driver. This is done once

DRV_I2S_BufferEventHandlerSet(myI2SHandle, APP_I2SBufferEventHandle,
                                                    (uintptr_t)&myAppObj);

DRV_I2S_BufferAddRead(myI2Shandle,&bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// The data is being processed after adding the buffer to the queue.
// The user can get to know dynamically available data in the queue to be
// transmitted by calling DRV_I2S_BufferCombinedQueueSizeGet
bufferQueuedSize = DRV_I2S_BufferCombinedQueueSizeGet(myI2SHandle);
```

Parameters

Parameters	Description
handle	Opened client handle associated with a driver object.

Function

size_t DRV_I2S_BufferCombinedQueueSizeGet(DRV_HANDLE handle)

DRV_I2S_BufferQueueFlush Function

This function flushes off the buffers associated with the client object.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_BufferQueueFlush(DRV_HANDLE handle);
```

Returns

None.

Description

This function flushes off the buffers associated with the client object and disables the DMA channel used for transmission.

Remarks

None.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

One of DRV_I2S_BufferAddRead/DRV_I2S_BufferAddWrite function must have been called and buffers should have been queued for transmission.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;
size_t bufferQueuedSize;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_I2S_BUFFER_HANDLE bufferHandle;

// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.

// Client registers an event handler with driver. This is done once

DRV_I2S_BufferEventHandlerSet(myI2SHandle, APP_I2SBufferEventHandle,
                                                    (uintptr_t)&myAppObj);

DRV_I2S_BufferAddRead(myI2Shandle,&bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// The data is being processed after adding the buffer to the queue.
// The user can stop the data processing and flushoff the data
// in the queue by calling DRV_I2S_BufferQueueFlush
DRV_I2S_BufferQueueFlush(myI2SHandle);
```

Parameters

Parameters	Description
handle	Opened client handle associated with a driver object.

Function

void DRV_I2S_BufferQueueFlush(DRV_HANDLE handle)

DRV_I2S_Read Function

Reads data from the I2S.

Implementation: Dynamic

File

drv_i2s.h

C

```
size_t DRV_I2S_Read(const DRV_HANDLE handle, uint8_t * buffer, const size_t numBytes);
```

Returns

Number of bytes actually copied into the caller's buffer. Returns DRV_I2S_READ_ERROR in case of an error.

Description

This routine reads data from the I2S. This function is blocking if the driver was opened by the client for blocking operation. This function will not

block if the driver was opened by the client for non blocking operation. If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_BLOCKING, this function will only return when (or will block until) numBytes of bytes have been received or if an error occurred.

If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_NON_BLOCKING, this function will return with the number of bytes that were actually read. The function will not wait until numBytes of bytes have been read.

Remarks

This function is thread safe in a RTOS application. It is recommended that this function not be called in I2S Driver Event Handler due to the potential blocking nature of the function. This function should not be called directly in an ISR. It should not be called in the event handler associated with another I2S driver instance.

This function does not supports DMA mode of operation.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_I2S_Open call.

Example

```
DRV_HANDLE      myI2SHandle;    // Returned from DRV_I2S_Open
char            myBuffer[MY_BUFFER_SIZE];
unsigned int    count;
unsigned int    total;

total = 0;
do
{
    count  = DRV_I2S_Read(myI2SHandle, &myBuffer[total],
                          MY_BUFFER_SIZE - total);
    total += count;
    if(count == DRV_I2S_READ_ERROR)
    {
        // Handle error ...
    }
    else
    {
        // Do what needs to be..
    }
} while( total < MY_BUFFER_SIZE );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
buffer	Buffer into which the data read from the I2S instance will be placed.
numBytes	Total number of bytes that need to be read from the module instance (must be equal to or less than the size of the buffer)

Function

size_t DRV_I2S_Read(const DRV_HANDLE handle, uint8_t *buffer,

const size_t numBytes)

DRV_I2S_Write Function

Writes data to the I2S.

Implementation: Dynamic

File

drv_i2s.h

C

```
size_t DRV_I2S_Write(const DRV_HANDLE handle, uint8_t * buffer, const size_t numBytes);
```

Returns

Number of bytes actually written to the driver. Return DRV_I2S_WRITE_ERROR in case of an error.

Description

This routine writes data to the I2S. This function is blocking if the driver was opened by the client for blocking operation. This function will not block if the driver was opened by the client for non blocking operation. If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_BLOCKING, this function will only return when (or will block until) numbytes of bytes have been transmitted or if an error occurred.

If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_NON_BLOCKING, this function will return with the number of bytes that were actually accepted for transmission. The function will not wait until numBytes of bytes have been transmitted.

Remarks

This function is thread safe in a RTOS application. It is recommended that this function not be called in I2S Driver Event Handler due to the potential blocking nature of the function. This function should not be called directly in an ISR. It should not be called in the event handler associated with another USART driver instance.

This function does not supports DMA mode of operation.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_I2S_Open call.

Example

```
DRV_HANDLE myI2SHandle;    // Returned from DRV_I2S_Open
char myBuffer[MY_BUFFER_SIZE];
int count;
unsigned int total;
total = 0;
do
{
    count  = DRV_I2S_Write(myI2SHandle, &myBuffer[total],
            MY_BUFFER_SIZE - total);
    total += count;
    if(count == DRV_I2S_WRITE_ERROR)
    {
        // Handle error ...
    }
    else
    {
        // Do what needs to be ..
    }
} while( total < MY_BUFFER_SIZE );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
buffer	Buffer containing the data to written.
numbytes	size of the buffer

Function

size_t DRV_I2S_Write(const DRV_HANDLE handle, void * buffer,

const size_t numbytes)

d) Miscellaneous Functions

DRV_I2S_BaudSet Function

This function sets the baud.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_BaudSet(DRV_HANDLE handle, uint32_t spiClock, uint32_t baud);
```

Returns

None

Description

This function sets the baud rate for the I2S operation.

Remarks

None.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_HANDLE handle;
uint32_t baud;
uint32_t clock;

// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.

// Client registers an event handler with driver. This is done once

DRV_I2S_BufferEventHandlerSet(myI2SHandle, APP_I2SBufferEventHandle,
                                                        (uintptr_t)&myAppObj);

// Sets the baud rate to a new value as below
baud = 115200;
clock = 40000000UL;
DRV_I2S_BaudSet(myI2SHandle, clock, baud);

// Further perform the operation needed
DRV_I2S_BufferAddRead(myI2Shandle,&bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_I2SBufferEventHandler(DRV_I2S_BUFFER_EVENT event,
        DRV_I2S_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;
    size_t processedBytes;

    switch(event)
    {
        case DRV_I2S_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;
```

```
            case DRV_I2S_BUFFER_EVENT_ERROR:

                // Error handling here.
                // We can find out how many bytes were processed in this
                // buffer before the error occurred.

                processedBytes = DRV_I2S_BufferProcessedSizeGet(bufferHandle);

                break;

            default:
                break;
        }
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
i2sClock	The Source clock frequency to the i2S module.
baud	The baud to be set.

Function

void DRV_I2S_BaudSet(DRV_HANDLE handle, uint32_t spiClock, uint32_t baud)

DRV_I2S_ErrorGet Function

This function returns the error(if any) associated with the last client request.

Implementation: Dynamic

File

drv_i2s.h

C

```
DRV_I2S_ERROR DRV_I2S_ErrorGet(DRV_HANDLE handle);
```

Returns

A DRV_I2S_ERROR type indicating last known error status.

Description

This function returns the error(if any) associated with the last client request. The DRV_I2S_Read() and DRV_I2S_Write() will update the client error status when these functions return DRV_I2S_READ_ERROR and DRV_I2S_WRITE_ERROR, respectively. If the driver send a DRV_I2S_BUFFER_EVENT_ERROR to the client, the client can call this function to know the error cause. The error status will be updated on every operation and should be read frequently (ideally immediately after the driver operation has completed) to know the relevant error status.

Remarks

It is the client's responsibility to make sure that the error status is obtained frequently. The driver will update the client error status regardless of whether this has been examined by the client.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_I2S_BUFFER_HANDLE bufferHandle;

// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.

// Client registers an event handler with driver. This is done once
```

```
DRV_I2S_BufferEventHandlerSet( myI2SHandle, APP_I2SBufferEventHandle,
                                (uintptr_t)&myAppObj );

DRV_I2S_BufferAddRead( myI2Shandle,&bufferHandle,
                                     myBuffer, MY_BUFFER_SIZE );

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_I2SBufferEventHandler( DRV_I2S_BUFFER_EVENT event,
        DRV_I2S_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle )
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;
    size_t processedBytes;

    switch(event)
    {
        case DRV_I2S_BUFFER_EVENT_SUCCESS:

            // This means the data was transferred.
            break;

        case DRV_I2S_BUFFER_EVENT_FAILURE:

            // Error handling here.
            // We can find out how many bytes were processed in this
            // buffer before the error occurred. We can also find
            // the error cause.

            processedBytes = DRV_I2S_BufferProcessedSizeGet(bufferHandle);
            if(DRV_I2S_ERROR_RECEIVE_OVERRUN == DRV_I2S_ErrorGet(myI2SHandle))
            {
                // There was an receive over flow error.
                // Do error handling here.
            }

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferhandle	Handle of the buffer of which the processed number of bytes to be obtained.

Function

DRV_I2S_ERROR DRV_I2S_ErrorGet(DRV_HANDLE handle)

DRV_I2S_ReceiveErrorIgnore Function

This function enable/disable ignoring of the receive overflow error.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_ReceiveErrorIgnore(DRV_HANDLE handle, bool errorEnable);
```

Returns

None

Description

A receive overflow is not a critical error; during receive overflow data in the FIFO is not overwritten by receive data. Ignore receive overflow is needed for cases when there is a general performance problem in the system that software must handle properly.

Remarks

None.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_HANDLE handle;
uint32_t baud;
uint32_t baud;*

// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.

// Client registers an event handler with driver. This is done once

DRV_I2S_BufferEventHandlerSet(myI2SHandle, APP_I2SBufferEventHandle,
                                                        (uintptr_t)&myAppObj);

// Enable ignoring of receive overflow error
DRV_I2S_ReceiveErrorIgnore(myI2SHandle, true);

// Further perform the operation needed
DRV_I2S_BufferAddRead(myI2Shandle,&bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_I2SBufferEventHandler(DRV_I2S_BUFFER_EVENT event,
        DRV_I2S_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;
    size_t processedBytes;

    switch(event)
    {
        case DRV_I2S_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_I2S_BUFFER_EVENT_ERROR:
```

```
            // Error handling here.
            // We can find out how many bytes were processed in this
            // buffer before the error occurred.

            processedBytes = DRV_I2S_BufferProcessedSizeGet(bufferHandle);

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
errorIgnore	When set to 'true' enables ignoring of transmit underrun error. When set to 'false' disables ignoring of transmit underrun error.

Function

void DRV_I2S_ReceiveErrorIgnore(DRV_HANDLE handle, bool errorEnable)

DRV_I2S_TransmitErrorIgnore Function

This function enable/disable ignoring of the transmit underrun error.

Implementation: Dynamic

File

drv_i2s.h

C

```
void DRV_I2S_TransmitErrorIgnore(DRV_HANDLE handle, bool errorIgnore);
```

Returns

None

Description

A Transmit underrun error is not a critical error and zeros are transmitted until the SPIxTXB is not empty. Ignore Transmit underrun error is needed for cases when software does not care or does not need to know about underrun conditions.

Remarks

None.

Preconditions

The DRV_I2S_Initialize routine must have been called for the specified I2S driver instance.

DRV_I2S_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_HANDLE handle;
uint32_t baud;
uint32_t baud;*

// myI2SHandle is the handle returned
// by the DRV_I2S_Open function.

// Client registers an event handler with driver. This is done once

DRV_I2S_BufferEventHandlerSet(myI2SHandle, APP_I2SBufferEventHandle,
                                                    (uintptr_t)&myAppObj);
```

```
// Enable ignoring of transmit underrun error
DRV_I2S_TransmitErrorIgnore(myI2SHandle, true);

// Further perform the operation needed
DRV_I2S_BufferAddRead(myI2Shandle,&bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_I2S_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_I2SBufferEventHandler(DRV_I2S_BUFFER_EVENT event,
        DRV_I2S_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;
    size_t processedBytes;

    switch(event)
    {
        case DRV_I2S_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_I2S_BUFFER_EVENT_ERROR:

            // Error handling here.
            // We can find out how many bytes were processed in this
            // buffer before the error occurred.

            processedBytes = DRV_I2S_BufferProcessedSizeGet(bufferHandle);

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
errorIgnore	When set to 'true' enables ignoring of transmit underrun error. When set to 'false' disables ignoring of transmit underrun error.

Function

void DRV_I2S_TransmitErrorIgnore(DRV_HANDLE handle, bool errorIgnore)

e) Data Types and Constants

DRV_I2S_AUDIO_PROTOCOL_MODE Enumeration

Identifies the Audio Protocol Mode of the I2S module.

File

drv_i2s.h

C

```
typedef enum {
```

```
  DRV_I2S_AUDIO_I2S,
  DRV_I2S_AUDIO_LFET_JUSTIFIED,
  DRV_I2S_AUDIO_RIGHT_JUSTIFIED,
  DRV_I2S_AUDIO_PCM_DSP
} DRV_I2S_AUDIO_PROTOCOL_MODE;
```

Members

Members	Description
DRV_I2S_AUDIO_I2S	I2S Audio Protocol
DRV_I2S_AUDIO_LFET_JUSTIFIED	Left Justified Audio Protocol
DRV_I2S_AUDIO_RIGHT_JUSTIFIED	Right Justified Audio Protocol
DRV_I2S_AUDIO_PCM_DSP	PCM/DSP Audio Protocol

Description

I2S Audio Protocol Mode

This enumeration identifies Audio Protocol Mode of the I2S module.

Remarks

None.

DRV_I2S_BUFFER_EVENT Enumeration

Identifies the possible events that can result from a buffer add request.

File

drv_i2s.h

C

```
typedef enum {
  DRV_I2S_BUFFER_EVENT_COMPLETE,
  DRV_I2S_BUFFER_EVENT_ERROR,
  DRV_I2S_BUFFER_EVENT_ABORT
} DRV_I2S_BUFFER_EVENT;
```

Members

Members	Description
DRV_I2S_BUFFER_EVENT_COMPLETE	Data was transferred successfully.
DRV_I2S_BUFFER_EVENT_ERROR	Error while processing the request
DRV_I2S_BUFFER_EVENT_ABORT	Data transfer aborted (Applicable in DMA mode)

Description

I2S Driver Events

This enumeration identifies the possible events that can result from a buffer add request caused by the client calling either the DRV_I2S_BufferAddRead, DRV_I2S_BufferAddWrite or DRV_I2S_BufferAddWriteRead functions.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that the client registered with the driver by calling the DRV_I2S_BufferEventHandlerSet function when a buffer transfer request is completed.

DRV_I2S_BUFFER_EVENT_HANDLER Type

Pointer to a I2S Driver Buffer Event handler function

File

drv_i2s.h

C

```
typedef void (* DRV_I2S_BUFFER_EVENT_HANDLER)(DRV_I2S_BUFFER_EVENT event, DRV_I2S_BUFFER_HANDLE
bufferHandle, uintptr_t contextHandle);
```

Returns

None.

Description

I2S Driver Buffer Event Handler Function

This data type defines the required function signature for the I2S driver buffer event handling callback function. A client must register a pointer to a buffer event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive buffer related event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

If the event is DRV_I2S_BUFFER_EVENT_COMPLETE, this means that the data was transferred successfully.

If the event is DRV_I2S_BUFFER_EVENT_ERROR, this means that the data was not transferred successfully. The bufferHandle parameter contains the buffer handle of the buffer that failed. The DRV_I2S_ErrorGet function can be called to know the error. The DRV_I2S_BufferProcessedSizeGet function can be called to find out how many bytes were processed.

The bufferHandle parameter contains the buffer handle of the buffer that associated with the event.

The context parameter contains a handle to the client context, provided at the time the event handling function was registered using the DRV_I2S_BufferEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The buffer handle in bufferHandle expires after this event handler exits. In that the buffer object that was allocated is deallocated by the driver after the event handler exits.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

The DRV_I2S_BufferAddRead, DRV_I2S_BufferAddWrite and DRV_I2S_BufferAddWriteRead functions can be called in the event handler to add a buffer to the driver queue. These functions can only be called to add buffers to the driver whose event handler is running. For example, buffers cannot be added I2S2 driver in I2S1 driver event handler.

Example

```
void APP_MyBufferEventHandler( DRV_I2S_BUFFER_EVENT event,
                               DRV_I2S_BUFFER_HANDLE bufferHandle,
                               uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_I2S_BUFFER_EVENT_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_I2S_BUFFER_EVENT_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
bufferHandle	Handle identifying the buffer to which the event relates
context	Value identifying the context of the application that registered the event handling function.

DRV_I2S_BUFFER_HANDLE Type

Handle identifying a read or write buffer passed to the driver.

File

drv_i2s.h

C

```
typedef uintptr_t DRV_I2S_BUFFER_HANDLE;
```

Description

I2S Driver Buffer Handle

A buffer handle value is returned by a call to the DRV_I2S_BufferAddRead, DRV_I2S_BufferAddWrite, and DRV_I2S_BufferAddWriteRead functions. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from the "buffer add" function is returned back to the client by the "event handler callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None

DRV_I2S_CLOCK_MODE Enumeration

Identifies the various clock modes of the I2S module.

File

drv_i2s.h

C

```
typedef enum {
  DRV_I2S_CLOCK_MODE_IDLE_LOW_EDGE_RISE,
  DRV_I2S_CLOCK_MODE_IDLE_LOW_EDGE_FALL,
  DRV_I2S_CLOCK_MODE_IDLE_HIGH_EDGE_FALL,
  DRV_I2S_CLOCK_MODE_IDLE_HIGH_EDGE_RISE
} DRV_I2S_CLOCK_MODE;
```

Members

Members	Description
DRV_I2S_CLOCK_MODE_IDLE_LOW_EDGE_RISE	I2S Clock Mode 0 - Idle State Low & Sampling on Rising Edge
DRV_I2S_CLOCK_MODE_IDLE_LOW_EDGE_FALL	I2S Clock Mode 1 - Idle State Low & Sampling on Falling Edge
DRV_I2S_CLOCK_MODE_IDLE_HIGH_EDGE_FALL	I2S Clock Mode 2 - Idle State High & Sampling on Falling Edge
DRV_I2S_CLOCK_MODE_IDLE_HIGH_EDGE_RISE	I2S Clock Mode 3 - Idle State High & Sampling on Rising Edge

Description

I2S Clock Mode Selection

This enumeration identifies the supported clock modes of the I2S module.

Remarks

None.

DRV_I2S_DATA16 Structure

Defines the left and right channel data for 16-bit audio data

File

drv_i2s.h

C

```
typedef struct _DRV_I2S_DATA16 {
  int16_t leftData;
  int16_t rightData;
} DRV_I2S_DATA16;
```

Members

Members	Description
int16_t leftData;	Left channel data
int16_t rightData;	Right channel data

Description

I2S Driver Audio Data 16

Defines the left and right channel data for 16-bit audio data

Remarks

None.

DRV_I2S_DATA24 Structure

Defines the left and right channel data for 24-bit audio data

File

drv_i2s.h

C

```
typedef struct _DRV_I2S_DATA24 {
  int32_t leftData : 24;
  int32_t leftDataPad : 8;
  int32_t rightData : 24;
  int32_t rightDataPad : 8;
} DRV_I2S_DATA24;
```

Members

Members	Description
int32_t leftData : 24;	Left channel data
int32_t leftDataPad : 8;	Left channel data pad
int32_t rightData : 24;	Right channel data
int32_t rightDataPad : 8;	Right channel data pad

Description

I2S Driver Audio Data 24

Defines the left and right channel data for 24-bit audio data

Remarks

None.

DRV_I2S_DATA32 Structure

Defines the left and right channel data for 32-bit audio data

File

drv_i2s.h

C

```
typedef struct _DRV_I2S_DATA32 {
  int32_t leftData;
  int32_t rightDataPad;
} DRV_I2S_DATA32;
```

Members

Members	Description
int32_t leftData;	Left channel data
int32_t rightDataPad;	Right channel data

Description

I2S Driver Audio Data 32

Defines the left and right channel data for 32-bit audio data

Remarks

None.

DRV_I2S_ERROR Enumeration

Defines the possible errors that can occur during driver operation.

File

drv_i2s.h

C

```
typedef enum {
  DRV_I2S_ERROR_NONE,
  DRV_I2S_ERROR_RECEIVE_OVERFLOW,
  DRV_I2S_ERROR_TRANSMIT_UNDERUN,
  DRV_I2S_ERROR_FRAMING,
  DRV_I2S_ERROR_ADDRESS
} DRV_I2S_ERROR;
```

Members

Members	Description
DRV_I2S_ERROR_NONE	Data was transferred successfully.
DRV_I2S_ERROR_RECEIVE_OVERFLOW	Receive overflow error.
DRV_I2S_ERROR_TRANSMIT_UNDERUN	Transmit underrun error.
DRV_I2S_ERROR_FRAMING	Framing error.
DRV_I2S_ERROR_ADDRESS	Channel address error (Applicable in DMA mode)

Description

I2S Driver Error

This data type defines the possible errors that can occur when occur during USART driver operation. These values are returned by DRV_I2S_ErrorGet function.

Remarks

None.

DRV_I2S_INIT Structure

Defines the data required to initialize or reinitialize the I2S driver

File

drv_i2s.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SPI_MODULE_ID spiID;
  DRV_I2S_MODE usageMode;
  SPI_BAUD_RATE_CLOCK baudClock;
  uint32_t baud;
  DRV_I2S_CLOCK_MODE clockMode;
  SPI_AUDIO_COMMUNICATION_WIDTH audioCommWidth;
  SPI_AUDIO_TRANSMIT_MODE audioTransmitMode;
  SPI_INPUT_SAMPLING_PHASE inputSamplePhase;
  DRV_I2S_AUDIO_PROTOCOL_MODE protocolMode;
  INT_SOURCE txInterruptSource;
  INT_SOURCE rxInterruptSource;
  INT_SOURCE errorInterruptSource;
  uint32_t queueSizeTransmit;
  uint32_t queueSizeReceive;
  DMA_CHANNEL dmaChannelTransmit;
  DMA_CHANNEL dmaChaningChannelTransmit;
  DMA_CHANNEL dmaChannelReceive;
  DMA_CHANNEL dmaChaningChannelReceive;
  INT_SOURCE dmaInterruptTransmitSource;
  INT_SOURCE dmaInterruptChainingTransmitSource;
  INT_SOURCE dmaInterruptReceiveSource;
  INT_SOURCE dmaInterruptChainingReceiveSource;
} DRV_I2S_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization

SPI_MODULE_ID spiID;	Identifies I2S hardware module ID(PLIB-level SPI ID) For static build of the driver, this is overridden by DRV_I2S_MODULE_ID macro in system_config.h.
DRV_I2S_MODE usageMode;	Usage Mode Type
SPI_BAUD_RATE_CLOCK baudClock;	Select the clock which generates the baud rate The options available are Peripheral Clock/ Reference clock.
uint32_t baud;	Initial Baud Rate Value
DRV_I2S_CLOCK_MODE clockMode;	Clock mode
SPI_AUDIO_COMMUNICATION_WIDTH audioCommWidth;	Audio communication width
SPI_AUDIO_TRANSMIT_MODE audioTransmitMode;	Audio mono/stereo
SPI_INPUT_SAMPLING_PHASE inputSamplePhase;	Input Sample Phase Selection
DRV_I2S_AUDIO_PROTOCOL_MODE protocolMode;	Audio Protocol Mode
INT_SOURCE txInterruptSource;	Interrupt Source for Transmit Interrupt. For static build of the driver, this is overridden by the DRV_I2S_TRANSMIT_INTERRUPT_SOURCE macro in system_config.h.
INT_SOURCE rxInterruptSource;	Interrupt Source for Receive Interrupt. For static build of the driver, this is overridden by the DRV_I2S_RECEIVE_INTERRUPT_SOURCE macro in system_config.h.
INT_SOURCE errorInterruptSource;	Interrupt Source for Error Interrupt. For static build of the driver, this is overridden by the DRV_I2S_ERROR_INTERRUPT_SOURCE macro in system_config.h.
uint32_t queueSizeTransmit;	This is the transmit buffer queue size. This is the maximum number of write requests that driver will queue. For a static build of the driver, this is overridden by the DRV_I2S_TRANSMIT_QUEUE_SIZE macro in system_config.h.
uint32_t queueSizeReceive;	This is the receive buffer queue size. This is the maximum number of read requests that driver will queue. For a static build of the driver, this is overridden by the DRV_I2S_RECEIVE_QUEUE_SIZE macro in system_config.h.
DMA_CHANNEL dmaChannelTransmit;	This is the transmit DMA channel. A value of DMA_CHANNEL_NONE indicates DMA is not required for Tx. For a static build of the driver this is overridden by the DRV_I2S_TRANSMIT_DMA_CHANNEL macro in system_config.h.
DMA_CHANNEL dmaChaningChannelTransmit;	This is the transmit DMA chaining channel. This channel is needed when DMA is needed to be used channel chaining mode for Tx. Channel Chaining could be used to obtain high quality/resolution audio.
DMA_CHANNEL dmaChannelReceive;	This is the receive DMA channel. A value of DMA_CHANNEL_NONE indicates DMA is not required for Rx. For a static build of the driver this is overridden by the DRV_I2S_RECEIVE_DMA_CHANNEL macro in system_config.h.
DMA_CHANNEL dmaChaningChannelReceive;	This is the receive DMA chaining channel. This channel is needed when DMA is needed to be used channel chaining mode for Rx. Channel Chaining could be used to obtain high quality/resolution audio.
INT_SOURCE dmaInterruptTransmitSource;	This is the transmit DMA channel interrupt. This is applicable only if 'dmaChannelTransmit' has a valid channel number. This takes the interrupt source number for the corresponding DMA channel.
INT_SOURCE dmaInterruptChainingTransmitSource;	This is the transmit DMA chaining channel interrupt. This is applicable only if 'dmaChaningChannelTransmit' has a valid channel number. This takes the interrupt source number for the corresponding DMA chaining channel.
INT_SOURCE dmaInterruptReceiveSource;	This is the receive DMA channel interrupt. This is applicable only if 'dmaChannelReceive' has a valid channel number. This takes the interrupt source number for the corresponding DMA channel.
INT_SOURCE dmaInterruptChainingReceiveSource;	This is the receive DMA chaining channel interrupt. This is applicable only if 'dmaInterruptReceiveSource' has a valid channel number. This takes the interrupt source number for the corresponding DMA chaining channel.

Description

I2S Driver Initialization Data

This data type defines the data required to initialize or reinitialize the I2S driver. If the driver is built statically, some members of this data structure are statically over-ridden by static overrides in the system_config.h file.

Remarks

None.

DRV_I2S_MODE Enumeration

Identifies the usage modes of the I2S module.

File

drv_i2s.h

C

```
typedef enum {
  DRV_I2S_MODE_SLAVE,
  DRV_I2S_MODE_MASTER
} DRV_I2S_MODE;
```

Members

Members	Description
DRV_I2S_MODE_SLAVE	I2S Mode Slave
DRV_I2S_MODE_MASTER	I2S Mode Master

Description

I2S Usage Modes Enumeration

This enumeration identifies the whether the I2S module will be used as a master or slave.

Remarks

None.

DRV_I2S_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_i2s.h

C

```
#define DRV_I2S_BUFFER_HANDLE_INVALID ((DRV_I2S_BUFFER_HANDLE)(-1))
```

Description

I2S Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_I2S_BufferAddRead, DRV_I2S_BufferAddWrite and DRV_I2S_BufferAddWriteRead functions if the buffer add request was not successful.

Remarks

None

DRV_I2S_COUNT Macro

Number of valid I2S driver indices

File

drv_i2s.h

C

```
#define DRV_I2S_COUNT
```

Description

I2S Driver Module Count

This constant identifies the maximum number of I2S Driver instances that should be defined by the application. Defining more instances than this constant will waste RAM memory space.

This constant can also be used by the application to identify the number of I2S instances on this microcontroller.

Remarks

This value is part-specific.

DRV_I2S_READ_ERROR Macro

I2S Driver Read Error.

File

drv_i2s.h

C

```
#define DRV_I2S_READ_ERROR ((size_t)(-1))
```

Description

I2S Driver Read Error

This constant is returned by DRV_I2S_Read function when an error occurs.

Remarks

None.

DRV_I2S_WRITE_ERROR Macro

I2S Driver Write Error.

File

drv_i2s.h

C

```
#define DRV_I2S_WRITE_ERROR ((size_t)(-1))
```

Description

I2S Driver Write Error

This constant is returned by DRV_I2S_Write() function when an error occurs.

Remarks

None.

DRV_I2S_INDEX_0 Macro

I2S driver index definitions

File

drv_i2s.h

C

```
#define DRV_I2S_INDEX_0 0
```

Description

Driver I2S Module Index

These constants provide I2S driver index definition.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_I2S_Initialize and DRV_I2S_Open routines to identify the driver instance in use.

DRV_I2S_INDEX_1 Macro

File

drv_i2s.h

C

```
#define DRV_I2S_INDEX_1 1
```

Description

This is macro DRV_I2S_INDEX_1.

DRV_I2S_INDEX_2 Macro

File

drv_i2s.h

C

```
#define DRV_I2S_INDEX_2 2
```

Description

This is macro DRV_I2S_INDEX_2.

DRV_I2S_INDEX_3 Macro

File

drv_i2s.h

C

```
#define DRV_I2S_INDEX_3 3
```

Description

This is macro DRV_I2S_INDEX_3.

DRV_I2S_INDEX_4 Macro

File

drv_i2s.h

C

```
#define DRV_I2S_INDEX_4 4
```

Description

This is macro DRV_I2S_INDEX_4.

DRV_I2S_INDEX_5 Macro

File

drv_i2s.h

C

```
#define DRV_I2S_INDEX_5 5
```

Description

This is macro DRV_I2S_INDEX_5.

Files

Files

Name	Description
drv_i2s.h	I2S Driver Interface header file
drv_i2s_config_template.h	I2S Driver Configuration Template.

Description

drv_i2s.h

I2S Driver Interface header file

Enumerations

	Name	Description
	DRV_I2S_AUDIO_PROTOCOL_MODE	Identifies the Audio Protocol Mode of the I2S module.
	DRV_I2S_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_I2S_CLOCK_MODE	Identifies the various clock modes of the I2S module.
	DRV_I2S_ERROR	Defines the possible errors that can occur during driver operation.
	DRV_I2S_MODE	Identifies the usage modes of the I2S module.

Functions

	Name	Description
	DRV_I2S_BaudSet	This function sets the baud. **Implementation:** Dynamic
	DRV_I2S_BufferAddRead	Schedule a non-blocking driver read operation. **Implementation:** Dynamic
	DRV_I2S_BufferAddWrite	Schedule a non-blocking driver write operation. **Implementation:** Dynamic
	DRV_I2S_BufferAddWriteRead	Schedule a non-blocking driver write-read operation. **Implementation:** Dynamic
	DRV_I2S_BufferCombinedQueueSizeGet	This function returns the number of bytes queued (to be processed) in the buffer queue. **Implementation:** Dynamic
	DRV_I2S_BufferEventHandlerSet	This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. **Implementation:** Dynamic
	DRV_I2S_BufferProcessedSizeGet	This function returns number of bytes that have been processed for the specified buffer. **Implementation:** Dynamic
	DRV_I2S_BufferQueueFlush	This function flushes off the buffers associated with the client object. **Implementation:** Dynamic
	DRV_I2S_Close	Closes an opened-instance of the I2S driver. **Implementation:** Dynamic
	DRV_I2S_Deinitialize	Deinitializes the specified instance of the I2S driver module. **Implementation:** Dynamic
	DRV_I2S_ErrorGet	This function returns the error(if any) associated with the last client request. **Implementation:** Dynamic
	DRV_I2S_Initialize	Initializes hardware and data for the instance of the I2S module. **Implementation:** Dynamic
	DRV_I2S_Open	Opens the specified I2S driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_I2S_Read	Reads data from the I2S. **Implementation:** Dynamic
	DRV_I2S_ReceiveErrorIgnore	This function enable/disable ignoring of the receive overflow error. **Implementation:** Dynamic
	DRV_I2S_Status	Gets the current status of the I2S driver module. **Implementation:** Dynamic
	DRV_I2S_Tasks	Maintains the driver's receive state machine and implements its ISR. **Implementation:** Dynamic
	DRV_I2S_TasksError	Maintains the driver's error state machine and implements its ISR. **Implementation:** Dynamic
	DRV_I2S_TransmitErrorIgnore	This function enable/disable ignoring of the transmit underrun error. **Implementation:** Dynamic
	DRV_I2S_Write	Writes data to the I2S. **Implementation:** Dynamic

Macros

	Name	Description
	DRV_I2S_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_I2S_COUNT	Number of valid I2S driver indices
	DRV_I2S_INDEX_0	I2S driver index definitions

	DRV_I2S_INDEX_1	This is macro DRV_I2S_INDEX_1.
	DRV_I2S_INDEX_2	This is macro DRV_I2S_INDEX_2.
	DRV_I2S_INDEX_3	This is macro DRV_I2S_INDEX_3.
	DRV_I2S_INDEX_4	This is macro DRV_I2S_INDEX_4.
	DRV_I2S_INDEX_5	This is macro DRV_I2S_INDEX_5.
	DRV_I2S_READ_ERROR	I2S Driver Read Error.
	DRV_I2S_WRITE_ERROR	I2S Driver Write Error.

Structures

	Name	Description
	_DRV_I2S_DATA16	Defines the left and right channel data for 16-bit audio data
	_DRV_I2S_DATA24	Defines the left and right channel data for 24-bit audio data
	_DRV_I2S_DATA32	Defines the left and right channel data for 32-bit audio data
	DRV_I2S_DATA16	Defines the left and right channel data for 16-bit audio data
	DRV_I2S_DATA24	Defines the left and right channel data for 24-bit audio data
	DRV_I2S_DATA32	Defines the left and right channel data for 32-bit audio data
	DRV_I2S_INIT	Defines the data required to initialize or reinitialize the I2S driver

Types

	Name	Description
	DRV_I2S_BUFFER_EVENT_HANDLER	Pointer to a I2S Driver Buffer Event handler function
	DRV_I2S_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.

Description

I2S Driver Interface

The I2S device driver provides a simple interface to manage the I2S module on Microchip microcontrollers. This file provides the interface definition for the I2S driver.

File Name

drv_i2s.h

Company

Microchip Technology Inc.

drv_i2s_config_template.h

I2S Driver Configuration Template.

Macros

	Name	Description
	DRV_I2S_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_I2S_INDEX	I2S Static Index selection
	DRV_I2S_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_I2S_INTERRUPT_MODE	Macro controls interrupt based operation of the driver
	DRV_I2S_INTERRUPT_SOURCE_ERROR	Defines the interrupt source for the error interrupt
	DRV_I2S_INTERRUPT_SOURCE_RECEIVE	Macro to define the Receive interrupt source in case of static driver
	DRV_I2S_INTERRUPT_SOURCE_TRANSMIT	Macro to define the Transmit interrupt source in case of static driver
	DRV_I2S_PERIPHERAL_ID	Configures the I2S PLIB Module ID
	DRV_I2S_QUEUE_DEPTH_COMBINED	Number of entries of all queues in all instances of the driver.
	DRV_I2S_RECEIVE_DMA_CHAINING_CHANNEL	Macro to defines the I2S Driver Receive DMA Chaining Channel in case of static driver
	DRV_I2S_RECEIVE_DMA_CHANNEL	Macro to defines the I2S Driver Receive DMA Channel in case of static driver
	DRV_I2S_STOP_IN_IDLE	Identifies whether the driver should stop operations in stop in Idle mode.
	DRV_I2S_TRANSMIT_DMA_CHANNEL	Macro to defines the I2S Driver Transmit DMA Channel in case of static driver

Description

I2S Driver Configuration Template

These file provides the list of all the configurations that can be used with the driver. This file should not be included in the driver.

Input Capture Driver Library

This section describes the Input Capture Driver Library.

Introduction

The Input Capture Static Driver provides a high-level interface to manage the Input Capture module on the Microchip family of microcontrollers.

Description

Through the MHC, this driver provides APIs for the following:

- Initializing the module
- Starting/Stopping of the capture
- 16/32-bit data reads
- Buffer empty status

Library Interface

Functions

	Name	Description
	DRV_IC_Initialize	Initializes the Input Capture instance for the specified driver index. **Implementation:** Static
	DRV_IC_BufferIsEmpty	Returns the Input Capture instance buffer empty status for the specified driver index. **Implementation:** Static
	DRV_IC_Capture16BitDataRead	Reads the 16-bit Input Capture for the specified driver index. **Implementation:** Static
	DRV_IC_Capture32BitDataRead	Reads the 32-bit Input Capture for the specified driver index. **Implementation:** Static
	DRV_IC_Start	Starts the Input Capture instance for the specified driver index. **Implementation:** Static
	DRV_IC_Stop	Stops the Input Capture instance for the specified driver index. **Implementation:** Static

Description

This section describes the Application Programming Interface (API) functions of the Input Capture Driver Library.

Functions

DRV_IC_Initialize Function

Initializes the Input Capture instance for the specified driver index.

Implementation: Static

File

help_drv_ic.h

C

```
void DRV_IC_Initialize();
```

Returns

None.

Description

This routine initializes the Input Capture driver instance for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters. The driver instance index is independent of the Input Capture module ID. For example, driver instance 0 can be assigned to Input Capture 2.

Remarks

This routine must be called before any other Input Capture routine is called. This routine should only be called once during system initialization.

Preconditions

None.

Function

void DRV_IC_Initialize(void)

DRV_IC_BufferIsEmpty Function

Returns the Input Capture instance buffer empty status for the specified driver index.

Implementation: Static

File

help_drv_ic.h

C

```
bool DRV_IC_BufferIsEmpty();
```

Returns

Boolean

- 1 - Buffer is empty
- 0 - Buffer is not empty

Description

Returns the Input Capture instance buffer empty status for the specified driver index. The function should be called to determine whether or not the IC buffer has data.

Remarks

None.

Preconditions

DRV_IC_Initialize has been called.

Function

bool DRV_IC_BufferIsEmpty(void)

DRV_IC_Capture16BitDataRead Function

Reads the 16-bit Input Capture for the specified driver index.

Implementation: Static

File

help_drv_ic.h

C

```
uint16_t DRV_IC_Capture16BitDataRead();
```

Returns

uint16_t value of the data read from the Input Capture.

Description

This routine reads the 16-bit data for the specified driver index.

Remarks

None.

Preconditions

DRV_IC_Initialize has been called.

Function

uint16_t DRV_IC_Capture16BitDataRead(void)

DRV_IC_Capture32BitDataRead Function

Reads the 32-bit Input Capture for the specified driver index.

Implementation: Static

File

help_drv_ic.h

C

```
uint32_t DRV_IC_Capture32BitDataRead();
```

Returns

uint32_t value of the data read from the Input Capture.

Description

This routine reads the 32-bit data for the specified driver index

Remarks

None.

Preconditions

DRV_IC_Initialize has been called.

Function

uint32_t DRV_IC_Capture32BitDataRead(void)

DRV_IC_Start Function

Starts the Input Capture instance for the specified driver index.

Implementation: Static

File

help_drv_ic.h

C

```
void DRV_IC_Start();
```

Returns

None.

Description

This routine starts the Input Capture driver for the specified driver index, starting an input capture.

Remarks

None.

Preconditions

DRV_IC_Initialize has been called.

Function

void DRV_IC_Start(void)

DRV_IC_Stop Function

Stops the Input Capture instance for the specified driver index.

Implementation: Static

File

help_drv_ic.h

C

```
void DRV_IC_Stop();
```

Returns

None.

Description

This routine stops the Input Capture driver for the specified driver index, stopping an input capture.

Remarks

None.

Preconditions

DRV_IC_Initialize has been called.

Function

void DRV_IC_Stop(void)

NVM Driver Library

This section describes the Non-volatile Memory (NVM) Driver Library.

Migrating Applications from v1.03.01 and Earlier Releases of MPLAB Harmony

Provides information on migrating applications from v1.03.01 and earlier releases of MPLAB Harmony to release v1.04 and later.

Description

The NVM Driver Library APIs have changed beginning with the v1.04 release of MPLAB Harmony. Applications that were developed using the earlier version of the MPLAB Harmony NVM Driver (v1.03.01 and earlier) will not build unless the application calls to NVM Driver are updated. While the MHC utility provides an option to continue creating applications using the v1.03.01 and earlier NVM Driver API, it is recommended that existing applications migrate to the latest API to take advantage of the latest features in the NVM Driver. The following sections describe the API changes and other considerations while updating the application for changes in the NVM Driver.

All NVM Driver Demonstration Applications and NVM Driver related documentation have been updated to the latest (new) API. The following sections do not discuss changes in the NVM Driver configuration related code. This code is updated automatically when the project is regenerated using the MHC utility. Only the application related API changes are discussed.

The following table shows the beta API and corresponding v1.04 and Later MPLAB Harmony NVM Driver API.

v1.03.01 and Earlier NVM Driver API	v1.04 and Later NVM Driver API	v1.04 and Later API Notes
DRV_NVM_Initialize	DRV_NVM_Initialize	The init structure now has additional members that allow the NVM media address and geometry to be specified.
DRV_NVM_Deinitialize	DRV_NVM_Deinitialize	No change.
DRV_NVM_Status	DRV_NVM_Status	No change.
DRV_NVM_Open	DRV_NVM_Open	No change.
DRV_NVM_Close	DRV_NVM_Close	No change.
DRV_NVM_Read	DRV_NVM_Read	Parameters have changed: • Returns the command handle associated with the read operation as an output parameter • Data is now read in terms of blocks. The read block size is specified in the NVM Geometry.

DRV_NVM_Write	DRV_NVM_Write	Parameters have changed: • Returns the command handle associated with the write operation as an output parameter • Data is now written in terms of blocks. The write block size is specified in the NVM Geometry.
DRV_NVM_Erase	DRV_NVM_Erase	Parameters have changed: • Returns the command handle associated with the erase operation as an output parameter • NVM Flash is erased in terms of blocks. The erase block size is specified in the NVM Geometry.
DRV_NVM_EraseWrite	DRV_NVM_EraseWrite	Parameters have changed: • Returns the command handle associated with the Erase/Write operation as an output parameter. • Data is now written in terms of blocks. The write block size is specified in the NVM Geometry.
DRV_NVM_BlockEventHandlerSet	DRV_NVM_EventHandlerSet	Function name and parameter type have changed.
DRV_NVM_ClientStatus	Not Available	This API is no longer available.
DRV_NVM_BufferStatus	DRV_NVM_CommandStatus	The DRV_NVM_Read, DRV_NVM_Write, DRV_NVM_Erase, and DRV_NVM_EraseWrite functions now return a command handle associated with the operation. The status of the operation can be checked by passing the command handle to this function.
Not Available	DRV_NVM_GeometryGet	This API gives the following geometrical details of the NVM Flash: • Media Property • Number of Read/Write/Erase regions in the flash device • Number of Blocks and their size in each region of the device
Not Available	DRV_NVM_IsAttached	Returns the physical attach status of the NVM Flash.
Not Available	DRV_NVM_IsWriteProtected	Returns the write protect status of the NVM Flash.
Not Available	DRV_NVM_AddressGet	Returns the NVM Media Start address.

NVM Driver Initialization

DRV_NVM_INIT now takes the following two additional initialization parameters:

- mediaStartAddress - NVM Media Start address. The driver treats this address as the start address for read, write and erase operations.
- nvmMediaGeometry - Indicates the layout of the media in terms of read, write and erase regions.

The following code examples show how the driver initialization was performed with 1.03 APIs and how it is performed with the 1.04 APIs:

Example 1: v1.03 and Earlier Code

```
const DRV_NVM_INIT drvNvmInit =
{
    .moduleInit.sys.powerState = SYS_MODULE_POWER_RUN_FULL,
    .nvmID = NVM_ID_0,
    .interruptSource = INT_SOURCE_FLASH_CONTROL,
};

void SYS_Initialize (void *data)
{
.
.
    // Initialize NVM Driver Layer
    sysObj.drvNvm = DRV_NVM_Initialize(DRV_NVM_INDEX_0, (SYS_MODULE_INIT *)&drvNvmInit);
.
}
```

Example: v1.04 and Later Code

```
/* NVM Geometry structure */
SYS_FS_MEDIA_REGION_GEOMETRY NVMGeometryTable[3] =
{
    {
        .blockSize = 1,
        .numBlocks = (DRV_NVM_MEDIA_SIZE * 1024),
    },
    {
       .blockSize = DRV_NVM_ROW_SIZE,
```

```
        .numBlocks = ((DRV_NVM_MEDIA_SIZE * 1024)/DRV_NVM_ROW_SIZE)
    },
    {
        .blockSize = DRV_NVM_PAGE_SIZE,
        .numBlocks = ((DRV_NVM_MEDIA_SIZE * 1024)/DRV_NVM_PAGE_SIZE)
    }
};

const SYS_FS_MEDIA_GEOMETRY NVMGeometry =
{
    .mediaProperty = SYS_FS_MEDIA_WRITE_IS_BLOCKING,
    .numReadRegions = 1,
    .numWriteRegions = 1,
    .numEraseRegions = 1,
    .geometryTable = (SYS_FS_MEDIA_REGION_GEOMETRY *)&NVMGeometryTable
};

const DRV_NVM_INIT drvNvmInit =
{
    .moduleInit.sys.powerState = SYS_MODULE_POWER_RUN_FULL,
    .nvmID = NVM_ID_0,
    .interruptSource = INT_SOURCE_FLASH_CONTROL,
    .mediaStartAddress = 0x9D010000,
    .nvmMediaGeometry = (SYS_FS_MEDIA_GEOMETRY *)&NVMGeometry
};

void SYS_Initialize (void *data)
{
.
.
    // Initialize NVM Driver Layer
    sysObj.drvNvm = DRV_NVM_Initialize(DRV_NVM_INDEX_0, (SYS_MODULE_INIT *)&drvNvmInit);
.
.
}
```

Addressing in NVM Driver

The v1.03.01 and earlier Read, Write, Erase and EraseWrite APIs took the actual address on which the operation was to be performed. The unit of access was bytes.

In v1.04 the addressing mechanism has been modified. The media start address is set in the DRV_NVM_Initialize. This address is used as the base address for the Read, Write, Erase and EraseWrite APIs. The unit of access is in terms of blocks. The NVM Geometry specifies the media layout in terms of:

- Number of erase, read and write regions
- Block size for erase, read and write operations.
- Number of blocks in erase, read and write regions

For example, in PIC32MZ family devices:

- Read block size = 1 byte
- Write block size = ROW Size = 2048 bytes
- Erase block size = PAGE Size = 16384 bytes

If the size of media is 32 KB then the following table illustrates the address range and number of blocks for the read, write and erase regions:

Region Type	Block Size	Number of blocks	Address range
Read Region	1 Byte	32 KB / Read block size = 32768	0–32767
Write Region	2048 Bytes	32 KB / Write block size = 16 blocks	0–15
Erase Region	16384 Bytes	32 KB / Erase block size = 2 blocks	0–1

Erasing Data on NVM Flash

The NVM Geometry indicates the number of erase blocks and the size of a single erase block. The Erase API takes in the erase block start address and the number of blocks to be erased. The following code examples show how to perform the erase operation in v1.03.01 and earlier and how to perform it with v1.04 and later.

Example: v1.03.01 and Earlier Code

```
DRV_HANDLE      myNVMHandle;    // Returned from DRV_NVM_Open
DRV_NVM_BUFFER_HANDLE bufferHandle;
```

```
bufferHandle = DRV_NVM_Erase(myNVMHandle, (uint8_t*)NVM_BASE_ADDRESS, DRV_NVM_PAGE_SIZE);
if(DRV_NVM_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Do error handling here
}

// Wait until the buffer completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
while(DRV_NVM_BufferStatus(bufferHandle) != DRV_NVM_BUFFER_COMPLETED);
```

Example: v1.04 and Later Code

```
/* This code example shows how to erase NVM Media data */
DRV_HANDLE nvmHandle;
DRV_NVM_COMMAND_HANDLE nvmCommandHandle;
DRV_NVM_COMMAND_STATUS commandStatus;
uint32_t blockAddress;
uint32_t nBlocks;

blockAddress = 0;
nBlocks = 1;

DRV_NVM_Erase(nvmHandle, &nvmCommandHandle, blockAddress, nBlocks);
if(DRV_NVM_COMMAND_HANDLE_INVALID == nvmCommandHandle)
{
    /* Failed to queue the erase request. Handle the error. */
}
// Wait until the command completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.

commandStatus = DRV_NVM_CommandStatus(nvmHandle, nvmCommandHandle);
if(DRV_NVM_COMMAND_COMPLETED == commandStatus)
{
    /* Erase completed */
}
else if (DRV_NVM_COMMAND_ERROR_UNKNOWN == commandStatus)
{
    /* Erase Failed */
}
```

Writing Data to NVM Flash

The NVM Geometry indicates the number of write blocks and the size of a single write block. The Write API takes in the write block start address and the number of blocks to be written. The following code examples show how the write operation was performed in v1.03.01 and earlier and how to perform it with v1.04 and later APIs:

Example : v1.03.01 and Earlier Code

```
DRV_HANDLE myNVMHandle;    // Returned from DRV_NVM_Open
char       myBuffer[2 * DRV_NVM_ROW_SIZE];

// Destination address should be row aligned.
char       *destAddress = (char *)NVM_BASE_ADDRESS_TO_WRITE;

unsigned int    count = 2 * MY_BUFFER_SIZE;
DRV_NVM_BUFFER_HANDLE bufferHandle;

bufferHandle  = DRV_NVM_Write(myNVMHandle, destAddress, &myBuffer[total], count);
if(DRV_NVM_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Do error handling here
}

// Wait until the buffer completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
while(DRV_NVM_BufferStatus(bufferHandle) != DRV_NVM_BUFFER_COMPLETED);
```

Example: v1.04 and Later Code

```
/* This code example shows how to write data to NVM Media */
DRV_HANDLE nvmHandle;
DRV_NVM_COMMAND_HANDLE nvmCommandHandle;
DRV_NVM_COMMAND_STATUS commandStatus;
uint8_t writeBuf[DRV_NVM_ROW_SIZE];
uint32_t blockAddress;
uint32_t nBlocks;

blockAddress = 0;
nBlocks = 1;

DRV_NVM_Write(nvmHandle, &nvmCommandHandle, (uint8_t *)writeBuf, blockAddress, nBlocks);
if(DRV_NVM_COMMAND_HANDLE_INVALID == nvmCommandHandle)
{
    /* Failed to queue the write request. Handle the error. */
}
// Wait until the command completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.

commandStatus = DRV_NVM_CommandStatus(nvmHandle, nvmCommandHandle);
if(DRV_NVM_COMMAND_COMPLETED == commandStatus)
{
    /* Write completed */
}
else if (DRV_NVM_COMMAND_ERROR_UNKNOWN == commandStatus)
{
    /* Write Failed */
}
```

Reading Data from NVM Flash

The NVM Geometry indicates the number of read blocks and the size of a single read block. The Read API takes in the read block start address and the number of blocks to be read. The following code examples show how the read operation was performed with v1.03.01 and earlier APIs and how to perform the same with v1.04 and later APIs:

Example: v1.03.01 and Earlier Code

```
DRV_HANDLE      myNVMHandle;    // Returned from DRV_NVM_Open
char            myBuffer[MY_BUFFER_SIZE];
char            *srcAddress = NVM_BASE_ADDRESS_TO_READ_FROM;
unsigned int    count = MY_BUFFER_SIZE;
DRV_NVM_BUFFER_HANDLE bufferHandle;

bufferHandle  = DRV_NVM_Read(myNVMHandle, &myBuffer[total], srcAddress, count);
if(DRV_NVM_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Do error handling here
}

// Wait until the buffer completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
while(DRV_NVM_BufferStatus(bufferHandle) != DRV_NVM_BUFFER_COMPLETED);
```

Example: v1.04 and Later Code

```
/* This code example shows how to read data from NVM Media */
DRV_HANDLE nvmHandle;
DRV_NVM_COMMAND_HANDLE nvmCommandHandle;
DRV_NVM_COMMAND_STATUS commandStatus;
uint8_t readBuf[DRV_NVM_ROW_SIZE];
uint32_t blockAddress;
uint32_t nBlocks;

blockAddress = 0;
nBlocks = DRV_NVM_ROW_SIZE;

DRV_NVM_Read(nvmHandle, &nvmCommandHandle, (uint8_t *)readBuf, blockAddress, nBlocks);
if(DRV_NVM_COMMAND_HANDLE_INVALID == nvmCommandHandle)
```

```
{
    /* Failed to queue the read request. Handle the error. */
}
// Wait until the command completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.

commandStatus = DRV_NVM_CommandStatus(nvmHandle, nvmCommandHandle);
if(DRV_NVM_COMMAND_COMPLETED == commandStatus)
{
    /* Read completed */
}
else if (DRV_NVM_COMMAND_ERROR_UNKNOWN == commandStatus)
{
    /* Read Failed */
}
```

Introduction

The NVM Driver library provides APIs that can be used to interface with the NVM module (controller plus memory) for memory needs.

Description

The NVM Driver provides APIs for block access of the physical media through NVM Driver APIs. As shown in the NVM Driver Abstraction Model, an application or a client can access the physical media using multiple methods, which eventually are facilitated through the NVM Driver.

Memory Devices for PIC Microcontrollers

Depending on the device, there are two primary forms of on-chip memory: Programmable Flash memory and data EEPROM memory. The access mechanism for both of these types are varied.

Flash Program Memory

The Flash program memory is readable, writeable, and erasable during normal operation over the entire operating voltage range.

A read from program memory is executed at one byte/word at a time depending on the width of the data bus.

A write to the program memory is executed in either blocks of specific sizes or a single word depending on the type of processor used.

An erase is performed in blocks. A bulk erase may be performed from user code depending on the type of processor supporting the operation.

Writing or erasing program memory will cease instruction fetches until the operation is complete, restricting memory access, and therefore preventing code execution. This is controlled by an internal programming timer.

There are three processor dependant methods for program memory modification:

- Run-Time Self-Programming (RTSP)
- In-Circuit Serial Programming (ICSP)
- EJTAG programming

This section describes the RTSP techniques.

Using the Library

This topic describes the basic architecture of the NVM Driver Library and provides information and examples on its use.

Description

Interface Header Files: `drv_nvm.h`

The interface to the NVM Driver Library is defined in the `drv_nvm.h` header file. Any C language source (`.c`) file that uses the NVM Driver library should include `drv_nvm.h`.

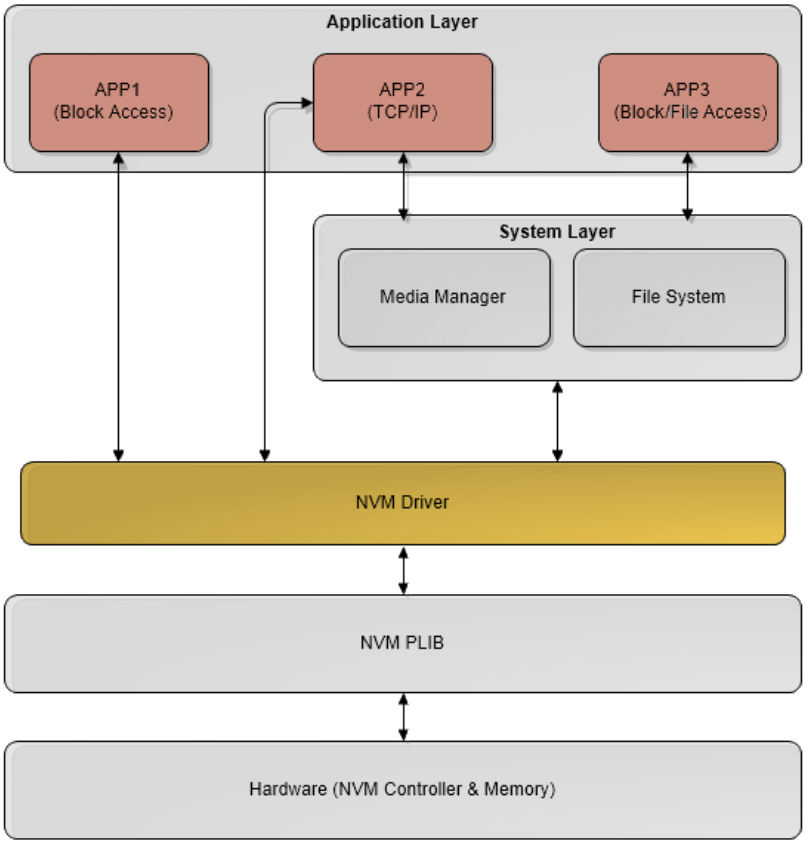
Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the NVM module on the Microchip family of microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

NVM Driver Abstraction Model



Abstraction Model

As shown in the previous diagram, the NVM Driver sits between the Peripheral Libraries and the application or system layer to facilitate block and file access to the NVM media (currently Flash). The application scenarios show how different layers can be accessed by different applications with certain needs. For example, APP1 can access the NVM Driver directly to erase, write, or read NVM with direct addressing. APP2, in this case TCP/IP, can bypass the system layer and access the NVM Driver layer if necessary to fulfill its robust data needs. Finally, APP3 accesses the NVM Driver through the File System Layer using block access methods, so the application does not need to keep track of the physical layout of the media.

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the NVM module.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Client Core Functions	Provides open, close, status and other setup functions.
Client Block Transfer Functions	Provides buffered data operation functions available in the core configuration.
Miscellaneous Functions	Provides driver miscellaneous functions related to versions and others.

How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality
- Media Functionality

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the modes supported for your device.

NVM Driver Initialization

This section provides information for system initialization and reinitialization.

Description

The system performs the initialization and the reinitialization of the device driver with settings that affect only the instance of the device that is being initialized or reinitialized. During system initialization each instance of the NVM module would be initialized with the following configuration settings (either passed dynamically at run time using DRV_NVM_INIT or by using initialization overrides) that are supported by the specific NVM device hardware:

- Device requested power state: One of the system module power states. For specific details please refer to **Data Types and Constants** in the Library Interface section.
- The actual peripheral ID enumerated as the PLIB level module ID (e.g., NVM_ID_0)
- Defining the respective interrupt sources
- NVM Media Start Address
- NVM Media Geometry

The DRV_NVM_Initialize function returns an object handle of the type SYS_MODULE_OBJ. After this, the object handle returned by the initialize interface would be used by the other system interfaces, such as DRV_NVM_Deinitialize, DRV_NVM_Status, and DRV_NVM_Tasks.

Note: The system initialization and the reinitialization settings, only affect the instance of the peripheral that is being initialized or reinitialized.

The SYS_MODULE_INDEX is passed to the DRV_NVM_Initialize function to determine which type of memory is selected using:
DRV_NVM_INDEX_0 - FLASH

Example:

```
const DRV_NVM_INIT drvNvmInit =
{
    .moduleInit.sys.powerState = SYS_MODULE_POWER_RUN_FULL,
    .nvmID = NVM_ID_0,
    .interruptSource = INT_SOURCE_FLASH_CONTROL,
    .mediaStartAddress = 0x9D010000,
    .nvmMediaGeometry = (SYS_FS_MEDIA_GEOMETRY *)&NVMGeometry
};
void SYS_Initialize (void *data)
{
.
.
.

   // Initialize NVM Driver Layer
     sysObj.drvNvm = DRV_NVM_Initialize(DRV_NVM_INDEX_0, (SYS_MODULE_INIT *)&drvNvmInit);
.
.
.
}
```

Tasks Routine

The system will call DRV_NVM_Tasks, from system task service (in a polled environment) or DRV_NVM_Tasks will be called from the Interrupt Service Routine (ISR) of the NVM.

Client Access Operation

This section provides information for general client operation.

Description

General Client Operation

For the application to start using an instance of the module, it must call the DRV_NVM_Open function. This provides the configuration required to open the NVM instance for operation. If the driver is deinitialized using the function DRV_NVM_Deinitialize, the application must call the DRV_NVM_Open function again to set up the instance of the NVM.

For the various options available for I/O INTENT please refer to **Data Types and Constants** in the Library Interface section.

Example:

```
DRV_HANDLE handle;
```

```
handle = DRV_NVM_Open(DRV_NVM_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Client Block Data Operation

This topic provides information on client block data operation.

Description

The NVM Driver provides a block interface to access the NVM media. The interface provides functionality to read, write, erase, and erase-write the NVM media. These interface functions depend on the block sizes and boundaries of the individual devices. The interfaces are responsible for keeping this information transparent from the application.

Erasing Data on the NVM:

The following steps outline the sequence for erasing data on the NVM media:

1. The system should have completed necessary initialization and DRV_NVM_Tasks should either be running in a polled environment, or in an interrupt environment.
2. The driver should have been opened with the necessary intent.
3. Provide the block start address and the number of blocks to be erased and begin the erase process using the DRV_NVM_Erase.
4. The client can check the state of the erase request by invoking the DRV_NVM_CommandStatus and passing the command handle returned by the erase request.
5. The client will be able to close itself by calling the DRV_NVM_Close.

Example:

```
// This code shows how to erase NVM Media data
DRV_HANDLE             nvmHandle;
DRV_NVM_COMMAND_HANDLE nvmCommandHandle;

DRV_NVM_COMMAND_STATUS commandStatus;

uint32_t blockAddress;
uint32_t nBlocks;

blockAddress = 0;
nBlocks = 1;

DRV_NVM_Erase(nvmHandle, &nvmCommandHandle, blockAddress, nBlocks);

if(DRV_NVM_COMMAND_HANDLE_INVALID == nvmCommandHandle)
{
    /* Failed to queue the erase request. Handle the error. */
}

// Wait until the command completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
commandStatus = DRV_NVM_CommandStatus(nvmHandle, nvmCommandHandle);
if(DRV_NVM_COMMAND_COMPLETED == commandStatus)
{
    /* Erase completed */
}
else if (DRV_NVM_COMMAND_ERROR_UNKNOWN == commandStatus)
{
    /* Erase Failed */
}
```

Writing Data to the NVM:

The following steps outline the sequence to be followed for writing data to the NVM Media:

1. The system should have completed necessary initialization and DRV_NVM_Tasks should either be running in a polled environment, or in an interrupt environment.
2. The driver should have been opened with the necessary intent.
3. The client should ensure that blocks of addresses to which write is being performed should be in the erased state.
4. Provide the data to be written, block start address and the number of blocks to be written and begin write using the DRV_NVM_Write.

5. The client can check the state of the write request by invoking the DRV_NVM_CommandStatus and passing the command handle returned by the write request.
6. The client will be able to close itself by calling the DRV_NVM_Close.

Example:

```
// This code shows how to write data to NVM Media
DRV_HANDLE              nvmHandle;
DRV_NVM_COMMAND_HANDLE nvmCommandHandle;

DRV_NVM_COMMAND_STATUS commandStatus;

uint8_t writeBuf[DRV_NVM_ROW_SIZE];
uint32_t blockAddress;
uint32_t nBlocks;

blockAddress = 0;
nBlocks = 1;

DRV_NVM_Write(nvmHandle, &nvmCommandHandle, (uint8_t *)writeBuf, blockAddress, nBlocks);

if(DRV_NVM_COMMAND_HANDLE_INVALID == nvmCommandHandle)
{
    /* Failed to queue the write request. Handle the error. */
}

// Wait until the command completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
commandStatus = DRV_NVM_CommandStatus(nvmHandle, nvmCommandHandle);
if(DRV_NVM_COMMAND_COMPLETED == commandStatus)
{
    /* Write completed */
}
else if (DRV_NVM_COMMAND_ERROR_UNKNOWN == commandStatus)
{
    /* Write Failed */
}
```

Reading Data from the NVM:

The following steps outline the sequence to be followed for reading data from the NVM Media:

1. The system should have completed necessary initialization and DRV_NVM_Tasks should either be running in a polled environment, or in an interrupt environment.
2. The driver should have been opened with the necessary intent.
3. Provide the target buffer, block start address and the number of blocks to be read and begin reading using the DRV_NVM_Read.
4. The client can check the state of the read request by invoking the DRV_NVM_CommandStatus and passing the command handle returned by the read request.
5. The client will be able to close itself by calling the DRV_NVM_Close.

Example:

```
// This code shows how to read data from NVM Media
DRV_HANDLE              nvmHandle;
DRV_NVM_COMMAND_HANDLE nvmCommandHandle;

DRV_NVM_COMMAND_STATUS commandStatus;

uint8_t readBuf[DRV_NVM_ROW_SIZE];
uint32_t blockAddress;
uint32_t nBlocks;

blockAddress = 0;
nBlocks = DRV_NVM_ROW_SIZE;

DRV_NVM_Read(nvmHandle, &nvmCommandHandle, (uint8_t *)readBuf, blockAddress, nBlocks);

if(DRV_NVM_COMMAND_HANDLE_INVALID == nvmCommandHandle)
{
    /* Failed to queue the read request. Handle the error. */
}
```

```
// Wait until the command completes. This should not
// be a while loop if a part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.

commandStatus = DRV_NVM_CommandStatus(nvmHandle, nvmCommandHandle);
if(DRV_NVM_COMMAND_COMPLETED == commandStatus)
{
    /* Read completed */
}
else if (DRV_NVM_COMMAND_ERROR_UNKNOWN == commandStatus)
{
    /* Read Failed */
}
```

Configuring the Library

Macros

	Name	Description
	DRV_NVM_BUFFER_OBJECT_NUMBER	Selects the maximum number of buffer objects
	DRV_NVM_CLIENTS_NUMBER	Selects the maximum number of clients
	DRV_NVM_INSTANCES_NUMBER	Selects the maximum number of Driver instances that can be supported by the dynamic driver.
	DRV_NVM_INTERRUPT_MODE	Macro specifies operation of the driver to be in the interrupt mode or polled mode
	DRV_NVM_ROW_SIZE	Specifies the NVM Driver Program Row Size in bytes.
	DRV_NVM_ERASE_WRITE_ENABLE	Enables support for NVM Driver Erase Write Feature.
	DRV_NVM_PAGE_SIZE	Specifies the NVM Driver Program Page Size in bytes.
	DRV_NVM_DISABLE_ERROR_CHECK	Disables the error checks in the driver.
	DRV_NVM_MEDIA_SIZE	Specifies the NVM Media size.
	DRV_NVM_MEDIA_START_ADDRESS	Specifies the NVM Media start address.
	DRV_NVM_SYS_FS_REGISTER	Register to use with the File system

Description

The configuration of the NVM Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the NVM Driver. Based on the selections made, the NVM Driver may support the selected features. These configuration settings will apply to all instances of the NVM Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_NVM_BUFFER_OBJECT_NUMBER Macro

Selects the maximum number of buffer objects

File

drv_nvm_config_template.h

C

```
#define DRV_NVM_BUFFER_OBJECT_NUMBER 5
```

Description

NVM Driver maximum number of buffer objects

This definition selects the maximum number of buffer objects. This indirectly also specifies the queue depth. The NVM Driver can queue up DRV_NVM_BUFFER_OBJECT_NUMBER of read/write/erase requests before return a DRV_NVM_BUFFER_HANDLE_INVALID due to the queue being full. Buffer objects are shared by all instances of the driver. Increasing this number increases the RAM requirement of the driver.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_NVM_CLIENTS_NUMBER Macro

Selects the maximum number of clients

File

drv_nvm_config_template.h

C

```
#define DRV_NVM_CLIENTS_NUMBER 1
```

Description

NVM maximum number of clients

This definition selects the maximum number of clients that the NVM driver can supported at run time. This constant defines the total number of NVM driver clients that will be available to all instances of the NVM driver.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_NVM_INSTANCES_NUMBER Macro

Selects the maximum number of Driver instances that can be supported by the dynamic driver.

File

drv_nvm_config_template.h

C

```
#define DRV_NVM_INSTANCES_NUMBER 1
```

Description

NVM Driver instance configuration

This definition selects the maximum number of Driver instances that can be supported by the dynamic driver. In case of this driver, multiple instances of the driver could use the same hardware instance.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_NVM_INTERRUPT_MODE Macro

Macro specifies operation of the driver to be in the interrupt mode or polled mode

File

drv_nvm_config_template.h

C

```
#define DRV_NVM_INTERRUPT_MODE true
```

Description

NVM interrupt and polled mode operation control

This macro specifies operation of the driver to be in the interrupt mode or polled mode

- true - Select if interrupt mode of NVM operation is desired
- false - Select if polling mode of NVM operation is desired

Not defining this option to true or false will result in build error.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_NVM_ROW_SIZE Macro

Specifies the NVM Driver Program Row Size in bytes.

File

drv_nvm.h

C

```
#define DRV_NVM_ROW_SIZE (NVM_ROW_SIZE)
```

Description

NVM Driver Program Row Size.

This definition specifies the NVM Driver Program Row Size in bytes. This parameter is device specific and is obtained from the device specific processor header file. The Program Row Size is the minimum block size that can be programmed in one program operation.

Remarks

None

DRV_NVM_ERASE_WRITE_ENABLE Macro

Enables support for NVM Driver Erase Write Feature.

File

drv_nvm_config_template.h

C

```
#define DRV_NVM_ERASE_WRITE_ENABLE
```

Description

NVM Driver Erase Write Feature Enable

Specifying this macro enable row erase write feature. If this macro is specified, the drv_nvm_erasewrite.c file should be added in the project. Support for DRV_NVM_EraseWrite() function then gets enabled.

Remarks

This macro is optional and should be specified only if the DRV_NVM_EraseWrite() function is required.

DRV_NVM_PAGE_SIZE Macro

Specifies the NVM Driver Program Page Size in bytes.

File

drv_nvm.h

C

```
#define DRV_NVM_PAGE_SIZE (NVM_PAGE_SIZE)
```

Description

NVM Driver Program Page Size.

This definition specifies the NVM Driver Program Page Size in bytes. This parameter is device specific and is obtained from the device specific processor header file.

Remarks

None

DRV_NVM_DISABLE_ERROR_CHECK Macro

Disables the error checks in the driver.

File

drv_nvm_config_template.h

C

```
#define DRV_NVM_DISABLE_ERROR_CHECK
```

Description

NVM Driver Disable Error Checks

Specifying this macro disables the error checks in the driver. Error checks like parameter validation, NULL checks etc, will be disabled in the driver in order to optimize the code space.

Remarks

This macro is optional and should be specified only if code space is a constraint.

DRV_NVM_MEDIA_SIZE Macro

Specifies the NVM Media size.

File

drv_nvm_config_template.h

C

```
#define DRV_NVM_MEDIA_SIZE 32
```

Description

NVM Media Size

This definition specifies the NVM Media Size to be used. The size is specified in number of Kilo Bytes. The media size MUST never exceed physical available NVM Memory size. Application code requirements should be kept in mind while defining this parameter.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_NVM_MEDIA_START_ADDRESS Macro

Specifies the NVM Media start address.

File

drv_nvm_config_template.h

C

```
#define DRV_NVM_MEDIA_START_ADDRESS 0x9D010000
```

Description

NVM Media Start Address

This definition specifies the NVM Media Start address parameter.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_NVM_SYS_FS_REGISTER Macro

Register to use with the File system

File

drv_nvm_config_template.h

C

```
#define DRV_NVM_SYS_FS_REGISTER
```

Description

NVM Driver Register with File System

Specifying this macro enables the NVM driver to register its services with the SYS FS.

Remarks

This macro is optional and should be specified only if the NVM driver is to be used with the File System.

Building the Library

This section lists the files that are available in the NVM Driver Library.

Description

This section list the files that are available in the `\src` folder of the NVM Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/nvm`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_nvm.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_nvm.c` `/src/dynamic/drv_nvm_erasewrite.c`	Dynamic NVM Driver implementation file. Dynamic NVM Driver Erase/Write implementation file.
`/src/static/drv_nvm_static.c`	Static NVM Driver implementation file for single clients.
`/src/static_multi/drv_nvm_static_multi.c`	Static NVM Driver implementation file for multiple clients.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The NVM Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library

Library Interface

a) System Functions

	Name	Description
	DRV_NVM_Initialize	Initializes the NVM instance for the specified driver index **Implementation:** Static/Dynamic
	DRV_NVM_Deinitialize	Deinitializes the specified instance of the NVM driver module **Implementation:** Static/Dynamic
	DRV_NVM_Status	Gets the current status of the NVM driver module. **Implementation:** Static/Dynamic

b) Client Core Functions

	Name	Description
	DRV_NVM_Open	Opens the specified NVM driver instance and returns a handle to it **Implementation:** Static/Dynamic
	DRV_NVM_Close	Closes an opened-instance of the NVM driver **Implementation:** Static/Dynamic

	DRV_NVM_Read	Reads blocks of data from the specified address in memory. **Implementation:** Static/Dynamic
	DRV_NVM_Write	Writes blocks of data starting from the specified address in flash memory. **Implementation:** Static/Dynamic
	DRV_NVM_Erase	Erase the specified number of blocks of the Flash memory. **Implementation:** Static/Dynamic
	DRV_NVM_EraseWrite	Erase and Write blocks of data starting from a specified address in flash memory. **Implementation:** Static/Dynamic
	DRV_NVM_EventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed. **Implementation:** Static/Dynamic

c) Client Block Data Functions

	Name	Description
	DRV_NVM_Tasks	Maintains the driver's erase and write state machine and implements its ISR. **Implementation:** Static/Dynamic

d) Status Functions

	Name	Description
	DRV_NVM_AddressGet	Returns the NVM media start address **Implementation:** Static/Dynamic
	DRV_NVM_CommandStatus	Gets the current status of the command. **Implementation:** Static/Dynamic
	DRV_NVM_GeometryGet	Returns the geometry of the device. **Implementation:** Static/Dynamic

e) Miscellaneous Functions

	Name	Description
	DRV_NVM_IsAttached	Returns the physical attach status of the NVM. **Implementation:** Static/Dynamic
	DRV_NVM_IsWriteProtected	Returns the write protect status of the NVM. **Implementation:** Static/Dynamic

f) Data Types and Constants

	Name	Description
	DRV_NVM_INDEX_0	NVM driver index definitions
	DRV_NVM_INIT	Defines the data required to initialize or reinitialize the NVM driver
	DRV_NVM_INDEX_1	This is macro DRV_NVM_INDEX_1.
	DRV_NVM_EVENT	Identifies the possible events that can result from a request.
	DRV_NVM_EVENT_HANDLER	Pointer to a NVM Driver Event handler function
	DRV_NVM_COMMAND_HANDLE	Handle identifying commands queued in the driver.
	DRV_NVM_COMMAND_STATUS	Specifies the status of the command for the read, write and erase operations.
	DRV_NVM_COMMAND_HANDLE_INVALID	This value defines the NVM Driver's Invalid Command Handle.
	DRV_NVM_PROGRAM_UNLOCK_KEY1	Specifies the NVM Driver Program Unlock Key 1
	DRV_NVM_PROGRAM_UNLOCK_KEY2	Specifies the NVM Driver Program Unlock Key 2

Description

This section describes the Application Programming Interface (API) functions of the NVM Driver Library.

Refer to each section for a detailed description.

a) System Functions

DRV_NVM_Initialize Function

Initializes the NVM instance for the specified driver index

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
SYS_MODULE_OBJ DRV_NVM_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise it returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the NVM driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This routine must be called before any other NVM routine is called.

This routine should only be called once during system initialization unless DRV_NVM_Deinitialize is called to deinitialize the driver instance.

This routine will NEVER block for hardware access. If the operation requires time to allow the hardware to reinitialize, it will be reported by the DRV_NVM_Status operation. The system must use DRV_NVM_Status to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this routine.

Preconditions

None.

Example

```
// This code snippet shows an example
// of initializing the NVM Driver.

SYS_MODULE_OBJ  objectHandle;

SYS_FS_MEDIA_REGION_GEOMETRY gNvmGeometryTable[3] =
{
    {
        // Read Region Geometry
        .blockSize = 1,
        .numBlocks = (DRV_NVM_MEDIA_SIZE * 1024),
    },
    {
        // Write Region Geometry
        .blockSize = DRV_NVM_ROW_SIZE,
        .numBlocks = ((DRV_NVM_MEDIA_SIZE * 1024)/DRV_NVM_ROW_SIZE)
    },
    {
        // Erase Region Geometry
        .blockSize = DRV_NVM_PAGE_SIZE,
        .numBlocks = ((DRV_NVM_MEDIA_SIZE * 1024)/DRV_NVM_PAGE_SIZE)
    }
};

const SYS_FS_MEDIA_GEOMETRY gNvmGeometry =
{
    .mediaProperty = SYS_FS_MEDIA_WRITE_IS_BLOCKING,

    // Number of read, write and erase entries in the table
    .numReadRegions = 1,
    .numWriteRegions = 1,
    .numEraseRegions = 1,
    .geometryTable = &gNvmGeometryTable
};

// FLASH Driver Initialization Data
const DRV_NVM_INIT drvNvmInit =
{
    .moduleInit.sys.powerState = SYS_MODULE_POWER_RUN_FULL,
    .nvmID = NVM_ID_0,
    .interruptSource = INT_SOURCE_FLASH_CONTROL,
```

```
    .mediaStartAddress = NVM_BASE_ADDRESS,
    .nvmMediaGeometry = &gNvmGeometry
};

//usage of DRV_NVM_INDEX_0 indicates usage of Flash-related APIs
objectHandle = DRV_NVM_Initialize(DRV_NVM_INDEX_0, (SYS_MODULE_INIT*)&drvNVMInit);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized also the type of memory used
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_NVM_Initialize
(
const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init
);

DRV_NVM_Deinitialize Function

Deinitializes the specified instance of the NVM driver module

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
void DRV_NVM_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the NVM driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

Preconditions

Function DRV_NVM_Initialize should have been called before calling this function.

Parameter: object - Driver object handle, returned from the DRV_NVM_Initialize routine

Example

```
// This code snippet shows an example
// of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_NVM_Initialize
SYS_STATUS          status;

DRV_NVM_Deinitialize(object);

status = DRV_NVM_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Function

void DRV_NVM_Deinitialize
(
SYS_MODULE_OBJ object
);

DRV_NVM_Status Function

Gets the current status of the NVM driver module.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
SYS_STATUS DRV_NVM_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and accept requests for new operations.
SYS_STATUS_UNINITIALIZED - Indicates the driver is not initialized.

Description

This routine provides the current status of the NVM driver module.

Remarks

This routine will NEVER block waiting for hardware.

Preconditions

Function DRV_NVM_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_NVM_Initialize
SYS_STATUS          NVMStatus;

NVMStatus = DRV_NVM_Status(object);
else if (SYS_STATUS_ERROR >= NVMStatus)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_NVM_Initialize routine

Function

SYS_STATUS DRV_NVM_Status
(
SYS_MODULE_OBJ object
);

b) Client Core Functions

DRV_NVM_Open Function

Opens the specified NVM driver instance and returns a handle to it

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
DRV_HANDLE DRV_NVM_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, DRV_HANDLE_INVALID is returned. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_NVM_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.
- if the driver hardware instance being opened is not initialized or is invalid

Description

This routine opens the specified NVM driver instance and provides a handle. This handle must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The handle returned is valid until the DRV_NVM_Close routine is called. This routine will NEVER block waiting for hardware. If the driver has has already been opened, it cannot be opened exclusively.

Preconditions

Function DRV_NVM_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_NVM_Open(DRV_NVM_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

```
DRV_HANDLE DRV_NVM_Open
(
const    SYS_MODULE_INDEX index,
const    DRV_IO_INTENT ioIntent
);
```

DRV_NVM_Close Function

Closes an opened-instance of the NVM driver

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
void DRV_NVM_Close(const DRV_HANDLE handle);
```

Returns

None

Description

This routine closes an opened-instance of the NVM driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_NVM_Open before the caller may use the driver again. Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_NVM_Initialize routine must have been called for the specified NVM driver instance.

DRV_NVM_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_NVM_Open

DRV_NVM_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_NVM_Close

(

const DRV_HANDLE handle

);

DRV_NVM_Read Function

Reads blocks of data from the specified address in memory.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
void DRV_NVM_Read(const DRV_HANDLE handle, DRV_NVM_COMMAND_HANDLE * commandHandle, void * targetBuffer,
uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_NVM_COMMAND_HANDLE_INVALID if the request was not successful.

Description

This routine reads blocks of data from the specified address in memory. This operation is blocking and returns with the required data in the target buffer. If an event handler is registered with the driver the event handler would be invoked from within this function to indicate the status of the operation. This function should not be used to read areas of memory which are queued to be programmed or erased. If required, the program or erase operations should be allowed to complete. The function returns DRV_NVM_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the driver handle is invalid
- if the target buffer pointer is NULL
- if the number of blocks to be read is zero or more than the actual number of blocks available
- if a buffer object could not be allocated to the request
- if the client opened the driver in write only mode

Remarks

None.

Preconditions

The DRV_NVM_Initialize routine must have been called for the specified NVM driver instance.

DRV_NVM_Open must have been called with DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE as the ioIntent to obtain a valid opened device handle.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = NVM_BASE_ADDRESS_TO_READ_FROM;
uint32_t    nBlock = 2;
DRV_NVM_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// myNVMHandle is the handle returned
// by the DRV_NVM_Open function.

DRV_NVM_Read(myNVMHandle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_NVM_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}
else
{
    // Read Successful
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
targetBuffer	Buffer into which the data read from the NVM Flash instance will be placed
blockStart	Start block address in NVM memory from where the read should begin. It can be any address of the flash.
nBlock	Total number of blocks to be read. Each Read block is of 1 byte.

Function

void DRV_NVM_Read

(

const DRV_HANDLE handle,

DRV_NVM_COMMAND_HANDLE * commandHandle,

void * targetBuffer,

uint32_t blockStart,

uint32_t nBlock

);

DRV_NVM_Write Function

Writes blocks of data starting from the specified address in flash memory.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
void DRV_NVM_Write(const DRV_HANDLE handle, DRV_NVM_COMMAND_HANDLE * commandHandle, void * sourceBuffer,
uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_NVM_COMMAND_HANDLE_INVALID if the request was not

successful.

Description

This function schedules a non-blocking write operation for writing blocks of data into flash memory. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_NVM_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer object could not be allocated to the request
- if the source buffer pointer is NULL
- if the client opened the driver for read only
- if the number of blocks to be written is either zero or more than the number of blocks actually available
- if the write queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_NVM_EVENT_COMMAND_COMPLETE event if the buffer was processed successfully or DRV_NVM_EVENT_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

Performing a flash programming operation while executing (fetching) instructions from program Flash memory, the CPU stalls (waits) until the programming operation is finished. The CPU will not execute any instruction, or respond to interrupts, during this time. If any interrupts occur during the programming cycle, they remain pending until the cycle completes. This makes the NVM write operation blocking in nature.

Preconditions

The DRV_NVM_Initialize() routine must have been called for the specified NVM driver instance.

DRV_NVM_Open() routine must have been called to obtain a valid opened device handle. DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified as a parameter to this routine.

The flash address location which has to be written, must have be erased before using the DRV_NVM_Erase() routine.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = NVM_BASE_ADDRESS_TO_WRITE_TO;
uint32_t    nBlock = 2;
DRV_NVM_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// myNVMHandle is the handle returned
// by the DRV_NVM_Open function.

// Client registers an event handler with driver

DRV_NVM_EventHandlerSet(myNVMHandle, APP_NVMEventHandler, (uintptr_t)&myAppObj);

DRV_NVM_Write(myNVMHandle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_NVM_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_NVMEventHandler(DRV_NVM_EVENT event,
        DRV_NVM_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_NVM_EVENT_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_NVM_EVENT_COMMAND_ERROR:
```

```
            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
sourceBuffer	The source buffer containing data to be programmed into NVM Flash
blockStart	Start block address of NVM Flash where the write should begin. This address should be aligned on a block boundary.
nBlock	Total number of blocks to be written.

Function

void DRV_NVM_Write

(

const DRV_HANDLE handle,

DRV_NVM_COMMAND_HANDLE * commandHandle,

void * sourceBuffer,

uint32_t blockStart,

uint32_t nBlock

);

DRV_NVM_Erase Function

Erase the specified number of blocks of the Flash memory.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
void DRV_NVM_Erase(const DRV_HANDLE handle, DRV_NVM_COMMAND_HANDLE * commandHandle, uint32_t blockStart,
uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It Will be DRV_NVM_COMMAND_HANDLE_INVALID if the request was not queued.

Description

This function schedules a non-blocking erase operation of flash memory. The function returns with a valid erase handle in the commandHandle argument if the erase request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_NVM_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer object could not be allocated to the request
- if the client opened the driver for read only
- if the number of blocks to be erased is either zero or more than the number of blocks actually available
- if the erase queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_NVM_EVENT_COMMAND_COMPLETE event if the erase operation was successful or DRV_NVM_EVENT_COMMAND_ERROR event if the erase operation was not successful.

Remarks

Performing a flash erase operation while executing (fetching) instructions from program Flash memory, the CPU stalls (waits) until the erase operation is finished. The CPU will not execute any instruction, or respond to interrupts, during this time. If any interrupts occur during the programming cycle, they remain pending until the cycle completes. This make the NVM erase operation blocking in nature.

Preconditions

The DRV_NVM_Initialize() routine must have been called for the specified NVM driver instance.

The DRV_NVM_Open() routine must have been called with DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE to obtain a valid opened device handle.

Example

```
// Destination address should be block aligned.
uint32_t blockStart;
uint32_t nBlock;
DRV_NVM_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// myNVMHandle is the handle returned
// by the DRV_NVM_Open function.

// Client registers an event handler with driver

DRV_NVM_EventHandlerSet(myNVMHandle, APP_NVMEventHandler, (uintptr_t)&myAppObj);

DRV_NVM_Erase( myNVMHandle, &commandHandle, blockStart, nBlock );

if(DRV_NVM_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer queue is processed.

void APP_NVMEventHandler(DRV_NVM_EVENT event,
        DRV_NVM_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_NVM_EVENT_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_NVM_EVENT_COMMAND_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
blockStart	Start block address in NVM memory from where the erase should begin. This should be aligned on a DRV_NVM_PAGE_SIZE byte boundary.
nBlock	Total number of blocks to be erased.

Function

void DRV_NVM_Erase

(

const DRV_HANDLE handle,

DRV_NVM_COMMAND_HANDLE * commandHandle,

uint32_t blockStart,
uint32_t nBlock
);

DRV_NVM_EraseWrite Function

Erase and Write blocks of data starting from a specified address in flash memory.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
void DRV_NVM_EraseWrite(const DRV_HANDLE handle, DRV_NVM_COMMAND_HANDLE * commandHandle, void *
sourceBuffer, uint32_t writeBlockStart, uint32_t nWriteBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It Will be DRV_NVM_COMMAND_HANDLE_INVALID if the request was not queued.

Description

This function combines the step of erasing a page and then writing the row. The application can use this function if it wants to avoid having to explicitly delete a page in order to update the rows contained in the page.

This function schedules a non-blocking operation to erase and write blocks of data into flash memory. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_NVM_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only
- if the buffer size is 0
- if the write queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_NVM_EVENT_COMMAND_COMPLETE event if the buffer was processed successfully or DRV_NVM_EVENT_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

In order to use this function, the DRV_NVM_ERASE_WRITE_ENABLE must be defined in system_config.h and the drv_nvm_erasewrite.c file must be included in the project.

Preconditions

The DRV_NVM_Initialize() routine must have been called for the specified NVM driver instance.

The DRV_NVM_Open() must have been called with DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE as a parameter to obtain a valid opened device handle.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = NVM_BASE_ADDRESS_TO_WRITE_TO;
uint32_t    nBlock = 2;
DRV_NVM_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// myNVMHandle is the handle returned
// by the DRV_NVM_Open function.

// Client registers an event handler with driver

DRV_NVM_EventHandlerSet(myNVMHandle, APP_NVMEventHandler, (uintptr_t)&myAppObj);

DRV_NVM_EraseWrite(myNVMHandle, &commandHandle, &myBuffer, blockStart, nBlock);
```

```
if(DRV_NVM_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_NVMEventHandler(DRV_NVM_EVENT event,
        DRV_NVM_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_NVM_EVENT_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_NVM_EVENT_COMMAND_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle. If NULL, then buffer handle is not returned.
sourceBuffer	The source buffer containing data to be programmed into NVM Flash
writeBlockStart	Start block address of NVM Flash where the write should begin. This address should be aligned on a DRV_NVM_ROW_SIZE byte boundary.
nWriteBlock	Total number of blocks to be written.

Function

void DRV_NVM_EraseWrite
(
const DRV_HANDLE handle,
DRV_NVM_COMMAND_HANDLE * commandHandle,
void * sourceBuffer,
uint32_t writeBlockStart,
uint32_t nWriteBlock
);

DRV_NVM_EventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
void DRV_NVM_EventHandlerSet(const DRV_HANDLE handle, const void * eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client calls a write or erase function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any write or erase operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_NVM_Initialize() routine must have been called for the specified NVM driver instance.

The DRV_NVM_Open() routine must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_NVM_COMMAND_HANDLE commandHandle;

// drvNVMHandle is the handle returned
// by the DRV_NVM_Open function.

// Client registers an event handler with driver. This is done once.

DRV_NVM_EventHandlerSet(drvNVMHandle, APP_NVMEventHandler, (uintptr_t)&myAppObj);

DRV_NVM_Read(drvNVMHandle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_NVM_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_NVMEventHandler(DRV_NVM_EVENT event,
        DRV_NVM_COMMAND_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_NVM_EVENT_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_NVM_EVENT_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_NVM_EventHandlerSet
(
const DRV_HANDLE handle,
const void * eventHandler,
const uintptr_t context
);

c) Client Block Data Functions

DRV_NVM_Tasks Function

Maintains the driver's erase and write state machine and implements its ISR.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
void DRV_NVM_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal write and erase state machine and implement its ISR for interrupt-driven implementations.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_NVM_Initialize routine must have been called for the specified NVM driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_NVM_Initialize

while (true)
{
    DRV_NVM_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_NVM_Initialize)

Function

void DRV_NVM_Tasks

(
SYS_MODULE_OBJ object
);

d) Status Functions

DRV_NVM_AddressGet Function

Returns the NVM media start address

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
uintptr_t DRV_NVM_AddressGet(const DRV_HANDLE handle);
```

Returns

Start address of the NVM Media if the handle is valid otherwise NULL.

Description

This function returns the NVM Media start address.

Remarks

None.

Preconditions

The DRV_NVM_Initialize() routine must have been called for the specified NVM driver instance.

The DRV_NVM_Open() routine must have been called to obtain a valid opened device handle.

Example

```
uintptr_t startAddress;
startAddress = DRV_NVM_AddressGet(drvNVMHandle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

uintptr_t DRV_NVM_AddressGet
(
const DRV_HANDLE handle
);

DRV_NVM_CommandStatus Function

Gets the current status of the command.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
DRV_NVM_COMMAND_STATUS DRV_NVM_CommandStatus(const DRV_HANDLE handle, const DRV_NVM_COMMAND_HANDLE
commandHandle);
```

Returns

A DRV_NVM_COMMAND_STATUS value describing the current status of the command. Returns DRV_NVM_COMMAND_HANDLE_INVALID if

the client handle or the command handle is not valid.

Description

This routine gets the current status of the command. The application must use this routine where the status of a scheduled command needs to polled on. The function may return DRV_NVM_COMMAND_HANDLE_INVALID in a case where the command handle has expired. A command handle expires when the internal buffer object is re-assigned to another erase or write request. It is recommended that this function be called regularly in order to track the command status correctly.

The application can alternatively register an event handler to receive write or erase operation completion events.

Remarks

This routine will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_NVM_Initialize() routine must have been called.

The DRV_NVM_Open() must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE                  handle;         // Returned from DRV_NVM_Open
DRV_NVM_COMMAND_HANDLE      commandHandle;
DRV_NVM_COMMAND_STATUS      status;

status = DRV_NVM_CommandStatus(handle, commandHandle);
if(status == DRV_NVM_COMMAND_COMPLETED)
{
    // Operation Done
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_NVM_COMMAND_STATUS DRV_NVM_CommandStatus

(

const DRV_HANDLE handle,

const DRV_NVM_COMMAND_HANDLE commandHandle

);

DRV_NVM_GeometryGet Function

Returns the geometry of the device.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_NVM_GeometryGet(const DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Pointer to structure which holds the media geometry information.

Description

This API gives the following geometrical details of the NVM Flash:

- Media Property
- Number of Read/Write/Erase regions in the flash device
- Number of Blocks and their size in each region of the device

Remarks

None.

Preconditions

The DRV_NVM_Initialize() routine must have been called for the specified NVM driver instance.

The DRV_NVM_Open() routine must have been called to obtain a valid opened device handle.

Example

```
SYS_FS_MEDIA_GEOMETRY * nvmFlashGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalFlashSize;

nvmFlashGeometry = DRV_NVM_GeometryGet(nvmOpenHandle1);

readBlockSize  = nvmFlashGeometry->geometryTable->blockSize;
nReadBlocks = nvmFlashGeometry->geometryTable->numBlocks;
nReadRegions = nvmFlashGeometry->numReadRegions;

writeBlockSize  = (nvmFlashGeometry->geometryTable +1)->blockSize;
eraseBlockSize  = (nvmFlashGeometry->geometryTable +2)->blockSize;

totalFlashSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY * DRV_NVM_GeometryGet

(

const DRV_HANDLE handle

);

e) Miscellaneous Functions

DRV_NVM_IsAttached Function

Returns the physical attach status of the NVM.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
bool DRV_NVM_IsAttached(const DRV_HANDLE handle);
```

Returns

Returns false if the handle is invalid otherwise returns true.

Description

This function returns the physical attach status of the NVM.

Remarks

None.

Preconditions

The DRV_NVM_Initialize() routine must have been called for the specified NVM driver instance.

The DRV_NVM_Open() routine must have been called to obtain a valid opened device handle.

Example

```
// The NVM media is always attached and so the below
// always returns true.
```

```
bool isNVMAttached;
isNVMAttached = DRV_NVM_isAttached(drvNVMHandle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_NVM_IsAttached

(

const DRV_HANDLE handle

);

DRV_NVM_IsWriteProtected Function

Returns the write protect status of the NVM.

Implementation: Static/Dynamic

File

drv_nvm.h

C

```
bool DRV_NVM_IsWriteProtected(const DRV_HANDLE handle);
```

Returns

Always returns false.

Description

This function returns the physical attach status of the NVM. This function always returns false.

Remarks

None.

Preconditions

The DRV_NVM_Initialize() routine must have been called for the specified NVM driver instance.

The DRV_NVM_Open() routine must have been called to obtain a valid opened device handle.

Example

```
// The NVM media is treated as always writeable.
bool isWriteProtected;
isWriteProtected = DRV_NVM_IsWriteProtected(drvNVMHandle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_NVM_IsWriteProtected

(

const DRV_HANDLE handle

);

f) Data Types and Constants

DRV_NVM_INDEX_0 Macro

NVM driver index definitions

File

drv_nvm.h

C

```
#define DRV_NVM_INDEX_0 0
```

Description

Driver NVM Module Index reference

These constants provide NVM driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_NVM_Initialize and DRV_NVM_Open routines to identify the driver instance in use.

DRV_NVM_INIT Structure

Defines the data required to initialize or reinitialize the NVM driver

File

drv_nvm.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  NVM_MODULE_ID nvmID;
  INT_SOURCE interruptSource;
  uint32_t mediaStartAddress;
  const SYS_FS_MEDIA_GEOMETRY * nvmMediaGeometry;
} DRV_NVM_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
NVM_MODULE_ID nvmID;	Identifies NVM hardware module (PLIB-level) ID
INT_SOURCE interruptSource;	Interrupt Source for Write Interrupt
uint32_t mediaStartAddress;	NVM Media start address. The driver treats this address as • block 0 address for read, write and erase operations.
const SYS_FS_MEDIA_GEOMETRY * nvmMediaGeometry;	NVM Media geometry object.

Description

NVM Driver Initialization Data

This data type defines the data required to initialize or reinitialize the NVM driver.

Remarks

Not all initialization features are available for all devices. Please refer to the specific device data sheet to determine availability.

DRV_NVM_INDEX_1 Macro

File

drv_nvm.h

C

```
#define DRV_NVM_INDEX_1 1
```

Description

This is macro DRV_NVM_INDEX_1.

DRV_NVM_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_nvm.h

C

```
typedef enum {
  DRV_NVM_EVENT_COMMAND_COMPLETE = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_NVM_EVENT_COMMAND_ERROR = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_ERROR
} DRV_NVM_EVENT;
```

Members

Members	Description
DRV_NVM_EVENT_COMMAND_COMPLETE = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_COMPLETE	Operation has been completed successfully.
DRV_NVM_EVENT_COMMAND_ERROR = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_ERROR	There was an error during the operation

Description

NVM Driver Events

This enumeration identifies the possible events that can result from a Write or Erase request caused by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_NVM_EventHandlerSet function when a request is completed.

DRV_NVM_EVENT_HANDLER Type

Pointer to a NVM Driver Event handler function

File

drv_nvm.h

C

```
typedef SYS_FS_MEDIA_EVENT_HANDLER DRV_NVM_EVENT_HANDLER;
```

Returns

None.

Description

NVM Driver Event Handler Function Pointer

This data type defines the required function signature for the NVM event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

If the event is DRV_NVM_EVENT_COMMAND_COMPLETE, it means that the write or a erase operation was completed successfully.

If the event is DRV_NVM_EVENT_COMMAND_ERROR, it means that the scheduled operation was not completed successfully.

The context parameter contains the handle to the client context, provided at the time the event handling function was registered using the DRV_NVM_EventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write/erase request.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations within this function.

Example

```
void APP_MyNvmEventHandler
(
```

```
    DRV_NVM_EVENT event,
    DRV_NVM_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_NVM_EVENT_COMMAND_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_NVM_EVENT_COMMAND_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle returned from the Read/Write/Erase requests
context	Value identifying the context of the application that registered the event handling function

DRV_NVM_COMMAND_HANDLE Type

Handle identifying commands queued in the driver.

File

drv_nvm.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_NVM_COMMAND_HANDLE;
```

Description

NVM Driver command handle.

A command handle is returned by a call to the Read, Write or Erase functions. This handle allows the application to track the completion of the operation. This command handle is also returned to the client along with the event that has occurred with respect to the command. This allows the application to connect the event to a specific command in case where multiple commands are queued.

The command handle associated with the command request expires when the client has been notified of the completion of the command (after event handler function that notifies the client returns) or after the command has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_NVM_COMMAND_STATUS Enumeration

Specifies the status of the command for the read, write and erase operations.

File

drv_nvm.h

C

```
typedef enum {
  DRV_NVM_COMMAND_COMPLETED = SYS_FS_MEDIA_COMMAND_COMPLETED,
  DRV_NVM_COMMAND_QUEUED = SYS_FS_MEDIA_COMMAND_QUEUED,
  DRV_NVM_COMMAND_IN_PROGRESS = SYS_FS_MEDIA_COMMAND_IN_PROGRESS,
  DRV_NVM_COMMAND_ERROR_UNKNOWN = SYS_FS_MEDIA_COMMAND_UNKNOWN
} DRV_NVM_COMMAND_STATUS;
```

Members

Members	Description
DRV_NVM_COMMAND_COMPLETED = SYS_FS_MEDIA_COMMAND_COMPLETED	Done OK and ready
DRV_NVM_COMMAND_QUEUED = SYS_FS_MEDIA_COMMAND_QUEUED	Scheduled but not started
DRV_NVM_COMMAND_IN_PROGRESS = SYS_FS_MEDIA_COMMAND_IN_PROGRESS	Currently being in transfer
DRV_NVM_COMMAND_ERROR_UNKNOWN = SYS_FS_MEDIA_COMMAND_UNKNOWN	Unknown Command

Description

NVM Driver Command Status

NVM Driver command Status

This type specifies the status of the command for the read, write and erase operations.

Remarks

None.

DRV_NVM_COMMAND_HANDLE_INVALID Macro

This value defines the NVM Driver's Invalid Command Handle.

File

drv_nvm.h

C

```
#define DRV_NVM_COMMAND_HANDLE_INVALID SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE_INVALID
```

Description

NVM Driver Invalid Command Handle.

This value defines the NVM Driver Invalid Command Handle. This value is returned by read/write/erase routines when the command request was not accepted.

Remarks

None.

DRV_NVM_PROGRAM_UNLOCK_KEY1 Macro

Specifies the NVM Driver Program Unlock Key 1

File

drv_nvm.h

C

```
#define DRV_NVM_PROGRAM_UNLOCK_KEY1 (NVM_UNLOCK_KEY1)
```

Description

NVM Driver Program Unlock Key 1

This definition specifies the NVM Driver Program Unlock Key 1 parameter is device specific and is obtained from the device specific processor header file.

Remarks

None

DRV_NVM_PROGRAM_UNLOCK_KEY2 Macro

Specifies the NVM Driver Program Unlock Key 2

File

drv_nvm.h

C

```
#define DRV_NVM_PROGRAM_UNLOCK_KEY2 (NVM_UNLOCK_KEY2)
```

Description

NVM Driver Program Unlock Key 2

This definition specifies the NVM Driver Program Unlock Key 2 parameter is device specific and is obtained from the device specific processor header file.

Remarks

None

NVM Driver Interface Definition

Enumerations

	Name	Description
	DRV_NVM_COMMAND_STATUS	Specifies the status of the command for the read, write and erase operations.
	DRV_NVM_EVENT	Identifies the possible events that can result from a request.

Functions

	Name	Description
	DRV_NVM_AddressGet	Returns the NVM media start address **Implementation:** Static/Dynamic
	DRV_NVM_Close	Closes an opened-instance of the NVM driver **Implementation:** Static/Dynamic
	DRV_NVM_CommandStatus	Gets the current status of the command. **Implementation:** Static/Dynamic
	DRV_NVM_Deinitialize	Deinitializes the specified instance of the NVM driver module **Implementation:** Static/Dynamic
	DRV_NVM_Erase	Erase the specified number of blocks of the Flash memory. **Implementation:** Static/Dynamic
	DRV_NVM_EraseWrite	Erase and Write blocks of data starting from a specified address in flash memory. **Implementation:** Static/Dynamic
	DRV_NVM_EventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed. **Implementation:** Static/Dynamic
	DRV_NVM_GeometryGet	Returns the geometry of the device. **Implementation:** Static/Dynamic
	DRV_NVM_Initialize	Initializes the NVM instance for the specified driver index **Implementation:** Static/Dynamic
	DRV_NVM_IsAttached	Returns the physical attach status of the NVM. **Implementation:** Static/Dynamic
	DRV_NVM_IsWriteProtected	Returns the write protect status of the NVM. **Implementation:** Static/Dynamic

	DRV_NVM_Open	Opens the specified NVM driver instance and returns a handle to it **Implementation:** Static/Dynamic
	DRV_NVM_Read	Reads blocks of data from the specified address in memory. **Implementation:** Static/Dynamic
	DRV_NVM_Status	Gets the current status of the NVM driver module. **Implementation:** Static/Dynamic
	DRV_NVM_Tasks	Maintains the driver's erase and write state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_NVM_Write	Writes blocks of data starting from the specified address in flash memory. **Implementation:** Static/Dynamic

Macros

	Name	Description
	DRV_NVM_COMMAND_HANDLE_INVALID	This value defines the NVM Driver's Invalid Command Handle.
	DRV_NVM_INDEX_0	NVM driver index definitions
	DRV_NVM_INDEX_1	This is macro DRV_NVM_INDEX_1.
	DRV_NVM_PAGE_SIZE	Specifies the NVM Driver Program Page Size in bytes.
	DRV_NVM_PROGRAM_UNLOCK_KEY1	Specifies the NVM Driver Program Unlock Key 1
	DRV_NVM_PROGRAM_UNLOCK_KEY2	Specifies the NVM Driver Program Unlock Key 2
	DRV_NVM_ROW_SIZE	Specifies the NVM Driver Program Row Size in bytes.

Structures

	Name	Description
	DRV_NVM_INIT	Defines the data required to initialize or reinitialize the NVM driver

Types

	Name	Description
	DRV_NVM_COMMAND_HANDLE	Handle identifying commands queued in the driver.
	DRV_NVM_EVENT_HANDLER	Pointer to a NVM Driver Event handler function

Description

NVM Driver Interface Definition

The NVM driver provides a simple interface to manage the Non Volatile Flash Memory on Microchip microcontrollers. This file defines the interface definition for the NVM driver.

File Name

drv_nvm.h

Company

Microchip Technology Inc.

drv_nvm_config_template.h

NVM driver configuration definitions.

Macros

	Name	Description
	DRV_NVM_BUFFER_OBJECT_NUMBER	Selects the maximum number of buffer objects
	DRV_NVM_CLIENTS_NUMBER	Selects the maximum number of clients
	DRV_NVM_DISABLE_ERROR_CHECK	Disables the error checks in the driver.
	DRV_NVM_ERASE_WRITE_ENABLE	Enables support for NVM Driver Erase Write Feature.
	DRV_NVM_INSTANCES_NUMBER	Selects the maximum number of Driver instances that can be supported by the dynamic driver.
	DRV_NVM_INTERRUPT_MODE	Macro specifies operation of the driver to be in the interrupt mode or polled mode
	DRV_NVM_MEDIA_SIZE	Specifies the NVM Media size.
	DRV_NVM_MEDIA_START_ADDRESS	Specifies the NVM Media start address.
	DRV_NVM_SYS_FS_REGISTER	Register to use with the File system

Description

NVM Driver Configuration Template Header file.

This template file describes all the mandatory and optional configuration macros that are needed for building the NVM driver. Do not include this file in source code.

Output Compare Driver Library

This section describes the Output Compare Driver Library.

Introduction

The Output Compare Static Driver provides a high-level interface to manage the Output Compare module on the Microchip family of microcontrollers.

Description

Through the MHC, this driver provides APIs for the following:

- Initializing the module
- Enabling/Disabling of the output compare
- Starting/Stopping of the output compare
- Fault checking

Library Interface

Functions

	Name	Description
	DRV_OC_Disable	Disables the Output Compare instance for the specified driver index. **Implementation:** Static
	DRV_OC_Enable	Enables the Output Compare for the specified driver index. **Implementation:** Static
	DRV_OC_FaultHasOccurred	Checks if a Fault has occurred for the specified driver index. **Implementation:** Static
	DRV_OC_Initialize	Initializes the Comparator instance for the specified driver index. **Implementation:** Static
	DRV_OC_Start	Starts the Comparator instance for the specified driver index. **Implementation:** Static
	DRV_OC_Stop	Stops the Output Compare instance for the specified driver index. **Implementation:** Static

Description

This section describes the Application Programming Interface (API) functions of the Output Compare Driver Library.

Functions

DRV_OC_Disable Function

Disables the Output Compare instance for the specified driver index.

Implementation: Static

File

help_drv_oc.h

C

```
void DRV_OC_Disable();
```

Returns

None.

Description

This routine disables the Output Compare for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters.

Remarks

None.

Preconditions

DRV_OC_Initialize has been called.

Function

void DRV_OC_Disable(void)

DRV_OC_Enable Function

Enables the Output Compare for the specified driver index.

Implementation: Static

File

help_drv_oc.h

C

```
void DRV_OC_Enable();
```

Returns

None.

Description

This routine enables the Output Compare for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters.

Remarks

None.

Preconditions

DRV_OC_Initialize has been called.

Function

void DRV_OC_Enable(void)

DRV_OC_FaultHasOccurred Function

Checks if a Fault has occurred for the specified driver index.

Implementation: Static

File

help_drv_oc.h

C

```
bool DRV_OC_FaultHasOccurred();
```

Returns

Boolean

- 1 - A Fault has occurred
- 0 - A Fault has not occurred

Description

This routine checks whether or not a Fault has occurred for the specified driver index. The initialization routine is specified by the MHC parameters.

Remarks

None.

Preconditions

DRV_OC_Initialize has been called.

Function

bool DRV_OC_FaultHasOccurred(void)

DRV_OC_Initialize Function

Initializes the Comparator instance for the specified driver index.

Implementation: Static

File

help_drv_oc.h

C

```
void DRV_OC_Initialize();
```

Returns

None.

Description

This routine initializes the Output Compare driver instance for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters. The driver instance index is independent of the Output Compare module ID. For example, driver instance 0 can be assigned to Output Compare 1.

Remarks

This routine must be called before any other Comparator routine is called. This routine should only be called once during system initialization.

Preconditions

None.

Function

void DRV_OC_Initialize(void)

DRV_OC_Start Function

Starts the Comparator instance for the specified driver index.

Implementation: Static

File

help_drv_oc.h

C

```
void DRV_OC_Start();
```

Returns

None.

Description

This routine starts the Output Compare for the specified driver instance.

Remarks

None.

Preconditions

DRV_OC_Initialize has been called.

Function

void DRV_OC_Start(void)

DRV_OC_Stop Function

Stops the Output Compare instance for the specified driver index.

Implementation: Static

File

help_drv_oc.h

C

```
void DRV_OC_Stop();
```

Returns

None.

Description

This routine stops the Output Compare for the specified driver instance.

Remarks

None.

Preconditions

DRV_OC_Initialize has been called.

Function

void DRV_OC_Stop(void)

Parallel Master Port (PMP) Driver Library

This section describes the Parallel Master Port Driver Library.

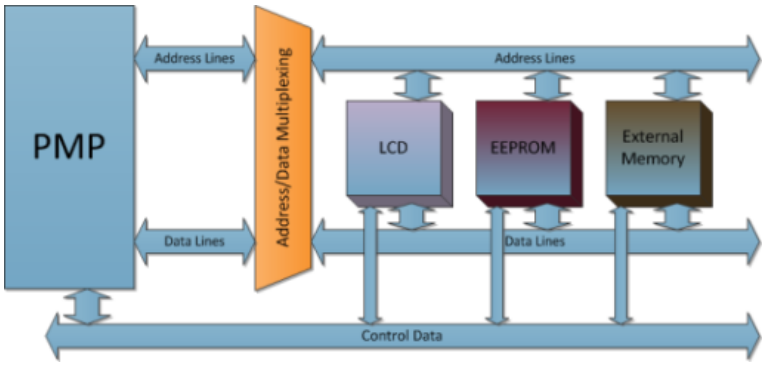
Introduction

This library provides an interface to manage the Parallel Master Port (PMP) module on Microchip family of microcontrollers in different modes of operation.

Description

The Parallel Master Port (PMP) is a parallel 8-bit/16-bit I/O module specifically designed to communicate with a wide variety of parallel devices such as communications peripherals, LCDs, external memory devices and microcontrollers. Because the interfaces to parallel peripherals vary significantly, the PMP module is highly configurable.

The following figure shows a generic block diagram, which illustrates the ways the PMP module can be used:



The PMP module can be used in different modes. Master and Slave are the two modes that can have additional sub-modes, depending on the different microcontroller families.

Master Mode: In Master mode, the PMP module can provide a 8-bit or 16-bit data bus, up to 16 bits of address, and all of the necessary control signals to operate a variety of external parallel devices such as memory devices, peripherals and slave microcontrollers. The PMP master modes provide a simple interface for reading and writing data, but not executing program instructions from external devices, such as SRAM or Flash memories.

Slave Mode: Slave mode only supports 8-bit data and the module control pins are automatically dedicated when this mode is selected.

Using the Library

This topic describes the basic architecture of the PMP Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_pmp.h`

The interface to the PMP Driver library is defined in the `drv_pmp.h` header file. This file is included by the `drv.h` file. Any C language source (`.c`) file that uses the PMP Driver Library should include `drv.h`.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

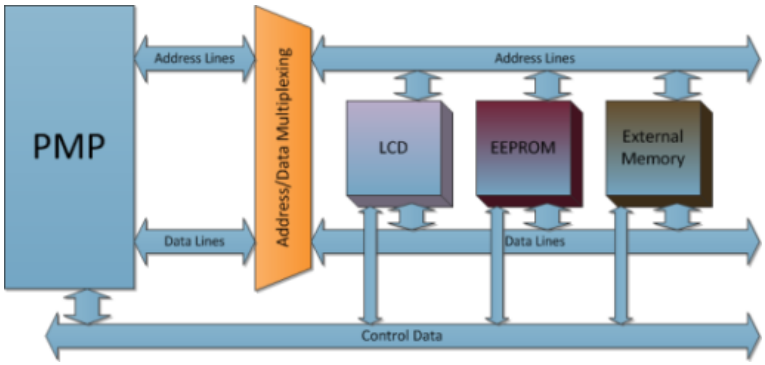
This library provides a low-level abstraction of the Parallel Master Port (PMP) module on Microchip's microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

Hardware Abstraction Model Description

Depending on the device,the PMP module provides interface routines to interact with external peripherals such as LCD, EEPROM, Flash memory, etc., as shown in the following diagram. The diagram shows the PMP module acting as a master. The PMP module can be easily configured to act as a slave. The address and data lines can be multiplexed to suit the application. The address and data buffers are up to 2-byte (16-bit) buffers for data transmitted or received by the parallel interface to the PMP bus over the data and address lines synchronized with control logic including the read and write strobe.

The desired timing wait states to suit different peripheral timings can also be programmed using the PMP module.



PMP Hardware Abstraction Model Diagram

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the PMP module.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks, and status functions.
Client Interaction Functions	Provides open, close, client status and client mode configuration functions.
Client Transfer Functions	Provides interface for data transfer in master and slave mode.
Miscellaneous	Provides driver miscellaneous functions, version identification functions, etc.

How the Library Works

This section describes how the PMP Driver Library operates.

Description

Before the driver is ready for use, its should be configured (compile time configuration). Refer to the Configuring the Library section for more details on how to configure the driver.

There are few run-time configuration items that are done during initialization of the driver instance, and a few that are client-specific and are done using dedicated functions.

To use the PMP Driver, initialization and client functions should be invoked in a specific sequence to ensure correct operation.

The following is the sequence in which various routines should be called:

1. Call DRV_PMP_Initialize to initialize the PMP Driver. Note that this may be performed by the MPLAB Harmony system module. The DRV_PMP_Status function may be used to check the status of the initialization.
2. Once initialization for a particular driver instance is done, the client wanting to use the driver can open it using DRV_PMP_Open.
3. The DRV_PMP_ModeConfig function should now be called, which will configure the driver for the exact mode of operation required by that client.
4. After configuring the mode, DRV_PMP_Write and/or DRV_PMP_Read can be called by the user application to Write/Read using the PMP module. Calling these functions does not start the PMP transfer immediately in non-interrupt mode. Instead, all of these transfer tasks are queued in an internal queue. Actual transfer starts only when the PMP Task function is called by the system/user. In interrupt mode, although transfer tasks are queued, the actual transfer starts immediately.
5. PMP Write and Read functions return an ID of that particular transfer, which should be saved by user to get the status of that transfer later.
6. The system will either call DRV_PMP_Tasks from the System Task Service (in a polled environment), or it will be called from the ISR of the PMP.
7. At any time status of the transfer can be obtained by using DRV_PMP_TransferStatus.

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

System Initialization

This section describes initialization and reinitialization features.

Description

Initialization and Reinitialization

The system performs the initialization and the reinitialization of the device driver with settings that affect only the instance of the device that is being initialized or reinitialized. During system initialization each instance of the PMP device will be initialized with the following configuration settings:

Initialization Member	Description
`moduleInit`	System module initialization of the power state.
`pmpId`	PMP hardware module ID (peripheral library-level ID).
`stopInIdle`	Decide whether or not the module should be stopped in Idle mode.
`muxMode`	To select one of the different multiplexing modes possible for PMP module.
`inputBuffer`	Select the type of Input Buffer (TTL or Schmitt Trigger).
`polarity`	Select polarity of different PMP pins.
`ports`	Set the pins the user wants to use as port or PMP pins.

The DRV_PMP_Initialize function returns an object handle of the type SYS_MODULE_OBJ. After this, the object handle returned by the initialize interface would be used by the other system interfaces, such as DRV_PMP_Reinitialize, DRV_PMP_Deinitialize, DRV_PMP_Status, and DRV_PMP_Tasks.

Example for PMP Initialization Through the DRV_PMP_INIT Structure

```
DRV_PMP_INIT     init;
SYS_MODULE_OBJ   object;
SYS_STATUS       pmpStatus;

// populate the PMP init configuration structure
    init.inputBuffer = PMP_INPUT_BUFFER_TTL;
    init.polarity.addressLatchPolarity = PMP_POLARITY_ACTIVE_HIGH;
    init.polarity.rwStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
    init.polarity.writeEnableStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
    init.polarity.chipselect1Polarity = PMP_POLARITY_ACTIVE_HIGH;
    init.polarity.chipselect2Polarity = PMP_POLARITY_ACTIVE_LOW;
    init.ports.addressPortsMask = PMP_PMA0_PORT | PMP_PMA1_PORT | PMP_PMA2_TO_PMA13_PORTS | PMP_PMA14_PORT;
    init.ports.readWriteStrobe = PORT_ENABLE;
```

```
    init.ports.writeEnableStrobe = PORT_ENABLE;
    init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
    init.pmpID            = PMP_ID_0;
    init.stopInIdle       = false;
    init.muxMode          = PMP_MUX_NONE;

object = DRV_PMP_Initialize (DRV_PMP_INDEX_0, (SYS_MODULE_INIT *)&init);

pmpStatus = DRV_PMP_Status(object);

if ( SYS_STATUS_READY != pmpStatus)
{
    // Handle error
}
```

Deinitialization

Once the initialize operation has been called, the deinitialize operation must be called before the initialize operation can be called again. This routine may block if the driver is running in an OS environment that supports blocking operations and the driver requires system resources access. However, the function will never block for hardware PMP access. If the operation requires time to allow the hardware to complete, which will be reported by DRV_PMP_Status.

Status

PMP status is available to query the module state before, during and after initialization, deinitialization, and reinitialization.

Tasks Routine

The DRV_PMP_Tasks function will see the queue status and perform the task of transferring the data accordingly. In the Blocking mode when interrupts are disabled, it will finish one of the tasks completely (that means emptying one space in queue), and then return back. Whereas in Non-Blocking mode, it will return back just after starting one word (8-bit or 16-bit) of transfer (may not be emptying one space in the queue, as that task may not be completely finished).

The DRV_PMP_Tasks function can be called in two ways:

- By the system task service in a polled environment
- By the ISR of the PMP in an interrupt-based system

Example: Polling

```
int main( void )
{
    SYS_MODULE_OBJ object;
    object = DRV_PMP_Initialize( DRV_PMP_INDEX_0, (SYS_MODULE_INIT *) &initConf );

    if( SYS_STATUS_READY != DRV_PMP_Status( object ) )
        return 0;

    while (1)
    {
        DRV_PMP_Tasks (object);
    }
}
```

Example: Interrupt

```
int main( void )
{
    SYS_MODULE_OBJ object;
    object = DRV_PMP_Initialize( DRV_PMP_INDEX_0, (SYS_MODULE_INIT *) &initConf );

    if( SYS_STATUS_READY != DRV_PMP_Status( object ) )
        return 0;

    while (1);
}

/* Sample interrupt routine not specific to any device family */
void ISR PMPInterrupt(void)
{
    //Call the PMP Tasks routine
    DRV_PMP_Tasks(object);
}
```

Note: A PMP transfer in Blocking mode in an interrupt environment is not supported.

Transfer Operation

This section describes transfer operation.

Description

Once the PMP Driver is open and configured for a client, it is set to start Reading/Writing through DRV_PMP_Read and DRV_PMP_Write. However, these functions will not directly start reading or writing. These will just put the relevant information in a queue in non-interrupt mode and return an ID that can be used later for checking the transfer status. In Interrupt mode, the Read/Write functions will trigger the transfer immediately after storing the transfer information in the queue.

The user must use a buffer pointing to character for data values.

The repeatCount parameter allows the user to repeatedly write the same nBytes of data into the slave devices.

Example:

```
unsigned char myReadBuffer[300], myWriteBuffer[100]; // has to be 'char' arrays
uint32_t deviceAddress, nBytes, repeatCount, i;
uint32_t writeID, readID;
DRV_HANDLE handle;

//initialize, open and configure the driver/client
/* ... */

deviceAddress = 0x0206;
nBytes = 100;
repeatCount = 0x01;
for (i=0; i<nBytes; i++)
{
   myWriteBuffer[i]=i*5+7;
}

/* it will write 100 bytes of data in the location starting from 0x0206 and then it will repeat
 writing the same set of data in next 100 location starting from 0x206+100 for 8 bit data mode
 and 50 location starting from 0x206+50 for 16 bit data mode. */
writeID = DRV_PMP_Write ( handle, deviceAddress, &myWriteBuffer[0], nBytes, repeatCount);

// it will read 300 locations starting from 0x0206 into myReadBuffer
readID = DRV_PMP_Read ( handle, deviceAddress, &myReadBuffer[0], nBytes);
```

Transfer Status

The status of the read/write transfers can be obtained using API DRV_PMP_TransferStatus.

Example:

```
DRV_PMP_TRANSFER_STATUS writeStatus, readStatus;
uint32_t writeID, readID;

writeStatus = DRV_PMP_TransferStatus( DRV_PMP_INDEX_0, writeID);
readStatus = DRV_PMP_TransferStatus( DRV_PMP_INDEX_0, readID);
```

Client Operation

This section describes general client operation.

Description

General Client Operation

For the application to start using an instance of the module, it must call the DRV_PMP_Open function with a specific intent. This provides the configuration required to open the PMP instance for operation. If the driver is deinitialized using the function DRV_PMP_Deinitialize, the application must call the DRV_PMP_Open function again to set up the instance of the PMP. The function DRV_PMP_Open need not be called again if the system is reinitialized using the DRV_PMP_Reinitialize function.

The PMP driver supports DRV_IO_INTENT_NONBLOCKING, DRV_IO_INTENT_BLOCKING, DRV_IO_INTENT_EXCLUSIVE, and DRV_IO_INTENT_SHARED IO.

Example:

```
DRV_HANDLE handle;
```

```
// Open the instance DRV_PMP_INDEX_0 with Non-blocking and Shared intent
handle = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_SHARED | DRV_IO_INTENT_NONBLOCKING);

if( handle == DRV_HANDLE_INVALID )
{
    // Client cannot open the instance.
}
```

The function DRV_PMP_Close closes an already opened instance of the PMP driver, invalidating the handle. DRV_PMP_Open must have been called to obtain a valid opened device handle.

Example:

```
DRV_HANDLE handle;

// Open the instance DRV_PMP_INDEX_0 with Non-blocking and Shared intent
handle = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_SHARED | DRV_IO_INTENT_NONBLOCKING);

/*...*/

DRV_PMP_Close( handle );
```

The client has the option to check the status through the function DRV_PMP_ClientStatus.

Example:

```
DRV_HANDLE handle;

// Open the instance DRV_PMP_INDEX_0 with Non-blocking and Shared intent
handle = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_SHARED | DRV_IO_INTENT_NONBLOCKING);

if ( DRV_PMP_CLIENT_STATUS_OPEN != DRV_PMP_ClientStatus( handle ) )
   return 0;
```

Client Mode Setting

Any client-specific PMP configuration has to be done using a separate function, DRV_PMP_ModeConfig. This function must be called after the client is open using DRV_PMP_Open.

Following are the client-specific configuration parameters the user can set using this function:

Configuration Parameter	Description
pmpMode	Selects the PMP mode (master or slave) to use.
intMode	Selects the interrupt mode to use.
incrementMode	Sets up address for either auto-increment or decrement mode.
endianMode	Sets Little/Big endian mode.
portSize	Specifies the data width (8-bit or 16-bit).
waitStates	Selects the different wait states.
chipSelect	Selects the Chip Select line.

Example:

```
DRV_HANDLE handle;
DRV_PMP_MODE_CONFIG config;

config.chipSelect = PMCS1_AND_PMCS2_AS_CHIP_SELECT;
config.endianMode = LITTLE_ENDIAN;
config.incrementMode = PMP_ADDRESS_AUTO_INCREMENT;
config.intMode =  PMP_INTERRUPT_NONE;
config.pmpMode = PMP_MASTER_READ_WRITE_STROBES_INDEPENDENT; //Master Mode 2
config.portSize =  PMP_DATA_SIZE_8_BITS;
config.waitStates.dataHoldWait = PMP_DATA_HOLD_2;
config.waitStates.dataWait = PMP_DATA_WAIT_THREE;
config.waitStates.strobeWait = PMP_STROBE_WAIT_5;

// Open the instance DRV_PMP_INDEX_0 with Non-blocking and Shared intent
handle = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_SHARED | DRV_IO_INTENT_NONBLOCKING);

// Configure the client
DRV_PMP_ModeConfig ( handle, config );
```

Example Code for Complete Operation

A code example of complete operation is provided in this section.

Description

This example code will write 100 bytes of data twice (i.e., repeat once) in the memory location starting from 0x0206, and then it will be read in the buffer, myReadBuffer. The modes selected for this transfer are:

- Non-blocking
- No Interrupt
- PMP Master Mode 2
- Address Auto-increment
- No Address/Data Lines Multiplexing
- 8-bit data

Example:

```
void main(void)
{
DRV_PMP_INIT     init;
SYS_MODULE_OBJ   object;
SYS_STATUS       pmpStatus;
DRV_HANDLE       handle;
DRV_PMP_MODE_CONFIG config;
unsigned char myReadBuffer[300], myWriteBuffer[100];
uint32_t deviceAddress, nBytes, repeatCount, i;
uint32_t writeID, readID;
DRV_PMP_TRANSFER_STATUS writeStatus=0, readStatus=0;

// populate the PMP init configuration structure
    init.inputBuffer = PMP_INPUT_BUFFER_TTL;
    init.polarity.addressLatchPolarity = PMP_POLARITY_ACTIVE_HIGH;
    init.polarity.rwStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
    init.polarity.writeEnableStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
    init.polarity.chipselect1Polarity = PMP_POLARITY_ACTIVE_HIGH;
    init.polarity.chipselect2Polarity = PMP_POLARITY_ACTIVE_LOW;
    init.ports.addressPortsMask = PMP_PMA0_PORT | PMP_PMA1_PORT | PMP_PMA2_TO_PMA13_PORTS;
    init.ports.readWriteStrobe = PORT_ENABLE;
    init.ports.writeEnableStrobe = PORT_ENABLE;
    init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
    init.pmpID           = PMP_ID_0;
    init.stopInIdle      = false;
    init.muxMode         = PMP_MUX_NONE;

object = DRV_PMP_Initialize (DRV_PMP_INDEX_0, (SYS_MODULE_INIT *)&init);

pmpStatus = DRV_PMP_Status(object);

if ( SYS_STATUS_READY != pmpStatus)
{
    // Handle error
}

// Open the instance DRV_PMP_INDEX_0 with Non-blocking and Shared intent
handle = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_SHARED | DRV_IO_INTENT_NONBLOCKING);

if( handle == DRV_HANDLE_INVALID )
{
    // Client cannot open the instance.
}

config.chipSelect = PMCS1_AND_PMCS2_AS_CHIP_SELECT;
config.endianMode = LITTLE_ENDIAN;
config.incrementMode = PMP_ADDRESS_AUTO_INCREMENT;
config.intMode =  PMP_INTERRUPT_NONE;
config.pmpMode = PMP_MASTER_READ_WRITE_STROBES_INDEPENDENT; //Master Mode 2
config.portSize =  PMP_DATA_SIZE_8_BITS;
```

```
config.waitStates.dataHoldWait = PMP_DATA_HOLD_2;
config.waitStates.dataWait = PMP_DATA_WAIT_THREE;
config.waitStates.strobeWait = PMP_STROBE_WAIT_5;

// Configure the client
DRV_PMP_ModeConfig ( handle, config );

deviceAddress = 0x0206;
nBytes = 100;
repeatCount = 0x01;
for (i=0; i<nBytes; i++)
{
   myWriteBuffer[i]=i*5+7;
}

writeID = DRV_PMP_Write ( handle, deviceAddress, &myWriteBuffer[0], nBytes, repeatCount);
readID = DRV_PMP_Read ( handle, deviceAddress, &myReadBuffer[0], nBytes*2);

while(!((writeStatus == PMP_TRANSFER_FINISHED)&&(readStatus == PMP_TRANSFER_FINISHED)))
{
    DRV_PMP_Tasks (object);

    writeStatus = DRV_PMP_TransferStatus( DRV_PMP_INDEX_0, writeID);
    readStatus = DRV_PMP_TransferStatus( DRV_PMP_INDEX_0, readID);
}

while(1);
}
```

Configuring the Library

Macros

	Name	Description
	DRV_PMP_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_PMP_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_PMP_QUEUE_SIZE	PMP queue size for different instances.

Description

The configuration of the PMP driver is based on the file `drv_pmp_config.h`.

This header file contains the configuration selection for the PMP Driver. Based on the selections made, the PMP Driver may support the selected features. These configuration settings will apply to all instances of the PMP Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_PMP_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_pmp_config.h

C

```
#define DRV_PMP_CLIENTS_NUMBER 2
```

Description

PMP maximum number of clients

This definition select the maximum number of clients that the PMP driver can support at run time.

Remarks

None.

DRV_PMP_INSTANCES_NUMBER Macro

Selects the maximum number of hardware instances that can be supported by the dynamic driver.

File

drv_pmp_config.h

C

```
#define DRV_PMP_INSTANCES_NUMBER 1
```

Description

PMP hardware instance configuration

This definition selects the maximum number of hardware instances that can be supported by the dynamic driver.

Remarks

None.

DRV_PMP_QUEUE_SIZE Macro

PMP queue size for different instances.

File

drv_pmp_config.h

C

```
#define DRV_PMP_QUEUE_SIZE 8
```

Description

PMP queue size

The PMP queue size for a driver instances should be placed here. If more than one driver instance of PMP is present, then all takes the same queue size.

Remarks

All the transfers (Read/Write) first gets queued and gets completed sequentially when Task API is called in a loop. Therefore, the minimum value of this index should be 1.

Building the Library

This section lists the files that are available in the PMP Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/pmp`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_pmp.h`	This file provides the interface definitions of the PMP driver

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_pmp_dynamic.c`	This file contains the core implementation of the PMP driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library

Module Dependencies

The PMP Driver Library depends on the following modules:

- PMP Peripheral Library
- Interrupt System Service Library

Library Interface

a) System Functions

	Name	Description
	DRV_PMP_Deinitialize	Deinitializes the specified instance of the PMP driver module. **Implementation:** Dynamic
	DRV_PMP_Initialize	Initializes the PMP driver. **Implementation:** Static/Dynamic
	DRV_PMP_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings. **Implementation:** Dynamic
	DRV_PMP_Status	Provides the current status of the PMP driver module. **Implementation:** Dynamic
	DRV_PMP_Tasks	Maintains the driver's state machine and implements its ISR. **Implementation:** Dynamic
	DRV_PMP_TimingSet	Sets PMP timing parameters. **Implementation:** Static

b) Client Interaction Functions

	Name	Description
	DRV_PMP_ClientStatus	Gets the current client-specific status of the PMP driver. **Implementation:** Dynamic
	DRV_PMP_Close	Closes an opened instance of the PMP driver. **Implementation:** Dynamic
	DRV_PMP_ModeConfig	Configures the PMP modes. **Implementation:** Static/Dynamic
	DRV_PMP_Open	Opens the specified PMP driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_PMP_Read	Read the data from external device. **Implementation:** Static/Dynamic
	DRV_PMP_Write	Transfers the data from the MCU to the external device. **Implementation:** Static/Dynamic

c) Client Transfer Functions

	Name	Description
	DRV_PMP_TransferStatus	Returns the transfer status. **Implementation:** Dynamic

e) Data Types and Constants

	Name	Description
	DRV_PMP_INDEX_COUNT	Number of valid PMP driver indices.
	DRV_PMP_CHIPX_STROBE_MODE	PMP writeEnable/ReadWrite strobes.
	DRV_PMP_CLIENT_STATUS	PMP client status definitions.
	DRV_PMP_ENDIAN_MODE	PMP Endian modes.
	DRV_PMP_INDEX	PMP driver index definitions.
	DRV_PMP_INIT	Defines the PMP driver initialization data.
	DRV_PMP_MODE_CONFIG	PMP modes configuration.
	DRV_PMP_POLARITY_OBJECT	PMP polarity object.

	DRV_PMP_PORT_CONTROL	PMP port enable/disable definitions.
	DRV_PMP_PORTS	PMP port configuration.
	DRV_PMP_QUEUE_ELEMENT_OBJ	Defines the object for PMP queue element.
	_DRV_PMP_QUEUE_ELEMENT_OBJ	Defines the object for PMP queue element.
	DRV_PMP_TRANSFER_STATUS	Defines the PMP transfer status.
	DRV_PMP_WAIT_STATES	PMP wait states object.
	MAX_NONBUFFERED_BYTE_COUNT	After this number the PMP transfer should be polled to guarantee data transfer
	DRV_PMP_TRANSFER_TYPE	This is type DRV_PMP_TRANSFER_TYPE.
	PMP_QUEUE_ELEMENT_OBJECT	Defines the structure required for maintaining the queue element.

Description

This section describes the Application Programming Interface (API) functions of the PMP Driver.

Refer to each section for a detailed description.

a) System Functions

DRV_PMP_Deinitialize Function

Deinitializes the specified instance of the PMP driver module.

Implementation: Dynamic

File

drv_pmp.h

C

```
void DRV_PMP_Deinitialize(const SYS_MODULE_OBJ pmpDriverObject);
```

Returns

None.

Description

This function deinitializes the specified instance of the PMP driver module, disabling its operation (and any hardware). All internal data is invalidated.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_PMP_Status operation. The system has to use DRV_PMP_Status to find out when the module is in the ready state.

Preconditions

The DRV_PMP_Initialize function must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Example

```
SYS_MODULE_OBJ      pmpDriverObject;     //  Returned from DRV_PMP_Initialize
SYS_STATUS          status;

DRV_PMP_Deinitialize(pmpDriverObject);

status = DRV_PMP_Status(pmpDriverObject);
if (SYS_MODULE_DEINITIALIZED == status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
pmpDriverObject	Driver object handle, returned from the DRV_PMP_Initialize

Function

void DRV_PMP_Deinitialize (SYS_MODULE_OBJ pmpDriverObject)

DRV_PMP_Initialize Function

Initializes the PMP driver.

Implementation: Static/Dynamic

File

drv_pmp.h

C

```
SYS_MODULE_OBJ DRV_PMP_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

If successful, it returns a valid handle to a driver object. Otherwise, it returns SYS_MODULE_OBJ_INVALID. The returned object must be passed as argument to DRV_PMP_Reinitialize, DRV_PMP_Deinitialize, DRV_PMP_Tasks and DRV_PMP_Status routines.

Description

This function initializes the PMP driver, making it ready for clients to open and use it.

Remarks

This function must be called before any other PMP function is called.

This function should only be called once during system initialization unless DRV_PMP_Deinitialize is called to deinitialize the driver instance.

This function will NEVER block for hardware access. If the operation requires time to allow the hardware to reinitialize, it will be reported by the DRV_PMP_Status operation. The system must use DRV_PMP_Status to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

None.

Example

```
DRV_PMP_INIT    init;
SYS_MODULE_OBJ  objectHandle;

// Populate the initialization structure
init.inputBuffer = PMP_INPUT_BUFFER_TTL;
init.polarity.addressLatchPolarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.rwStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.writeEnableStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.chipselect1Polarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.chipselect2Polarity = PMP_POLARITY_ACTIVE_LOW;
init.ports.addressPortsMask = PMP_PMA0_PORT | PMP_PMA1_PORT | PMP_PMA2_TO_PMA13_PORTS | PMP_PMA14_PORT;
init.ports.readWriteStrobe = PORT_ENABLE;
init.ports.writeEnableStrobe = PORT_ENABLE;
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.pmpID            = PMP_ID_0;
init.stopInIdle       = false;
init.muxMode          = PMP_MUX_NONE;

// Do something

objectHandle = DRV_PMP_Initialize(DRV_PMP_INDEX_0,  (SYS_MODULE_INIT*)&init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
drvIndex	Index for the driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver

Function

SYS_MODULE_OBJ DRV_PMP_Initialize(const SYS_MODULE_INDEX drvIndex,
const SYS_MODULE_INIT * const init)

DRV_PMP_Reinitialize Function

Reinitializes the driver and refreshes any associated hardware settings.

Implementation: Dynamic

File

drv_pmp.h

C

```
void DRV_PMP_Reinitialize(const SYS_MODULE_OBJ pmpDriverObject, const SYS_MODULE_INIT * const init);
```

Returns

None.

Description

This function reinitializes the driver and refreshes any associated hardware settings using the specified initialization data, but it will not interrupt any ongoing operations.

Remarks

This function can be called multiple times to reinitialize the module.

This operation can be used to refresh any supported hardware registers as specified by the initialization data or to change the power state of the module.

This function will NEVER block for hardware access. If the operation requires time to allow the hardware to re-initialize, it will be reported by the DRV_PMP_Status operation. The system must use DRV_PMP_Status to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

The DRV_PMP_Initialize function must have been called before calling this function and a valid SYS_MODULE_OBJ must have been returned.

Example

```
DRV_PMP_INIT    init;
SYS_MODULE_OBJ  pmpDriverObject;
SYS_STATUS  pmpStatus;

// Populate the initialization structure
init.inputBuffer = PMP_INPUT_BUFFER_TTL;
init.polarity.addressLatchPolarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.rwStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.writeEnableStrobePolarity = PMP_POLARITY_ACTIVE_LOW;
init.polarity.chipselect1Polarity = PMP_POLARITY_ACTIVE_HIGH;
init.polarity.chipselect2Polarity = PMP_POLARITY_ACTIVE_LOW;
init.ports.addressPortsMask = PMP_PMA0_PORT | PMP_PMA1_PORT | PMP_PMA2_TO_PMA13_PORTS | PMP_PMA14_PORT;
init.ports.readWriteStrobe = PORT_ENABLE;
init.ports.writeEnableStrobe = PORT_ENABLE;
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.pmpID            = PMP_ID_0;
init.stopInIdle       = false;
init.muxMode          = PMP_MUX_NONE;

DRV_PMP_Reinitialize(pmpDriverObject, (SYS_MODULE_INIT*)&init);

pmpStatus = DRV_PMP_Status(pmpDriverObject);
if (SYS_STATUS_BUSY == pmpStatus)
{
    // Check again later to ensure the driver is ready
}
else if (SYS_STATUS_ERROR >= pmpStatus)
```

```
{
    // Handle error
}
```

Parameters

Parameters	Description
pmpDriverObject	Driver object handle, returned from the DRV_PMP_Initialize

Function

void DRV_PMP_Reinitialize (SYS_MODULE_OBJ pmpDriverObject,
const SYS_MODULE_INIT * const init)

init - Pointer to the initialization data structure

DRV_PMP_Status Function

Provides the current status of the PMP driver module.

Implementation: Dynamic

File

drv_pmp.h

C

```
SYS_STATUS DRV_PMP_Status(const SYS_MODULE_OBJ pmpDriverObject);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Description

This function provides the current status of the PMP driver module.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

This operation can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, a previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

The DRV_PMP_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      pmpDriverObject;     // Returned from DRV_PMP_Initialize
SYS_STATUS          status;

status = DRV_PMP_Status(pmpDriverObject);
else if (SYS_STATUS_ERROR >= status)
{
    // Handle error
}
```

Parameters

Parameters	Description
pmpDriverObject	Driver object handle, returned from the DRV_PMP_Initialize routine

Function

SYS_STATUS DRV_PMP_Status (SYS_MODULE_OBJ pmpDriverObject)

DRV_PMP_Tasks Function

Maintains the driver's state machine and implements its ISR.

Implementation: Dynamic

File

drv_pmp.h

C

```
void DRV_PMP_Tasks(SYS_MODULE_OBJ pmpDriverObject);
```

Returns

None.

Description

This function is used to maintain the queue and execute the tasks stored in the queue. It resides in the ISR of the PMP for interrupt-driven implementations.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This function may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_PMP_Initialize function must have been called for the specified PMP driver instance.

Example

```
SYS_MODULE_OBJ      pmpDriverObject;     // Returned from DRV_PMP_Initialize

while (true)
{
    DRV_PMP_Tasks (pmpDriverObject);

    // Do other tasks
}
```

Parameters

Parameters	Description
pmpDriverObject	Object handle for the specified driver instance (returned from DRV_PMP_Initialize)

Function

void DRV_PMP_Tasks (SYS_MODULE_OBJ pmpDriverObject);

DRV_PMP_TimingSet Function

Sets PMP timing parameters.

Implementation: Static

File

drv_pmp.h

C

```
void DRV_PMP_TimingSet(PMP_DATA_WAIT_STATES dataWait, PMP_STROBE_WAIT_STATES strobeWait,
PMP_DATA_HOLD_STATES dataHold);
```

Returns

None.

Description

This function sets the PMP timing parameters.

Remarks

None.

Preconditions

The DRV_PMP_Initialize function must have been called.

Example

```
DRV_PMP0_TimingSet(PMP_DATA_WAIT_THREE,PMP_STROBE_WAIT_6,PMP_DATA_HOLD_4);
```

Parameters

Parameters	Description
dataWait	Data setup to read/write strobe wait states
strobeWait	Read/write strobe wait states
dataHold	Data hold time after read/write strobe wait states

Function

void DRV_PMP_TimingSet(
PMP_DATA_WAIT_STATES dataWait,
PMP_STROBE_WAIT_STATES strobeWait,
PMP_DATA_HOLD_STATES dataHold
)

b) Client Interaction Functions

DRV_PMP_ClientStatus Function

Gets the current client-specific status of the PMP driver.

Implementation: Dynamic

File

drv_pmp.h

C

```
DRV_PMP_CLIENT_STATUS DRV_PMP_ClientStatus(DRV_HANDLE hClient);
```

Returns

A DRV_PMP_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the PMP driver associated with the specified handle.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_PMP_Initialize routine must have been called.

DRV_PMP_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE hClient;  // Returned from DRV_PMP_Open
DRV_PMP_CLIENT_STATUS pmpClientStatus;

pmpClientStatus = DRV_PMP_ClientStatus(hClient);
```

```
if(DRV_PMP_CLIENT_STATUS_ERROR >= pmpClientStatus)
{
    // Handle the error
}
```

Parameters

Parameters	Description
hClient	A valid open-instance handle, returned from the driver's open routine

Function

DRV_PMP_CLIENT_STATUS DRV_PMP_ClientStatus (DRV_HANDLE hClient)

DRV_PMP_Close Function

Closes an opened instance of the PMP driver.

Implementation: Dynamic

File

drv_pmp.h

C

```
void DRV_PMP_Close(const DRV_HANDLE hClient);
```

Returns

None

Description

This function closes an opened instance of the PMP driver, invalidating the handle.

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_PMP_Open before the caller may use the driver again.

If DRV_IO_INTENT_BLOCKING was requested and the driver was built appropriately to support blocking behavior call may block until the operation is complete.

If DRV_IO_INTENT_NON_BLOCKING request the driver client can call the DRV_PMP_Status operation to find out when the module is in the ready state (the handle is no longer valid).

Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_PMP_Initialize routine must have been called for the specified PMP driver instance.

DRV_PMP_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE hClient;  // Returned from DRV_PMP_Open

DRV_PMP_Close(hClient);
```

Parameters

Parameters	Description
hClient	A valid open instance handle, returned from the driver's open routine

Function

void DRV_PMP_Close (DRV_HANDLE hClient)

DRV_PMP_ModeConfig Function

Configures the PMP modes.

Implementation: Static/Dynamic

File

drv_pmp.h

C

```
void DRV_PMP_ModeConfig(DRV_HANDLE hClient, DRV_PMP_MODE_CONFIG config);
```

Returns

None.

Description

This function configures the modes for client in which it wants to operate. Different master-slave modes, 8/16 data bits selection, address increment/decrement, interrupt mode, wait states, etc., can be configured through this function.

Remarks

This function will NEVER block waiting for hardware. If this API is called more than once for a particular client handle, previous config setting of that client will be overwritten.

Preconditions

Function DRV_PMP_Initialize must have been called. DRV_PMP_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE  hClient;
DRV_PMP_MODE_CONFIG config;

config.chipSelect = PMCS1_AND_PMCS2_AS_CHIP_SELECT;
config.endianMode = LITTLE_ENDIAN;
config.incrementMode = PMP_ADDRESS_AUTO_INCREMENT;
config.intMode =  PMP_INTERRUPT_NONE;
config.pmpMode = PMP_MASTER_READ_WRITE_STROBES_INDEPENDENT;
config.portSize =  PMP_DATA_SIZE_8_BITS;
config.waitStates.dataHoldWait = PMP_DATA_HOLD_2;
config.waitStates.dataWait = PMP_DATA_WAIT_THREE;
config.waitStates.strobeWait = PMP_STROBE_WAIT_5;

DRV_PMP_ModeConfig ( hClient, config );
```

Parameters

Parameters	Description
hClient	Client handle obtained from DRV_PMP_Open API
config	Structure which will have all the required PMP modes configuration

Function

void DRV_PMP_ModeConfig (DRV_HANDLE hClient,
DRV_PMP_MODE_CONFIG config)

DRV_PMP_Open Function

Opens the specified PMP driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_pmp.h

C

```
DRV_HANDLE DRV_PMP_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID.

Description

This function opens the specified PMP driver instance and provides a handle that must be provided to all other client-level operations to identify

the caller and the instance of the driver.

Remarks

The handle returned is valid until the DRV_PMP_Close routine is called.

This function will NEVER block waiting for hardware.

If the DRV_IO_INTENT_BLOCKING is requested and the driver was built appropriately to support blocking behavior, other client-level operations may block waiting on hardware until they are complete.

If DRV_IO_INTENT_NON_BLOCKING is requested the driver client can call the DRV_PMP_ClientStatus operation to find out when the module is in the ready state.

If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID.

Preconditions

The DRV_PMP_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  hClient;

hClient = DRV_PMP_Open(DRV_PMP_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == hClient)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_PMP_Open (const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent)

DRV_PMP_Read Function

Read the data from external device.

Implementation: Static/Dynamic

File

drv_pmp.h

C

```
PMP_QUEUE_ELEMENT_OBJECT* DRV_PMP_Read(DRV_HANDLE hClient, uint32_t address, uint16_t* buffer, uint32_t
nBytes);
```

Returns

Returns the position number of the queue, where the data element was stored. Returns '0' when there is no place in the queue to store the data.

Description

This function reads the given number of data bytes from the given address of the external device to the MCU buffer through the selected PMP instance. This function should be used for all the master and slave modes. Proper configuration should be done using DRV_PMP_ModeConfig before calling this function.

Preconditions

The DRV_PMP_Initialize routine must have been called. DRV_PMP_Open must have been called to obtain a valid opened device handle. DRV_PMP_ModeConfig must have been called to configure the desired mode

Example

```
DRV_HANDLE hClient;  // Returned from DRV_PMP_Open
uint32_t deviceAddress;
uint32_t nBytes;
unsigned char myBuffer[nBytes];
uint32_t transferID;
```

```
transferID = DRV_PMP_Read ( hClient, deviceAddress, &myBuffer, nBytes);
```

Parameters

Parameters	Description
hClient	A valid open-instance handle, returned from the driver's open routine
address	Starting address of the slave device from where data has to be read. It does not have any significance for legacy slave mode and buffer mode. In PMP enhanced slave mode i.e. addressable buffer slave mode, this parameter should be the buffer number to be used.
buffer	Pointer to the buffer into which the data read through the PMP instance will be placed. Even if only one word has to be transferred, pointer should be used.
nBytes	Number of bytes that need to be read through the PMP instance

Function

uint32_t DRV_PMP_Read (DRV_HANDLE hClient,

uint32_t address,

unsigned char* buffer,

uint32_t nBytes)

DRV_PMP_Write Function

Transfers the data from the MCU to the external device.

Implementation: Static/Dynamic

File

drv_pmp.h

C

```
PMP_QUEUE_ELEMENT_OBJECT* DRV_PMP_Write(DRV_HANDLE* hClient, bool address, uint32_t * buffer, uint32_t
nBytes, uint32_t repeatCount);
```

Returns

Returns a 32-bit ID with which status of the transfer can be checked later. Returns '0' when there is no place in the queue to store the data.

Description

This function transfer the given number of data bytes from the MCU buffer location to the defined address of the external device through the selected PMP instance. It repeats the operation n (=repeatCount) number of times as well. This function should be used for all the master and slave modes. Proper configuration should be done using DRV_PMP_ModeConfig before calling this function.

Preconditions

The DRV_PMP_Initialize routine must have been called. DRV_PMP_Open must have been called to obtain a valid opened device handle. DRV_PMP_ModeConfig must have been called to configure the desired mode.

Example

```
DRV_HANDLE hClient;  // Returned from DRV_PMP_Open
uint32_t deviceAddress;
uint32_t nBytes;
unsigned char myBuffer[nBytes];
uint32_t repeatCount;
uint32_t transferID;

transferID = DRV_PMP_MasterWrite ( hClient, deviceAddress, &myBuffer, nBytes, repeatCount);
```

Parameters

Parameters	Description
hClient	A valid open-instance handle, returned from the driver's open routine
address	Starting address of the slave device where data has to be written. It does not have any significance for legacy slave mode and buffer mode. In PMP enhanced slave mode (i.e., addressable buffer slave mode), this parameter should be the buffer number to be used.
buffer	Pointer to MCU Buffer from which the data will be written through the PMP instance. even if only one word has to be transferred, pointer should be used.

nBytes	Total number of bytes that need to be written through the PMP instance
repeatCount	Number of times the data set (nBytes of data) to be repeatedly written. This value should be 0 if user does not want any repetition. If repeatCount is greater than 0, then after writing every nBytes of data, the buffer starts pointing to its first element. Ideally, PMP Address should be in auto increment/decrement mode for repeatCount greater than 0.

Function

uint32_t DRV_PMP_Write (DRV_HANDLE hClient,
uint32_t address,
unsigned char* buffer,
uint32_t nBytes,
uint32_t repeatCount)

c) Client Transfer Functions

DRV_PMP_TransferStatus Function

Returns the transfer status.

Implementation: Dynamic

File

drv_pmp.h

C

```
DRV_PMP_TRANSFER_STATUS DRV_PMP_TransferStatus(PMP_QUEUE_ELEMENT_OBJECT* queueObject);
```

Returns

A DRV_PMP_TRANSFER_STATUS value describing the current status of the transfer.

Description

This function returns the status of a particular transfer whose ID has been specified as input.

Example

```
uint32_8 seqID;
DRV_PMP_TRANSFER_STATUS transferStatus;

transferStatus = DRV_PMP_TransferStatus( DRV_PMP_INDEX_0, seqID);
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
seqID	A valid ID returned from read/write transfer functions

Function

DRV_PMP_TRANSFER_STATUS DRV_PMP_TransferStatus(DRV_HANDLE hClient)

d) Miscellaneous Functions

e) Data Types and Constants

DRV_PMP_INDEX_COUNT Macro

Number of valid PMP driver indices.

File

drv_pmp.h

C

```
#define DRV_PMP_INDEX_COUNT _PMP_EXISTS
```

Description

PMP Driver Module Index Count

This constant identifies the number of valid PMP driver indices.

Remarks

The value of "_PMP_EXISTS" is derived from device-specific header files defined as part of the peripheral libraries.

DRV_PMP_CHIPX_STROBE_MODE Enumeration

PMP writeEnable/ReadWrite strobes.

File

drv_pmp.h

C

```
typedef enum {
  PMP_RW_STROBE_WITH_ENABLE_STROBE,
  PMP_READ_AND_WRITE_STROBES
} DRV_PMP_CHIPX_STROBE_MODE;
```

Members

Members	Description
PMP_RW_STROBE_WITH_ENABLE_STROBE	One strobe for read/write and another for enable
PMP_READ_AND_WRITE_STROBES	Separate strobes for read and write operations

Description

PMP writeEnable/ReadWrite strobes

This enumeration provides ReadWrite/WriteEnable Strobe definitions.

DRV_PMP_CLIENT_STATUS Enumeration

PMP client status definitions.

File

drv_pmp.h

C

```
typedef enum {
  DRV_PMP_CLIENT_STATUS_INVALID,
  PMP_CLIENT_STATUS_CLOSED,
  DRV_PMP_CLIENT_STATUS_OPEN
} DRV_PMP_CLIENT_STATUS;
```

Description

PMP Client Status

This enumeration provides various client status possibilities.

DRV_PMP_ENDIAN_MODE Enumeration

PMP Endian modes.

File

drv_pmp.h

C

```
typedef enum {
  LITTLE,
  BIG
} DRV_PMP_ENDIAN_MODE;
```

Members

Members	Description
LITTLE	Little Endian
BIG	Big Endian

Description

PMP Endian modes

This enumeration holds the Endian configuration options.

DRV_PMP_INDEX Enumeration

PMP driver index definitions.

File

drv_pmp.h

C

```
typedef enum {
  DRV_PMP_INDEX_0,
  DRV_PMP_INDEX_1
} DRV_PMP_INDEX;
```

Members

Members	Description
DRV_PMP_INDEX_0	First PMP instance
DRV_PMP_INDEX_1	Second PMP instance (not available for now)

Description

PMP Driver Module Index Numbers

These constants provide PMP driver index definitions.

Remarks

These values should be passed into the DRV_PMP_Initialize and DRV_PMP_Open functions to identify the driver instance in use.

DRV_PMP_INIT Structure

Defines the PMP driver initialization data.

File

drv_pmp.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  PMP_MODULE_ID pmpID;
  bool stopInIdle;
  PMP_MUX_MODE muxMode;
  PMP_INPUT_BUFFER_TYPE inputBuffer;
  DRV_PMP_POLARITY_OBJECT polarity;
  DRV_PMP_PORTS ports;
} DRV_PMP_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	module power state info
PMP_MODULE_ID pmpID;	module PLIB ID
bool stopInIdle;	Stop in Idle enable
PMP_MUX_MODE muxMode;	MUX mode
PMP_INPUT_BUFFER_TYPE inputBuffer;	Input buffer type to be used
DRV_PMP_POLARITY_OBJECT polarity;	Polarity settings

DRV_PMP_PORTS ports;	PMP port settings

Description

PMP Driver Initialize Data

This data type defines data required to initialize or reinitialize the PMP driver.

Remarks

Not all the initialization features are available for all devices.

DRV_PMP_MODE_CONFIG Structure

PMP modes configuration.

File

drv_pmp.h

C

```
typedef struct {
  PMP_OPERATION_MODE pmpMode;
  PMP_INTERRUPT_MODE intMode;
  PMP_INCREMENT_MODE incrementMode;
  DRV_PMP_ENDIAN_MODE endianMode;
  PMP_DATA_SIZE portSize;
  DRV_PMP_WAIT_STATES waitStates;
  PMP_CHIPSELECT_FUNCTION chipSelect;
} DRV_PMP_MODE_CONFIG;
```

Members

Members	Description
PMP_OPERATION_MODE pmpMode;	PMP Usage Mode Type
PMP_INTERRUPT_MODE intMode;	Interrupt mode
PMP_INCREMENT_MODE incrementMode;	should be appropriately selected based on read/write requirements and operation mode setting */ address/buffer increment mode
DRV_PMP_ENDIAN_MODE endianMode;	it does not have any significance in PMP slave mode or 8bit data mode */ Endian modes
PMP_DATA_SIZE portSize;	Data Port Size
DRV_PMP_WAIT_STATES waitStates;	Wait states
PMP_CHIPSELECT_FUNCTION chipSelect;	use this when PLIB is fixed

Description

PMP modes configuration

This data type controls the configuration of PMP modes.

DRV_PMP_POLARITY_OBJECT Structure

PMP polarity object.

File

drv_pmp.h

C

```
typedef struct {
  PMP_POLARITY_LEVEL addressLatchPolarity;
  PMP_POLARITY_LEVEL byteEnablePolarity;
  PMP_POLARITY_LEVEL rwStrobePolarity;
  PMP_POLARITY_LEVEL writeEnableStrobePolarity;
  PMP_POLARITY_LEVEL chipselect1Polarity;
  PMP_POLARITY_LEVEL chipselect2Polarity;
} DRV_PMP_POLARITY_OBJECT;
```

Members

Members	Description
PMP_POLARITY_LEVEL addressLatchPolarity;	Address latch polarity

PMP_POLARITY_LEVEL byteEnablePolarity;	ByteEnable port polarity
PMP_POLARITY_LEVEL rwStrobePolarity;	Read/Write strobe polarity
PMP_POLARITY_LEVEL writeEnableStrobePolarity;	Write/Enable strobe polarity
PMP_POLARITY_LEVEL chipselect1Polarity;	ChipSelect-1 Polarity
PMP_POLARITY_LEVEL chipselect2Polarity;	chipSelect-2 Polarity

Description

PMP polarity object

This structure holds the polarities of different entities to be configured.

DRV_PMP_PORT_CONTROL Enumeration

PMP port enable/disable definitions.

File

drv_pmp.h

C

```
typedef enum {
  PORT_ENABLE,
  PORT_DISABLE
} DRV_PMP_PORT_CONTROL;
```

Members

Members	Description
PORT_ENABLE	Enable the given port
PORT_DISABLE	Disable the given port

Description

PMP port enable/disable.

This enumeration provides port enable/disable values.

DRV_PMP_PORTS Structure

PMP port configuration.

File

drv_pmp.h

C

```
typedef struct {
  PMP_ADDRESS_PORT addressPortsMask;
  PMP_PMBE_PORT byteEnablePort;
  DRV_PMP_PORT_CONTROL readWriteStrobe;
  DRV_PMP_PORT_CONTROL writeEnableStrobe;
} DRV_PMP_PORTS;
```

Members

Members	Description
PMP_ADDRESS_PORT addressPortsMask;	User needs to put the address lines which he wants to use in ORed fashion * Address ports
PMP_PMBE_PORT byteEnablePort;	Byte enable ports
DRV_PMP_PORT_CONTROL readWriteStrobe;	READ/WRITE Strobe PORT
DRV_PMP_PORT_CONTROL writeEnableStrobe;	WRITE/ENABLE strobe port

Description

PMP Ports

This structure holds the ports (including the address ports) to be configured by the application to function as general purpose I/O (GPIO) or part of the PMP.

DRV_PMP_QUEUE_ELEMENT_OBJ Structure

Defines the object for PMP queue element.

File

drv_pmp.h

C

```
typedef struct _DRV_PMP_QUEUE_ELEMENT_OBJ {
  struct _DRV_PMP_CLIENT_OBJ * hClient;
  uint32_t buffer;
  uint16_t* addressBuffer;
  uint32_t nTransfers;
  int32_t nRepeats;
  DRV_PMP_TRANSFER_TYPE type;
} DRV_PMP_QUEUE_ELEMENT_OBJ;
```

Members

Members	Description
struct _DRV_PMP_CLIENT_OBJ * hClient;	handle of the client object returned from open API
uint32_t buffer;	pointer to the buffer holding the transmitted data
uint16_t* addressBuffer;	pointer to the buffer holding the transmitted data
uint32_t nTransfers;	number of bytes to be transferred
int32_t nRepeats;	number of times the data set has to be transferred repeatedly
DRV_PMP_TRANSFER_TYPE type;	PMP Read or Write

Description

PMP Driver Queue Element Object

This defines the object structure for each queue element of PMP. This object gets created for every Read/Write operations APIs.

Remarks

None

DRV_PMP_TRANSFER_STATUS Enumeration

Defines the PMP transfer status.

File

drv_pmp.h

C

```
typedef enum {
  MASTER_8BIT_TRANSFER_IN_PROGRESS = PMP_DATA_SIZE_8_BITS,
  MASTER_16BIT_TRANSFER_IN_PROGRESS = PMP_DATA_SIZE_16_BITS,
  MASTER_8BIT_BUFFER_IN_PROGRESS,
  MASTER_16BIT_BUFFER_IN_PROGRESS,
  MASTER_8BIT_TRANSFER_CONTINUE,
  MASTER_8BIT_BUFFER_CONTINUE,
  QUEUED_BUT_PMP_TRANSFER_NOT_STARTED,
  PMP_TRANSFER_FINISHED
} DRV_PMP_TRANSFER_STATUS;
```

Description

Queue Element Transfer Status

This enumeration defines the PMP transfer status.

DRV_PMP_WAIT_STATES Structure

PMP wait states object.

File

drv_pmp.h

C

```
typedef struct {
  PMP_DATA_HOLD_STATES dataHoldWait;
  PMP_STROBE_WAIT_STATES strobeWait;
  PMP_DATA_WAIT_STATES dataWait;
} DRV_PMP_WAIT_STATES;
```

Members

Members	Description
PMP_DATA_HOLD_STATES dataHoldWait;	data hold wait states
PMP_STROBE_WAIT_STATES strobeWait;	read/write strobe wait states
PMP_DATA_WAIT_STATES dataWait;	data wait strobe wait sates

Description

PMP wait states object

This structure holds the different wait states to be configured. Refer to the PMP PLIB help document for the possible values and meaning of the different wait states.

MAX_NONBUFFERED_BYTE_COUNT Macro

File

drv_pmp.h

C

```
#define MAX_NONBUFFERED_BYTE_COUNT 4 /*************************************************************************
                                      After this number the PMP transfer should be polled to guarantee data
                                      transfer
                                      *************************************************************************

*/
```

Description

After this number the PMP transfer should be polled to guarantee data transfer

DRV_PMP_TRANSFER_TYPE Enumeration

File

drv_pmp.h

C

```
typedef enum {
  ADDRESS,
  READ,
  WRITE,
  BUFFERED_WRITE
} DRV_PMP_TRANSFER_TYPE;
```

Members

Members	Description
ADDRESS	PMP Address needs to be updated
READ	PMP Read Transfer
WRITE	PMP Write Transfer
BUFFERED_WRITE	PMP Array Write Transfer

Description

This is type DRV_PMP_TRANSFER_TYPE.

PMP_QUEUE_ELEMENT_OBJECT Structure

Defines the structure required for maintaining the queue element.

File

drv_pmp.h

C

```
typedef struct {
  DRV_PMP_QUEUE_ELEMENT_OBJ data;
  DRV_PMP_TRANSFER_STATUS eTransferStatus;
  uint32_t nTransfersDone;
} PMP_QUEUE_ELEMENT_OBJECT;
```

Members

Members	Description
DRV_PMP_QUEUE_ELEMENT_OBJ data;	The PMP Q Element
DRV_PMP_TRANSFER_STATUS eTransferStatus;	Flag to indicate that the element is in use
uint32_t nTransfersDone;	sequence id

Description

Queue Element Object

This defines the structure required for maintaining the queue element.

Remarks

None

Files

Files

Name	Description
drv_pmp.h	Parallel Master Port (PMP) device driver interface file.
drv_pmp_config.h	PMP driver configuration definitions template

Description

This section lists the source and header files used by the PMP Driver Library.

drv_pmp.h

Parallel Master Port (PMP) device driver interface file.

Enumerations

	Name	Description
	DRV_PMP_CHIPX_STROBE_MODE	PMP writeEnable/ReadWrite strobes.
	DRV_PMP_CLIENT_STATUS	PMP client status definitions.
	DRV_PMP_ENDIAN_MODE	PMP Endian modes.
	DRV_PMP_INDEX	PMP driver index definitions.
	DRV_PMP_PORT_CONTROL	PMP port enable/disable definitions.
	DRV_PMP_TRANSFER_STATUS	Defines the PMP transfer status.
	DRV_PMP_TRANSFER_TYPE	This is type DRV_PMP_TRANSFER_TYPE.

Functions

	Name	Description
	DRV_PMP_ClientStatus	Gets the current client-specific status of the PMP driver. **Implementation:** Dynamic
	DRV_PMP_Close	Closes an opened instance of the PMP driver. **Implementation:** Dynamic
	DRV_PMP_Deinitialize	Deinitializes the specified instance of the PMP driver module. **Implementation:** Dynamic
	DRV_PMP_Initialize	Initializes the PMP driver. **Implementation:** Static/Dynamic

	DRV_PMP_ModeConfig	Configures the PMP modes. **Implementation:** Static/Dynamic
	DRV_PMP_Open	Opens the specified PMP driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_PMP_Read	Read the data from external device. **Implementation:** Static/Dynamic
	DRV_PMP_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings. **Implementation:** Dynamic
	DRV_PMP_Status	Provides the current status of the PMP driver module. **Implementation:** Dynamic
	DRV_PMP_Tasks	Maintains the driver's state machine and implements its ISR. **Implementation:** Dynamic
	DRV_PMP_TimingSet	Sets PMP timing parameters. **Implementation:** Static
	DRV_PMP_TransferStatus	Returns the transfer status. **Implementation:** Dynamic
	DRV_PMP_Write	Transfers the data from the MCU to the external device. **Implementation:** Static/Dynamic

Macros

	Name	Description
	DRV_PMP_INDEX_COUNT	Number of valid PMP driver indices.
	MAX_NONBUFFERED_BYTE_COUNT	After this number the PMP transfer should be polled to guarantee data transfer

Structures

	Name	Description
	_DRV_PMP_QUEUE_ELEMENT_OBJ	Defines the object for PMP queue element.
	DRV_PMP_INIT	Defines the PMP driver initialization data.
	DRV_PMP_MODE_CONFIG	PMP modes configuration.
	DRV_PMP_POLARITY_OBJECT	PMP polarity object.
	DRV_PMP_PORTS	PMP port configuration.
	DRV_PMP_QUEUE_ELEMENT_OBJ	Defines the object for PMP queue element.
	DRV_PMP_WAIT_STATES	PMP wait states object.
	PMP_QUEUE_ELEMENT_OBJECT	Defines the structure required for maintaining the queue element.

Description

PMP Device Driver Interface

The PMP device driver provides a simple interface to manage the Parallel Master and Slave ports. This file defines the interface definitions and prototypes for the PMP driver.

File Name

drv_pmp.h

RTCC Driver Library

This section describes the RTCC Driver Library.

Introduction

The Real-Time Clock Calendar (RTCC) Static Driver provides a high-level interface to manage the RTCC module on the Microchip family of microcontrollers.

Description

Through the MHC, this driver provides APIs for the following:

- Initializing the module
- Starting/Stopping the RTCC
- Status functions to yield the date/time
- Status functions to yield the alarm date/time
- Clock output control

Library Interface

System Interaction Functions

	Name	Description
	DRV_RTCC_AlarmDateGet	Gets the Alarm Date of the RTCC. **Implementation:** Static
	DRV_RTCC_AlarmTimeGet	Gets the Alarm Time of the RTCC. **Implementation:** Static
	DRV_RTCC_ClockOutput	Enables Clock Output for the RTCC. **Implementation:** Static
	DRV_RTCC_DateGet	Gets the Date of the RTCC. **Implementation:** Static
	DRV_RTCC_Initialize	Initializes the RTCC instance for the specified driver index. **Implementation:** Static
	DRV_RTCC_Start	Starts the RTCC. **Implementation:** Static
	DRV_RTCC_Stop	Stops the RTCC. **Implementation:** Static
	DRV_RTCC_TimeGet	Gets the time of the RTCC. **Implementation:** Static

Description

This section describes the Application Programming Interface (API) functions of the RTCC Driver Library.

System Interaction Functions

DRV_RTCC_AlarmDateGet Function

Gets the Alarm Date of the RTCC.

Implementation: Static

File

help_drv_rtcc.h

C

```
uint32_t DRV_RTCC_AlarmDateGet();
```

Returns

uint32_t alarm date value

Description

This routine gets the RTCC alarm date.

Remarks

None.

Preconditions

DRV_RTCC_Initialize has been called.

Function

uint32_t DRV_RTCC_AlarmDateGet(void)

DRV_RTCC_AlarmTimeGet Function

Gets the Alarm Time of the RTCC.

Implementation: Static

File

help_drv_rtcc.h

C

```
uint32_t DRV_RTCC_AlarmTimeGet();
```

Returns

uint32_t alarm time value

Description

This routine gets the RTCC alarm time.

Remarks

None.

Preconditions

DRV_RTCC_Initialize has been called.

Function

uint32_t DRV_RTCC_AlarmTimeGet(void)

DRV_RTCC_ClockOutput Function

Enables Clock Output for the RTCC.

Implementation: Static

File

help_drv_rtcc.h

C

```
void DRV_RTCC_ClockOutput();
```

Returns

None.

Description

This routine enables the clock output for the RTCC

Remarks

None.

Preconditions

DRV_RTCC_Initialize has been called.

Function

void DRV_RTCC_ClockOutput(void)

DRV_RTCC_DateGet Function

Gets the Date of the RTCC.

Implementation: Static

File

help_drv_rtcc.h

C

```
uint32_t DRV_RTCC_DateGet();
```

Returns

uint32_t date value

Description

This routine gets the RTCC date.

Remarks

None.

Preconditions

DRV_RTCC_Initialize has been called.

Function

uint32_t DRV_RTCC_DateGet(void)

DRV_RTCC_Initialize Function

Initializes the RTCC instance for the specified driver index.

Implementation: Static

File

help_drv_rtcc.h

C

```
void DRV_RTCC_Initialize();
```

Returns

None.

Description

This routine initializes the RTCC driver instance for the specified driver instance, making it ready for clients to use it. The initialization routine is specified by the MHC parameters.

Remarks

This routine must be called before any other RTCC routine is called. This routine should only be called once during system initialization.

Preconditions

None.

Function

void DRV_RTCC_Initialize(void)

DRV_RTCC_Start Function

Starts the RTCC.

Implementation: Static

File

help_drv_rtcc.h

C

```
void DRV_RTCC_Start();
```

Returns

None.

Description

This routine starts the RTCC, making it ready for clients to use it.

Remarks

None.

Preconditions

DRV_RTCC_Initialize has been called.

Function

void DRV_RTCC_Start(void)

DRV_RTCC_Stop Function

Stops the RTCC.

Implementation: Static

File

help_drv_rtcc.h

C

```
void DRV_RTCC_Stop();
```

Returns

None.

Description

This routine stops the RTCC.

Remarks

None.

Preconditions

DRV_RTCC_Initialize has been called.

Function

void DRV_RTCC_Stop(void)

DRV_RTCC_TimeGet Function

Gets the time of the RTCC.

Implementation: Static

File

help_drv_rtcc.h

C

```
uint32_t DRV_RTCC_TimeGet();
```

Returns

uint32_t time value

Description

This routine gets the RTCC time.

Remarks

None.

Preconditions

DRV_RTCC_Initialize has been called.

Function

uint32_t DRV_RTCC_TimeGet(void)

Secure Digital (SD) Card Driver Library

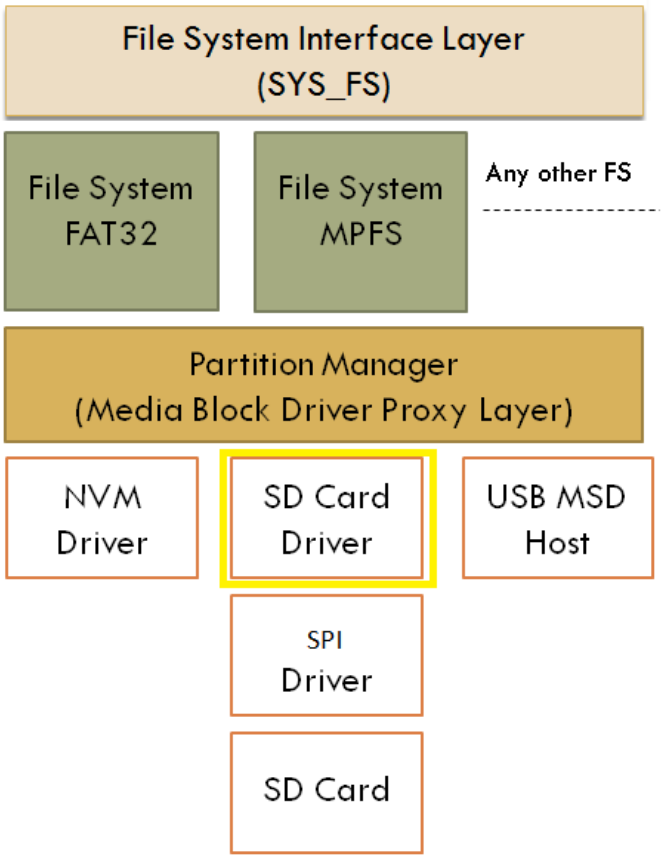
This section describes the Secure Digital (SD) Card Driver Library.

Introduction

The SD Card driver provides the necessary interfaces to interact with an SD card. It provides the necessary abstraction for the higher layer.

Description

A SD Card is a non-volatile memory (Flash memory) card designed to provide high-capacity memory in a small size. Its applications include digital video camcorders, digital cameras, handheld computers, audio players, and mobile phones.



Using the Library

This topic describes the basic architecture of the SD Card Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_sdcard.h`

The interface to the SD Card Driver library is defined in the `drv_sdcard.h` header file. This file is included by the `drv.h` file. Any C language source (`.c`) file that uses the SD Card Driver library should include `drv.h`.

Please refer to the What is MPLAB Harmony? section for how the Driver interacts with the framework.

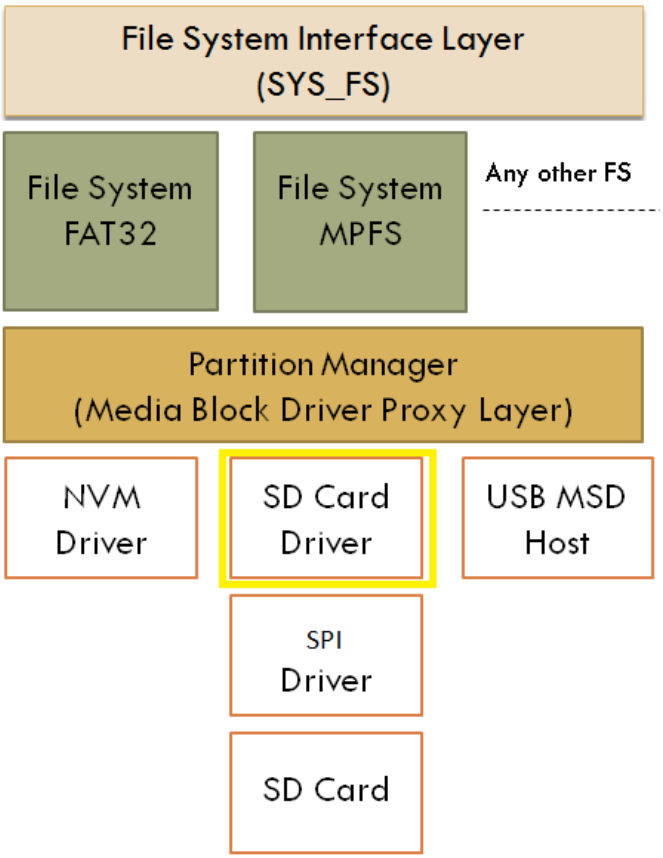
Abstraction Model

This library provides a low-level abstraction of the SD Card Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The SD Card driver comes in the layer below the Partition Manager in the MPLAB Harmony file system architecture and it uses the SPI Driver to interact with the SD card.

SD Card Driver Software Abstraction Block Diagram



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the SD Card module.

Library Interface Section	Description
System Level Functions	Includes functions for initialize the module.
Client Level Functions	Functions to open and close a client.
Operation Functions	Functions for read and write operations
Module Information Functions	Functions for information about the module.
Version Information Functions	Functions to get the software version.

How the Library Works

This section describes how the SD Card Driver Library operates.

Description

Note: Not all modes are available on all devices. Please refer to the specific device data sheet to determine the supported modes.

The library provides interfaces that support:

- Driver Initialization Functionality
- Client Block Data Functionality
- Client Access Functionality

SD Card Driver Initialization

This section provides information for system initialization and reinitialization.

Description

The system performs the initialization and the reinitialization of the device driver with settings that affect only the instance of the device that is being initialized or reinitialized. During system initialization each instance of the SD Card module would be initialized with the following configuration settings (either passed dynamically at run time using DRV_SDCARD_INIT or by using initialization overrides) that are supported by the specific SD Card device hardware:

- SPI Peripheral ID: Identifies the SPI Peripheral ID to be used for the SD Card Driver
- SPI Index: SPI Driver Index
- SD Card frequency: SD Card communication speed
- SPI Clock source: Peripheral clock used by the SPI
- Write-Protect Port: Port used to check if the SD Card is write protected
- Write-Protect Pin: Pin used to check if the SD Card is write protected
- Chip Select Port: Port used for the SPI Chip Select
- Chip Select Pin: Pin used for the SPI Chip Select

The DRV_SDCARD_Initialize function returns an object handle of the type SYS_MODULE_OBJ. After this, the object handle returned by the initialize interface would be used by the other system interfaces, such as DRV_SDCARD_Deinitialize, DRV_SDCARD_Status, and DRV_SDCARD_Tasks.

Note: The system initialization and the reinitialization settings, only affect the instance of the peripheral that is being initialized or reinitialized.

Example:

```
const DRV_SDCARD_INIT drvSDCardInit =
{
.spiId = SPI_ID_2,
.spiIndex = 0,
.sdcardSpeedHz = 20000000,
.spiClk = CLK_BUS_PERIPHERAL_2,
.writeProtectPort = PORT_CHANNEL_F,
.writeProtectBitPosition = PORTS_BIT_POS_1,
.chipSelectPort = PORT_CHANNEL_B,
.chipSelectBitPosition = PORTS_BIT_POS_14,
};

void SYS_Initialize (void *data)
{
.
.
sysObj.drvSDCard = DRV_SDCARD_Initialize(DRV_SDCARD_INDEX_0,(SYS_MODULE_INIT *)&drvSDCardInit);
.
.
}
```

Tasks Routine

The system will call DRV_SDCARD_Tasks, from system task service to maintain the driver's state machine.

Client Access Operation

This section provides information for general client operation.

Description

General Client Operation

For the application to start using an instance of the module, it must call the DRV_SDCARD_Open function. This provides the configuration required to open the SD Card instance for operation. If the driver is deinitialized using the function DRV_SDCARD_Deinitialize, the application must call the DRV_SDCARD_Open function again to set up the instance of the SDCARD.

For the various options available for I/O INTENT please refer to Data Types and Constants in the Library Interface section.

Example:

```
DRV_HANDLE handle;
handle = DRV_SDCARD_Open(DRV_SDCARD_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
// Unable to open the driver
}
```

Client Block Data Operation

This topic provides information on client block data operation.

Description

The SDCARD Driver provides a block interface to access the SD Card. The interface provides functionality to read from and write to the SD Card.

Reading Data from the SD Card:

The following steps outline the sequence to be followed for reading data from the SD Card:

1. The system should have completed necessary initialization and DRV_SDCARD_Tasks should either be running in a polled environment, or in an interrupt environment.
2. The driver should have been opened with the necessary intent.
3. Invoke the DRV_SDCARD_Read function and pass the pointer where the data is to be stored, block start address and the number of blocks of data to be read.
4. The client should validate the command handle returned by the DRV_SDCARD_Read function. DRV_SDCARD_COMMAND_HANDLE_INVALID value indicates that an error has occurred which the client needs to handle.
5. If the request was successful then the client can check the status of the request by invoking the DRV_SDCARD_CommandStatus and passing the command handle returned by the read request. Alternately the client could use the event handler for notifications from the driver.
6. The client will be able to close itself by calling the DRV_SDCARD_Close.

Example:

```
// This code shows how to read data from the SD Card
DRV_HANDLE sdcardHandle;
DRV_SDCARD_COMMAND_HANDLE sdcardCommandHandle;
DRV_SDCARD_COMMAND_STATUS commandStatus;
uint8_t readBuf[512];
uint32_t blockAddress;
uint32_t nBlocks;

/* Initialize the block start address and the number of blocks to be read */
blockAddress = 0;
nBlocks = 1;

DRV_SDCARD_Read(sdcardHandle, &sdcardCommandHandle, (uint8_t *)readBuf, blockAddress, nBlocks);
if(DRV_SDCARD_COMMAND_HANDLE_INVALID == sdcardCommandHandle)
{
    /* Failed to queue the read request. Handle the error. */
}
// Wait until the command completes. This should not
// be a while loop if part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
commandStatus = DRV_SDCARD_CommandStatus(sdcardHandle, sdcardCommandHandle);
if(DRV_SDCARD_COMMAND_COMPLETED == commandStatus)
{
    /* Read completed */
}
else if (DRV_SDCARD_COMMAND_ERROR_UNKNOWN == commandStatus)
{
    /* Read Failed */
}
```

Writing Data to the SD Card:

The following steps outline the sequence to be followed for writing data to the SD Card:

1. The system should have completed necessary initialization and DRV_SDCARD_Tasks should either be running in a polled environment, or in an interrupt environment.
2. The driver should have been opened with the necessary intent.
3. Invoke the DRV_SDCARD_Write function and pass the pointer to the data to be written, block start address and the number of blocks of data to be written.
4. The client should validate the command handle returned by the DRV_SDCARD_Write function. DRV_SDCARD_COMMAND_HANDLE_INVALID value indicates that an error has occurred which the client needs to handle.
5. If the request was successful then the client can check the status of the request by invoking the DRV_SDCARD_CommandStatus and passing the command handle returned by the write request. Alternately, the client could use the event handler for notifications from the driver.
6. The client will be able to close itself by calling the DRV_SDCARD_Close.

Example:

```
// This code shows how to write data to the SD Card
```

```
DRV_HANDLE sdcardHandle;
DRV_SDCARD_COMMAND_HANDLE sdcardCommandHandle;
DRV_SDCARD_COMMAND_STATUS commandStatus;
uint8_t writeBuf[512];
uint32_t blockAddress;
uint32_t nBlocks;

/* Initialize the block start address and the number of blocks to be written */
blockAddress = 0;
nBlocks = 1;
/* Populate writeBuf with the data to be written */

DRV_SDCARD_Write(sdcardHandle, &sdcardCommandHandle, (uint8_t *)writeBuf, blockAddress, nBlocks);
if(DRV_SDCARD_COMMAND_HANDLE_INVALID == sdcardCommandHandle)
{
    /* Failed to queue the write request. Handle the error. */
}
// Wait until the command completes. This should not
// be a while loop if part of cooperative multi-tasking
// routine. In that case, it should be invoked in task
// state machine.
commandStatus = DRV_SDCARD_CommandStatus(sdcardHandle, sdcardCommandHandle);
if(DRV_SDCARD_COMMAND_COMPLETED == commandStatus)
{
    /* Write completed */
}
else if (DRV_SDCARD_COMMAND_ERROR_UNKNOWN == commandStatus)
{
    /* Write Failed */
}
```

Configuring the Library

Macros

	Name	Description
	DRV_SDCARD_CLIENTS_NUMBER	Selects the miximum number of clients
	DRV_SDCARD_INDEX_MAX	SD Card Static Index selection
	DRV_SDCARD_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver
	DRV_SDCARD_POWER_STATE	Defines an override of the power state of the SD Card driver.
	DRV_SDCARD_SYS_FS_REGISTER	Register to use with the File system
	DRV_SDCARD_ENABLE_WRITE_PROTECT_CHECK	Enable SD Card write protect check.

Description

The configuration of the SD Card Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the SD Card Driver. Based on the selections made, the SD Card Driver may support the selected features. These configuration settings will apply to all instances of the SD Card.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_SDCARD_CLIENTS_NUMBER Macro

Selects the miximum number of clients

File

drv_sdcard_config_template.h

C

```
#define DRV_SDCARD_CLIENTS_NUMBER 1
```

Description

SD Card Maximum Number of Clients

This definition select the maximum number of clients that the SD Card driver can support at run time. Not defining it means using a single client.

Remarks

None.

DRV_SDCARD_INDEX_MAX Macro

SD Card Static Index selection

File

drv_sdcard_config_template.h

C

```
#define DRV_SDCARD_INDEX_MAX 1
```

Description

SD Card Static Index Selection

SD Card Static Index selection for the driver object reference

Remarks

This index is required to make a reference to the driver object

DRV_SDCARD_INSTANCES_NUMBER Macro

Selects the maximum number of hardware instances that can be supported by the dynamic driver

File

drv_sdcard_config_template.h

C

```
#define DRV_SDCARD_INSTANCES_NUMBER 1
```

Description

SD Card hardware instance configuration

This definition selects the maximum number of hardware instances that can be supported by the dynamic driver. Not defining it means using a static driver.

Remarks

None

DRV_SDCARD_POWER_STATE Macro

Defines an override of the power state of the SD Card driver.

File

drv_sdcard_config_template.h

C

```
#define DRV_SDCARD_POWER_STATE SYS_MODULE_POWER_IDLE_STOP
```

Description

SD Card power state configuration

Defines an override of the power state of the SD Card driver.

Remarks

This feature may not be available in the device or the SD Card module selected.

DRV_SDCARD_SYS_FS_REGISTER Macro

Register to use with the File system

File

drv_sdcard_config_template.h

C

```
#define DRV_SDCARD_SYS_FS_REGISTER
```

Description

SDCARD Driver Register with File System

Specifying this macro enables the SDCARD driver to register its services with the SYS FS.

Remarks

This macro is optional and should be specified only if the SDCARD driver is to be used with the File System.

DRV_SDCARD_ENABLE_WRITE_PROTECT_CHECK Macro

Enable SD Card write protect check.

File

drv_sdcard_config_template.h

C

```
#define DRV_SDCARD_ENABLE_WRITE_PROTECT_CHECK
```

Description

SDCARD Driver Enable Write Protect Check

Specifying this macro enables the SDCARD driver to check whether the SD card is write protected.

Remarks

None

Building the Library

This section lists the files that are available in the SD Card Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/sdcard`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_sdcard.h	This file provides the interface definitions of the SD Card driver

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/dynamic/drv_sdcard.c	This file contains the core implementation of the SD Card driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library

Module Dependencies

The SD Card Driver Library depends on the following modules:

- SPI Driver Library
- Clock System Service Library
- Interrupt System Service Library
- Ports System Service Library
- Timer System Service Library
- Timer Driver Library

Library Interface

a) System Level Functions

	Name	Description
	DRV_SDCARD_Initialize	Initializes the SD Card driver. **Implementation:** Dynamic
	DRV_SDCARD_Deinitialize	Deinitializes the specified instance of the SD Card driver module. **Implementation:** Dynamic
	DRV_SDCARD_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings. **Implementation:** Dynamic
	DRV_SDCARD_Status	Provides the current status of the SD Card driver module. **Implementation:** Dynamic
	DRV_SDCARD_Tasks	Maintains the driver's state machine. **Implementation:** Dynamic

b) Client Level Functions

	Name	Description
	DRV_SDCARD_Close	Closes an opened-instance of the SD Card driver. **Implementation:** Dynamic
	DRV_SDCARD_Open	Opens the specified SD Card driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_SDCARD_Read	Reads blocks of data from the specified block address of the SD Card.
	DRV_SDCARD_Write	Writes blocks of data starting at the specified address of the SD Card.
	DRV_SDCARD_EventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

c) Status Functions

	Name	Description
	DRV_SDCARD_IsAttached	Returns the physical attach status of the SD Card.
	DRV_SDCARD_IsWriteProtected	Returns the write protect status of the SDCARD.
	DRV_SDCARD_CommandStatus	Gets the current status of the command.
	DRV_SDCARD_GeometryGet	Returns the geometry of the device.

d) Data Types and Constants

	Name	Description
	DRV_SDCARD_INDEX_0	SD Card driver index definitions
	DRV_SDCARD_INDEX_COUNT	Number of valid SD Card driver indices
	DRV_SDCARD_INIT	Contains all the data necessary to initialize the SD Card device
	_DRV_SDCARD_INIT	Contains all the data necessary to initialize the SD Card device
	SDCARD_DETECTION_LOGIC	Defines the different system events
	SDCARD_MAX_LIMIT	Maximum allowed SD card instances
	DRV_SDCARD_INDEX_1	This is macro DRV_SDCARD_INDEX_1.
	DRV_SDCARD_INDEX_2	This is macro DRV_SDCARD_INDEX_2.
	DRV_SDCARD_INDEX_3	This is macro DRV_SDCARD_INDEX_3.
	DRV_SDCARD_COMMAND_HANDLE_INVALID	SDCARD Driver's Invalid Command Handle.
	DRV_SDCARD_COMMAND_HANDLE	Handle identifying commands queued in the driver.
	DRV_SDCARD_COMMAND_STATUS	Identifies the possible events that can result from a request.
	DRV_SDCARD_EVENT	Identifies the possible events that can result from a request.

	DRV_SDCARD_EVENT_HANDLER	Pointer to a SDCARDDriver Event handler function

Description

This section describes the Application Programming Interface (API) functions of the SD Card Driver.

Refer to each section for a detailed description.

a) System Level Functions

DRV_SDCARD_Initialize Function

Initializes the SD Card driver.

Implementation: Dynamic

File

drv_sdcard.h

C

```
SYS_MODULE_OBJ DRV_SDCARD_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT *const init);
```

Returns

If successful, returns a valid handle to a driver object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the SD Card driver, making it ready for clients to open and use the driver.

Remarks

This routine must be called before any other SD Card routine is called.

This routine should only be called once during system initialization unless DRV_SDCARD_Deinitialize is called to deinitialize the driver instance.

This routine will NEVER block for hardware access. If the operation requires time to allow the hardware to reinitialize, it will be reported by the DRV_SDCARD_Status operation. The system must use DRV_SDCARD_Status to find out when the driver is in the ready state.

Preconditions

None.

Example

```
DRV_SDCARD_INIT     init;
SYS_MODULE_OBJ      objectHandle;

// Populate the SD Card initialization structure

objectHandle = DRV_SDCARD_Initialize(DRV_SDCARD_INDEX_0, (SYS_MODULE_INIT*)&init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
drvIndex	Index for the driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

```
SYS_MODULE_OBJ DRV_SDCARD_Initialize
(
const       SYS_MODULE_INDEX index,
const       SYS_MODULE_INIT  * const init
);
```

DRV_SDCARD_Deinitialize Function

Deinitializes the specified instance of the SD Card driver module.

Implementation: Dynamic

File

drv_sdcard.h

C

```
void DRV_SDCARD_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SD Card driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This routine will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_SDCARD_Status operation. The system has to use DRV_SDCARD_Status to check if the de-initialization is complete.

Preconditions

Function DRV_SDCARD_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Example

```
SYS_MODULE_OBJ      objectHandle;     //  Returned from DRV_SDCARD_Initialize
SYS_STATUS          status;

DRV_SDCARD_Deinitialize(objectHandle);

status = DRV_SDCARD_Status(objectHandle);
if (SYS_MODULE_UNINITIALIZED == status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SDCARD_Initialize routine.

Function

void DRV_SDCARD_Deinitialize

(

SYS_MODULE_OBJ object

);

DRV_SDCARD_Reinitialize Function

Reinitializes the driver and refreshes any associated hardware settings.

Implementation: Dynamic

File

drv_sdcard.h

C

```
void DRV_SDCARD_Reinitialize(SYS_MODULE_OBJ object, const SYS_MODULE_INIT * const init);
```

Returns

None

Description

This routine reinitializes the driver and refreshes any associated hardware settings using the given initialization data, but it will not interrupt any ongoing operations.

Remarks

This function can be called multiple times to reinitialize the module.

This operation can be used to refresh any supported hardware registers as specified by the initialization data or to change the power state of the module.

This routine will NEVER block for hardware access. If the operation requires time to allow the hardware to reinitialize, it will be reported by the DRV_SDCARD_Status operation. The system must use DRV_SDCARD_Status to find out when the driver is in the ready state.

Preconditions

Function DRV_SDCARD_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Example

```
DRV_SDCARD_INIT     init;
SYS_MODULE_OBJ      objectHandle;  //  Returned from DRV_SDCARD_Initialize

// Update the required fields of the SD Card initialization structure

DRV_SDCARD_Reinitialize (objectHandle, (SYS_MODULE_INIT*)&init);
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SDCARD_Initialize routine
init	Pointer to the initialization data structure

Function

void DRV_SDCARD_Reinitialize

(

SYS_MODULE_OBJ object,

const SYS_MODULE_INIT * const init

);

DRV_SDCARD_Status Function

Provides the current status of the SD Card driver module.

Implementation: Dynamic

File

drv_sdcard.h

C

```
SYS_STATUS DRV_SDCARD_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Note Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_STATUS_BUSY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Description

This routine provides the current status of the SD Card driver module.

Remarks

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_DEINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR

This operation can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, then a previous operation has not yet completed. If the status operation returns SYS_STATUS_READY, then it indicates that all previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This routine will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

Function DRV_SDCARD_Initialize must have been called before calling this

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SDCARD_Initialize
SYS_STATUS          status;

status = DRV_SDCARD_Status(object);

if (SYS_MODULE_UNINITIALIZED == status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
else if (SYS_STATUS_ERROR >= status)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SDCARD_Initialize routine

Function

```
SYS_STATUS DRV_SDCARD_Status
(
    SYS_MODULE_OBJ object
);
```

DRV_SDCARD_Tasks Function

Maintains the driver's state machine.

Implementation: Dynamic

File

drv_sdcard.h

C

```
void DRV_SDCARD_Tasks(SYS_MODULE_OBJ object);
```

Returns

None

Description

This routine is used to maintain the driver's internal state machine.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_SDCARD_Initialize routine must have been called for the specified SDCARD driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SDCARD_Initialize
```

```
while (true)
{
    DRV_SDCARD_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SDCARD_Initialize)

Function

void DRV_SDCARD_Tasks
(
    SYS_MODULE_OBJ object
);

b) Client Level Functions

DRV_SDCARD_Close Function

Closes an opened-instance of the SD Card driver.

Implementation: Dynamic

File

drv_sdcard.h

C

```
void DRV_SDCARD_Close(DRV_HANDLE handle);
```

Returns

None

Description

This routine closes an opened-instance of the SD Card driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SDCARD_Open before the caller may use the driver again.

If DRV_IO_INTENT_BLOCKING was requested and the driver was built appropriately to support blocking behavior call may block until the operation is complete.

If DRV_IO_INTENT_NON_BLOCKING request the driver client can call the DRV_SDCARD_Status operation to find out when the module is in the ready state (the handle is no longer valid).

Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SDCARD_Initialize routine must have been called for the specified SD Card driver instance.

DRV_SDCARD_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SDCARD_Open

DRV_SDCARD_Close (handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_SDCARD_Close
(
DRV_HANDLE handle
);

DRV_SDCARD_Open Function

Opens the specified SD Card driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_sdcard.h

C

```
DRV_HANDLE DRV_SDCARD_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID.

Description

This routine opens the specified SD Card driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The handle returned is valid until the DRV_SDCARD_Close routine is called.

This routine will NEVER block waiting for hardware.

If the DRV_IO_INTENT_BLOCKING is requested and the driver was built appropriately to support blocking behavior, then other client-level operations may block waiting on hardware until they are complete.

If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID.

Preconditions

Function DRV_SDCARD_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_SDCARD_Open (DRV_SDCARD_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);

if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_SDCARD_Open
(
const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent
);

DRV_SDCARD_Read Function

Reads blocks of data from the specified block address of the SD Card.

File

drv_sdcard.h

C

```
void DRV_SDCARD_Read(DRV_HANDLE handle, DRV_SDCARD_COMMAND_HANDLE * commandHandle, void * targetBuffer,
uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_SDCARD_COMMAND_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation for reading blocks of data from the SD Card. The function returns with a valid buffer handle in the commandHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SDCARD_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the driver handle is invalid
- if the target buffer pointer is NULL
- if the number of blocks to be read is zero or more than the actual number of blocks available
- if a buffer object could not be allocated to the request
- if the client opened the driver in write only mode

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SDCARD_EVENT_COMMAND_COMPLETE event if the buffer was processed successfully or DRV_SDCARD_EVENT_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

None.

Preconditions

The DRV_SDCARD_Initialize routine must have been called for the specified SDCARD driver instance.

DRV_SDCARD_Open must have been called with DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE as the ioIntent to obtain a valid opened device handle.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = 0x00;
uint32_t    nBlock = 2;
DRV_SDCARD_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySDCARDHandle is the handle returned
// by the DRV_SDCARD_Open function.

DRV_SDCARD_Read(mySDCARDHandle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_SDCARD_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}
else
{
    // Read Successful
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle

targetBuffer	Buffer into which the data read from the SD Card will be placed
blockStart	Start block address of the SD Card from where the read should begin.
nBlock	Total number of blocks to be read.

Function

void DRV_SDCARD_Read
(
const DRV_HANDLE handle,
DRV_SDCARD_COMMAND_HANDLE * commandHandle,
void * targetBuffer,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SDCARD_Write Function

Writes blocks of data starting at the specified address of the SD Card.

File

drv_sdcard.h

C

```
void DRV_SDCARD_Write(DRV_HANDLE handle, DRV_SDCARD_COMMAND_HANDLE * commandHandle, void * sourceBuffer,
uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_SDCARD_COMMAND_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking write operation for writing blocks of data to the SD Card. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SDCARD_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer object could not be allocated to the request
- if the source buffer pointer is NULL
- if the client opened the driver for read only
- if the number of blocks to be written is either zero or more than the number of blocks actually available
- if the write queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SDCARD_EVENT_COMMAND_COMPLETE event if the buffer was processed successfully or DRV_SDCARD_EVENT_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

None.

Preconditions

The DRV_SDCARD_Initialize() routine must have been called for the specified SDCARD driver instance.

DRV_SDCARD_Open() routine must have been called to obtain a valid opened device handle. DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified as a parameter to this routine.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = 0x00;
uint32_t    nBlock = 2;
DRV_SDCARD_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySDCARDHandle is the handle returned
```

```
// by the DRV_SDCARD_Open function.

// Client registers an event handler with driver

DRV_SDCARD_EventHandlerSet(mySDCARDHandle, APP_SDCARDEventHandler, (uintptr_t)&myAppObj);

DRV_SDCARD_Write(mySDCARDHandle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_SDCARD_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_SDCARDEventHandler(DRV_SDCARD_EVENT event,
        DRV_SDCARD_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SDCARD_EVENT_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SDCARD_EVENT_COMMAND_ERROR:

            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
sourceBuffer	The source buffer containing data to be programmed to the SD Card.
blockStart	Start block address of SD Card where the writes should begin.
nBlock	Total number of blocks to be written.

Function

```
void DRV_SDCARD_Write
(
const       DRV_HANDLE handle,
    DRV_SDCARD_COMMAND_HANDLE * commandHandle,
void * sourceBuffer,
uint32_t blockStart,
uint32_t nBlock
);
```

DRV_SDCARD_EventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

File

drv_sdcard.h

C

```
void DRV_SDCARD_EventHandlerSet(const DRV_HANDLE handle, const void * eventHandler, const uintptr_t
context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client queues a request for a read or a write operation, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any read or write operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_SDCARD_Initialize() routine must have been called for the specified SDCARD driver instance.

The DRV_SDCARD_Open() routine must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_SDCARD_COMMAND_HANDLE commandHandle;

// drvSDCARDHandle is the handle returned
// by the DRV_SDCARD_Open function.

// Client registers an event handler with driver. This is done once.

DRV_SDCARD_EventHandlerSet(drvSDCARDHandle, APP_SDCARDEventHandler, (uintptr_t)&myAppObj);

DRV_SDCARD_Read(drvSDCARDHandle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_SDCARD_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_SDCARDEventHandler(DRV_SDCARD_EVENT event,
        DRV_SDCARD_COMMAND_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SDCARD_EVENT_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SDCARD_EVENT_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
```

```
            break;
        }
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_SDCARD_EventHandlerSet

(

const DRV_HANDLE handle,

const void * eventHandler,

const uintptr_t context

);

c) Status Functions

DRV_SDCARD_IsAttached Function

Returns the physical attach status of the SD Card.

File

drv_sdcard.h

C

```
bool DRV_SDCARD_IsAttached(const DRV_HANDLE handle);
```

Returns

Returns false if the handle is invalid otherwise returns the attach status of the SD Card. Returns true if the SD Card is attached and initialized by the SDCARD driver otherwise returns false.

Description

This function returns the physical attach status of the SD Card.

Remarks

None.

Preconditions

The DRV_SDCARD_Initialize() routine must have been called for the specified SDCARD driver instance.

The DRV_SDCARD_Open() routine must have been called to obtain a valid opened device handle.

Example

```
bool isSDCARDAttached;
isSDCARDAttached = DRV_SDCARD_isAttached(drvSDCARDHandle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SDCARD_IsAttached

(

const DRV_HANDLE handle

);

DRV_SDCARD_IsWriteProtected Function

Returns the write protect status of the SDCARD.

File

drv_sdcard.h

C

```
bool DRV_SDCARD_IsWriteProtected(const DRV_HANDLE handle);
```

Returns

Returns true if the attached SD Card is write protected. Returns false if the handle is not valid, or if the SD Card is not write protected.

Description

This function returns true if the SD Card is write protected otherwise it returns false.

Remarks

None.

Preconditions

The DRV_SDCARD_Initialize() routine must have been called for the specified SDCARD driver instance.

The DRV_SDCARD_Open() routine must have been called to obtain a valid opened device handle.

Example

```
bool isWriteProtected;
isWriteProtected = DRV_SDCARD_IsWriteProtected(drvSDCARDHandle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SDCARD_IsWriteProtected

(

const DRV_HANDLE handle

);

DRV_SDCARD_CommandStatus Function

Gets the current status of the command.

File

drv_sdcard.h

C

```
DRV_SDCARD_COMMAND_STATUS DRV_SDCARD_CommandStatus(const DRV_HANDLE handle, const DRV_SDCARD_COMMAND_HANDLE
commandHandle);
```

Returns

A DRV_SDCARD_COMMAND_STATUS value describing the current status of the command. Returns DRV_SDCARD_COMMAND_HANDLE_INVALID if the client handle or the command handle is not valid.

Description

This routine gets the current status of the command. The application must use this routine where the status of a scheduled command needs to be polled on. The function may return DRV_SDCARD_COMMAND_HANDLE_INVALID in a case where the command handle has expired. A command handle expires when the internal buffer object is re-assigned to another read or write request. It is recommended that this function be called regularly in order to track the command status correctly.

The application can alternatively register an event handler to receive read or write operation completion events.

Remarks

This routine will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_SDCARD_Initialize() routine must have been called.

The DRV_SDCARD_Open() must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE                      handle;         // Returned from DRV_SDCARD_Open
DRV_SDCARD_COMMAND_HANDLE       commandHandle;
DRV_SDCARD_COMMAND_STATUS       status;

status = DRV_SDCARD_CommandStatus(handle, commandHandle);
if(status == DRV_SDCARD_COMMAND_COMPLETED)
{
    // Operation Done
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_SDCARD_COMMAND_STATUS DRV_SDCARD_CommandStatus

(

const DRV_HANDLE handle,

const DRV_SDCARD_COMMAND_HANDLE commandHandle

);

DRV_SDCARD_GeometryGet Function

Returns the geometry of the device.

File

drv_sdcard.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_SDCARD_GeometryGet(const DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Pointer to structure which holds the media geometry information.

Description

This API gives the following geometrical details of the SD Card.

- Media Property
- Number of Read/Write/Erase regions in the SD Card
- Number of Blocks and their size in each region of the device

Remarks

None.

Preconditions

The DRV_SDCARD_Initialize() routine must have been called for the specified SDCARD driver instance.

The DRV_SDCARD_Open() routine must have been called to obtain a valid opened device handle.

Example

```
SYS_FS_MEDIA_GEOMETRY * SDCARDGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalSize;

SDCARDGeometry = DRV_SDCARD_GeometryGet(SDCARDOpenHandle1);
```

```
readBlockSize  = SDCARDGeometry->geometryTable->blockSize;
nReadBlocks = SDCARDGeometry->geometryTable->numBlocks;
nReadRegions = SDCARDGeometry->numReadRegions;

writeBlockSize  = (SDCARDGeometry->geometryTable +1)->blockSize;
eraseBlockSize  = (SDCARDGeometry->geometryTable +2)->blockSize;

totalSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY * DRV_SDCARD_GeometryGet
(
const DRV_HANDLE handle
);

d) Data Types and Constants

DRV_SDCARD_INDEX_0 Macro

SD Card driver index definitions

File

drv_sdcard.h

C

```
#define DRV_SDCARD_INDEX_0 0
```

Description

SD Card Driver Module Index Numbers

These constants provide SD Card driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_SDCARD_Initialize and DRV_SDCARD_Open routines to identify the driver instance in use.

DRV_SDCARD_INDEX_COUNT Macro

Number of valid SD Card driver indices

File

drv_sdcard.h

C

```
#define DRV_SDCARD_INDEX_COUNT DRV_SDCARD_INDEX_MAX
```

Description

SD Card Driver Module Index Count

This constant identifies number of valid SD Card driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from part-specific header files defined as part of the peripheral libraries.

DRV_SDCARD_INIT Structure

Contains all the data necessary to initialize the SD Card device

File

drv_sdcard.h

C

```
typedef struct _DRV_SDCARD_INIT {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX spiIndex;
  SPI_MODULE_ID spiId;
  CLK_BUSES_PERIPHERAL spiClk;
  uint32_t sdcardSpeedHz;
  SDCARD_DETECTION_LOGIC sdCardPinActiveLogic;
  PORTS_CHANNEL cardDetectPort;
  PORTS_BIT_POS cardDetectBitPosition;
  PORTS_CHANNEL writeProtectPort;
  PORTS_BIT_POS writeProtectBitPosition;
  PORTS_CHANNEL chipSelectPort;
  PORTS_BIT_POS chipSelectBitPosition;
} DRV_SDCARD_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX spiIndex;	SPI driver index
SPI_MODULE_ID spiId;	Identifies peripheral (PLIB-level) ID
CLK_BUSES_PERIPHERAL spiClk;	Peripheral clock used by the SPI
uint32_t sdcardSpeedHz;	SD card communication speed
SDCARD_DETECTION_LOGIC sdCardPinActiveLogic;	SD Card Pin Detection Logic
PORTS_CHANNEL cardDetectPort;	Card detect port
PORTS_BIT_POS cardDetectBitPosition;	Card detect pin
PORTS_CHANNEL writeProtectPort;	Write protect port
PORTS_BIT_POS writeProtectBitPosition;	Write protect pin
PORTS_CHANNEL chipSelectPort;	Chip select port
PORTS_BIT_POS chipSelectBitPosition;	Chip select pin

Description

SD Card Device Driver Initialization Data

This structure contains all the data necessary to initialize the SD Card device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the DRV_SDCARD_Initialize routine.

SDCARD_DETECTION_LOGIC Enumeration

Defines the different system events

File

drv_sdcard.h

C

```
typedef enum {
  SDCARD_DETECTION_LOGIC_ACTIVE_LOW,
  SDCARD_DETECTION_LOGIC_ACTIVE_HIGH
} SDCARD_DETECTION_LOGIC;
```

Members

Members	Description
SDCARD_DETECTION_LOGIC_ACTIVE_LOW	The media event is SD Card attach

SDCARD_DETECTION_LOGIC_ACTIVE_HIGH	The media event is SD Card detach

Description

System events

This enum defines different system events.

Remarks

None.

SDCARD_MAX_LIMIT Macro

Maximum allowed SD card instances

File

drv_sdcard.h

C

```
#define SDCARD_MAX_LIMIT 2
```

Description

SD Card Driver Maximum allowed limit

This constant identifies number of valid SD Card driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from part-specific header files defined as part of the peripheral libraries.

DRV_SDCARD_INDEX_1 Macro

File

drv_sdcard.h

C

```
#define DRV_SDCARD_INDEX_1 1
```

Description

This is macro DRV_SDCARD_INDEX_1.

DRV_SDCARD_INDEX_2 Macro

File

drv_sdcard.h

C

```
#define DRV_SDCARD_INDEX_2 2
```

Description

This is macro DRV_SDCARD_INDEX_2.

DRV_SDCARD_INDEX_3 Macro

File

drv_sdcard.h

C

```
#define DRV_SDCARD_INDEX_3 3
```

Description

This is macro DRV_SDCARD_INDEX_3.

DRV_SDCARD_COMMAND_HANDLE_INVALID Macro

SDCARD Driver's Invalid Command Handle.

File

drv_sdcard.h

C

```
#define DRV_SDCARD_COMMAND_HANDLE_INVALID SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE_INVALID
```

Description

SDCARD Driver Invalid Command Handle.

This value defines the SDCARD Driver Invalid Command Handle. This value is returned by read or write routines when the command request was not accepted.

Remarks

None.

DRV_SDCARD_COMMAND_HANDLE Type

Handle identifying commands queued in the driver.

File

drv_sdcard.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_SDCARD_COMMAND_HANDLE;
```

Description

SDCARD Driver command handle.

A command handle is returned by a call to the Read or Write functions. This handle allows the application to track the completion of the operation. This command handle is also returned to the client along with the event that has occurred with respect to the command. This allows the application to connect the event to a specific command in case where multiple commands are queued.

The command handle associated with the command request expires when the client has been notified of the completion of the command (after event handler function that notifies the client returns) or after the command has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SDCARD_COMMAND_STATUS Enumeration

Identifies the possible events that can result from a request.

File

drv_sdcard.h

C

```
typedef enum {
  DRV_SDCARD_COMMAND_COMPLETED = SYS_FS_MEDIA_COMMAND_COMPLETED,
  DRV_SDCARD_COMMAND_QUEUED = SYS_FS_MEDIA_COMMAND_QUEUED,
  DRV_SDCARD_COMMAND_IN_PROGRESS = SYS_FS_MEDIA_COMMAND_IN_PROGRESS,
  DRV_SDCARD_COMMAND_ERROR_UNKNOWN = SYS_FS_MEDIA_COMMAND_UNKNOWN
} DRV_SDCARD_COMMAND_STATUS;
```

Members

Members	Description
DRV_SDCARD_COMMAND_COMPLETED = SYS_FS_MEDIA_COMMAND_COMPLETED	Done OK and ready
DRV_SDCARD_COMMAND_QUEUED = SYS_FS_MEDIA_COMMAND_QUEUED	Scheduled but not started

DRV_SDCARD_COMMAND_IN_PROGRESS = SYS_FS_MEDIA_COMMAND_IN_PROGRESS	Currently being in transfer
DRV_SDCARD_COMMAND_ERROR_UNKNOWN = SYS_FS_MEDIA_COMMAND_UNKNOWN	Unknown Command

Description

SDCARD Driver Events

This enumeration identifies the possible events that can result from a read or a write request made by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SDCARD_EventHandlerSet function when a request is completed.

DRV_SDCARD_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_sdcard.h

C

```
typedef enum {
  DRV_SDCARD_EVENT_COMMAND_COMPLETE = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_SDCARD_EVENT_COMMAND_ERROR = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_ERROR
} DRV_SDCARD_EVENT;
```

Members

Members	Description
DRV_SDCARD_EVENT_COMMAND_COMPLETE = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_COMPLETE	Operation has been completed successfully.
DRV_SDCARD_EVENT_COMMAND_ERROR = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_ERROR	There was an error during the operation

Description

SDCARD Driver Events

This enumeration identifies the possible events that can result from a read or a write request issued by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SDCARD_EventHandlerSet function when a request is completed.

DRV_SDCARD_EVENT_HANDLER Type

Pointer to a SDCARDDriver Event handler function

File

drv_sdcard.h

C

```
typedef SYS_FS_MEDIA_EVENT_HANDLER DRV_SDCARD_EVENT_HANDLER;
```

Returns

None.

Description

SDCARD Driver Event Handler Function Pointer

This data type defines the required function signature for the SDCARD event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SDCARD_EVENT_COMMAND_COMPLETE, it means that the write or a erase operation was completed successfully.

If the event is DRV_SDCARD_EVENT_COMMAND_ERROR, it means that the scheduled operation was not completed successfully.

The context parameter contains the handle to the client context, provided at the time the event handling function was registered using the DRV_SDCARD_EventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write/erase request.

Example

```
void APP_MySDCARDEventHandler
(
    DRV_SDCARD_EVENT event,
    DRV_SDCARD_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_SDCARD_EVENT_COMMAND_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_SDCARD_EVENT_COMMAND_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle returned from the Read/Write requests
context	Value identifying the context of the application that registered the event handling function

Files

Enumerations

	Name	Description
	DRV_SDCARD_COMMAND_STATUS	Identifies the possible events that can result from a request.
	DRV_SDCARD_EVENT	Identifies the possible events that can result from a request.
	SDCARD_DETECTION_LOGIC	Defines the different system events

Functions

	Name	Description
	DRV_SDCARD_Close	Closes an opened-instance of the SD Card driver. **Implementation:** Dynamic
	DRV_SDCARD_CommandStatus	Gets the current status of the command.
	DRV_SDCARD_Deinitialize	Deinitializes the specified instance of the SD Card driver module. **Implementation:** Dynamic
	DRV_SDCARD_EventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed.
	DRV_SDCARD_GeometryGet	Returns the geometry of the device.
	DRV_SDCARD_Initialize	Initializes the SD Card driver. **Implementation:** Dynamic
	DRV_SDCARD_IsAttached	Returns the physical attach status of the SD Card.
	DRV_SDCARD_IsWriteProtected	Returns the write protect status of the SDCARD.
	DRV_SDCARD_Open	Opens the specified SD Card driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_SDCARD_Read	Reads blocks of data from the specified block address of the SD Card.
	DRV_SDCARD_Reinitialize	Reinitializes the driver and refreshes any associated hardware settings. **Implementation:** Dynamic
	DRV_SDCARD_Status	Provides the current status of the SD Card driver module. **Implementation:** Dynamic
	DRV_SDCARD_Tasks	Maintains the driver's state machine. **Implementation:** Dynamic
	DRV_SDCARD_Write	Writes blocks of data starting at the specified address of the SD Card.

SPI Driver Library

This section describes the Serial Peripheral Interface (SPI) Driver Library.

Introduction

This library provides an interface to manage the Serial Peripheral Interface (SPI) module on the Microchip family of microcontrollers in different modes of operation.

Description

The SPI module is a full duplex synchronous serial interface useful for communicating with other peripherals or microcontrollers in master/slave relationship and it can transfer data over short distances at high speeds. The peripheral devices may be serial EEPROMs, shift registers, display drivers, analog-to-digital converters, etc. The SPI module is compatible with Motorola's SPI and SIOP interfaces.

During data transfer devices can work either in master or in Slave mode. The source of synchronization is the system clock, which is generated by the master. The SPI module allows one or more slave devices to be connected to a single master device via the same bus.

The SPI serial interface consists of four pins, which are further sub-divided into data and control lines:

Data Lines:

• MOSI – Master Data Output, Slave Data Input

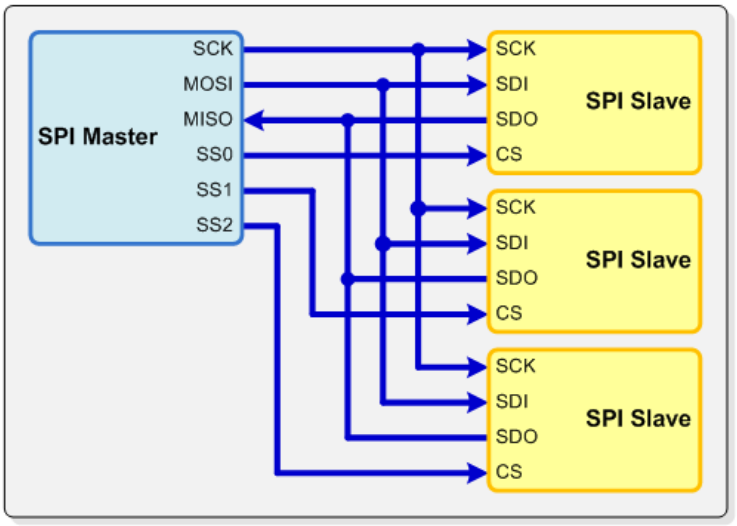
• MISO – Master Data Input, Slave Data Output

Control Lines:

• SCLK – Serial Clock

• /SS – Slave Select (no addressing)

SPI Master-Slave Relationship



The SPI module can be configured to operate using two, three, or four pins. In the 3-pin mode, the Slave Select line is not used. In the 2-pin mode, both the MOSI and /SS lines are not used.

Note: Third-party trademarks are property of their respective owners. Refer to the MPLAB Harmony *Software License Agreement* for complete licensing information. A copy of this agreement is available in the `<install-dir>/doc` folder of your MPLAB Harmony installation.

Using the Library

This topic describes the basic architecture of the SPI Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_spi.h`

The interface to the SPI Driver library is defined in the `drv_spi.h` header file. Any C language source (`.c`) file that uses the SPI Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the Driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the SPI Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

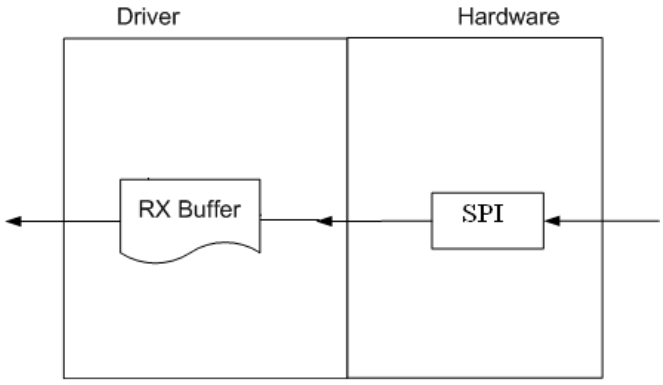
Description

Different types of SPIs are available on Microchip microcontrollers. Some have an internal buffer mechanism and some do not. The buffer depth varies across part families. The SPI driver abstracts out these differences and provides a unified model for data transfer across different types of SPIs available.

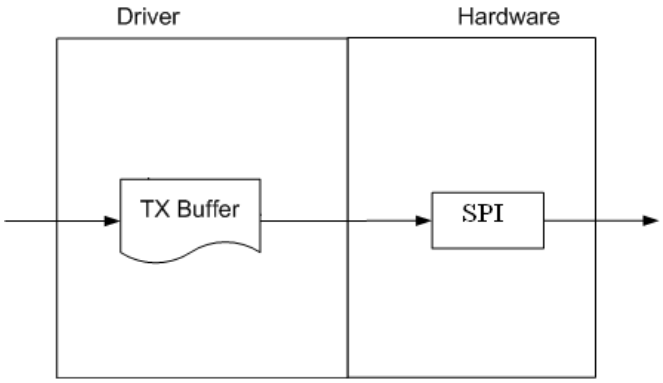
Both transmitter and receiver provides a buffer in the driver which transmits and receives data to/from the hardware. The SPI driver provides a set of interfaces to perform the read and the write.

The following diagrams illustrate the model used by the SPI driver for transmitter and receiver.

Receiver Abstraction Model



Transmitter Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the SPI module.

Library Interface Section	Description
System Interaction Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Client Setup Functions	Provides open, close, status and other setup functions.
Data Transfer Functions	Provides data transfer functions available in the configuration.
Miscellaneous	Provides driver miscellaneous functions, data transfer status function, version identification functions etc.

How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality

Note: Not all modes are available on all devices, please refer to the specific device data sheet to determine the modes that are supported for your device.

System Access

System Initialization and Reinitialization

The system performs the initialization and the reinitialization of the device driver with settings that affect only the instance of the device that is being initialized or reinitialized. During system initialization each instance of the SPI module would be initialized with the following configuration

settings (either passed dynamically at run time using DRV_SPI_INIT or by using Initialization Overrides) that are supported by the specific SPI device hardware:

- Device requested power state: one of the System Module Power States. For specific details please refer to **Data Types and Constants** in the Library Interface section
- The actual peripheral ID enumerated as the PLIB level module ID (e.g., SPI_ID_2)
- Defining the respective interrupt sources for TX, RX, and Error Interrupt

The DRV_SPI_Initialize API returns an object handle of the type SYS_MODULE_OBJ. After this, the object handle returned by the Initialize interface would be used by the other system interfaces like DRV_SPI_Deinitialize, DRV_SPI_Status, and DRV_SPI_Tasks.

Note: The system initialization and the reinitialization settings, only affect the instance of the peripheral that is being initialized or reinitialized.

Example:

```
DRV_SPI_INIT               spiInitData;
SYS_MODULE_OBJ             objectHandle;

    spiInitData.moduleInit.value    = SYS_MODULE_POWER_RUN_FULL;
    spiInitData.spiId               = SPI_ID_1;
    spiInitData.taskMode            = DRV_SPI_TASK_MODE_POLLED;
    spiInitData.spiMode             = DRV_SPI_MODE_MASTER;
    spiInitData.spiProtocolType     = DRV_SPI_PROTOCOL_TYPE_STANDARD;
    spiInitData.commWidth           = SPI_COMMUNICATION_WIDTH_8BITS;
    spiInitData.baudRate            = 5000;
    spiInitData.bufferType          = DRV_SPI_BUFFER_TYPE_STANDARD;
                                      // It is highly recommended to set this to
                                      // DRV_SPI_BUFFER_TYPE_ENHANCED for hardware
                                      // that supports it
    spiInitData.inputSamplePhase    = SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE;
    spiInitData.clockMode           = DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_RISE;
    spiInitData.txInterruptSource   = INT_SOURCE_SPI_1_TRANSMIT;
    spiInitData.rxInterruptSource   = INT_SOURCE_SPI_1_RECEIVE;
    spiInitData.errInterruptSource  = INT_SOURCE_SPI_1_ERROR;
    spiInitData.queueSize = 10;
    spiInitData.jobQueueReserveSize = 1;

    objectHandle = DRV_SPI_Initialize(DRV_SPI_INDEX_1, (SYS_MODULE_INIT*)&spiInitData);
    if (SYS_MODULE_OBJ_INVALID == objectHandle)
   {
    // Handle error
  }
```

Tasks Routine

The system will either call DRV_SPI_Tasks, from System Task Service (in a polled environment) or DRV_SPI_Tasks will be called from the ISR of the SPI.

Client Access

General Client Operation

For the application to start using an instance of the module, it must call the DRV_SPI_Open function. This provides the configuration required to open the SPI instance for operation. If the driver is deinitialized using the function DRV_SPI_Deinitialize, the application must call the DRV_SPI_Open function again to set up the instance of the SPI.

For the various options available for IO_INTENT, please refer to **Data Types and Constants** in the Library Interface section.

After a client instance is opened, DRV_SPI_ClientConfigure can be called to set a client-specific bps, OperationStarting and OperationEnded callbacks. The OperationStarting callback will be called before the first bit is put onto the SPI bus, allowing for the slave select line to be toggled to active. The OperationEnded callback will be called after the last bit is received, allowing for the slave select line to be toggled to inactive. These two callbacks will be called from the ISR, if the SPI driver is operating in ISR mode, care should be taken that they do the minimum needed. For example, OSAL calls make cause exceptions in ISR context.

Example:

```
DRV_HANDLE handle;

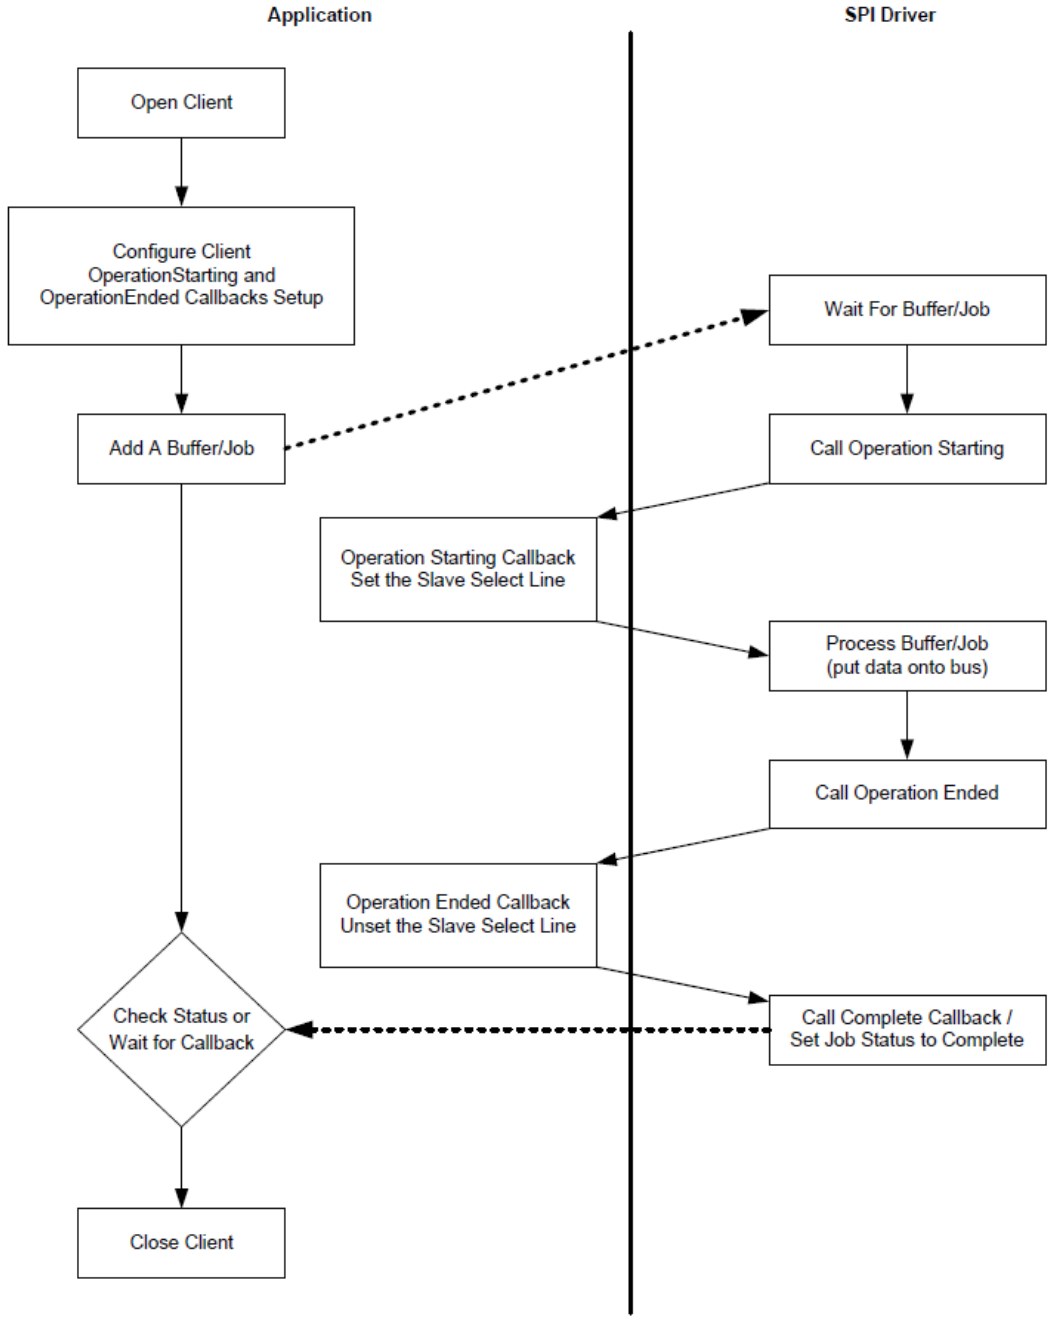
// Configure the instance DRV_SPI_INDEX_1 with the configuration
handle = DRV_SPI_Open(DRV_SPI_INDEX_1, DRV_IO_INTENT_READWRITE);

if(handle == DRV_HANDLE_INVALID)
{
    // Client cannot open the instance.
}
```

Client Transfer - Core

Client basic functionality provides a extremely basic interface for the driver operation.

The following diagram illustrates the byte/word model used for the data transfer.



Note: It is not necessary to close and reopen the client between multiple transfers.

Client Data Transfer Functionality

Applications using the SPI byte/word functionality, need to perform the following:

1. The system should have completed necessary initialization and the DRV_SPI_Tasks should either be running in polled environment, or in an interrupt environment.
2. Open the driver using DRV_SPI_Open with the necessary intent.
3. Optionally configure the client with DRV_SPI_ClientConfigure to set up OperationStarting and OperationEnded callbacks to handle selecting and deselecting the slave select pin.
4. Add a buffer using the DRV_SPI_BufferAddRead/DRV_SPI_BufferAddWrite/DRV_SPI_BufferAddWriteRead functions. An optional callback can be provided that will be called when the buffer/job is complete.

5. Check for the current transfer status using DRV_SPI_BufferStatus until the transfer progress is DRV_SPI_BUFFER_EVENT_COMPLETE, or wait for the callback to be called. If the SPI driver is configured in Polled more, ensure that DRV_SPI_Tasks is called regularly to handle the buffer/job.
6. The client will be able to close the driver using DRV_SPI_Close when required.

Example:

```
SYS_MODULE_OBJ spiObject;

int main( void )
{
    while ( 1 )
    {
        appTask ();
        DRV_SPI_Tasks(spiObject);
    }
}
void appTask ()
{
    #define MY_BUFFER_SIZE   5
    DRV_HANDLE          handle;    // Returned from DRV_SPI_Open
    char          myBuffer[MY_BUFFER_SIZE] = { 11, 22, 33, 44, 55};
    unsigned int        numBytes;
    DRV_SPI_BUFFER_HANDLE bufHandle;

    // Preinitialize myBuffer with MY_BUFFER_SIZE bytes of valid data.
    while( 1 )
    {
        switch( state )
        {
            case APP_STATE_INIT:
                /* Initialize the SPI Driver */
                spiObject = DRV_SPI_Initialize( DRV_SPI_INDEX_1,
                                                ( SYS_MODULE_INIT * )
                                                  &initConf_1 );

                /* Check for the System Status */
                if( SYS_STATUS_READY != DRV_SPI_Status( spiObject ) )
                    return 0;

                /* Open the Driver */
                handle = DRV_SPI_Open( DRV_SPI_INDEX_1,
                                       DRV_IO_INTENT_EXCLUSIVE );

                /* Enable/Activate the CS */

                /* Update the state to transfer data */
                state = APP_STATE_DATA_PUT;
            break;

            case APP_STATE_DATA_PUT:
                bufHandle = DRV_SPI_BufferAddWrite ( handle, myBuffer,
                                                     5, NULL, NULL );
                /* Update the state to status check */
                state = APP_STATE_DATA_CHECK;
            break;

            case APP_STATE_DATA_CHECK:
                /* Check for the successful data transfer */
                if( DRV_SPI_BUFFER_EVENT_COMPLETE &
                    DRV_SPI_BufferStatus( bufhandle ) )
                {
                    /* Do this repeatedly */
                    state = APP_STATE_DATA_PUT;
                }

            break;
            default:
            break;
        }
    }
```

Configuring the Library

Miscellaneous Configuration

	Name	Description
	DRV_SPI_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver .
	DRV_SPI_CLIENTS_NUMBER	Selects the maximum number of clients.

System Configuration

	Name	Description
	DRV_SPI_16BIT	Controls the compilation of 16 Bit mode
	DRV_SPI_32BIT	Controls the compilation of 32 Bit mode
	DRV_SPI_8BIT	Controls the compilation of 8 Bit mode
	DRV_SPI_DMA	Controls the compilation of DMA support
	DRV_SPI_DMA_DUMMY_BUFFER_SIZE	Controls the size of DMA dummy buffer
	DRV_SPI_DMA_TXFER_SIZE	Controls the size of DMA transfers
	DRV_SPI_EBM	Controls the compilation of Enhanced Buffer Mode mode
	DRV_SPI_ELEMENTS_PER_QUEUE	Controls the number of elements that are allocated.
	DRV_SPI_ISR	Controls the compilation of ISR mode
	DRV_SPI_MASTER	Controls the compilation of master mode
	DRV_SPI_POLLED	Controls the compilation of Polled mode
	DRV_SPI_RM	Controls the compilation of Standard Buffer mode
	DRV_SPI_SLAVE	Controls the compilation of slave mode

Description

The configuration of the SPI driver is based on the file `system_config.h`.

This header file contains the configuration selection for the SPI driver. Based on the selections made, the SPI driver may support the selected features. These configuration settings will apply to all instances of the SPI driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

System Configuration

DRV_SPI_16BIT Macro

Controls the compilation of 16 Bit mode

File

drv_spi_config_template.h

C

```
#define DRV_SPI_16BIT 1
```

Description

SPI 16 Bit Mode Enable

This definition controls whether or not 16 Bit mode functionality is built as part of the driver. With it set to 1 then 16 Bit mode will be compiled and commWidth = SPI_COMMUNICATION_WIDTH_16BITS will be accepted by SPI_DRV_Initialize(). With it set to 0 SPI_DRV_Initialize() will cause an assert. With this set the BufferAdd functions will only accept buffer sizes of multiples of 2 (16 bit words)

Remarks

Optional definition

DRV_SPI_32BIT Macro

Controls the compilation of 32 Bit mode

File

drv_spi_config_template.h

C

```
#define DRV_SPI_32BIT 1
```

Description

SPI 32 Bit Mode Enable

This definition controls whether or not 32 Bit mode functionality is built as part of the driver. With it set to 1 then 32 Bit mode will be compiled and commWidth = SPI_COMMUNICATION_WIDTH_32BITS will be accepted by SPI_DRV_Initialize(). With it set to 0 SPI_DRV_Initialize() will cause an assert. With this set the BufferAdd functions will only accept buffer sizes of multiples of 4 (32 bit words)

Remarks

Optional definition

DRV_SPI_8BIT Macro

Controls the compilation of 8 Bit mode

File

drv_spi_config_template.h

C

```
#define DRV_SPI_8BIT 1
```

Description

SPI 8 Bit Mode Enable

This definition controls whether or not 8 Bit mode functionality is built as part of the driver. With it set to 1 then 8 Bit mode will be compiled and commWidth = SPI_COMMUNICATION_WIDTH_8BITS will be accepted by SPI_DRV_Initialize(). With it set to 0 SPI_DRV_Initialize() will cause an assert.

Remarks

Optional definition

DRV_SPI_DMA Macro

Controls the compilation of DMA support

File

drv_spi_config_template.h

C

```
#define DRV_SPI_DMA 1
```

Description

SPI DMA Enable

This definition controls whether or not DMA functionality is built as part of the driver. With it set to 1 then DMA will be compiled.

Remarks

Optional definition

DRV_SPI_DMA_DUMMY_BUFFER_SIZE Macro

Controls the size of DMA dummy buffer

File

drv_spi_config_template.h

C

```
#define DRV_SPI_DMA_DUMMY_BUFFER_SIZE 256
```

Description

SPI DMA Dummy Buffer Size

This controls the size of the buffer the SPI driver uses to give to the DMA service when it is to send and receive invalid data on the bus. This occurs when the number of bytes to be read are different than the number of bytes transmitted.

Remarks

Optional definition

DRV_SPI_DMA_TXFER_SIZE Macro

Controls the size of DMA transfers

File

drv_spi_config_template.h

C

```
#define DRV_SPI_DMA_TXFER_SIZE 256
```

Description

SPI DMA Transfer Size

This definition controls the maximum number of bytes to transfer per DMA transfer.

Remarks

Optional definition

DRV_SPI_EBM Macro

Controls the compilation of Enhanced Buffer Mode mode

File

drv_spi_config_template.h

C

```
#define DRV_SPI_EBM 1
```

Description

SPI Enhanced Buffer Mode Enable (Hardware FIFO)

This definition controls whether or not Enhanced Buffer mode functionality is built as part of the driver. With it set to 1 then enhanced buffer mode will be compiled and bufferType = DRV_SPI_BUFFER_TYPE_ENHANCED will be accepted by SPI_DRV_Initialize(). With it set to 0 SPI_DRV_Initialize() will cause an assert. This mode is not available on all PIC32s. Trying to use this mode on PICMX3XX/4XX will cause compile time warnings and errors.

Remarks

Optional definition

DRV_SPI_ELEMENTS_PER_QUEUE Macro

Controls the number of elements that are allocated.

File

drv_spi_config_template.h

C

```
#define DRV_SPI_ELEMENTS_PER_QUEUE 10
```

Description

SPI Buffer Queue Depth

This definition along with DRV_SPI_INSTANCES_NUMBER and DRV_SPI_CLIENT_NUMBER controls how many buffer queue elements are created.

Remarks

Optional definition

DRV_SPI_ISR Macro

Controls the compilation of ISR mode

File

drv_spi_config_template.h

C

```
#define DRV_SPI_ISR 1
```

Description

SPI ISR Mode Enable

This definition controls whether or not ISR mode functionality is built as part of the driver. With it set to 1 then ISR mode will be compiled and taskMode = DRV_SPI_TASK_MODE_ISR will be accepted by SPI_DRV_Initialize(). With it set to 0 SPI_DRV_Initialize() will cause an assert

Remarks

Optional definition

DRV_SPI_MASTER Macro

Controls the compilation of master mode

File

drv_spi_config_template.h

C

```
#define DRV_SPI_MASTER 1
```

Description

SPI Master Mode Enable

This definition controls whether or not master mode functionality is built as part of the driver. With it set to 1 then master mode will be compiled and spiMode = DRV_SPI_MODE_MASTER will be accepted by SPI_DRV_Initialize(). With it set to 0 SPI_DRV_Initialize() will cause an assert

Remarks

Optional definition

DRV_SPI_POLLED Macro

Controls the compilation of Polled mode

File

drv_spi_config_template.h

C

```
#define DRV_SPI_POLLED 1
```

Description

SPI Polled Mode Enable

This definition controls whether or not polled mode functionality is built as part of the driver. With it set to 1 then polled mode will be compiled and taskMode = DRV_SPI_TASK_MODE_POLLED will be accepted by SPI_DRV_Initialize(). With it set to 0 SPI_DRV_Initialize() will cause an assert

Remarks

Optional definition

DRV_SPI_RM Macro

Controls the compilation of Standard Buffer mode

File

drv_spi_config_template.h

C

```
#define DRV_SPI_RM 1
```

Description

SPI Standard Buffer Mode Enable

This definition controls whether or not Standard Buffer mode functionality is built as part of the driver. With it set to 1 then standard buffer mode will be compiled and bufferType = DRV_SPI_BUFFER_TYPE_STANDARD will be accepted by SPI_DRV_Initialize(). With it set to 0 SPI_DRV_Initialize() will cause an assert. This mode is available on all PIC32s

Remarks

Optional definition

DRV_SPI_SLAVE Macro

Controls the compilation of slave mode

File

drv_spi_config_template.h

C

```
#define DRV_SPI_SLAVE 1
```

Description

SPI Slave Mode Enable

This definition controls whether or not slave mode functionality is built as part of the driver. With it set to 1 then slave mode will be compiled and spiMode = DRV_SPI_MODE_SLAVE will be accepted by SPI_DRV_Initialize(). With it set to 0 SPI_DRV_Initialize() will cause an assert

Remarks

Optional definition

Miscellaneous Configuration

DRV_SPI_INSTANCES_NUMBER Macro

Selects the maximum number of hardware instances that can be supported by the dynamic driver .

File

drv_spi_config_template.h

C

```
#define DRV_SPI_INSTANCES_NUMBER 1
```

Description

SPI hardware instance configuration

This definition selects the maximum number of hardware instances that can be supported by the dynamic driver.

Remarks

Mandatory definition

DRV_SPI_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_spi_config_template.h

C

```
#define DRV_SPI_CLIENTS_NUMBER 1
```

Description

SPI maximum number of clients

This definition selects the maximum number of clients that the SPI driver can support at run time.

Remarks

Mandatory definition

Building the Library

This section lists the files that are available in the SPI Driver Library.

Description

This section list the files that are available in the \src folder of the SPI Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (.h) and source (.c) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/spi`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_spi.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_spi.c`	Basic SPI Driver implementation file.
`/src/dynamic/drv_spi_api.c`	Functions used by the driver API.
`/src/drv_spi_sys_queue_fifo.c`	Queue implementation used by the SPI Driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library

Module Dependencies

The SPI Driver Library depends on the following modules:

- Clock System Service Library

Optional Dependencies

- DMA System Service Library (used when operating in DMA mode)
- Interrupt System Service Library (used when task is running in Interrupt mode)

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_SPI_Initialize	Initializes the SPI instance for the specified driver index. **Implementation:** Static/Dynamic

	DRV_SPI_Deinitialize	Deinitializes the specified instance of the SPI driver module. **Implementation:** Static/Dynamic
	DRV_SPI_Status	Provides the current status of the SPI driver module. **Implementation:** Static/Dynamic
	DRV_SPI_Tasks	Maintains the driver's state machine and implements its ISR. **Implementation:** Static/Dynamic

b) Client Setup Functions

	Name	Description
	DRV_SPI_Close	Closes an opened instance of the SPI driver. **Implementation:** Static/Dynamic
	DRV_SPI_Open	Opens the specified SPI driver instance and returns a handle to it. **Implementation:** Static/Dynamic
	DRV_SPI_ClientConfigure	Configures a SPI client with specific data. **Implementation:** Static/Dynamic

c) Data Transfer Functions

	Name	Description
	DRV_SPI_BufferStatus	Returns the transmitter and receiver transfer status. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddRead	Registers a buffer for a read operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddWrite	Registers a buffer for a write operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddWriteRead	Registers a buffer for a read and write operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddRead2	Registers a buffer for a read operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddWrite2	Registers a buffer for a write operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddWriteRead2	Registers a buffer for a read and write operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPIn_ReceiverBufferIsFull	Returns the receive buffer status. 'n' represents the instance of the SPI driver used. **Implementation:** Static
	DRV_SPIn_TransmitterBufferIsFull	Returns the transmit buffer status. 'n' represents the instance of the SPI driver used. **Implementation:** Static

e) Data Types and Constants

	Name	Description
	DRV_SPI_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_SPI_INDEX_0	SPI driver index definitions.
	DRV_SPI_INDEX_COUNT	Number of valid SPI driver indices.
	DRV_SPI_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_SPI_BUFFER_EVENT_HANDLER	Pointer to a SPI Driver Buffer Event handler function
	DRV_SPI_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.
	DRV_SPI_BUFFER_TYPE	Identifies the various buffer types of the SPI module.
	DRV_SPI_CLOCK_MODE	Identifies the various clock modes of the SPI module.
	DRV_SPI_INIT	Defines the data required to initialize or reinitialize the SPI driver
	_DRV_SPI_INIT	Defines the data required to initialize or reinitialize the SPI driver
	DRV_SPI_MODE	Identifies the various usage modes of the SPI module.
	DRV_SPI_PROTOCOL_TYPE	Identifies the various protocols of the SPI module.
	DRV_SPI_INDEX_1	This is macro DRV_SPI_INDEX_1.
	DRV_SPI_INDEX_2	This is macro DRV_SPI_INDEX_2.
	DRV_SPI_INDEX_3	This is macro DRV_SPI_INDEX_3.
	DRV_SPI_INDEX_4	This is macro DRV_SPI_INDEX_4.

	DRV_SPI_INDEX_5	This is macro DRV_SPI_INDEX_5.
	DRV_SPI_TASK_MODE	Identifies the various modes of how the tasks function will be run.
	DRV_SPI_CLIENT_DATA	Defines the data that can be changed per client.
	_DRV_SPI_CLIENT_DATA	Defines the data that can be changed per client.

Description

This section describes the API functions of the SPI Driver library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_SPI_Initialize Function

Initializes the SPI instance for the specified driver index.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
SYS_MODULE_OBJ DRV_SPI_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

- If successful - returns a valid handle to a driver instance object
- If unsuccessful - returns SYS_MODULE_OBJ_INVALID

Description

This routine initializes the SPI driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the 'init' parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the SPI module ID. For example, driver instance 0 can be assigned to SPI2. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_SPI_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other SPI routine is called.

This routine should only be called once during system initialization unless DRV_SPI_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
DRV_SPI_INIT        init;
SYS_MODULE_OBJ      objectHandle;

// Populate the SPI initialization structure
init.spiId = SPI_ID_1,
init.taskMode = DRV_SPI_TASK_MODE_ISR,
init.spiMode = DRV_SPI_MODE_MASTER,
init.allowIdleRun = false,
init.spiProtocolType = DRV_SPI_PROTOCOL_TYPE_STANDARD,
init.commWidth = SPI_COMMUNICATION_WIDTH_8BITS,
init.spiClk = CLK_BUS_PERIPHERAL_2,
init.baudRate = 10000000,
init.bufferType = DRV_SPI_BUFFER_TYPE_ENHANCED,
init.clockMode = DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_FALL,
init.inputSamplePhase = SPI_INPUT_SAMPLING_PHASE_IN_MIDDLE,
init.txInterruptSource = INT_SOURCE_SPI_1_TRANSMIT,
init.rxInterruptSource = INT_SOURCE_SPI_1_RECEIVE,
init.errInterruptSource = INT_SOURCE_SPI_1_ERROR,
init.queueSize = 10,
init.jobQueueReserveSize = 1,
```

```
objectHandle = DRV_SPI_Initialize(DRV_SPI_INDEX_1, (SYS_MODULE_INIT*)usartInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized. Please note this is not the SPI id. The hardware SPI id is set in the initialization structure. This is the index of the driver index to use.
init	Pointer to a data structure containing any data necessary to initialize the driver. If this pointer is NULL, the driver uses the static initialization override macros for each member of the initialization data structure.

Function

SYS_MODULE_OBJ DRV_SPI_Initialize(const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init)

DRV_SPI_Deinitialize Function

Deinitializes the specified instance of the SPI driver module.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
void DRV_SPI_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SPI driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the De-initialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_SPI_Status operation. The system has to use DRV_SPI_Status to find out when the module is in the ready state.

Preconditions

Function DRV_SPI_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_SPI_Initialize
SYS_STATUS          status;

DRV_SPI_Deinitialize ( object );

status = DRV_SPI_Status( object );
if( SYS_MODULE_UNINITIALIZED == status )
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_SPI_Initialize

Function

void DRV_SPI_Deinitialize (SYS_MODULE_OBJ object)

DRV_SPI_Status Function

Provides the current status of the SPI driver module.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
SYS_STATUS DRV_SPI_Status(SYS_MODULE_OBJ object);
```

Returns

- SYS_STATUS_READY - Indicates that the driver is busy with a previous

system level operation and cannot start another

Description

This function provides the current status of the SPI driver module.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

This function can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

The DRV_SPI_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SPI_Initialize
SYS_STATUS          status;

status = DRV_SPI_Status( object );
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_SPI_Initialize

Function

SYS_STATUS DRV_SPI_Status (SYS_MODULE_OBJ object)

DRV_SPI_Tasks Function

Maintains the driver's state machine and implements its ISR.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
void DRV_SPI_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal state machine and implement its transmit ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks() function. In interrupt mode, this function should be called in the transmit interrupt service routine of the USART that is associated with this USART driver hardware instance.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This function may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_SPI_Initialize routine must have been called for the specified SPI driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SPI_Initialize

while( true )
{
    DRV_SPI_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SPI_Initialize)

Function

void DRV_SPI_Tasks (SYS_MODULE_OBJ object);

b) Client Setup Functions

DRV_SPI_Close Function

Closes an opened instance of the SPI driver.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
void DRV_SPI_Close(DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened instance of the SPI driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SPI_Open before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SPI_Initialize routine must have been called for the specified SPI driver instance.

DRV_SPI_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SPI_Open

DRV_SPI_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_SPI_Close (DRV_HANDLE handle)

DRV_SPI_Open Function

Opens the specified SPI driver instance and returns a handle to it.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
DRV_HANDLE DRV_SPI_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. An error can occur when the following is true:

- if the number of client objects allocated via DRV_SPI_INSTANCES_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid

Description

This routine opens the specified SPI driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

If ioIntent is DRV_IO_INTENT_READ, the client will only be read from the driver. If ioIntent is DRV_IO_INTENT_WRITE, the client will only be able to write to the driver. If the ioIntent in DRV_IO_INTENT_READWRITE, the client will be able to do both, read and write.

Specifying a DRV_IO_INTENT_EXCLUSIVE will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Remarks

The handle returned is valid until the DRV_SPI_Close routine is called. This routine will NEVER block waiting for hardware. If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

The DRV_SPI_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_SPI_Open( DRV_SPI_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Index of the driver initialized with DRV_SPI_Initialize(). Please note this is not the SPI ID.
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_SPI_Open (const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT ioIntent)

DRV_SPI_ClientConfigure Function

Configures a SPI client with specific data.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
int32_t DRV_SPI_ClientConfigure(DRV_HANDLE handle, const DRV_SPI_CLIENT_DATA * cfgData);
```

Returns

- If successful - the routing will return greater than or equal to zero
- If an error occurs - the return value is negative

Description

This routine takes a DRV_SPI_CLIENT_DATA structure and sets client specific options. Whenever a new SPI job is started these values will be used. Passing in NULL will reset the client back to configuration parameters passed to driver initialization. A zero in any of the structure elements will reset that specific configuration back to the driver default.

Preconditions

The DRV_SPI_Open function must have been called before calling this function.

Parameters

Parameters	Description
handle	handle of the client returned by DRV_SPI_Open.
cfgData	Client-specific configuration data.

Function

int32_t DRV_SPI_ClientConfigure (DRV_HANDLE handle,
const DRV_SPI_CLIENT_DATA * cfgData)

c) Data Transfer Functions

DRV_SPI_BufferStatus Function

Returns the transmitter and receiver transfer status.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
DRV_SPI_BUFFER_EVENT DRV_SPI_BufferStatus(DRV_SPI_BUFFER_HANDLE bufferHandle);
```

Returns

A DRV_SPI_BUFFER_STATUS value describing the current status of the transfer.

Description

This returns the transmitter and receiver transfer status.

Remarks

The returned status may contain a value with more than one of the bits specified in the DRV_SPI_BUFFER_STATUS enumeration set. The caller should perform an AND with the bit of interest and verify if the result is non-zero (as shown in the example) to verify the desired status bit.

Preconditions

The DRV_SPI_Initialize routine must have been called for the specified SPI driver instance.

DRV_SPI_Open must have been called to obtain a valid opened device handle.

DRV_SPI_BufferAddmust have been called to obtain the buffer handle associated with that transfer.

Example

```
// Buffer handle returned from the data transfer function
DRV_SPI_BUFFER_HANDLE bufferHandle;

if( DRV_SPI_BUFFER_STATUS_SUCCESS & DRV_SPI_BufferStatus( bufferHandle ) )
{
    // All transmitter data has been sent.
}
```

Parameters

Parameters	Description
bufferHandle	A valid buffer handle, returned from the driver's data transfer routine

Function

DRV_SPI_BUFFER_EVENT DRV_SPI_BufferStatus (DRV_SPI_BUFFER_HANDLE bufferHandle)

DRV_SPI_BufferAddRead Function

Registers a buffer for a read operation. Actual transfer will happen in the Task function.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddRead(DRV_HANDLE handle, void * rxBuffer, size_t size,
DRV_SPI_BUFFER_EVENT_HANDLER completeCB, void * context);
```

Returns

If the buffer add request is successful, a valid buffer handle is returned. If request is not queued up, DRV_SPI_BUFFER_HANDLE_INVALID is returned.

Description

Registers a buffer for a read operation. Actual transfer will happen in the Task function. The status of this operation can be monitored using DRV_SPI_BufferStatus function. A optional callback can also be provided that will be called when the operation is complete.

Remarks

This API will be deprecated soon, so avoid using it. Use "DRV_SPI_BufferAddRead2" instead of it.

Preconditions

The DRV_SPI_Initialize routine must have been called for the specified SPI driver instance.

DRV_SPI_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SPI_Open call.

Example

```
DRV_HANDLE      handle;    // Returned from DRV_SPI_Open
char   myBuffer[MY_BUFFER_SIZE], state = 0;
DRV_SPI_BUFFER_HANDLE bufferHandle;

switch ( state )
{
    case 0:
        bufferHandle = DRV_SPI_BufferAddRead( handle, myBuffer, 10, NULL, NULL );
        if(bufferHandle != DRV_SPI_BUFFER_HANDLE_INVALID )
        {
            state++;
        }
```

```
            break;
        case 1:
            if( DRV_SPI_BUFFER_EVENT_COMPLETE & DRV_SPI_BufferStatus( bufferHandle ) )
            {
                state++;
                // All transmitter data has been sent successfully.
            }
            break;
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
rxBuffer	The buffer to which the data should be written to.
size	Number of bytes to be read from the SPI bus.
completeCB	Pointer to a function to be called when this queued operation is complete.
context	unused by the driver but this is passed to the callback when it is called.

Function

DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddRead (DRV_HANDLE handle, void *rxBuffer,
size_t size, DRV_SPI_BUFFER_EVENT_HANDLER completeCB,
void * context)

DRV_SPI_BufferAddWrite Function

Registers a buffer for a write operation. Actual transfer will happen in the Task function.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddWrite(DRV_HANDLE handle, void * txBuffer, size_t size,
DRV_SPI_BUFFER_EVENT_HANDLER completeCB, void * context);
```

Returns

If the buffer add request is successful, a valid buffer handle is returned. If request is not queued up, DRV_SPI_BUFFER_HANDLE_INVALID is returned.

Description

Registers a buffer for a write operation. Actual transfer will happen in the Task function. The status of this operation can be monitored using DRV_SPI_BufferStatus function. A optional callback can also be provided that will be called when the operation is complete.

Remarks

This API will be deprecated soon, so avoid using it. Use "DRV_SPI_BufferAddWrite2" instead of it.

Preconditions

The DRV_SPI_Initialize routine must have been called for the specified SPI driver instance.

DRV_SPI_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SPI_Open call.

Example

```
DRV_HANDLE      handle;    // Returned from DRV_SPI_Open
char   myBuffer[MY_BUFFER_SIZE], state = 0;
DRV_SPI_BUFFER_HANDLE bufferHandle;

switch ( state )
{
    case 0:
        bufferHandle = DRV_SPI_BufferAddWrite( handle, myBuffer, 10, NULL, NULL );
        if(bufferHandle != DRV_SPI_BUFFER_HANDLE_INVALID )
        {
            state++;
```

```
            }
            break;
        case 1:
            if( DRV_SPI_BUFFER_EVENT_COMPLETE & DRV_SPI_BufferStatus( bufferHandle ) )
            {
                state++;
                // All transmitter data has been sent successfully.
            }
            break;
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
txBuffer	The buffer which hold the data.
size	Number of bytes to be written to the SPI bus.
completeCB	Pointer to a function to be called when this queued operation is complete
context	unused by the driver but this is passed to the callback when it is called

Function

DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddWrite (DRV_HANDLE handle, void *txBuffer,
size_t size, DRV_SPI_BUFFER_EVENT_HANDLER completeCB,
void * context)

DRV_SPI_BufferAddWriteRead Function

Registers a buffer for a read and write operation. Actual transfer will happen in the Task function.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddWriteRead(DRV_HANDLE handle, void * txBuffer, size_t txSize, void *
rxBuffer, size_t rxSize, DRV_SPI_BUFFER_EVENT_HANDLER completeCB, void * context);
```

Returns

If the buffer add request is successful, a valid buffer handle is returned. If request is not queued up, DRV_SPI_BUFFER_HANDLE_INVALID is returned.

Description

Registers a buffer for a read and write operation. Actual transfer will happen in the Task function. The status of this operation can be monitored using DRV_SPI_BufferStatus function. A optional callback can also be provided that will be called when the operation is complete.

Remarks

This API will be deprecated soon, so avoid using it. Use "DRV_SPI_BufferAddWriteRead2" instead of it.

Preconditions

The DRV_SPI_Initialize routine must have been called for the specified SPI driver instance.

DRV_SPI_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      handle;    // Returned from DRV_SPI_Open
char   myReadBuffer[MY_BUFFER_SIZE], myWriteBuffer[MY_BUFFER_SIZE], state = 0;
DRV_SPI_BUFFER_HANDLE bufferHandle;

switch ( state )
{
    case 0:
        bufferHandle = DRV_SPI_BufferAddWriteRead( handle, myWriteBuffer, 10, myReadBuffer, 10, NULL, NULL
);
        if(bufferHandle != DRV_SPI_BUFFER_HANDLE_INVALID )
        {
```

```
            state++;
        }
        break;
    case 1:
        if( DRV_SPI_BUFFER_EVENT_COMPLETE & DRV_SPI_BufferStatus( bufferHandle ) )
        {
            state++;
            // All transmitter data has been sent successfully.
        }
        break;
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
txBuffer	The buffer which hold the data.
txSize	Number of bytes to be written to the SPI bus.
rxBuffer	The buffer to which the data should be written to.
rxSize	Number of bytes to be read from the SPI bus
completeCB	Pointer to a function to be called when this queued operation is complete
context	unused by the driver but this is passed to the callback when it is called

Function

DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddWriteRead(DRV_HANDLE handle,

void *txBuffer, void *rxBuffer, size_t size,)

DRV_SPI_BufferAddRead2 Function

Registers a buffer for a read operation. Actual transfer will happen in the Task function.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddRead2(DRV_HANDLE handle, void * rxBuffer, size_t size,
DRV_SPI_BUFFER_EVENT_HANDLER completeCB, void * context, DRV_SPI_BUFFER_HANDLE * jobHandle);
```

Returns

If the buffer add request is successful, a valid buffer handle is returned. If request is not queued up, DRV_SPI_BUFFER_HANDLE_INVALID is returned.

Description

Registers a buffer for a read operation. Actual transfer will happen in the Task function. The status of this operation can be monitored using DRV_SPI_BufferStatus function. A optional callback can also be provided that will be called when the operation is complete.

Remarks

None.

Preconditions

The DRV_SPI_Initialize routine must have been called for the specified SPI driver instance.

DRV_SPI_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SPI_Open call.

Example

```
DRV_HANDLE      handle;    // Returned from DRV_SPI_Open
char   myBuffer[MY_BUFFER_SIZE], state = 0;
DRV_SPI_BUFFER_HANDLE bufferHandle, bufferHandle2;

switch ( state )
{
    case 0:
        bufferHandle = DRV_SPI_BufferAddRead2( handle, myBuffer, 10, NULL, NULL, bufferHandle2 );
```

```
            if(bufferHandle2 != DRV_SPI_BUFFER_HANDLE_INVALID )
            {
                state++;
            }
            break;
        case 1:
            if( DRV_SPI_BUFFER_EVENT_COMPLETE & DRV_SPI_BufferStatus( bufferHandle2 ) )
            {
                state++;
                // All transmitter data has been sent successfully.
            }
            break;
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
rxBuffer	The buffer to which the data should be written to.
size	Number of bytes to be read from the SPI bus.
completeCB	Pointer to a function to be called when this queued operation is complete
context	unused by the driver but this is passed to the callback when it is called
jobHandle	pointer to the buffer handle, this will be set before the function returns and can be used in the ISR callback.

Function

DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddRead2 (DRV_HANDLE handle, void *rxBuffer,
size_t size, DRV_SPI_BUFFER_EVENT_HANDLER completeCB,
void * context, DRV_SPI_BUFFER_HANDLE * jobHandle)

DRV_SPI_BufferAddWrite2 Function

Registers a buffer for a write operation. Actual transfer will happen in the Task function.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddWrite2(DRV_HANDLE handle, void * txBuffer, size_t size,
DRV_SPI_BUFFER_EVENT_HANDLER completeCB, void * context, DRV_SPI_BUFFER_HANDLE * jobHandle);
```

Returns

If the buffer add request is successful, a valid buffer handle is returned. If request is not queued up, DRV_SPI_BUFFER_HANDLE_INVALID is returned.

Description

Registers a buffer for a write operation. Actual transfer will happen in the Task function. The status of this operation can be monitored using DRV_SPI_BufferStatus function. A optional callback can also be provided that will be called when the operation is complete.

Remarks

None.

Preconditions

The DRV_SPI_Initialize routine must have been called for the specified SPI driver instance.

DRV_SPI_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SPI_Open call.

Example

```
DRV_HANDLE      handle;    // Returned from DRV_SPI_Open
char   myBuffer[MY_BUFFER_SIZE], state = 0;
DRV_SPI_BUFFER_HANDLE bufferHandle, bufferHandle2;

switch ( state )
```

```
{
    case 0:
        bufferHandle = DRV_SPI_BufferAddWrite2( handle, myBuffer, 10, NULL, NULL, bufferHandle2 );
        if(bufferHandle2 != DRV_SPI_BUFFER_HANDLE_INVALID )
        {
            state++;
        }
        break;
    case 1:
        if( DRV_SPI_BUFFER_EVENT_COMPLETE & DRV_SPI_BufferStatus( bufferHandle2 ) )
        {
            state++;
            // All transmitter data has been sent successfully.
        }
        break;
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
txBuffer	The buffer which hold the data.
size	Number of bytes to be written to the SPI bus.
completeCB	Pointer to a function to be called when this queued operation is complete
context	unused by the driver but this is passed to the callback when it is called
jobHandle	pointer to the buffer handle, this will be set before the function returns and can be used in the ISR callback.

Function

DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddWrite2 (DRV_HANDLE handle, void *txBuffer,
size_t size, DRV_SPI_BUFFER_EVENT_HANDLER completeCB,
void * context, DRV_SPI_BUFFER_HANDLE * jobHandle)

DRV_SPI_BufferAddWriteRead2 Function

Registers a buffer for a read and write operation. Actual transfer will happen in the Task function.

Implementation: Static/Dynamic

File

drv_spi.h

C

```
DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddWriteRead2(DRV_HANDLE handle, void * txBuffer, size_t txSize, void *
rxBuffer, size_t rxSize, DRV_SPI_BUFFER_EVENT_HANDLER completeCB, void * context, DRV_SPI_BUFFER_HANDLE *
jobHandle);
```

Returns

If the buffer add request is successful, a valid buffer handle is returned. If request is not queued up, DRV_SPI_BUFFER_HANDLE_INVALID is returned.

Description

Registers a buffer for a read and write operation. Actual transfer will happen in the Task function. The status of this operation can be monitored using DRV_SPI_BufferStatus function. A optional callback can also be provided that will be called when the operation is complete.

Remarks

None.

Preconditions

The DRV_SPI_Initialize routine must have been called for the specified SPI driver instance.

DRV_SPI_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      handle;    // Returned from DRV_SPI_Open
char   myReadBuffer[MY_BUFFER_SIZE], myWriteBuffer[MY_BUFFER_SIZE], state = 0;
```

```
DRV_SPI_BUFFER_HANDLE bufferHandle, bufferHandle2;

switch ( state )
{
    case 0:
        bufferHandle = DRV_SPI_BufferAddWriteRead2( handle, myWriteBuffer, 10, myReadBuffer, 10, NULL,
NULL, bufferHandle2 );
        if(bufferHandle2 != DRV_SPI_BUFFER_HANDLE_INVALID )
        {
            state++;
        }
        break;
    case 1:
        if( DRV_SPI_BUFFER_EVENT_COMPLETE & DRV_SPI_BufferStatus( bufferHandle2 ) )
        {
            state++;
            // All transmitter data has been sent successfully.
        }
        break;
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
txBuffer	The buffer which hold the data.
txSize	Number of bytes to be written to the SPI bus.
rxBuffer	The buffer to which the data should be written to.
rxSize	Number of bytes to be read from the SPI bus
completeCB	Pointer to a function to be called when this queued operation is complete
context	unused by the driver but this is passed to the callback when it is called
jobHandle	pointer to the buffer handle, this will be set before the function returns and can be used in the ISR callback.

Function

DRV_SPI_BUFFER_HANDLE DRV_SPI_BufferAddWriteRead2(DRV_HANDLE handle,
void *txBuffer, void *rxBuffer, size_t size,
DRV_SPI_BUFFER_EVENT_HANDLER completeCB,
void * context, DRV_SPI_BUFFER_HANDLE * jobHandle)

DRV_SPIn_ReceiverBufferIsFull Function

Returns the receive buffer status. 'n' represents the instance of the SPI driver used.

Implementation: Static

File

drv_spi.h

C

```
bool DRV_SPIn_ReceiverBufferIsFull();
```

Returns

Receive Buffer Status

- 1 - Full
- 0 - Empty

Description

This function returns the receive buffer status (full/empty).

Remarks

None.

Preconditions

None.

Example

```
bool rxBufStat;
// Using instance 1 of SPI driver, that is n = 1
rxBufStat = DRV_SPI1_ReceiverBufferIsFull();

if (rxBufStat)
{
...
}
```

Function

bool DRV_SPIn_ReceiverBufferIsFull(void)

DRV_SPIn_TransmitterBufferIsFull Function

Returns the transmit buffer status. 'n' represents the instance of the SPI driver used.

Implementation: Static

File

drv_spi.h

C

```
bool DRV_SPIn_TransmitterBufferIsFull();
```

Returns

Transmit Buffer Status

- 1 - Full
- 0 - Empty

Description

This function returns the transmit buffer status (full/empty).

Remarks

None.

Preconditions

None.

Example

```
bool txBufStat;
// Using instance 1 of SPI driver, that is n = 1
txBufStat = DRV_SPI1_TransmitterBufferIsFull();

if (txBufStat)
{
...
}
```

Function

bool DRV_SPIn_TransmitterBufferIsFull(void)

d) Miscellaneous Functions

e) Data Types and Constants

DRV_SPI_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_spi.h

C

```
#define DRV_SPI_BUFFER_HANDLE_INVALID ((DRV_SPI_BUFFER_HANDLE)(-1))
```

Description

SPI Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_SPI_BufferAddRead() and DRV_SPI_BufferAddWrite() function if the buffer add request was not successful.

Remarks

None.

DRV_SPI_INDEX_0 Macro

SPI driver index definitions.

File

drv_spi.h

C

```
#define DRV_SPI_INDEX_0 0
```

Description

SPI Driver Module Index Numbers

These constants provide the SPI driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_SPI_Initialize and DRV_SPI_Open functions to identify the driver instance in use.

DRV_SPI_INDEX_COUNT Macro

Number of valid SPI driver indices.

File

drv_spi.h

C

```
#define DRV_SPI_INDEX_COUNT SPI_NUMBER_OF_MODULES
```

Description

SPI Driver Module Index Count

This constant identifies the number of valid SPI driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

DRV_SPI_BUFFER_EVENT Enumeration

Identifies the possible events that can result from a buffer add request.

File

drv_spi.h

C

```
typedef enum {
  DRV_SPI_BUFFER_EVENT_PENDING,
  DRV_SPI_BUFFER_EVENT_PROCESSING,
  DRV_SPI_BUFFER_EVENT_COMPLETE,
  DRV_SPI_BUFFER_EVENT_ERROR
} DRV_SPI_BUFFER_EVENT;
```

Members

Members	Description
DRV_SPI_BUFFER_EVENT_PENDING	Buffer is pending to get processed
DRV_SPI_BUFFER_EVENT_PROCESSING	Buffer is being processed
DRV_SPI_BUFFER_EVENT_COMPLETE	All data from or to the buffer was transferred successfully.
DRV_SPI_BUFFER_EVENT_ERROR	There was an error while processing the buffer transfer request.

Description

SPI Driver Buffer Events

This enumeration identifies the possible events that can result from a buffer add request caused by the client calling either DRV_SPI_BufferAddRead2 or DRV_SPI_BufferAddWrite2 or similar functions.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that the client registered during buffer add requests.

DRV_SPI_BUFFER_EVENT_HANDLER Type

Pointer to a SPI Driver Buffer Event handler function

File

drv_spi.h

C

```
typedef void (* DRV_SPI_BUFFER_EVENT_HANDLER)(DRV_SPI_BUFFER_EVENT event, DRV_SPI_BUFFER_HANDLE
bufferHandle, void * context);
```

Returns

None.

Description

SPI Driver Buffer Event Handler Function Pointer

This data type defines the required function signature for the SPI driver buffer event handling callback function. A client must register a pointer to a buffer event handling function who's function signature (parameter and return value types) match the types specified by this function pointer in order to receive buffer related event calls back from the driver.

The parameters and return values and return value are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SPI_BUFFER_EVENT_COMPLETE, it means that the data was transferred successfully.

If the event is DRV_SPI_BUFFER_EVENT_ERROR, it means that the data was not transferred successfully.

The bufferHandle parameter contains the buffer handle of the buffer that failed.

The context parameter contains the a handle to the client context, provided at the time the event handling function registration. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The event handler function executes in an interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive operations with in this function.

Example

```
void APP_MyBufferEventHandler( DRV_SPI_BUFFER_EVENT event,
                               DRV_SPI_BUFFER_HANDLE bufferHandle,
                               uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
```

```
    {
        case DRV_SPI_BUFFER_EVENT_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_SPI_BUFFER_EVENT_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
bufferHandle	Handle identifying the buffer to which the vent relates
context	Value identifying the context of the application that registered the event handling function.

DRV_SPI_BUFFER_HANDLE Type

Handle identifying a read or write buffer passed to the driver.

File

drv_spi.h

C

```
typedef uintptr_t DRV_SPI_BUFFER_HANDLE;
```

Description

SPI Driver Buffer Handle

A buffer handle value is returned by a call to the DRV_SPI_BufferAddRead()/ DRV_SPI_BufferAddWrite or DRV_SPI_BufferAddReadWrite() functions. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from the "buffer add" function is returned back to the client by the "callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SPI_BUFFER_TYPE Enumeration

Identifies the various buffer types of the SPI module.

File

drv_spi.h

C

```
typedef enum {
  DRV_SPI_BUFFER_TYPE_STANDARD,
  DRV_SPI_BUFFER_TYPE_ENHANCED
} DRV_SPI_BUFFER_TYPE;
```

Members

Members	Description
DRV_SPI_BUFFER_TYPE_STANDARD	SPI Buffer Type Standard
DRV_SPI_BUFFER_TYPE_ENHANCED	SPI Enhanced Buffer Type

Description

SPI Buffer Type Selection

This enumeration identifies the various buffer types of the SPI module.

Remarks

None.

DRV_SPI_CLOCK_MODE Enumeration

Identifies the various clock modes of the SPI module.

File

drv_spi.h

C

```
typedef enum {
  DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_RISE,
  DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_FALL,
  DRV_SPI_CLOCK_MODE_IDLE_HIGH_EDGE_FALL,
  DRV_SPI_CLOCK_MODE_IDLE_HIGH_EDGE_RISE
} DRV_SPI_CLOCK_MODE;
```

Members

Members	Description
DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_RISE	SPI Clock Mode 0 - Idle State Low & SDO Sampling on Rising Edge
DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_FALL	SPI Clock Mode 1 - Idle State Low & SDO Sampling on Falling Edge
DRV_SPI_CLOCK_MODE_IDLE_HIGH_EDGE_FALL	SPI Clock Mode 2 - Idle State High & SDO Sampling on Falling Edge
DRV_SPI_CLOCK_MODE_IDLE_HIGH_EDGE_RISE	SPI Clock Mode 3 - Idle State High & SDO Sampling on Rising Edge

Description

SPI Clock Mode Selection

This enumeration identifies the various clock modes of the SPI module.

Remarks

None.

DRV_SPI_INIT Structure

Defines the data required to initialize or reinitialize the SPI driver

File

drv_spi.h

C

```
typedef struct _DRV_SPI_INIT {
  SYS_MODULE_INIT moduleInit;
  SPI_MODULE_ID spiId;
  DRV_SPI_TASK_MODE taskMode;
  DRV_SPI_MODE spiMode;
  bool allowIdleRun;
  DRV_SPI_PROTOCOL_TYPE spiProtocolType;
  bool spiSlaveSSPin;
  SPI_FRAME_SYNC_PULSE frameSyncPulse;
  SPI_FRAME_PULSE_POLARITY framePulsePolarity;
  SPI_FRAME_PULSE_DIRECTION framePulseDirection;
  SPI_FRAME_PULSE_EDGE framePulseEdge;
  SPI_FRAME_PULSE_WIDTH framePulseWidth;
  SPI_AUDIO_TRANSMIT_MODE audioTransmitMode;
  SPI_AUDIO_PROTOCOL audioProtocolMode;
  SPI_COMMUNICATION_WIDTH commWidth;
  CLK_BUSES_PERIPHERAL spiClk;
  uint32_t baudRate;
  DRV_SPI_BUFFER_TYPE bufferType;
  DRV_SPI_CLOCK_MODE clockMode;
  SPI_INPUT_SAMPLING_PHASE inputSamplePhase;
  INT_SOURCE txInterruptSource;
  INT_SOURCE rxInterruptSource;
  INT_SOURCE errInterruptSource;
```

```
    uint8_t numTrfsSmPolled;
    DMA_CHANNEL txDmaChannel;
    uint8_t txDmaThreshold;
    DMA_CHANNEL rxDmaChannel;
    uint8_t rxDmaThreshold;
    uint8_t queueSize;
    uint8_t jobQueueReserveSize;
    DRV_SPI_BUFFER_EVENT_HANDLER operationStarting;
    DRV_SPI_BUFFER_EVENT_HANDLER operationEnded;
  } DRV_SPI_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SPI_MODULE_ID spiId;	Identifies peripheral (PLIB-level) ID
DRV_SPI_TASK_MODE taskMode;	SPI Task Mode Type
DRV_SPI_MODE spiMode;	SPI Usage Mode Type
bool allowIdleRun;	Allow SPI to run when CPU goes to idle mode
DRV_SPI_PROTOCOL_TYPE spiProtocolType;	SPI Protocol Type
bool spiSlaveSSPin;	SPI Slave Mode SSx Pin Select
SPI_FRAME_SYNC_PULSE frameSyncPulse;	Framed mode Sync Pulse
SPI_FRAME_PULSE_POLARITY framePulsePolarity;	Framed Mode pulse polarity
SPI_FRAME_PULSE_DIRECTION framePulseDirection;	Framed Mode Pulse Direction
SPI_FRAME_PULSE_EDGE framePulseEdge;	Framed mode Pulse Edge
SPI_FRAME_PULSE_WIDTH framePulseWidth;	Framed Mode Pulse width
SPI_AUDIO_TRANSMIT_MODE audioTransmitMode;	Audio mode transmit mode
SPI_AUDIO_PROTOCOL audioProtocolMode;	Audio mode protocol mode
SPI_COMMUNICATION_WIDTH commWidth;	Communication Width
CLK_BUSES_PERIPHERAL spiClk;	Peripheral clock used by the SPI driver
uint32_t baudRate;	Baud Rate Value
DRV_SPI_BUFFER_TYPE bufferType;	SPI Buffer Type
DRV_SPI_CLOCK_MODE clockMode;	SPI Clock mode
SPI_INPUT_SAMPLING_PHASE inputSamplePhase;	SPI Input Sample Phase Selection
INT_SOURCE txInterruptSource;	Transmit/Receive or Transmit Interrupt Source for SPI module
INT_SOURCE rxInterruptSource;	Receive Interrupt Source for SPI module
INT_SOURCE errInterruptSource;	Error Interrupt Source for SPI module
uint8_t numTrfsSmPolled;	While using standard buffer and polled mode how many transfers to do before yielding to other tasks
DMA_CHANNEL txDmaChannel;	DMA Channel for the Transmitter
uint8_t txDmaThreshold;	Threshold for the minimum number of bytes to send to use DMA
DMA_CHANNEL rxDmaChannel;	DMA Channel for the Receiver
uint8_t rxDmaThreshold;	Threshold for the minimum number of bytes to receive to use DMA
uint8_t queueSize;	This is the buffer queue size. This is the maximum number of transfer requests that driver will queue.
uint8_t jobQueueReserveSize;	This controls the minimum number of jobs that the driver will be able to accept without running out of memory. The driver will reserve this number of jobs from the global SPI queue so that it will always be available
DRV_SPI_BUFFER_EVENT_HANDLER operationStarting;	This callback is fired when an operation is about to start on the SPI bus. This allows the user to set any pins that need to be set. This callback may be called from an ISR so should not include OSAL calls. The context parameter is the same one passed into the BufferAddRead, BufferAddWrite, BufferAddWriteRead function.
DRV_SPI_BUFFER_EVENT_HANDLER operationEnded;	This callback is fired when an operation has just completed on the SPI bus. This allows the user to set any pins that need to be set. This callback may be called from an ISR so should not include OSAL calls. The context parameter is the same one passed into the BufferAddRead, BufferAddWrite, BufferAddWriteRead function.

Description

SPI Driver Initialization Data

This data type defines the data required to initialize or reinitialize the SPI driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

DRV_SPI_MODE Enumeration

Identifies the various usage modes of the SPI module.

File

drv_spi.h

C

```
typedef enum {
  DRV_SPI_MODE_MASTER,
  DRV_SPI_MODE_SLAVE
} DRV_SPI_MODE;
```

Members

Members	Description
DRV_SPI_MODE_MASTER	SPI Mode Master
DRV_SPI_MODE_SLAVE	SPI Mode Slave

Description

SPI Usage Modes Enumeration

This enumeration identifies the various usage modes of the SPI module.

Remarks

None.

DRV_SPI_PROTOCOL_TYPE Enumeration

Identifies the various protocols of the SPI module.

File

drv_spi.h

C

```
typedef enum {
  DRV_SPI_PROTOCOL_TYPE_STANDARD,
  DRV_SPI_PROTOCOL_TYPE_FRAMED,
  DRV_SPI_PROTOCOL_TYPE_AUDIO
} DRV_SPI_PROTOCOL_TYPE;
```

Members

Members	Description
DRV_SPI_PROTOCOL_TYPE_STANDARD	SPI Protocol Type Standard
DRV_SPI_PROTOCOL_TYPE_FRAMED	SPI Protocol Type Framed
DRV_SPI_PROTOCOL_TYPE_AUDIO	SPI Protocol Type Audio

Description

SPI Protocols Enumeration

This enumeration identifies the various protocols of the SPI module.

Remarks

None.

DRV_SPI_INDEX_1 Macro

File

drv_spi.h

C

```
#define DRV_SPI_INDEX_1 1
```

Description

This is macro DRV_SPI_INDEX_1.

DRV_SPI_INDEX_2 Macro

File

drv_spi.h

C

SPI device driver interface file.

Enumerations

	Name	Description
	DRV_SPI_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_SPI_BUFFER_TYPE	Identifies the various buffer types of the SPI module.
	DRV_SPI_CLOCK_MODE	Identifies the various clock modes of the SPI module.
	DRV_SPI_MODE	Identifies the various usage modes of the SPI module.
	DRV_SPI_PROTOCOL_TYPE	Identifies the various protocols of the SPI module.
	DRV_SPI_TASK_MODE	Identifies the various modes of how the tasks function will be run.

Functions

	Name	Description
	DRV_SPI_BufferAddRead	Registers a buffer for a read operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddRead2	Registers a buffer for a read operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddWrite	Registers a buffer for a write operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddWrite2	Registers a buffer for a write operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddWriteRead	Registers a buffer for a read and write operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferAddWriteRead2	Registers a buffer for a read and write operation. Actual transfer will happen in the Task function. **Implementation:** Static/Dynamic
	DRV_SPI_BufferStatus	Returns the transmitter and receiver transfer status. **Implementation:** Static/Dynamic
	DRV_SPI_ClientConfigure	Configures a SPI client with specific data. **Implementation:** Static/Dynamic
	DRV_SPI_Close	Closes an opened instance of the SPI driver. **Implementation:** Static/Dynamic
	DRV_SPI_Deinitialize	Deinitializes the specified instance of the SPI driver module. **Implementation:** Static/Dynamic
	DRV_SPI_Initialize	Initializes the SPI instance for the specified driver index. **Implementation:** Static/Dynamic
	DRV_SPI_Open	Opens the specified SPI driver instance and returns a handle to it. **Implementation:** Static/Dynamic
	DRV_SPI_Status	Provides the current status of the SPI driver module. **Implementation:** Static/Dynamic
	DRV_SPI_Tasks	Maintains the driver's state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_SPIn_ReceiverBufferIsFull	Returns the receive buffer status. 'n' represents the instance of the SPI driver used. **Implementation:** Static

	DRV_SPIn_TransmitterBufferIsFull	Returns the transmit buffer status. 'n' represents the instance of the SPI driver used. **Implementation:** Static

Macros

	Name	Description
	DRV_SPI_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_SPI_INDEX_0	SPI driver index definitions.
	DRV_SPI_INDEX_1	This is macro DRV_SPI_INDEX_1.
	DRV_SPI_INDEX_2	This is macro DRV_SPI_INDEX_2.
	DRV_SPI_INDEX_3	This is macro DRV_SPI_INDEX_3.
	DRV_SPI_INDEX_4	This is macro DRV_SPI_INDEX_4.
	DRV_SPI_INDEX_5	This is macro DRV_SPI_INDEX_5.
	DRV_SPI_INDEX_COUNT	Number of valid SPI driver indices.

Structures

	Name	Description
	_DRV_SPI_CLIENT_DATA	Defines the data that can be changed per client.
	_DRV_SPI_INIT	Defines the data required to initialize or reinitialize the SPI driver
	DRV_SPI_CLIENT_DATA	Defines the data that can be changed per client.
	DRV_SPI_INIT	Defines the data required to initialize or reinitialize the SPI driver

Types

	Name	Description
	DRV_SPI_BUFFER_EVENT_HANDLER	Pointer to a SPI Driver Buffer Event handler function
	DRV_SPI_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.

Description

SPI Driver Interface

The SPI driver provides a simple interface to manage the SPI module. This file defines the interface definitions and prototypes for the SPI driver.

File Name

drv_spi.h

Company

Microchip Technology Inc.

drv_spi_config_template.h

SPI Driver configuration definitions template.

Macros

	Name	Description
	DRV_SPI_16BIT	Controls the compilation of 16 Bit mode
	DRV_SPI_32BIT	Controls the compilation of 32 Bit mode
	DRV_SPI_8BIT	Controls the compilation of 8 Bit mode
	DRV_SPI_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_SPI_DMA	Controls the compilation of DMA support
	DRV_SPI_DMA_DUMMY_BUFFER_SIZE	Controls the size of DMA dummy buffer
	DRV_SPI_DMA_TXFER_SIZE	Controls the size of DMA transfers
	DRV_SPI_EBM	Controls the compilation of Enhanced Buffer Mode mode
	DRV_SPI_ELEMENTS_PER_QUEUE	Controls the number of elements that are allocated.
	DRV_SPI_INSTANCES_NUMBER	Selects the maximum number of hardware instances that can be supported by the dynamic driver .
	DRV_SPI_ISR	Controls the compilation of ISR mode
	DRV_SPI_MASTER	Controls the compilation of master mode
	DRV_SPI_POLLED	Controls the compilation of Polled mode
	DRV_SPI_RM	Controls the compilation of Standard Buffer mode

	DRV_SPI_SLAVE	Controls the compilation of slave mode

SPI Flash Driver Libraries

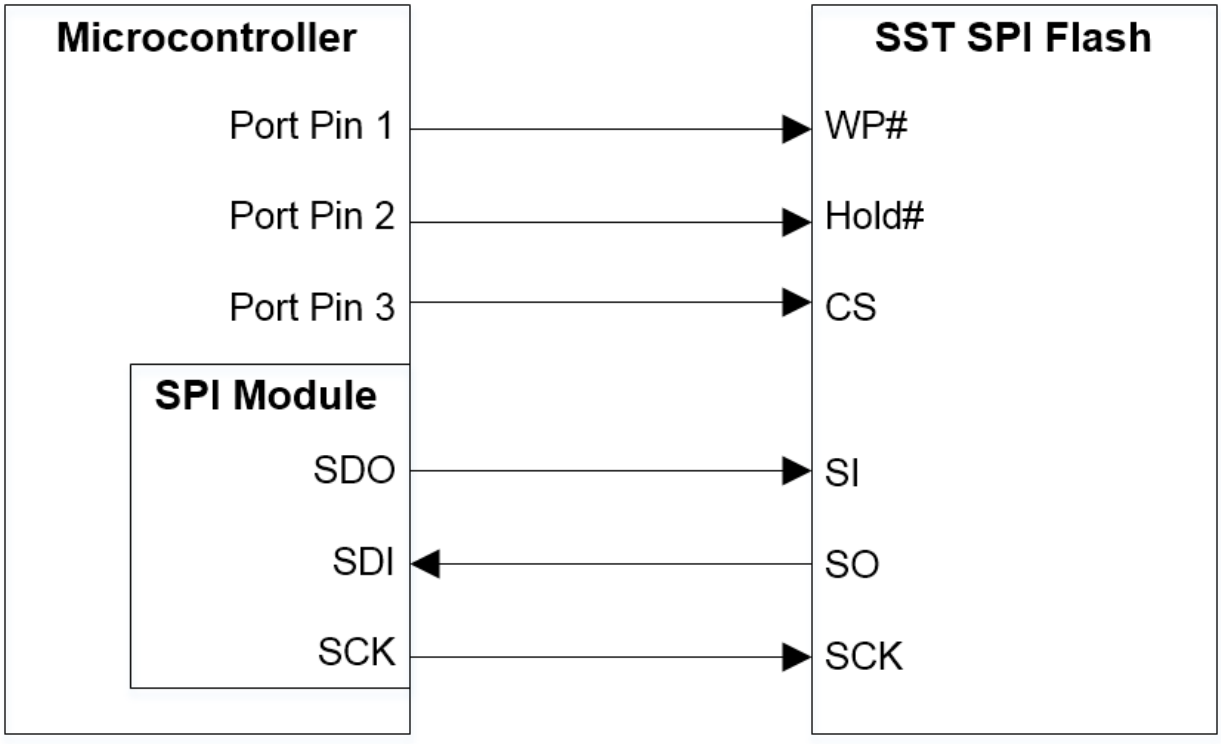
This section describes the Serial Peripheral Interface (SPI) Flash Driver Libraries.

Introduction

This library provides an interface to manage the SST SPI Flash modules (SST25VF020B, SST25VF016B, and SST25VF064C) in different modes of operation.

Description

The SPI Flash Driver uses SPI interface to establish the communication between SST Flash and Microchip microcontrollers. The SPI module of the controller works as a Master device and the Flash module works as a Slave. The following diagram shows the pin connections that are required to make the driver operational:



The SPI Flash Driver is dynamic in nature, so single instance of it can support multiple clients that want to use the same Flash. Multiple instances of the driver can be used when multiple Flash devices are required to be part of the system. The SPI Driver, which is used by the SPI Flash Driver, can be configured for use in either Polled or Interrupt mode.

Using the Library

This topic describes the basic architecture of the SPI Flash Driver Library and provides information and examples on its use.

Description

Interface Header Files: `drv_sst25vf016b.h`, `drv_sst25vf020b.h`, or `drv_sst25vf064c.h`

The interface to the SPI Flash Driver Library is defined in the header file. Any C language source (`.c`) file that uses the SPI Flash Driver library should include this header.

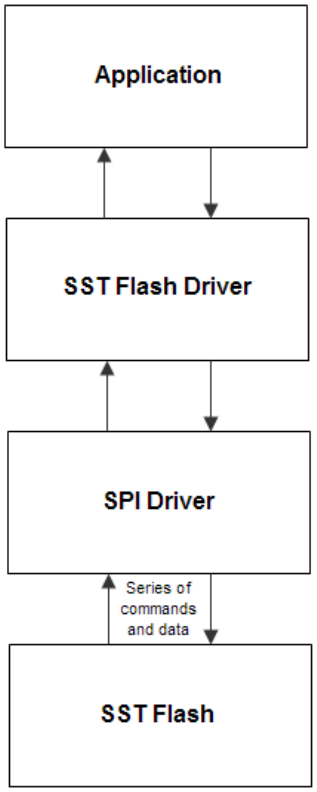
Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the SPI Flash Driver Library with a convenient C language interface. This topic describes how that abstraction is modeled in software.

Description

The SST SPI Flash needs a specific set of commands to be given on its SPI interface along with the required address and data to do different operations. This driver abstracts these requirements and provide simple APIs that can be used to perform Erase, Write, and Read operations. The SPI Driver is used for this purpose. The following layered diagram depicts the communication between different modules.



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the SPI Flash module.

Library Interface Section	Description
System Functions	These functions are accessed by the MPLAB Harmony System module and allow the driver to be initialized, deinitialized, and maintained.
Core Client Functions	These functions allow the application client to open and close the driver.
Block Operation Functions	These functions enable the Flash module to be erased, written, and read (to/from).
Media Interface Functions	These functions provide media status and the Flash geometry.

How the Library Works

The library provides interfaces to support:

- System Initialization/Deinitialization

- Opening the Driver
- Block Operations

System Initialization and Deinitialization

Provides information on initializing the system.

Description

System Initialization and Deinitialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization each instance of the SST Flash module would be initialized with the following configuration settings (either passed dynamically at run-time using DRV_SST25VF020B_INIT, DRV_SST25VF016B_INIT, or DRV_SST25VF064C_INIT, or by using Initialization Overrides) that are supported or used by the specific SST Flash device hardware:

- Device requested power state: one of the System Module Power States. For specific details please refer to **Data Types and Constants** in the Library Interface section
- The SPI Driver Module Index which is intended to be used to communicate with SST Flash (e.g., DRV_SPI_INDEX_0)
- Port Pins of the microcontroller to be used for Chip Select, Write Protection, and Hold operations on the SST Flash device
- Maximum Buffer Queue Size for that instance of the SST Flash Driver

Using the SST25VF020B as an example, the DRV_SST25VF020B_Initialize function returns an object handle of the type SYS_MODULE_OBJ. After this, the object handle returned by the Initialize interface would be used by the other system interfaces like DRV_SST25VF020B_Deinitialize, DRV_SST25VF020B_Status, and DRV_SST25VF020B_Tasks.

Note: The system initialization and the deinitialization settings, only affect the instance of the peripheral that is being initialized or deinitialized.

Example:

```
// This code example shows the initialization of the SST25VF020B SPI Flash
// Driver. SPI driver index 0 is used for the purpose. Pin numbers 1, 2,
// and 3 of PORTB are configured for the Hold pin, Write Protection pin, and
// the Chip Select pin, respectively. The maximum buffer queue size is set to 5.

   DRV_SST25VF020B_INIT   SST25VF020BInitData;
   SYS_MODULE_OBJ      objectHandle;

   SST25VF020BInitData.moduleInit.value        = SYS_MODULE_POWER_RUN_FULL;
   SST25VF020BInitData.spiDriverModuleIndex    = DRV_SPI_INDEX_0;
   SST25VF020BInitData.holdPortChannel         = PORT_CHANNEL_B;
   SST25VF020BInitData.holdBitPosition         = PORTS_BIT_POS_1;
   SST25VF020BInitData.writeProtectPortChannel = PORT_CHANNEL_B;
   SST25VF020BInitData.writeProtectBitPosition = PORTS_BIT_POS_2;
   SST25VF020BInitData.chipSelectPortChannel   = PORT_CHANNEL_F;
   SST25VF020BInitData.chipSelectBitPosition   = PORTS_BIT_POS_2;
   SST25VF020BInitData.queueSize               = 5;

   objectHandle = DRV_SST25VF020B_Initialize(DRV_SST25VF020B_INDEX_0,
                                (SYS_MODULE_INIT*)SST25VF020BInitData);
   if (SYS_MODULE_OBJ_INVALID == objectHandle)
   {
       // Handle error
   }
```

Tasks Routine

The system will either call DRV_SST25VF020B_Tasks, from SYS_Tasks (in a polled environment) or DRV_SST25VF020B_Tasks will be called from the ISR of the SPI module in use.

Opening the Driver

Provides information on opening the driver.

Description

To use the SST Flash driver, the application must open the driver. Using the SST25VF020B as an example, this is done by calling the DRV_SST25VF020B_Open function. Calling this function with DRV_IO_INTENT_NONBLOCKING will cause the driver to be opened in non blocking mode. Then DRV_SST25VF020B_BlockErase, DRV_SST25VF020B_BlockWrite and DRV_SST25VF020B_BlockRead functions when called by this client will be non-blocking.

The client can also open the driver in Read-only mode (DRV_IO_INTENT_READ), Write-only mode (DRV_IO_INTENT_WRITE), and Exclusive mode (DRV_IO_INTENT_EXCLUSIVE). If the driver has been opened exclusively by a client, it cannot be opened again by another client.

If successful, the DRV_SST25VF020B_Open function will return a handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_SST25VF020B_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in other (error) cases as well.

The following code shows an example of the driver being opened in different modes.

```
DRV_HANDLE sstHandle1, sstHandle2;

/* Client 1 opens the SST driver in non blocking mode */
sstHandle1 = DRV_SST25VF020B_Open(DRV_SST25VF020B_INDEX_0, DRV_IO_INTENT_NONBLOCKING);

/* Check if the handle is valid */
if(DRV_HANDLE_INVALID == sstHandle1)
{
    /* The driver was not opened successfully. The client
     * can try opening it again */
}

/* Client 2 opens the SST driver in Exclusive Write only mode */
sstHandle2 = DRV_SST25VF020B_Open(DRV_SST25VF020B_INDEX_0, DRV_IO_INTENT_WRITE | DRV_IO_INTENT_EXCLUSIVE);

/* Check if the handle is valid */
if(DRV_HANDLE_INVALID == sstHandle2)
{
    /* The driver was not opened successfully. The client
     * can try opening it again */
}
```

Block Operations

Provides information on block operations.

Description

This driver provides simple client interfaces to Erase, Write, and Read the SST flash in blocks. A block is the unit to represent minimum amount of data that can be erased, written, or read. Block size may differ for Erase, Write, and Read operations. Using the SST25VF020B as an example, the DRV_SST25VF020B_GeometryGet function can be used to determine the different block sizes for the driver.

The DRV_SST25VF020B_BlockErase, DRV_SST25VF020B_BlockWrite, and DRV_SST25VF020B_BlockRead functions are used to erase, write, and read the data to/from SST SPI Flash. These functions are always non-blocking. All of these functions follow a standard queue model to read, write, and erase. When any of these functions are called (i.e., a block request is made), the request is queued. The size of the queue is determined by the queueSize member of the DRV_SST25VF020B_INIT data structure. All of the requests in the queue are executed by the DRV_SST25VF020B_Tasks function one-by-one.

When the driver adds a request to the queue, it returns a buffer handle. This handle allows the client to track the request as it progresses through the queue. The buffer handle expires when the event associated with the buffer completes. The driver provides driver events (DRV_SST25VF020B_BLOCK_EVENT) that indicate termination of the buffer requests.

The following steps can be performed for a simple Block Data Operation:

1. The system should have completed necessary initialization of the SPI Driver and the SST Flash Driver, and the DRV_SST25VF020B_Tasks function should be running in a polled environment.
2. The DRV_SPI_Tasks function should be running in either a polled environment or an interrupt environment.
3. Open the driver using DRV_SST25VF020B_Open with the necessary intent.
4. Set an event handler callback using the function DRV_SST25VF020B_BlockEventHandlerSet.
5. Request for block operations using the functions, DRV_SST25VF020B_BlockErase, DRV_SST25VF020B_BlockWrite, and DRV_SST25VF020B_BlockRead, with the appropriate parameters.
6. Wait for event handler callback to occur and check the status of the block operation using the callback function parameter of type DRV_SST25VF020B_BLOCK_EVENT.
7. The client will be able to close the driver using the function, DRV_SST25VF020B_Close, when required.

Example:

```
/* This code example shows usage of the block operations
 * on the SPI Flash SST25VF020B device */

DRV_HANDLE sstHandle1;
uint8_t myData1[10], myData2[10];
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE  blockHandle1, blockHandle2, blockHandle3;

/* The driver is opened for read-write in Exclusive mode */
```

```
sstHandle1 = DRV_SST25VF020B_Open(DRV_SST25VF020B_INDEX_0,
                                  DRV_IO_INTENT_READWRITE | DRV_IO_INTENT_EXCLUSIVE);

/* Check if the driver was opened successfully */
if(DRV_HANDLE_INVALID == sstHandle1)
{
    /* The driver could not be opened successfully */
}

/* Register a Buffer Event Handler with SST25VF020B  driver.
 * This event handler function will be called whenever
 * there is a buffer event.  An application defined
 * context can also be specified. This is returned when
 * the event handler is called.
 * */
DRV_SST25VF020B_BlockEventHandlerSet(sstHandle1,
        APP_SSTBufferEventHandler, NULL);

/* Request for all the three block operations one by one */

/* first block API to erase 1 block of the flash starting from address 0x0, each block is of 4kbyte */
DRV_SST25VF020B_BlockErase(sstHandle1, &blockHandle1, 0x0, 1);
/* 2nd block API to write myData1 in the first 10 locations of the flash */
DRV_SST25VF020B_BlockWrite(sstHandle1, &blockHandle2, &myData1[0], 0x0, 10);
/* 3rd block API to read the first 10 locations of the flash into myData2 */
DRV_SST25VF020B_BlockRead(sstHandle1, &blockHandle3, &myData2[0], 0x0, 10);

/* This is the Driver Event Handler */

void APP_SSTBufferEventHandler(DRV_SST25VF020B_BLOCK_EVENT event,
        DRV_SST25VF020B_BLOCK_COMMAND_HANDLE blockHandle, uintptr_t contextHandle)
{
    switch(event)
    {
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE:
    if ( blockHandle == blockHandle3)
    {
            /* This means the data was read */
    /* Do data verification/processing */
    }
            break;
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR:
            /* Error handling here. */
            break;
        default:
            break;
    }
}
```

Configuring the Library

SST25VF016B Configuration

	Name	Description
	DRV_SST25VF016B_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_SST25VF016B_HARDWARE_HOLD_ENABLE	Specifies if the hardware hold feature is enabled or not.
	DRV_SST25VF016B_HARDWARE_WRITE_PROTECTION_ENABLE	Specifies if the hardware write protect feature is enabled or not.
	DRV_SST25VF016B_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_SST25VF016B_MODE	Determines whether the driver is implemented as static or dynamic
	DRV_SST25VF016B_QUEUE_DEPTH_COMBINED	Number of entries of queues in all instances of the driver.

SST25VF020B Configuration

	Name	Description
	DRV_SST25VF020B_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_SST25VF020B_HARDWARE_HOLD_ENABLE	Specifies if the hardware hold feature is enabled or not.
	DRV_SST25VF020B_HARDWARE_WRITE_PROTECTION_ENABLE	Specifies if the hardware write protect feature is enabled or not.
	DRV_SST25VF020B_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_SST25VF020B_MODE	Determines whether the driver is implemented as static or dynamic.
	DRV_SST25VF020B_QUEUE_DEPTH_COMBINED	Number of entries of queues in all instances of the driver.

SST25VF064C Configuration

	Name	Description
	DRV_SST25VF064C_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_SST25VF064C_HARDWARE_HOLD_ENABLE	Specifies whether or not the hardware hold feature is enabled.
	DRV_SST25VF064C_HARDWARE_WRITE_PROTECTION_ENABLE	Specifies whether or not the hardware write protect feature is enabled.
	DRV_SST25VF064C_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_SST25VF064C_MODE	Determines whether the driver is implemented as static or dynamic.
	DRV_SST25VF064C_QUEUE_DEPTH_COMBINED	Number of entries of queues in all instances of the driver.

Description

The SST Flash Driver requires the specification of compile-time configuration macros. These macros define resource usage, feature availability, and dynamic behavior of the driver. These configuration macros should be defined in the `system_config.h` file.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

SST25VF016B Configuration

DRV_SST25VF016B_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_CLIENTS_NUMBER 4
```

Description

SST25VF016B Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance. This value represents the total number of clients to be supported across all hardware instances. So if SST25VF016B-1 will be accessed by 2 clients and SST25VF016B-2 will accessed by 3 clients, then this number should be 5. It is recommended that this be set exactly equal to the number of expected clients. Client support consumes RAM memory space. If this macro is not defined and the DRV_SST25VF016B_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - single client operation. If this macro is defined and the DRV_SST25VF016B_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - multi client operation.

Remarks

None.

DRV_SST25VF016B_HARDWARE_HOLD_ENABLE Macro

Specifies if the hardware hold feature is enabled or not.

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_HARDWARE_HOLD_ENABLE false
```

Description

SST25VF016B Hardware HOLD Support

This macro defines if the hardware hold feature is enabled or not. If hardware hold is enabled, then user must provide a port pin corresponding to HOLD pin on the flash

Remarks

None

DRV_SST25VF016B_HARDWARE_WRITE_PROTECTION_ENABLE Macro

Specifies if the hardware write protect feature is enabled or not.

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_HARDWARE_WRITE_PROTECTION_ENABLE false
```

Description

SST25VF016B Hardware Write Protect Support

This macro defines if the hardware Write Protect feature is enabled or not. If hardware write protection is enabled, then user must provide a port pin corresponding to WP pin on the flash

Remarks

None.

DRV_SST25VF016B_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_INSTANCES_NUMBER 2
```

Description

SST25VF016B driver objects configuration

Sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of SST25VF016B modules that are needed by the application. Hardware Instance support consumes RAM memory space. If this macro is not defined, then the driver will be built statically.

Remarks

None.

DRV_SST25VF016B_MODE Macro

Determines whether the driver is implemented as static or dynamic

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_MODE DYNAMIC
```

Description

SST25VF016B mode

Determines whether the driver is implemented as static or dynamic. Static drivers control the peripheral directly with peripheral library routines.

Remarks

None.

DRV_SST25VF016B_QUEUE_DEPTH_COMBINED Macro

Number of entries of queues in all instances of the driver.

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_QUEUE_DEPTH_COMBINED 7
```

Description

SST25VF016B Driver Instance combined queue depth.

This macro defines the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for all the read/write/erase operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build).

A buffer queue will contain buffer queue entries, each related to a BufferAdd request. This configuration macro defines total number of buffer entries that will be available for use between all SST25VF016B driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking erase/write/read requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. More the number of buffer entries, greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its buffer queue size.

SST25VF020B Configuration

DRV_SST25VF020B_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_CLIENTS_NUMBER 4
```

Description

SST25VF020B Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance. This value represents the total number of clients to be supported across all hardware instances. So if SST25VF020B-1 will be accessed by 2 clients and SST25VF020B-2 will accessed by 3 clients, then this number should be 5. It is recommended that this be set exactly equal to the number of expected clients. Client support consumes RAM memory space. If this macro is not defined and the DRV_SST25VF020B_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - single client operation. If this macro is defined and the DRV_SST25VF020B_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - multi client operation.

Remarks

None.

DRV_SST25VF020B_HARDWARE_HOLD_ENABLE Macro

Specifies if the hardware hold feature is enabled or not.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_HARDWARE_HOLD_ENABLE false
```

Description

SST25VF020B Hardware HOLD Support

This macro defines if the hardware hold feature is enabled or not. If hardware hold is enabled, then user must provide a port pin corresponding to HOLD pin on the flash

Remarks

None.

DRV_SST25VF020B_HARDWARE_WRITE_PROTECTION_ENABLE Macro

Specifies if the hardware write protect feature is enabled or not.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_HARDWARE_WRITE_PROTECTION_ENABLE false
```

Description

SST25VF020B Hardware Write Protect Support

This macro defines if the hardware Write Protect feature is enabled or not. If hardware write protection is enabled, then user must provide a port pin corresponding to WP pin on the flash

Remarks

None.

DRV_SST25VF020B_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_INSTANCES_NUMBER 2
```

Description

SST25VF020B driver objects configuration

Sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of SST25VF020B modules that are needed by the application. Hardware Instance support consumes RAM memory space. If this macro is not defined, then the driver will be built statically.

Remarks

None.

DRV_SST25VF020B_MODE Macro

Determines whether the driver is implemented as static or dynamic.

File

C

```
#define DRV_SST25VF020B_MODE DYNAMIC
```

Description

SST25VF020B mode

Determines whether the driver is implemented as static or dynamic. Static drivers control the peripheral directly with peripheral library routines.

Remarks

None.

DRV_SST25VF020B_QUEUE_DEPTH_COMBINED Macro

Number of entries of queues in all instances of the driver.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_QUEUE_DEPTH_COMBINED 7
```

Description

SST25VF020B Driver Instance combined queue depth.

This macro defines the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for all the read/write/erase operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build).

A buffer queue will contain buffer queue entries, each related to a BufferAdd request. This configuration macro defines total number of buffer entries that will be available for use between all SST25VF020B driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking erase/write/read requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. More the number of buffer entries, greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its buffer queue size.

SST25VF064C Configuration

DRV_SST25VF064C_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_sst25vf064c_config_template.h

C

```
#define DRV_SST25VF064C_CLIENTS_NUMBER 4
```

Description

SST25VF064C Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance. This value represents the total number of clients to be supported across all hardware instances. So if SST25VF064C-1 will be accessed by 2 clients and SST25VF064C-2 will accessed by 3 clients, then this number should be 5. It is recommended that this be set exactly equal to the number of expected clients. Client support consumes RAM memory space. If this macro is not defined and the DRV_SST25VF064C_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - single client operation. If this macro is defined and the DRV_SST25VF064C_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - multi client operation.

Remarks

None.

drv_sst25vf064c_config_template.h

C

```
#define DRV_SST25VF064C_MODE DYNAMIC
```

Description

SST25VF064C mode

Determines whether the driver is implemented as static or dynamic. Static drivers control the peripheral directly with peripheral library routines.

Remarks

None.

DRV_SST25VF064C_QUEUE_DEPTH_COMBINED Macro

Number of entries of queues in all instances of the driver.

File

drv_sst25vf064c_config_template.h

C

```
#define DRV_SST25VF064C_QUEUE_DEPTH_COMBINED 7
```

Description

SST25VF064C Driver Instance combined queue depth.

This macro defines the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for all the read/write/erase operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build).

A buffer queue will contain buffer queue entries, each related to a BufferAdd request. This configuration macro defines total number of buffer entries that will be available for use between all SST25VF064C driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking erase/write/read requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. More the number of buffer entries, greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its buffer queue size.

Building the Library

This section lists the files that are available in the SPI Flash Driver Library.

Description

This section list the files that are available in the `/src` folder of the SPI Flash Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/spi_flash`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`sst25vf016b/drv_sst25vf016b.h`	Header file that exports the SST25VF016B driver API.
`sst25vf020b/drv_sst25vf020b.h`	Header file that exports the SST25VF020B driver API.
`sst25vf064c/drv_sst25vf064c.h`	Header file that exports the SST25VF064C driver API.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`sst25vf016b/src/dynamic/drv_sst25vf016b.c`	Basic SPI Flash Driver SST25VF016B implementation file.

sst25vf020b/src/dynamic/drv_sst25vf020b.c	Basic SPI Flash Driver SST25VF020B implementation file.
sst25vf064c/src/dynamic/drv_sst25vf064c.c	Basic SPI Flash Driver SST25VF064C implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
sst25vf020b/src/dynamic/drv_sst25vf020b_erasewrite.c	This file implements an optional BlockEraseWrite feature for the SST25VF020B driver.

Module Dependencies

The SPI Flash Driver Library depends on the following modules:

- SPI Driver Library
- Ports System Service Library

Library Interface

This section describes the API functions of the SPI Flash Driver Library.

Refer to each section for a detailed description.

SST25FV016B API

a) System Functions

	Name	Description
	DRV_SST25VF016B_Initialize	Initializes the SST25VF016B SPI Flash Driver instance for the specified driver index. **Implementation:** Dynamic
	DRV_SST25VF016B_Deinitialize	Deinitializes the specified instance of the SPI Flash driver module. **Implementation:** Dynamic
	DRV_SST25VF016B_Status	Gets the current status of the SPI Flash Driver module. **Implementation:** Dynamic
	DRV_SST25VF016B_Tasks	Maintains the driver's read, erase, and write state machine and implements its ISR. **Implementation:** Dynamic

b) Core Client Functions

	Name	Description
	DRV_SST25VF016B_Close	Closes an opened-instance of the SPI Flash driver. **Implementation:** Dynamic
	DRV_SST25VF016B_Open	Opens the specified SPI Flash driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_SST25VF016B_ClientStatus	Gets current client-specific status of the SPI Flash driver. **Implementation:** Dynamic

c) Block Operation Functions

	Name	Description
	DRV_SST25VF016B_BlockErase	Erase the specified number of blocks in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF016B_BlockEventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed. **Implementation:** Dynamic
	DRV_SST25VF016B_BlockRead	Reads blocks of data starting from the specified address in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF016B_BlockWrite	Write blocks of data starting from a specified address in Flash memory. **Implementation:** Dynamic

d) Media Interface Functions

	Name	Description
	DRV_SST25VF016B_GeometryGet	Returns the geometry of the device. **Implementation:** Dynamic
	DRV_SST25VF016B_MediaIsAttached	Returns the status of the media. **Implementation:** Dynamic

e) Data Types and Constants

	Name	Description
	DRV_SST25VF016B_BLOCK_COMMAND_HANDLE	Handle identifying block commands of the driver.
	DRV_SST25VF016B_BLOCK_EVENT	Identifies the possible events that can result from a request.
	DRV_SST25VF016B_CLIENT_STATUS	Defines the client status. **Implementation:** Dynamic
	DRV_SST25VF016B_EVENT_HANDLER	Pointer to a SST25VF016B SPI Flash Driver Event handler function. **Implementation:** Dynamic
	DRV_SST25VF016B_INIT	Contains all the data necessary to initialize the SPI Flash device. **Implementation:** Dynamic
	DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID	This value defines the SPI Flash Driver Block Command Invalid handle.
	DRV_SST25VF016B_INDEX_0	SPI Flash driver index definitions
	DRV_SST25VF016B_INDEX_1	This is macro DRV_SST25VF016B_INDEX_1.

Description

This section contains the SST25V016B Flash device API.

a) System Functions

DRV_SST25VF016B_Initialize Function

Initializes the SST25VF016B SPI Flash Driver instance for the specified driver index.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
SYS_MODULE_OBJ DRV_SST25VF016B_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the SPI Flash driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This function must be called before any other SPI Flash function is called.

This function should only be called once during system initialization unless DRV_SST25VF016B_Deinitialize is called to deinitialize the driver instance.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

None.

Example

```
// This code snippet shows an example of initializing the SST25VF016B SPI
// Flash Driver. SPI driver index 0 is used for the purpose. Pin numbers 1, 2
// and 3 of port channel B are configured for hold pin, write protection pin
```

```
// and chip select pin respectively. Maximum buffer queue size is set 5.

DRV_SST25VF016B_INIT   SST25VF016BInitData;
SYS_MODULE_OBJ      objectHandle;

SST25VF016BInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
SST25VF016BInitData.spiDriverModuleIndex  = DRV_SPI_INDEX_0;
SST25VF016BInitData.holdPortChannel       = PORT_CHANNEL_B;
SST25VF016BInitData.holdBitPosition       = PORTS_BIT_POS_1;
SST25VF016BInitData.writeProtectPortChannel = PORT_CHANNEL_B;
SST25VF016BInitData.writeProtectBitPosition = PORTS_BIT_POS_2;
SST25VF016BInitData.chipSelectPortChannel = PORT_CHANNEL_F;
SST25VF016BInitData.chipSelectBitPosition = PORTS_BIT_POS_2;
SST25VF016BInitData.queueSize = 5;

objectHandle = DRV_SST25VF016B_Initialize(DRV_SST25VF016B_INDEX_0,
                                (SYS_MODULE_INIT*)SST25VF016BInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_SST25VF016B_Initialize
(
const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init
);

DRV_SST25VF016B_Deinitialize Function

Deinitializes the specified instance of the SPI Flash driver module.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SPI Flash Driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF016B_Initialize should have been called before calling this function.

Example

```
// This code snippet shows an example of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_SST25VF016B_Initialize
SYS_STATUS          status;
```

```
DRV_SST25VF016B_Deinitialize(object);

status = DRV_SST25VF016B_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF016B_Initialize

Function

void DRV_SST25VF016B_Deinitialize(SYS_MODULE_OBJ object)

DRV_SST25VF016B_Status Function

Gets the current status of the SPI Flash Driver module.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
SYS_STATUS DRV_SST25VF016B_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and accept requests for new operations

SYS_STATUS_UNINITIALIZED - Indicates that the driver is not initialized

Description

This function provides the current status of the SPI Flash Driver module.

Remarks

A driver can only be opened when its status is SYS_STATUS_READY.

Preconditions

Function DRV_SST25VF016B_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF016B_Initialize
SYS_STATUS          SST25VF016BStatus;

SST25VF016BStatus = DRV_SST25VF016B_Status(object);
else if (SYS_STATUS_ERROR >= SST25VF016BStatus)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF016B_Initialize

Function

SYS_STATUS DRV_SST25VF016B_Status(SYS_MODULE_OBJ object)

DRV_SST25VF016B_Tasks Function

Maintains the driver's read, erase, and write state machine and implements its ISR.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal state machine and should be called from the system's Tasks function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function (SYS_Tasks).

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI Flash driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF016B_Initialize

while (true)
{
    DRV_SST25VF016B_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SST25VF016B_Initialize)

Function

void DRV_SST25VF016B_Tasks (SYS_MODULE_OBJ object);

b) Core Client Functions

DRV_SST25VF016B_Close Function

Closes an opened-instance of the SPI Flash driver.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the SPI Flash driver, invalidating the handle.

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SST25VF016B_Open before the caller may use the driver again.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SST25VF016B_Open

DRV_SST25VF016B_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

void DRV_SST25VF016B_Close(DRV_Handle handle);

DRV_SST25VF016B_Open Function

Opens the specified SPI Flash driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
DRV_HANDLE DRV_SST25VF016B_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_SST25VF016B_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.
- if the driver status is not ready.

The driver status becomes ready inside "DRV_SST25VF016B_Tasks" function. To make the SST Driver status ready and hence successfully "Open" the driver, "Task" routine need to be called periodically.

Description

This function opens the specified SPI Flash driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The driver will always work in Non-Blocking mode even if IO-intent is selected as blocking.

The handle returned is valid until the DRV_SST25VF016B_Close function is called.

This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF016B_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_SST25VF016B_Open(DRV_SST25VF016B_INDEX_0,
                                                DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
```

```
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

```
DRV_HANDLE DRV_SST25VF016B_Open
(
const    SYS_MODULE_INDEX drvIndex,
const    DRV_IO_INTENT ioIntent
);
```

DRV_SST25VF016B_ClientStatus Function

Gets current client-specific status of the SPI Flash driver.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
DRV_SST25VF016B_CLIENT_STATUS DRV_SST25VF016B_ClientStatus(const DRV_HANDLE handle);
```

Returns

A DRV_SST25VF016B_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the SPI Flash driver associated with the given handle.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      handle;         // Returned from DRV_SST25VF016B_Open
DRV_SST25VF016B_CLIENT_STATUS     clientStatus;

clientStatus = DRV_SST25VF016B_ClientStatus(handle);
if(DRV_SST25VF016B_CLIENT_STATUS_READY == clientStatus)
{
    // do the tasks
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's open

Function

```
DRV_SST25VF016B_CLIENT_STATUS DRV_SST25VF016B_ClientStatus(DRV_HANDLE handle);
```

c) Block Operation Functions

DRV_SST25VF016B_BlockErase Function

Erase the specified number of blocks in Flash memory.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_BlockErase(const DRV_HANDLE handle, DRV_SST25VF016B_BLOCK_COMMAND_HANDLE *
commandHandle, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It Will be DRV_BUFFER_HANDLE_INVALID if the request was not queued.

Description

This function schedules a non-blocking erase operation in flash memory. The function returns with a valid erase handle in the commandHandle argument if the erase request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the client opened the driver for read only
- if nBlock is 0
- if the queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SST25VF016B_EVENT_ERASE_COMPLETE event if the erase operation was successful or DRV_SST25VF016B_EVENT_ERASE_ERROR event if the erase operation was not successful.

Remarks

Write Protection will be disabled for the complete flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF016B_Open call.

Example

```
// Destination address should be block aligned.
uint32_t blockStart;
uint32_t nBlock;
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF016BHandle is the handle returned
// by the DRV_SST25VF016B_Open function.

// Client registers an event handler with driver

DRV_SST25VF016B_BlockEventHandlerSet(mySST25VF016BHandle,
                APP_SST25VF016BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF016B_BlockErase( mySST25VF016BHandle, commandHandle,
                                                    blockStart, nBlock );

if(DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer queue is processed.

void APP_SST25VF016BEventHandler(DRV_SST25VF016B_BLOCK_EVENT event,
        DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
```

```
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF016B_EVENT_ERASE_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF016B_EVENT_ERASE_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
blockStart	Start block address in SST25VF016B memory from where the erase should begin. LSBs (A0-A11) of block start address will be ignored to align it with Erase block size boundary.
nBlock	Total number of blocks to be erased. Each Erase block is of size 4 KByte.

Function

void DRV_SST25VF016B_BlockErase
(
const DRV_HANDLE handle,
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE * commandHandle,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST25VF016B_BlockEventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_BlockEventHandlerSet(const DRV_HANDLE handle, const DRV_SST25VF016B_EVENT_HANDLER
eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client calls any read, write or erase function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any read/write/erase operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI FLash driver instance.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle;

// mySST25VF016BHandle is the handle returned
// by the DRV_SST25VF016B_Open function.

// Client registers an event handler with driver. This is done once.

DRV_SST25VF016B_BlockEventHandlerSet( mySST25VF016BHandle,
                APP_SST25VF016BEventHandler, (uintptr_t)&myAppObj );

DRV_SST25VF016B_BlockRead( mySST25VF016BHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_SST25VF016BEventHandler(DRV_SST25VF016B_BLOCK_EVENT event,
        DRV_SST25VF016B_BLOCK_COMMAND_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_SST25VF016B_BlockEventHandlerSet

```
(
const      DRV_HANDLE handle,
const      DRV_SST25VF016B_EVENT_HANDLER eventHandler,
const uintptr_t context
);
```

DRV_SST25VF016B_BlockRead Function

Reads blocks of data starting from the specified address in Flash memory.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_BlockRead(const DRV_HANDLE handle, DRV_SST25VF016B_BLOCK_COMMAND_HANDLE *
commandHandle, uint8_t * targetBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation for reading blocks of data from flash memory. The function returns with a valid handle in the commandHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the target buffer pointer is NULL
- if the client opened the driver for write only
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully of
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

The maximum read speed is 33 MHz.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF016B_Open call.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF016B_BASE_ADDRESS_TO_READ_FROM;
uint32_t    nBlock = 2;
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF016BHandle is the handle returned
// by the DRV_SST25VF016B_Open function.

// Client registers an event handler with driver

DRV_SST25VF016B_BlockEventHandlerSet(mySST25VF016BHandle,
                APP_SST25VF016BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF016B_BlockRead( mySST25VF016BHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );
```

```
if(DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when the buffer is processed.

void APP_SST25VF016BEventHandler(DRV_SST25VF016B_BLOCK_EVENT event,
        DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
*targetBuffer	Buffer into which the data read from the SPI Flash instance will be placed
blockStart	Start block address in SST25VF016B memory from where the read should begin. It can be any address of the flash.
nBlock	Total number of blocks to be read. Each Read block is of 1 byte.

Function

void DRV_SST25VF016B_BlockRead
(
const DRV_HANDLE handle,
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *targetBuffer,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST25VF016B_BlockWrite Function

Write blocks of data starting from a specified address in Flash memory.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_BlockWrite(DRV_HANDLE handle, DRV_SST25VF016B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t * sourceBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking write operation for writing blocks of data into flash memory. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only
- if the buffer size is 0
- if the write queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully or
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

In the case of multi bytes write operation, byte by byte writing will happen instead of Address auto Increment writing.

Write Protection will be disabled for the complete flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF016B_Open call.

The flash address location which has to be written, must be erased before using the API DRV_SST25VF016B_BlockErase().

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF016B_BASE_ADDRESS_TO_WRITE_TO;
uint32_t    nBlock = 2;
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF016BHandle is the handle returned
// by the DRV_SST25VF016B_Open function.

// Client registers an event handler with driver

DRV_SST25VF016B_BlockEventHandlerSet(mySST25VF016BHandle,
                APP_SST25VF016BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF016B_BlockWrite( mySST25VF016BHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_SST25VF016BEventHandler(DRV_SST25VF016B_BLOCK_EVENT event,
        DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE:
```

```
            // This means the data was transferred.
            break;

        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function commandHandle -Pointer to an argument that will contain the return buffer handle
sourceBuffer	The source buffer containing data to be programmed into SPI Flash
blockStart	Start block address of SST25VF016B Flash where the write should begin. It can be any address of the flash.
nBlock	Total number of blocks to be written. Each write block is of 1 byte.

Function

void DRV_SST25VF016B_BlockWrite
(
DRV_HANDLE handle,
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *sourceBuffer,
uint32_t blockStart,
uint32_t nBlock
);

d) Media Interface Functions

DRV_SST25VF016B_GeometryGet Function

Returns the geometry of the device.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_SST25VF016B_GeometryGet(DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Structure which holds the media geometry information.

Description

This API gives the following geometrical details of the SST25VF016B Flash:

- Media Property
- Number of Read/Write/Erase regions in the flash device
- Number of Blocks and their size in each region of the device

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
SYS_FS_MEDIA_GEOMETRY * sstFlashGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalFlashSize;

sstFlashGeometry = DRV_SST25VF016B_GeometryGet(sstOpenHandle1);

// read block size should be 1 byte
readBlockSize  = sstFlashGeometry->geometryTable->blockSize;
nReadBlocks = sstFlashGeometry->geometryTable->numBlocks;
nReadRegions = sstFlashGeometry->numReadRegions;

// write block size should be 1 byte
writeBlockSize  = (sstFlashGeometry->geometryTable +1)->blockSize;
// erase block size should be 4k byte
eraseBlockSize  = (sstFlashGeometry->geometryTable +2)->blockSize;

// total flash size should be 256k byte
totalFlashSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY DRV_SST25VF016B_GeometryGet(DRV_HANDLE handle);

DRV_SST25VF016B_MediaIsAttached Function

Returns the status of the media.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
bool DRV_SST25VF016B_MediaIsAttached(DRV_HANDLE handle);
```

Returns

- True - Media is attached
- False - Media is not attached

Description

This API tells if the media is attached or not.

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
if (DRV_SST25VF016B_MediaIsAttached(handle))
{
// Do Something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SST25VF016B_MediaIsAttached(DRV_HANDLE handle);

e) Data Types and Constants

DRV_SST25VF016B_BLOCK_COMMAND_HANDLE Type

Handle identifying block commands of the driver.

File

drv_sst25vf016b.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_SST25VF016B_BLOCK_COMMAND_HANDLE;
```

Description

SPI Flash Driver Block Command Handle

A block command handle is returned by a call to the Read, Write, or Erase functions. This handle allows the application to track the completion of the operation. The handle is returned back to the client by the "event handler callback" function registered with the driver.

The handle assigned to a client request expires when the client has been notified of the completion of the operation (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SST25VF016B_BLOCK_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_sst25vf016b.h

C

```
typedef enum {
  DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR
} DRV_SST25VF016B_BLOCK_EVENT;
```

Members

Members	Description
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE	Block operation has been completed successfully. Read/Write/Erase Complete
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR	There was an error during the block operation Read/Write/Erase Error

Description

SST25VF016B SPI Flash Driver Events

This enumeration identifies the possible events that can result from a Read, Write, or Erase request caused by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SST25VF016B_BlockEventHandlerSet function when a block request is completed.

DRV_SST25VF016B_CLIENT_STATUS Enumeration

Defines the client status.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
typedef enum {
  DRV_SST25VF016B_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0,
  DRV_SST25VF016B_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY,
  DRV_SST25VF016B_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED,
  DRV_SST25VF016B_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR
} DRV_SST25VF016B_CLIENT_STATUS;
```

Members

Members	Description
DRV_SST25VF016B_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0	Up and running, ready to start new operations
DRV_SST25VF016B_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY	Operation in progress, unable to start a new one
DRV_SST25VF016B_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED	Client is closed
DRV_SST25VF016B_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR	Client Error

Description

SPI Flash Client Status

Defines the various client status codes.

Remarks

None.

DRV_SST25VF016B_EVENT_HANDLER Type

Pointer to a SST25VF016B SPI Flash Driver Event handler function.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
typedef void (* DRV_SST25VF016B_EVENT_HANDLER)(DRV_SST25VF016B_BLOCK_EVENT event,
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t context);
```

Returns

None.

Description

SST25VF016B SPI Flash Driver Event Handler Function Pointer

This data type defines the required function signature for the SST25VF016B SPI Flash driver event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event calls back from the driver.

The parameters and return values and return value are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE, it means that the data was transferred successfully.

If the event is DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR, it means that the data was not transferred successfully.

The context parameter contains the a handle to the client context, provided at the time the event handling function was registered using the DRV_SST25VF016B_BlockEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write/erase request.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

The Read, Write, and Erase functions can be called in the event handler to add a buffer to the driver queue. These functions can only be called to add buffers to the driver whose event handler is running.

Example

```
void APP_MyBufferEventHandler
(
    DRV_SST25VF016B_BLOCK_EVENT event,
    DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle returned from the Read/Write/Erase requests
context	Value identifying the context of the application that registered the event handling function

DRV_SST25VF016B_INIT Structure

Contains all the data necessary to initialize the SPI Flash device.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX spiDriverModuleIndex;
  PORTS_CHANNEL holdPortChannel;
  PORTS_BIT_POS holdBitPosition;
  PORTS_CHANNEL writeProtectPortChannel;
  PORTS_BIT_POS writeProtectBitPosition;
  PORTS_CHANNEL chipSelectPortChannel;
  PORTS_BIT_POS chipSelectBitPosition;
  uint32_t queueSize;
} DRV_SST25VF016B_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX spiDriverModuleIndex;	Identifies the SPI driver to be used
PORTS_CHANNEL holdPortChannel;	HOLD pin port channel
PORTS_BIT_POS holdBitPosition;	HOLD pin port position
PORTS_CHANNEL writeProtectPortChannel;	Write protect pin port channel
PORTS_BIT_POS writeProtectBitPosition;	Write Protect Bit pin position
PORTS_CHANNEL chipSelectPortChannel;	Chip select pin port channel
PORTS_BIT_POS chipSelectBitPosition;	Chip Select Bit pin position

uint32_t queueSize;	This is the buffer queue size. This is the maximum number of requests that this instance of the driver will queue. For a static build of the driver, this is overridden by the DRV_SST25VF016B_QUEUE_SIZE macro in system_config.h

Description

SST SPI Flash Driver Initialization Data

This structure contains all of the data necessary to initialize the SPI Flash device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the DRV_SST25VF016B_Initialize function.

DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID Macro

This value defines the SPI Flash Driver Block Command Invalid handle.

File

drv_sst25vf016b.h

C

```
#define DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID
```

Description

SPI Flash Driver Block Event Invalid Handle

This value defines the SPI Flash Driver Block Command Invalid handle. It is returned by read/write/erase routines when the request could not be taken.

Remarks

None.

DRV_SST25VF016B_INDEX_0 Macro

SPI Flash driver index definitions

File

drv_sst25vf016b.h

C

```
#define DRV_SST25VF016B_INDEX_0 0
```

Description

Driver SPI Flash Module Index reference

These constants provide SST25VF016B SPI Flash driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_SST25VF016B_Initialize and DRV_SST25VF016B_Open routines to identify the driver instance in use.

DRV_SST25VF016B_INDEX_1 Macro

File

drv_sst25vf016b.h

C

```
#define DRV_SST25VF016B_INDEX_1 1
```

Description

This is macro DRV_SST25VF016B_INDEX_1.

SST25VF020B API

a) System Functions

	Name	Description
	DRV_SST25VF020B_Initialize	Initializes the SST25VF020B SPI Flash Driver instance for the specified driver index. **Implementation:** Dynamic
	DRV_SST25VF020B_Deinitialize	Deinitializes the specified instance of the SPI Flash driver module. **Implementation:** Dynamic
	DRV_SST25VF020B_Status	Gets the current status of the SPI Flash Driver module. **Implementation:** Dynamic
	DRV_SST25VF020B_Tasks	Maintains the driver's read, erase, and write state machine and implements its ISR. **Implementation:** Dynamic

b) Core Client Functions

	Name	Description
	DRV_SST25VF020B_ClientStatus	Gets current client-specific status of the SPI Flash driver. **Implementation:** Dynamic
	DRV_SST25VF020B_CommandStatus	Gets the current status of the command.
	DRV_SST25VF020B_Close	Closes an opened-instance of the SPI Flash driver. **Implementation:** Dynamic
	DRV_SST25VF020B_Open	Opens the specified SPI Flash driver instance and returns a handle to it. **Implementation:** Dynamic

c) Block Operation Functions

	Name	Description
	DRV_SST25VF020B_BlockErase	Erase the specified number of blocks in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF020B_BlockEventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed. **Implementation:** Dynamic
	DRV_SST25VF020B_BlockRead	Reads blocks of data starting from the specified address in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF020B_BlockWrite	Write blocks of data starting from a specified address in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF020B_BlockEraseWrite	Erase and Write blocks of data starting from a specified address in SST flash memory.

d) Media Interface Functions

	Name	Description
	DRV_SST25VF020B_GeometryGet	Returns the geometry of the device. **Implementation:** Dynamic
	DRV_SST25VF020B_MediaIsAttached	Returns the status of the media. **Implementation:** Dynamic

e) Data Types and Constants

	Name	Description
	DRV_SST25VF020B_BLOCK_COMMAND_HANDLE	Handle identifying block commands of the driver.
	DRV_SST25VF020B_BLOCK_EVENT	Identifies the possible events that can result from a request.
	DRV_SST25VF020B_CLIENT_STATUS	Defines the client status.
	DRV_SST25VF020B_EVENT_HANDLER	Pointer to a SST25VF020B SPI Flash Driver Event handler function.
	DRV_SST25VF020B_INIT	Contains all the data necessary to initialize the SPI Flash device.
	DRV_SST25VF020B_COMMAND_STATUS	Specifies the status of the command for the read, write and erase operations.
	DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID	This value defines the SPI Flash Driver Block Command Invalid handle.
	DRV_SST25VF020B_INDEX_0	SPI Flash driver index definitions.

	DRV_SST25VF020B_INDEX_1	This is macro DRV_SST25VF020B_INDEX_1.

Description

This section contains the SST25V020B Flash device API.

a) System Functions

DRV_SST25VF020B_Initialize Function

Initializes the SST25VF020B SPI Flash Driver instance for the specified driver index.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
SYS_MODULE_OBJ DRV_SST25VF020B_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the SPI Flash driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This function must be called before any other SPI Flash function is called.

This function should only be called once during system initialization unless DRV_SST25VF020B_Deinitialize is called to deinitialize the driver instance.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

None.

Example

```
// This code snippet shows an example of initializing the SST25VF020B SPI
// Flash Driver. SPI driver index 0 is used for the purpose. Pin numbers 1, 2
// and 3 of port channel B are configured for hold pin, write protection pin
// and chip select pin respectively. Maximum buffer queue size is set 5.

DRV_SST25VF020B_INIT   SST25VF020BInitData;
SYS_MODULE_OBJ      objectHandle;

SST25VF020BInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
SST25VF020BInitData.spiDriverModuleIndex  = DRV_SPI_INDEX_0;
SST25VF020BInitData.holdPortChannel       = PORT_CHANNEL_B;
SST25VF020BInitData.holdBitPosition       = PORTS_BIT_POS_1;
SST25VF020BInitData.writeProtectPortChannel = PORT_CHANNEL_B;
SST25VF020BInitData.writeProtectBitPosition = PORTS_BIT_POS_2;
SST25VF020BInitData.chipSelectPortChannel = PORT_CHANNEL_F;
SST25VF020BInitData.chipSelectBitPosition = PORTS_BIT_POS_2;
SST25VF020BInitData.queueSize = 5;

objectHandle = DRV_SST25VF020B_Initialize(DRV_SST25VF020B_INDEX_0,
                            (SYS_MODULE_INIT*)SST25VF020BInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing data necessary to initialize the driver.

Function

```
  SYS_MODULE_OBJ DRV_SST25VF020B_Initialize
(
const    SYS_MODULE_INDEX index,
const    SYS_MODULE_INIT * const init
);
```

DRV_SST25VF020B_Deinitialize Function

Deinitializes the specified instance of the SPI Flash driver module.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SPI Flash Driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF020B_Initialize should have been called before calling this function.

Example

```
// This code snippet shows an example of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_SST25VF020B_Initialize
SYS_STATUS          status;

DRV_SST25VF020B_Deinitialize(object);

status = DRV_SST25VF020B_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF020B_Initialize

Function

void DRV_SST25VF020B_Deinitialize(SYS_MODULE_OBJ object)

DRV_SST25VF020B_Status Function

Gets the current status of the SPI Flash Driver module.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
SYS_STATUS DRV_SST25VF020B_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and accept requests for new operations

SYS_STATUS_UNINITIALIZED - Indicates that the driver is not initialized

Description

This function provides the current status of the SPI Flash Driver module.

Remarks

A driver can only be opened when its status is SYS_STATUS_READY.

Preconditions

Function DRV_SST25VF020B_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF020B_Initialize
SYS_STATUS          SST25VF020BStatus;

SST25VF020BStatus = DRV_SST25VF020B_Status(object);
else if (SYS_STATUS_ERROR >= SST25VF020BStatus)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF020B_Initialize

Function

SYS_STATUS DRV_SST25VF020B_Status(SYS_MODULE_OBJ object)

DRV_SST25VF020B_Tasks Function

Maintains the driver's read, erase, and write state machine and implements its ISR.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal state machine and should be called from the system's Tasks function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function (SYS_Tasks).

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI Flash driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF020B_Initialize

while (true)
{
    DRV_SST25VF020B_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SST25VF020B_Initialize)

Function

void DRV_SST25VF020B_Tasks (SYS_MODULE_OBJ object);

b) Core Client Functions

DRV_SST25VF020B_ClientStatus Function

Gets current client-specific status of the SPI Flash driver.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
DRV_SST25VF020B_CLIENT_STATUS DRV_SST25VF020B_ClientStatus(const DRV_HANDLE handle);
```

Returns

A DRV_SST25VF020B_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the SPI Flash driver associated with the given handle.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      handle;         // Returned from DRV_SST25VF020B_Open
DRV_SST25VF020B_CLIENT_STATUS     clientStatus;

clientStatus = DRV_SST25VF020B_ClientStatus(handle);
if(DRV_SST25VF020B_CLIENT_STATUS_READY == clientStatus)
{
    // do the tasks
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's open

Function

DRV_SST25VF020B_CLIENT_STATUS DRV_SST25VF020B_ClientStatus(DRV_HANDLE handle);

DRV_SST25VF020B_CommandStatus Function

Gets the current status of the command.

File

drv_sst25vf020b.h

C

```
DRV_SST25VF020B_COMMAND_STATUS DRV_SST25VF020B_CommandStatus(const DRV_HANDLE handle, const
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle);
```

Returns

A DRV_SST25VF020B_COMMAND_STATUS value describing the current status of the buffer. Returns DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID if the client handle or the command handle is not valid.

Description

This routine gets the current status of the buffer. The application must use this routine where the status of a scheduled buffer needs to polled on. The function may return DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID in a case where the buffer handle has expired. A buffer handle expires when the internal buffer object is re-assigned to another erase, read or write request. It is recommended that this function be called regularly in order to track the buffer status correctly.

The application can alternatively register an event handler to receive write, read or erase operation completion events.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

Block command request must have been made using Erase, Read or Write APIs to get a valid command handle.

Example

```
DRV_HANDLE      sstOpenHandle;   // Returned from DRV_SST25VF020B_Open
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE  commandHandle;
DRV_SST25VF020B_BlockErase
                        (
                            sstOpenHandle,
                            &commandHandle,
                            0,
                            1
                        );

if(DRV_SST25VF020B_CommandStatus(sstOpenHandle, commandHandle) == DRV_SST25VF020B_COMMAND_COMPLETED );
{
    // do something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
commandHandle	A valid command handle, returned from Read/Write/Erase APIs.

Function

DRV_SST25VF020B_COMMAND_STATUS DRV_SST25VF020B_CommandStatus

(

const DRV_HANDLE handle,
const DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle
);

DRV_SST25VF020B_Close Function

Closes an opened-instance of the SPI Flash driver.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the SPI Flash driver, invalidating the handle.

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SST25VF020B_Open before the caller may use the driver again.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SST25VF020B_Open

DRV_SST25VF020B_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

void DRV_SST25VF020B_Close(DRV_Handle handle);

DRV_SST25VF020B_Open Function

Opens the specified SPI Flash driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
DRV_HANDLE DRV_SST25VF020B_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_SST25VF020B_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.
- if the driver status is not ready.

The driver status becomes ready inside "DRV_SST25VF020B_Tasks" function. To make the SST Driver status ready and hence successfully "Open" the driver, "Task" routine need to be called periodically.

Description

This function opens the specified SPI Flash driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The driver will always work in Non-Blocking mode even if IO-intent is selected as blocking.

The handle returned is valid until the DRV_SST25VF020B_Close function is called.

This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF020B_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_SST25VF020B_Open(DRV_SST25VF020B_INDEX_0,
                                                DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_SST25VF020B_Open
(
const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT ioIntent
);

c) Block Operation Functions

DRV_SST25VF020B_BlockErase Function

Erase the specified number of blocks in Flash memory.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_BlockErase(const DRV_HANDLE handle, DRV_SST25VF020B_BLOCK_COMMAND_HANDLE *
commandHandle, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It Will be DRV_BUFFER_HANDLE_INVALID if the request was not queued.

Description

This function schedules a non-blocking erase operation in flash memory. The function returns with a valid erase handle in the commandHandle argument if the erase request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the client opened the driver for read only
- if nBlock is 0
- if the queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SST25VF020B_EVENT_ERASE_COMPLETE event if the erase operation was successful or DRV_SST25VF020B_EVENT_ERASE_ERROR event if the erase operation was not successful.

Remarks

Write Protection will be disabled for the complete flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF020B_Open call.

Example

```
// Destination address should be block aligned.
uint32_t blockStart;
uint32_t nBlock;
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF020BHandle is the handle returned
// by the DRV_SST25VF020B_Open function.

// Client registers an event handler with driver

DRV_SST25VF020B_BlockEventHandlerSet(mySST25VF020BHandle,
                APP_SST25VF020BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF020B_BlockErase( mySST25VF020BHandle, commandHandle,
                                                    blockStart, nBlock );

if(DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer queue is processed.

void APP_SST25VF020BEventHandler(DRV_SST25VF020B_BLOCK_EVENT event,
        DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF020B_EVENT_ERASE_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF020B_EVENT_ERASE_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
blockStart	Start block address in SST25VF020B memory from where the erase should begin. LSBs (A0-A11) of block start address will be ignored to align it with Erase block size boundary.
nBlock	Total number of blocks to be erased. Each Erase block is of size 4 KByte.

Function

```
void DRV_SST25VF020B_BlockErase
(
const       DRV_HANDLE handle,
    DRV_SST25VF020B_BLOCK_COMMAND_HANDLE * commandHandle,
uint32_t blockStart,
uint32_t nBlock
);
```

DRV_SST25VF020B_BlockEventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_BlockEventHandlerSet(const DRV_HANDLE handle, const DRV_SST25VF020B_EVENT_HANDLER
eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client calls any read, write or erase function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any read/write/erase operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI FLash driver instance.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle;

// mySST25VF020BHandle is the handle returned
// by the DRV_SST25VF020B_Open function.

// Client registers an event handler with driver. This is done once.

DRV_SST25VF020B_BlockEventHandlerSet( mySST25VF020BHandle,
```

```
                APP_SST25VF020BEventHandler, (uintptr_t)&myAppObj );

DRV_SST25VF020B_BlockRead( mySST25VF020BHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_SST25VF020BEventHandler(DRV_SST25VF020B_BLOCK_EVENT event,
        DRV_SST25VF020B_BLOCK_COMMAND_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_SST25VF020B_BlockEventHandlerSet

(

const DRV_HANDLE handle,

const DRV_SST25VF020B_EVENT_HANDLER eventHandler,

const uintptr_t context

);

DRV_SST25VF020B_BlockRead Function

Reads blocks of data starting from the specified address in Flash memory.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_BlockRead(const DRV_HANDLE handle, DRV_SST25VF020B_BLOCK_COMMAND_HANDLE *
commandHandle, uint8_t * targetBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation for reading blocks of data from flash memory. The function returns with a valid handle in the commandHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the target buffer pointer is NULL
- if the client opened the driver for write only
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully of DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

The maximum read speed is 33 MHz.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF020B_Open call.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF020B_BASE_ADDRESS_TO_READ_FROM;
uint32_t    nBlock = 2;
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF020BHandle is the handle returned
// by the DRV_SST25VF020B_Open function.

// Client registers an event handler with driver

DRV_SST25VF020B_BlockEventHandlerSet(mySST25VF020BHandle,
                APP_SST25VF020BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF020B_BlockRead( mySST25VF020BHandle, commandHandle,
                                      &myBuffer, blockStart, nBlock );

if(DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when the buffer is processed.

void APP_SST25VF020BEventHandler(DRV_SST25VF020B_BLOCK_EVENT event,
        DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;
```

```
            case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR:

                // Error handling here.

                break;

            default:
                break;
        }
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
*targetBuffer	Buffer into which the data read from the SPI Flash instance will be placed
blockStart	Start block address in SST25VF020B memory from where the read should begin. It can be any address of the flash.
nBlock	Total number of blocks to be read. Each Read block is of 1 byte.

Function

void DRV_SST25VF020B_BlockRead
(
const DRV_HANDLE handle,
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *targetBuffer,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST25VF020B_BlockWrite Function

Write blocks of data starting from a specified address in Flash memory.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_BlockWrite(DRV_HANDLE handle, DRV_SST25VF020B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t * sourceBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking write operation for writing blocks of data into flash memory. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only
- if the buffer size is 0
- if the write queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully or
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

In the case of multi bytes write operation, byte by byte writing will happen instead of Address auto Increment writing.

Write Protection will be disabled for the complete flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF020B_Open call.

The flash address location which has to be written, must be erased before using the API DRV_SST25VF020B_BlockErase().

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF020B_BASE_ADDRESS_TO_WRITE_TO;
uint32_t    nBlock = 2;
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF020BHandle is the handle returned
// by the DRV_SST25VF020B_Open function.

// Client registers an event handler with driver

DRV_SST25VF020B_BlockEventHandlerSet(mySST25VF020BHandle,
                APP_SST25VF020BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF020B_BlockWrite( mySST25VF020BHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_SST25VF020BEventHandler(DRV_SST25VF020B_BLOCK_EVENT event,
        DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function commandHandle -Pointer to an argument that will contain the return buffer handle

sourceBuffer	The source buffer containing data to be programmed into SPI Flash
blockStart	Start block address of SST25VF020B Flash where the write should begin. It can be any address of the flash.
nBlock	Total number of blocks to be written. Each write block is of 1 byte.

Function

void DRV_SST25VF020B_BlockWrite
(
DRV_HANDLE handle,
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *sourceBuffer,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST25VF020B_BlockEraseWrite Function

Erase and Write blocks of data starting from a specified address in SST flash memory.

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_BlockEraseWrite(DRV_HANDLE hClient, DRV_SST25VF020B_BLOCK_COMMAND_HANDLE *
commandHandle, uint8_t * sourceBuffer, uint32_t blockStart, uint32_t nBlock);
```

Description

This function combines the step of erasing blocks of SST Flash and then writing the data. The application can use this function if it wants to avoid having to explicitly delete a block in order to update the bytes contained in the block.

This function schedules a non-blocking operation to erase and write blocks of data into SST flash. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only
- if the buffer size is 0
- if the queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully or
DRV_SST25VF020B_EVENT_ERASE_ERROR event if the buffer was not processed successfully.

Remarks

Refer to drv_sst25vf020b.h for usage information.

Function

void DRV_SST25VF020B_BlockEraseWrite
(
const DRV_HANDLE handle,
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE * commandHandle,
void * sourceBuffer,
uint32_t writeBlockStart,
uint32_t nWriteBlock
)

d) Media Interface Functions

DRV_SST25VF020B_GeometryGet Function

Returns the geometry of the device.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_SST25VF020B_GeometryGet(DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Structure which holds the media geometry information.

Description

This API gives the following geometrical details of the SST25VF020B Flash:

- Media Property
- Number of Read/Write/Erase regions in the flash device
- Number of Blocks and their size in each region of the device

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
SYS_FS_MEDIA_GEOMETRY * sstFlashGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalFlashSize;

sstFlashGeometry = DRV_SST25VF020B_GeometryGet(sstOpenHandle1);

// read block size should be 1 byte
readBlockSize  = sstFlashGeometry->geometryTable->blockSize;
nReadBlocks = sstFlashGeometry->geometryTable->numBlocks;
nReadRegions = sstFlashGeometry->numReadRegions;

// write block size should be 1 byte
writeBlockSize  = (sstFlashGeometry->geometryTable +1)->blockSize;
// erase block size should be 4k byte
eraseBlockSize  = (sstFlashGeometry->geometryTable +2)->blockSize;

// total flash size should be 256k byte
totalFlashSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY DRV_SST25VF020B_GeometryGet(DRV_HANDLE handle);

DRV_SST25VF020B_MediaIsAttached Function

Returns the status of the media.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
bool DRV_SST25VF020B_MediaIsAttached(DRV_HANDLE handle);
```

Returns

- True - Media is attached
- False - Media is not attached

Description

This function determines whether or not the media is attached.

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
if (DRV_SST25VF020B_MediaIsAttached(handle))
{
// Do Something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SST25VF020B_MediaIsAttached(DRV_HANDLE handle);

e) Data Types and Constants

DRV_SST25VF020B_BLOCK_COMMAND_HANDLE Type

Handle identifying block commands of the driver.

File

drv_sst25vf020b.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_SST25VF020B_BLOCK_COMMAND_HANDLE;
```

Description

SPI Flash Driver Block Command Handle

A block command handle is returned by a call to the Read, Write, or Erase functions. This handle allows the application to track the completion of the operation. The handle is returned back to the client by the "event handler callback" function registered with the driver.

The handle assigned to a client request expires when the client has been notified of the completion of the operation (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SST25VF020B_BLOCK_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_sst25vf020b.h

C

```
typedef enum {
```

```
  DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR
} DRV_SST25VF020B_BLOCK_EVENT;
```

Members

Members	Description
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE	Block operation has been completed successfully. Read/Write/Erase Complete
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR	There was an error during the block operation Read/Write/Erase Error

Description

SST25VF020B SPI Flash Driver Events

This enumeration identifies the possible events that can result from a Read, Write, or Erase request caused by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SST25VF020B_BlockEventHandlerSet function when a block request is completed.

DRV_SST25VF020B_CLIENT_STATUS Enumeration

Defines the client status.

File

drv_sst25vf020b.h

C

```
typedef enum {
  DRV_SST25VF020B_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0,
  DRV_SST25VF020B_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY,
  DRV_SST25VF020B_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED,
  DRV_SST25VF020B_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR
} DRV_SST25VF020B_CLIENT_STATUS;
```

Members

Members	Description
DRV_SST25VF020B_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0	Up and running, ready to start new operations
DRV_SST25VF020B_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY	Operation in progress, unable to start a new one
DRV_SST25VF020B_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED	Client is closed
DRV_SST25VF020B_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR	Client Error

Description

SPI Flash Client Status

Defines the various client status codes.

Remarks

None.

DRV_SST25VF020B_EVENT_HANDLER Type

Pointer to a SST25VF020B SPI Flash Driver Event handler function.

File

drv_sst25vf020b.h

C

```
typedef void (* DRV_SST25VF020B_EVENT_HANDLER)(DRV_SST25VF020B_BLOCK_EVENT event,
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t context);
```

Returns

None.

Description

SST25VF020B SPI Flash Driver Event Handler Function Pointer

This data type defines the required function signature for the SST25VF020B SPI Flash driver event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event calls back from the driver.

The parameters and return values and return value are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE, it means that the data was transferred successfully.

If the event is DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR, it means that the data was not transferred successfully.

The context parameter contains the a handle to the client context, provided at the time the event handling function was registered using the DRV_SST25VF020B_BlockEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write/erase request.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

The Read, Write, and Erase functions can be called in the event handler to add a buffer to the driver queue. These functions can only be called to add buffers to the driver whose event handler is running.

Example

```
void APP_MyBufferEventHandler
(
    DRV_SST25VF020B_BLOCK_EVENT event,
    DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle returned from the Read/Write/Erase requests
context	Value identifying the context of the application that registered the event handling function

DRV_SST25VF020B_INIT Structure

Contains all the data necessary to initialize the SPI Flash device.

File

drv_sst25vf020b.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX spiDriverModuleIndex;
  PORTS_CHANNEL holdPortChannel;
  PORTS_BIT_POS holdBitPosition;
```

```
  PORTS_CHANNEL writeProtectPortChannel;
  PORTS_BIT_POS writeProtectBitPosition;
  PORTS_CHANNEL chipSelectPortChannel;
  PORTS_BIT_POS chipSelectBitPosition;
  uint32_t queueSize;
} DRV_SST25VF020B_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX spiDriverModuleIndex;	Identifies the SPI driver to be used
PORTS_CHANNEL holdPortChannel;	HOLD pin port channel
PORTS_BIT_POS holdBitPosition;	HOLD pin port position
PORTS_CHANNEL writeProtectPortChannel;	Write protect pin port channel
PORTS_BIT_POS writeProtectBitPosition;	Write Protect Bit pin position
PORTS_CHANNEL chipSelectPortChannel;	Chip select pin port channel
PORTS_BIT_POS chipSelectBitPosition;	Chip Select Bit pin position
uint32_t queueSize;	This is the buffer queue size. This is the maximum number of requests that this instance of the driver will queue. For a static build of the driver, this is overridden by the DRV_SST25VF020B_QUEUE_SIZE macro in system_config.h

Description

SST SPI Flash Driver Initialization Data

This structure contains all of the data necessary to initialize the SPI Flash device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the DRV_SST25VF020B_Initialize function.

DRV_SST25VF020B_COMMAND_STATUS Enumeration

Specifies the status of the command for the read, write and erase operations.

File

drv_sst25vf020b.h

C

```
typedef enum {
  DRV_SST25VF020B_COMMAND_COMPLETED,
  DRV_SST25VF020B_COMMAND_QUEUED,
  DRV_SST25VF020B_COMMAND_IN_PROGRESS,
  DRV_SST25VF020B_COMMAND_ERROR_UNKNOWN
} DRV_SST25VF020B_COMMAND_STATUS;
```

Members

Members	Description
DRV_SST25VF020B_COMMAND_COMPLETED	Requested operation is completed
DRV_SST25VF020B_COMMAND_QUEUED	Scheduled but not started
DRV_SST25VF020B_COMMAND_IN_PROGRESS	Currently being in transfer
DRV_SST25VF020B_COMMAND_ERROR_UNKNOWN	Unknown Command

Description

SST Flash Driver Command Status

SST Flash Driver command Status

This type specifies the status of the command for the read, write and erase operations.

Remarks

None.

DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID Macro

This value defines the SPI Flash Driver Block Command Invalid handle.

File

drv_sst25vf020b.h

C

```
#define DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID
```

Description

SPI Flash Driver Block Event Invalid Handle

This value defines the SPI Flash Driver Block Command Invalid handle. It is returned by read/write/erase routines when the request could not be taken.

Remarks

None.

DRV_SST25VF020B_INDEX_0 Macro

SPI Flash driver index definitions.

File

drv_sst25vf020b.h

C

```
#define DRV_SST25VF020B_INDEX_0 0
```

Description

Driver SPI Flash Module Index reference

These constants provide SST25VF020B SPI Flash driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_SST25VF020B_Initialize and DRV_SST25VF020B_Open routines to identify the driver instance in use.

DRV_SST25VF020B_INDEX_1 Macro

File

drv_sst25vf020b.h

C

```
#define DRV_SST25VF020B_INDEX_1 1
```

Description

This is macro DRV_SST25VF020B_INDEX_1.

SST25VF064C API

a) System Functions

	Name	Description
	DRV_SST25VF064C_Initialize	Initializes the SST25VF064C SPI Flash Driver instance for the specified driver index.
	DRV_SST25VF064C_Deinitialize	Deinitializes the specified instance of the SPI Flash driver module.
	DRV_SST25VF064C_Status	Gets the current status of the SPI Flash Driver module.
	DRV_SST25VF064C_Tasks	Maintains the driver's read, erase, and write state machine and implements its ISR.

b) Core Client Functions

	Name	Description
	DRV_SST25VF064C_ClientStatus	Gets current client-specific status of the SPI Flash driver.
	DRV_SST25VF064C_Close	Closes an opened-instance of the SPI Flash driver.
	DRV_SST25VF064C_CommandStatus	Gets the current status of the command.

	DRV_SST25VF064C_Open	Opens the specified SPI Flash driver instance and returns a handle to it.

c) Block Operation Functions

	Name	Description
	DRV_SST25VF064C_BlockErase	Erase the specified number of blocks in Flash memory.
	DRV_SST25VF064C_BlockEventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed.
	DRV_SST25VF064C_BlockRead	Reads blocks of data starting from the specified address in Flash memory.
	DRV_SST25VF064C_BlockWrite	Write blocks of data starting from a specified address in Flash memory.

d) Media Interface Functions

	Name	Description
	DRV_SST25VF064C_GeometryGet	Returns the geometry of the device.
	DRV_SST25VF064C_MediaIsAttached	Returns the status of the media.

e) Data Types and Constants

	Name	Description
	DRV_SST25VF064C_BLOCK_COMMAND_HANDLE	Handle identifying block commands of the driver.
	DRV_SST25VF064C_BLOCK_EVENT	Identifies the possible events that can result from a request.
	DRV_SST25VF064C_CLIENT_STATUS	Defines the client status.
	DRV_SST25VF064C_COMMAND_STATUS	Specifies the status of the command for the read, write and erase operations.
	DRV_SST25VF064C_EVENT_HANDLER	Pointer to a SST25VF064C SPI Flash Driver Event handler function.
	DRV_SST25VF064C_INIT	Contains all the data necessary to initialize the SPI Flash device.
	DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID	This value defines the SPI Flash Driver Block Command Invalid handle.
	DRV_SST25VF064C_INDEX_0	SPI Flash driver index definitions.
	DRV_SST25VF064C_INDEX_1	This is macro DRV_SST25VF064C_INDEX_1.

Description

a) System Functions

DRV_SST25VF064C_Initialize Function

Initializes the SST25VF064C SPI Flash Driver instance for the specified driver index.

File

drv_sst25vf064c.h

C

```
SYS_MODULE_OBJ DRV_SST25VF064C_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the SPI Flash driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This function must be called before any other SPI Flash function is called.

This function should only be called once during system initialization unless DRV_SST25VF064C_Deinitialize is called to deinitialize the driver instance.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

None.

Example

```
// This code snippet shows an example of initializing the SST25VF064C SPI
// Flash Driver. SPI driver index 0 is used for the purpose. Pin numbers 1, 2
// and 3 of port channel B are configured for hold pin, write protection pin
// and chip select pin respectively. Maximum buffer queue size is set 5.

DRV_SST25VF064C_INIT   SST25VF064CInitData;
SYS_MODULE_OBJ      objectHandle;

SST25VF064CInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
SST25VF064CInitData.spiDriverModuleIndex  = DRV_SPI_INDEX_0;
SST25VF064CInitData.holdPortChannel       = PORT_CHANNEL_B;
SST25VF064CInitData.holdBitPosition       = PORTS_BIT_POS_1;
SST25VF064CInitData.writeProtectPortChannel = PORT_CHANNEL_B;
SST25VF064CInitData.writeProtectBitPosition = PORTS_BIT_POS_2;
SST25VF064CInitData.chipSelectPortChannel = PORT_CHANNEL_F;
SST25VF064CInitData.chipSelectBitPosition = PORTS_BIT_POS_2;
SST25VF064CInitData.queueSize = 5;

objectHandle = DRV_SST25VF064C_Initialize(DRV_SST25VF064C_INDEX_0,
                                (SYS_MODULE_INIT*)SST25VF064CInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing data necessary to initialize the driver.

Function

```
SYS_MODULE_OBJ DRV_SST25VF064C_Initialize
(
const    SYS_MODULE_INDEX index,
const    SYS_MODULE_INIT * const init
);
```

DRV_SST25VF064C_Deinitialize Function

Deinitializes the specified instance of the SPI Flash driver module.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SPI Flash Driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF064C_Initialize should have been called before calling this function.

Example

```
// This code snippet shows an example of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_SST25VF064C_Initialize
SYS_STATUS          status;

DRV_SST25VF064C_Deinitialize(object);

status = DRV_SST25VF064C_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF064C_Initialize

Function

void DRV_SST25VF064C_Deinitialize(SYS_MODULE_OBJ object)

DRV_SST25VF064C_Status Function

Gets the current status of the SPI Flash Driver module.

File

drv_sst25vf064c.h

C

```
SYS_STATUS DRV_SST25VF064C_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and accept requests for new operations

SYS_STATUS_UNINITIALIZED - Indicates that the driver is not initialized

Description

This function provides the current status of the SPI Flash Driver module.

Remarks

A driver can only be opened when its status is SYS_STATUS_READY.

Preconditions

Function DRV_SST25VF064C_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF064C_Initialize
SYS_STATUS          SST25VF064CStatus;

SST25VF064CStatus = DRV_SST25VF064C_Status(object);
else if (SYS_STATUS_ERROR >= SST25VF064CStatus)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF064C_Initialize

Function

SYS_STATUS DRV_SST25VF064C_Status(SYS_MODULE_OBJ object)

DRV_SST25VF064C_Tasks Function

Maintains the driver's read, erase, and write state machine and implements its ISR.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal state machine and should be called from the system's Tasks function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function (SYS_Tasks).

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI Flash driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF064C_Initialize

while (true)
{
    DRV_SST25VF064C_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SST25VF064C_Initialize)

Function

void DRV_SST25VF064C_Tasks (SYS_MODULE_OBJ object);

b) Core Client Functions

DRV_SST25VF064C_ClientStatus Function

Gets current client-specific status of the SPI Flash driver.

File

drv_sst25vf064c.h

C

```
DRV_SST25VF064C_CLIENT_STATUS DRV_SST25VF064C_ClientStatus(const DRV_HANDLE handle);
```

Returns

A DRV_SST25VF064C_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the SPI Flash driver associated with the given handle.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      handle;         // Returned from DRV_SST25VF064C_Open
DRV_SST25VF064C_CLIENT_STATUS     clientStatus;

clientStatus = DRV_SST25VF064C_ClientStatus(handle);
if(DRV_SST25VF064C_CLIENT_STATUS_READY == clientStatus)
{
    // do the tasks
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's open

Function

DRV_SST25VF064C_CLIENT_STATUS DRV_SST25VF064C_ClientStatus(DRV_HANDLE handle);

DRV_SST25VF064C_Close Function

Closes an opened-instance of the SPI Flash driver.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the SPI Flash driver, invalidating the handle.

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SST25VF064C_Open before the caller may use the driver again.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SST25VF064C_Open

DRV_SST25VF064C_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

void DRV_SST25VF064C_Close(DRV_Handle handle);

DRV_SST25VF064C_CommandStatus Function

Gets the current status of the command.

File

drv_sst25vf064c.h

C

```
DRV_SST25VF064C_COMMAND_STATUS DRV_SST25VF064C_CommandStatus(const DRV_HANDLE handle, const
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle);
```

Returns

A DRV_SST25VF064C_COMMAND_STATUS value describing the current status of the buffer. Returns DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID if the client handle or the command handle is not valid.

Description

This routine gets the current status of the buffer. The application must use this routine where the status of a scheduled buffer needs to polled on. The function may return DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID in a case where the buffer handle has expired. A buffer handle expires when the internal buffer object is re-assigned to another erase, read or write request. It is recommended that this function be called regularly in order to track the buffer status correctly.

The application can alternatively register an event handler to receive write, read or erase operation completion events.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

Block command request must have been made using Erase, Read or Write APIs to get a valid command handle.

Example

```
DRV_HANDLE      sstOpenHandle;   // Returned from DRV_SST25VF064C_Open
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE  commandHandle;
DRV_SST25VF064C_BlockErase
                        (
                            sstOpenHandle,
                            &commandHandle,
                            0,
                            1
                        );

if(DRV_SST25VF064C_CommandStatus(sstOpenHandle, commandHandle) == DRV_SST25VF064C_COMMAND_COMPLETED );
{
    // do something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
commandHandle	A valid command handle, returned from Read/Write/Erase APIs.

Function

DRV_SST25VF064C_COMMAND_STATUS DRV_SST25VF064C_CommandStatus

(

const DRV_HANDLE handle,

const DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle

);

DRV_SST25VF064C_Open Function

Opens the specified SPI Flash driver instance and returns a handle to it.

File

drv_sst25vf064c.h

C

```
DRV_HANDLE DRV_SST25VF064C_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_SST25VF064C_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.

Description

This function opens the specified SPI Flash driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The driver will always work in Non-Blocking mode even if IO-intent is selected as blocking.

The handle returned is valid until the DRV_SST25VF064C_Close function is called.

This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF064C_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_SST25VF064C_Open(DRV_SST25VF064C_INDEX_0,
                                                DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_SST25VF064C_Open

(

const SYS_MODULE_INDEX drvIndex,

const DRV_IO_INTENT ioIntent

);

c) Block Operation Functions

DRV_SST25VF064C_BlockErase Function

Erase the specified number of blocks in Flash memory.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_BlockErase(const DRV_HANDLE handle, DRV_SST25VF064C_BLOCK_COMMAND_HANDLE *
commandHandle, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It Will be DRV_BUFFER_HANDLE_INVALID if the request was not queued.

Description

This function schedules a non-blocking erase operation in Flash memory. The function returns with a valid erase handle in the commandHandle argument if the erase request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the client opened the driver for read only
- if nBlock is 0
- if the queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SST25VF064C_EVENT_ERASE_COMPLETE event if the erase operation was successful or DRV_SST25VF064C_EVENT_ERASE_ERROR event if the erase operation was not successful.

Remarks

Write Protection will be disabled for the complete Flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF064C_Open call.

Example

```
// Destination address should be block aligned.
uint32_t blockStart;
uint32_t nBlock;
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF064CHandle is the handle returned
// by the DRV_SST25VF064C_Open function.

// Client registers an event handler with driver

DRV_SST25VF064C_BlockEventHandlerSet(mySST25VF064CHandle,
                APP_SST25VF064CEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF064C_BlockErase( mySST25VF064CHandle, commandHandle,
                                                    blockStart, nBlock );

if(DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer queue is processed.

void APP_SST25VF064CEventHandler(DRV_SST25VF064C_BLOCK_EVENT event,
        DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF064C_EVENT_ERASE_COMPLETE:
```

```
            // This means the data was transferred.
            break;

        case DRV_SST25VF064C_EVENT_ERASE_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
blockStart	Start block address in SST25VF064C memory from where the erase should begin. LSBs (A0-A11) of block start address will be ignored to align it with Erase block size boundary.
nBlock	Total number of blocks to be erased. Each Erase block is of size 4 KByte.

Function

void DRV_SST25VF064C_BlockErase
(
const DRV_HANDLE handle,
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE * commandHandle,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST25VF064C_BlockEventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_BlockEventHandlerSet(const DRV_HANDLE handle, const DRV_SST25VF064C_EVENT_HANDLER
eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client calls any read, write or erase function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any read/write/erase operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI FLash driver instance.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;
```

```
uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle;

// mySST25VF064CHandle is the handle returned
// by the DRV_SST25VF064C_Open function.

// Client registers an event handler with driver. This is done once.

DRV_SST25VF064C_BlockEventHandlerSet( mySST25VF064CHandle,
                APP_SST25VF064CEventHandler, (uintptr_t)&myAppObj );

DRV_SST25VF064C_BlockRead( mySST25VF064CHandle, commandHandle,
                                      &myBuffer, blockStart, nBlock );

if(DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_SST25VF064CEventHandler(DRV_SST25VF064C_BLOCK_EVENT event,
        DRV_SST25VF064C_BLOCK_COMMAND_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_SST25VF064C_BlockEventHandlerSet

(

const DRV_HANDLE handle,

const DRV_SST25VF064C_EVENT_HANDLER eventHandler,

const uintptr_t context

);

DRV_SST25VF064C_BlockRead Function

Reads blocks of data starting from the specified address in Flash memory.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_BlockRead(const DRV_HANDLE handle, DRV_SST25VF064C_BLOCK_COMMAND_HANDLE *
commandHandle, uint8_t * targetBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation for reading blocks of data from Flash memory. The function returns with a valid handle in the commandHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the target buffer pointer is NULL
- if the client opened the driver for write only
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully of
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

The maximum read speed is 33 MHz.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF064C_Open call.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF064C_BASE_ADDRESS_TO_READ_FROM;
uint32_t    nBlock = 2;
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF064CHandle is the handle returned
// by the DRV_SST25VF064C_Open function.

// Client registers an event handler with driver

DRV_SST25VF064C_BlockEventHandlerSet(mySST25VF064CHandle,
                APP_SST25VF064CEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF064C_BlockRead( mySST25VF064CHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when the buffer is processed.
```

```
void APP_SST25VF064CEventHandler(DRV_SST25VF064C_BLOCK_EVENT event,
        DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
*targetBuffer	Buffer into which the data read from the SPI Flash instance will be placed
blockStart	Start block address in SST25VF064C memory from where the read should begin. It can be any address of the Flash.
nBlock	Total number of blocks to be read. Each Read block is of 1 byte.

Function

void DRV_SST25VF064C_BlockRead

(

const DRV_HANDLE handle,

DRV_SST25VF064C_BLOCK_COMMAND_HANDLE * commandHandle,

uint8_t *targetBuffer,

uint32_t blockStart,

uint32_t nBlock

);

DRV_SST25VF064C_BlockWrite Function

Write blocks of data starting from a specified address in Flash memory.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_BlockWrite(DRV_HANDLE handle, DRV_SST25VF064C_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t * sourceBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking write operation for writing blocks of data into Flash memory. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL

- if the client opened the driver for read only
- if the buffer size is 0
- if the write queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully or
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

In the case of multi bytes write operation, byte by byte writing will happen instead of Address auto Increment writing.

Write Protection will be disabled for the complete Flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF064C_Open call.

The Flash address location which has to be written, must be erased before using the API DRV_SST25VF064C_BlockErase().

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF064C_BASE_ADDRESS_TO_WRITE_TO;
uint32_t    nBlock = 2;
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF064CHandle is the handle returned
// by the DRV_SST25VF064C_Open function.

// Client registers an event handler with driver

DRV_SST25VF064C_BlockEventHandlerSet(mySST25VF064CHandle,
                APP_SST25VF064CEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF064C_BlockWrite( mySST25VF064CHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_SST25VF064CEventHandler(DRV_SST25VF064C_BLOCK_EVENT event,
        DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
```

```
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function commandHandle -Pointer to an argument that will contain the return buffer handle
sourceBuffer	The source buffer containing data to be programmed into SPI Flash
blockStart	Start block address of SST25VF064C Flash where the write should begin. It can be any address of the Flash.
nBlock	Total number of blocks to be written. Each write block is of 1 byte.

Function

```
void DRV_SST25VF064C_BlockWrite
(
    DRV_HANDLE handle,
    DRV_SST25VF064C_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *sourceBuffer,
uint32_t blockStart,
uint32_t nBlock
);
```

d) Media Interface Functions

DRV_SST25VF064C_GeometryGet Function

Returns the geometry of the device.

File

drv_sst25vf064c.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_SST25VF064C_GeometryGet(DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Structure which holds the media geometry information.

Description

This API gives the following geometrical details of the SST25VF064C Flash:

- Media Property
- Number of Read/Write/Erase regions in the Flash device
- Number of Blocks and their size in each region of the device

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
SYS_FS_MEDIA_GEOMETRY * sstFlashGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalFlashSize;

sstFlashGeometry = DRV_SST25VF064C_GeometryGet(sstOpenHandle1);

// read block size should be 1 byte
readBlockSize  = sstFlashGeometry->geometryTable->blockSize;
nReadBlocks = sstFlashGeometry->geometryTable->numBlocks;
nReadRegions = sstFlashGeometry->numReadRegions;
```

```
// write block size should be 1 byte
writeBlockSize  = (sstFlashGeometry->geometryTable +1)->blockSize;
// erase block size should be 4k byte
eraseBlockSize  = (sstFlashGeometry->geometryTable +2)->blockSize;

// total Flash size should be 8 MB
totalFlashSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY DRV_SST25VF064C_GeometryGet(DRV_HANDLE handle);

DRV_SST25VF064C_MediaIsAttached Function

Returns the status of the media.

File

drv_sst25vf064c.h

C

```
bool DRV_SST25VF064C_MediaIsAttached(DRV_HANDLE handle);
```

Returns

- True - Media is attached
- False - Media is not attached

Description

This function determines whether or not the media is attached.

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
if (DRV_SST25VF064C_MediaIsAttached(handle))
{
// Do Something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SST25VF064C_MediaIsAttached(DRV_HANDLE handle);

e) Data Types and Constants

DRV_SST25VF064C_BLOCK_COMMAND_HANDLE Type

Handle identifying block commands of the driver.

File

drv_sst25vf064c.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_SST25VF064C_BLOCK_COMMAND_HANDLE;
```

Description

SPI Flash Driver Block Command Handle

A block command handle is returned by a call to the Read, Write, or Erase functions. This handle allows the application to track the completion of the operation. The handle is returned back to the client by the "event handler callback" function registered with the driver.

The handle assigned to a client request expires when the client has been notified of the completion of the operation (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SST25VF064C_BLOCK_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_sst25vf064c.h

C

```
typedef enum {
  DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR
} DRV_SST25VF064C_BLOCK_EVENT;
```

Members

Members	Description
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE	Block operation has been completed successfully. Read/Write/Erase Complete
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR	There was an error during the block operation Read/Write/Erase Error

Description

SST25VF064C SPI Flash Driver Events

This enumeration identifies the possible events that can result from a Read, Write, or Erase request caused by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SST25VF064C_BlockEventHandlerSet function when a block request is completed.

DRV_SST25VF064C_CLIENT_STATUS Enumeration

Defines the client status.

File

drv_sst25vf064c.h

C

```
typedef enum {
  DRV_SST25VF064C_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0,
  DRV_SST25VF064C_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY,
  DRV_SST25VF064C_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED,
  DRV_SST25VF064C_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR
} DRV_SST25VF064C_CLIENT_STATUS;
```

Members

Members	Description
DRV_SST25VF064C_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0	Up and running, ready to start new operations
DRV_SST25VF064C_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY	Operation in progress, unable to start a new one
DRV_SST25VF064C_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED	Client is closed

DRV_SST25VF064C_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR	Client Error

Description

SPI Flash Client Status

Defines the various client status codes.

Remarks

None.

DRV_SST25VF064C_COMMAND_STATUS Enumeration

Specifies the status of the command for the read, write and erase operations.

File

drv_sst25vf064c.h

C

```
typedef enum {
  DRV_SST25VF064C_COMMAND_COMPLETED,
  DRV_SST25VF064C_COMMAND_QUEUED,
  DRV_SST25VF064C_COMMAND_IN_PROGRESS,
  DRV_SST25VF064C_COMMAND_ERROR_UNKNOWN
} DRV_SST25VF064C_COMMAND_STATUS;
```

Members

Members	Description
DRV_SST25VF064C_COMMAND_COMPLETED	Requested operation is completed
DRV_SST25VF064C_COMMAND_QUEUED	Scheduled but not started
DRV_SST25VF064C_COMMAND_IN_PROGRESS	Currently being in transfer
DRV_SST25VF064C_COMMAND_ERROR_UNKNOWN	Unknown Command

Description

SST Flash Driver Command Status

SST Flash Driver command Status. This type specifies the status of the command for the read, write and erase operations.

Remarks

None.

DRV_SST25VF064C_EVENT_HANDLER Type

Pointer to a SST25VF064C SPI Flash Driver Event handler function.

File

drv_sst25vf064c.h

C

```
typedef void (* DRV_SST25VF064C_EVENT_HANDLER)(DRV_SST25VF064C_BLOCK_EVENT event,
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t context);
```

Returns

None.

Description

SST25VF064C SPI Flash Driver Event Handler Function Pointer

This data type defines the required function signature for the SST25VF064C SPI Flash driver event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event calls back from the driver.

The parameters and return values and return value are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE, it means that the data was transferred successfully.

If the event is DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR, it means that the data was not transferred successfully.

The context parameter contains the a handle to the client context, provided at the time the event handling function was registered using the DRV_SST25VF064C_BlockEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write/erase request.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

The Read, Write, and Erase functions can be called in the event handler to add a buffer to the driver queue. These functions can only be called to add buffers to the driver whose event handler is running.

Example

```
void APP_MyBufferEventHandler
(
    DRV_SST25VF064C_BLOCK_EVENT event,
    DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle returned from the Read/Write/Erase requests
context	Value identifying the context of the application that registered the event handling function

DRV_SST25VF064C_INIT Structure

Contains all the data necessary to initialize the SPI Flash device.

File

drv_sst25vf064c.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX spiDriverModuleIndex;
  PORTS_CHANNEL holdPortChannel;
  PORTS_BIT_POS holdBitPosition;
  PORTS_CHANNEL writeProtectPortChannel;
  PORTS_BIT_POS writeProtectBitPosition;
  PORTS_CHANNEL chipSelectPortChannel;
  PORTS_BIT_POS chipSelectBitPosition;
  uint32_t queueSize;
} DRV_SST25VF064C_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX spiDriverModuleIndex;	Identifies the SPI driver to be used

PORTS_CHANNEL holdPortChannel;	HOLD pin port channel
PORTS_BIT_POS holdBitPosition;	HOLD pin port position
PORTS_CHANNEL writeProtectPortChannel;	Write protect pin port channel
PORTS_BIT_POS writeProtectBitPosition;	Write Protect Bit pin position
PORTS_CHANNEL chipSelectPortChannel;	Chip select pin port channel
PORTS_BIT_POS chipSelectBitPosition;	Chip Select Bit pin position
uint32_t queueSize;	This is the buffer queue size. This is the maximum number of requests that this instance of the driver will queue. For a static build of the driver, this is overridden by the DRV_SST25VF064C_QUEUE_SIZE macro in system_config.h

Description

SST SPI Flash Driver Initialization Data

This structure contains all of the data necessary to initialize the SPI Flash device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the DRV_SST25VF064C_Initialize function.

DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID Macro

This value defines the SPI Flash Driver Block Command Invalid handle.

File

drv_sst25vf064c.h

C

```
#define DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID
```

Description

SPI Flash Driver Block Event Invalid Handle

This value defines the SPI Flash Driver Block Command Invalid handle. It is returned by read/write/erase routines when the request could not be taken.

Remarks

None.

DRV_SST25VF064C_INDEX_0 Macro

SPI Flash driver index definitions.

File

drv_sst25vf064c.h

C

```
#define DRV_SST25VF064C_INDEX_0 0
```

Description

Driver SPI Flash Module Index reference

These constants provide SST25VF064C SPI Flash driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_SST25VF064C_Initialize and DRV_SST25VF064C_Open routines to identify the driver instance in use.

DRV_SST25VF064C_INDEX_1 Macro

File

drv_sst25vf064c.h

C

```
#define DRV_SST25VF064C_INDEX_1 1
```

Description

This is macro DRV_SST25VF064C_INDEX_1.

Timer Driver Library

This section describes the Timer Driver Library.

Introduction

This library provides an interface to manage the Timer module on the Microchip family of microcontrollers during different modes of operation.

Description

Timers are useful for generating accurate time based periodic interrupts for software application or real time operating systems. Other uses include counting external pulses or accurate timing measurement of external events using the timer's gate functions and accurate hardware delays.

Note: Not all features are available on all devices. Please refer to the specific device data sheet to determine availability.

Using the Library

This topic describes the basic architecture of the Timer Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_tmr.h`

The interface to the Timer Driver Library is defined in the `drv_tmr.h` header file.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

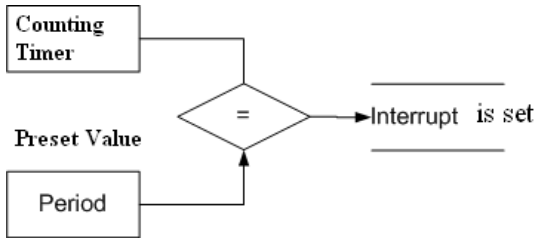
Abstraction Model

The Timer Driver abstracts the hardware by providing the capability to register callback functions to the application.

Description

Abstraction Model

The abstraction model of the Timer Driver is explained in the following diagram:



The core functionality of the Timer allows access to both the counter and the period values.

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Timer Driver Library.

Library Interface Section	Description
Configuration	Provides macros for configuring the system. It is required that the system configures the driver to build correctly by choosing appropriate configuration options as listed in this section. These macros enable different features or modes of the timer peripheral.
System Interaction Functions	Provides interfaces to system layer to initialize, deinitialize and reinitialize the module. This section also describes functions to query the status of the module.
Core Functions	Provides interfaces for core functionality of the driver.
Alarm Functions	Provides interfaces to handle alarm features, if alarm functionality is enabled.
Period Functions	Provides interfaces to control the periodicity of the timers.
Counter Control Functions	Provides interfaces to update the counter values.
Miscellaneous Functions	Provides interfaces to get the version information, timer tick and operating frequencies.

How the Library Works

The library provides interfaces to support:

- System Interaction
- Sync Mode Setup
- Period Modification
- Counter Modification
- Client Core Functionality
- Client Alarm Functionality (optional function, enabled using configuration options)
- Other Optional Functionality (enabled using configuration options)

Note: Any code segment pertaining to the driver interfaces will work for both the static or dynamic configurations. It is not necessary to modify the code to move from one configuration to the other (i.e., from static or dynamic or static-multi).

System Interaction

This section describes Timer initialization and reinitialization.

Description

Initialization and Reinitialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized.

The DRV_TMR_Initialize function returns an object handle of the type SYS_MODULE_OBJ. After this, the object handle returned by the Initialize interface would be used by the other system interfaces such as DRV_TMR_Deinitialize and DRV_TMR_Status, DRV_TMR_Tasks.

Example: Timer Initialization

```
DRV_TMR_INIT     init;
SYS_MODULE_OBJ   object;
SYS_STATUS       tmrStatus;

// populate the TMR init configuration structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId            = TMR_ID_2;
init.clockSource      = TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK;
init.prescale         = TMR_PRESCALE_VALUE_256;
init.interruptSource  = INT_SOURCE_TIMER_2;
init.mode             = DRV_TMR_OPERATION_MODE_16_BIT;
init.asyncWriteEnable = false;

object = DRV_TMR_Initialize (DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&init);

if (object == SYS_MODULE_OBJ_INVALID)
{
    // Handle error
}
```

Deinitialization

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This routine may block if the driver is running in an OS environment that supports blocking operations and the driver requires system resources access. However, the routine will never block for hardware Timer access.

Status

Timer status is available to query the module state after initialization and reinitialization.

Tasks Routine

The interface DRV_TMR_Tasks needs to be called by the system task service in a polled environment and in an interrupt-based system.

Example: Polling

```
int main( void )
{
    SYS_MODULE_OBJ object;
    object = DRV_TMR_Initialize( DRV_TMR_INDEX_0, (SYS_MODULE_INIT *) &initConf );

    if( SYS_STATUS_READY != DRV_TMR_Status( object ) )
        return 0;

    while (1)
    {
        DRV_TMR_Tasks (object);
    }
}
```

Example: Interrupt

```
int main( void )
{
    SYS_MODULE_OBJ object;
    object = DRV_TMR_Initialize( DRV_TMR_INDEX_0, (SYS_MODULE_INIT *) &initConf );

    if( SYS_STATUS_READY != DRV_TMR_Status( object ) )
        return 0;

    while (1);
}

/* Sample interrupt routine not specific to any device family */
void ISR T1Interrupt(void)
{
    //Call the Timer Tasks routine
    DRV_TMR_Tasks(object);
}
```

Client Interaction

This section describes general client operation.

Description

General Client Operation

For the application to begin using an instance of the Timer module, it must call the DRV_TMR_Open function. This provides the configuration required to open the Timer instance for operation.

The Timer Driver supports only the 'DRV_IO_INTENT_EXCLUSIVE' IO_INTENT.

Example:

```
DRV_HANDLE handle;

// Configure the instance DRV_TMR_INDEX_1 with the configuration
handle = DRV_TMR_Open(DRV_TMR_INDEX_1, DRV_IO_INTENT_EXCLUSIVE);

if( handle == DRV_HANDLE_INVALID )
{
    // Client cannot open the instance.
}
```

The function DRV_TMR_Close closes an already opened instance of the Timer Driver, invalidating the handle. DRV_TMR_Open must have been

called to obtain a valid opened device handle.

Example:
```
DRV_HANDLE handle;

// Configure the instance DRV_TMR_INDEX_1 with the configuration
handle = DRV_TMR_Open(DRV_TMR_INDEX_1, DRV_IO_INTENT_EXCLUSIVE);

/*...*/

DRV_TMR_Close( handle );
```

The client has the option to check the status through the interface DRV_TMR_ClientStatus.

Example:
```
DRV_HANDLE handle;

// Configure the instance DRV_TMR_INDEX_1 with the configuration
handle = DRV_TMR_Open(DRV_TMR_INDEX_1, DRV_IO_INTENT_EXCLUSIVE);

if ( DRV_TMR_CLIENT_STATUS_READY != DRV_TMR_ClientStatus( handle ) )
   return 0;
```

Modification

This section describes Period modification for the different types of Timers (i.e., 16-/32-bit).

Description

These set of functions help modify the Timer periodicity at the client level.

Period Modification

Periodicity of Timer (16/32-bit) can be modified using DRV_TMR_AlarmPeriodSet and the current period can be obtained using DRV_TMR_AlarmPeriodGet.

Example:
```
DRV_HANDLE handle;
/* Open the client */
handle = DRV_TMR_Open( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

/* ... */

/* Update the new period */
DRV_TMR_AlarmPeriodSet( handle, 0xC350);
```

Counter Modification

This section describes counter modification for the different types of Timers (i.e., 8-/16-/32-bit).

Description

These set of functions help modify the initial value of the Timer counters to help adjust any errors in the periodicity.

Counter Modification

The Timer initial value can be modified using DRV_TMR_CounterValueSet and the current counter value can be obtained using DRV_TMR_CounterValueGet.

Example:
```
DRV_HANDLE handle;
/* Open the client */
handle = DRV_TMR_Open( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

/* ... */

/* Update the counter value */
/* Following code updates the initial value from 0x0000 to 0x0010
   to cover up any error in the previously set periodicity */

DRV_TMR_CounterValueSet( handle, 0x0010);
```

Core Functionality

This section describes core functionality of the Timer Driver.

Description

Core functionality provides an extremely basic interface for the driver operation.

Applications using the Timer core functionality need to perform the following:

1. The system should have completed the necessary initialization and DRV_TMR_Tasks should be called in a polled/interrupt environment.
2. Open_the driver using DRV_TMR_Open. The Timer Driver only supports exclusive access.
3. The Timer can be updated using DRV_TMR_AlarmPeriodSet. The previously set value can be retrieved using DRV_TMR_AlarmPeriodGet.
4. Start the driver using DRV_TMR_Start.
5. Poll for the elapsed alarm status using DRV_TMR_AlarmHasElapsed.
6. The client will be able to stop the started Timer instance using DRV_TMR_Stop at any time and will be able to close it using DRV_TMR_Close when it is no longer required.

Example:

```
/* Open the client */
handle = DRV_TMR_Open( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );
DRV_TMR_Start (handle);
unsigned int alarmCount = 0;
while (1)
{
    if (true == DRV_TMR_AlarmHasElapsed (handle))
    {
        alarmCount++;
        // Do something
    }
}
```

Notes:

1. The user needs to stop the Timer before any updates on the counter or period and restart it later.
2. The Timer alarm count gets reset after any call to DRV_TMR_AlarmHasElapsed.
3. The Timer alarm status remains unchanged if the user stops the timer and restarts later.

Alarm Functionality

This section describes the Timer Driver alarm functionality.

Description

The Timer Driver provides alarm functionality.

Applications using the Timer alarm functionality, need to perform the following:

1. The system should have completed the necessary initialization and DRV_TMR_Tasks should be running in either a polled environment or in an interrupt environment.
2. Open the driver using DRV_TMR_Open. The Timer Driver supports exclusive access only.
3. Configure the alarm using DRV_TMR_AlarmRegister.
4. Start the driver using DRV_TMR_Start.
5. If a callback is supplied, the Timer Driver will call the callback function when the alarm expires.
6. The client will be able to stop the started Timer module instance using DRV_TMR_Stop at any time and will be able to close it using DRV_TMR_Close when it is no longer required.
7. The client can deregister the callback by using DRV_TMR_AlarmDeregister.

Example:

```
DRV_HANDLE handle;
/* Open the client */
handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
/* Configure the timer alarm feature */
uint32_t myFreq = 1000; // 1KHz
uint32_t clkFreq = DRV_TMR_CounterFrequencyGet(tmrHandle);   // timer running frequency

// calculate the divider needed
uint32_t divider = clkFreq / myFreq;

// Start the alarm
if(!DRV_TMR_AlarmRegister ( tmrHandle, divider, true, 0, CallBackFreq ))
```

```
{
    // divider value could not be obtain;
    // handle the error
    //
    return;
}

DRV_TMR_Start (handle);

// The driver tasks function calls the client registered callback after the alarm expires.
void CallBackFreq (uintptr_t context, uint32_t alarmCount)
{
    // Do something specific on an alarm event trigger
}
```

Optional Interfaces

This section describes additional/optional client interfaces.

Description

Additional/Optional client interfaces include the following:

Get Operating Frequency

The function DRV_TMR_CounterFrequencyGet provides the client with the information on the Timer operating frequency.

Example:

```
DRV_HANDLE handle;
uint32_t freq;

/* Open the client */
handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);

freq = DRV_TMR_OperatingFrequencyGet (handle);
```

Example Usage of the Timer Driver

This section describes typical usage of the Timer Driver for various Timer modules in polling/interrupt advanced/core modes.

Description

The user can pass NULL to the driver initialize interface. However, the respective configuration parameters need to be configured in the correct manner.

Example:

```
//Polled mode under 32-bit count mode for a PIC32 device using the alarm feature
SYS_MODULE_OBJ object;

// main
DRV_TMR_INIT init;
DRV_HANDLE handle;

init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId            = TMR_ID_2;
init.clockSource      = TMR_CLKSOURCE_INTERNAL;
init.prescale         = TMR_PRESCALE_TX_VALUE_256;
init.interruptSource  = INT_SOURCE_TIMER_3;
init.mode             = DRV_TMR_OPERATION_MODE_16_BIT;init.asyncWriteEnable = false;

object = DRV_TMR_Initialize (DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&init);
if ( SYS_STATUS_READY != DRV_TMR_Status(object))
    return 0;

handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if ( DRV_TMR_CLIENT_STATUS_READY != DRV_TMR_ClientStatus(handle))
    return 0;

if(!DRV_TMR_AlarmRegister ( tmrHandle, divider, true, 0, AlarmCallback ))
{
    // divider value could not be obtain;
```

```
    // handle the error
}

DRV_TMR_Start (handle);

while (1)
{
    DRV_TMR_Tasks (object);
}

DRV_TMR_Stop (handle);

DRV_TMR_Close (handle);
if ( DRV_TMR_CLIENT_STATUS_INVALID != DRV_TMR_ClientStatus(handle))
    return 0;

DRV_TMR_Deinitialize (object);
// end main

void AlarmCallback (uintptr_t context, uint32_t alarmCount)
{
  // Do something specific on an alarm event trigger
}
```

Configuring the Library

Macros

	Name	Description
	DRV_TMR_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_TMR_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_TMR_CLOCK_PRESCALER	Sets the default timer driver clock prescaler.
	DRV_TMR_MODE	Sets the default timer driver clock operating mode.
	DRV_TMR_MODULE_ID	Sets the default timer module ID to be used by the timer driver.
	DRV_TMR_MODULE_INIT	Sets the default module init value for the timer driver.
	DRV_TMR_INTERRUPT_SOURCE	Sets the default timer driver clock interrupt source
	DRV_TMR_ASYNC_WRITE_ENABLE	Controls Asynchronous Write mode of the Timer.
	DRV_TMR_CLOCK_SOURCE	Sets the default timer driver clock source.
	DRV_TMR_CLIENTS_NUMBER	Sets up the maximum number of clients that can be supported by an instance of the dynamic driver.

Description

The configuration of the Timer Driver Library is based on the file `system_config.h`.

This header file contains the configuration selection for the Timer Driver Library build. Based on the selections made here and the system setup, the Timer Driver may support the selected features. These configuration settings will apply to all instances of the driver.

This header can be placed anywhere in the application-specific folders and the path of this header needs to be presented to the include search for a successful build. Refer to the Applications Help section for more details.

DRV_TMR_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported by the dynamic driver.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_INSTANCES_NUMBER 5
```

Description

Hardware instances support

This definition sets up the maximum number of hardware instances that can be supported by the dynamic driver.

Remarks

None

DRV_TMR_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_INTERRUPT_MODE true
```

Description

TMR Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of timer operation is desired
- false - Select if polling mode of timer operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

DRV_TMR_CLOCK_PRESCALER Macro

Sets the default timer driver clock prescaler.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_CLOCK_PRESCALER (TMR_PRESCALE_VALUE_256)
```

Description

Default timer driver clock prescaler

This macro sets the default timer driver clock prescaler.

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_MODE Macro

Sets the default timer driver clock operating mode.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_MODE (DRV_TMR_OPERATION_MODE_16_BIT)
```

Description

Default timer driver clock operating mode

This macro sets the default timer driver clock operating mode.

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_MODULE_ID Macro

Sets the default timer module ID to be used by the timer driver.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_MODULE_ID (TMR_ID_2)
```

Description

Default timer driver index

This macro sets the default timer module ID to be used by the timer driver.

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_MODULE_INIT Macro

Sets the default module init value for the timer driver.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_MODULE_INIT (SYS_MODULE_POWER_RUN_FULL)
```

Description

Default module init object configuration

This macro sets the default module init value for the timer driver.

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_INTERRUPT_SOURCE Macro

Sets the default timer driver clock interrupt source

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_INTERRUPT_SOURCE (INT_SOURCE_TIMER_2)
```

Description

Default timer driver clock interrupt source

This macro sets the default timer driver clock interrupt source

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_ASYNC_WRITE_ENABLE Macro

Controls Asynchronous Write mode of the Timer.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_ASYNC_WRITE_ENABLE false
```

Description

TMR Asynchronous write mode configuration

This macro controls the Asynchronous Write mode of the Timer. This macro accepts the following values:

- true - Configures the Timer to enable asynchronous write control
- false - Configures the Timer to disable asynchronous write control
- DRV_CONFIG_NOT_SUPPORTED - When the feature is not supported on the instance.

Remarks

This feature is not available in all modules/devices. Refer to the specific device data sheet for more information.

DRV_TMR_CLOCK_SOURCE Macro

Sets the default timer driver clock source.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_CLOCK_SOURCE (DRV_TMR_CLKSOURCE_INTERNAL)
```

Description

Default timer driver clock source

This macro sets the default timer driver clock source.

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be supported by an instance of the dynamic driver.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_CLIENTS_NUMBER 1
```

Description

Client instances support

This definition sets up the maximum number of clients that can be supported by an instance of the dynamic driver.

Remarks

Currently each client is required to get exclusive access to the timer module. Therfore the DRV_TMR_CLIENTS_NUMBER should always be set to 1.

Building the Library

This section lists the files that are available in the Timer Driver Library.

Description

This section list the files that are available in the `\src` folder of the Timer Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/tmr`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_tmr.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_tmr_dynamic.c`	Basic Timer driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library

Module Dependencies

The Timer Driver Library depends on the following modules:

- Clock System Service Library
- Interrupt System Service Library
- Interrupt Peripheral Library
- Device Control System Service Library

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_TMR_Deinitialize	Deinitializes the specified instance of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_Initialize	Initializes the Timer driver. **Implementation:** Static/Dynamic
	DRV_TMR_Status	Provides the current status of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_Tasks	Maintains the driver's state machine. **Implementation:** Dynamic
	DRV_TMR_ClockSet	Sets the timers clock by selecting the source and prescaler. **Implementation:** Dynamic
	DRV_TMR_GateModeSet	Enables the Gate mode. **Implementation:** Dynamic

b) Core Functions

	Name	Description
	DRV_TMR_ClientStatus	Gets the status of the client operation. **Implementation:** Dynamic
	DRV_TMR_Close	Closes an opened instance of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_Open	Opens the specified Timer driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_TMR_Start	Starts the Timer counting. **Implementation:** Static/Dynamic
	DRV_TMR_Stop	Stops the Timer from counting. **Implementation:** Static/Dynamic

c) Alarm Functions

	Name	Description
	DRV_TMR_Alarm16BitDeregister	Removes a previously set alarm. **Implementation:** Dynamic
	DRV_TMR_Alarm32BitDeregister	Removes a previously set alarm. **Implementation:** Dynamic
	DRV_TMR_AlarmHasElapsed	Provides the status of Timer's period elapse. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriod16BitGet	Provides the 16-bit Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriod16BitSet	Updates the 16-bit Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriod32BitGet	Provides the 32-bit Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriod32BitSet	Updates the 32-bit Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmDisable	Disables an alarm signal. **Implementation:** Dynamic
	DRV_TMR_AlarmEnable	Re-enables an alarm signal. **Implementation:** Dynamic
	DRV_TMR_Alarm16BitRegister	Sets up an alarm. **Implementation:** Dynamic
	DRV_TMR_Alarm32BitRegister	Sets up an alarm. **Implementation:** Dynamic
	DRV_TMR_AlarmDeregister	Removes a previously set alarm. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriodGet	Provides the Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriodSet	Updates the Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmRegister	Sets up an alarm. **Implementation:** Dynamic

d) Counter Control Functions

	Name	Description
	DRV_TMR_CounterFrequencyGet	Provides the Timer input frequency. **Implementation:** Dynamic
	DRV_TMR_CounterValue16BitGet	Reads the 16-bit Timer's counter register. **Implementation:** Dynamic
	DRV_TMR_CounterValue16BitSet	Updates the 16-bit Timer's counter register. **Implementation:** Dynamic
	DRV_TMR_CounterValue32BitGet	Reads the 32-bit Timer's counter register. **Implementation:** Dynamic
	DRV_TMR_CounterValue32BitSet	Updates the 32-bit Timer's counter register. **Implementation:** Dynamic
	DRV_TMR_CounterClear	Clears the Timer's counter register. **Implementation:** Static/Dynamic
	DRV_TMR_CounterValueGet	Reads the Timer's counter register. **Implementation:** Static/Dynamic
	DRV_TMR_CounterValueSet	Updates the Timer's counter register. **Implementation:** Static/Dynamic

e) Miscellaneous Functions

	Name	Description
	DRV_TMR_GateModeClear	Enables the Gate mode. **Implementation:** Dynamic

	DRV_TMR_PrescalerGet	This function gets the currently selected prescaler. **Implementation:** Dynamic
	DRV_TMR_OperationModeGet	This function gets the currently selected operation mode. **Implementation:** Dynamic
	DRV_TMR_DividerRangeGet	Returns the Timer divider values. **Implementation:** Dynamic
	DRV_TMR_Tasks_ISR	Maintains the driver's state machine, processes the events and implements its ISR. **Implementation:** Dynamic

f) Data Types and Constants

	Name	Description
	DRV_TMR_CALLBACK	Pointer to a Timer driver callback function data type.
	DRV_TMR_INIT	Defines the Timer driver initialization data.
	DRV_TMR_CLIENT_STATUS	Identifies the client-specific status of the Timer driver
	DRV_TMR_CLK_SOURCES	Lists the clock sources available for timer driver.
	DRV_TMR_DIVIDER_RANGE	This data structure specifies the divider values that can be obtained by the timer module.
	DRV_TMR_OPERATION_MODE	Lists the operation modes available for timer driver.
	DRV_TMR_INDEX_COUNT	Number of valid Timer driver indices.
	DRV_TMR_INDEX_0	Timer driver index definitions
	DRV_TMR_INDEX_1	This is macro DRV_TMR_INDEX_1.
	DRV_TMR_INDEX_2	This is macro DRV_TMR_INDEX_2.
	DRV_TMR_INDEX_3	This is macro DRV_TMR_INDEX_3.
	DRV_TMR_INDEX_4	This is macro DRV_TMR_INDEX_4.
	DRV_TMR_INDEX_5	This is macro DRV_TMR_INDEX_5.
	DRV_TMR_INDEX_6	This is macro DRV_TMR_INDEX_6.
	DRV_TMR_INDEX_7	This is macro DRV_TMR_INDEX_7.
	DRV_TMR_INDEX_8	This is macro DRV_TMR_INDEX_8.
	DRV_TMR_INDEX_9	This is macro DRV_TMR_INDEX_9.

Description

This section describes the functions of the Timer Driver Library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_TMR_Deinitialize Function

Deinitializes the specified instance of the Timer driver.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the Timer driver, disabling its operation (and any hardware). All internal data is invalidated.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_TMR_Status operation. The system has to use DRV_TMR_Status to find out when the module is in the ready state.

Preconditions

The DRV_TMR_Initialize function must have been called before calling this function and a valid SYS_MODULE_OBJ must have been returned.

Example

```
SYS_MODULE_OBJ      tmrObject;     //  Returned from DRV_TMR_Initialize
SYS_STATUS          tmrStatus;

DRV_TMR_Deinitialize ( tmrObject );

tmrStatus = DRV_TMR_Status ( tmrObject );

if ( SYS_MODULE_UNINITIALIZED == tmrStatus )
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TMR_Initialize

Function

void DRV_TMR_Deinitialize (SYS_MODULE_OBJ object)

DRV_TMR_Initialize Function

Initializes the Timer driver.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
SYS_MODULE_OBJ DRV_TMR_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver object. Otherwise, it returns SYS_MODULE_OBJ_INVALID. The returned object must be passed as argument to DRV_TMR_Deinitialize, DRV_TMR_Tasks, DRV_TMR_Tasks_ISR and DRV_TMR_Status functions.

Description

This function initializes the Timer driver, making it ready for clients to open and use it.

Remarks

This function must be called before any other Timer driver function is called.

This function should only be called once during system initialization unless DRV_TMR_Deinitialize is called to deinitialize the driver instance.

This function will NEVER block for hardware access. The system must use DRV_TMR_Status to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

None.

Example

```
DRV_TMR_INIT    init;
SYS_MODULE_OBJ  objectHandle;

// Populate the timer initialization structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId            = TMR_ID_2;
init.clockSource      = DRV_TMR_CLKSOURCE_INTERNAL;
init.prescale         = TMR_PRESCALE_VALUE_256;
init.interruptSource  = INT_SOURCE_TIMER_2;
```

```
init.mode             = DRV_TMR_OPERATION_MODE_16_BIT;
init.asyncWriteEnable = false;

// Do something

objectHandle = DRV_TMR_Initialize ( DRV_TMR_INDEX_0, (SYS_MODULE_INIT*)&init );

if ( SYS_MODULE_OBJ_INVALID == objectHandle )
{
    // Handle error
}
```

Parameters

Parameters	Description
drvIndex	Index for the driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_TMR_Initialize
(
const SYS_MODULE_INDEX drvIndex,
const SYS_MODULE_INIT * const init
)

DRV_TMR_Status Function

Provides the current status of the Timer driver.

Implementation: Dynamic

File

drv_tmr.h

C

```
SYS_STATUS DRV_TMR_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is initialized and ready for operation

Description

This function provides the current status of the Timer driver.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

The this operation can be used to determine when any of the driver's module level operations has completed.

Once the status operation returns SYS_STATUS_READY, the driver is ready for operation.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

Preconditions

The DRV_TMR_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TMR_Initialize
SYS_STATUS          tmrStatus;

tmrStatus = DRV_TMR_Status ( object );
```

```
else if ( SYS_STATUS_ERROR >= tmrStatus )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TMR_Initialize

Function

SYS_STATUS DRV_TMR_Status (SYS_MODULE_OBJ object)

DRV_TMR_Tasks Function

Maintains the driver's state machine.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Tasks(SYS_MODULE_OBJ object);
```

Returns

None

Description

This function is used to maintain the driver's internal state machine and processes the timer events..

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks)

Preconditions

The DRV_TMR_Initialize function must have been called for the specified Timer driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TMR_Initialize

while (true)
{
    DRV_TMR_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TMR_Initialize)

Function

void DRV_TMR_Tasks (SYS_MODULE_OBJ object)

DRV_TMR_ClockSet Function

Sets the timers clock by selecting the source and prescaler.

Implementation: Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_ClockSet(DRV_HANDLE handle, DRV_TMR_CLK_SOURCES clockSource, TMR_PRESCALE preScale);
```

Returns

- true - if the operation is successful
- false - either the handle is invalid or the clockSource and/or prescaler are not supported

Description

This function sets the timer clock by selecting the source and prescaler. The clock sources are device specific, refer device datasheet for supported clock sources. If unsupported clock source is passed then the behaviour of this function is unpredictable.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 32-Bit timer mode if mode selection is applicable.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE              tmrHandle;  // Returned from DRV_TMR_Open

DRV_TMR_ClockSet ( tmrHandle, DRV_TMR_CLKSOURCE_INTERNAL, TMR_PRESCALE_VALUE_256 );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
clockSource	Clock source of the timer
preScale	Timer's Prescaler divisor

Function

bool DRV_TMR_ClockSet

(

DRV_HANDLE handle,

DRV_TMR_CLK_SOURCES clockSource,

TMR_PRESCALE preScale

)

DRV_TMR_GateModeSet Function

Enables the Gate mode.

Implementation: Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_GateModeSet(DRV_HANDLE handle);
```

Returns

- true - if the operation is successful
- false - either the handle is invalid or the gate mode is not supported

Description

This function enables the Gated mode of Timer. User can measure the duration of an external signal in this mode. Once the Gate mode is enabled, Timer will start on the raising edge of the external signal. It will keep counting until the next falling edge.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

DRV_TMR_GateModeSet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

bool DRV_TMR_GateModeSet (DRV_HANDLE handle)

b) Core Functions

DRV_TMR_ClientStatus Function

Gets the status of the client operation.

Implementation: Dynamic

File

drv_tmr.h

C

```
DRV_TMR_CLIENT_STATUS DRV_TMR_ClientStatus(DRV_HANDLE handle);
```

Returns

None

Description

This function gets the status of the recently completed client level operation.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called for the specified Timer driver instance.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
DRV_TMR_CLIENT_STATUS tmrDrvStatus;

tmrDrvStatus = DRV_TMR_ClientStatus ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_TMR_CLIENT_STATUS DRV_TMR_ClientStatus (DRV_HANDLE handle)

DRV_TMR_Close Function

Closes an opened instance of the Timer driver.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the Timer driver, invalidating the handle.

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver functions. A new handle must be obtained by calling DRV_TMR_Open before the caller may use the driver again.

Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_TMR_Initialize function must have been called for the specified Timer driver instance.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TMR_Open

DRV_TMR_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TMR_Close (DRV_HANDLE handle)

DRV_TMR_Open Function

Opens the specified Timer driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_tmr.h

C

```
DRV_HANDLE DRV_TMR_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Returns

If successful, the function returns a valid open instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID.

Description

This function opens the specified Timer driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. Timer driver does not support multiple clients. If two tasks want to use the timer, one should wait until the other one gets closed.

Remarks

The handle returned is valid until the DRV_TMR_Close function is called.

This function will NEVER block waiting for hardware.

If the requested intent flags are not supported, the function will return DRV_HANDLE_INVALID.

The Timer driver does not support DRV_IO_INTENT_SHARED. Only exclusive access is supported for now.

Preconditions

The DRV_TMR_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_TMR_Open ( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

if ( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_TMR_Open
(
const SYS_MODULE_INDEX index,
const DRV_IO_INTENT intent
)

DRV_TMR_Start Function

Starts the Timer counting.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_Start(DRV_HANDLE handle);
```

Returns

- true - if the operation succeeded
- false - the supplied handle is invalid or the client doesn't have the needed parameters to run (alarm callback and period)

Description

This function starts the Timer counting.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Timer parameters must have been set by a call to DRV_TMR_AlarmRegister.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

DRV_TMR_AlarmRegister(tmrHandle, 0x100, true, 0, myTmrCallback);
DRV_TMR_Start ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

bool DRV_TMR_Start (DRV_HANDLE handle)

DRV_TMR_Stop Function

Stops the Timer from counting.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Stop(DRV_HANDLE handle);
```

Returns

None.

Description

This function stops the running Timer from counting.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TMR_Open

DRV_TMR_Stop ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TMR_Stop (DRV_HANDLE handle)

c) Alarm Functions

DRV_TMR_Alarm16BitDeregister Function

Removes a previously set alarm.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Alarm16BitDeregister(DRV_HANDLE handle);
```

Returns

None.

Description

This function removes a previously set alarm. This API is valid only if the 16-bit mode of the timer is selected Otherwise use DRV_TMR_Alarm32BitDeregister function.

Remarks

This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_AlarmDeregister" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 16-Bit timer mode if mode selection is applicable.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

DRV_TMR_Alarm16BitRegister function must have been called before.

Example

```
//Example of a key debounce check

static unsigned int lastReadKey, readKey, keyCount, globalKeyState;
DRV_HANDLE              tmrHandle;  // Returned from DRV_TMR_Open
//Do the initialization with 'mode' set to DRV_TMR_OPERATION_MODE_16_BIT

void keyPressDetect ()
{
    // Calculate the count to be passed on from the clock input
    //Periodically toggle LED
    DRV_TMR_Alarm16BitRegister ( tmrHandle, 0xFF00, true,
                                    DebounceCheck );
}

void DebounceCheck ( uintptr_t context )
{
    readKey = AppReadKey();

    if ( readKey != lastReadKey )
    {
        lastReadKey = readKey;
        keyCount = 0;
    }
    else
    {
        if ( keyCount > 20 )
        {
            globalKeyState = readKey;
            DRV_TMR_Alarm16BitDeregister ( tmrHandle );
        }
        keyCount++;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TMR_Alarm16BitDeregister (DRV_HANDLE handle)

DRV_TMR_Alarm32BitDeregister Function

Removes a previously set alarm.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Alarm32BitDeregister(DRV_HANDLE handle);
```

Returns

None.

Description

This function removes a previously set alarm. This API is valid only if the 32-bit mode of the timer is selected Otherwise use DRV_TMR_Alarm16BitDeregister function.

Remarks

In most of the devices only even numbered instances of timer supports 32-bit mode. This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_AlarmDeregister" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 32-Bit timer mode if mode selection is applicable.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

DRV_TMR_Alarm32BitRegister function must have been called before.

Example

```
//Example of a key debounce check

static unsigned int lastReadKey, readKey, keyCount, globalKeyState;
DRV_HANDLE              tmrHandle;  // Returned from DRV_TMR_Open
//Do the initialization with 'mode' set to DRV_TMR_OPERATION_MODE_32_BIT

void keyPressDetect ( void )
{
    // Calculate the count to be passed on from the clock input
    //Periodically check the key status
    DRV_TMR_Alarm32BitRegister ( tmrHandle, 0xFF0FFD20, true, 0,
                                    DebounceCheck );
}

void DebounceCheck ( uintptr_t context )
{
    readKey = AppReadKey();

    if ( readKey != lastReadKey )
    {
        lastReadKey = readKey;
        keyCount = 0;
    }
    else
    {
        if ( keyCount > 20 )
        {
            //Key is stable now
            globalKeyState = readKey;
            DRV_TMR_Alarm32BitDeregister ( tmrHandle );
        }
        keyCount++;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TMR_Alarm32BitDeregister (DRV_HANDLE handle)

DRV_TMR_AlarmHasElapsed Function

Provides the status of Timer's period elapse.

Implementation: Dynamic

File

drv_tmr.h

C

```
uint32_t DRV_TMR_AlarmHasElapsed(DRV_HANDLE handle);
```

Returns

Number of times timer has elapsed since the last call.

Description

This function returns the number of times Timer's period has elapsed since last call to this API has made. On calling this API, the internally maintained counter will be cleared and count will be started again from next elapse.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      tmrHandle;  // Returned from DRV_TMR_Open
bool            elapseStatus;
SYS_MODULE_OBJ  tmrObject // Returned by DRV_TMR_Initialize
unsigned int    appInternalTime = 0;

Sys_Tasks()
{
    //Timer task will be called from ISR

    APP_TimeUpdate_Task();

    //Other Tasks
}

void APP_TimeUpdate_Task ( void )
{
    //We will not miss a count even though we are late
    appInternalTime += DRV_TMR_AlarmHasElapsed ( tmrHandle );
}
```

Parameters

Parameters	Description
handle	A valid handle, returned from the DRV_TMR_Open

Function

unsigned int DRV_TMR_AlarmHasElapsed (DRV_HANDLE handle)

DRV_TMR_AlarmPeriod16BitGet Function

Provides the 16-bit Timer's period.

Implementation: Dynamic

File

drv_tmr.h

C

```
uint16_t DRV_TMR_AlarmPeriod16BitGet(DRV_HANDLE handle);
```

Returns

16-bit timer period value

Description

This function gets the 16-bit Timer's period. This API is valid only if the 16-bit mode of the timer is selected. Otherwise use DRV_TMR_AlarmPeriod32BitGet function.

Remarks

This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_AlarmPeriodGet" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 16-Bit timer mode if mode selection is applicable.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
uint16_t period;

period = DRV_TMR_AlarmPeriod16BitGet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint16_t DRV_TMR_AlarmPeriod16BitGet (DRV_HANDLE handle)

DRV_TMR_AlarmPeriod16BitSet Function

Updates the 16-bit Timer's period.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_AlarmPeriod16BitSet(DRV_HANDLE handle, uint16_t value);
```

Returns

None.

Description

This function updates the 16-bit Timer's period. This API is valid only if the 16-bit mode of the timer is selected Otherwise use DRV_TMR_AlarmPeriod32BitSet function.

Remarks

This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_AlarmPeriodSet" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 16-Bit timer mode if mode selection is applicable.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TMR_Open

DRV_TMR_AlarmPeriod16BitSet ( handle, 0x1000 );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
value	16-bit Period value

Function

void DRV_TMR_AlarmPeriod16BitSet (DRV_HANDLE handle, uint16_t value)

DRV_TMR_AlarmPeriod32BitGet Function

Provides the 32-bit Timer's period.

Implementation: Dynamic

File

drv_tmr.h

C

```
uint32_t DRV_TMR_AlarmPeriod32BitGet(DRV_HANDLE handle);
```

Returns

32-bit Timer period value.

Description

This function gets the 32-bit Timer's period. This API is valid only if the 32-bit mode of the timer is selected Otherwise use DRV_TMR_AlarmPeriod16BitGet function.

Remarks

In most of the devices only even numbered instances of timer supports 32-bit mode. This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_AlarmPeriodGet" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 32-Bit timer mode.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TMR_Open
uint32_t period;

period = DRV_TMR_AlarmPeriod32BitGet ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_TMR_AlarmPeriod32BitGet (DRV_HANDLE handle)

DRV_TMR_AlarmPeriod32BitSet Function

Updates the 32-bit Timer's period.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_AlarmPeriod32BitSet(DRV_HANDLE handle, uint32_t period);
```

Returns

None.

Description

This function updates the 32-bit Timer's period. This API is valid only if the 32-bit mode of the timer is selected Otherwise use DRV_TMR_AlarmPeriod16BitSet function.

Remarks

In most of the devices only even numbered instances of timer supports 32-bit mode. This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_AlarmPeriodSet" instead of this.

Preconditions

The DRV_TMR_Initialize unction must have been called. Must have selected 32-Bit timer mode.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TMR_Open

DRV_TMR_AlarmPeriod32BitSet ( handle, 0xFFFFFF00 );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
period	32-bit Period value

Function

void DRV_TMR_AlarmPeriod32BitSet (DRV_HANDLE handle, uint32_t period)

DRV_TMR_AlarmDisable Function

Disables an alarm signal.

Implementation: Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_AlarmDisable(DRV_HANDLE handle);
```

Returns

The current status of the alarm:

- true if the alarm was currently enabled
- false if the alarm was currently disabled

Description

This function allows the client to disable an alarm generation. Use DRV_TMR_AlarmEnable to re-enable.

Remarks

When the driver operates in interrupts this call resolves to a device interrupt disable.

Do NOT disable the timer except for very short periods of time. If the time that the interrupt is disabled is longer than a wrap around period and the interrupt is missed, the hardware has no means of recovering and the resulting timing will be inaccurate.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

A client alarm must be active.

Example

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open

Function

bool DRV_TMR_AlarmDisable (DRV_HANDLE handle);

DRV_TMR_AlarmEnable Function

Re-enables an alarm signal.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_AlarmEnable(DRV_HANDLE handle, bool enable);
```

Returns

None

Description

This function allows the client to re-enable an alarm after it has been disabled by a DRV_TMR_AlarmDisable call.

Remarks

When the driver operates in interrupts this call resolves to a device interrupt re-enable.

Preconditions

The DRV_TMR_Initialize function must have been called. DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open
enable	boolean to enable the current callback

Function

void DRV_TMR_AlarmEnable (DRV_HANDLE handle, bool enable);

DRV_TMR_Alarm16BitRegister Function

Sets up an alarm.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Alarm16BitRegister(DRV_HANDLE handle, uint16_t period, bool isPeriodic, uintptr_t context,
DRV_TMR_CALLBACK callBack);
```

Returns

None

Description

This function sets up an alarm, allowing the client to receive a callback from the driver when the counter period elapses. Alarms can be one-shot or periodic. This API is valid only if the 16-bit mode of the timer is selected. Otherwise use DRV_TMR_Alarm32BitRegister function.

Remarks

This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_AlarmRegister" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 16-Bit timer mode if mode selection is applicable.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
//Do the initialization with 'mode' set to DRV_TMR_OPERATION_MODE_16_BIT

void setupTask ()
{
    DRV_HANDLE              tmrHandle;  // Returned from DRV_TMR_Open

    // Calculate the count to be passed on from the clock input
```

```
    //Periodically toggle LED
    DRV_TMR_Alarm16BitRegister ( tmrHandle, 0xFF40, true, 0,
                                    ToggleLedCallBack );
}

void ToggleLedCallBack ( uintptr_t context )
{
    //Toggle
}
```

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open
period	16-bit period which will be loaded into the Timer hardware register.
isPeriodic	Flag indicating whether the alarm should be one-shot or periodic.
context	A reference, call back function will be called with the same reference.
callBack	A call back function which will be called on period elapse.

Function

void DRV_TMR_Alarm16BitRegister
(
DRV_HANDLE handle,
uint16_t period,
bool isPeriodic,
uintptr_t context,
DRV_TMR_CALLBACK callBack
)

DRV_TMR_Alarm32BitRegister Function

Sets up an alarm.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Alarm32BitRegister(DRV_HANDLE handle, uint32_t period, bool isPeriodic, uintptr_t context,
DRV_TMR_CALLBACK callBack);
```

Returns

None

Description

This function sets up an alarm, allowing the client to receive a callback from the driver when the counter period elapses. Alarms can be one-shot or periodic. This API is valid only if the 32-bit mode of the timer is selected Otherwise use DRV_TMR_Alarm16BitRegister function.

Remarks

In most of the devices only even numbered instances of timer supports 32-bit mode. This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_AlarmRegister" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 32-Bit timer mode.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
//Do the initialization with 'mode' set to DRV_TMR_OPERATION_MODE_32_BIT

void setupTask ()
{
    DRV_HANDLE              tmrHandle;  // Returned from DRV_TMR_Open
```

```
    // Calculate the count to be passed on from the clock input
    //Periodically toggle LED
    DRV_TMR_Alarm32BitRegister ( tmrHandle, 0xFFFFFF00, true, 0,
                                    ToggleLedCallBack );
}

void ToggleLedCallBack ( uintptr_t context )
{
    //Toggle
}
```

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open
period	32-bit period which will be loaded into the Timer hardware register.
isPeriodic	Flag indicating whether the alarm should be one-shot or periodic.
context	A reference, call back function will be called with the same reference.
callBack	A call back function which will be called on period elapse.

Function

void DRV_TMR_Alarm32BitRegister
(
DRV_HANDLE handle,
uint32_t period,
bool isPeriodic,
uintptr_t context,
DRV_TMR_CALLBACK callBack
)

DRV_TMR_AlarmDeregister Function

Removes a previously set alarm.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_AlarmDeregister(DRV_HANDLE handle);
```

Returns

None.

Description

This function removes a previously set alarm.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

DRV_TMR_AlarmRegister function must have been called before.

Example

```
// Example of a key debounce check

static unsigned int lastReadKey, readKey, keyCount, globalKeyState;
DRV_HANDLE              tmrHandle;  // Returned from DRV_TMR_Open

void keyPressDetect ()
```

```
{
    // Calculate the count to be passed on from the clock input
    DRV_TMR_AlarmRegister ( tmrHandle, 0xFF00, true, DebounceCheck );
}

void DebounceCheck ( uintptr_t context )
{
    readKey = AppReadKey();

    if ( readKey != lastReadKey )
    {
        lastReadKey = readKey;
        keyCount = 0;
    }
    else
    {
        if ( keyCount > 20 )
        {
            globalKeyState = readKey;
            DRV_TMR_AlarmDeregister ( tmrHandle );
        }
        keyCount++;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TMR_AlarmDeregister (DRV_HANDLE handle)

DRV_TMR_AlarmPeriodGet Function

Provides the Timer's period.

Implementation: Dynamic

File

drv_tmr.h

C

```
uint32_t DRV_TMR_AlarmPeriodGet(DRV_HANDLE handle);
```

Returns

Timer period value:

- a 16 bit value if the timer is configured in 16 bit mode
- a 32 bit value if the timer is configured in 32 bit mode

Description

This function gets the Timer's period.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
uint32_t period;

period = DRV_TMR_AlarmPeriodGet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_TMR_AlarmPeriodGet (DRV_HANDLE handle)

DRV_TMR_AlarmPeriodSet Function

Updates the Timer's period.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_AlarmPeriodSet(DRV_HANDLE handle, uint32_t value);
```

Returns

None.

Description

This function updates the Timer's period.

Remarks

- The period value will be truncated to a 16 bit value if the timer is

configured in 16 bit mode.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TMR_Open

DRV_TMR_AlarmPeriodSet ( handle, 0x1000 );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
value	Period value • a 16 bit value if the timer is configured in 16 bit mode • a 32 bit value if the timer is configured in 32 bit mode

Function

void DRV_TMR_AlarmPeriodSet (DRV_HANDLE handle, uint32_t value)

DRV_TMR_AlarmRegister Function

Sets up an alarm.

Implementation: Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_AlarmRegister(DRV_HANDLE handle, uint32_t divider, bool isPeriodic, uintptr_t context,
DRV_TMR_CALLBACK callBack);
```

Returns

- true - if the call succeeded
- false - the obtained divider could not be obtained or the passed handle was invalid

Description

This function sets up an alarm, allowing the client to receive a callback from the driver when the timer counter reaches zero. Alarms can be one-shot or periodic. A periodic alarm will reload the timer and generate alarm until stopped. The alarm frequency is: DRV_TMR_CounterFrequencyGet() / divider;

Remarks

The divider value will be truncated to a 16 bit value if the timer is configured in 16 bit mode.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

divider value has to be within the timer divider range (see DRV_TMR_DividerSpecGet).

Example

```
//Do the initialization with 'mode' set to DRV_TMR_OPERATION_MODE_16_BIT

void setupTask ()
{
    DRV_HANDLE              tmrHandle;  // Returned from DRV_TMR_Open

    uint32_t myFreq = 1000; // 1KHz
    uint32_t clkFreq = DRV_TMR_CounterFrequencyGet(tmrHandle);   // timer running frequency

    // calculate the divider needed
    uint32_t divider = clkFreq / myFreq;

    // Start the alarm
    if(!DRV_TMR_AlarmRegister ( tmrHandle, divider, true, 0, CallBackFreq ))
    {
        // divider value could not be obtain;
        // handle the error
        //
    }
}
```

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open
divider	The value to divide the timer clock source to obtain the required alarm frequency. • a 16 bit value if the timer is configured in 16 bit mode • a 32 bit value if the timer is configured in 32 bit mode
isPeriodic	Flag indicating whether the alarm should be one-shot or periodic.
context	A reference, call back function will be called with the same reference.
callBack	A call back function which will be called on time out.

Function

bool DRV_TMR_AlarmRegister

(

DRV_HANDLE handle,

uint32_t divider,

bool isPeriodic,

uintptr_t context,

DRV_TMR_CALLBACK callBack

)

d) Counter Control Functions

DRV_TMR_CounterFrequencyGet Function

Provides the Timer input frequency.

Implementation: Dynamic

File

drv_tmr.h

C

```
uint32_t DRV_TMR_CounterFrequencyGet(DRV_HANDLE handle);
```

Returns

32-bit value corresponding to the running frequency. If Timer clock source is external, then this function returns 0.

Description

This function provides the Timer input frequency. Input frequency is the clock to the Timer register and it is considering the prescaler divisor.

Remarks

On most processors, the Timer's base frequency is the same as the peripheral bus clock.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
uint32_t   clkFreqHz;

clkFreqHz = DRV_TMR_CounterFrequencyGet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_TMR_CounterFrequencyGet (DRV_HANDLE handle)

DRV_TMR_CounterValue16BitGet Function

Reads the 16-bit Timer's counter register.

Implementation: Dynamic

File

drv_tmr.h

C

```
uint16_t DRV_TMR_CounterValue16BitGet(DRV_HANDLE handle);
```

Returns

Timer period in 16-bit mode.

Description

This function returns the 16-bit Timer's value in the counter register. This is valid only if the 16-bit mode of the timer is selected. Otherwise use DRV_TMR_CounterValue32BitGet function.

Remarks

This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_CounterValueGet" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 16-Bit timer mode if mode selection is applicable.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
//Example to use timer for precision time measurement
//without configuring an alarm (interrupt based)
char appState = 0;
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

switch ( appState )
{
    case 0:
        //Calculate and set the counter period
        DRV_TMR_CounterValue16BitSet ( tmrHandle, ( 0xFFFF - 0x1000 ) );

        //counter starts
        DRV_TMR_Start ( tmrHandle );

        //Trigger an application operation
        app_trigger_operation();

        //Check for time-out in the next state
        appState++;
    case 1:
        //Overflows and stops at 0 if no alarm is set
        if ( DRV_TMR_CounterValue16BitGet ( tmrHandle ) == 0 )
        {
            //Time-out
            return false;
        }
        else if ( app_operation_isComplete( ) )
        {
            //Operation is complete before time-out
            return true;
        }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint16_t DRV_TMR_CounterValue16BitGet (DRV_HANDLE handle)

DRV_TMR_CounterValue16BitSet Function

Updates the 16-bit Timer's counter register.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_CounterValue16BitSet(DRV_HANDLE handle, uint16_t counterPeriod);
```

Returns

None.

Description

This function updates the 16-bit Timer's value in the counter register. This is valid only if the 16-bit mode of the timer is selected('mode' in the INIT structure is set to DRV_TMR_OPERATION_MODE_16_BIT). Otherwise use DRV_TMR_CounterValue32BitSet function.

Remarks

This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_CounterValueSet" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 16-Bit timer mode if mode selection is applicable.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
//Example to use timer for precision time measurement
//without configuring an alarm (interrupt based)
char appState = 0;
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

switch ( appState )
{
    case 0:
        //Calculate and set the counter period
        DRV_TMR_CounterValue16BitSet ( tmrHandle, ( 0xFFFF - 0x1000 ) );

        //counter starts
        DRV_TMR_Start ( tmrHandle );

        //Trigger an application operation
        app_trigger_operation();

        //Check for time-out in the next state
        appState++;
    case 1:
        //Overflows and stops at 0 if no alarm is set
        if ( DRV_TMR_CounterValue16BitGet ( tmrHandle ) == 0 )
        {
            //Time-out
            return false;
        }
        else if ( app_operation_isComplete( ) )
        {
            //Operation is complete before time-out
            return true;
        }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
counterPeriod	16-bit counter period value

Function

void DRV_TMR_CounterValue16BitSet
(
DRV_HANDLE handle,
uint16_t counterPeriod
)

DRV_TMR_CounterValue32BitGet Function

Reads the 32-bit Timer's counter register.

Implementation: Dynamic

File

drv_tmr.h

C

```
uint32_t DRV_TMR_CounterValue32BitGet(DRV_HANDLE handle);
```

Returns

32-Bit Counter value.

Description

This function returns the 32-bit Timer's value in the counter register. This is valid only if the 32-bit mode of the timer is selected Otherwise use DRV_TMR_CounterValue16BitGet function.

Remarks

In most of the devices only even numbered instances of timer supports 32-bit mode. This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_CounterValueGet" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 32-Bit timer mode.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
//Example to use timer for precision time measurement
//without configuring an alarm (interrupt based)
char appState = 0;
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

switch ( appState )
{
    case 0:
        //Calculate and set the counter period
        DRV_TMR_CounterValue32BitSet ( tmrHandle, ( 0xFFFFFFFF - 0x23321000 ) );

        //counter starts
        DRV_TMR_Start ( tmrHandle );

        //Trigger an application operation
        app_trigger_operation();

        //Check for time-out in the next state
        appState++;
    case 1:
        //Overflows and stops at 0 if no alarm is set
        if ( DRV_TMR_CounterValue32BitGet ( tmrHandle ) == 0 )
        {
            //Time-out
            return false;
        }
        else if ( app_operation_isComplete( ) )
        {
            //Operation is complete before time-out
            return true;
        }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_TMR_CounterValue32BitGet (DRV_HANDLE handle)

DRV_TMR_CounterValue32BitSet Function

Updates the 32-bit Timer's counter register.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_CounterValue32BitSet(DRV_HANDLE handle, uint32_t counterPeriod);
```

Returns

None.

Description

This function updates the 32-bit Timer's value in the counter register. This is valid only if the 32-bit mode of the timer is selected Otherwise use DRV_TMR_CounterValue16BitSet function.

Remarks

In most of the devices only even numbered instances of timer supports 32-bit mode. This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_CounterValueSet" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 32-Bit timer mode.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
//Example to use timer for precision time measurement
//without configuring an alarm (interrupt based)
char appState = 0;
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

switch ( appState )
{
    case 0:
        //Calculate and set the counter period
        DRV_TMR_CounterValue32BitSet ( tmrHandle, ( 0xFFFFFFFF - 0xFF343100 ) );

        //counter starts
        DRV_TMR_Start ( tmrHandle );

        //Trigger an application operation against which we want to use the time-out
        app_trigger_operation();

        //Check for time-out in the next state
        appState++;
    case 1:
        //Overflows and stops at 0 if no alarm is set
        if ( DRV_TMR_CounterValue32BitGet ( tmrHandle ) == 0 )
        {
            //Time-out
            return false;
        }
        else if ( app_operation_isComplete( ) )
        {
            //Operation is complete before time-out
            return true;
        }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
counterPeriod	32-bit counter period value

Function

void DRV_TMR_CounterValue32BitSet

(

DRV_HANDLE handle,

uint32_t counterPeriod

)

DRV_TMR_CounterClear Function

Clears the Timer's counter register.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_CounterClear(DRV_HANDLE handle);
```

Returns

None.

Description

This function clears the Timer's value in the counter register.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TMR_CounterClear (DRV_HANDLE handle)

DRV_TMR_CounterValueGet Function

Reads the Timer's counter register.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
uint32_t DRV_TMR_CounterValueGet(DRV_HANDLE handle);
```

Returns

Timer current period:

- a 16 bit value if the timer is configured in 16 bit mode
- a 32 bit value if the timer is configured in 32 bit mode

Description

This function returns the Timer's value in the counter register.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
//Example to use timer for precision time measurement
//without configuring an alarm (interrupt based)
char appState = 0;
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

switch ( appState )
```

```
{
    case 0:
        //Calculate and set the counter period
        DRV_TMR_CounterValueSet ( tmrHandle, ( 0xFFFF - 0x1000 ) );

        //counter starts
        DRV_TMR_Start ( tmrHandle );

        //Trigger an application operation
        app_trigger_operation();

        //Check for time-out in the next state
        appState++;
    case 1:
        //Overflows and stops at 0 if no alarm is set
        if ( DRV_TMR_CounterValueGet ( tmrHandle ) == 0 )
        {
            //Time-out
            return false;
        }
        else if ( app_operation_isComplete( ) )
        {
            //Operation is complete before time-out
            return true;
        }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_TMR_CounterValueGet (DRV_HANDLE handle)

DRV_TMR_CounterValueSet Function

Updates the Timer's counter register.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_CounterValueSet(DRV_HANDLE handle, uint32_t counterPeriod);
```

Returns

None.

Description

This function updates the Timer's value in the counter register.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

counterPeriod	counter period value • a 16 bit value if the timer is configured in 16 bit mode • a 32 bit value if the timer is configured in 32 bit mode

Function

void DRV_TMR_CounterValueSet (DRV_HANDLE handle, uint32_t counterPeriod)

e) Miscellaneous Functions

DRV_TMR_GateModeClear Function

Enables the Gate mode.

Implementation: Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_GateModeClear(DRV_HANDLE handle);
```

Returns

- true - if the operation is successful
- false - either the handle is invalid or the gate mode is not supported

Description

This function enables the Gated mode of Timer. User can measure the duration of an external signal in this mode. Once the Gate mode is enabled, Timer will start on the raising edge of the external signal. It will keep counting until the next falling edge.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

DRV_TMR_GateModeClear ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

bool DRV_TMR_GateModeClear (DRV_HANDLE handle)

DRV_TMR_PrescalerGet Function

This function gets the currently selected prescaler.

Implementation: Dynamic

File

drv_tmr.h

C

```
TMR_PRESCALE DRV_TMR_PrescalerGet(DRV_HANDLE handle);
```

Returns

Timer prescaler.

Description

This function gets the currently selected prescaler.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
TMR_PRESCALE preScale;

preScale = DRV_TMR_PrescalerGet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

TMR_PRESCALE DRV_TMR_PrescalerGet (DRV_HANDLE handle)

DRV_TMR_OperationModeGet Function

This function gets the currently selected operation mode.

Implementation: Dynamic

File

drv_tmr.h

C

```
DRV_TMR_OPERATION_MODE DRV_TMR_OperationModeGet(DRV_HANDLE handle);
```

Returns

A DRV_TMR_OPERATION_MODE value showing how the timer is currently configured. DRV_TMR_OPERATION_MODE_NONE is returned for an invalid client handle.

Description

This function gets the currently selected 16/32 bit operation mode.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
DRV_TMR_OPERATION_MODE operMode;

operMode = DRV_TMR_OperationModeGet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_TMR_OPERATION_MODE DRV_TMR_OperationModeGet(DRV_HANDLE handle)

DRV_TMR_DividerRangeGet Function

Returns the Timer divider values.

Implementation: Dynamic

File

drv_tmr.h

C

```
DRV_TMR_OPERATION_MODE DRV_TMR_DividerRangeGet(DRV_HANDLE handle, DRV_TMR_DIVIDER_RANGE* pDivRange);
```

Returns

- A DRV_TMR_OPERATION_MODE value showing how the timer is currently configured. The pDivRange is updated with the supported range values.
- DRV_TMR_OPERATION_MODE_NONE for invalid client handle

Description

This function provides the Timer operating mode and divider range.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
DRV_TMR_OPERATION_MODE  timerMode;
DRV_TMR_DIVIDER_RANGE   timerRange;

DRV_TMR_DividerRangeGet(handle, &timerRange);
uint32_t   clkFreqHz = DRV_TMR_CounterFrequencyGet ( tmrHandle );

uint32_t    maxFreqHz = clkFreqHz / timerRange.dividerMin;
uint32_t    minFreqHz = clkFreqHz / timerRange.dividerMax;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
pDivRange	Address to store the timer divider range.

Function

```
DRV_TMR_OPERATION_MODE DRV_TMR_DividerRangeGet
(
    DRV_HANDLE handle,
    DRV_TMR_DIVIDER_RANGE* pDivRange
)
```

DRV_TMR_Tasks_ISR Function

Maintains the driver's state machine, processes the events and implements its ISR.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Tasks_ISR(SYS_MODULE_OBJ object);
```

Returns

None

Description

This function is used to maintain the driver's internal state machine and processes the timer events in interrupt-driven implementations (DRV_TMR_INTERRUPT_MODE == true).

Remarks

This function is normally not called directly by an application. It is called by the timer driver raw ISR.

This function will execute in an ISR context and will never block or access any resources that may cause it to block.

This function will be deprecated later, so avoid using it as much as possible. Use generic function "DRV_TMR_Tasks" instead of this.

Preconditions

The DRV_TMR_Initialize function must have been called for the specified Timer driver instance.

Example

```
void __ISR(_TIMER_2_VECTOR, ipl4) _InterruptHandler_TMR2(void)
{
    DRV_TMR_Tasks_ISR(appDrvObjects.drvTmrObject);
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TMR_Initialize)

Function

void DRV_TMR_Tasks_ISR (SYS_MODULE_OBJ object)

f) Data Types and Constants

DRV_TMR_CALLBACK Type

Pointer to a Timer driver callback function data type.

File

drv_tmr.h

C

```
typedef void (* DRV_TMR_CALLBACK)(uintptr_t context, uint32_t alarmCount);
```

Description

Timer Driver Callback Function Pointer

This data type defines a pointer to a Timer driver callback function.

Remarks

Useful only when timer alarm callback support is enabled by defining the DRV_TMR_ALARM_ENABLE configuration option.

DRV_TMR_INIT Structure

Defines the Timer driver initialization data.

File

drv_tmr.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  TMR_MODULE_ID tmrId;
  DRV_TMR_CLK_SOURCES clockSource;
  TMR_PRESCALE prescale;
```

```
  INT_SOURCE interruptSource;
  DRV_TMR_OPERATION_MODE mode;
  bool asyncWriteEnable;
} DRV_TMR_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization.
TMR_MODULE_ID tmrId;	Identifies timer hardware module (PLIB-level) ID
DRV_TMR_CLK_SOURCES clockSource;	Clock Source select.
TMR_PRESCALE prescale;	Prescaler Selection from the processor enumeration
INT_SOURCE interruptSource;	Interrupt Source for TMR module. If 'DRV_TMR_OPERATION_MODE_32_BIT' flag is selected the interrupt will be generated by the 2nd timer of the pair, the odd numbered one.
DRV_TMR_OPERATION_MODE mode;	Select 16/32 bit operation mode. 32 bit mode will combine two 16 bit timer modules to form a 32 bit one. This is usually only necessary for very long delays.
bool asyncWriteEnable;	Asynchronous write enable configuration. If true the asynchronous write is enabled. For timers that do not support this feature the value is ignored

Description

Timer Driver Initialize Data

This data type defines data required to initialize the Timer driver.

Remarks

Not all initialization features are available on all devices.

DRV_TMR_CLIENT_STATUS Enumeration

Identifies the client-specific status of the Timer driver

File

drv_tmr.h

C

```
typedef enum {
  DRV_TMR_CLIENT_STATUS_INVALID,
  DRV_TMR_CLIENT_STATUS_BUSY,
  DRV_TMR_CLIENT_STATUS_READY,
  DRV_TMR_CLIENT_STATUS_RUNNING
} DRV_TMR_CLIENT_STATUS;
```

Members

Members	Description
DRV_TMR_CLIENT_STATUS_INVALID	Driver is invalid (or unopened) state
DRV_TMR_CLIENT_STATUS_BUSY	An operation is currently in progress
DRV_TMR_CLIENT_STATUS_READY	Ready, no operations running
DRV_TMR_CLIENT_STATUS_RUNNING	Timer started and running, processing transactions

Description

Timer Driver Client Status

This enumeration identifies the client-specific status of the Timer driver.

Remarks

None.

DRV_TMR_CLK_SOURCES Enumeration

Lists the clock sources available for timer driver.

File

drv_tmr.h

C

```
typedef enum {
  DRV_TMR_CLKSOURCE_INTERNAL,
  DRV_TMR_CLKSOURCE_EXTERNAL_SYNCHRONOUS,
  DRV_TMR_CLKSOURCE_EXTERNAL_ASYNCHRONOUS,
  DRV_TMR_CLKSOURCE_SECONDARY_OSCILLATOR_SYNCHRONOUS,
  DRV_TMR_CLKSOURCE_SECONDARY_OSCILLATOR_ASYNCHRONOUS,
  DRV_TMR_CLKSOURCE_LPRC_OSCILLATOR_SYNCHRONOUS,
  DRV_TMR_CLKSOURCE_LPRC_OSCILLATOR_ASYNCHRONOUS
} DRV_TMR_CLK_SOURCES;
```

Members

Members	Description
DRV_TMR_CLKSOURCE_INTERNAL	Clock input to the timer module is internal(Peripheral Clock)
DRV_TMR_CLKSOURCE_EXTERNAL_SYNCHRONOUS	Clock input to the timer module is from T1CK pin (external) with clock synchronization enabled
DRV_TMR_CLKSOURCE_EXTERNAL_ASYNCHRONOUS	Clock input to the timer module is from T1CK pin (external) with clock synchronization disabled
DRV_TMR_CLKSOURCE_SECONDARY_OSCILLATOR_SYNCHRONOUS	Clock input to the timer module is from secondary oscillator (external) with clock synchronization enabled
DRV_TMR_CLKSOURCE_SECONDARY_OSCILLATOR_ASYNCHRONOUS	Clock input to the timer module is from secondary oscillator (external) with clock synchronization disabled
DRV_TMR_CLKSOURCE_LPRC_OSCILLATOR_SYNCHRONOUS	Clock input to the timer module is from LPRC with clock synchronization enabled
DRV_TMR_CLKSOURCE_LPRC_OSCILLATOR_ASYNCHRONOUS	Clock input to the timer module is from LPRC with clock synchronization disabled

Description

Timer Driver Clock sources

This enumeration lists all the available clock sources for the timer hardware.

Remarks

Not all modes are available on all devices.

'Synchronization' may not be applicable for all the instances of the timer. The driver discards the Synchronization mode selected if it is not applicable for the selected hardware.

DRV_TMR_DIVIDER_RANGE Structure

This data structure specifies the divider values that can be obtained by the timer module.

File

drv_tmr.h

C

```
typedef struct {
  uint32_t dividerMin;
  uint32_t dividerMax;
  uint32_t dividerStep;
} DRV_TMR_DIVIDER_RANGE;
```

Members

Members	Description
uint32_t dividerMin;	The minimum divider value that the timer module can obtain
uint32_t dividerMax;	The maximum divider value that the timer module can obtain
uint32_t dividerStep;	The divider step value, between 2 divider values Should be 1 for most timers

Description

Timer Driver divider operating specification

This data structure specifies the divider values that can be obtained by the timer hardware.

Remarks

None.

DRV_TMR_OPERATION_MODE Enumeration

Lists the operation modes available for timer driver.

File

drv_tmr.h

C

```
typedef enum {
  DRV_TMR_OPERATION_MODE_NONE,
  DRV_TMR_OPERATION_MODE_16_BIT,
  DRV_TMR_OPERATION_MODE_32_BIT
} DRV_TMR_OPERATION_MODE;
```

Members

Members	Description
DRV_TMR_OPERATION_MODE_NONE	The timer module operating mode none/invalid
DRV_TMR_OPERATION_MODE_16_BIT	The timer module operates in 16 bit mode
DRV_TMR_OPERATION_MODE_32_BIT	The timer module operates in 32 bit mode This will combine two 16 bit timer modules

Description

Timer Driver Operation mode

This enumeration lists all the available operation modes that are valid for the timer hardware.

Remarks

Not all modes are available on all devices.

DRV_TMR_INDEX_COUNT Macro

Number of valid Timer driver indices.

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_COUNT TMR_NUMBER_OF_MODULES
```

Description

Timer Driver Module Index Count

This constant identifies Timer driver index definitions.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is device-specific.

DRV_TMR_INDEX_0 Macro

Timer driver index definitions

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_0 0
```

Description

Timer Driver Module Index Numbers

These constants provide Timer driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_TMR_Initialize and DRV_TMR_Open functions to identify the driver instance in use.

DRV_TMR_INDEX_1 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_1 1
```

Description

This is macro DRV_TMR_INDEX_1.

DRV_TMR_INDEX_2 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_2 2
```

Description

This is macro DRV_TMR_INDEX_2.

DRV_TMR_INDEX_3 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_3 3
```

Description

This is macro DRV_TMR_INDEX_3.

DRV_TMR_INDEX_4 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_4 4
```

Description

This is macro DRV_TMR_INDEX_4.

DRV_TMR_INDEX_5 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_5 5
```

Description

This is macro DRV_TMR_INDEX_5.

DRV_TMR_INDEX_6 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_6 6
```

Description

This is macro DRV_TMR_INDEX_6.

DRV_TMR_INDEX_7 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_7 7
```

Description

This is macro DRV_TMR_INDEX_7.

DRV_TMR_INDEX_8 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_8 8
```

Description

This is macro DRV_TMR_INDEX_8.

DRV_TMR_INDEX_9 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_9 9
```

Description

This is macro DRV_TMR_INDEX_9.

Files

Files

drv_tmr.h

Timer device driver interface header file.

Enumerations

	Name	Description
	DRV_TMR_CLIENT_STATUS	Identifies the client-specific status of the Timer driver
	DRV_TMR_CLK_SOURCES	Lists the clock sources available for timer driver.
	DRV_TMR_OPERATION_MODE	Lists the operation modes available for timer driver.

Functions

	Name	Description
	DRV_TMR_Alarm16BitDeregister	Removes a previously set alarm. **Implementation:** Dynamic
	DRV_TMR_Alarm16BitRegister	Sets up an alarm. **Implementation:** Dynamic
	DRV_TMR_Alarm32BitDeregister	Removes a previously set alarm. **Implementation:** Dynamic
	DRV_TMR_Alarm32BitRegister	Sets up an alarm. **Implementation:** Dynamic
	DRV_TMR_AlarmDeregister	Removes a previously set alarm. **Implementation:** Dynamic
	DRV_TMR_AlarmDisable	Disables an alarm signal. **Implementation:** Dynamic
	DRV_TMR_AlarmEnable	Re-enables an alarm signal. **Implementation:** Dynamic
	DRV_TMR_AlarmHasElapsed	Provides the status of Timer's period elapse. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriod16BitGet	Provides the 16-bit Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriod16BitSet	Updates the 16-bit Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriod32BitGet	Provides the 32-bit Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriod32BitSet	Updates the 32-bit Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriodGet	Provides the Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriodSet	Updates the Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmRegister	Sets up an alarm. **Implementation:** Dynamic
	DRV_TMR_ClientStatus	Gets the status of the client operation. **Implementation:** Dynamic
	DRV_TMR_ClockSet	Sets the timers clock by selecting the source and prescaler. **Implementation:** Dynamic
	DRV_TMR_Close	Closes an opened instance of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_CounterClear	Clears the Timer's counter register. **Implementation:** Static/Dynamic
	DRV_TMR_CounterFrequencyGet	Provides the Timer input frequency. **Implementation:** Dynamic
	DRV_TMR_CounterValue16BitGet	Reads the 16-bit Timer's counter register. **Implementation:** Dynamic
	DRV_TMR_CounterValue16BitSet	Updates the 16-bit Timer's counter register. **Implementation:** Dynamic
	DRV_TMR_CounterValue32BitGet	Reads the 32-bit Timer's counter register. **Implementation:** Dynamic
	DRV_TMR_CounterValue32BitSet	Updates the 32-bit Timer's counter register. **Implementation:** Dynamic

	DRV_TMR_CounterValueGet	Reads the Timer's counter register. **Implementation:** Static/Dynamic
	DRV_TMR_CounterValueSet	Updates the Timer's counter register. **Implementation:** Static/Dynamic
	DRV_TMR_Deinitialize	Deinitializes the specified instance of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_DividerRangeGet	Returns the Timer divider values. **Implementation:** Dynamic
	DRV_TMR_GateModeClear	Enables the Gate mode. **Implementation:** Dynamic
	DRV_TMR_GateModeSet	Enables the Gate mode. **Implementation:** Dynamic
	DRV_TMR_Initialize	Initializes the Timer driver. **Implementation:** Static/Dynamic
	DRV_TMR_Open	Opens the specified Timer driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_TMR_OperationModeGet	This function gets the currently selected operation mode. **Implementation:** Dynamic
	DRV_TMR_PrescalerGet	This function gets the currently selected prescaler. **Implementation:** Dynamic
	DRV_TMR_Start	Starts the Timer counting. **Implementation:** Static/Dynamic
	DRV_TMR_Status	Provides the current status of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_Stop	Stops the Timer from counting. **Implementation:** Static/Dynamic
	DRV_TMR_Tasks	Maintains the driver's state machine. **Implementation:** Dynamic
	DRV_TMR_Tasks_ISR	Maintains the driver's state machine, processes the events and implements its ISR. **Implementation:** Dynamic

Touch Driver Libraries Help

This section describes the Touch Driver Libraries.

10-bit ADC Touch Driver Library

This topic describes the 10-bit ADC Touch Driver Library.

Introduction

This library provides an interface to manage the 10-bit ADC Touch Driver module on the Microchip family of microcontrollers in different modes of operation.

Description

The MPLAB Harmony 10-bit ADC Touch Driver provides a high-level interface to the 10-bit ADC touch device. This driver provides application routines to read non-gestural single-point touch input data from the touch screen. The 10-bit ADC touch device can notify the availability of touch input data through external interrupt. The 10-bit ADC Touch Driver allows the application to map a controller pin as an external interrupt pin.

Using the Library

This topic describes the basic architecture of the 10-bit ADC Touch Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_adc10bit.h`

The interface to the 10-bit ADC Touch Driver library is defined in the `drv_adc10bit.h` header file. Any C language source (`.c`) file that uses the ADC 10-bit Touch Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the 10-bit ADC Touch Driver module.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, open, close, task, and status functions.

Configuring the Library

Macros

	Name	Description
	DRV_ADC10BIT_CALIBRATION_DELAY	Defines the calibration delay.
	DRV_ADC10BIT_CALIBRATION_INSET	Defines the calibration inset.
	DRV_ADC10BIT_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_ADC10BIT_INDEX	ADC10BIT static index selection.
	DRV_ADC10BIT_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_ADC10BIT_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_ADC10BIT_SAMPLE_POINTS	Defines the sample points.
	DRV_ADC10BIT_TOUCH_DIAMETER	Defines the touch diameter.

Description

The configuration of the 10-bit ADC Touch Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the ADC 10-bit Touch Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the 10-bit ADC Touch Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_ADC10BIT_CALIBRATION_DELAY Macro

Defines the calibration delay.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_CALIBRATION_DELAY 300
```

Description

ADC10BIT Calibration Delay

This macro enables the delay between calibration touch points.

Remarks

None.

DRV_ADC10BIT_CALIBRATION_INSET Macro

Defines the calibration inset.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_CALIBRATION_INSET 25
```

Description

ADC10BIT Calibration Inset

This macro defines the calibration inset.

Remarks

None.

DRV_ADC10BIT_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_CLIENTS_NUMBER 1
```

Description

ADC10BIT client number

This macro selects the maximum number of clients.

This definition selected the maximum number of clients that the ADC10BIT driver can support at run-time.

Remarks

None.

DRV_ADC10BIT_INDEX Macro

ADC10BIT static index selection.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_INDEX DRV_ADC10BIT_INDEX_0
```

Description

ADC10BIT Static Index Selection

This macro specifies the static index selection for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

DRV_ADC10BIT_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_INSTANCES_NUMBER 1
```

Description

ADC10BIT hardware instance configuration

This macro sets up the maximum number of hardware instances that can be supported.

Remarks

None.

DRV_ADC10BIT_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_INTERRUPT_MODE false
```

Description

ADC10BIT Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of ADC10BIT operation is desired
- false - Select if polling mode of ADC10BIT operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

DRV_ADC10BIT_SAMPLE_POINTS Macro

Defines the sample points.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_SAMPLE_POINTS 4
```

Description

ADC10BIT Sample Points

This macro defines the sample points.

Remarks

None.

DRV_ADC10BIT_TOUCH_DIAMETER Macro

Defines the touch diameter.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_TOUCH_DIAMETER 10
```

Description

ADC10BIT Touch Diameter

This macro defines the touch diameter.

Remarks

None.

Building the Library

This section lists the files that are available in the 10-bit ADC Touch Driver Library.

Description

This section list the files that are available in the `\src` folder of the 10-bit ADC Touch Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/touch/adc10bit`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_adc10bit.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/drv_adc10bit.c`	Basic 10-bit ADC Touch Driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The 10-bit ADC Touch Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library
- Touch System Service Library
- I2C Driver Library

Library Interface

a) System Functions

	Name	Description
	DRV_TOUCH_ADC10BIT_CalibrationSet	Loads calibration parameters from Non-volatile Memory.
	DRV_TOUCH_ADC10BIT_Close	Closes an opened instance of the 10-bit ADC Driver.
	DRV_TOUCH_ADC10BIT_Deinitialize	Deinitializes the specified instance of the ADC10BIT driver module.
	DRV_TOUCH_ADC10BIT_Initialize	Initializes the 10-bit ADC Driver instance for the specified driver index
	DRV_TOUCH_ADC10BIT_Open	Opens the specified ADC10BIT driver instance and returns a handle to it.
	DRV_TOUCH_ADC10BIT_Status	Provides the current status of the ADC10BIT driver module.
	DRV_TOUCH_ADC10BIT_Tasks	Maintains the driver's state machine and implements its ISR.
	DRV_TOUCH_ADC10BIT_TouchGetRawX	Returns raw x coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchGetRawY	Returns raw y coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchGetX	Returns x coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchStoreCalibration	Stores calibration parameters into Non-volatile Memory.
	DRV_TOUCH_ADC10BIT_PositionDetect	None.
	DRV_TOUCH_ADC10BIT_TouchGetY	Returns y coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchDataRead	Notifies the driver that the current touch data has been read

	DRV_TOUCH_ADC10BIT_TouchStatus	Returns the status of the current touch input.

b) Data Types and Constants

	Name	Description
	_DRV_TOUCH_ADC10BIT_CLIENT_DATA	Defines the data that can be changed per client.
	_DRV_TOUCH_ADC10BIT_INIT	Defines the data required to initialize or reinitialize the 10-bit ADC Driver.
	DRV_ADC10BIT_MODULE_ID	This is type DRV_ADC10BIT_MODULE_ID.
	DRV_TOUCH_ADC10BIT_CLIENT_DATA	Defines the data that can be changed per client.
	DRV_TOUCH_ADC10BIT_HANDLE	Driver handle.
	DRV_TOUCH_ADC10BIT_INIT	Defines the data required to initialize or reinitialize the 10-bit ADC Driver.
	DRV_TOUCH_ADC10BIT_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_ADC10BIT_INDEX_0	ADC10BIT driver index definitions.
	DRV_TOUCH_ADC10BIT_INDEX_1	This is macro DRV_TOUCH_ADC10BIT_INDEX_1.
	DRV_TOUCH_ADC10BIT_INDEX_COUNT	Number of valid ADC10BIT driver indices.

Description

This section describes the API functions of the 10-bit ADC Touch Driver library.

Refer to each section for a detailed description.

a) System Functions

DRV_TOUCH_ADC10BIT_CalibrationSet Function

Loads calibration parameters from Non-volatile Memory.

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_CalibrationSet(DRV_TOUCH_SAMPLE_POINTS * samplePoints);
```

Returns

None.

Description

This function loads calibration parameters from Non-volatile Memory.

Preconditions

The NVM initialization function must be called before calling this function.

Function

void DRV_TOUCH_ADC10BIT_TouchLoadCalibration(void)

DRV_TOUCH_ADC10BIT_Close Function

Closes an opened instance of the 10-bit ADC Driver.

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the 10-bit ADC Driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_TOUCH_ADC10BIT_Open before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

DRV_TOUCH_ADC10BIT_Initialize must have been called for the specified ADC10BIT driver instance.

DRV_TOUCH_ADC10BIT_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TOUCH_ADC10BIT_Open

DRV_TOUCH_ADC10BIT_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TOUCH_ADC10BIT_Close (DRV_HANDLE handle)

DRV_TOUCH_ADC10BIT_Deinitialize Function

Deinitializes the specified instance of the ADC10BIT driver module.

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function deinitializes the specified instance of the 10-bit ADC Driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_TOUCH_ADC10BIT_Status operation. The system has to use DRV_TOUCH_ADC10BIT_Status to determine when the module is in the ready state.

Preconditions

DRV_TOUCH_ADC10BIT_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_TOUCH_ADC10BIT_Initialize
SYS_STATUS          status;

DRV_TOUCH_ADC10BIT_Deinitialize ( object );

status = DRV_TOUCH_ADC10BIT_Status( object );
if( SYS_MODULE_UNINITIALIZED == status )
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TOUCH_ADC10BIT_Initialize

Function

void DRV_TOUCH_ADC10BIT_Deinitialize (SYS_MODULE_OBJ object)

DRV_TOUCH_ADC10BIT_Initialize Function

Initializes the 10-bit ADC Driver instance for the specified driver index

File

drv_adc10bit.h

C

```
SYS_MODULE_OBJ DRV_TOUCH_ADC10BIT_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const
init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the 10-bit ADC Driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the 'init' parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the 10-bit ADC Driver module ID. For example, driver instance 0 can be assigned to ADC10BIT2. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_TOUCH_ADC10BIT_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other ADC10BIT routine is called.

This routine should only be called once during system initialization unless DRV_TOUCH_ADC10BIT_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
DRV_TOUCH_ADC10BIT_INIT        init;
SYS_MODULE_OBJ      objectHandle;

// Populate the ADC10BIT initialization structure
init.spiId              = ADC10BIT_ID_1;

objectHandle = DRV_TOUCH_ADC10BIT_Initialize(DRV_TOUCH_ADC10BIT_INDEX_1, (SYS_MODULE_INIT*)usartInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized. Please note this is not the 10-bit ADC Driver ID. The hardware 10-bit ADC Driver ID is set in the initialization structure. This is the index of the driver index to use.
init	Pointer to a data structure containing any data necessary to initialize the driver. If this pointer is NULL, the driver uses the static initialization override macros for each member of the initialization data structure.

Function

SYS_MODULE_OBJ DRV_TOUCH_ADC10BIT_Initialize(const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init)

DRV_TOUCH_ADC10BIT_Open Function

Opens the specified ADC10BIT driver instance and returns a handle to it.

File

drv_adc10bit.h

C

```
DRV_HANDLE DRV_TOUCH_ADC10BIT_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. An error can occur when the following is true:

- if the number of client objects allocated via DRV_TOUCH_ADC10BIT_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid

Description

This function opens the specified USART driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The DRV_IO_INTENT_BLOCKING and DRV_IO_INTENT_NONBLOCKING ioIntent options additionally affect the behavior of the DRV_USART_Read() and DRV_USART_Write() functions. If the ioIntent is DRV_IO_INTENT_NONBLOCKING, then these function will not block even if the required amount of data could not be processed. If the ioIntent is DRV_IO_INTENT_BLOCKING, these functions will block until the required amount of data is processed.

If ioIntent is DRV_IO_INTENT_READ, the client will only be read from the driver. If ioIntent is DRV_IO_INTENT_WRITE, the client will only be able to write to the driver. If the ioIntent in DRV_IO_INTENT_READWRITE, the client will be able to do both, read and write.

Specifying a DRV_IO_INTENT_EXCLUSIVE will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Remarks

The handle returned is valid until the DRV_TOUCH_ADC10BIT_Close routine is called. This routine will NEVER block waiting for hardware. If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

DRV_TOUCH_ADC10BIT_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_TOUCH_ADC10BIT_Open( DRV_TOUCH_ADC10BIT_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Index of the driver initialized with DRV_TOUCH_ADC10BIT_Initialize. Please note this is not the SPI id.
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_TOUCH_ADC10BIT_Open (const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent)

DRV_TOUCH_ADC10BIT_Status Function

Provides the current status of the ADC10BIT driver module.

File

drv_adc10bit.h

C

```
SYS_STATUS DRV_TOUCH_ADC10BIT_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Description

This function provides the current status of the ADC10BIT driver module.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

This function can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

DRV_TOUCH_ADC10BIT_Initialize must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TOUCH_ADC10BIT_Initialize
SYS_STATUS          status;

status = DRV_TOUCH_ADC10BIT_Status( object );
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TOUCH_ADC10BIT_Initialize

Function

SYS_STATUS DRV_TOUCH_ADC10BIT_Status (SYS_MODULE_OBJ object)

DRV_TOUCH_ADC10BIT_Tasks Function

Maintains the driver's state machine and implements its ISR.

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal state machine and implement its transmit ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks function. In Interrupt mode, this function should be called in the transmit interrupt service routine of the USART that is associated with this USART driver hardware instance.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR. This function may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

DRV_TOUCH_ADC10BIT_Initialize must have been called for the specified 10-bit ADC Driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TOUCH_ADC10BIT_Initialize

while( true )
{
    DRV_TOUCH_ADC10BIT_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TOUCH_ADC10BIT_Initialize)

Function

void DRV_TOUCH_ADC10BIT_Tasks (SYS_MODULE_OBJ object);

DRV_TOUCH_ADC10BIT_TouchGetRawX Function

Returns raw x coordinate status when the touch screen is pressed.

File

drv_adc10bit.h

C

```
short DRV_TOUCH_ADC10BIT_TouchGetRawX();
```

Returns

- raw x coordinate - Indicates the touch screen was pressed
- -1 - Indicates the touch screen was not pressed

Description

This function returns the raw x coordinate status when the touch screen is pressed.

Remarks

None.

Preconditions

None.

Function

short DRV_TOUCH_ADC10BIT_TouchGetRawX()

DRV_TOUCH_ADC10BIT_TouchGetRawY Function

Returns raw y coordinate status when the touch screen is pressed.

File

drv_adc10bit.h

C

```
short DRV_TOUCH_ADC10BIT_TouchGetRawY();
```

Returns

- raw y coordinate - Indicates the touch screen was pressed
- -1 - Indicates the touch screen was not pressed

Description

This function returns the raw y coordinate status when the touch screen is pressed.

Remarks

None.

Preconditions

None.

Function

short DRV_TOUCH_ADC10BIT_TouchGetRawY()

DRV_TOUCH_ADC10BIT_TouchGetX Function

Returns x coordinate status when the touch screen is pressed.

File

drv_adc10bit.h

C

```
short DRV_TOUCH_ADC10BIT_TouchGetX(uint8_t touchNumber);
```

Returns

- x coordinate - Indicates the touch screen was pressed
- -1 - Indicates the touch screen was not pressed

Description

This function returns the x coordinate status when the touch screen is pressed.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
touchNumber	touch input index.

Function

short DRV_TOUCH_ADC10BIT_TouchGetX(uint8_t touchNumber)

DRV_TOUCH_ADC10BIT_TouchStoreCalibration Function

Stores calibration parameters into Non-volatile Memory.

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_TouchStoreCalibration();
```

Returns

None.

Description

This function stores calibration parameters into Non-volatile Memory.

Remarks

This API is deprecated and its funcationality is handled via SYSTEM_INITIALIZATION

Preconditions

The NVM initialization function must be called before calling this function.

Function

void DRV_TOUCH_ADC10BIT_TouchStoreCalibration(void)

DRV_TOUCH_ADC10BIT_PositionDetect Function

None.

File

drv_adc10bit.h

C

```
short DRV_TOUCH_ADC10BIT_PositionDetect();
```

Returns

None.

Description

None.

Preconditions

None.

Function

void DRV_TOUCH_ADC10BIT_TouchLoadCalibration(void)

DRV_TOUCH_ADC10BIT_TouchGetY Function

Returns y coordinate status when the touch screen is pressed.

File

drv_adc10bit.h

C

```
short DRV_TOUCH_ADC10BIT_TouchGetY(uint8_t touchNumber);
```

Returns

- y coordinate - Indicates the touch screen was pressed
- -1 - Indicates the touch screen was not pressed

Description

This function returns the y coordinate status when the touch screen is pressed.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
handle	driver client handle.
touchNumber	touch input index.

Function

short DRV_TOUCH_ADC10BIT_TouchGetY(DRV_HANDLE handle, uint8_t touchNumber)

DRV_TOUCH_ADC10BIT_TouchDataRead Function

Notifies the driver that the current touch data has been read

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_TouchDataRead(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

Notifies the driver that the current touch data has been read

Function

void DRV_TOUCH_ADC10BIT_TouchDataRead(const SYS_MODULE_INDEX index)

DRV_TOUCH_ADC10BIT_TouchStatus Function

Returns the status of the current touch input.

File

drv_adc10bit.h

C

```
DRV_TOUCH_POSITION_STATUS DRV_TOUCH_ADC10BIT_TouchStatus(const SYS_MODULE_INDEX index);
```

Returns

It returns the status of the current touch input.

Description

It returns the status of the current touch input.

Function

DRV_TOUCH_POSITION_SINGLE DRV_TOUCH_ADC10BIT_TouchStatus(const SYS_MODULE_INDEX index)

b) Data Types and Constants

DRV_ADC10BIT_MODULE_ID Enumeration

File

drv_adc10bit.h

C

```
typedef enum {
  ADC10BIT_ID_1 = 0,
  ADC10BIT_NUMBER_OF_MODULES
} DRV_ADC10BIT_MODULE_ID;
```

Description

This is type DRV_ADC10BIT_MODULE_ID.

DRV_TOUCH_ADC10BIT_CLIENT_DATA Structure

Defines the data that can be changed per client.

File

drv_adc10bit.h

C

```
typedef struct _DRV_TOUCH_ADC10BIT_CLIENT_DATA {
} DRV_TOUCH_ADC10BIT_CLIENT_DATA;
```

Description

Macro: ADC10BIT Driver Client Specific Configuration

This data type defines the data can be configured per client. This data can be per client, and overrides the configuration data contained inside of DRV_TOUCH_ADC10BIT_INIT.

Remarks

None.

DRV_TOUCH_ADC10BIT_HANDLE Type

Driver handle.

File

drv_adc10bit.h

C

```
typedef uintptr_t DRV_TOUCH_ADC10BIT_HANDLE;
```

Description

Macro: ADC10BIT Driver Handle

Touch screen controller interfacing with the 10-bit Analog-to-Digital (ADC) converter device.

Remarks

None

DRV_TOUCH_ADC10BIT_INIT Structure

Defines the data required to initialize or reinitialize the 10-bit ADC Driver.

File

drv_adc10bit.h

C

```
typedef struct _DRV_TOUCH_ADC10BIT_INIT {
  SYS_MODULE_INIT moduleInit;
  DRV_ADC10BIT_MODULE_ID adc10bitId;
} DRV_TOUCH_ADC10BIT_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
DRV_ADC10BIT_MODULE_ID adc10bitId;	Identifies peripheral (PLIB-level) ID

Description

Macro: ADC10BIT Driver Initialization Data

This data type defines the data required to initialize or reinitialize the 10-bit ADC Driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

DRV_TOUCH_ADC10BIT_HANDLE_INVALID Macro

Definition of an invalid handle.

File

drv_adc10bit.h

C

```
#define DRV_TOUCH_ADC10BIT_HANDLE_INVALID ((DRV_TOUCH_ADC10BIT_HANDLE)(-1))
```

Description

Macro: ADC10BIT Driver Invalid Handle

This is the definition of an invalid handle. An invalid handle is returned by DRV_ADC10BIT_RawRead and DRV_ADC10BIT_RawRead functions if the request was not successful.

Remarks

None.

DRV_TOUCH_ADC10BIT_INDEX_0 Macro

ADC10BIT driver index definitions.

File

drv_adc10bit.h

C

```
#define DRV_TOUCH_ADC10BIT_INDEX_0 0
```

Description

Macro: ADC10BIT Driver Module Index Numbers

These constants provide the 10-bit ADC Driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_ADC10BIT_Initialize and DRV_ADC10BIT_Open functions to identify the driver instance in use.

DRV_TOUCH_ADC10BIT_INDEX_1 Macro

File

drv_adc10bit.h

C

```
#define DRV_TOUCH_ADC10BIT_INDEX_1 1
```

Description

This is macro DRV_TOUCH_ADC10BIT_INDEX_1.

DRV_TOUCH_ADC10BIT_INDEX_COUNT Macro

Number of valid ADC10BIT driver indices.

File

drv_adc10bit.h

C

```
#define DRV_TOUCH_ADC10BIT_INDEX_COUNT 2
```

Description

Macro: ADC10BIT Driver Module Index Count

This constant identifies the number of valid 10-bit ADC Driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

Files

Name	Description
drv_adc10bit.h	10-bit ADC Touch Driver interface definitions
drv_adc10bit_config_template.h	10-bit ADC Touch Driver configuration template.

Description

This section lists the source and header files used by the 10-bit ADC Touch Driver Library.

drv_adc10bit.h

10-bit ADC Touch Driver interface definitions

Enumerations

	Name	Description
	DRV_ADC10BIT_MODULE_ID	This is type DRV_ADC10BIT_MODULE_ID.

Functions

	Name	Description
	DRV_TOUCH_ADC10BIT_CalibrationSet	Loads calibration parameters from Non-volatile Memory.
	DRV_TOUCH_ADC10BIT_Close	Closes an opened instance of the 10-bit ADC Driver.
	DRV_TOUCH_ADC10BIT_Deinitialize	Deinitializes the specified instance of the ADC10BIT driver module.
	DRV_TOUCH_ADC10BIT_Initialize	Initializes the 10-bit ADC Driver instance for the specified driver index
	DRV_TOUCH_ADC10BIT_Open	Opens the specified ADC10BIT driver instance and returns a handle to it.
	DRV_TOUCH_ADC10BIT_PositionDetect	None.
	DRV_TOUCH_ADC10BIT_Status	Provides the current status of the ADC10BIT driver module.
	DRV_TOUCH_ADC10BIT_Tasks	Maintains the driver's state machine and implements its ISR.
	DRV_TOUCH_ADC10BIT_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_TOUCH_ADC10BIT_TouchGetRawX	Returns raw x coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchGetRawY	Returns raw y coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchGetX	Returns x coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchGetY	Returns y coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchStatus	Returns the status of the current touch input.
	DRV_TOUCH_ADC10BIT_TouchStoreCalibration	Stores calibration parameters into Non-volatile Memory.

Macros

	Name	Description
	DRV_TOUCH_ADC10BIT_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_ADC10BIT_INDEX_0	ADC10BIT driver index definitions.
	DRV_TOUCH_ADC10BIT_INDEX_1	This is macro DRV_TOUCH_ADC10BIT_INDEX_1.
	DRV_TOUCH_ADC10BIT_INDEX_COUNT	Number of valid ADC10BIT driver indices.

Structures

	Name	Description
	_DRV_TOUCH_ADC10BIT_CLIENT_DATA	Defines the data that can be changed per client.
	_DRV_TOUCH_ADC10BIT_INIT	Defines the data required to initialize or reinitialize the 10-bit ADC Driver.

	DRV_TOUCH_ADC10BIT_CLIENT_DATA	Defines the data that can be changed per client.
	DRV_TOUCH_ADC10BIT_INIT	Defines the data required to initialize or reinitialize the 10-bit ADC Driver.

Types

	Name	Description
	DRV_TOUCH_ADC10BIT_HANDLE	Driver handle.

Description

10-bit ADC Touch Driver Interface Definition

This is a resistive touch screen driver that is using the Microchip Graphics Library. The calibration values are automatically checked (by reading a specific memory location on the non-volatile memory) when initializing the module if the function pointers to the read and write callback functions are initialized. If the read value is invalid calibration will automatically be executed. Otherwise, the calibration values will be loaded and used. The driver assumes that the application side provides the read and write routines to a non-volatile memory. If the callback functions are not initialized, the calibration routine will always be called at start-up to initialize the global calibration values. This driver assumes that the Graphics Library is initialized and will be using the default font of the library.

File Name

drv_adc10bit.h

Company

Microchip Technology Inc.

drv_adc10bit_config_template.h

10-bit ADC Touch Driver configuration template.

Macros

	Name	Description
	DRV_ADC10BIT_CALIBRATION_DELAY	Defines the calibration delay.
	DRV_ADC10BIT_CALIBRATION_INSET	Defines the calibration inset.
	DRV_ADC10BIT_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_ADC10BIT_INDEX	ADC10BIT static index selection.
	DRV_ADC10BIT_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_ADC10BIT_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_ADC10BIT_SAMPLE_POINTS	Defines the sample points.
	DRV_ADC10BIT_TOUCH_DIAMETER	Defines the touch diameter.

Description

10-bit ADC Touch Driver Configuration Template

This header file contains the build-time configuration selections for the 10-bit ADC Touch Driver. This is the template file which give all possible configurations that can be made. This file should not be included in any project.

File Name

drv_adc10bit_config_template.h

AR1021 Touch Driver Library

This topic describes the AR1021 Touch Driver Library.

Introduction

This library provides a low-level abstraction of the AR1021 Touch Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

The AR1021 Touch Driver Library, in conjunction with the Microchip AR1021 Resistive Touch Screen Controller module, allows an application to:

- Calibrate touch points
- Receive touch points

The following application services are provided by the AR1021 Touch Driver Library:

- Configuring the AR1021 controller (TouchThreshold, PenUpDelay, PenStateReportDelaylist, SensitivityFilter, etc.)
- Saving touch points to EEPROM

The operational services are not typically accessible to the application as this portion of the code resides within the Touch System Service Library software layer and is used by the Graphics Library stack services to receive touch point data.

Using the Library

This topic describes the basic architecture of the AR1021 Touch Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_ar1021.h`

The interface to the AR1021 Touch Driver library is defined in the `drv_ar1021.h` header file. Any C language source (`.c`) file that uses the AR1021 Touch Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the AR1021 Touch Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

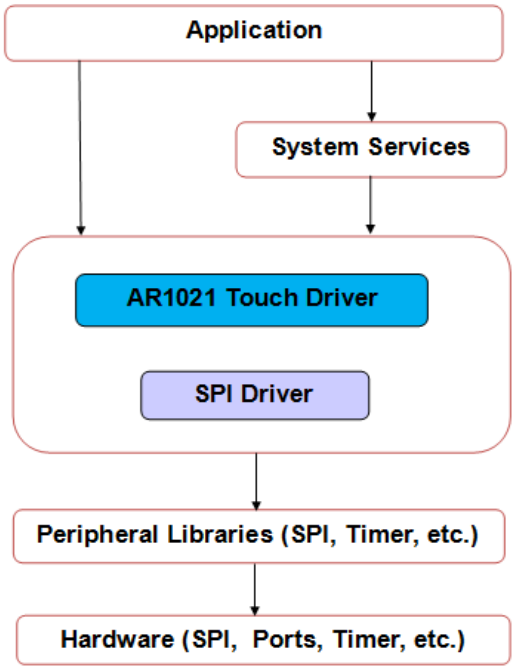
Description

The AR1021 Touch Driver Library provides the following functionality:

- AR1021 library initialization
- AR1021 controller configuration
- AR1021 controller connectivity
- AR1021 polling for pen-down and pen-up touch point events

The abstraction model shown in the following diagram depicts how the AR1021 Touch Driver is positioned in the MPLAB Harmony framework. The AR1021 Touch Driver Library uses the SPI Driver for control and touch data transfers to the AR1021 module.

AR1021 Touch Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the AR1021 Touch Driver module.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, task, and status functions.
Client Functions	Provides functions to open, close, and calibrate the AR1021 Touch Driver.

How the Library Works

The library provides interfaces to support:

- System functions, which provide system module interfaces, device initialization, deinitialization, task, touch, and status functions
- Client functions, which open, close, and calibrate the AR1021 Touch Driver

Initializing the Driver

Before the AR1021 Touch Driver can be opened, it must be configured and initialized. The driver build time configuration is defined by the configuration macros. Refer to the Building the Library section for the location of and more information on the various configuration macros and how these macros should be designed. The driver initialization is configured through the DRV_TOUCH_INIT data structure that is passed to the DRV_TOUCH_AR1021_Initialize function. The initialization parameters include the interrupt source, interrupt pin remap configuration and touch screen resolution. The following code shows an example of initializing the AR1021 Touch Driver.

Example:

```
/* The following code shows an example of designing the
 *  DRV_TOUCH_INIT data structure. It also shows how an example
 *  usage of the DRV_TOUCH_AR1021_Initialize function.
 */

DRV_TOUCH_INIT drvTouchInitData;
SYS_MODULE_OBJ objectHandle;

/* Driver initialization */
objectHandle = DRV_TOUCH_AR1021_Initialize(DRV_TOUCH_INDEX_0,
                                        (SYS_MODULE_INIT*)drvTouchInitData);
    if (SYS_MODULE_OBJ_INVALID == objectHandle)
    {
        // Handle error
    }
```

Opening the Driver

To use the AR1021 Touch Driver, the application must open the driver. This is done by calling the DRV_TOUCH_AR1021_Open function.

If successful, the DRV_TOUCH_AR1021_Open function will return a handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_TOUCH_AR1021_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in other (error) cases as well. The following code shows an example of the driver being opened.

```
    DRV_HANDLE  handle;

    handle = DRV_TOUCH_AR1021_Open( DRV_TOUCH_AR1021_INDEX_0,
                                    DRV_IO_INTENT_EXCLUSIVE );

    if( DRV_HANDLE_INVALID == handle )
    {
        // Unable to open the driver
    }
```

Tasks Routine

This routine processes the AR1021 Touch Driver commands from the command queue. If the state of the command is initialize or done it returns. If the read request registration is successful the state of command is to decode input. The tasks routine decodes the input and updates the global variables storing the touch input data in form of x and y coordinates. The AR1021 Touch Driver task routine is to be called from SYS_Tasks. The following code shows an example:

```
SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_AR1021_Initialize
```

```
void SYS_Tasks( void )
{
    DRV_TOUCH_AR1021_Tasks ( object );

    // Do other tasks
}
```

Configuring the Library

Macros

	Name	Description
	DRV_AR1021_CALIBRATION_DELAY	Define the calibration delay.
	DRV_AR1021_CALIBRATION_INSET	Define the calibration inset.
	DRV_AR1021_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_AR1021_INDEX	AR1021 static index selection.
	DRV_AR1021_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_AR1021_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_AR1021_SAMPLE_POINTS	Define the sample points.
	DRV_AR1021_TOUCH_DIAMETER	Define the touch diameter.

Description

The configuration of the AR1021 Touch Driver is accomplished through AR1021 Touch Driver selections in the MPLAB Harmony Configurator (MHC). Based on the selections made, a specific AR1021 Touch Driver is established automatically to execute all system configuration, initialization, and steady-state touch acquisitions.

Refer to Volume II: MPLAB Harmony Configurator (MHC) for more details on system configuration. Refer to the Applications Help section for additional information.

DRV_AR1021_CALIBRATION_DELAY Macro

Define the calibration delay.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_CALIBRATION_DELAY 300
```

Description

AR1021 Calibration Delay

This macro enables the delay between calibration touch points.

Remarks

None.

DRV_AR1021_CALIBRATION_INSET Macro

Define the calibration inset.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_CALIBRATION_INSET 25
```

Description

AR1021 Calibration Inset

This macro define the calibration inset.

Remarks

None.

DRV_AR1021_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_CLIENTS_NUMBER 1
```

Description

AR1021 Maximum Number of Clients

This definition selected the maximum number of clients that the AR1021 driver can support at run time.

Remarks

None.

DRV_AR1021_INDEX Macro

AR1021 static index selection.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_INDEX DRV_AR1021_INDEX_0
```

Description

AR1021 Static Index Selection

AR1021 static index selection for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

DRV_AR1021_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_INSTANCES_NUMBER 1
```

Description

AR1021 hardware instance configuration

This macro sets up the maximum number of hardware instances that can be supported.

Remarks

None.

DRV_AR1021_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_INTERRUPT_MODE false
```

Description

AR1021 Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of AR1021 operation is desired
- false - Select if polling mode of AR1021 operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

DRV_AR1021_SAMPLE_POINTS Macro

Define the sample points.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_SAMPLE_POINTS 4
```

Description

AR1021 Sample Points

AR1021 sample points

Remarks

None.

DRV_AR1021_TOUCH_DIAMETER Macro

Define the touch diameter.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_TOUCH_DIAMETER 10
```

Description

AR1021 Touch Diameter

This macro defines the touch diameter

Remarks

None.

Building the Library

This section lists the files that are available in the AR1021 Touch Driver Library.

Description

This section list the files that are available in the `\src` folder of the AR1021 Touch Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/touch/ar1021`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_ar1021.h	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/drv_ar1021.c	Basic AR1021 Touch Driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The AR1021 Touch Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library
- Touch System Service Library
- I2C Driver Library

Library Interface

a) System Functions

	Name	Description
	DRV_TOUCH_AR1021_Deinitialize	De-initializes the specified instance of the AR1021 driver module.
	DRV_TOUCH_AR1021_FactoryDefaultSet	Set AR1021 controller to factory default configuration settings.
	DRV_TOUCH_AR1021_Initialize	Initializes the AR1021 instance for the specified driver index
	DRV_TOUCH_AR1021_RegisterConfigWrite	Write a value to the given AR1021 configuration register.
	DRV_TOUCH_AR1021_Status	Provides the current status of the AR1021 driver module.
	DRV_TOUCH_AR1021_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_TOUCH_AR1021_TouchGetX	Returns the x coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchGetY	Returns the y coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchPenGet	Returns the PEN state of the touch event.
	DRV_TOUCH_AR1021_TouchStatus	Returns the status of the current touch input.

b) Client Functions

	Name	Description
	DRV_TOUCH_AR1021_Calibrate	Calibrate the touch screen
	DRV_TOUCH_AR1021_CalibrationSet	Set calibration with pre-defined points..
	DRV_TOUCH_AR1021_Close	Closes an opened instance of the AR1021 driver
	DRV_TOUCH_AR1021_Open	Opens the specified AR1021 driver instance and returns a handle to it. **Implementation:** Dynamic

c) Data Types and Constants

	Name	Description
	DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK	Defines the callback functions required to inform the user of touch and release targets.
	DRV_TOUCH_AR1021_HANDLE	Touch screen controller AR1021 driver handle.
	DRV_TOUCH_AR1021_MODULE_ID	This is type DRV_TOUCH_AR1021_MODULE_ID.
	DRV_TOUCH_AR1021_TASK_STATE	Enumeration defining AR1021 touch controller driver task state.
	DRV_TOUCH_AR1021_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_AR1021_INDEX_0	AR1021 driver index definitions.
	DRV_TOUCH_AR1021_INDEX_COUNT	Number of valid AR1021 driver indices.

Description

This section describes the API functions of the AR1021 Touch Driver Library.

a) System Functions

DRV_TOUCH_AR1021_Deinitialize Function

De-initializes the specified instance of the AR1021 driver module.

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

De-initializes the specified instance of the AR1021 driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the De-initialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_TOUCH_AR1021_Status operation. The system has to use DRV_TOUCH_AR1021_Status to find out when the module is in the ready state.

Preconditions

Function DRV_TOUCH_AR1021_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_TOUCH_AR1021_Initialize
SYS_STATUS          status;

DRV_TOUCH_AR1021_Deinitialize ( object );

status = DRV_TOUCH_AR1021_Status( object );
if( SYS_MODULE_UNINITIALIZED == status )
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TOUCH_AR1021_Initialize

Function

void DRV_TOUCH_AR1021_Deinitialize (SYS_MODULE_OBJ object)

DRV_TOUCH_AR1021_FactoryDefaultSet Function

Set AR1021 controller to factory default configuration settings.

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_FactoryDefaultSet();
```

Returns

None

Description

This function returns the AR1021 to operate on factory default configuration settings.

Remarks

A power cycle is required to run on the default settings.

Preconditions

The DRV_TOUCH_AR1021_Open routine must have been called for the specified AR1021 driver instance.

Example

```
DRV_TOUCH_AR1021_FactoryDefaultSet ( void );
```

Function

void DRV_TOUCH_AR1021_FactoryDefaultSet(void)

DRV_TOUCH_AR1021_Initialize Function

Initializes the AR1021 instance for the specified driver index

File

drv_ar1021.h

C

```
SYS_MODULE_OBJ DRV_TOUCH_AR1021_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const
init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the AR1021 driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the 'init' parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the AR1021 module ID. For example, driver instance 0 can be assigned to AR10212. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_TOUCH_AR1021_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other AR1021 routine is called.

This routine should only be called once during system initialization unless DRV_TOUCH_AR1021_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
DRV_TOUCH_INIT      drvAr1021InitData;
SYS_MODULE_OBJ      objectHandle;

objectHandle = DRV_TOUCH_AR1021_Initialize(DRV_TOUCH_AR1021_INDEX_1, (SYS_MODULE_INIT*)drvAr1021InitData);
```

```
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized. Please note this is not the AR1021 id. The hardware AR1021 id is set in the initialization structure. This is the index of the driver index to use.
init	Pointer to a data structure containing any data necessary to initialize the driver. If this pointer is NULL, the driver uses the static initialization override macros for each member of the initialization data structure.

Function

SYS_MODULE_OBJ DRV_TOUCH_AR1021_Initialize(const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init)

DRV_TOUCH_AR1021_RegisterConfigWrite Function

Write a value to the given AR1021 configuration register.

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_RegisterConfigWrite(uint16_t regOffset, uint8_t Value);
```

Returns

None

Description

This function set a value to the given AR1021 configuration register.

Remarks

none

Preconditions

The DRV_TOUCH_AR1021_Open routine must have been called for the specified AR1021 driver instance.

Example

```
DRV_TOUCH_AR1021_RegisterConfigWrite(uint16_t regOffset, uint8_t Value);
```

Function

void DRV_TOUCH_AR1021_RegisterConfigWrite(uint16_t regOffset, uint8_t Value)

DRV_TOUCH_AR1021_Status Function

Provides the current status of the AR1021 driver module.

File

drv_ar1021.h

C

```
SYS_STATUS DRV_TOUCH_AR1021_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Description

This function provides the current status of the AR1021 driver module.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

This function can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

The DRV_TOUCH_AR1021_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TOUCH_AR1021_Initialize
SYS_STATUS          status;

status = DRV_TOUCH_AR1021_Status( object );
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TOUCH_AR1021_Initialize

Function

SYS_STATUS DRV_TOUCH_AR1021_Status (SYS_MODULE_OBJ object)

DRV_TOUCH_AR1021_Tasks Function

Maintains the driver's state machine and implements its task queue processing.

Implementation: Dynamic

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal state machine and implement its command queue processing. It is always called from SYS_Tasks() function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks)

Preconditions

The DRV_TOUCH_AR1021_Initialize routine must have been called for the specified AR1021 driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TOUCH_AR1021_Initialize

while( true )
{
    DRV_TOUCH_AR1021_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TOUCH_AR1021_Initialize)

Function

void DRV_TOUCH_AR1021_Tasks (SYS_MODULE_OBJ object);

DRV_TOUCH_AR1021_TouchDataRead Function

Notifies the driver that the current touch data has been read

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_TouchDataRead(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

Notifies the driver that the current touch data has been read

Function

void DRV_TOUCH_AR1021_TouchDataRead(const SYS_MODULE_INDEX index)

DRV_TOUCH_AR1021_TouchGetX Function

Returns the x coordinate of touch input.

Implementation: Dynamic

File

drv_ar1021.h

C

```
short DRV_TOUCH_AR1021_TouchGetX(uint8_t touchNumber);
```

Returns

It returns the x coordinate of the touch input in terms of number of pixels.

Description

It returns the x coordinate in form of number of pixels for a touch input denoted by touchNumber.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

short DRV_TOUCH_AR1021_TouchGetX(uint8 touchNumber)

DRV_TOUCH_AR1021_TouchGetY Function

Returns the y coordinate of touch input.

Implementation: Dynamic

File

drv_ar1021.h

C

```
short DRV_TOUCH_AR1021_TouchGetY(uint8_t touchNumber);
```

Returns

It returns the y coordinate of the touch input in terms of number of pixels.

Description

It returns the y coordinate in form of number of pixes for a touch input denoted by touchNumber.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

short DRV_TOUCH_AR1021_TouchGetY(uint8 touchNumber)

DRV_TOUCH_AR1021_TouchPenGet Function

Returns the PEN state of the touch event.

File

drv_ar1021.h

C

```
DRV_TOUCH_PEN_STATE DRV_TOUCH_AR1021_TouchPenGet(uint8_t touchNumber);
```

Returns

It returns DRV_TOUCH_PEN_STATE

Description

It returns the PEN state of the last touch event corresponding to the x and y position.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

DRV_TOUCH_PEN_STATE DRV_TOUCH_AR1021_TouchPenGet(uint8_t touchNumber)

DRV_TOUCH_AR1021_TouchStatus Function

Returns the status of the current touch input.

File

drv_ar1021.h

C

```
DRV_TOUCH_POSITION_STATUS DRV_TOUCH_AR1021_TouchStatus(const SYS_MODULE_INDEX index);
```

Returns

It returns the status of the current touch input.

Description

It returns the status of the current touch input.

Function

DRV_TOUCH_POSITION_SINGLE DRV_TOUCH_AR1021_TouchStatus(const SYS_MODULE_INDEX index)

b) Client Functions

DRV_TOUCH_AR1021_Calibrate Function

Calibrate the touch screen

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_Calibrate(const DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK * prompt);
```

Returns

None

Description

This function display calibration points on the display to enable calibration.

Remarks

None

Preconditions

The DRV_TOUCH_AR1021_Initialize routine must have been called for the specified AR1021 driver instance.

Example

```
DRV_TOUCH_AR1021_Calibrate ( handle );
```

Function

void DRV_TOUCH_AR1021_Calibrate ((const DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK * prompt))

DRV_TOUCH_AR1021_CalibrationSet Function

Set calibration with pre-defined points..

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_CalibrationSet(DRV_TOUCH_SAMPLE_POINTS * samplePoints);
```

Returns

None

Description

This function allows for the setting of pre-loaded calibration points.

Remarks

None

Preconditions

The DRV_TOUCH_AR1021_Open routine must have been called for the specified AR1021 driver instance.

Example

```
DRV_TOUCH_AR1021_CalibrationSet ( void );
```

Function

void DRV_TOUCH_AR1021_CalibrationSet(void)

DRV_TOUCH_AR1021_Close Function

Closes an opened instance of the AR1021 driver

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the AR1021 driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_TOUCH_AR1021_Open before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_TOUCH_AR1021_Initialize routine must have been called for the specified AR1021 driver instance.

DRV_TOUCH_AR1021_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TOUCH_AR1021_Open

DRV_TOUCH_AR1021_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TOUCH_AR1021_Close (DRV_HANDLE handle)

DRV_TOUCH_AR1021_Open Function

Opens the specified AR1021 driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_ar1021.h

C

```
DRV_HANDLE DRV_TOUCH_AR1021_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. An error can occur when the following is true:

- if the number of client objects allocated via DRV_TOUCH_AR1021_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid

Description

This routine opens the specified AR1021 driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The current version of driver does not support the DRV_IO_INTENT feature. The driver is by default non-blocking. The driver can perform both read and write to the AR1021 device. The driver supports single client only.

Remarks

The handle returned is valid until the DRV_TOUCH_AR1021_Close routine is called. This routine will NEVER block waiting for hardware. If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

The DRV_TOUCH_AR1021_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_TOUCH_AR1021_Open( DRV_TOUCH_AR1021_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Index of the driver initialized with DRV_TOUCH_AR1021_Initialize().
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver. The current version of driver does not support the selective IO intent feature.

Function

DRV_HANDLE DRV_TOUCH_AR1021_Open (const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent)

c) Data Types and Constants

DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK Structure

Defines the callback functions required to inform the user of touch and release targets.

File

drv_ar1021.h

C

```
typedef struct {
  void (* firstPromptCallback)(void);
  void (* secondPromptCallback)(void);
  void (* thirdPromptCallback)(void);
  void (* fourthPromptCallback)(void);
  void (* completeCallback)(void);
} DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK;
```

Members

Members	Description
void (* firstPromptCallback)(void);	first calibration target
void (* secondPromptCallback)(void);	second calibration target
void (* thirdPromptCallback)(void);	third calibration target
void (* fourthPromptCallback)(void);	fourth calibration target
void (* completeCallback)(void);	complete calibration

Description

TOUCH Driver Calibration Initialization Data

This data type defines the callback function pointers required to inform of touch and release targets. The driver will invoke each callback in sequential order. The host code can display graphic and/or textual content to direct the user when a where on the LCD display to touch and release.

Remarks

None.

DRV_TOUCH_AR1021_HANDLE Type

Touch screen controller AR1021 driver handle.

File

drv_ar1021.h

C

```
typedef uintptr_t DRV_TOUCH_AR1021_HANDLE;
```

Description

AR1021 Driver Handle

Touch controller AR1021 driver handle is a handle for the driver client object. Each driver with successful open call will return a new handle to the client object.

Remarks

None.

DRV_TOUCH_AR1021_MODULE_ID Enumeration

File

drv_ar1021.h

C

```
typedef enum {
  AR1021_ID_1 = 0,
  AR1021_NUMBER_OF_MODULES
} DRV_TOUCH_AR1021_MODULE_ID;
```

Description

This is type DRV_TOUCH_AR1021_MODULE_ID.

DRV_TOUCH_AR1021_TASK_STATE Enumeration

Enumeration defining AR1021 touch controller driver task state.

File

drv_ar1021.h

C

```
typedef enum {
  DRV_TOUCH_AR1021_TASK_STATE_INIT = 0,
  DRV_TOUCH_AR1021_TASK_STATE_DONE
} DRV_TOUCH_AR1021_TASK_STATE;
```

Members

Members	Description
DRV_TOUCH_AR1021_TASK_STATE_INIT = 0	Task initialize state
DRV_TOUCH_AR1021_TASK_STATE_DONE	Task complete state

Description

AR1021 Touch Controller Driver Task State

This enumeration defines the AR1021 touch controller driver task state. The task state helps to synchronize the operations of initialization the the task, adding the read input task to the task queue once the touch controller notifies the available touch input and a decoding the touch input received.

Remarks

None.

DRV_TOUCH_AR1021_HANDLE_INVALID Macro

Definition of an invalid handle.

File

drv_ar1021.h

C

```
#define DRV_TOUCH_AR1021_HANDLE_INVALID ((DRV_TOUCH_AR1021_HANDLE)(-1))
```

Description

AR1021 Driver Invalid Handle

This is the definition of an invalid handle. An invalid handle is is returned by DRV_TOUCH_AR1021_Open() and DRV_AR1021_Close() functions if the request was not successful.

Remarks

None.

DRV_TOUCH_AR1021_INDEX_0 Macro

AR1021 driver index definitions.

File

drv_ar1021.h

C

```
#define DRV_TOUCH_AR1021_INDEX_0 0
```

Description

AR1021 Driver Module Index Numbers

These constants provide the AR1021 driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_AR1021_Initialize and DRV_AR1021_Open functions to identify the driver instance in use.

DRV_TOUCH_AR1021_INDEX_COUNT Macro

Number of valid AR1021 driver indices.

File

drv_ar1021.h

C

```
#define DRV_TOUCH_AR1021_INDEX_COUNT 1
```

Description

AR1021 Driver Module Index Count

This constant identifies the number of valid AR1021 driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

Files

Files

Name	Description
drv_ar1021.h	Touch controller AR1021 driver implementation.

Description

This section lists the source and header files used by the AR1021 Touch Driver Library.

drv_ar1021.h

Touch controller AR1021 driver implementation.

Enumerations

	Name	Description
	DRV_TOUCH_AR1021_MODULE_ID	This is type DRV_TOUCH_AR1021_MODULE_ID.
	DRV_TOUCH_AR1021_TASK_STATE	Enumeration defining AR1021 touch controller driver task state.

Functions

	Name	Description
	DRV_TOUCH_AR1021_Calibrate	Calibrate the touch screen
	DRV_TOUCH_AR1021_CalibrationSet	Set calibration with pre-defined points..
	DRV_TOUCH_AR1021_Close	Closes an opened instance of the AR1021 driver
	DRV_TOUCH_AR1021_Deinitialize	De-initializes the specified instance of the AR1021 driver module.
	DRV_TOUCH_AR1021_FactoryDefaultSet	Set AR1021 controller to factory default configuration settings.
	DRV_TOUCH_AR1021_Initialize	Initializes the AR1021 instance for the specified driver index
	DRV_TOUCH_AR1021_Open	Opens the specified AR1021 driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_RegisterConfigWrite	Write a value to the given AR1021 configuration register.
	DRV_TOUCH_AR1021_Status	Provides the current status of the AR1021 driver module.
	DRV_TOUCH_AR1021_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_TOUCH_AR1021_TouchGetX	Returns the x coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchGetY	Returns the y coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchPenGet	Returns the PEN state of the touch event.
	DRV_TOUCH_AR1021_TouchStatus	Returns the status of the current touch input.

Macros

	Name	Description
	DRV_TOUCH_AR1021_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_AR1021_INDEX_0	AR1021 driver index definitions.
	DRV_TOUCH_AR1021_INDEX_COUNT	Number of valid AR1021 driver indices.

Structures

	Name	Description
	DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK	Defines the callback functions required to inform the user of touch and release targets.

Types

	Name	Description
	DRV_TOUCH_AR1021_HANDLE	Touch screen controller AR1021 driver handle.

Description

Touch controller AR1021 driver file

This file consist of touch controller AR1021 driver interfaces. It implements the driver interfaces which read the touch input data from AR1021 through SPI bus.

File Name

drv_ar1021.c

MTCH6301 Touch Driver Library

This topic describes the MTCH6301 Touch Driver Library.

Introduction

This library provides an interface to manage the MTCH6301 Touch Driver module on the Microchip family of microcontrollers in different modes of operation.

Description

The MPLAB Harmony MTCH6301 Touch Driver provides a high-level interface to the MTCH6301 touch controller device. This driver provides application routines to read the touch input data from the touch screen. The MTCH6301 device can notify the availability of touch input data through external interrupt. The MTCH6301 driver allows the application to map a controller pin as an external interrupt pin.

Currently, the MTCH6301 Touch Driver only supports non-gestural single-fingered touch input.

Using the Library

This topic describes the basic architecture of the MTCH6301 Touch Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_mtch6301.h`

The interface to the MTCH6301 Touch Driver library is defined in the `drv_mtch6301.h` header file. Any C language source (`.c`) file that uses the MTCH6301 Touch Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the MTCH6301 Touch Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

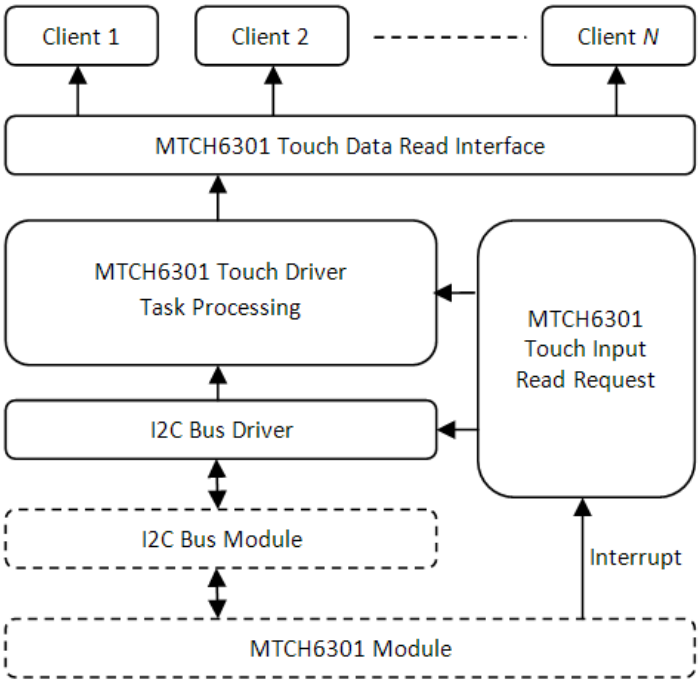
Description

The MTCH6301 Touch Driver has routines to perform the following operations:

- Sending read request
- Reading the touch input data
- Access to the touch input data

The driver initialization routines allow the application to initialize the driver. The driver must be initialized before it can be used by application. Once the driver is initialized the driver open routine allows to retrieve the client handle. Once the touch input is available a touch input read request is sent and input data is retrieved in a buffer. The buffer data is then decoded to get the x and y coordinate of the touch screen in the form of the number of pixels.

MTCH6301 Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the MTCH6301 Touch Driver.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, open, close, task, and status functions.

How the Library Works

The library provides interfaces to support:

- System functions, which provide system module interfaces, device initialization, deinitialization, open, close, task, and status functions.
- Read Request function, which provides Touch input data read request function
- Read Touch Input function, which provides functions retrieving updated Touch input in the form x and y coordinates.

Initializing the Driver

Before the MTCH6301 Touch Driver can be opened, it must be configured and initialized. The driver build time configuration is defined by the configuration macros. Refer to the Building the Library section for the location of and more information on the various configuration macros and how these macros should be designed. The driver initialization is configured through the DRV_TOUCH_INIT data structure that is passed to the DRV_TOUCH_MTCH6301_Initialize function. The initialization parameters include the interrupt source, interrupt pin remap configuration and touch screen resolution. The following code shows an example of initializing the MTCH6301 Touch Driver.

Example:

```
/* The following code shows an example of designing the
 *  DRV_TOUCH_INIT data structure. It also shows how an example
 *  usage of the DRV_TOUCH_MTCH6301_Initialize function.
 */

DRV_TOUCH_INIT drvTouchInitData;
SYS_MODULE_OBJ objectHandle;

/* Touch Module Id*/
drvTouchInitData.touchId                    = DRV_TOUCH_INDEX_0;
```

```
/* I2C Bus driver open */
drvTouchInitData.drvOpen                    = DRV_I2C_Open;

/* Interrupt Source for Touch */
drvTouchInitData.interruptSource            = INT_SOURCE_EXTERNAL_1;

/* Interrupt Pin function mapping */
drvTouchInitData.interruptPort.inputFunction = INPUT_FUNC_INT1;

/* Pin to be mapped as interrupt pin */
drvTouchInitData.interruptPort.inputPin     = INPUT_PIN_RPE8;

/* Analog pin number */
drvTouchInitData.interruptPort.analogPin    = PORTS_ANALOG_PIN_25;

/* Pin Mode of analog pin */
drvTouchInitData.interruptPort.pinMode      = PORTS_PIN_MODE_DIGITAL;

/* Interrupt pin port */
drvTouchInitData.interruptPort.channel      = PORT_CHANNEL_E;

/* Interrupt pin port maskl */
drvTouchInitData.interruptPort.dataMask     = 0x8;

/* Touch screen orientation */
drvTouchInitData.orientation                = DISP_ORIENTATION;

/* Touch screen horizontal resolution */
drvTouchInitData.horizontalResolution           = DISP_HOR_RESOLUTION;

/* Touch screen vertical resolution */
drvTouchInitData.verticalResolution         = DISP_VER_RESOLUTION;

/* Driver initialization */
objectHandle = DRV_TOUCH_MTCH6301_Initialize(DRV_TOUCH_INDEX_0,
                                             (SYS_MODULE_INIT*)drvTouchInitData);
    if (SYS_MODULE_OBJ_INVALID == objectHandle)
    {
        // Handle error
    }
```

Opening the Driver

To use the MTCH6301 Touch Driver, the application must open the driver. This is done by calling the DRV_TOUCH_MTCH6301_Open function.

If successful, the DRV_TOUCH_MTCH6301_Open function will return a handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_TOUCH_MTCH6301_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in other (error) cases as well. The following code shows an example of the driver being opened.

```
    DRV_HANDLE  handle;

    handle = DRV_TOUCH_MTCH6301_Open( DRV_TOUCH_MTCH6301_INDEX_0,
                                      DRV_IO_INTENT_EXCLUSIVE );

    if( DRV_HANDLE_INVALID == handle )
    {
        // Unable to open the driver
    }
```

Touch Input Read Request

To read the touch input from the MTCH6301 touch controller device, a read request must be registered. This is done by calling the DRV_TOUCH_MTCH6301_ReadRequest. If successful it registers a buffer read request to the I2C command queue. It also adds a input decode command to the MTCH6301 command queue once the I2C returns with touch input data. It can return error if the driver instance object is invalid or the MTCH6301 command queue is full. The read request is to be called from the MTCH6301 ISR. This ISR is triggered once the touch input is available. The following code shows an example of a MTCH6301 read request registration:

```
    SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_MTCH6301_Initialize
```

```
void __ISR(_EXTERNAL_INT_VECTOR, ipl5) _IntHandlerDrvMtch6301(void)
{
    DRV_TOUCH_MTCH6301_ReadRequest ( object );

    // Do other tasks
}
```

Tasks Routine

This routine processes the MTCH6301 commands from the command queue. If the state of the command is initialize or done it returns. If the read request registration is successful the state of command is to decode input. The tasks routine decodes the input and updates the global variables storing the touch input data in form of x and y coordinates. The MTCH6301 Touch Driver task routine is to be called from SYS_Tasks. The following code shows an example:

```
SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_MTCH6301_Initialize

void SYS_Tasks( void )
{
    DRV_TOUCH_MTCH6301_Tasks ( object );

    // Do other tasks
}
```

Configuring the Library

Macros

	Name	Description
	DRV_MTCH6301_CALIBRATION_DELAY	Defines the calibration delay.
	DRV_MTCH6301_CALIBRATION_INSET	Defines the calibration inset.
	DRV_MTCH6301_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_MTCH6301_INDEX	MTCH6301 static index selection.
	DRV_MTCH6301_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_MTCH6301_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_MTCH6301_SAMPLE_POINTS	Define the sample points.
	DRV_MTCH6301_TOUCH_DIAMETER	Defines the touch diameter.

Description

The configuration of the MTCH6301 Touch Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the MTCH6301 Touch Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the MTCH6301 Touch Driver.
