This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_MTCH6301_CALIBRATION_DELAY Macro

Defines the calibration delay.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_CALIBRATION_DELAY 300
```

Description

MTCH6301 Calibration Delay

This macro enables the delay between calibration touch points.

Remarks

None.

DRV_MTCH6301_CALIBRATION_INSET Macro

Defines the calibration inset.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_CALIBRATION_INSET 25
```

Description

MTCH6301 Calibration Inset

This macro defines the calibration inset.

Remarks

None.

DRV_MTCH6301_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_CLIENTS_NUMBER 1
```

Description

MTCH6301 maximum number of clients

This macro selects the maximum number of clients.

This definition selected the maximum number of clients that the MTCH6301 driver can support at run time.

Remarks

None.

DRV_MTCH6301_INDEX Macro

MTCH6301 static index selection.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_INDEX DRV_MTCH6301_INDEX_0
```

Description

MTCH6301 Static Index Selection

This macro specifies the static index selection for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

DRV_MTCH6301_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_INSTANCES_NUMBER 1
```

Description

MTCH6301 hardware instance configuration

This macro sets up the maximum number of hardware instances that can be supported.

Remarks

None.

DRV_MTCH6301_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_INTERRUPT_MODE false
```

Description

MTCH6301 Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of MTCH6301 operation is desired
- false - Select if polling mode of MTCH6301 operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

DRV_MTCH6301_SAMPLE_POINTS Macro

Define the sample points.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_SAMPLE_POINTS 4
```

Description

MTCH6301 Sample Points

MTCH6301 sample points

Remarks

None.

DRV_MTCH6301_TOUCH_DIAMETER Macro

Defines the touch diameter.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_TOUCH_DIAMETER 10
```

Description

MTCH6301 Touch Diameter

This macro defines the touch diameter

Remarks

None.

Building the Library

This section lists the files that are available in the MTCH6301 Touch Driver Library.

Description

This section list the files that are available in the \src folder of the MTCH6301 Touch Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/touch/mtch6301`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_mtch6301.h	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/drv_mtch6301.c	Basic MTCH6301 Touch Driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The MTCH6301 Touch Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library
- Touch System Service Library
- I2C Driver Library

Library Interface

a) System Functions

	Name	Description
	DRV_TOUCH_MTCH6301_Close	Closes an opened instance of the MTCH6301 driver. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Deinitialize	Deinitializes the specified instance of the MTCH6301 driver module. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Initialize	Initializes the MTCH6301 instance for the specified driver index. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Open	Opens the specified MTCH6301 driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Status	Provides the current status of the MTCH6301 driver module. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic

	DRV_TOUCH_MTCH6301_ReadRequest	Sends a read request to I2C bus driver and adds the read task to queue. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchGetX	Returns the x coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchGetY	Returns the y coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_TOUCH_MTCH6301_TouchStatus	Returns the status of the current touch input.

b) Data Types and Constants

	Name	Description
	_DRV_MTCH6301_CLIENT_OBJECT	MTCH6301 Driver client object maintaining client data.
	DRV_TOUCH_MTCH6301_HANDLE	Touch screen controller MTCH6301 driver handle.
	DRV_TOUCH_MTCH6301_MODULE_ID	Number of valid MTCH6301 driver indices.
	DRV_TOUCH_MTCH6301_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE	I2C Frame size for reading MTCH6301 touch input.
	DRV_TOUCH_MTCH6301_CLIENT_OBJECT	MTCH6301 Driver client object maintaining client data.
	DRV_TOUCH_MTCH6301_INDEX_0	MTCH6301 driver index definitions.
	DRV_TOUCH_MTCH6301_INDEX_1	This is macro DRV_TOUCH_MTCH6301_INDEX_1.
	DRV_TOUCH_MTCH6301_INDEX_COUNT	Number of valid Touch controller MTCH6301 driver indices.
	DRV_TOUCH_MTCH6301_OBJECT	Defines the data structure maintaining MTCH6301 driver instance object.
	DRV_TOUCH_MTCH6301_TASK_QUEUE	Defines the MTCH6301 Touch Controller driver task data structure.
	DRV_TOUCH_MTCH6301_TASK_STATE	Enumeration defining MTCH6301 touch controller driver task state.
	DRV_TOUCH_MTCH6301_I2C_MASTER_READ_ID	MTCH6301 input read, I2C address from where master reads touch input data.
	DRV_TOUCH_MTCH6301_I2C_MASTER_WRITE_ID	MTCH6301 command register write, I2C address where master sends the commands.

Description

This section describes the API functions of the MTCH6301 Touch Driver library.

Refer to each section for a detailed description.

a) System Functions

DRV_TOUCH_MTCH6301_Close Function

Closes an opened instance of the MTCH6301 driver.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
void DRV_TOUCH_MTCH6301_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the MTCH6301 driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_TOUCH_MTCH6301_Open before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_TOUCH_MTCH6301_Initialize routine must have been called for the specified MTCH6301 driver instance.

DRV_TOUCH_MTCH6301_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TOUCH_MTCH6301_Open

DRV_TOUCH_MTCH6301_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TOUCH_MTCH6301_Close (DRV_HANDLE handle)

DRV_TOUCH_MTCH6301_Deinitialize Function

Deinitializes the specified instance of the MTCH6301 driver module.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
void DRV_TOUCH_MTCH6301_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the MTCH6301 driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the De-initialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_TOUCH_MTCH6301_Status operation. The system has to use DRV_TOUCH_MTCH6301_Status to determine when the module is in the ready state.

Preconditions

Function DRV_TOUCH_MTCH6301_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Parameter: object - Driver object handle, returned from DRV_TOUCH_MTCH6301_Initialize

Example

```
SYS_MODULE_OBJ      object;    //Returned from DRV_TOUCH_MTCH6301_Initialize
SYS_STATUS          status;

DRV_TOUCH_MTCH6301_Deinitialize ( object );

status = DRV_TOUCH_MTCH6301_Status( object );
if( SYS_MODULE_UNINITIALIZED == status )
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Function

void DRV_TOUCH_MTCH6301_Deinitialize (SYS_MODULE_OBJ object)

DRV_TOUCH_MTCH6301_Initialize Function

Initializes the MTCH6301 instance for the specified driver index.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
SYS_MODULE_OBJ DRV_TOUCH_MTCH6301_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the MTCH6301 driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the 'init' parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the MTCH6301 module ID. For example, driver instance 0 can be assigned to MTCH63012. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_TOUCH_MTCH6301_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other MTCH6301 routine is called.

This routine should only be called once during system initialization unless DRV_TOUCH_MTCH6301_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
DRV_TOUCH_MTCH6301_INIT        init;
SYS_MODULE_OBJ      objectHandle;

// Populate the MTCH6301 initialization structure
// Touch Module Id
init.touchId                      = DRV_TOUCH_INDEX_0;

// I2C Bus driver open
init.drvOpen                      = DRV_I2C_Open;

// Interrupt Source for Touch
init.interruptSource              = INT_SOURCE_EXTERNAL_1;

// Interrupt Pin function mapping
init.interruptPort.inputFunction  = INPUT_FUNC_INT1;

// Pin to be mapped as interrupt pin
init.interruptPort.inputPin       = INPUT_PIN_RPE8;

// Analog pin number
init.interruptPort.analogPin      = PORTS_ANALOG_PIN_25;

// Pin Mode of analog pin
init.interruptPort.pinMode        = PORTS_PIN_MODE_DIGITAL;

// Interrupt pin port
init.interruptPort.channel        = PORT_CHANNEL_E;

// Interrupt pin port maskl
init.interruptPort.dataMask       = 0x8;

// Touch screen orientation
init.orientation                  = DISP_ORIENTATION;

// Touch screen horizontal resolution
init.horizontalResolution         = DISP_HOR_RESOLUTION;

// Touch screen vertical resolution
init.verticalResolution           = DISP_VER_RESOLUTION;
```

```
objectHandle = DRV_TOUCH_MTCH6301_Initialize(DRV_TOUCH_INDEX_0,
                                             (SYS_MODULE_INIT*)init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized. Please note this is not the MTCH6301 ID. The hardware MTCH6301 ID is set in the initialization structure. This is the index of the driver index to use.
init	Pointer to a data structure containing any data necessary to initialize the driver. If this pointer is NULL, the driver uses the static initialization override macros for each member of the initialization data structure.

Function

SYS_MODULE_OBJ DRV_TOUCH_MTCH6301_Initialize(const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init)

DRV_TOUCH_MTCH6301_Open Function

Opens the specified MTCH6301 driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
DRV_HANDLE DRV_TOUCH_MTCH6301_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. An error can occur when the following is true:

- if the number of client objects allocated via DRV_TOUCH_MTCH6301_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid

Description

This routine opens the specified MTCH6301 driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The current version of driver does not support the DRV_IO_INTENT feature. The driver is by default non-blocking. The driver can perform both read and write to the MTCH6301 device. The driver supports single client only.

Remarks

The handle returned is valid until the DRV_TOUCH_MTCH6301_Close routine is called. This routine will NEVER block waiting for hardware. If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

The DRV_TOUCH_MTCH6301_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_TOUCH_MTCH6301_Open( DRV_TOUCH_MTCH6301_INDEX_0,
                                  DRV_IO_INTENT_EXCLUSIVE );

if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Index of the driver initialized with DRV_TOUCH_MTCH6301_Initialize().
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver. The current version of driver does not support the selective IO intent feature.

Function

DRV_HANDLE DRV_TOUCH_MTCH6301_Open (const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent)

DRV_TOUCH_MTCH6301_Status Function

Provides the current status of the MTCH6301 driver module.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
SYS_STATUS DRV_TOUCH_MTCH6301_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system-level operation and cannot start another

Description

This function provides the current status of the MTCH6301 driver module.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

This function can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

The DRV_TOUCH_MTCH6301_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;  // Returned from DRV_TOUCH_MTCH6301_Initialize
SYS_STATUS          status;

status = DRV_TOUCH_MTCH6301_Status( object );
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TOUCH_MTCH6301_Initialize

Function

SYS_STATUS DRV_TOUCH_MTCH6301_Status (SYS_MODULE_OBJ object)

DRV_TOUCH_MTCH6301_Tasks Function

Maintains the driver's state machine and implements its task queue processing.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
void DRV_TOUCH_MTCH6301_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal state machine and implement its command queue processing. It is always called from SYS_Tasks() function. This routine decodes the touch input data available in drvI2CReadFrameData.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks)

Preconditions

The DRV_TOUCH_MTCH6301_Initialize routine must have been called for the specified MTCH6301 driver instance.

Example

```
SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_MTCH6301_Initialize

void SYS_Tasks( void )
{
    DRV_TOUCH_MTCH6301_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TOUCH_MTCH6301_Initialize)

Function

void DRV_TOUCH_MTCH6301_Tasks (SYS_MODULE_OBJ object);

DRV_TOUCH_MTCH6301_ReadRequest Function

Sends a read request to I2C bus driver and adds the read task to queue.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
void DRV_TOUCH_MTCH6301_ReadRequest(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to send a touch input read request to the I2C bus driver and adding the input read decode task to the queue. It is always called from MTCH6301 interrupt ISR routine.

Remarks

This function is normally not called directly by an application. It is called by the MTCH6301 ISR routine.

Preconditions

The DRV_TOUCH_MTCH6301_Initialize routine must have been called for the specified MTCH6301 driver instance.

Example

```
SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_MTCH6301_Initialize

void __ISR(_EXTERNAL_INT_VECTOR, ipl5) _IntHandlerDrvMtch6301(void)
{
    DRV_TOUCH_MTCH6301_ReadRequest ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TOUCH_MTCH6301_Initialize)

Function

void DRV_TOUCH_MTCH6301_ReadRequest(SYS_MODULE_OBJ object)

DRV_TOUCH_MTCH6301_TouchGetX Function

Returns the x coordinate of touch input.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
short DRV_TOUCH_MTCH6301_TouchGetX(uint8_t touchNumber);
```

Returns

It returns the x coordinate of the touch input in terms of number of pixels.

Description

It returns the x coordinate in form of number of pixes for a touch input denoted by touchNumber.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

short DRV_TOUCH_MTCH6301_TouchGetX(uint8 touchNumber)

DRV_TOUCH_MTCH6301_TouchGetY Function

Returns the y coordinate of touch input.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
short DRV_TOUCH_MTCH6301_TouchGetY(uint8_t touchNumber);
```

Returns

It returns the y coordinate of the touch input in terms of number of pixels.

Description

It returns the y coordinate in form of number of pixes for a touch input denoted by touchNumber.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

short DRV_TOUCH_MTCH6301_TouchGetY(uint8 touchNumber)

DRV_TOUCH_MTCH6301_TouchDataRead Function

Notifies the driver that the current touch data has been read

File

drv_mtch6301.h

C

```
void DRV_TOUCH_MTCH6301_TouchDataRead(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

Notifies the driver that the current touch data has been read

Function

void DRV_TOUCH_MTCH6301_TouchDataRead(const SYS_MODULE_INDEX index)

DRV_TOUCH_MTCH6301_TouchStatus Function

Returns the status of the current touch input.

File

drv_mtch6301.h

C

```
DRV_TOUCH_POSITION_STATUS DRV_TOUCH_MTCH6301_TouchStatus(const SYS_MODULE_INDEX index);
```

Returns

It returns the status of the current touch input.

Description

It returns the status of the current touch input.

Function

DRV_TOUCH_POSITION_SINGLE DRV_TOUCH_MTCH6301_TouchStatus(const SYS_MODULE_INDEX index)

b) Data Types and Constants

DRV_TOUCH_MTCH6301_HANDLE Type

Touch screen controller MTCH6301 driver handle.

File

drv_mtch6301.h

C

```
typedef uintptr_t DRV_TOUCH_MTCH6301_HANDLE;
```

Description

MTCH6301 Driver Handle

Touch controller MTCH6301 driver handle is a handle for the driver client object. Each driver with succesful open call will return a new handle to the client object.

Remarks

None.

DRV_TOUCH_MTCH6301_MODULE_ID Enumeration

Number of valid MTCH6301 driver indices.

File

drv_mtch6301.h

C

```
typedef enum {
  MTCH6301_ID_1 = 0,
  MTCH6301_NUMBER_OF_MODULES
} DRV_TOUCH_MTCH6301_MODULE_ID;
```

Description

MTCH6301 Driver Module Index Count

This constant identifies the number of valid MTCH6301 driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

DRV_TOUCH_MTCH6301_HANDLE_INVALID Macro

Definition of an invalid handle.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_HANDLE_INVALID ((DRV_TOUCH_MTCH6301_HANDLE)(-1))
```

Description

MTCH6301 Driver Invalid Handle

This is the definition of an invalid handle. An invalid handle is is returned by DRV_TOUCH_MTCH6301_Open() and DRV_MTCH6301_Close() functions if the request was not successful.

Remarks

None.

DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE Macro

I2C Frame size for reading MTCH6301 touch input.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE 7
```

Description

MTCH6301 Driver Module I2C Frame Size

This constant identifies the size of I2C frame required to read from MTCH6301 touch controller. MTCH6301 notifies the availability of input data through interrupt pin.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific data sheets.

DRV_TOUCH_MTCH6301_CLIENT_OBJECT Structure

MTCH6301 Driver client object maintaining client data.

File

drv_mtch6301.h

C

```
typedef struct _DRV_MTCH6301_CLIENT_OBJECT {
  DRV_TOUCH_MTCH6301_OBJECT* driverObject;
  DRV_IO_INTENT intent;
  struct DRV_TOUCH_MTCH6301_CLIENT_OBJECT* pNext;
} DRV_TOUCH_MTCH6301_CLIENT_OBJECT;
```

Members

Members	Description
DRV_TOUCH_MTCH6301_OBJECT* driverObject;	Driver Object associated with the client
DRV_IO_INTENT intent;	The intent with which the client was opened
struct DRV_TOUCH_MTCH6301_CLIENT_OBJECT* pNext;	Next driver client object

Description

MTCH6301 Driver client object

This defines the object required for the maintenance of the software clients instance. This object exists once per client instance.

Remarks

None.

DRV_TOUCH_MTCH6301_INDEX_0 Macro

MTCH6301 driver index definitions.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_INDEX_0 0
```

Description

MTCH6301 Driver Module Index Numbers

These constants provide the MTCH6301 driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_MTCH6301_Initialize and DRV_MTCH6301_Open functions to identify the driver instance in use.

DRV_TOUCH_MTCH6301_INDEX_1 Macro

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_INDEX_1 1
```

Description

This is macro DRV_TOUCH_MTCH6301_INDEX_1.

DRV_TOUCH_MTCH6301_INDEX_COUNT Macro

Number of valid Touch controller MTCH6301 driver indices.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_INDEX_COUNT 2
```

Description

MTCH6301 Driver Module Index Count

This constant identifies the number of valid Touch Controller MTCH6301 driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific header files defined as part of the peripheral libraries.

DRV_TOUCH_MTCH6301_OBJECT Structure

Defines the data structure maintaining MTCH6301 driver instance object.

File

drv_mtch6301.h

C

```
typedef struct {
  SYS_STATUS status;
  int touchId;
  SYS_MODULE_INDEX drvIndex;
  bool inUse;
  bool isExclusive;
  uint8_t numClients;
  INT_SOURCE interruptSource;
  uint16_t orientation;
  uint16_t horizontalResolution;
  uint16_t verticalResolution;
  DRV_HANDLE (* drvOpen)(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
  int32_t readRequest;
  DRV_TOUCH_MTCH6301_TASK_QUEUE* taskQueue;
  DRV_HANDLE drvI2CHandle;
  DRV_TOUCH_POSITION_STATUS touchStatus;
} DRV_TOUCH_MTCH6301_OBJECT;
```

Members

Members	Description
SYS_STATUS status;	The status of the driver
int touchId;	The peripheral Id associated with the object
SYS_MODULE_INDEX drvIndex;	Save the index of the driver. Important to know this as we are using reference based accessing
bool inUse;	Flag to indicate instance in use
bool isExclusive;	Flag to indicate module used in exclusive access mode
uint8_t numClients;	Number of clients possible with the hardware instance
INT_SOURCE interruptSource;	Touch input interrupt source
uint16_t orientation;	Orientation of the display (given in degrees of 0,90,180,270)
uint16_t horizontalResolution;	Horizontal Resolution of the displayed orientation in Pixels
uint16_t verticalResolution;	Vertical Resolution of the displayed orientaion in Pixels
DRV_HANDLE (* drvOpen)(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);	Callback for I2C Driver Open call
int32_t readRequest;	Touch Input read request counter
DRV_TOUCH_MTCH6301_TASK_QUEUE* taskQueue;	Head of the task queue

DRV_HANDLE drvI2CHandle;	I2C bus driver handle
DRV_TOUCH_POSITION_STATUS touchStatus;	Touch status

Description

MTCH6301 Driver Instance Object.

This data structure maintains the MTCH6301 driver instance object. The object exists once per hardware instance.

Remarks

None.

DRV_TOUCH_MTCH6301_TASK_QUEUE Structure

Defines the MTCH6301 Touch Controller driver task data structure.

File

drv_mtch6301.h

C

```
typedef struct {
  bool inUse;
  DRV_TOUCH_MTCH6301_TASK_STATE taskState;
  DRV_I2C_BUFFER_HANDLE drvI2CReadBufferHandle;
  uint8_t drvI2CReadFrameData[DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE];
} DRV_TOUCH_MTCH6301_TASK_QUEUE;
```

Members

Members	Description
bool inUse;	Flag denoting the allocation of task
DRV_TOUCH_MTCH6301_TASK_STATE taskState;	Enum maintaining the task state
DRV_I2C_BUFFER_HANDLE drvI2CReadBufferHandle;	I2C Buffer handle
uint8_t drvI2CReadFrameData[DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE];	Response to Read Touch Input Command • Response = { MTCH6301 Read Address, • Input Data Size, • Touch Id, Pen status, • Touch X coordinate (0 to 6), • Touch X coordinate (7 to 11), • Touch Y coordinate (0 to 6), • Touch Y coordinate (7 to 11) }

Description

MTCH6301 Touch Controller driver task data structure.

This data type defines the data structure maintaing task context in the task queue. The inUse flag denotes the task context allocation for a task. The enum variable taskState maintains the current task state. The I2C buffer handle drvI2CReadBufferHandle maintains the I2C driver buffer handle returned by the I2C driver read request. The byte array variable drvI2CReadFrameData maintains the I2C frame data sent by MTCH6301 after a successful read request.

Remarks

None.

DRV_TOUCH_MTCH6301_TASK_STATE Enumeration

Enumeration defining MTCH6301 touch controller driver task state.

File

drv_mtch6301.h

C

```
typedef enum {
  DRV_TOUCH_MTCH6301_TASK_STATE_INIT = 0,
  DRV_TOUCH_MTCH6301_TASK_STATE_READ_INPUT,
```

```
  DRV_TOUCH_MTCH6301_TASK_STATE_DECODE_INPUT,
  DRV_TOUCH_MTCH6301_TASK_STATE_DONE
} DRV_TOUCH_MTCH6301_TASK_STATE;
```

Members

Members	Description
DRV_TOUCH_MTCH6301_TASK_STATE_INIT = 0	Task initialize state
DRV_TOUCH_MTCH6301_TASK_STATE_READ_INPUT	Task read touch input request state
DRV_TOUCH_MTCH6301_TASK_STATE_DECODE_INPUT	Task touch input decode state
DRV_TOUCH_MTCH6301_TASK_STATE_DONE	Task complete state

Description

MTCH6301 Touch Controller Driver Task State

This enumeration defines the MTCH6301 touch controller driver task state. The task state helps to synchronize the operations of initialization the the task, adding the read input task to the task queue once the touch controller notifies the available touch input and a decoding the touch input received.

Remarks

None.

DRV_TOUCH_MTCH6301_I2C_MASTER_READ_ID Macro

MTCH6301 input read, I2C address from where master reads touch input data.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_I2C_MASTER_READ_ID 0x4B
```

Description

MTCH6301 Driver Module Master Input Read I2C address

This constant defines the MTCH6301 touch input read I2C address. This address is used as I2C address to read Touch input from MTCH6301 Touch controller.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific data sheets.

DRV_TOUCH_MTCH6301_I2C_MASTER_WRITE_ID Macro

MTCH6301 command register write, I2C address where master sends the commands.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_I2C_MASTER_WRITE_ID 0x4A
```

Description

MTCH6301 Driver Module Master Command Write I2C Address

This constant defines the MTCH6301 command register I2C write address. This address is used as I2C address to write commands into MTCH6301 Touch controller register.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific data sheets.

Files

Files

Name	Description
drv_mtch6301.h	Touch controller MTCH6301 Driver interface header file.
drv_mtch6301_config_template.h	MTCH6301 Touch Driver configuration template.

Description

This section lists the source and header files used by the MTCH6301 Touch Driver Library.

drv_mtch6301.h

Touch controller MTCH6301 Driver interface header file.

Enumerations

	Name	Description
	DRV_TOUCH_MTCH6301_MODULE_ID	Number of valid MTCH6301 driver indices.
	DRV_TOUCH_MTCH6301_TASK_STATE	Enumeration defining MTCH6301 touch controller driver task state.

Functions

	Name	Description
	DRV_TOUCH_MTCH6301_Close	Closes an opened instance of the MTCH6301 driver. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Deinitialize	Deinitializes the specified instance of the MTCH6301 driver module. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Initialize	Initializes the MTCH6301 instance for the specified driver index. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Open	Opens the specified MTCH6301 driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_ReadRequest	Sends a read request to I2C bus driver and adds the read task to queue. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Status	Provides the current status of the MTCH6301 driver module. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_TOUCH_MTCH6301_TouchGetX	Returns the x coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchGetY	Returns the y coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchStatus	Returns the status of the current touch input.

Macros

	Name	Description
	DRV_TOUCH_MTCH6301_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_MTCH6301_I2C_MASTER_READ_ID	MTCH6301 input read, I2C address from where master reads touch input data.
	DRV_TOUCH_MTCH6301_I2C_MASTER_WRITE_ID	MTCH6301 command register write, I2C address where master sends the commands.
	DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE	I2C Frame size for reading MTCH6301 touch input.
	DRV_TOUCH_MTCH6301_INDEX_0	MTCH6301 driver index definitions.
	DRV_TOUCH_MTCH6301_INDEX_1	This is macro DRV_TOUCH_MTCH6301_INDEX_1.
	DRV_TOUCH_MTCH6301_INDEX_COUNT	Number of valid Touch controller MTCH6301 driver indices.

Structures

	Name	Description
	_DRV_MTCH6301_CLIENT_OBJECT	MTCH6301 Driver client object maintaining client data.
	DRV_TOUCH_MTCH6301_CLIENT_OBJECT	MTCH6301 Driver client object maintaining client data.
	DRV_TOUCH_MTCH6301_OBJECT	Defines the data structure maintaining MTCH6301 driver instance object.
	DRV_TOUCH_MTCH6301_TASK_QUEUE	Defines the MTCH6301 Touch Controller driver task data structure.

Types

	Name	Description
	DRV_TOUCH_MTCH6301_HANDLE	Touch screen controller MTCH6301 driver handle.

Description

Touch Controller MTCH6301 Driver Interface File

This header file describes the macros, data structure and prototypes of the touch controller MTCH6301 driver interface.

File Name

drv_mtch6301.c

drv_mtch6301_config_template.h

MTCH6301 Touch Driver configuration template.

Macros

	Name	Description
	DRV_MTCH6301_CALIBRATION_DELAY	Defines the calibration delay.
	DRV_MTCH6301_CALIBRATION_INSET	Defines the calibration inset.
	DRV_MTCH6301_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_MTCH6301_INDEX	MTCH6301 static index selection.
	DRV_MTCH6301_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_MTCH6301_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_MTCH6301_SAMPLE_POINTS	Define the sample points.
	DRV_MTCH6301_TOUCH_DIAMETER	Defines the touch diameter.

Description

MTCH6301 Touch Driver Configuration Template

This header file contains the build-time configuration selections for the MTCH6301 Touch Driver. This is the template file which give all possible configurations that can be made. This file should not be included in any project.

File Name

drv_mtch6301_config_template.h

Microchip Technology Inc.

MTCH6303 Touch Driver Library

This topic describes the MTCH6303 Touch Driver Library.

Introduction

This library provides an interface to manage the MTCH6303 Touch Driver module on the Microchip family of microcontrollers in different modes of operation.

Description

The MPLAB Harmony MTCH6303 Touch Driver provides a high-level interface to the MTCH6303 touch controller device. This driver provides application routines to read the touch input data from the touch screen. The MTCH6303 device can notify the availability of touch input data through external interrupt. The MTCH6303 driver allows the application to map a controller pin as an external interrupt pin.

Currently, the MTCH6303 Touch Driver only supports non-gestural single-finger touch screen input.

Using the Library

This topic describes the basic architecture of the MTCH6303 Touch Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_mtch6303_static.h`

The interface to the MTCH6303 Touch Driver Library is defined in the `drv_mtch6303_static.h` header file. This file is generated by the MPLAB Harmony Configurator (MHC) during application code generation. It is included in `system_definitions.h` by MHC during application code generation. Any configuration macros required for MTCH6303 Driver are included in `system_config.h` by MHC during code generation. Any C language source (`.c`) file that uses the MTCH6303 Touch Driver Library should include `system_config.h` and `system_definitions.h`, respectively.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the MTCH6303 Touch Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

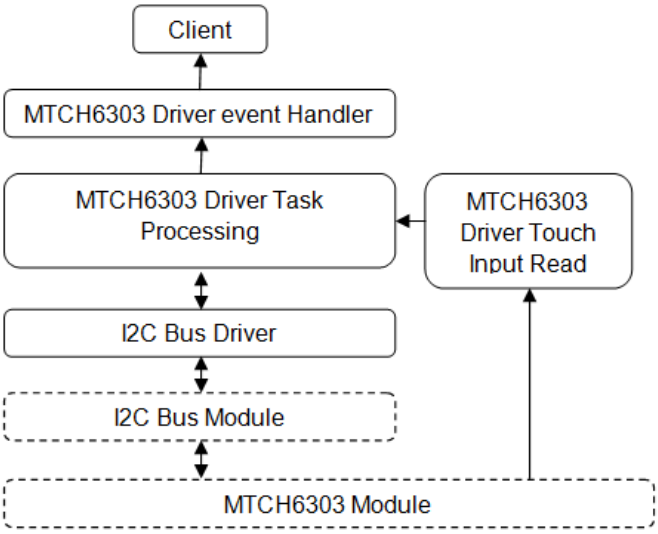
The MTCH6303 Touch Driver has routines to perform the following operations:

- MTCH6303 register read and write
- MTCh6303 message read and write
- MTCH6303 touch input read
- Mapping of the touch input to screen resolution

The driver Initialization routine allows the application to initialize the driver. The driver must be initialized before it can be used by the application. Once the driver is initialized, the driver Open function allows retrieval of the client handle. If the client handle is valid, an event handler routine needs to be registered by the application. The MTCH6303 Touch Driver triggers an interrupt once touch input is available to be read from the MTCH6303 registers. A touch input Read function is called from the interrupt handler to initiate the touch input read task. An Event Handler function is called once the touch input read task is completed. A valid touch input will be available only after the event handler routine is triggered. The touch input must be read inside of the event handler function.

The touch input data is a raw value and needs to be mapped to the target screen resolution. At zero degree orientation, touch input is mapped on the x axis from zero at the left and the maximum value at the right. At zero degree orientation, touch input is mapped on the y axis from zero at the top and the maximum value at the bottom.

MTCH6303 Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the MTCH6303 Touch Driver.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks, and status functions.
Client Setup Functions	Provides open, close, status, and other setup function.
Read and Write Functions	Provides functions to read and write to the MTCH6303 registers, messages, and touch data.
Miscellaneous Functions	Provides miscellaneous functions.

How the Library Works

The library provides interfaces to support:

- System functions, which provide system module interfaces, device initialization, deinitialization, task, and status functions
- Client setup functions, which provide client interfaces such as open, close and event handler registration
- Read and write functions, initiate the touch input or register or message read and write tasks
- Miscellaneous functions such as touch input map function are provided to process the raw touch input data

Configuring the Library

The configuration of the MTCH6303 Touch Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the MTCH6303 Touch Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the MTCH6303 Touch Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Building the Library

This section lists the files that are available in the MTCH6303 Touch Driver Library.

Description

This section list the files that are available in the `/src` folder of the MTCH6303 Touch Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/touch/mtch6303`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_mtch6303_static.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/drv_mtch6303_static.c`	Basic MTCH6303 Touch Driver implementation file.
`/src/drv_mtch6303_buffer_queue_i2c_static.c`	MTCH6303 I2C buffer queue implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
`/drv_mtch6303_buffer_queue_touch_static.c`	MTCH6303 message buffer queue implementation file.

Module Dependencies

The MTCH6303 Touch Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library
- I2C Driver Library

Library Interface

a) System Functions

	Name	Description
	DRV_MTCH6303_Deinitialize	Deinitializes the instance of the MTCH6303 driver module.
	DRV_MTCH6303_Initialize	Initializes the MTCH6303 static single instance.
	DRV_MTCH6303_Status	Gets the current status of the MTCH6303 driver module.
	DRV_MTCH6303_Tasks	Maintains the driver's register read/write state machine and implements its ISR.

b) Client Setup Functions

	Name	Description
	DRV_MTCH6303_Close	Closes an opened-instance of the MTCH6303 driver.
	DRV_MTCH6303_ErrorGet	This function returns the error associated with the last client request.
	DRV_MTCH6303_Open	Opens the MTCH6303 driver instance and returns a handle to it.

c) Read and Write Functions

	Name	Description
	DRV_MTCH6303_AddRegisterRead	Schedules a non-blocking register read request to read I2C accessible MTCH6303 registers.
	DRV_MTCH6303_AddRegisterWrite	Schedule a non-blocking driver register write operation to write I2C accessible MTCH6303 registers.
	DRV_MTCH6303_TOUCH_AddMessageCommandWrite	Schedule a non-blocking driver command message write operation to write command message to MTCH6303 registers.
	DRV_MTCH6303_TOUCH_AddMessageReportRead	Schedules a non-blocking report message read request to read the report message from MTCH6303 device.
	DRV_MTCH6303_TOUCH_AddTouchInputRead	Schedules a non-blocking read buffer request to read touch input from MTCH6303.
	DRV_MTCH6303_TOUCH_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued message transfers have finished.
	DRV_MTCH6303_TOUCH_Tasks	Maintains the driver's message state machine and implements its ISR.
	DRV_MTCH6303_TouchInputMap	Maps the raw touch input to display resolution.
	DRV_MTCH6303_TouchInputRead	Schedules a non-blocking read buffer request to read touch input from MTCH6303.
	DRV_MTCH6303_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

e) Data Types and Constants

	Name	Description
	DRV_MTCH6303_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_MTCH6303_TOUCH_NUM_INPUTS	Definition of number of touch input packets can be identified by MTCH6303.
	DRV_MTCH6303_BUFFER_EVENT	Lists the different conditions that happens during a buffer transfer.
	DRV_MTCH6303_BUFFER_EVENT_HANDLER	Points to a callback after completion of an register read -write or message stream read - write.
	DRV_MTCH6303_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.
	DRV_MTCH6303_CLIENT_STATUS	Defines the client-specific status of the MTCH6303 driver.
	DRV_MTCH6303_ERROR	Defines the possible errors that can occur during driver operation.
	DRV_MTCH6303_TOUCH_BUFFER_EVENT	Lists the different conditions that happens during a touch message buffer transfer.
	DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER	Points to a callback after completion of an message report read or message command write.

	DRV_MTCH6303_TOUCH_BUFFER_HANDLE	Handle identifying a read or write touch message buffer passed to the driver.
	DRV_MTCH6303_TOUCH_DATA	Defines MTCH6303 I2C Touch Data
	DRV_MTCH6303_TOUCH_INPUT	Defines MTCH6303 Touch Input Packet
	DRV_MTCH6303_TOUCH_MESSAGE	Defines MTCH6303 Touch Message.
	DRV_MTCH6303_TOUCH_MESSAGE_HEADER	Defines Touch Message Header.
	DRV_MTCH6303_TOUCH_NIBBLE_0	Defines the I2C Nibble 0 of MTCH6303 Touch input packet.
	DRV_MTCH6303_TOUCH_STATUS	Defines the I2C touch status register bits
	DRV_TOUCH_MTCH6303_MSG_ID	List of report or command message identification.
	DRV_TOUCH_MTCH6303_I2C_REGISTER_MAP	List of MTCH6303 I2C Accessible Register Identification.

Description

This section describes the API functions of the MTCH6303 Touch Driver library.

Refer to each section for a detailed description.

a) System Functions

DRV_MTCH6303_Deinitialize Function

Deinitializes the instance of the MTCH6303 driver module.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_Deinitialize();
```

Returns

None.

Description

Deinitializes the instance of the MTCH6303 driver module, disabling its operation. Invalidates all the internal data.

Remarks

once the initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. this routine will NEVER block waiting for hardware.

Preconditions

Function DRV_MTCH6303_Initialize should have been called before calling this function.

Example

```
SYS_STATUS    status;

DRV_MTCH6303_Deinitialize();

status = DRV_MTCH6303_Status();
if(SYS_MODULE_DEINITIALIZED != status)
{
    //check again later if you need to know
    //when the driver is deinitialized
}
```

Function

void DRV_MTCH6303_Deinitialize(void)

DRV_MTCH6303_Initialize Function

Initializes the MTCH6303 static single instance.

File

drv_mtch6303.h

C

```
SYS_MODULE_OBJ DRV_MTCH6303_Initialize();
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the MTCH6303 static driver instance. It makes the instance ready for a client to open and use it. The instance parameters are initialized by values set by MPLAB Harmony Configurator.

Preconditions

None.

Example

```
// The following code snippet shows an example MTCH6303 driver initialization.

SYS_MODULE_OBJ    objectHandle;

objectHandle = DRV_MTCH6303_Initialize();
if( SYS_MODULE_OBJ_INVALID == objectHandle )
{
   // Handle error
}
Remarks:   This routine must be called before any other MTCH6303 routine is called.

   This routine should only be called once during system initialization unless
   DRV_MTCH6303_Deinitialize is called to deinitialize the driver instance.
   This routine will NEVER block for hardware access.
```

Function

SYS_MODULE_OBJ DRV_MTCH6303_Initialize (void)

DRV_MTCH6303_Status Function

Gets the current status of the MTCH6303 driver module.

File

drv_mtch6303.h

C

```
SYS_STATUS DRV_MTCH6303_Status();
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another.

SYS_STATUS_DEINITIALIZED - Indicates that the driver has been deinitialized.

Description

This routine provides the current status of the MTCH6303 driver module.

Remarks

A driver can opened only when its status is SYS_STATUS_READY.

Preconditions

Function DRV_MTCH6303_Initialize should have been called before calling this function.

Example

```
SYS_STATUS mtch6303Status;

mtch6303Status = DRV_MTCH6303_Status();
if(SYS_STATUS_READY == mtch6303Status)
```

```
{
    // This means the driver can be opened using the
    // DRV_MTCH6303_Open() function.
}
```

Function

SYS_STATUS DRV_MTCH6303_Status(void)

DRV_MTCH6303_Tasks Function

Maintains the driver's register read/write state machine and implements its ISR.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_Tasks();
```

Returns

None.

Description

This routine is used to maintain the driver's register read/write state machine and implement its ISR for interrupt-driven implementations. In interrupt mode, this function is called in I2C Driver event Handler routine. The I2C Driver event Handler routine is registered by MTCH6303 event Handler register routine.

Remarks

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

Function DRV_MTCH6303_Initialize should have been called before calling this function. It also needs registration of the MTCH6303 Driver event handler routine.

Function

void DRV_MTCH6303_Tasks(void)

b) Client Setup Functions

DRV_MTCH6303_Close Function

Closes an opened-instance of the MTCH6303 driver.

File

drv_mtch6303.h

C

```
DRV_MTCH6303_CLIENT_STATUS DRV_MTCH6303_Close();
```

Returns

DRV_MTCH6303_CLIENT_STATUS_ERROR - if driver fails to remove buffer objects from queue.

DRV_MTCHC6303_CLIENT_STATUS_CLOSED - client is successfully closed

Description

This routine closes an opened-instance of the MTCH6303 driver. Any buffers in the driver queue that were submitted by this client will be removed. DRV_MTCH6303_Open must be called to before using the driver again.

Remarks

The driver will abort any ongoing operations when this routine is called.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called. DRV_MTCH6303_Open must have been called.

Example

```
DRV_MTH6303_CLIENT_STATUS mtch6303Status;

mtch6303Status = DRV_MTCH6303_Close()
if( DRV_MTCH6303_CLIENT_STATUS_ERROR == mtch6303Status )
{
    //retry closing the driver client
}
```

Function

DRV_MTCH6303_CLIENT_STATUS DRV_MTCH6303_Close (void)

DRV_MTCH6303_ErrorGet Function

This function returns the error associated with the last client request.

File

drv_mtch6303.h

C

```
DRV_MTCH6303_ERROR DRV_MTCH6303_ErrorGet();
```

Returns

DRV_MTCH6303_ERROR_NONE - no error

Description

This function returns the error associated with the last client request.

Remarks

This routine always return DRV_MTCH6303_ERROR_NONE the client error is currently not updated by any of the MTCH6303 operations API's.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called. DRV_MTCH6303_Open must have been called to open a device client.

Function

DRV_MTCH6303_ERROR DRV_MTCH6303_ErrorGet (void)

DRV_MTCH6303_Open Function

Opens the MTCH6303 driver instance and returns a handle to it.

File

drv_mtch6303.h

C

```
DRV_HANDLE DRV_MTCH6303_Open();
```

Returns

If successful, the routine returns a valid open-instance handle. If an error occurs, the return value is DRV_HANDLE_INVALID. Error can occur

- if the driver is not ready to be opened, typically when the initialize routine has not completed execution.
- if the bus driver fails to open
- if the client is trying to open the driver but driver has been opened exclusively by another client.

Description

This routine opens the specified MTCH6303 driver instance and provides a handle.

Remarks

The handle returned is valid until the DRV_MTCH6303_Close routine is called. This routine will NEVER block waiting for hardware.If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application.

Preconditions

Function DRV_MTCH6303_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_MTCH6303_Open( );
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

Function

DRV_HANDLE DRV_MTCH6303_Open { void }

c) Read and Write Functions

DRV_MTCH6303_AddRegisterRead Function

Schedules a non-blocking register read request to read I2C accessible MTCH6303 registers.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_AddRegisterRead(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle, uint8_t source, size_t nBytes,
uint8_t * destination);
```

Returns

None.

Description

This function schedules a non-blocking register read request to read I2C accessible MTCH6303 registers. The function returns with a valid buffer handle in the bufferHandle argument if the register read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_MTCH6303_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. The register data is collected into destination and can be read once a buffer event complete is reported. A event handler is called on buffer event complete where the register data must be read from destination.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t registerData[NUM_REGISTERS];
DRV_MTCH6303_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver

DRV_MTCH6303_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                    (uintptr_t)&myAppObj);

DRV_MTCH6303_AddRegisterRead( &bufferHandle,
                              DRV_MTCH6303_REG_TOUCH_STATUS,
                              NUM_REGISTERS,
                              &registerData );
```

```
if(DRV_MTCH6303_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_BUFFER_EVENT event,
                                     DRV_MTCH6303_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
Remarks:   None.
```

Parameters

Parameters	Description
bufferHandle	Handle to the buffer scheduled.
source	Register index.
nBytes	Number of registers to be read, starting from source.
destination	buffer collecting register data.

Function

void DRV_MTCH6303_AddRegisterRead(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle,

uint8_t source,

size_t nBytes,

uint8_t * destination)

DRV_MTCH6303_AddRegisterWrite Function

Schedule a non-blocking driver register write operation to write I2C accessible MTCH6303 registers.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_AddRegisterWrite(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle, uint8_t destination, size_t
nBytes, uint8_t * source);
```

Returns

None.

Description

This function schedules a non-blocking register write request to write I2C accessible MTCH6303 registers. The function returns with a valid buffer handle in the bufferHandle argument if the register write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be

modified. The function returns DRV_MTCH6303_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the write queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. A event handler is called on buffer event complete where the application data is written to the I2C accessible MTCH6303 Register.

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t registerData[NUM_REGISTERS];
DRV_MTCH6303_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver

DRV_MTCH6303_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                    (uintptr_t)&myAppObj);

DRV_MTCH6303_AddRegisterWrite( &bufferHandle,
                               DRV_MTCH6303_REG_TOUCH_STATUS,
                               NUM_REGISTERS,
                               &registerData );

if(DRV_MTCH6303_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_BUFFER_EVENT event,
                                     DRV_MTCH6303_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferHandle	Pointer to an argument that will contain the return buffer handle.
destination	Index to the start of destination register list.
nBytes	number of registers.
source	pointer to the data to be written to the register.

Function

void DRV_MTCH6303_AddRegisterWrite(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle,
uint8_t destination,
size_t nBytes,
uint8_t * source)

DRV_MTCH6303_TOUCH_AddMessageCommandWrite Function

Schedule a non-blocking driver command message write operation to write command message to MTCH6303 registers.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TOUCH_AddMessageCommandWrite(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_MESSAGE * messageCmd, size_t messageSize);
```

Returns

None.

Description

This function schedules a non-blocking command message write request to write command message to MTCH6303. The function returns with a valid buffer handle in the bufferHandle argument if the register command message write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application message buffer is owned by the driver and should not be modified. The function returns DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the message write queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. A event handler is called on buffer event complete where the application command message is written to MTCH6303.

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
DRV_MTCH6303_TOUCH_MESSAGE messageCommand;
DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver

DRV_MTCH6303_TOUCH_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                          (uintptr_t)&myAppObj);

DRV_MTCH6303_TOUCH_AddMessageCommandWrite( &bufferHandle,
                                           &messageCommand,
```

```
                                        MY_MESSAGE_SIZE );

if(DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
                                     DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferHandle	Pointer to an argument that will contain the return buffer handle.
messageCmd	command message to write to MTCH6303.
messageSize	command message size. It includes message header and payload size.

Function

void DRV_MTCH6303_TOUCH_AddMessageCommandWrite
(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_MESSAGE * messageCmd,
size_t messageSize)

DRV_MTCH6303_TOUCH_AddMessageReportRead Function

Schedules a non-blocking report message read request to read the report message from MTCH6303 device.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TOUCH_AddMessageReportRead(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_MESSAGE * messageRep, size_t messageSize);
```

Returns

None.

Description

This function schedules a non-blocking report message read request to read the report message from MTCH6303 device. The function returns with a valid buffer handle in the bufferHandle argument if the register read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. The register data is collected into destination and can be read once a buffer event complete is reported. A event handler is called on buffer event complete where the register data must be read from destination.

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
DRV_MTCH6303_TOUCH_MESSAGE messageReport;
DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver

DRV_MTCH6303_TOUCH_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                          (uintptr_t)&myAppObj);

DRV_MTCH6303_TOUCH_AddMessageReportRead( &bufferHandle,
                                         &messageReport,
                                         MY_MESSAGE_SIZE );

if(DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
                                     DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferHandle	Handle to the buffer scheduled.
messageRep	report message buffer.
messageSize	report message size. It includes message header and payload size.

Function

void DRV_MTCH6303_TOUCH_AddMessageReportRead
(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_MESSAGE * messageRep,
size_t messageSize)

DRV_MTCH6303_TOUCH_AddTouchInputRead Function

Schedules a non-blocking read buffer request to read touch input from MTCH6303.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TOUCH_AddTouchInputRead(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_DATA * touchData);
```

Returns

None.

Description

This function schedules a non-blocking read buffer request to read touch input from MTCH6303. The function returns with a valid buffer handle in the bufferHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. The touch data is collected into touchData and can be read once a buffer event complete is reported. A event handler is called on buffer event complete where the touch data must be read from touchData.

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
DRV_MTCH6303_TOUCH_DATA touchData;
DRV_MTCH6303_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver

DRV_MTCH6303_TOUCH_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                          (uintptr_t)&myAppObj);

DRV_MTCH6303_TOUCH_AddTouchInputRead( &bufferHandle, &touchData );

if(DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID == bufferHandle)
{
```

```
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
                                     DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferHandle	Handle to the buffer scheduled.
touchData	Buffer collecting touch data.

Function

void DRV_MTCH6303_TOUCH_AddTouchInputRead
(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_DATA * touchData)

DRV_MTCH6303_TOUCH_BufferEventHandlerSet Function

Allows a client to identify a buffer event handling function for the driver to call back when queued message transfers have finished.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TOUCH_BufferEventHandlerSet(const DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER eventHandler,
const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify a message event handling function for the driver to call back when queued message transfers have finished. When a client calls either the DRV_MTCH6303_TOUCH_AddTouchInputRead, DRV_MTCH6303_TOUCH_AddMessageReportRead or DRV_MTCH6303_TOUCH_AddMessageCommandWrite function, it is provided with a handle identifying the message that was added to the driver's message queue. The driver will pass this handle back to the client by calling "eventHandler" function when the message transfer has completed.

The event handler should be set before the client performs any "message add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;
DRV_MTCH6303_TOUCH_MESSAGE messageReport;
DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle;

// myMTCH6303Handle is the handle returned
// by the DRV_MTCH6303_Open function.

// Client registers an event handler with driver. This is done once

DRV_MTCH6303_TOUCH_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                  (uintptr_t)&myAppObj );

DRV_MTCH6303_TOUCH_AddMessageReportRead( &bufferHandle, &messageReport );

if(DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
                                     DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_MTCH6303_TOUCH_BufferEventHandlerSet

(

const DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER eventHandler,

const uintptr_t context

)

DRV_MTCH6303_TOUCH_Tasks Function

Maintains the driver's message state machine and implements its ISR.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TOUCH_Tasks();
```

Returns

None.

Description

This routine is used to maintain the driver's message state machine and implement its ISR for interrupt-driven implementations. In interrupt mode, this function is called in I2C Driver event Handler routine. The I2C Driver event Handler routine is registered by MTCH6303 Touch event Handler register routine.

Remarks

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

Function DRV_MTCH6303_Initialize should have been called before calling this function. It also needs registration of the MTCH6303 Driver Touch event handler routine.

Function

void DRV_MTCH6303_TOUCH_Tasks(void)

DRV_MTCH6303_TouchInputMap Function

Maps the raw touch input to display resolution.

File

drv_mtch6303.h

C

```
inline uint16_t DRV_MTCH6303_TouchInputMap(uint16_t touchValue, uint16_t dispResolution);
```

Returns

This function returns the raw touch input mapped to display resolution in form of number of pixels.

Description

This function maps the raw touch input to display resolution. Raw touch input touchValue is obtained from the individual x or y value of DRV_MTCH6303_TOUCH_DATA. Raw touch value varies from 0 to 0x7FFF. The displayResolution is either horizontal or vertical resolution of the display in pixels. The function returns the raw touch input mapped to display resolution in form of number of pixels.

Remarks

None.

Preconditions

None.

Example

```
// Display with resolution 800 x 480
#define DISP_HOR_RESOUTION  800
#define DISP_VER_RESOLUTION 480

DRV_MTCH6303_TOUCH_DATA touchData;
uint16_t rawTouchX;
uint16_t rawTouchY;
uint16_t touchX;
uint16_t touchY;
```

```
// map 0th touch packet to display resolution
rawTouchX = touchData.touch[0].x;
rawTouchY = touchData.touch[0].y;

// map raw touch input in x direction to display horizontal resolution
touchX = DRV_MTCH6303_TouchInputMap( rawTouchX, DISP_HOR_RESOLUTION );

// map raw touch input in y direction to display vertical resolution
touchY = DRV_MTCH6303_TouchInputMap( rawTouchY, DISP_VER_RESOLUTION );

// use touchX and touchY as input to graphics objects.
```

Parameters

Parameters	Description
touchValue	raw touch input either in x or y direction (0 - 0x7FFF).
dispResolution	display resolution specifying either width or height of the display in pixels.

Function

uint16_t DRV_MTCH6303_TouchInputMap(uint16_t touchValue, uint16_t dispResolution)

DRV_MTCH6303_TouchInputRead Function

Schedules a non-blocking read buffer request to read touch input from MTCH6303.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TouchInputRead(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle, DRV_MTCH6303_TOUCH_DATA *
touchData);
```

Returns

None.

Description

This function schedules a non-blocking read buffer request to read touch input from MTCH6303. The function returns with a valid buffer handle in the bufferHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_MTCH6303_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. The touch data is collected into touchData and can be read once a buffer event complete is reported. A event handler is called on buffer event complete where the touch data must be read from touchData.

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
DRV_MTCH6303_TOUCH_DATA touchData;
DRV_MTCH6303_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver

DRV_MTCH6303_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                    (uintptr_t)&myAppObj);
```

```
DRV_MTCH6303_TouchInputRead( &bufferHandle, &touchData );

if(DRV_MTCH6303_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_BUFFER_EVENT event,
                                     DRV_MTCH6303_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferHandle	Handle to the buffer scheduled.
touchData	Buffer collecting touch data.

Function

void DRV_MTCH6303_TouchInputRead(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_DATA * touchData)

DRV_MTCH6303_BufferEventHandlerSet Function

Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_BufferEventHandlerSet(const DRV_MTCH6303_BUFFER_EVENT_HANDLER eventHandler, const
uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. When a client calls either the DRV_MTCH6303_TouchInputRead, DRV_MTCH6303_AddRegisterRead or DRV_MTCH6303_AddRegisterWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "buffer add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];

// myMTCH6303Handle is the handle returned
// by the DRV_MTCH6303_Open function.

// Client registers an event handler with driver. This is done once

DRV_MTCH6303_BufferEventHandlerSet( APP_MTCH6303BufferEventHandle,
                                    (uintptr_t)&myAppObj );

DRV_MTCH6303_AddRegisterRead( &bufferHandle
                              DRV_MTCH6303_REG_TOUCH_STATUS,
                              MY_BUFFER_SIZE,
                              &mybuffer);

if(DRV_MTCH6303_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandle( DRV_MTCH6303_BUFFER_EVENT event,
                                    DRV_MTCH6303_BUFFER_HANDLE handle,
                                    uintptr_t context)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_MTCH6303_BufferEventHandlerSet
(
const DRV_MTCH6303_BUFFER_EVENT_HANDLER eventHandler,
const uintptr_t context
)

e) Data Types and Constants

DRV_MTCH6303_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_mtch6303.h

C

```
#define DRV_MTCH6303_BUFFER_HANDLE_INVALID
```

Description

MTCH6303 Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_MTCH6303_AddRegisterRead, DRV_MTCH6303_AddRegisterWrite or DRV_MTCH6303_TouchInputRead functions if the request was not successful.

Remarks

None

DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_mtch6303.h

C

```
#define DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID
```

Description

MTCH6303 Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_MTCH6303_TOUCH_AddMessageReportRead, DRV_MTCH6303_TOUCH_AddMessageCommandWrite or DRV_MTCH6303_TOUCH_AddTouchInputRead functions if the request was not successful.

Remarks

None

DRV_MTCH6303_TOUCH_NUM_INPUTS Macro

Definition of number of touch input packets can be identified by MTCH6303.

File

drv_mtch6303.h

C

```
#define DRV_MTCH6303_TOUCH_NUM_INPUTS 0xA
```

Description

MTCH6303 Number of touch input packets

MTCH6303 supports multi-touch and can identify upto 10 different touch input packets.

Remarks

None.

DRV_MTCH6303_BUFFER_EVENT Enumeration

Lists the different conditions that happens during a buffer transfer.

File

drv_mtch6303.h

C

```
typedef enum {
  DRV_MTCH6303_BUFFER_EVENT_COMPLETE,
  DRV_MTCH6303_BUFFER_EVENT_ERROR,
  DRV_MTCH6303_BUFFER_EVENT_ABORT
} DRV_MTCH6303_BUFFER_EVENT;
```

Members

Members	Description
DRV_MTCH6303_BUFFER_EVENT_COMPLETE	Event buffer transfer complete
DRV_MTCH6303_BUFFER_EVENT_ERROR	Event buffer transfer error
DRV_MTCH6303_BUFFER_EVENT_ABORT	Event buffer transfer abort

Description

MTCH6303 Buffer Events

This enumeration identifies the different conditions that can happen during a buffer transaction. Callbacks can be made with the appropriate buffer condition passed as a parameter to execute the desired action.

The values act like flags and multiple flags can be set.

Remarks

None.

DRV_MTCH6303_BUFFER_EVENT_HANDLER Type

Points to a callback after completion of an register read -write or message stream read - write.

File

drv_mtch6303.h

C

```
typedef void (* DRV_MTCH6303_BUFFER_EVENT_HANDLER)(DRV_MTCH6303_BUFFER_EVENT event,
DRV_MTCH6303_BUFFER_HANDLE bufferHandle, uintptr_t context);
```

Description

MTCH6303 Buffer Event Callback

This type identifies the MTCH6303 Buffer Event. It allows the client driver to register a callback using DRV_MTCH6303_BUFFER_EVENT_HANDLER. By using this mechanism, the driver client will be notified at the completion of the corresponding transfer.

Remarks

A transfer can be composed of various transfer segments. Once a transfer is completed the driver will call the client registered transfer callback.

The callback could be called from ISR context and should be kept as short as possible. It is meant for signaling and it should not be blocking.

Parameters

Parameters	Description
DRV_MTCH6303_BUFFER_EVENT	Status of MTCH6303 transfer

bufferHandle	Handle that identifies the particular Buffer Object
context	pointer to the object to be processed.

Function

void (*DRV_MTCH6303_BUFFER_EVENT_HANDLER) (DRV_MTCH6303_BUFFER_EVENT event,
DRV_MTCH6303_BUFFER_HANDLE bufferHandle,
uintptr_t context)

DRV_MTCH6303_BUFFER_HANDLE Type

Handle identifying a read or write buffer passed to the driver.

File

drv_mtch6303.h

C

```
typedef uintptr_t DRV_MTCH6303_BUFFER_HANDLE;
```

Description

MTCH6303 Driver Buffer Handle

A buffer handle value is returned by a call to the DRV_MTCH6303_AddRegisterRead, DRV_MTCH6303_AddRegisterWrite or DRV_MTCH6303_TouchInputRead functions. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from these functions is returned back to the client by the "event handler callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None

DRV_MTCH6303_CLIENT_STATUS Enumeration

Defines the client-specific status of the MTCH6303 driver.

File

drv_mtch6303.h

C

```
typedef enum {
  DRV_MTCH6303_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR,
  DRV_MTCH6303_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED,
  DRV_MTCH6303_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY,
  DRV_MTCH6303_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY
} DRV_MTCH6303_CLIENT_STATUS;
```

Members

Members	Description
DRV_MTCH6303_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR	An error has occurred.
DRV_MTCH6303_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED	The driver is closed, no operations for this client are ongoing, and/or the given handle is invalid.
DRV_MTCH6303_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY	The driver is currently busy and cannot start additional operations.
DRV_MTCH6303_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY	The module is running and ready for additional operations

Description

MTCH6303 Client-Specific Driver Status

This enumeration defines the client-specific status codes of the MTCH6303 driver.

Remarks

Returned by the DRV_MTCH6303_ClientStatus function.

DRV_MTCH6303_ERROR Enumeration

Defines the possible errors that can occur during driver operation.

File

drv_mtch6303.h

C

```
typedef enum {
} DRV_MTCH6303_ERROR;
```

Description

MTCH6303 Driver Errors.

This data type defines the possible errors that can occur when occur during MTCH6303 driver operation. These values are returned by DRV_MTCH6303_ErrorGet function.

Remarks

None

DRV_MTCH6303_TOUCH_BUFFER_EVENT Enumeration

Lists the different conditions that happens during a touch message buffer transfer.

File

drv_mtch6303.h

C

```
typedef enum {
  DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE,
  DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR,
  DRV_MTCH6303_TOUCH_BUFFER_EVENT_ABORT
} DRV_MTCH6303_TOUCH_BUFFER_EVENT;
```

Members

Members	Description
DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE	Event touch message buffer transfer complete
DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR	Event touch message buffer transfer error
DRV_MTCH6303_TOUCH_BUFFER_EVENT_ABORT	Event touch message buffer transfer abort

Description

MTCH6303 Touch Message Buffer Events

This enumeration identifies the different conditions that can happen during a touch message buffer transaction. Callbacks can be made with the appropriate touch message buffer condition passed as a parameter to execute the desired action.

The values act like flags and multiple flags can be set.

Remarks

None.

DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER Type

Points to a callback after completion of an message report read or message command write.

File

drv_mtch6303.h

C

```
typedef void (* DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER)(DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle, uintptr_t context);
```

Description

MTCH6303 Touch Buffer Event Callback

This type identifies the MTCH6303 Touch Buffer Event. It allows the client driver to register a callback using DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER. By using this mechanism, the driver client will be notified at the completion of the corresponding transfer.

Remarks

A transfer can be composed of various transfer segments. Once a transfer is completed the driver will call the client registered transfer callback.

The callback could be called from ISR context and should be kept as short as possible. It is meant for signaling and it should not be blocking.

Parameters

Parameters	Description
DRV_MTCH6303_TOUCH_BUFFER_EVENT	Status of MTCH6303 touch message transfer
bufferHandle	Handle that identifies the particular Buffer Object
context	pointer to the object to be processed.

Function

void (*DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER) (DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle,
uintptr_t context)

DRV_MTCH6303_TOUCH_BUFFER_HANDLE Type

Handle identifying a read or write touch message buffer passed to the driver.

File

drv_mtch6303.h

C

```
typedef uintptr_t DRV_MTCH6303_TOUCH_BUFFER_HANDLE;
```

Description

MTCH6303 Driver Touch Message Queue Buffer Handle

A touch message buffer handle value is returned by a call to the DRV_MTCH6303_TOUCH_AddMessageReportRead, DRV_MTCH6303_TOUCH_AddMessageCommandWrite or DRV_MTCH6303_TOUCH_AddTouchInputRead. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from these functions is returned back to the client by the "event handler callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_MTCH6303_TOUCH_DATA Structure

Defines MTCH6303 I2C Touch Data

File

drv_mtch6303.h

C

```
typedef struct {
  uint8_t i2cReadAddr;
  DRV_MTCH6303_TOUCH_STATUS status;
  DRV_MTCH6303_TOUCH_INPUT touch[ DRV_MTCH6303_TOUCH_NUM_INPUTS ];
} DRV_MTCH6303_TOUCH_DATA;
```

Members

Members	Description
uint8_t i2cReadAddr;	Dummy I2C Read Address required for bitbang driver
DRV_MTCH6303_TOUCH_STATUS status;	MTCH6303 Touch Status
DRV_MTCH6303_TOUCH_INPUT touch[DRV_MTCH6303_TOUCH_NUM_INPUTS];	MTCH6303 Touch Input array of size DRV_MTCH6303_TOUCH_NUM_INPUTS

Description

MTCH6303 I2C Touch Data

This structure defines MTCH6303 I2C Touch Data. The structure DRV_MTCH6303_TOUCH_DATA is passed to API's DRV_MTCH6303_AddRegisterRead or DRV_MTCH6303_TOUCH_AddTouchInputRead. The API's will update the structure with touch input.

Remarks

It is packed to form structure of size 62 bytes. The structure member i2cReadAddr is only applicable if the I2C driver is of type bitbang. Otherwise the variable required to be commented out.

DRV_MTCH6303_TOUCH_INPUT Structure

Defines MTCH6303 Touch Input Packet

File

drv_mtch6303.h

C

```
typedef struct {
  DRV_MTCH6303_TOUCH_NIBBLE_0 nibble_0;
  uint8_t touchId;
  uint16_t x;
  uint16_t y;
} DRV_MTCH6303_TOUCH_INPUT;
```

Members

Members	Description
DRV_MTCH6303_TOUCH_NIBBLE_0 nibble_0;	MTCH6303 I2C Touch Input Packet Nibble 0
uint8_t touchId;	MTCH6303 I2C Touch Input Packet ID (0 - 16)
uint16_t x;	MTCH6303 I2C Touch Input Packet position x (0 - 0x7FFF)
uint16_t y;	MTCH6303 I2C Touch Input Packet position y (0 - 0x7FFF)

Description

MTCH6303 Touch Input Packet.

This structure defines the MTCH6303 Touch Input Packet.

Remarks

It is part of DRV_MTCH6303_TOUCH_DATA structure. It is packed to form structure of size 6 bytes.

DRV_MTCH6303_TOUCH_MESSAGE Structure

Defines MTCH6303 Touch Message.

File

drv_mtch6303.h

C

```
typedef struct {
  DRV_MTCH6303_TOUCH_MESSAGE_HEADER header;
  uint8_t payload[0x3E];
} DRV_MTCH6303_TOUCH_MESSAGE;
```

Members

Members	Description
DRV_MTCH6303_TOUCH_MESSAGE_HEADER header;	MTCH6303 Touch Message Header
uint8_t payload[0x3E];	MTCH6303 Touch Message payload. First byte of payload is of type DRV_TOUCH_MTCH6303_MSG_ID in case of first fragment of message. Otherwise the first byte acts as a normal payload.

Description

MTCH6303 Touch Message

This structure defines MTCH6303 Touch Message. The variable pointer of type DRV_MTCH6303_TOUCH_MESSAGE is passed to the API's

DRV_MTCH6303_TOUCH_AddMessageReportRead or DRV_MTCH6303_TOUCH_AddMessageCommandWrite.

Remarks

It is packed to form structure of size 63 bytes.

DRV_MTCH6303_TOUCH_MESSAGE_HEADER Structure

Defines Touch Message Header.

File

drv_mtch6303.h

C

```
typedef struct {
  uint32_t msgFragSize : 6;
  uint32_t continued : 1;
  uint32_t moreMessages : 1;
} DRV_MTCH6303_TOUCH_MESSAGE_HEADER;
```

Members

Members	Description
uint32_t msgFragSize : 6;	MTCH6303 Message Fragment Size. If Message Fragment size is 0x3F the Fragment is incomplete and uses up ALL of the parent transport layer packet.
uint32_t continued : 1;	MTCH6303 Message continued from last fragment if set to 1.
uint32_t moreMessages : 1;	MTCH6303 more messages to follow in this block if set to 1.

Description

MTCH6303 Touch Message Header

This structure defines Touch Message Header.

Remarks

It is part of structure DRV_MTCH6303_TOUCH_MESSAGE. It is packed to form structure of size 1 byte.

DRV_MTCH6303_TOUCH_NIBBLE_0 Structure

Defines the I2C Nibble 0 of MTCH6303 Touch input packet.

File

drv_mtch6303.h

C

```
typedef struct {
  uint32_t touchState : 1;
  uint32_t inRange : 1;
  uint32_t reserved : 6;
} DRV_MTCH6303_TOUCH_NIBBLE_0;
```

Members

Members	Description
uint32_t touchState : 1;	Touch packet available
uint32_t inRange : 1;	Touch packet in range
uint32_t reserved : 6;	Reserved bits

Description

MTCH6303 I2C Touch Input Packet Nibble 0

This structure defines the I2C Nibble 0 of MTCH6303 Touch input packet.

Remarks

It is part of DRV_MTCH6303_TOUCH_INPUT structure. It is packed to form structure of size 1 byte.

DRV_MTCH6303_TOUCH_STATUS Structure

Defines the I2C touch status register bits

File

drv_mtch6303.h

C

```
typedef struct {
  uint32_t nTouch : 4;
  uint32_t streamReady : 1;
  uint32_t gestureReady : 1;
  uint32_t gestICData : 1;
  uint32_t reserved : 1;
} DRV_MTCH6303_TOUCH_STATUS;
```

Members

Members	Description
uint32_t nTouch : 4;	Number of available touch packets
uint32_t streamReady : 1;	stream data ready
uint32_t gestureReady : 1;	gesture data ready
uint32_t gestICData : 1;	GestIC data ready
uint32_t reserved : 1;	reserved bit

Description

MTCH6303 I2C touch status

This structure defines the I2C touch status register bits.

Remarks

It is part of DRV_MTCH6303_TOUCH_DATA structure. It is packed to form structure of size 1 byte.

DRV_TOUCH_MTCH6303_MSG_ID Enumeration

List of report or command message identification.

File

drv_mtch6303.h

C

```
typedef enum {
  DRV_TOUCH_MTCH6303_MSG_CMD_QUERY_VERSION
} DRV_TOUCH_MTCH6303_MSG_ID;
```

Members

Members	Description
DRV_TOUCH_MTCH6303_MSG_CMD_QUERY_VERSION	Message sends firmware version query command. Bytes 124:127 = Rev[2].Minor.Major

Description

MTCH6303 Touch message Identification.

This enumeration identifies the different report or command messages supported by MTCH6303. This identifier identifies the type of the message. The identifier is passed in the message DRV_MTCH6303_TOUCH_MESSAGE as first byte of the payload. It is applicable only for first fragment of message. If message involves multiple fragments, the payload of message fragments other than first fragment should start with normal payload byte. The touch message is read or send to MTCH6303 by using DRV_MTCH6303_TOUCH_AddMessageReportRead or DRV_MTCH6303_TOUCH_AddMessageCommandWrite.

Remarks

To be passed as first byte of message payload. Applicable only for first fragment of message.

DRV_TOUCH_MTCH6303_I2C_REGISTER_MAP Enumeration

List of MTCH6303 I2C Accessible Register Identification.

File

drv_mtch6303.h

C

```
typedef enum {
} DRV_TOUCH_MTCH6303_I2C_REGISTER_MAP;
```

Description

MTCH6303 I2C Accessible Register Identification.

This enumeration identifies the different I2C accessible MTCH6303 Registers. The identifier is passed as source to the register read routine or as destination to the register write routine. The MTCH6303 driver routine to read the I2C accessible MTCH6303 registers is DRV_MTCH6303_AddRegisterRead. The MTCH6303 driver routine to write the I2C accessible MTCH6303 registers is DRV_MTCH6303_AddRegisterWrite.

Remarks

To read or write multiple registers, identifier of only first register is sufficient as source or destination respectively.

	Name	Description
	DRV_MTCH6303_BUFFER_EVENT	Lists the different conditions that happens during a buffer transfer.
	DRV_MTCH6303_CLIENT_STATUS	Defines the client-specific status of the MTCH6303 driver.
	DRV_MTCH6303_ERROR	Defines the possible errors that can occur during driver operation.
	DRV_MTCH6303_TOUCH_BUFFER_EVENT	Lists the different conditions that happens during a touch message buffer transfer.
	DRV_TOUCH_MTCH6303_I2C_REGISTER_MAP	List of MTCH6303 I2C Accessible Register Identification.
	DRV_TOUCH_MTCH6303_MSG_ID	List of report or command message identification.

Functions

	Name	Description
	DRV_MTCH6303_AddRegisterRead	Schedules a non-blocking register read request to read I2C accessible MTCH6303 registers.
	DRV_MTCH6303_AddRegisterWrite	Schedule a non-blocking driver register write operation to write I2C accessible MTCH6303 registers.
	DRV_MTCH6303_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.
	DRV_MTCH6303_Close	Closes an opened-instance of the MTCH6303 driver.
	DRV_MTCH6303_Deinitialize	Deinitializes the instance of the MTCH6303 driver module.
	DRV_MTCH6303_ErrorGet	This function returns the error associated with the last client request.
	DRV_MTCH6303_Initialize	Initializes the MTCH6303 static single instance.
	DRV_MTCH6303_Open	Opens the MTCH6303 driver instance and returns a handle to it.
	DRV_MTCH6303_Status	Gets the current status of the MTCH6303 driver module.

	DRV_MTCH6303_Tasks	Maintains the driver's register read/write state machine and implements its ISR.
	DRV_MTCH6303_TOUCH_AddMessageCommandWrite	Schedule a non-blocking driver command message write operation to write command message to MTCH6303 registers.
	DRV_MTCH6303_TOUCH_AddMessageReportRead	Schedules a non-blocking report message read request to read the report message from MTCH6303 device.
	DRV_MTCH6303_TOUCH_AddTouchInputRead	Schedules a non-blocking read buffer request to read touch input from MTCH6303.
	DRV_MTCH6303_TOUCH_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued message transfers have finished.
	DRV_MTCH6303_TOUCH_Tasks	Maintains the driver's message state machine and implements its ISR.
	DRV_MTCH6303_TouchInputMap	Maps the raw touch input to display resolution.
	DRV_MTCH6303_TouchInputRead	Schedules a non-blocking read buffer request to read touch input from MTCH6303.

Macros

	Name	Description
	DRV_MTCH6303_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_MTCH6303_TOUCH_NUM_INPUTS	Definition of number of touch input packets can be identified by MTCH6303.

Structures

	Name	Description
	DRV_MTCH6303_TOUCH_DATA	Defines MTCH6303 I2C Touch Data
	DRV_MTCH6303_TOUCH_INPUT	Defines MTCH6303 Touch Input Packet
	DRV_MTCH6303_TOUCH_MESSAGE	Defines MTCH6303 Touch Message.
	DRV_MTCH6303_TOUCH_MESSAGE_HEADER	Defines Touch Message Header.
	DRV_MTCH6303_TOUCH_NIBBLE_0	Defines the I2C Nibble 0 of MTCH6303 Touch input packet.
	DRV_MTCH6303_TOUCH_STATUS	Defines the I2C touch status register bits

Types

	Name	Description
	DRV_MTCH6303_BUFFER_EVENT_HANDLER	Points to a callback after completion of an register read -write or message stream read - write.
	DRV_MTCH6303_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.
	DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER	Points to a callback after completion of an message report read or message command write.
	DRV_MTCH6303_TOUCH_BUFFER_HANDLE	Handle identifying a read or write touch message buffer passed to the driver.

Description

MTCH6303 Driver Interface Declarations for Static Single Instance Driver

The MTCH6303 device driver provides a simple interface to manage the MTCH6303 module. This file defines the interface Declarations for the MTCH6303 driver.

Remarks

Static single instance driver interface eliminates the need for an object ID or object handle. Static single-open interfaces also eliminate the need for the open handle.

File Name

drv_mtch6303_static.h

Company

Microchip Technology Inc.

USB Driver Libraries

Common Interface

Provides information on the USB Driver interface that is common to all PIC32 devices.

Description

The USB Driver Common Interface definition specifies the functions and their behavior that a USB Driver must implement so that the driver can be used by the MPLAB Harmony USB Host and Device Stack.

Note: The MPLAB Harmony USB Driver for PIC32MX and PIC32MZ devices implements the USB Driver Common Interface.

The USB Driver Common Interface contains functions that are grouped as follows:

- *Driver System Functions* - These functions are called by MPLAB Harmony to initialize and maintain the operational state of the USB Driver. The system functions can vary between different PIC32 device USB Drivers. As such, the USB Driver Common Interface does not require these functions to be of the same type. These functions are not called by the USB Host or Device Stack and therefore are allowed to (and can) vary across different PIC32 device USB Drivers. A description of these functions, along with a description of how to initialize the USB Driver for Host, Device or Dual Role operation, is provided in the specific PIC32 device USB Driver help section (see PIC32MX USB Driver and PIC32MZ USB Driver).
- *Driver General Client Functions* -These functions are called by the USB Host or Device Stack to gain access to the driver
- *Driver Host Mode Client Functions* - These functions are called exclusively by the USB Host Stack to operate and access the USB as a Host
- *Driver Device Mode Client Functions* - These functions are called exclusively by the USB Device Stack to operate and access the USB as a Device

The USB Driver Common Interface is defined in the `<install-dir>\framework\driver\usb\drv_usb.h` file. This file contains the data types and structures that define the interface. Specifically, the DRV_USB_HOST_INTERFACE structure, contained in this file, is the common interface for USB Driver Host mode functions. It is a structure of function pointers, pointing to functions that define the Driver Host mode Client functions. The following code example shows this structure and the function pointer it contains.

```
// *****************************************************************************
/* USB Driver Client Functions Interface (For Host mode)

  Summary:
    Group of function pointers to the USB Driver Host mode Client Functions.

  Description:
    This structure is a group of function pointers pointing to the USB Driver
    Host mode Client routines. The USB Driver should export this group of
    functions so that the Host layer can access the driver functionality.

  Remarks:
    None.
*/

typedef struct
{
    /* This is a pointer to the driver Open function. This function may be
     * called twice in a Dual Role application, once by the Host Stack and then
     * by the Device Stack */
    DRV_HANDLE (*open)(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);

    /* This is pointer to the driver Close function */
    void (*close)(DRV_HANDLE handle);

    /* This is a pointer to the event call back set function */
    void (*eventHandlerSet)(DRV_HANDLE handle, uintptr_t hReferenceData,
           DRV_USB_EVENT_CALLBACK eventHandler);

    /* This is a pointer to the Host IRP submit function */
    USB_ERROR (*hostIRPSubmit)(DRV_USB_HOST_PIPE_HANDLE pipeHandle, USB_HOST_IRP * irp);

    /* This is a pointer to the Host IRP Cancel all function */
    void (*hostIRPCancel)(USB_HOST_IRP * irp);

    /* This is pointer to the Host event disable function */
    bool (*hostEventsDisable)(DRV_HANDLE handle);

    /* This is a pointer to the Host event enable function */
    void (*hostEventsEnable)(DRV_HANDLE handle, bool eventContext);
```

```
    /* This is a pointer to the Host pipe setup function */
    DRV_USB_HOST_PIPE_HANDLE (*hostPipeSetup)
    (
        DRV_HANDLE client,
        uint8_t deviceAddress,
        USB_ENDPOINT endpointAndDirection,
        uint8_t hubAddress,
        uint8_t hubPort,
        USB_TRANSFER_TYPE pipeType,
        uint8_t bInterval,
        uint16_t wMaxPacketSize,
        USB_SPEED speed
    );

    /* This is a pointer to the Host Pipe Close function */
    void (*hostPipeClose)(DRV_USB_HOST_PIPE_HANDLE pipeHandle);

    /* This is a pointer to the Host Root Hub functions */
    DRV_USB_ROOT_HUB_INTERFACE rootHubInterface;

} DRV_USB_HOST_INTERFACE;
```

The DRV_USB_DEVICE_INTERFACE structure, contained in this file, is the common interface for USB Driver Device mode functions. It is a structure of function pointers, pointer to functions that define the Driver Device mode Client functions. The following code example shows this structure and the function pointer it contains.

```
// *****************************************************************************
/* USB Driver Client Functions Interface (For Device Mode)

  Summary:
    Group of function pointers to the USB Driver Device Mode Client Functions.

  Description:
    This structure is a group of function pointers pointing to the USB Driver
    Device Mode Client routines. The USB Driver should export this group of
    functions so that the Device Layer can access the driver functionality.

  Remarks:
    None.
*/

typedef struct
{
    /* This is a pointer to the driver Open function */
    DRV_HANDLE (*open)(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);

    /* This is pointer to the driver Close function */
    void (*close)(DRV_HANDLE handle);

    /* This is a pointer to the event call back set function */
    void (*eventHandlerSet)(DRV_HANDLE handle, uintptr_t hReferenceData,
           DRV_USB_EVENT_CALLBACK eventHandler);

    /* This is a pointer to the device address set function */
    void (*deviceAddressSet)(DRV_HANDLE handle, uint8_t address);

    /* This is a pointer to the device current speed get function */
    USB_SPEED (*deviceCurrentSpeedGet)(DRV_HANDLE handle);

    /* This is a pointer to the SOF Number get function */
    uint16_t (*deviceSOFNumberGet)(DRV_HANDLE handle);

    /* This is a pointer to the device attach function */
    void (*deviceAttach)(DRV_HANDLE handle);

    /* This is a pointer to the device detach function */
    void (*deviceDetach)(DRV_HANDLE handle);

    /* This is a pointer to the device endpoint enable function */
    USB_ERROR (*deviceEndpointEnable)(DRV_HANDLE handle, USB_ENDPOINT endpoint,
                USB_TRANSFER_TYPE transferType, uint16_t endpointSize);
```

```
    /* This is a pointer to the device endpoint disable function */
    USB_ERROR (*deviceEndpointDisable)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is a pointer to the device endpoint stall function */
    USB_ERROR (*deviceEndpointStall)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is a pointer to the device endpoint stall clear function */
    USB_ERROR (*deviceEndpointStallClear)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is pointer to the device endpoint enable status query function */
    bool (*deviceEndpointIsEnabled)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is pointer to the device endpoint stall status query function */
    bool (*deviceEndpointIsStalled)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is a pointer to the device IRP submit function */
    USB_ERROR (*deviceIRPSubmit)(DRV_HANDLE handle, USB_ENDPOINT endpoint,
                USB_DEVICE_IRP * irp);

    /* This is a pointer to the device IRP Cancel all function */
    USB_ERROR (*deviceIRPCancelAll)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is a pointer to the device remote wakeup start function */
    void (*deviceRemoteWakeupStart)(DRV_HANDLE handle);

    /* This is a pointer to the device remote wakeup stop function */
    void (*deviceRemoteWakeupStop)(DRV_HANDLE handle);

    /* This is a pointer to the device Test mode enter function */
    USB_ERROR (*deviceTestModeEnter)(DRV_HANDLE handle, USB_TEST_MODE_SELECTORS testMode);

} DRV_USB_DEVICE_INTERFACE;
```

Both of these structures also contain pointers to General Client functions. The specific PIC32 device USB Driver allocates and initializes such a structure. The following code example shows how the PIC32MX USB Host mode Driver allocates and initializes the DRV_USB_HOST_INTERFACE structure. This code is contained in the <install-dir>\framework\driver\usb\usbhs\src\dynamic\drv_usbfs_host.c file.

```
/*******************************************************
 * This structure is a set of pointer to the USBFS driver
 * functions. It is provided to the Host layer as the
 * interface to the driver.
 * *****************************************************/

DRV_USB_HOST_INTERFACE gDrvUSBFSHostInterface =
{
    .open = DRV_USBFS_Open,
    .close = DRV_USBFS_Close,
    .eventHandlerSet = DRV_USBFS_ClientEventCallBackSet,
    .hostIRPSubmit = DRV_USBFS_HOST_IRPSubmit,
    .hostIRPCancel = DRV_USBFS_HOST_IRPCancel,
    .hostPipeSetup = DRV_USBFS_HOST_PipeSetup,
    .hostPipeClose = DRV_USBFS_HOST_PipeClose,
    .hostEventsDisable = DRV_USBFS_HOST_EventsDisable,
    .hostEventsEnable = DRV_USBFS_HOST_EventsEnable,
    .rootHubInterface.rootHubPortInterface.hubPortReset = DRV_USBFS_HOST_ROOT_HUB_PortReset,
    .rootHubInterface.rootHubPortInterface.hubPortSpeedGet =
                                                DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet,
    .rootHubInterface.rootHubPortInterface.hubPortResetIsComplete =
                                                DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete,
    .rootHubInterface.rootHubPortInterface.hubPortSuspend = DRV_USBFS_HOST_ROOT_HUB_PortSuspend,
    .rootHubInterface.rootHubPortInterface.hubPortResume = DRV_USBFS_HOST_ROOT_HUB_PortResume,
    .rootHubInterface.rootHubMaxCurrentGet = DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet,
    .rootHubInterface.rootHubPortNumbersGet = DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet,
    .rootHubInterface.rootHubSpeedGet = DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet,
    .rootHubInterface.rootHubInitialize = DRV_USBFS_HOST_ROOT_HUB_Initialize,
    .rootHubInterface.rootHubOperationEnable = DRV_USBFS_HOST_ROOT_HUB_OperationEnable,
    .rootHubInterface.rootHubOperationIsEnabled = DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled,
};
```

Similarly, the PIC32MX USB Device mode Driver allocates and initializes the DRV_USB_DEVICE_INTERFACE structure. This can be reviewed in the <install-dir>\framework\driver\usb\usbhs\src\dynamic\drv_usbfs_device.c file.

```
/*************************************************
 * This structure is a pointer to a set of USB Driver
 * Device mode functions. This set is exported to the
 * Device Layer when the Device Layer must use the
 * PIC32MX USB Controller.
 *************************************************/

DRV_USB_DEVICE_INTERFACE gDrvUSBFSDeviceInterface =
{
    .open = DRV_USBFS_Open,
    .close = DRV_USBFS_Close,
    .eventHandlerSet = DRV_USBFS_ClientEventCallBackSet,
    .deviceAddressSet = DRV_USBFS_DEVICE_AddressSet,
    .deviceCurrentSpeedGet = DRV_USBFS_DEVICE_CurrentSpeedGet,
    .deviceSOFNumberGet = DRV_USBFS_DEVICE_SOFNumberGet,
    .deviceAttach = DRV_USBFS_DEVICE_Attach,
    .deviceDetach = DRV_USBFS_DEVICE_Detach,
    .deviceEndpointEnable = DRV_USBFS_DEVICE_EndpointEnable,
    .deviceEndpointDisable = DRV_USBFS_DEVICE_EndpointDisable,
    .deviceEndpointStall = DRV_USBFS_DEVICE_EndpointStall,
    .deviceEndpointStallClear = DRV_USBFS_DEVICE_EndpointStallClear,
    .deviceEndpointIsEnabled = DRV_USBFS_DEVICE_EndpointIsEnabled,
    .deviceEndpointIsStalled = DRV_USBFS_DEVICE_EndpointIsStalled,
    .deviceIRPSubmit = DRV_USBFS_DEVICE_IRPSubmit,
    .deviceIRPCancelAll = DRV_USBFS_DEVICE_IRPCancelAll,
    .deviceRemoteWakeupStop = DRV_USBFS_DEVICE_RemoteWakeupStop,
    .deviceRemoteWakeupStart = DRV_USBFS_DEVICE_RemoteWakeupStart,
    .deviceTestModeEnter = NULL

};
```

A pointer to the DRV_USB_HOST_INTERFACE structure is passed to the USB Host Stack as part of USB Host Stack initialization. The following code example shows how this is done.

```
/*************************************************************************
 * This is a table of the USB Host mode drivers that this application will
 * support. Also contained in the driver index. In this example, the
 * application will want to use instance 0 of the PIC32MX USB Full-Speed driver.
 * ***********************************************************************/
const USB_HOST_HCD hcdTable =
{
    .drvIndex = DRV_USBFS_INDEX_0,
    .hcdInterface = DRV_USBFS_HOST_INTERFACE
};

/* Here the pointer to the USB Driver Common Interface is provided to the USB
 * Host Layer via the hostControllerDrivers member of the Host Layer
 * Initialization data structure. */
const USB_HOST_INIT usbHostInitData =
{
    .nTPLEntries = 1 ,
    .tplList = (USB_HOST_TPL_ENTRY *)USBTPList,
    .hostControllerDrivers = (USB_HOST_HCD *)&hcdTable

};
```

A pointer to the DRV_USB_DEVICE_INTERFACE structure is passed to the USB Device Stack as part of the USB Device Stack initialization. The Host Stack and Device Stack then access the driver functions through the function pointers contained in these structures.

The Driver General Client, Host mode and Device mode Client functions are described in this section. Any references to a USB Driver Client in the following sections, implies the client is a USB Host Stack and/or the USB Device Stack.

Driver General Client Functions

Provides information on the General Client functions for the USB Driver.

Description

The DRV_USB_HOST_INTERFACE and the DRV_USB_DEVICE_INTERFACE structures contain pointers to the USB Driver's General Client

functions. These functions are not specific to the operation mode (Host, Device, or Dual Role) of the driver. A USB Driver must implement these functions and ensure that the Host or Device Stack can access these functions through the driver's common interface structures. The common interface contains three general client functions:

- Driver Open Function
- Driver Close Function
- Driver Event Handler Set Function

Driver Open Function

The `open` member of the DRV_USB_HOST_INTERFACE and the DRV_USB_DEVICE_INTERFACE structures should point to the USB Driver Open function. The signature of the Open function is as follows:

```
DRV_HANDLE (*open)(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

The USB Driver Open function must match this signature. The Driver Client uses the USB Driver index (drvIndex) to specify the instance of the USB module that Host Stack or the Device Stack should open. The USB Driver should ignore the `intent` parameter. The function should return a driver handle. If the driver is not ready to be opened, it should return an invalid handle (DRV_HANDLE_INVALID). In such a case, the client will continue trying to open the driver by calling the Open function again. The driver may also fail to open for an invalid `index` parameter or if USB module is in an error condition.

When supporting Dual Role operation, both the Host Stack and Device Stack will call the Driver Open function in one application. The USB Driver must support multiple calls to the Open function in the same application. The Open function should be thread-safe.

Driver Close Function

The `close` member of the DRV_USB_HOST_INTERFACE and the DRV_USB_DEVICE_INTERFACE structures should point to the USB Driver Close function. The signature of the Close function is as follows:

```
void (*close)(DRV_HANDLE handle);
```

The USB Driver Close function must match this signature. The Driver Client passes the handle obtained from the Driver Open function as a parameter to the close. The USB Host Stack or USB Device Stack will close the driver only when the stack is deinitialized (which is typically a rare case). The USB Driver should deallocate any client-related resources in the Close function. If the specified driver handle is not valid, the Close function should not have any side effects. The USB Driver expects the Close function to be called from the context of the thread in which the driver was opened; therefore, this function *is not* expected to be thread-safe.

Driver Event Handler Set Function

The `eventHandlerSet` member of the DRV_USB_HOST_INTERFACE and the DRV_USB_DEVICE_INTERFACE structures should point to the USB Driver Event Handler Set function. The signature of the Event Handler Set function is as follows:

```
void (*eventHandlerSet)(DRV_HANDLE handle, uintptr_t hReferenceData, DRV_USB_EVENT_CALLBACK eventHandler);
```

The USB Driver Event Handler Set function must match this signature. The signature of the Client Event Handling function should match DRV_USB_EVENT_CALLBACK. The USB Driver calls this function when it must communicate USB events to the client. The client can set the `eventHandler` parameter to NULL if it does not want to receive USB Driver events. The client will receive Host mode events if the USB Driver is operating in Host mode. It will receive Device mode events if the USB Driver is operating in Device mode. The DRV_USB_EVENT type enumeration contains all the possible events that the USB Driver would generate. The following code example shows the enumeration.

```
// *****************************************************************************
/* USB Driver Events Enumeration

  Summary:
    Identifies the different events that the USB Driver provides.

  Description:
    Identifies the different events that the USB Driver provides. The USB Driver
    should be able to provide these events.

  Remarks:
    None.
*/

typedef enum
{
    /* Bus error occurred and was reported. This event can be generated in both
     * Host and Device mode. */
    DRV_USB_EVENT_ERROR = 1,

    /* Host has issued a device Reset. This event occurs only in Device mode */
    DRV_USB_EVENT_RESET_DETECT,

    /* Resume detected while USB in suspend mode. This event can be generated in
     * both Host and Device mode. In Host mode, the events occurs when a remote
     * wakeup capable device has generated resume signaling. In Device mode,
     * this event will occur when the Host has issued resume signaling. */
```

```
    DRV_USB_EVENT_RESUME_DETECT,

    /* This event is generated in Device mode only. It occurs when the Host
     * suspends the bus and the bus goes idle. */
    DRV_USB_EVENT_IDLE_DETECT,

    /* This event is generated in Host mode and Device mode. In Host mode, this
     * event occurs when the device has stalled the Host. In Device mode, this
     * event occurs when the Host has accessed a stalled endpoint thus
     * triggering the device to send a STALL to the Host. */
    DRV_USB_EVENT_STALL,

    /* This event is generated in Host mode and Device mode. In Device mode,
     * this event occurs when a SOF has been generated by the Host. In Host
     * mode, this event occurs when controller is about to generate an SOF.
     * */
    DRV_USB_EVENT_SOF_DETECT,

    /* This event is generated in Device mode when the VBUS voltage is above
     * VBUS session valid. */
    DRV_USB_EVENT_DEVICE_SESSION_VALID,

    /* This event is generated in Device mode when the VBUS voltage falls
     * below VBUS session valid. */
    DRV_USB_EVENT_DEVICE_SESSION_INVALID,

} DRV_USB_EVENT;
```

This completes the discussion on the Driver General Client Functions.

Driver Host Mode Client Functions

Provides information on the Host mode Client functions for the USB Driver.

Description

The DRV_USB_HOST_INTERFACE structure contains pointers to the USB Driver's Host mode Client functions. These functions are only applicable when the USB module is operating as a USB Host. Along with the function pointers to the driver's Host mode specific functions, the DRV_USB_HOST_INTERFACE structure also contains another structure of function pointers of the type DRV_USB_ROOT_HUB_INTERFACE. This structure contains function pointers to the USB Driver's Root Hub functions. A USB Driver must implement these functions and ensure that the Host Stack can access these functions through the driver's DRV_USB_HOST_INTERFACE structure. The Driver Host mode Client functions in the DRV_USB_HOST_INTERFACE structure are:

- Driver Host Pipe Setup Function
- Driver Host Pipe Close Function
- Driver Host Events Disable Function
- Driver Host Events Enable Function
- Driver Host IRP Submit Function
- Driver Host IRP Cancel Function

Driver Host Pipe Setup Function

The `hostPipeSetup` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host Pipe Setup function. The signature of the Host Pipe Setup function is as follows:

```
DRV_USB_HOST_PIPE_HANDLE (*hostPipeSetup)  ( DRV_HANDLE client,  uint8_t deviceAddress,
                           USB_ENDPOINT endpointAndDirection, uint8_t hubAddress,
                           uint8_t hubPort, USB_TRANSFER_TYPE pipeType, uint8_t bInterval,
                           uint16_t wMaxPacketSize, USB_SPEED speed);
```

The USB Driver Host mode Pipe Setup function must match this signature. The USB Host Stack calls this function to create a communication pipe to the attached device. The function parameters define the property of this communication pipe. The `driverHandle` parameter is the handle to the driver obtained through the driver Open function. The `deviceAddress` and the `endpointAddress` parameters specify the address of the USB device and the endpoint on this device to which this pipe must connect.

If the device is connected to the Host though a hub, `hubAddress` and `hubPort` must specify the address of the hub and port to which the device is connected. The USB Driver will use these parameters to schedule split transactions if the target device is a Low-Speed or Full-Speed device and is connected to the Host through a high-speed hub. If the device is connected directly to the Host, these parameters should be set to zero ('`0`').

The `pipeType` parameter specifies the type of USB transfers that this pipe would support. The `bInterval` parameter is interpreted as per the USB 2.0 Specification based on the transfer type and the speed of the pipe. The `wMaxPacketSize` parameter defines the maximum size of a transaction that the driver should use while transporting a transfer on the pipe. The Host layer will use the information obtained from the USB device descriptors of the attached device to decide the `wMaxPacketSize` parameter.

The Driver Host Pipe Setup function should be thread-safe, but does not have to be event safe. The Host layer (or the Host Client Drivers) will not, and should not attempt to create a pipe in an interrupt, and therefore, an event context. The function should return DRV_USB_PIPE_HANDLE_INVALID if the driver could not open the pipe. The driver may not be able to open a pipe due to incorrect function parameters or due to lack of resources.

Driver Host Pipe Close Function

The `hostPipeClose` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host Pipe Close function. The signature of the Host Pipe Close function is as follows:

```
void (*hostPipeClose)(DRV_USB_HOST_PIPE_HANDLE pipeHandle);
```

The USB Driver Host mode Pipe Close function must match this signature. The USB Host Stack calls this function to close communication pipes. The `pipeHandle` parameter is the pipe handle obtained from the Pipe Setup function. The Host Client Driver typically closes pipes when a device detach was detected. The Client Driver may also close pipes when a device configuration needs to change or when the Client Driver is being unloaded by the Host. The Pipe Close function has no side effect if the pipe handle is invalid. Closing the pipe will abort all I/O Request Packets (IRP) that are scheduled on the pipe. Any transaction in progress will complete. The IRP callback functions for each IRP scheduled in the pipe will be called with a USB_HOST_IRP_STATUS_ABORTED status.

The USB Driver Pipe Close function must be thread-safe and event-safe. The latter requirement allows the Pipe Close function to be called in the context of the device detach Interrupt Service Routine.

Driver Host Event Disable Function

The `hostEventsDisable` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host mode Driver Events Disable function. The signature of the Events Disable function is as follows:

```
bool (*hostEventsDisable)(DRV_HANDLE handle);
```

The USB Driver Host mode Driver Events Disable function must match this signature. The Host Stack will call this function when it wants to execute a section of code that should not be interrupted by the USB Driver. Calling this function should disable USB Driver event generation. The `handle` parameter is set to the driver handle obtained via the driver Open function. The function will return the present state of the event generation, whether it is enabled or disabled. The Host Stack will pass this value to the USB Driver Host mode Driver Events Enable function when it needs to enable the driver events.

Driver Host Events Enable Function

The `hostEventsEnable` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host mode Driver Events Enable function. The signature of the events enable function is as follows:

```
void (*hostEventsEnable)(DRV_HANDLE handle, bool eventContext);
```

The USB Driver Host mode Driver Events Enable function must match this signature. The USB Host Stack calls this function to re-enable the USB Driver Host mode Events (if they were enabled) after it called the USB Driver Host mode Events Disable function to disable driver events. The `handle` parameter is set to the driver handle obtained via the driver Open function. The `eventContext` parameter is set to the value returned by the Host mode Driver Events Disable function. The USB Driver will use the `eventContext` parameter to restore the event generation status (enabled or disabled) to what it was when the USB Driver Host mode Driver Events Disable function was called.

Driver Host IRP Submit Function

The `hostIRPSubmit` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host IRP Submit function. The signature of the IRP Submit function is as follows:

```
USB_ERROR (*hostIRPSubmit)(DRV_USB_HOST_PIPE_HANDLE pipeHandle, USB_HOST_IRP * irp);
```

The USB Driver Host IRP Submit function must match this signature. The Host Stack calls this function to submit an IRP to the USB Driver. The USB Driver provides this mechanism to transfer data between the Host Stack and the attached device. The `pipeHandle` parameter should be set to the pipe handle obtained by the Pipe Setup function. The pipe handle specifies the pipe, and therefore, the target device, endpoint, speed and transfer type, on which the I/O must be processed. The `irp` parameter should point to the IRP data structure. The IRP data structure will transport an entire transfer over the pipe. The USB Driver will split up the transfer into transactions based on the parameters specified at the time of pipe creation. This process does not require Host Stack intervention.

The function will return USB_ERROR_HOST_PIPE_INVALID if the pipe handle is not valid. It will return USB_ERROR_OSAL_FUNCTION if an error occurred while performing a RTOS-related operation. It will return USB_ERROR_NONE if the IRP was submitted successfully.

The USB Driver will queue the IRP if there is already an IRP being processed on the pipe. The completion of the IRP processing is indicated by the USB Driver calling the IRP Callback function specified within the IRP. The Host IRP Submit function must be thread-safe and IRP callback-safe. The Host Stack may resubmit the IRP within the IRP Callback function. The IRP Callback function itself executes within an interrupt context. The completion status of the IRP will be available in the `status` member of the IRP when the IRP callback function is invoked.

Driver Host IRP Cancel Function

The `hostIRPCancel` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host IRP Cancel function. The signature of the IRP Cancel function is as follows

```
void (*hostIRPCancel)(USB_HOST_IRP * irp);
```

The USB Driver Host IRP Cancel function must match this signature. The Host Stack and Host Client Drivers will call this function to cancel an IRP that was submitted. The IRP will be aborted successfully if it is not in progress. If the IRP processing has begun, the on-going transaction will complete and pending transactions in the transfer will be aborted. In either case, the IRP Callback function will be called with the IRP status as USB_HOST_IRP_STATUS_ABORTED.

Driver Host USB Root Hub Port Interface

Provides information on the Root Hub Port interface of the USB Host Driver.

Description

The `rootHubPortInterface` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Port functions. The data type of this member is USB_HUB_INTERFACE. This data type is a structure containing function pointers pointing to the port control functions of the root hub. The USB Driver must assign the function pointers in this structure to the root hub port control functions. These same functions are also exported by a Hub Driver to the USB Host Stack, which allow the Host Stack to control a device regardless of whether it is connected to a root hub or an external hub. The port functions are valid only when a device is attached to the port. The behavior of these functions on a port to which no device is connected is not defined. Descriptions of the port control functions are provided, which include:

- Driver Host Hub Port Reset Function
- Driver Host Hub Port Reset Completion Status Function
- Driver Host Hub Port Suspend Function
- Driver Host Hub Port Resume Function
- Driver Host Hub Port Speed Get Function

Driver Host Hub Port Reset Function

The `hubPortReset` member of the USB_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Reset function. The signature of this function is as follows:

```
USB_ERROR (*hubPortReset)(uintptr_t hubAddress, uint8_t port);
```

The USB Driver Root Hub Port Reset function must follow this signature. This function starts reset signaling on the port. If the device is connected to the root hub, the USB Host Stack will set the `hubAddress` parameter to the driver handle obtained through the driver Open function. The USB Host Stack uses the parent identifier provided by the root hub driver when the USB_HOST_DeviceEnumerate function was called to query the driver handle that is linked to this root hub. If the device is connected to an external hub, the `hubAddress` parameter is directly set to the parent identifier.

For the PIC32MX and PIC32MZ USB Drivers, the `port` parameter is ignored. For an external hub, this must be set to the port to which the device is connected. The function returns USB_ERROR_NONE if the function was successful. If the reset signaling is already in progress on the port, calling this function has no effect. The USB Driver will itself time duration of the reset signal. This does not require USB Host Stack intervention. The USB Host Stack will call the port reset completion status function to check if the reset signaling has completed. Calling this function on a port which exists on an external hub will cause the hub driver to issue a control transfer to start the port reset procedure.

Driver Host Hub Port Reset Completion Status Function

The `hubPortResetIsComplete` member of the USB_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Reset Completion Status function. The signature of this function is as follows:

```
bool (*hubPortResetIsComplete)(uintptr_t hubAddress, uint8_t port);
```

The USB Driver Root Hub Port Reset Completion Status function must follow this signature. The USB Host Stack calls this function to check if the port reset sequence that was started on a port has completed. The function returns true if the reset signaling has completed. If the device is connected to the root hub, the USB Host Stack will set the `hubAddress` parameter to the driver handle obtained through the driver Open function. If the device is connected to an external hub, the `hubAddress` parameter is directly set to the parent identifier.

For the PIC32MX and PIC32MZ USB Drivers, the `port` parameter is ignored. For an external hub, this parameter must be set to the port to which the device is connected.

Driver Host Hub Port Suspend Function

The `hubPortSuspend` member of the USB_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Suspend function. The signature of this function is as follows:

```
USB_ERROR(*hubPortSuspend)(uintptr_t hubAddress, uint8_t port);
```

The USB Driver Root Hub Port Suspend function must follow this signature. The USB Host Stack calls this function to suspend the port. If the device is connected to the root hub, the USB Host Stack will set the `hubAddress` parameter to the driver handle obtained through the driver Open function. If the device is connected to an external hub, the `hubAddress` parameter is directly set to the parent identifier.

For the PIC32MX and PIC32MZ USB Drivers, the `port` parameter is ignored. For an external hub, this parameter must be set to the port to which the device is connected. The function returns USB_ERROR_NONE if the request was successful. Calling this function on a suspended port will not have any effect.

Driver Host Hub Port Resume Function

The `hubPortResume` member of the USB_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Resume function. The signature of this function is as follows:

```
USB_ERROR(*hubPortResume)(uintptr_t hubAddress, uint8_t port);
```

The USB Driver Root Hub Port Resume function must follow this signature. The USB Host Stack calls this function to resume a suspended port. If the device is connected to the root hub, the USB Host Stack will set the `hubAddress` parameter to the driver handle obtained through the driver Open function. If the device is connected to an external hub, the `hubAddress` parameter is directly set to the parent identifier.

For the PIC32MX and PIC32MZ USB Drivers, the `port` parameter is ignored. For an external hub, this parameter must be set to the port to which the device is connected. The function returns USB_ERROR_NONE if the request was successful. Calling this function on a port that is not suspended will not have any effect.

Driver Host Hub Port Speed Get Function

The `hubPortSpeedGet` member of the USB_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Speed Get function. The signature of this function is as follows:

```
USB_SPEED(*hubPortSpeedGet)(uintptr_t hubAddress, uint8_t port);
```

The USB Driver Root Hub Port Speed Get function must follow this signature. The USB Host Stack calls this function to obtain the USB speed of the device that is attached to the port. The Host Stack calls this function only after it has completed reset of the port. If the device is connected to the root hub, the USB Host Stack will set the `hubAddress` parameter to the driver handle obtained through the driver Open function. If the device is connected to an external hub, the `hubAddress` parameter is directly set to the parent identifier.

For the PIC32MX and PIC32MZ USB Drivers, the `port` parameter is ignored. For an external hub, this parameter must be set to the port to which the device is connected. The function returns USB_SPEED_ERROR if the request was not successful. It will return the functional USB speed otherwise.

This concludes the section describing the USB Driver Host mode Client Functions. The USB Driver Device Mode Client Functions are discussed in the next section.

Driver Host Root Hub Interface

Provides information on the Root Hub interface for the USB Host Driver.

Description

The USB Driver Common Interface requires the USB Driver to be operating in Host mode to provide root hub control functions. If the USB peripheral does not contain root hub features in hardware, these features must be emulated in software by the driver. The USB peripheral on PIC32MX and PIC32MZ devices does not contain root hub features; therefore, the USB Driver for these peripherals emulates the root hub functionality in software. The `rootHubInterface` member of the DRV_USB_HOST_INTERFACE structure is a structure of type DRV_USB_ROOT_HUB_INTERFACE. The members of this structure are function pointers to the root hub control functions of the USB Driver.

Along with other Host mode functions, the USB Driver while operating in Host mode must also ensure that the `rootHubInterface` member of DRV_USB_HOST_INTERFACE is set up correctly so that the USB Host Stack can access the root hub functions. Descriptions of the function pointer types in the DRV_USB_ROOT_HUB_INTERFACE include:

- Driver Host Root Hub Speed Get Function
- Driver Host Root Hub Port Numbers Get Function
- Driver Host Root Hub Maximum Current Get Function
- Driver Host Root Hub Operation Enable Function
- Driver Host Root Hub Operation Enable Status Function
- Driver Host Root Hub Initialize Function

Driver Host Root Hub Speed Get Function

The `rootHubSpeedGet` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Speed Get function. The signature of this function is as follows:

```
USB_SPEED (*rootHubSpeedGet)(DRV_HANDLE handle);
```

The USB Driver Root Hub Speed Get function must match this signature. The USB Host Stack calls this function to identify the speed at which the root hub is operating. The `handle` parameter is the handle obtained by calling the USB Driver Open function. The operation speed is configured by the USB Driver initialization and depends on the capability of the USB peripheral. For example, the USB peripheral on PIC32MZ devices supports both Hi-Speed and Full-Speed Host mode operation. It can be configured through initialization to only operate at Full-Speed. The Root Hub Speed Get function must return the USB speed at which the USB peripheral is operating. This should not be confused with the speed of the attached device.

Driver Host Root Hub Port Numbers Get Function

The `rootHubPortNumbersGet` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Numbers Get function. The signature of this function is as follows:

```
USB_SPEED (*rootHubSpeedGet)(DRV_HANDLE handle);
```

The USB Driver Root Hub Speed Get function must match this signature. This function should return the number of ports that the root hub contains. On the USB peripheral for both PIC32MZ and PIC32MX devices, this value is always '1'.

Driver Host Root Hub Maximum Current Get Function

The `rootHubMaxCurrentGet` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Maximum Current Get function. The signature of this function is as follows:

```
uint32_t (*rootHubMaxCurrentGet)(DRV_HANDLE handle);
```

The USB Driver Root Hub Maximum Current Get function must match this signature. This function returns the maximum VBUS current that the root hub can provide. The USB Host Stack calls this function to know the maximum current that the root hub VBUS power supply can provide. This

value is then used to determine if the Host can support the current requirements of the attached device. The `handle` parameter is the driver handle obtained by calling the driver Open function.

The PIC32MX and the PIC32MZ USB peripherals cannot supply VBUS. The root hub driver only switches the VBUS supply. The current rating of the VBUS is specified through the USB Driver initialization. The root hub maximum current get function implementation in these drivers returns this value to the Host Stack.

Driver Host Root Hub Operation Enable Function

The `rootHubOperationEnable` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Operation Enable function. The signature of this function is as follows"

```
void (*rootHubOperationEnable)(DRV_HANDLE handle, bool enable);
```

The USB Driver Root Hub Operation Enable function must match this signature. The USB Host Stack calls this function when it ready to receive device attach events from the root hub. Calling this function will cause the USB Driver root hub functionality to enable detection of device attach and detach. The USB Driver will then raise events to the USB Host Stack. The `handle` parameter is the driver handle obtained by calling the driver Open function. Setting the `enable` parameter to true enables the root hub operation. Setting the `enable` parameter to false disables the root hub operation.

Driver Host Root Hub Operation Enable Status Function

The `rootHubOperationIsEnabled` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Operation Enable Status function. The signature of this function is as follows:

```
bool (*rootHubOperationIsEnabled)(DRV_HANDLE handle);
```

The USB Driver Root Hub Operation Enable Status function must match this signature. This USB Host Stack calls this function after calling the operation enable function to check if this has completed. The function returns true if the operation enable function has completed. The USB Host Stack will call this function periodically until it returns true.

Driver Host Root Hub Initialize Function

The `rootHubInitialize` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Initialize function. The signature of this function is as follows:

```
void (*rootHubInitialize)(DRV_HANDLE handle, USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo);
```

The USB Driver Root Hub Initialize function must match this signature. The USB Host Stack calls this function to assign a device identifier (usbHostDeviceInfo) to the root hub. This function is called before the Host Stack enables the root hub operation. The USB Driver root hub should use this identifier as the parent identifier when it calls the USB_HOST_DeviceEnumerate function to enumerate the attached device. At the time of enumeration, the USB Host Stack will use this parent identifier to identify the parent hub (whether root hub or external hub) of the attached device. The USB Driver root hub should retain the `usbHostDeviceInfo` parameter for the life time of its operation.

Driver Device Mode Client Functions

Provides information on the USB Driver Device mode Client functions.

Description

The DRV_USB_DEVICE_INTERFACE structure contains pointers to the USB Driver's Device mode Client Functions. These functions are only applicable when the USB module is operating as a USB Device. A USB Driver must implement these functions and ensure that the Device Stack can access these functions through the driver's DRV_USB_DEVICE_INTERFACE structure. Descriptions of the Driver Device Mode Client functions in the DRV_USB_DEVICE_INTERFACE structure include:

- Driver Device Address Set Function
- Driver Device Current Speed Get Function
- Driver Device SOF Number Get Function
- Driver Device Attach Function
- Driver Device Detach Function
- Driver Device Endpoint Enable Function
- Driver Device Endpoint Disable Function
- Driver Device Endpoint Stall Function
- Driver Device Endpoint Stall Clear Function
- Driver Device Endpoint Enable Status Function
- Driver Device Endpoint Stall Status Function
- Driver Device IRP Submit Function
- Driver Device IRP Cancel All Function
- Driver Device IRP Cancel Function
- Driver Device Remote Wakeup Start Function
- Driver Device Remote Wakeup Stop Function
- Driver Device Test Mode Enter Function

The PIC32MZ and the PIC32MX USB peripheral drivers implement the Device mode functions and export these functions to the Device Stack

though their respective DRV_USB_DEVICE_INTERFACE structure.

Driver Device Address Set Function

The `deviceAddressSet` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device Address Set function. The signature of this function is as follows:

```
void (*deviceAddressSet)(DRV_HANDLE handle, uint8_t address);
```

The USB Driver Device Address Set Function should match this signature. The USB Device Stack will call this function to set the Device USB Address. The function will be called in an interrupt context and hence the function implementation must be interrupt-safe. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `address` parameter is the address provided by the USB Host through the Set Device Address Standard request.

Driver Device Current Speed Get Function

The `deviceCurrentSpeedGet` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Current Speed Get function. The signature of this function is as follows:

```
USB_SPEED (*deviceCurrentSpeedGet)(DRV_HANDLE handle);
```

The USB Driver Device Current Speed Get function should match this signature. The USB Device Stack will call this function to obtain the speed at which the device has connected to the USB. It will call this function after reset signaling has completed. The `handle` parameter is driver handle obtained from calling the driver Open function. This function is called in an interrupt context and should be interrupt-safe.

Driver Device SOF Number Get Function

The `deviceSOFNumberGet` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Start-Of-Frame Number Get function. The signature of this function is as follows:

```
uint16_t (*deviceSOFNumberGet)(DRV_HANDLE handle);
```

The USB Driver SOF Number Get function should match this signature. The USB Device Stack will call this function to obtain the current SOF number. The USB peripheral uses a 16 bit counter to count the number of SOFs that have occurred since USB reset. This value is returned along with the Device Stack Start of Frame event. This function is called from an interrupt context and should be interrupt-safe. The `handle` parameter is the driver handle obtained from calling the driver Open function.

Driver Device Attach Function

The `deviceAttach` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Attach function. The signature of this function is as follows:

```
uint16_t(*deviceAttach)(DRV_HANDLE handle);
```

The USB Driver Attach function should match this signature. The USB Device Stack will call this function when the Device application calls the USB Device Stack Device Attach function. The USB Driver will enable the required signaling resistors for indicate attach to the Host. The application could call this function in response to a VBUS power available event. This function must be interrupt-safe. The `handle` parameter is the driver handle obtained from calling the driver Open function.

Driver Device Detach Function

The deviceDetach member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Detach function. The signature of this function is as follows:

uint16_t(*deviceDetach)(DRV_HANDLE handle);

The USB Driver Detach function should match this signature. The USB Device Stack will call this function when the Device application calls the USB Device Stack Device Detach function. The USB Driver will disable the required signaling resistors to indicate detach to the Host. The application could call this function in response to a VBUS power not available event. This function should be interrupt-safe. The `handle` parameter is driver handle obtained from calling the driver Open function.

Driver Device Endpoint Enable Function

The `deviceEndpointEnable` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Enable function. The signature of this function is as follows:

```
USB_ERROR (*deviceEndpointEnable)(DRV_HANDLE handle, USB_ENDPOINT endpoint,
            USB_TRANSFER_TYPE transferType, uint16_t endpointSize);
```

The USB Driver Endpoint Enable function should match this signature. The USB Device Stack Function Driver will call this function when it is initialized by the USB Device Layer. The Device Layer, on receiving the Set Configuration request from the Host, identifies the function drivers that are required by the configuration and initializes them. The function drivers will call the endpoint enable function to enable the endpoints required for their operation. Enabling the endpoint will cause it reply to transaction requests from the Host and accept transfer requests from the device application.

The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) that should be enabled. The transferType is the type of the USB transfer that this endpoint will handle. The endpointSize is the size of the maximum transaction that the endpoint will handle. This should match the endpoint size communicated to the Host via the device endpoint descriptors.

The function will return USB_ERRROR_NONE if the endpoint was configured successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

The endpoint enable function will be called in an interrupt context and should be interrupt-safe. It is not expected to be thread safe. For standard function drivers, the endpoint enable function will be called in the context of the USB Device Layer Client. For vendor USB devices, the vendor application must call the endpoint enable function in response to and within the context of the device configured event. Again this event itself will execute in the context of the Device Layer.

Driver Device Endpoint Disable Function

The `deviceEndpointDisable` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Disable function. The signature of this function is as follows:

```
USB_ERROR (*deviceEndpointDisable)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Endpoint Disable function should match this signature. The USB Device Stack Function Driver will call this function when it is deinitialized by the USB Device Layer. The Device Layer will deinitialize function drivers when it receives a USB reset event from the driver or on receiving the Set Configuration request from the Host with configuration parameter 0. Disabling the endpoint will cause it NAK transaction request from the Host and not accept transfer requests from the device application.

The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) that should be disabled.

The function will return USB_ERRROR_NONE if the function executed successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

The endpoint disable function will be called in an interrupt context and should be interrupt-safe. It is not expected to be thread safe. For standard function drivers, the endpoint disable function will be called in the context of the USB Device Layer Client. For vendor USB devices, the vendor application must call the endpoint enable function in response to and within the context of the device reset event. Again this event itself will execute in the context of the Device Layer. Disabling the endpoint will not cancel any transfers that have been queued against the endpoint. The function drivers will call the IRP Cancel All function to cancel any pending transfers.

Driver Device Endpoint Stall Function

The `deviceEndpointStall` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Stall function. The signature of this function is as follows:

```
USB_ERROR (*deviceEndpointStall)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Endpoint Stall function should match this signature. The USB Device Stack Function Driver will call this function to stall an endpoint. The Device Layer itself will stall endpoint 0 for several reasons including non-support of the Host request or failure while executing the request. A function driver will also stall an endpoint for protocol specific reasons. The driver will stall both, receive and transmit directions when stalling Endpoint 0. The driver will stall the specified direction while stalling a non-zero endpoint.

This function must be thread safe and interrupt safe. Stalling the endpoint will abort all the transfers queued on the endpoint with the completion status set to USB_DEVICE_IRP_STATUS_ABORTED_ENDPOINT_HALT. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) that should be stalled. The function will return USB_ERRROR_NONE if the function executed successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

Driver Device Endpoint Stall Clear Function

The `deviceEndpointStallClear` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Stall Clear function. The signature of this function is as follows:

```
USB_ERROR (*deviceEndpointStallClear)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Endpoint Stall Clear function should match this signature. The USB Device Stack Function Driver will call this function to clear the stall on a non-zero endpoint. The Device Layer will call this function to clear the stall condition on Endpoint 0. Clearing the stall on a non-zero endpoint will clear all transfers scheduled on the endpoint and transfer completion status will be set to USB_DEVICE_IRP_STATUS_TERMINATED_BY_HOST. When the stall is cleared, the data toggle for non-zero endpoint will be set to DATA0. The data toggle on Endpoint 0 OUT endpoint will be set to DATA1. The USB Driver will clear the Stall condition on an endpoint even if it was not stalled.

This function must be thread safe and interrupt safe. Stalling the endpoint will flush all the transfers queued on the endpoint. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) whose stall condition must be cleared. The function will return USB_ERRROR_NONE if the function executed successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

Driver Device Endpoint Enable Status Function

The `deviceEndpointIsEnabled` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Enable Status function. The signature of this function is as follows:

```
bool (*deviceEndpointIsEnabled)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Endpoint Enable Status function should match this signature. The USB Device Stack function will call this function to check if an endpoint has been enabled. The function returns true if the endpoint is enabled. The endpoint is enabled through the USB Driver Endpoint Enable function. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) whose enable status needs to be queried.

Driver Device Endpoint Stall Status Function

The `deviceEndpointIsStalled` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Stall Status function. The signature of this function is as follows:

```
bool (*deviceEndpointIsStalled)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Endpoint Stall Status function should match this signature. The USB Device Stack function will call this function to check if an endpoint has been stalled. The function returns true if the endpoint is stalled. The endpoint is stalled through the USB Driver Endpoint Stall function. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) whose stall status needs to be queried.

Driver Device IRP Submit Function

The deviceIRPSubmit member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device IRP Submit function. The signature of the IRP submit function is as follows:

```
USB_ERROR (*deviceIRPSubmit)(DRV_HANDLE handle, USB_ENDPOINT endpoint, USB_DEVICE_IRP * irp);
```

The USB Driver Device IRP Submit function must match this signature. The Device Stack (USB Device calls this function to submit an IRP to the USB Driver. The USB Driver provides this mechanism to transfer data between the device and the Host. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter should set to endpoint through which transfer must be processed. The `irp` parameter should point to the Device IRP data structure. The IRP data structure will transport an entire transfer over the endpoint. The USB Driver will split up the transfer into transactions based on the endpoint size specified at the time of enabling the endpoint. This process does not require Device Stack intervention.

The function will return USB_ERRROR_NONE if the function executed successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid. It will return USB_ERROR_DEVICE_IRP_IN_USE if an in progress IRP is resubmitted. It will return USB_ERROR_ENDPOINT_NOT_CONFIGURED if the IRP is submitted to an endpoint that is not enabled.

The USB Driver will queue the IRP if there is already an IRP being processed on the endpoint. The completion of the IRP processing is indicated by the USB Driver calling the IRP callback function specified within the IRP. The Device IRP Submit function must be thread safe and IRP callback safe. The Device Stack may resubmit the IRP within the IRP callback function. The IRP callback function itself executes within an interrupt context. The completion status of the IRP will be available in the status member of the IRP when the IRP callback function is invoked.

Driver Device IRP Cancel All Function

The `deviceIRPCancelAll` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device IRP Cancel All function. The signature of this is as follows:

```
USB_ERROR (*deviceIRPCancelAll)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Device IRP Cancel All function must match this signature. The USB Device Stack will call this function before disabling the endpoint. Calling this function will call all IRPs that are queued on the endpoint to be canceled. The callback of each IRP will be invoked and the IRP completion status will be set to USB_DEVICE_IRP_STATUS_ABORTED. If an IRP is in progress, an ongoing transaction will be allowed to complete and pending transactions will be canceled. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) whose queued IRPs must be canceled.

The function is thread safe and interrupt safe and will return USB_ERRROR_NONE if it executed successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

Driver Device IRP Cancel Function

The `deviceIRPCancel` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device IRP Cancel function. The signature of this is as follows:

```
USB_ERROR (*deviceIRPCancel)(DRV_HANDLE handle, USB_DEVICE_IRP * IRP);
```

The USB Driver Device IRP Cancel function must match this signature. This function is called by the USB Device Stack function driver to cancel a scheduled IRP. If the IRP is in the queue but it's processing has not started, the IRP will removed from the queue and the IRP callback function will be called from within the cancel function. The callback will be invoked with the IRP completion status set to USB_DEVICE_IRP_STATUS_ABORTED. If an IRP is in progress, an ongoing transaction will be allowed to complete and pending transactions will be canceled. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `irp` parameter is the IRP to be canceled.

The function is thread safe and will return USB_ERRROR_NONE if it executed successfully. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid or if the IRP has status indicates that this IRP is not queued or not in progress. The application should not release the data memory associated with IRP unless the callback has been received.

Driver Device Remote Wakeup Start Function

The `deviceRemoteWakeupStart` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device Remote Wakeup Start function. The signature of this function is as follows:

```
void (*deviceRemoteWakeupStart)(DRV_HANDLE handle);
```

The USB Driver Device Remote Wakeup Start function must match this signature. The USB Device Stack will call the function when the device application wants to start remote wakeup signaling. This would happen if the device supports remote wake-up capability and this has been enabled by the Host. The `handle` parameter is the driver handle obtained from calling the driver Open function.

Driver Device Remote Wakeup Stop Function

The `deviceRemoteWakeupStop` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device Remote Wakeup Stop function. The signature of this function is as follows:

```
void (*deviceRemoteWakeupStop)(DRV_HANDLE handle);
```

The USB Driver Device Remote Wakeup Stop function must match this signature. The USB Device Stack will call the function when the device application wants to stop remote wakeup signaling. The application would call after calling the remote wakeup start function. The `handle` parameter is the driver handle obtained from calling the driver Open function.

Driver Device Test Mode Enter Function

The `deviceTestModeEnter` parameter of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device Test Mode Enter function. The signature of this function is as follows:

```
USB_ERROR (*deviceTestModeEnter)(DRV_HANDLE handle, USB_TEST_MODE_SELECTORS testMode);
```

The USB Driver Device Test Mode Enter function should match this signature. The USB Device Stack calls this driver function to place the driver into test mode. This is required when the USB Host (operating at Hi-Speed) send the Set Feature request with the feature selector test set to test mode. This request also specifies which of the test mode signals, the driver should enable. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `testMode` parameter should be set to one of the test modes as defined in table 9-7 of the USB 2.0 specification.

The test mode enter function is only supported by the PIC32MZ USB Driver as the USB peripheral on this controller supports Hi-Speed operation. The function will return USB_ERRROR_NONE if it executed successfully. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

This concludes the discussion on the DRV_USB_DEVICE_INTERFACE structure. The following sections describe using the USB Common Driver.

Opening the Driver

Provides information and examples for opening the driver.

Description

The USB Host Stack and the USB Device Stack must obtain a handle to the USB Driver to access the functionality of the driver. This handle is obtained through the USB Driver Open function. The DRV_USB_DEVICE_INTERFACE structure and DRV_USB_DEVICE_HOST_INTERFACE structure provide access to the USB Driver Open function through the `open` member of these structures. Calling the Open function may not return a valid driver handle the first time the function is called. In fact, the USB Driver will return an invalid driver handle until the driver is ready to be opened. The Host and the Device Stack call the Open function repetitively in a state machine, until the function returns a valid handle.

The USB Host Stack can open the USB Driver but can call its Host mode functions only if the USB Driver was initialized for Host mode or Dual Role operation. The USB Host Stack accesses the driver functions through the DRV_USB_HOST_INTERFACE pointer that was provided to the Host Layer through the Host Stack initialization. The USB Device Stack can open the USB Driver but can call its Device mode functions only if the USB Driver was initialized for Device mode or Dual Role operation. The USB Device Stack accesses the driver functions through the DRV_USB_HOST_INTERFACE pointer that was provided to the Host Layer through the Host Stack initialization

The following code example shows how the USB Host Layer opens the USB Driver.

```
/* This code example shows how the Host Layer open the HCD via the hcdInterface.
 * The driver handle is stored in hcdHandle member of the busObj data structure.
 * The busObj data structure Host Layer local data structure. The Host Layer
 * opens the HCD when the bus is enabled. This operation takes place in the
 * USB_HOST_BUS_STATE_ENABLING state. */

/* Note the Host Layer calls the Open function by accessing the open member of
 * the hcdInterface which is of the type DRV_USB_HOST_INTERFACE. Also note how
 * the function is called repetitively until the Open function returns a valid
 * handle. */

case USB_HOST_BUS_STATE_ENABLING:

    /* The bus is being enabled. Try opening the HCD */
    busObj->hcdHandle = busObj->hcdInterface->open(busObj->hcdIndex, DRV_IO_INTENT_EXCLUSIVE |
            DRV_IO_INTENT_NONBLOCKING | DRV_IO_INTENT_READWRITE );

    /* Validate the Open function status */
    if (DRV_HANDLE_INVALID == busObj->hcdHandle )
    {
        /* The driver may not open the first time. This is okay. We
         * should try opening it again. The state of bus is not
         * changed. */
    }
```

The following code example shows how the USB Device Layer opens the USB Driver.

```
/* This code example shows how the USB Device Layer calls the USBCD open
```

```
    * function to open the USBCD. The Device Layer accesses the USBCD Open function
    * through the driverInterface member of the usbDeviceInstanceState object. The
    * driverInterface member is a DRV_USB_DEVICE_INTERFACE type. The
    * usbDeviceInstanceState is a USB Device Layer local object. */

   /* The Device Layer attempts to open the USBCD when it is initializing. Note how
    * the Device Layer advances to the next state only when the USBCD returns a
    * valid handle.   */

   switch(usbDeviceThisInstance->taskState)
   {
       case USB_DEVICE_TASK_STATE_OPENING_USBCD:

           /* Try to open the driver handle. This could fail if the driver is
            * not ready to be opened. */
           usbDeviceThisInstance->usbCDHandle =
              usbDeviceThisInstance->driverInterface->open( usbDeviceThisInstance->driverIndex,
              DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_NONBLOCKING|DRV_IO_INTENT_READWRITE);

           /* Check if the driver was opened */
           if(usbDeviceThisInstance->usbCDHandle != DRV_HANDLE_INVALID)
           {
               /* Yes the driver could be opened. */

               /* Advance the state to the next state */
               usbDeviceThisInstance->taskState = USB_DEVICE_TASK_STATE_RUNNING;

               /* Update the USB Device Layer state to indicate that it can be
                * opened */
               usbDeviceThisInstance->usbDeviceInstanceState = SYS_STATUS_READY;
           }

           break;
```

USB Driver Host Mode Operation

Provides information on Host mode operation.

Description

The USB Driver operates or can operate in the Host mode when it is initialized for Host mode or Dual Role operation. When operating in Host mode, the USB Driver is also referred to as the Host Controller Driver (HCD). In Dual Role mode, the USB Driver will switch to Host mode when the USB Driver Host Root Hub Operation Enable function is called.

The USB Driver Client must perform these steps to operate the USB Driver in Host mode.

1. Open the USB Driver to obtain the driver handle.
2. Set the event handler.
3. Call the Root Hub Control function to obtain the speed of the root hub, the number of ports that the root hub supports, and the maximum current that the root hub VBUS can supply.
4. Calls the Root Hub Initialize function with an identifier parameter. This `identifier` parameter allows the Host Stack to uniquely identify the root hub when where there are multiple root hubs.
5. The Driver Client will then enable the root hub operation and will wait until the root hub operation is enabled.
6. The Driver Client can now call the USB Driver Host mode functions.

The following sections explain Steps 2 through 6 in more detail.

Handling Host Mode Driver Events

Currently, the HCD does not provide any events to the client. The client can optionally register an event handler through the eventHandlerSet function pointer in the DRV_USB_HOST_INTERFACE structure. Future releases of the USB Driver may contain features that provide events to the Driver Client. Please refer to the following **Root Hub Operation** section for details on how the driver indicates device attach and detach to the client.

Root Hub Operation

A key feature of the HCD is the Root Hub Driver. The Root Hub Driver emulates hub operation in USB Driver software and provides a hub like interface to the USB Host Layer. The USB Host Layer treats the root hub like an external hub. This simplifies the implementation of USB Host Layer while supporting multiple devices through a hub. In that, the USB Host layer does not have to treat a device connected directly to the USB peripheral differently than a device connected to an external hub. The following code example shows how the USB Host Layer calls the root hub function to obtain information about the root hub.

```
/* This code example shows how the USB Host Layer calls the root hub functions to
 * obtain information about the root. The USB Host Layer first opens the HCD and
 * then accesses the root hub functions through the rootHubInterface member of
 * hcdInterface. rootHubInterface is of the type DRV_USB_ROOT_HUB_INTERFACE and
 * the hcdInterface is of the type of DRV_USB_HOST_INTERFACE. */

/* The code example shows how the Host Layer gets to know the root hub operation
 * speed, number of root hub ports and the maximum amount of current that the
 * root can supply. These function can be called only after HCD was opened and a
 * valid driver handle obtained. */

case USB_HOST_BUS_STATE_ENABLING:

    /* The bus is being enabled. Try opening the HCD */
    busObj->hcdHandle = busObj->hcdInterface->open(busObj->hcdIndex, DRV_IO_INTENT_EXCLUSIVE |
            DRV_IO_INTENT_NONBLOCKING | DRV_IO_INTENT_READWRITE );

    /* Validate the Open function status */
    if (DRV_HANDLE_INVALID == busObj->hcdHandle )
    {
        /* The driver may not open the first time. This is okay. We
         * should try opening it again. The state of bus is not
         * changed. */
    }
    else
    {
        /* Update the bus root hub information with the
         * details of the controller. Get the bus speed, number of
         * ports, the maximum current that the HCD can supply,
         * pointer to the root hub port functions. */

        SYS_DEBUG_PRINT(SYS_ERROR_INFO,
             "\r\nUSB Host Layer: Bus %d Root Hub Driver Opened.",hcCount);

        busObj->rootHubInfo.speed =
             busObj->hcdInterface->rootHubInterface.rootHubSpeedGet(busObj->hcdHandle);

        busObj->rootHubInfo.ports =
             busObj->hcdInterface->rootHubInterface.rootHubPortNumbersGet(busObj->hcdHandle);

        busObj->rootHubInfo.power =
             busObj->hcdInterface->rootHubInterface.rootHubMaxCurrentGet(busObj->hcdHandle);

        busObj->rootHubInfo.rootHubPortInterface =
             busObj->hcdInterface->rootHubInterface.rootHubPortInterface;
```

The USB Host Layer must initialize and enable the operation of the root hub. While initializing the Root Hub Driver, the Host layer will assign a unique identifier to the root hub. The root hub will return this value as the parent identifier while calling the USB_HOST_DeviceEnumerate function. The USB Host Layer must then enable the operation of the root hub driver. This will cause the root hub driver to detect device attach and detach. The following code example shows how the USB Host Layer initializes and enables the root hub driver

```
/* The following code example show how the USB Host Layer initializes the root
 * hub and then enables the root hub operation. The
 * rootHubDevice->deviceIdentifier is a unique identifier that allows the USB
 * Host layer to identify this root hub. It is returned by the root hub driver
 * in the USB_HOST_DeviceEnumerate() function as the parent identifier when the
 * device is connected to the root hub. */

/* The hcdHandle is the driver handle. The hcdInterface pointer is of the type
 * DRV_USB_HOST_INTERFACE and points to the HCD interface. */

busObj->hcdInterface->rootHubInterface.rootHubInitialize( busObj->hcdHandle ,
                                                          rootHubDevice->deviceIdentifier );
busObj->hcdInterface->rootHubInterface.rootHubOperationEnable( busObj->hcdHandle , true );
```

When a device is attached, the Root Hub Driver will implement the required settling attach settling delay and will then call the USB Host Layer's USB_HOST_DeviceEnumerate function to enumerate the device. While calling this function, the root hub driver will provide the identifier that was provided to it in its initialize function. The USB_HOST_DeviceEnumerate function will return an identifier which uniquely identifies the attached device. The root hub driver uses this value to identify the device to the Host when the USB_HOST_DeviceDenumerate function is called on device detach. The following code example shows how the Root Hub driver calls the USB_HOST_DeviceEnumerate and the USB_HOST_DeviceDenumerate functions.

```
/* The following code shows how the root hub driver calls the
 * USB_HOST_DeviceEnumerate() function in the device attach interrupt. As seen
 * here, the root hub returns the identifier that the USB Host Layer assigned to
 * it the rootHubInitialize function call. The pUSBDrvObj->usbHostDeviceInfo
 * variable contains this identifier. */

if(PLIB_USB_InterruptFlagGet(usbID, USB_INT_ATTACH))
{
    /* We can treat this as a valid attach. We then clear the
     * detach flag and enable the detach interrupt. We enable
     * the Transaction interrupt */

    PLIB_USB_InterruptFlagClear(usbID, USB_INT_HOST_DETACH);
    PLIB_USB_InterruptEnable(usbID, USB_INT_HOST_DETACH);
    PLIB_USB_InterruptEnable(usbID, USB_INT_TOKEN_DONE);

    /* Ask the Host layer to enumerate this device. While calling
     * this function, the UHD of the parent device which is the
     * root hub in this case.
     * */
    pUSBDrvObj->attachedDeviceObjHandle = USB_HOST_DeviceEnumerate
                                          (pUSBDrvObj->usbHostDeviceInfo, 0);
}

/* The following code example shows how the root hub driver calls the
 * USB_HOST_DeviceDenumerate() function in the device detach interrupt. Note how
 * the attachedDeviceObjHandle that was assigned at the time of device
 * enumeration is returned to the Host Layer to let the Host know which device
 * is being detached. */

if((usbInterrupts & USB_INT_HOST_DETACH) && (enabledUSBInterrupts & USB_INT_HOST_DETACH))
{
    /* Perform other detach related handling */

    /* Ask the Host Layer to de-enumerate this device. */
    USB_HOST_DeviceDenumerate (pUSBDrvObj->attachedDeviceObjHandle);

    /* Disable the LS Direct Connect. It may have been enabled if the last
     attach was for a Low-Speed device. */
    PLIB_USB_EP0LSDirectConnectDisable(pUSBDrvObj->usbID);

    /* Continue to perform detach handling */
}
```

Root Hub Port Operation

The HCD Root Hub Driver exposes a set of port related functions that allow the USB Host Layer to control the port. The most commonly used functions are the function to reset the port and get the port speed. In this case, this is the speed of the attached device. The following code example shows how the USB Host Layer calls the hubPortReset, hubPortResetIsComplete and hubPortSpeedGet port functions.

```
/* The following code shows an example of how the Host Layer called the
 * hubPortReset function to reset the port to which the device is connected.
 * The code proceeds with the port reset if no device on the bus is in an
 * enumeration state. It will then call the hubPortReset function of the parent
 * hub of the device. The parent hub, hubInterface member of deviceObj points to
 * this driver, can be the root hub or an external hub */

if(!busObj->deviceIsEnumerating)
{
    /* Remember which device is enumerating */
    busObj->enumeratingDeviceIdentifier = deviceObj->deviceIdentifier;

    /* Grab the flag */
    busObj->deviceIsEnumerating = true;

    /* Reset the device */
    deviceObj->hubInterface->hubPortReset( deviceObj->hubHandle, deviceObj->devicePort );
}

/* The following code example shows how the Host checks if the port reset
```

```
 * operation has completed. If the reset operation has completed, the speed of
 * the attached device can be obtained. The reset settling delay can then be
 * started. */

case USB_HOST_DEVICE_STATE_WAITING_FOR_RESET_COMPLETE:

   /* Check if the reset has completed */
   if(deviceObj->hubInterface->hubPortResetIsComplete
               ( deviceObj->hubHandle ,deviceObj->devicePort ))
   {
       /* The reset has completed. We can also obtain the speed of the
        * device. We give a reset recovery delay to the device */

       deviceObj->speed = deviceObj->hubInterface->hubPortSpeedGet
                         (deviceObj->hubHandle, deviceObj->devicePort);

       deviceObj->deviceState = USB_HOST_DEVICE_STATE_START_RESET_SETTLING_DELAY;
   }
```

Opening and Closing a Pipe

The HCD client can open a pipe to the device after resetting the device. The USB Host Layer calls the hostPipeSetup function in the DRV_USB_HOST_INTERFACE structure to open a pipe. The USB Host Layer must open a pipe to communicate to a specific endpoint on a target device. While opening the pipe, the USB Host Layer must specify parameters which specify the address of the target device, the type of the transfer that the pipe must support and the speed of the pipe. If the device is connected to a hub, the address of the hub must be specified. The HCD Pipe Setup function *is not* interrupt-safe. It should not be called in any event handler that executes in an interrupt context.

The Pipe Setup function returns a valid pipe handle if the pipe was opened successfully. Pipe creation may fail if the target device was disconnected or if there are insufficient resources to open the pipe. The pipe handle is then used along with the hostIRPSubmit function to transfer data between the Host and the device. The following code shows example usage of a Pipe Open function.

```
/* The following code example shows how the Host Layer uses the hostPipeSetup
 * function to open a control pipe to the attached device. Most of the
 * parameters that are passed to this function become known when the device is
 * attached. The pipe handle is checked for validity after the hostPipeSetup
 * function call. */

if(busObj->timerExpired)
{
    busObj->busOperationsTimerHandle = SYS_TMR_HANDLE_INVALID;
    /* Settling delay has completed. Now we can open default address
     * pipe and and get the configuration descriptor */

    SYS_DEBUG_PRINT(SYS_ERROR_INFO,
                    "\r\nUSB Host Layer: Bus %d Device Reset Complete.", busIndex);

    deviceObj->controlPipeHandle =
               deviceObj->hcdInterface->hostPipeSetup( deviceObj->hcdHandle,
               USB_HOST_DEFAULT_ADDRESS , 0 /* Endpoint */,
               deviceObj->hubAddress /* Address of the hub */,
               deviceObj->devicePort /* Address of the port */,
               USB_TRANSFER_TYPE_CONTROL, /* Type of pipe to open */
               0 /* bInterval */, 8 /* Endpoint Size */, deviceObj->speed );

    if(DRV_USB_HOST_PIPE_HANDLE_INVALID == deviceObj->controlPipeHandle)
    {
        /* We need a pipe else we cannot proceed */
        SYS_DEBUG_PRINT(SYS_ERROR_DEBUG,
        "\r\nUSB Host Layer: Bus %d Could not open control pipe. Device not supported.", busIndex);
    }
}
```

An open pipe consumes computational and memory resources and must therefore must be closed if it will not be used. This is especially true of pipes to a device that is detached. The Host Layer calls the hostPipeClose function in the DRV_USB_HOST_INTERFACE structure to close the pipe. The pipe to be closed is specified by the pipe handle. The Pipe Close function can be called from an event handler. It is interrupt safe. Closing a pipe will cancel all pending transfers on that pipe. The IRP callback for such canceled transfers will be called with the status USB_HOST_IRP_STATUS_ABORTED. The following code example shows an example of closing the pipe.

```
/* The following code example shows an example of how the Host Layer calls the
 * hostPipeClose function to close an open pipe. Pipe should be closed if it
 * will not used. An open pipe consumes memory resources. In this example, the
 * Host Layer closes the pipe if it was not able successfully submit an IRP to
 * this pipe. */
```

```
/* Submit the IRP */
if(USB_ERROR_NONE != deviceObj->hcdInterface->hostIRPSubmit
                  ( deviceObj->controlPipeHandle, & (deviceObj->controlTransferObj.controlIRP)))
{
    /* We need to be able to send the IRP. We move the device to
     * an error state. Close the pipe and send an event to the
     * application. The assigned address will be released when
     * the device in unplugged. */

    SYS_DEBUG_PRINT(SYS_ERROR_DEBUG,
        "\r\nUSB Host Layer: Bus %d Set Address IRP failed. Device not supported.", busIndex);

    /* Move the device to error state */
    deviceObj->deviceState = USB_HOST_DEVICE_STATE_ERROR;

    /* Close the pipe as we are about mark this device as unsupported. */
    deviceObj->hcdInterface->hostPipeClose(deviceObj->controlPipeHandle);
}
```

Transferring Data to an Attached Device

The USB Host Layer, the HCD client, needs to transfer data to the attached device to understand the device capabilities and to operate the device. The HCD uses a concept of Input Output Request Packet (IRP) to transfer data to and from the attached device. IRPs are transported over pipes which are setup by calling the USB Driver Pipe Setup function.

A Host IRP is a USB_HOST_IRP type data structure. The IRP is created by the Host layer and submitted to the HCD for processing through the hostIRPSubmit function. At the time of submitting the IRP, the pipe over which the IRP must be transported is specified. The data request in the IRP is transported using the attributes of pipe. When an IRP is submitted to the HCD, it is owned by the HCD and cannot be modified by the Host Layer until the HCD issues an IRP callback. The HCD will issue the IRP callback when it has completed or terminated processing of the IRP.

An IRP does not have its own transfer type. It inherits the properties of the pipe to which it is submitted. Hence an IRP becomes a control transfer IRP it was submitted to a control transfer pipe. A pipe allows multiple IRPs to be queued. This allows the Host Layer to submit IRPs to a pipe even while an IRP is being processed on the pipe. The HCD will process an IRP in the order that it was received. The following code example shows the USB_HOST_IRP data structure.

```
/* The following code example shows the USB_HOST_IRP structure. The Host Layer
 * uses this structure to place data transfer requests on a pipe. */

typedef struct _USB_HOST_IRP
{
    /* Points to the 8 byte setup command packet in case this is a IRP is
     * scheduled on a CONTROL pipe. Should be NULL otherwise */
    void * setup;

    /* Pointer to data buffer */
    void * data;

    /* Size of the data buffer */
    unsigned int size;

    /* Status of the IRP */
    USB_HOST_IRP_STATUS status;

    /* Request specific flags */
    USB_HOST_IRP_FLAG flags;

    /* User data */
    uintptr_t userData;

    /* Pointer to function to be called when IRP is terminated. Can be NULL, in
     * which case the function will not be called. */
    void (*callback)(struct _USB_HOST_IRP * irp);

    /*************************************
     * These members of the IRP should not be
     * modified by client
     ************************************/
   uintptr_t privateData[7];

} USB_HOST_IRP;
```

The `setup` member of the USB_HOST_IRP structure must point to the 8 byte setup packet for control transfers. The driver will send this 8 byte data in the Setup phase of the control transfer. It can be NULL for non-control transfers. This member is only considered if the IRP is submitted to a control transfer pipe. It is ignored for non-control transfer pipes. The structure of the setup command should match that specified in the USB 2.0 specification.

The `data` member of the USB_HOST_IRP structure points to a data buffer. This data buffer will contain the data that needs to be sent to the device for data stage of a OUT transfer, or it will contain the data that was received from the device during an IN transfer. Any hardware specific cache coherency and address alignment requirements must be considered while allocating this data buffer. The Driver Client should not modify or examine the contents of the IRP after the IRP has been submitted and is being processed. It can be examined after the driver has released the IRP.

The `size` member of the USB_HOST_IRP structure contains the size of the transfer. for Bulk transfers, the size of the transfer can exceed the size of the transaction (which is equal to size of the endpoint reported by the device). The HCD in such a case will split up the transfer into transactions. This process does not require external intervention. For control transfers, the size of the transfer is specified in the setup packet (pointed to by the `setup` member of the USB_HOST_IRP structure). The driver will itself process the Setup, Data (if required) and Handshake stages of control transfer. This process again does not require external intervention. For interrupt and isochronous transfers, the size of transfer specified in the IRP cannot exceed the size of the transaction. If size is specified as 0, then the driver will send a zero length packet. The `size` parameter of the IRP is updated by the driver when IRP processing is completed. This will contain the size of the completed transfer.

The `status` member of the IRP provides the completion status of the IRP and should be checked only when the IRP processing has completed. This is indicated by the driver calling the IRP callback function. The IRP status is a USB_HOST_IRP_STATUS type. The following code example shows the different possible values of the `status` member and an example of submit a control transfer IRP.

```
/* The following code shows an example of how the Host Layer populates
 * the IRP object and then submits it. IRP_Callback function is called when an
 * IRP has completed processing. The status of the IRP at completion can be
 * checked in the status flag. The size field of the irp will contain the amount
 * of data transferred. */

void IRP_Callback(USB_HOST_IRP * irp)
{
    /* irp is pointing to the IRP for which the callback has occurred. In most
     * cases this function will execute in an interrupt context. The application
     * should not perform any hardware access or interrupt unsafe operations in
     * this function. */

    switch(irp->status)
    {
        case USB_HOST_IRP_STATUS_ERROR_UNKNOWN:
            /* IRP was terminated due to an unknown error */
            break;

        case USB_HOST_IRP_STATUS_ABORTED:
            /* IRP was terminated by the application */
            break;

        case USB_HOST_IRP_STATUS_ERROR_BUS:
            /* IRP was terminated due to a bus error */
            break;

        case USB_HOST_IRP_STATUS_ERROR_DATA:
            /* IRP was terminated due to data error */
            break;

        case USB_HOST_IRP_STATUS_ERROR_NAK_TIMEOUT:
            /* IRP was terminated because of a NAK timeout */
            break;

        case USB_HOST_IRP_STATUS_ERROR_STALL:
            /* IRP was terminated because of a device sent a STALL */
            break;

        case USB_HOST_IRP_STATUS_COMPLETED:
            /* IRP has been completed */
            break;

        case USB_HOST_IRP_STATUS_COMPLETED_SHORT:
            /* IRP has been completed but the amount of data processed was less
             * than requested. */
            break;

        default:
```

```
            break;
        }
    }

    /* In the following code example the a control transfer IRP is submitted to a
     * control pipe. The setup parameter of the IRP points to the Setup command of
     * the control transfer. The direction of the data stage is specified by the
     * Setup packet. */

    USB_HOST_IRP irp;
    USB_ERROR result;
    USB_HOST_PIPE_HANDLE controlPipe;
    USB_SETUP_PACKET setup;
    uint8_t controlTransferData[32];

    irp.setup = setup;
    irp.data = controlTransferData;
    irp.size = 32;

            break;

        case USB_ERROR_OSAL_FUNCTION:
            /* An error occurred while trying to grab mutex */
            break;

        default:
            break;
    }
```

The `flags` member of the USB_HOST_IRP structure specifies flags which affect the behavior of the IRP. The USB_HOST_IRP_FLAG enumeration specifies the available option. The USB_HOST_IRP_FLAG_SEND_ZLP causes the driver to add a Zero Length Packet (ZLP) to the data stage of the transfer when the transfer size is an exact multiple of the endpoint size. The USB_HOST_IRP_WAIT_FOR_ZLP flag will cause the driver to wait for a ZLP from the device in a case where the size of data received thus far in the transfer is an exact multiple of the endpoint size.

The `callback` member of the USB_HOST_IRP structure points to a function which the driver calls when the IRP processing is completed. The Driver Client must implement this function and assign the pointer to this function to the `callback` member of the IRP. Every IRP can have its own callback function or one common callback function could be used. The callback function will execute in an interrupt context. The Driver Client should not execute interrupt unsafe, blocking, or computationally intensive operations in the callback function. The client can call hostIRPSubmit function in the IRP callback function to submit another IRP or resubmit the same IRP. The client can check the status and size of the IRP in the callback function.

The `userData` member of the USB_HOST_IRP structure can be used by the client to associate a client specific context with the Host. This context can then be used by the client, in the IRP callback function to identify the context in which the IRP was submitted. This member is particularly useful if the client wants to implement one callback function for all IRPs.

The `privateData` member of the IRP is used by the driver and should not be accessed or manipulated by the Driver Client. The following code examples show usage of IRPs to transfer data between the Host and the attached device and along with the different flags.

```
/* The following code shows an example of submitting an IRP to send data
 * to a device. In this example we will request the driver to send a ZLP after
 * sending the last transaction. The driver will send the ZLP only if the size
 * of the transfer is a multiple of the endpoint size. This is not a control
 * transfer IRP. So the setup field of the IRP will be ignored.  */

irp.data = data;
irp.size = 128;
irp.flags = USB_HOST_IRP_FLAG_WAIT_FOR_ZLP ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

result = DRV_USBFS_HOST_IPRSubmit( bulkINPipeHandle, &irp );
```

USB Driver Device Mode Operation

Provides information on Device mode operation.

Description

The USB Driver operates can operate in the Device mode when it is initialized for Device mode or Dual Role operation. When operating in Device mode, the USB Driver is also referred to as the USB Controller Driver (USBCD). In Dual-Role mode, the USB Driver will switch to USBCD mode when the USB Driver Device Attach function is called.

The USB Driver Client must perform these steps to operate the USB Driver in Device mode.

1. Open the USB Driver to obtain the driver handle.
2. Set the event handler.
3. Wait for the application to attach the device to the bus.
4. Enable Endpoint 0 and respond to USB Host Enumeration requests.
5. Allow the application and function drivers to enable other endpoints and communicate with the Host.

The following sections discuss these operations in more detail.

General Device Mode Operations

Provides information on general Device mode operations.

Description

This section describes the USBCD operations such as setting event handlers and attaching and detaching the device.

Handling Device Mode Driver Events

The Device Layer will call the USBCD eventHandlerSet function to register the Device mode event handling function. The USBCD generates various events that indicate different states of the USB. These events are defined by the DRV_USB_EVENT enumeration. The following code example shows how the Device Layer registers the driver event handling function.

```
/* This code example shows the implementation of the USB_DEVICE_Attach and the
 * USB_DEVICE_Detach function. These functions are actually macro that map
 * directly deviceAttach and the deviceDetach function of the driverInterface
 * member of the deviceClient Object (which is the macro parameter) */

#define USB_DEVICE_Attach( x )  ((USB_DEVICE_OBJ *)x)->driverInterface->deviceAttach
                                ( ((USB_DEVICE_OBJ *)(x))->usbCDHandle)
#define USB_DEVICE_Detach( x )  ((USB_DEVICE_OBJ *)x)->driverInterface->deviceDetach
                                ( ((USB_DEVICE_OBJ *)x)->usbCDHandle)
```

If the driver is operating in interrupt mode, the client event handling function will execute in an interrupt context. The client should not call interrupt unsafe, computationally intensive or blocking functions in the event handler. The following code shows a small example of the Device Layer USBCD Event Handler:

```
/* This code example shows a partial implementation of the USB Device Layer
 * event handler. Note how the code type casts the referenceHandle parameter to
 * a USB_DEVICE_OBJ type. This referenceHandle is the same value that the Device
 * Layer passed when the event handler was set. This now easily allows one
 * implementation of the event handling code to be used by multiple Device
 * Layer instances. */

    void _USB_DEVICE_EventHandler
(
    uintptr_t referenceHandle,
    DRV_USB_EVENT eventType,
    void * eventData
)
{
    USB_DEVICE_OBJ* usbDeviceThisInstance;
    USB_DEVICE_MASTER_DESCRIPTOR * ptrMasterDescTable;
    USB_DEVICE_EVENT_DATA_SOF SOFFrameNumber;

    usbDeviceThisInstance = (USB_DEVICE_OBJ *)referenceHandle;

    /* Handle events, only if this instance is in initialized state */
    if( usbDeviceThisInstance->usbDeviceInstanceState <= SYS_STATUS_UNINITIALIZED )
    {
        /* The device should anyway not be attached when the Device Layer is
         * not initialized. If we receive driver event when the Device Layer is
         * not initialized, there is nothing we can do but ignore them. */
        return;
    }

    switch(eventType)
    {
        case DRV_USB_EVENT_RESET_DETECT:

            /* Clear the suspended state */
            usbDeviceThisInstance->usbDeviceStatusStruct.isSuspended = false;

            /* Cancel any IRP already submitted in the RX direction. */
            DRV_USB_DEVICE_IRPCancelAll( usbDeviceThisInstance->usbCDHandle,
                    controlEndpointRx );

            /* Code not shown for the sake of brevity. */

    }
}
```

In the previous code example, the Device Layer (the Driver Client) sets the `hReferenceData` parameter, of the Event Handler Set function, to point to a local object. This pointer is returned to the Device Layer, in the event handler when an event occurs. For multiple instances of USB drivers in one application, this allows the Device Layer to easily associate a Device Layer specific context to the driver instance, thus simplifying implementation of the event handler.

Attaching and Detaching the Device

The USB Device Layer calls the USBCD deviceAttach and deviceDetach functions to attach and detach the device on the USB. The USB Device Layer should be ready to handle events which would occur when the device is attached on the bus. Hence the USB Device Layer should register the USBCD event handler before the attach function is called. The deviceAttach and deviceDetach functions can be called in an interrupt context. These functions are respectively called when the USB Device application detects a valid VBUS voltage and when the VBUS voltage is not valid.

Setting the Device Address

The USB Device Layer will call the USBCD deviceAddressSet function to set the USB address of the device. The Device Layer will do this when it receives the Set Address control request from the Host. The USBCD will reset the device address to '0' when it has received reset signaling from the root hub. The following code example shows how the USB Device Layer calls this function.

```
/* The following code example shows how the USB Device Layer calls the
 * DRV_USB_DEVICE_AddressSet function to set the address. The
 * DRV_USB_DEVICE_AddressSet function is actually a macro that calls the
 * deviceAddressSet function of the driverInterface of usbDeviceThisInstance
 * object. The usbDeviceThisInstance is Device Layer object.
```

```
 *
 * As seen in this code, the Device Layer calls the address set function when
 * the it a pending set address control request from the Host has completed. */

void _USB_DEVICE_Ep0TransmitCompleteCallback(USB_DEVICE_IRP * handle)
{
    USB_DEVICE_IRP * irpHandle = (USB_DEVICE_IRP *)handle;
    USB_DEVICE_OBJ * usbDeviceThisInstance;
    USB_DEVICE_CONTROL_TRANSFER_STRUCT * controlTransfer;

    usbDeviceThisInstance = (USB_DEVICE_OBJ *)irpHandle->userData;
    controlTransfer = &(usbDeviceThisInstance->controlTransfer);

    if(irpHandle->status == USB_DEVICE_IRP_STATUS_ABORTED)
    {
        return;
    }

    if(usbDeviceThisInstance->usbDeviceStatusStruct.setAddressPending)
    {
        DRV_USB_DEVICE_AddressSet(usbDeviceThisInstance->usbCDHandle,
                                  usbDeviceThisInstance->deviceAddress);
        usbDeviceThisInstance->usbDeviceStatusStruct.setAddressPending = false;
    }

    /* Code not shown for the sake of brevity */

}
```

Device Current Speed and SOF Number

The USB Device Layer will call the USBCD deviceCurrentSpeedGet function to know the speed at which the device is attached to the USB. This allows the Device Layer to select the correct endpoint settings at the time of processing the Set Configuration request issued by the Host. The USB Device Layer will call the deviceSOFNumberGet function to return the SOF number at the time of the SOF event.

Device Remote Wake-up

The USB Device Layer will call the USBCD deviceRemoteWakeupStop and deviceRemoteWakeupStart functions to stop and start remote signaling. The Device layer application will call the USB Device Layer Stop and Start Remote Wakeup Signaling functions to remotely let the root hub know that the device is ready to be woken up. The timing of the remote signaling is controlled by the Device Layer. The client should call the remote wakeup function only when the device is suspended by the Host.

Device Endpoint Operations

Provides information on Device Endpoint operations.

Description

The UBSCD Endpoint functions allow the Driver Client to enable, disable, stall and clear the stall condition on an endpoint. The client submits requests to transmit and receive data from the USB Host on an endpoint.

Endpoint Enable and Disable functions

The USBCD client must enable an endpoint it must use the endpoint for communicating with the USB Host. The client will call the USBCD deviceEndpointEnable function to enable the endpoint. While calling this function, the client must specify the endpoint address, the transfer type to be processed on this endpoint and the maximum size of a transaction on this endpoint. This function is thread-safe when called in an RTOS application. The USBCD allows an endpoint to be accessed by one thread only. The USB Device Layer and the device function drivers will enable the endpoint when the Host sets the device configuration. The USBCD deviceEndpointIsEnabled function is available to check if an endpoint is enabled. The following code example shows how the USB Device Layer enables the device endpoint.

```
/* The following code example shows the USB Device Layer enables Endpoint 0 to
 * prepare for the enumeration process after it has received reset signaling
 * from the Host. The Device Layer calls the deviceEndpointEnable function to
 * to enable the endpoint. The driverInterface member of the
 * usbDeviceThisInstance structure points to the USB Device Mode Driver Common
 * Interface. */

void _USB_DEVICE_EventHandler
(
    uintptr_t referenceHandle,
```

```
    DRV_USB_EVENT eventType,
    void * eventData
)
{
    /* Code not shown due to space constraints */

    switch(eventType)
    {
        case DRV_USB_EVENT_RESET_DETECT:

            /* Clear the suspended state */
            usbDeviceThisInstance->usbDeviceStatusStruct.isSuspended = false;

            /* Cancel any IRP already submitted in the RX direction. */
            DRV_USB_DEVICE_IRPCancelAll( usbDeviceThisInstance->usbCDHandle,
                    controlEndpointRx );

            /* Cancel any IRP already submitted in the TX direction. */
            DRV_USB_DEVICE_IRPCancelAll( usbDeviceThisInstance->usbCDHandle,
                    controlEndpointTx );

            /* Deinitialize all function drivers.*/
            _USB_DEVICE_DeInitializeAllFunctionDrivers ( usbDeviceThisInstance );

            /* Disable all endpoints except for EP0.*/
            DRV_USB_DEVICE_EndpointDisableAll(usbDeviceThisInstance->usbCDHandle);

            /* Enable EP0 endpoint in RX direction */
            (void)usbDeviceThisInstance->driverInterface->deviceEndpointEnable
                  (usbDeviceThisInstance->usbCDHandle,
                    controlEndpointTx, USB_TRANSFER_TYPE_CONTROL, USB_DEVICE_EP0_BUFFER_SIZE);

            /* Code not shown due to space constraints */

            break;
    }
}
```

The USB Device Layer and the Function drivers will disable an endpoint when the Host sets a zero-device configuration or when the Host resets the device. The USBCD deviceEndpointDisable function disables an endpoint. When an endpoint is disabled, it does not accept requests for Host communication. Disabling an endpoint does not cancel any communication requests that that have been submitted on the endpoint. These requests must be canceled explicitly.

Device Endpoint Stall and Stall Clear

The USBCD client can call the deviceEndpointStall and deviceEndpointStallClear functions to stall and cleat the stall on an endpoint respectively. The USB Device Layer and function driver may stall endpoint to indicate error or to indicate a protocol state. The endpoint stall condition may be cleared in response to a USB Host Clear Feature request. Stalling or clearing the stall on an endpoint will cause all communication requests on the endpoint to be canceled. The function calls are thread safe and interrupt safe. The deviceEndpointIsStalled function is also available to check if an endpoint is in a stalled state. The following code example shows how the USB Device Layer calls these functions to stall and clear the stall on an endpoint.

```
/* The following code example shows how the USB Device Layer calls the driver
 * endpoint stall function (deviceEndpointStall) to stall an endpoint when the a
 * Host send a Set Feature request with feature selector set to endpoint halt.
 * The endpoint to be halted is identified in the setup packet and is identified
 * in this code example as usbEndpoint. Also shown is how the stall clear
 * (deviceEndpointStallClear) and stall status check (deviceEndpointIsStalled)
 * functions are called. */

/* The driverInterface member of the usbDeviceThisInstance structure is a
 * pointer to the USB Driver Common Interface. */

void _USB_DEVICE_ProcessStandardEndpointRequest
(
    USB_DEVICE_OBJ * usbDeviceThisInstance,
    uint8_t interfaceNumber,
    USB_SETUP_PACKET * setupPkt
)
{
    USB_ENDPOINT usbEndpoint;
```

```
    usbEndpoint = setupPkt->bEPID;

    if( setupPkt->bRequest == USB_REQUEST_GET_STATUS )
    {
        usbDeviceThisInstance->getStatusResponse.status = 0x00;
        usbDeviceThisInstance->getStatusResponse.endPointHalt
            =  usbDeviceThisInstance->driverInterface->deviceEndpointIsStalled
               (usbDeviceThisInstance->usbCDHandle, usbEndpoint );

        USB_DEVICE_ControlSend( (USB_DEVICE_HANDLE)usbDeviceThisInstance,
                (uint8_t *)&usbDeviceThisInstance->getStatusResponse, 2 );
    }
    else if( setupPkt->bRequest == USB_REQUEST_CLEAR_FEATURE )
    {
        if( setupPkt->wValue == USB_FEATURE_SELECTOR_ENDPOINT_HALT )
        {
            usbDeviceThisInstance->driverInterface->deviceEndpointStallClear
            (usbDeviceThisInstance->usbCDHandle, usbEndpoint );
            USB_DEVICE_ControlStatus((USB_DEVICE_HANDLE)usbDeviceThisInstance,
                                     USB_DEVICE_CONTROL_STATUS_OK );
        }
    }
    else if (setupPkt->bRequest == USB_REQUEST_SET_FEATURE )
    {
        if( setupPkt->wValue == USB_FEATURE_SELECTOR_ENDPOINT_HALT )
        {
            usbEndpoint = setupPkt->bEPID;
            usbDeviceThisInstance->driverInterface->deviceEndpointStall
                                 (usbDeviceThisInstance->usbCDHandle, usbEndpoint );
            USB_DEVICE_ControlStatus((USB_DEVICE_HANDLE)usbDeviceThisInstance,
                                     USB_DEVICE_CONTROL_STATUS_OK );
        }
    }

    /* Additional code is not shown due to space constraints */
}
```

Transferring Data to the Host

Provides information on transferring data to the Host.

Description

The USB Device Layer, the USBCD client, needs to transfer data to the Host in response to enumeration requests for general operation on the device. The USB uses a concept of Input Output Request Packet (IRP) to transfer data to and from the Host. IRPs are transported over endpoints which are enabled by calling the USBCD Endpoint Enable function.

A Device IRP is a USB_DEVICE_IRP type data structure. The IRP is created by the Device Layer and submitted to the USBCD for processing through the deviceIRPSubmit function. At the time of submitting the IRP, the endpoint over which the IRP must be transported is specified. The data request in the IRP is transported using the attributes of the endpoint. When an IRP is submitted to the USBCD, it is owned by the USBCD and cannot be modified by the Device Layer until the USBCD issues an IRP callback. The USBCD will issue the IRP callback when it has completed or terminated processing of the IRP.

An IRP does not have its own transfer type. It inherits the properties of the endpoint to which it is submitted. Hence an IRP becomes a control transfer IRP it was submitted to a control endpoint. An endpoint allows multiple IRPs to be queued. This allows the Device Layer to submit IRPs to an endpoint even while an IRP is being processed on the endpoint. The USBCD will process an IRP in the order that it was received. The following code example shows the USB_DEVICE_IRP data structure:

```
/* This code example shows the USB_DEVICE_IPR structure. The Device Layer
 * uses such a structure to transfer data through the driver. A structure of
 * this type is allocated by the Device Layer and the other function drivers and
 * passed to the deviceIRPSubmit function. */

typedef struct _USB_DEVICE_IRP
{
    /* Pointer to the data buffer */
    void * data;

    /* Size of the data buffer */
    unsigned int size;
```

```
    /* Status of the IRP */
    USB_DEVICE_IRP_STATUS status;

    /* IRP Callback. If this is NULL, then there is no callback generated */
    void (*callback)(struct _USB_DEVICE_IRP * irp);

    /* Request specific flags */
    USB_DEVICE_IRP_FLAG flags;

    /* User data */
    uintptr_t userData;

    /***********************************
     * The following members should not
     * be modified by the client
     ***********************************/
    uint32_t privateData[3];

} USB_DEVICE_IRP;
```

The `data` member of the USB_DEVICE_IRP structure points to a data buffer. This data buffer will contain the data that needs to be sent to the Host for the data stage of an IN transfer. For an OUT transfer, it will contain the data that was received from the Host. Any hardware specific cache coherency and address alignment requirements must be considered while allocating this data buffer. The Driver Client should not modify or examine the contents of the IRP after the IRP has been submitted and is being processed. It can be examined after the driver has released the IRP.

The `size` member of the USB_DEVICE_IRP structure specifies the size of the data buffer. The transfer will end when the device has sent or received size number of bytes. While sending data to the Host, the IRP size can exceed the size of the transaction (which is equal to the size of the endpoint). The USBCD in such a case will split up the transfer into transactions. This process does not require external intervention. The driver uses receive and transmit IRPs to process control transfers. When the driver receives a Setup packet, the IRP completion status would be USB_DEVICE_IRP_STATUS. The Driver Client should then use additional receive and transmit IRPs to complete the control transfer.

For interrupt and isochronous transfers, the size of transfer specified in the IRP cannot exceed the size of the transaction. If size is specified as 0, then the driver will send or expect a zero length packet. The `size` parameter of the IRP is updated by the driver when IRP processing is completed. This will contain the size of the completed transfer.

The `status` member of the IRP provides the completion status of the IRP and should be checked only when the IRP processing has completed. This is indicated by the driver calling the IRP callback function. The IRP status is a USB_DEVICE_IRP_STATUS type. The following code example shows the different possible values of the `status` member and example usage of IRPs to transfer data between the device and the Host.

```
/* The followoing code shows example usage of the device IRP. The submit status
 * of the IRP is available when IRP submit function returns. The completion
 * status of the IRP is available when the IRP has terminated and the IRP
 * callback function is invoked. The IRP callback
 * function shown in this example shows the possible complete status of the IRP.
 * The end application may or may not handle all the cases. Multiple IRPs can be
 * queued on an endpoint. */

void IRP_Callback(USB_DEVICE_IRP * irp)
{
    /* irp is pointing to the IRP for which the callback has occurred. In most
     * cases this function will execute in an interrupt context. The application
     * should not perform any hardware access or interrupt unsafe operations in
     * this function. */

    switch(irp->status)
    {
        case USB_DEVICE_IRP_STATUS_TERMINATED_BY_HOST:
            /* The IRP was aborted because the Host cleared the stall on the
             * endpoint */
            break;

        case USB_DEVICE_IRP_STATUS_ABORTED_ENDPOINT_HALT:
            /* IRP was aborted because the endpoint halted */
            break;

        case USB_DEVICE_IRP_STATUS_ABORTED:
            /* USB Device IRP was aborted by the function driver */
            break;

        case USB_DEVICE_IRP_STATUS_ERROR:
            /* An error occurred on the bus when the IRP was being processed */
```

```
            break;

        case USB_DEVICE_IRP_STATUS_COMPLETED:
            /* The IRP was completed */
            break;

        case USB_DEVICE_IRP_STATUS_COMPLETED_SHORT:
            /* The IRP was completed but the amount of data received was less
             * than the requested size */
            break;

        default:
            break;

    }
}

/* In the following example, the IRP is submitted to Endpoint 0x84. This is
 * interpreted as an IN direction endpoint (MSB of 0x84 is 1) and Endpoint 4.
 * The data contained in source will be sent to the USB Host. Assuming
 * the endpoint size is 64, the 130 bytes of data in this case will be sent to
 * the Host in three transaction of 64, 64 and 2 bytes. A transaction completes
 * when the Host polls (sends an IN token) the device.  The callback function
 * will then called indicating the completion status of the IRP. The application
 * should not modify the privateData field of the IRP. If the IRP was submitted
 * successfully, the buffer will be owned by the driver until the IRP callback
 * function has been called. Because the size of the transfer is not a multiple
 * of the endpoint size, the IRP flag must be set
 * USB_DEVICE_IRP_FLAG_DATA_COMPLETE. This directs the driver to not perform any
 * explicit signaling to the Host to indicate end of transfer. The last packet
 * in this case is a short packet and this signals the end of the transfer. */

        break;

    case USB_ERROR_ENDPOINT_NOT_CONFIGURED:
        /* The endpoint to which this IRP is being submitted is not enabled. It
         * must be enabled by calling the DRV_USBFS_DEVICE_EndpointEnable()
         * function. */
        break;

    case USB_ERROR_PARAMETER_INVALID:
        /* The USB_DEVICE_IRP_FLAG_DATA_PENDING flag was specified but the
```

```
            * transfer size is not a multiple of the endpoint size. If the IRP was
            * submitted to a receive endpoint, this error can occur if the size is
            * not a multiple of the endpoint size. */
            break;

        case USB_ERROR_OSAL_FUNCTION:
            /* An error occurred while trying to grab a mutex. This is applicable
             * when the driver is running with a RTOS. */
            break;

        case USB_ERROR_NONE:
            /* The IRP was submitted successfully. */
            break;

        default:
            break;
    }

    /* The following code example shows how an IRP is submitted to an OUT endpoint.
     * In this case data will be pointing to a buffer where the received data will
     * be stored. Note that the size of the IRP should be a multiple of the endpoint
     * size. The flags parameter is ignored in the data receive case. The IRP
     * terminates when the specified size of bytes has been received (the Host sends
     * OUT packets) or when a short packet has been received. */

    USB_DEVICE_IRP irp;
    USB_ERROR result;
    uint8_t destination[128];

    irp.data = destination;
    irp.size = 128;
    irp.called = IRP_Callback;
    userData = &someApplicationObject;

    result = DRV_USBFS_DEVICE_IRPSubmit(driverHandle, 0x04, &irp);
```

For IRPs submitted to an Interrupt or Isochronous endpoints, the driver will always send either the less than or equal to the maximum endpoint packet size worth of bytes in a transaction. The application could either submit an IRP per Interrupt/Isochronous polling interval or it could submit one IRP for multiple polling intervals.

The `flags` member of the USB_DEVICE_IRP structure specifies flags which affect the behavior of the IRP. The USB_DEVICE_IRP_FLAG enumeration specifies the available option. The USB_DEVICE_IRP_FLAG_DATA_COMPLETE causes the driver to add a Zero Length Packet (ZLP) to the data stage of the IN transfer when the transfer size is an exact multiple of the endpoint size. If the transfer size is not a multiple of the endpoint size, no ZLP will be sent. The USB_DEVICE_IRP_FLAG_PENDING flag will cause the driver to not send a ZLP in a case where the size of the IN transfer is an exact multiple of the endpoint size. The following code example demonstrates this.

```
    /* In the following code example, the IRP is submitted to an IN endpoint whose size
     * is 64. The transfer size is 128, which is an exact multiple of the endpoint
     * size. The flag is set to USB_DEVICE_IRP_FLAG_DATA_COMPLETE. The driver
     * will send two transactions of 64 bytes each and will then automatically send a
     * Zero Length Packet (ZLP), thus completing the transfer. The IRP callback will
     * be invoked when the ZLP transaction has completed. */

    USB_DEVICE_IRP irp;
    USB_ERROR result;
    uint8_t source[128];

    irp.data = source;
    irp.size = 128;
    irp.called = IRP_Callback;
    flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
    userData = &someApplicationObject;

    result = DRV_USBFS_DEVICE_IRPSubmit(driverHandle, 0x84, &irp);

    /* In the following code example, the IRP is submitted to an IN endpoint whose size
     * is 64. The transfer size is 128, which is an exact multiple of the endpoint
     * size. The flag is set to to USB_DEVICE_IRP_FLAG_DATA_PENDING. The driver will
     * send two transactions of 64 bytes each but will not send a ZLP. The USB Host
     * can then consider that there is more data pending in the transfer. The IRP
     * callback will be invoked when the two transactions have completed. */
```

```
USB_DEVICE_IRP irp;
USB_ERROR result;
uint8_t source[128];

irp.data = source;
irp.size = 128;
irp.called = IRP_Callback;
flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
userData = &someApplicationObject;

result = DRV_USBFS_DEVICE_IRPSubmit(driverHandle, 0x84, &irp);
```

The `callback` member of the USB_DEVICE_IRP structure points to a function which the driver calls when the IRP processing is completed. The Driver Client must implement this function and assign the pointer to this function to the `callback` member of the IRP. Every IRP can have its own callback function or one common callback function could be used. The callback function will execute in an interrupt context. The Driver Client should not execute interrupt unsafe, blocking or computationally intensive operations in the callback function. The client can call deviceIRPSubmit function in the IRP callback function to submit another IRP or resubmit the same IRP. The client can check the status and size of the IRP in the callback function.

The `userData` member of the USB_DEVICE_IRP structure can be used by the client to associate a client specific context with the Host. This context can then be used by the client, in the IRP callback function to identify the context in which the IRP was submitted. This member is particularly useful if the client wants to implement one callback function for all IRPs.

The `privateData` member of the IRP is used by the driver and should not be accessed or manipulated by the Driver Client.

PIC32MX USB Driver

Provides information on the USB Driver specific to PIC32MX devices.

Description

The PIC32MX USB Driver in MPLAB Harmony provides API functions that allow the MPLAB Harmony USB Host and Device Stack to access the USB while operating on a PIC32MX microcontroller. The driver implements the USB Driver Common Interface required by the USB Host and Device Stack. It abstracts the USB module operational details from the Host and Device Stack and provides the stacks with a modular access mechanism to the USB. The PIC32MX USB Driver features the following:

- USB 2.0 Full Speed operation in Peripheral mode
- USB 2.0 Full Speed and Low Speed USB Peripheral Support in Host mode
- Designed for Dual Role Operation
- Capable of operating multiple USB modules
- Features non-blocking function and is interoperable with other MPLAB Harmony modules
- Features thread safe functions when operating within an RTOS
- Capable of operating in Polled and Interrupt modes
- Implements the USB Driver Common Interface required by the MPLAB Harmony USB Host and Device Stack
- Completely configurable through MPLAB Harmony Configurator (MHC) tool
- Implements feature separation (Host and Device mode functions are implemented across different files)

Note: This help section only discusses features that are unique to the PIC32MX USB Driver and are not a part of the USB Driver Common Interface. The driver functions that implement the USB Driver Common Interface are described in the Common Interface Help section.

While the PIC32MX USB module supports USB "On-The-Go" (OTG), this release of the PIC32MX Driver does not implement USB OTG protocol support.

This help section only provides relevant information about the operation of the USB. The reader is encouraged to refer to the USB 2.0 Specification available at www.usb.org for a detailed explanation of USB protocol.

Using the Library

This topic describes the basic architecture of the PIC32MX USB Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_usbfs.h`

The interface to the PIC32MX USB Driver library is defined in the `drv_usbfs.h` header file.

Please refer to the What is MPLAB Harmony? section for how the Driver interacts with the framework.

Library Overview

Provides an overview of the library.

Description

The PIC32MX USB Driver will typically be used by a USB Host and/or Device Stack. The USB Host and Device Stack operate as driver client applications. The driver is initialized as part of the MPLAB Harmony System Initialization. The driver initialization data structure specifies the operation mode (Host, Device, or Dual Role) of the driver. The driver features task routines to be called in the MPLAB Harmony application tasks function (SYS_Tasks function) and the USB Module Interrupt Service Routine (ISR).

The Host and the Device Stack can open the driver only when initialization has completed. It will continue to return an invalid driver handle while the initialization is in progress. Once opened, the Device Mode function can be called if the driver is operating in Device mode. The Host Mode function can be called if the driver is operating in Host mode. In Dual Role operation mode, the driver supports Host and Device operation in the same application. Even then, the driver will either operate as a USB Host or Device. OTG operation is not supported.

The PIC32MX USB Driver features RTOS thread-safe functions. This allows the driver client application to safely call driver functions across different RTOS threads. Not all of the driver functions are interrupt-safe.

In addition to the USB Driver, which implements the USB Driver Common Interface, the PIC32MX USB Driver implements functions which are required for its operation in the MPLAB Harmony framework. The following table lists the different categories of functions in the PIC32MX USB Driver.

Library Interface Section	Description
System Function	These functions are accessed by the MPLAB Harmony System module. They allow the driver to be initialized, deinitialized and maintained. These functions are implemented in the `drv_usbfs.c` source file.
Client Core Functions	These functions allow the USB Host and Device Stack to open, close and perform other general driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbfs.c` source file.
Device Mode Operation Functions	These functions allow the USB Device Stack to perform USB Device mode specific driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbfs_device.c` source file
Host Mode Operation Functions	These functions allow the USB Host Stack to perform USB Host mode specific driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbfs_host.c` source file.
Root Hub Functions	These functions allow the USB Host Stack to access the driver Root hub operation. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbfs_host.c` source file.

Abstraction Model

Provides information on the abstraction model for the library.

Description

The PIC32MX USB Driver implements the abstraction model defined by the USB Driver Common interface. This interface abstracts USB module specific details and provides a module independent interface to the driver client applications.

While operating in Device mode, the driver expects the client application (the USB Device Stack) to enable endpoints and then submit I/O request packet (IRP) requests to the enabled endpoints. Multiple IRPs can be queued on an endpoint. The driver calls the IRP callback function when the IRP is processed. The driver allows the client application to also attach and detach the device on the bus. It generates events which indicate USB states.

While operating in Host mode, the driver expects the client application (the USB Host Stack) to open pipes to endpoints on the connected device. The client application can then submit IRPs to the pipes. Multiple IRPs can be queued on a pipe. The driver calls the IRP callback function when the IRP is processed. The driver will call application defined functions to enumerate and denumerate a device. These functions are called when the driver detect device attach and detach respectively. The driver also exports root hub functions to the client application. This allows the client application to treat the driver as a single port hub

Please refer to the PIC32 USB Driver Common Interface help section for more details on the driver abstraction model.

How the Library Works

Provides information on how the library works.

Description

This section only explains aspects of driver operation which are unique to the PIC32MX USB Driver. Major driver operations are described in the PIC32 USB Driver Common Interface help section.

Driver Initialization

Note: While generating a MPLAB Harmony USB project with MHC, the initialization code for the driver is generated automatically based on selections made in the USB Host stack or Device Stack Configuration trees.

The PIC32MX USB Driver must be initialized so that a client application can open. The client application will not be able to open the driver if the initialization is in progress or has failed. The driver is initialized by calling the DRV_USBFS_Initialize function. This function is called from the SYS_Initialize function in the MPLAB Harmony application project and accepts two input parameters. The index parameter defines the instance of the USB Driver to be initialized. This becomes significant when the PIC32MX microcontroller has more than one USB module. The init parameter is a driver specific data structure of the type DRV_USBFS_INIT. This structure is shown in the following code example.

```
/* This code snippet show the PIC32MX USB Driver Initialization data structure.
 * A structure of this type must be provided to the DRV_USBFS_Initialize()
 * function. */

typedef struct
{
    /* System Module Initialization */
    SYS_MODULE_INIT moduleInit;

    /* Identifies the USB peripheral to be used. This should be the USB PLIB
       module instance identifier. */
    uint8_t usbID;

    /* This should be set to true if the USB module must stop operation in IDLE
       mode */
    bool stopInIdle;

    /* This should be set to true if the USB module must suspend when the CPU
       enters sleep mode. */
    bool suspendInSleep;

    /* Specify the interrupt source for the USB module. This should be Interrupt
       PLIB Interrupt source identifier for the USB module instance specified in
       usbID. */
    INT_SOURCE interruptSource;

    /* Specify the operational speed of the USB module. This should always be
       set to USB_SPEED_FULL. The use of this parameter is deprecated. */
    USB_SPEED operationSpeed;

    /* Specify the operation mode of the USB module. This defines if the USB
     * module will support Device, Host or Dual Role operation */
    DRV_USBFS_OPMODES operationMode;

    /* A pointer to the endpoint descriptor table. This should be aligned at 512
       byte address boundary. The size of the table is equal to the
       DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE times the number of endpoints needed
       in the application. */
    void * endpointTable;

    /* Root hub available current in mA. This specifies the amount of current
       that root hub can provide to the attached device. This should be
       specified in mA. This is required when the driver is required to operate
       in host mode. */
    uint32_t rootHubAvailableCurrent;

    /* When operating in Host mode, the application can specify a Root Hub port
       enable function. This parameter should point to Root Hub port enable
       function. If this parameter is NULL, it implies that the Port is always
       enabled. */
    DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;

    /* When operating in Host mode, the application can specify a Root Port
       Indication. This parameter should point to the Root Port Indication
       function. If this parameter is NULL, it implies that Root Port Indication
       is not supported. */
    DRV_USBFS_ROOT_HUB_PORT_INDICATION portIndication;
```

```
    /* When operating is Host mode, the application can specify a Root Port
       Overcurrent detection. This parameter should point to the Root Port
       Indication function. If this parameter is NULL, it implies that
       Overcurrent detection is not supported. */
    DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;

} DRV_USBFS_INIT;
```

The operationMode parameter defines by the driver operation mode. parameter in the initialization data structure. This can be set DRV_USBFS_OPMODE_DEVICE, DRV_USBFS_OPMODE_HOST or DRV_USBFS_OPMODE_DUAL_ROLE for device, host and dual role operation respectively.

The `endpointTable` parameter must point to a byte array. The size of the array depends on the maximum number of device endpoints that application needs. A direction of an endpoint counts as one endpoint. Each endpoint requires 32 bytes. Therefore, if the USB Device requires 3 endpoints (Endpoint 0 + Endpoint 1 IN + Endpoint 2 OUT), the size of the array will 96 bytes (32 * 3). The byte array start address must be located on a 512 byte boundary. When operating in host mode, the driver will use only one endpoint and size of the endpoint table array should be set to 32.

The `rootHubAvailableCurrent` parameter should be set to the maximum current that VBUS power supply can provide on the bus. The driver does not use this information directly. It provides this data to the client application while operating in host mode.

The `portPowerEnable` parameter must point to a Port Power Enable function. The driver, while operating in host mode, will call this function to enable the VBUS switch. This function should activate the VBUS switch if the driver calls this function with the enable parameter set to true. It should deactivate the switch if the driver calls this function with the enable parameter set to false. This parameter should be set to NULL if such a switch (of the switch control) is not available in the application.

The `portIndication` parameter must point to a Port Indication function. The driver, while operating in host mode, will call this function to indicate the current state of the port. The driver will call this function with LED color status as defined in the Chapter 11 of the USB 2.0 Specification. This parameter should be set to NULL if such a LED indication is not available in the application.

The `portOverCurrentDetect` parameter must point to a Port Overcurrent Detect function. The driver, while operating in Host mode, will call this function periodically to check if the attached device is overdrawing current. If the function should return true if such a condition exists. This parameter should be set to NULL if such detection is not available in the application.

The following code example shows initialization of the driver for device mode operation.

```
/* This code shows an example of DRV_USBFS_INIT data structure for
 * device mode operation. Here the driver is initialized to work with USB1 USB
 * module. Note how the endPointTable is defined. It should be aligned on a 512
 * byte boundary. */

DRV_USBFS_INIT init;
SYS_MODULE_OBJ usbDriverObj;

uint8_t __attribute__((aligned(512))) endPointTable[DRV_USBFS_ENDPOINTS_NUMBER * 32];

const DRV_USBFS_INIT drvUSBInit =
{
    /* Assign the endpoint table */
    .endpointTable = endPointTable,

    /* Interrupt Source for USB module */
    .interruptSource = INT_SOURCE_USB_1,

    /* System module initialization. */
    .moduleInit = {SYS_MODULE_POWER_RUN_FULL},

    /* Configure the driver for device mode operation. */
    .operationMode = DRV_USBFS_OPMODE_DEVICE,

    /* Configure the driver to operate at full speed. */
    .operationSpeed = USB_SPEED_FULL,

    /* Stop in idle */
    .stopInIdle = false,

    /* Suspend in sleep */
    .suspendInSleep = false,

    /* Identifies peripheral (PLIB-level) ID */
    .usbID = USB_ID_1
};

void SYS_Initialize(void)
{
```

```
    /* Initialize the USB Driver. Note how the init parameter is typecasted to
     * SYS_MODULE_INIT type. The SYS_MODULE_OBJ returned by this function call
     * is passed to the driver tasks routine. DRV_USBFS_INDEX_0 is helper
     * constant defined in drv_usbfs.h */

    usbDriverObj = DRV_USBFS_Initialize(DRV_USBFS_INDEX_0, (SYS_MODULE_INIT *)(drvUSBInit));
}

void SYS_Tasks(void)
{
    /* The polled state of the USB driver is updated by calling the
     * DRV_USBFS_Tasks function in the SYS_Tasks() function. The
     * DRV_USBFS_Tasks() takes the driver module object returned by the
     * DRV_USBFS_Initialize funciton as a parameter. */

    DRV_USBFS_Tasks(usbDriverObj);
}

void __ISR(_USB_1_VECTOR, ipl4AUTO) _IntHandlerUSBInstance0(void)
{
    /* The DRV_USBFS_Tasks_ISR function update the interrupt state of the USB
     * Driver. If the driver is configured for polling mode, this function need
     * not be invoked or included in the project. */

    DRV_USBFS_Tasks_ISR(sysObj.drvUSBObject);
}
```

The following code example shows initialization of the driver for host mode operation.

```
/* This code shows an example of the USBFS driver can be configured for
 * host mode operation. For host mode operation, only one endpoint is needed and
 * hence the size of the endpoint table is 32 bytes (for one endpoint). In this
 * example, the BSP_USBVBUSSwitchOverCurrentDetect function checks for over
 * current condition and the BSP_USBVBUSPowerEnable function enables the VBUS
 * power. The port indication function is not implemented and hence the
 * portIndication member of the initialization data structure is set to NULL. */

/* The implementation of the port over current detect, indication and the VBUS
 * power supply functions is discussed later in this help section. */

uint8_t __attribute__((aligned(512))) endpointTable[32];

DRV_USBFS_INIT drvUSBFSInit =
{
    /* Pointer to the endpoint table */
    .endpointTable = endpointTable,

    /* Interrupt Source for the USB module */
    .interruptSource = INT_SOURCE_USB_1,

    /* This should always be set to SYS_MODULE_POWER_RUN_FULL. */
    .moduleInit = {SYS_MODULE_POWER_RUN_FULL},

    /* Configure for host mode operation. */
    .operationMode = DRV_USBFS_OPMODE_HOST,

    /* The driver should run at full speed. */
    .operationSpeed = USB_SPEED_FULL,

    /* Port indication function is not implemented. */
    .portIndication = NULL,

    /* This is the over current detect function. */
    .portOverCurrentDetect = BSP_USBVBUSSwitchOverCurrentDetect,

    /* This is the VBUS Power enable function */
    .portPowerEnable = BSP_USBVBUSPowerEnable,

    /* Here we state that the VBUS power supply can provide at most 500 mA of
     * current */
    .rootHubAvailableCurrent = 500,
```

```
    /* Module will operate in IDLE. */
    .stopInIdle = false,

    /* Module will not suspend automatically in sleep */
    .suspendInSleep = false,

    /* USB Module ID is 1 */
    .usbID = USB_ID_1
};

void SYS_Initialize(void)
{
    /* Initialize the USB Driver. Note how the init parameter is typecasted to
     * SYS_MODULE_INIT type. The SYS_MODULE_OBJ returned by this function call
     * is passed to the driver tasks routine. DRV_USBFS_INDEX_0 is helper
     * constant defined in drv_usbfs.h */

    usbDriverObj = DRV_USBFS_Initialize(DRV_USBFS_INDEX_0,
                                        (SYS_MODULE_INIT *)(drvUSBInit));
}

void SYS_Tasks(void)
{
    /* The polled state of the USB driver is updated by calling the
     * DRV_USBFS_Tasks function in the SYS_Tasks() function. The
     * DRV_USBFS_Tasks() takes the driver module object returned by the
     * DRV_USBFS_Initialize funciton as a parameter. */

    DRV_USBFS_Tasks(usbDriverObj);
}

void __ISR(_USB_1_VECTOR, ipl4AUTO) _IntHandlerUSBInstance0(void)
{
    /* The DRV_USBFS_Tasks_ISR function update the interrupt state of the USB
     * Driver. If the driver is configured for polling mode, this function need
     * not be invoked or included in the project. */

    DRV_USBFS_Tasks_ISR(sysObj.drvUSBObject);
}
```

The PIC32MX USB Driver requires definition of configuration constants to be available in the `system_config.h` file of the MPLAB Harmony Application Project Configuration. Refer to the Configuring the Library section for details.

Multi-client Operation

The PIC32MX USB Driver supports multi-client operation. In that, it can be opened by two application clients. This is required where Dual Operation is desired. The following should be noted when using multi-client operation:

- The driver should be initialized for Dual Role Operation mode.
- The DRV_USBFS_Open function can be called at the most twice in the application. The driver supports a maximum of two clients.
- A client can access either the host or device functionality of the driver. It cannot do both.
- It is possible for the two clients to operate in two different threads while operating with an RTOS.

Note: The typical the application clients for PIC32MX USB Driver would be the MPLAB Harmony USB Host and Device Stack. The complexity of operating the driver in Dual Role mode is handled by the stack operation. The MHC will configure the driver for Dual Role operation when such operation is selected in USB Stack configuration tree.

USB Driver Common Interface

The PIC32MX USB Driver exports its implementation of the USB Driver Common Interface to the Host and Device Layer via the DRV_USBFS_HOST_INTERFACE and DRV_USBFS_DEVICE_INTERFACE structures. The DRV_USBFS_HOST_INTERFACE structure is defined in the `drv_usbfs_host.c` file. The following code example shows this structure.

```
/*****************************************************
 * This structure is a set of pointer to the USBFS driver
 * functions. It is provided to the host and device layer
 * as the interface to the driver.
 * ****************************************************/

DRV_USB_HOST_INTERFACE gDrvUSBFSHostInterface =
{
```

```
    .open = DRV_USBFS_Open,
    .close = DRV_USBFS_Close,
    .eventHandlerSet = DRV_USBFS_ClientEventCallBackSet,
    .hostIRPSubmit = DRV_USBFS_HOST_IRPSubmit,
    .hostIRPCancel = DRV_USBFS_HOST_IRPCancel,
    .hostPipeSetup = DRV_USBFS_HOST_PipeSetup,
    .hostPipeClose = DRV_USBFS_HOST_PipeClose,
    .hostEventsDisable = DRV_USBFS_HOST_EventsDisable,
    .hostEventsEnable = DRV_USBFS_HOST_EventsEnable,
    .rootHubInterface.rootHubPortInterface.hubPortReset = DRV_USBFS_HOST_ROOT_HUB_PortReset,
    .rootHubInterface.rootHubPortInterface.hubPortSpeedGet = DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet,
    .rootHubInterface.rootHubPortInterface.hubPortResetIsComplete =
DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete,
    .rootHubInterface.rootHubPortInterface.hubPortSuspend = DRV_USBFS_HOST_ROOT_HUB_PortSuspend,
    .rootHubInterface.rootHubPortInterface.hubPortResume = DRV_USBFS_HOST_ROOT_HUB_PortResume,
    .rootHubInterface.rootHubMaxCurrentGet = DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet,
    .rootHubInterface.rootHubPortNumbersGet = DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet,
    .rootHubInterface.rootHubSpeedGet = DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet,
    .rootHubInterface.rootHubInitialize = DRV_USBFS_HOST_ROOT_HUB_Initialize,
    .rootHubInterface.rootHubOperationEnable = DRV_USBFS_HOST_ROOT_HUB_OperationEnable,
    .rootHubInterface.rootHubOperationIsEnabled = DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled,
};
```

The DRV_USBFS_DEVICE_INTERFACE structure is defined in the `drv_usbfs_device.c` file. The following code example shows this structure. The MPLAB Harmony USB Host and Device stack perform driver independent access through the function pointers contained in these structures.

```
/*************************************************
 * This structure is a pointer to a set of USB Driver
 * Device mode functions. This set is exported to the
 * device layer when the device layer must use the
 * PIC32MX USB Controller.
 *************************************************/

DRV_USB_DEVICE_INTERFACE gDrvUSBFSDeviceInterface =
{
    .open = DRV_USBFS_Open,
    .close = DRV_USBFS_Close,
    .eventHandlerSet = DRV_USBFS_ClientEventCallBackSet,
    .deviceAddressSet = DRV_USBFS_DEVICE_AddressSet,
    .deviceCurrentSpeedGet = DRV_USBFS_DEVICE_CurrentSpeedGet,
    .deviceSOFNumberGet = DRV_USBFS_DEVICE_SOFNumberGet,
    .deviceAttach = DRV_USBFS_DEVICE_Attach,
    .deviceDetach = DRV_USBFS_DEVICE_Detach,
    .deviceEndpointEnable = DRV_USBFS_DEVICE_EndpointEnable,
    .deviceEndpointDisable = DRV_USBFS_DEVICE_EndpointDisable,
    .deviceEndpointStall = DRV_USBFS_DEVICE_EndpointStall,
    .deviceEndpointStallClear = DRV_USBFS_DEVICE_EndpointStallClear,
    .deviceEndpointIsEnabled = DRV_USBFS_DEVICE_EndpointIsEnabled,
    .deviceEndpointIsStalled = DRV_USBFS_DEVICE_EndpointIsStalled,
    .deviceIRPSubmit = DRV_USBFS_DEVICE_IRPSubmit,
    .deviceIRPCancel = DRV_USBFS_DEVICE_IRPCancel,
    .deviceIRPCancelAll = DRV_USBFS_DEVICE_IRPCancelAll,
    .deviceRemoteWakeupStop = DRV_USBFS_DEVICE_RemoteWakeupStop,
    .deviceRemoteWakeupStart = DRV_USBFS_DEVICE_RemoteWakeupStart,
    .deviceTestModeEnter = NULL

};
```

Operation with RTOS

The PIC32MX USB Driver is designed to operate with a RTOS. The driver implementation uses the MPLAB Harmony Operating System Abstraction Layer (OSAL). This allows the driver to function with entire range of RTOSes supported in MPLAB Harmony. The following points must be considered while using the driver with an RTOS.

- The driver can be opened from different threads
- In Device mode, an enabled endpoint should only be accessed from one thread. For example, if an application requires two endpoints, Endpoint 2 and Endpoint 3, the application could contain two threads, one accessing Endpoint 2 and another accessing Endpoint 3. The thread accessing Endpoint 2 cannot access Endpoint 3.
- While operating in Host mode, endpoint pipes can be opened from different threads. A pipe handle to an open pipe cannot be shared across threads.

Host Mode Attach Detach Operation

When the PIC32MX USB Driver operating in Host mode detects a device attach or detach, it implements debouncing before signaling attach detach signal to the USB Host Stack. When the device is attached, the driver waits for DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION milliseconds to allow for the mechanical chatter, which occurs when the device is inserted into the host receptacle, to settle. If the device is still attached after the DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION expires, the driver calls the USB_HOST_DeviceEnumerate function to let the host stack enumerate the device. It also starts checking for Device Detach.

When the device is detached, the driver waits for DRV_USBFS_POST_DETACH_DELAY milliseconds to allow for the detach operation to settle. If the device is indeed detached after the DRV_USBFS_POST_DETACH_DELAY delay expires, the driver calls USB_HOST_DeviceDenumerate function to let the USB Host stack denumerate the device. It then starts checking for device attach.

Root Hub Operation

The PIC32MX USB Driver implements a Root Hub Driver Interface. This allows the driver to emulate a hub. The USB Host Stack enumerates the Root Hub as a device. The Host Stack then does not differentiate between an external hub and the root hub. While emulating a hub, the PIC32MX USB Driver Root Hub appears as a single port hub.

As a part of the root hub interface, the PIC32MX USB Driver requires the application to supply functions for hub features that it does not implement. These features are:

- Port Overcurrent Detect
- VBUS Switch Control
- Port Indication

A pointer to these functions (if implemented) must be supplied through the driver initialization data (of the type DRV_USBFS_INIT) structure at the time of driver initialization. The application has the option of not implementing these functions. In such a case, the function pointers for the unimplemented function, in the initialization data structure should be set to NULL.

The root hub driver must also be able to communicate the maximum current capability of its port to the USB Host Layer. The PIC32MX USB Controller does not contain built-in (hardware implemented) functionality for controlling the root hub port current. To facilitate this request, the driver will report the current capability that was specified in the `rootHubAvailableCurrent` parameter of the driver initialization data structure. The application must set this parameter to report the current supply capability of the VBUS power supply. The USB Host Layer uses this value to manage the bus current budget. If a connected device reports a configuration that requires more current than what the VBUS power supply can provide, the host will not set the configuration.

Port Overcurrent Detect

The Root Hub operation in PIC32MX USB Driver will periodically call a Port Overcurrent Detect function to detect if an overcurrent condition is active on the port. The application must supply this function if port overcurrent detection is needed. The PIC32MX USB Controller does not contain built-in (hardware implemented) functionality for checking overcurrent condition. The overcurrent condition on the port can occur in a case where the attached device has malfunctioned or when the USB VBUS line has short circuited to ground.

The signature of the function and an example implementation is shown in the following code example. The function must return (and must continue to return) true if an overcurrent condition exists on the port.

```
/* This code shows an example implementation of the
 * portOverCurrentDetect function. The PIC32MX USB Driver will call this
 * function periodically to check if an over current condition exists on the
 * port. In this example, we assume that the over current detect pin from an
 * external circuit in the system, is connected to  port RD0 and the pin logic
 * is active high. The function must return true if an over current condition is
 * present on this pin */

bool BSP_USBVBUSSwitchOverCurrentDetect(uint8_t port)
{
    if(PLIB_PORTS_PinGet(PORTS_ID_0, PORT_CHANNEL_D, 0) == 1)
    {
        return(true);
    }
    else
    {
        return(false);
    }
}
```

VBUS Switch Control

The PIC32MX USB Driver Root Hub operation will attempt to control the VBUS power supply to the port. Because the PIC32MX USB Controller does not contain built-in (hardware implemented) functionality for checking controlling VBUS, such a control function must be supplied by the application. The root hub operation will access this function when the PIC32MX USB Driver will call the portPowerEnable function as a part of the Bus Enable sequence.

The following code shows an example of how this function can be implemented.

```
/* This code shows an example implementation of the VBUS Power Enable
```

```
 * function. The PIC32MX USB Driver will call this function as a part of bus
 * enable function. In this example, it is assumed that system contains an
 * external VBUS power switch and this is control by port RB5.
 */

void BSP_USBVBUSPowerEnable(uint8_t port, bool enable)
{
    if(enable)
    {
        PLIB_PORTS_PinSet(PORTS_ID_0, PORT_CHANNEL_B, PORTS_BIT_POS_5);
    }
    else
    {
        PLIB_PORTS_PinClear(PORTS_ID_0, PORT_CHANNEL_B, PORTS_BIT_POS_5);
    }
}
```

Port Indication function

The Root Hub Operation in the PIC32MX USB Driver allows display of Port LED status. If the application requires this indication, it must implement a function which the Root Hub operation would call when a change in the Root Hub port has occurred. The port indication operation is specified in Section 11.5.3 of the USB 2.0 Specification.

```
/* This code shows an example implementation of the port indication
 * function. The PIC32MX USB Driver calls this function when it wants to indicate
 * port status. It is assumed that three function to switch off, blink and
 * switch on an LED are available. It is further assumed that these function
 * accept the color of the LED to operated on. */

void BSP_RootHubPortIndication
(
    uint8_t port,
    USB_HUB_PORT_INDICATOR_COLOR color,
    USB_HUB_PORT_INDICATOR_STATE state
)
{
    /* The color parameter indicates the color of the LED to be affected. The
     * color will be either USB_HUB_PORT_INDICATOR_COLOR_GREEN or
     * USB_HUB_PORT_INDICATOR_COLOR_AMBER. */

    switch (state)
    {
        case USB_HUB_PORT_INDICATOR_STATE_OFF:
            BSP_SwitchLEDOff(color);
            break;
        case USB_HUB_PORT_INDICATOR_STATE_BLINKING:
            BSP_LEDBlink(color);
            break;
        case USB_HUB_PORT_INDICATOR_STATE_ON:
            BSP_SwitchLEDOn(color);
            break;
        default:
            break;
    }
}
```

Configuring the Library

Provides information on the configuring the library.

Macros

	Name	Description
	DRV_USBFS_DEVICE_SUPPORT	Determines if the USB Device Functionality should be enabled.
	DRV_USBFS_ENDPOINTS_NUMBER	Configures the number of endpoints to be provisioned in the driver.
	DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION	Configures the time duration (in milliseconds) that the driver will wait to re-confirm a device attach.
	DRV_USBFS_HOST_NAK_LIMIT	Configures the NAK Limit for Host Mode Control Transfers.

	DRV_USBFS_HOST_PIPES_NUMBER	Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.
	DRV_USBFS_HOST_RESET_DURATION	Configures the time duration (in milliseconds) of the Reset Signal.
	DRV_USBFS_HOST_SUPPORT	Determines if the USB Host Functionality should be enabled.
	DRV_USBFS_INSTANCES_NUMBER	Specifies the number of driver instances to be enabled in the application.
	DRV_USBFS_INTERRUPT_MODE	Configures the driver for interrupt or polling mode operation.

Description

The PIC32MX USB Driver requires the specification of compile-time configuration macros. These macros define resource usage, feature availability, and dynamic behavior of the driver. These configuration macros should be defined in the `system_config.h` file.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_USBFS_DEVICE_SUPPORT Macro

Determines if the USB Device Functionality should be enabled.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_DEVICE_SUPPORT true
```

Description

USB Full Speed Driver Device Mode Support.

This constant should be set to true if USB device support is required in the application. It should be set to false if device support is not required.

Remarks

This constant should always be defined.

DRV_USBFS_ENDPOINTS_NUMBER Macro

Configures the number of endpoints to be provisioned in the driver.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_ENDPOINTS_NUMBER 3
```

Description

USB Full Speed Driver Endpoint Numbers.

This constant configures the number of endpoints that the driver needs to manage. When DRV_USBFS_DEVICE_SUPPORT is enabled, this constant should be set to the total number of endpoints to be enabled in the device. When enabled, a endpoint can be used for communication. Using any direction of an endpoint will require that entire endpoint to be enabled.

Consider the case of a composite USB Device that containing a CDC and MSD function. The CDC function will require 1 Bulk endpoint (OUT and IN directions) and 1 Interrupt endpoint (IN direction). The MSD function will require 1 Bulk endpoint (IN and OUT directions). This design can be implemented by using 4 endpoints. Endpoint 0 is used for the mandatory control interface. Endpoint 1 is used for CDC Bulk interface. Endpoint 2 is used for CDC interrupt interface and endpoint 3 is used for MSD Bulk Interface. The constant should then be set to 4.

For Host mode operation, this constant should be set to 1. Setting this to greater than 1 will result in unused data memory allocation.

Remarks

This constant should always be defined.

DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION Macro

Configures the time duration (in milliseconds) that the driver will wait to re-confirm a device attach.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION 500
```

Description

USB Full Speed Driver Host Mode Attach Debounce Duration.

This constant configures the time duration (in milliseconds) that driver will wait to re-confirm a device attach. When the driver first detects device attach, it start, it will start a timer for the duration specified by the constant. When the timer expires, the driver will check if the device is still attached. If so, the driver will then signal attach to the host stack. The duration allows for device attach to become electro-mechanically stable.

Remarks

This constant should always be defined when DRV_USBFS_HOST_SUPPORT is set to true.

DRV_USBFS_HOST_NAK_LIMIT Macro

Configures the NAK Limit for Host Mode Control Transfers.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_HOST_NAK_LIMIT 2000
```

Description

USB Full Speed Driver Host Mode Control Transfers NAK Limit.

This constant configures the number of NAKs that the driver can accept from the device in the data stage of a control transfer before aborting the control transfer with a USB_HOST_IRP_STATUS_ERROR_NAK_TIMEOUT. Setting this constant to 0 will disable NAK limit checking. This constant should be adjusted to enable USB host compatibility with USB Devices which require more time to process control transfers.

Remarks

This constant should always be defined when DRV_USBFS_HOST_SUPPORT is set to true.

DRV_USBFS_HOST_PIPES_NUMBER Macro

Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_HOST_PIPES_NUMBER 10
```

Description

USB Full Speed Driver Host Mode Pipes Number.

This constant configures the maximum number of pipes that can be opened when the driver is operating in Host mode. Calling the DRV_USBFS_HOST_PipeSetup function will cause a pipe to be opened. Calling this function when DRV_USBFS_HOST_PIPES_NUMBER number of pipes have already been opened will cause the function to return an Invalid Pipe Handle. This constant should be configured to account for the maximum number of devices and the device types to be supported by the host application.

For example if the USB Host application must support 2 USB Mass Storage devices and 1 CDC device, it must set this constant 9 (4 bulk pipes for 2 Mass Storage devices + 2 bulk pipes and 1 interrupt pipe for 1 CDC device and 2 control pipes for 2 devices). Allocating pipes consumes data memory.

Remarks

This constant should always be defined when DRV_USBFS_HOST_SUPPORT is set to true.

DRV_USBFS_HOST_RESET_DURATION Macro

Configures the time duration (in milliseconds) of the Reset Signal.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_HOST_RESET_DURATION 100
```

Description

USB Full Speed Driver Host Mode Reset Duration.

This constant configures the duration of the reset signal. The driver generates reset signal when the USB Host stack requests for root hub port reset. The driver will generate the reset signal for the duration specified by this constant and will then stop generating the reset signal.

Remarks

This constant should always be defined when DRV_USBFS_HOST_SUPPORT is set to true.

DRV_USBFS_HOST_SUPPORT Macro

Determines if the USB Host Functionality should be enabled.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_HOST_SUPPORT false
```

Description

USB Full Speed Driver Host Mode Support.

This constant should be set to true if USB Host mode support is required in the application. It should be set to false if host support is not required.

Remarks

This constant should always be defined.

DRV_USBFS_INSTANCES_NUMBER Macro

Specifies the number of driver instances to be enabled in the application.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_INSTANCES_NUMBER 1
```

Description

USB Full Speed Driver Instances Number.

This constant defines the number of driver instances to be enabled in the application. This will be typically be the number of USB controllers to be used in the application. On PIC32MX microcontrollers that have one USB controller, this value will always be 1. On PIC32MX microcontrollers which have 2 USB controllers, this value could 1 or 2, depending on whether 1 or 2 USB segments are required. To conserve data memory, this constant should be set to exactly the number of USB controller that are required in the system.

Remarks

This constant should always be defined.

DRV_USBFS_INTERRUPT_MODE Macro

Configures the driver for interrupt or polling mode operation.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_INTERRUPT_MODE true
```

Description

USB Full Speed Driver Interrupt Mode.

This constant configures the driver for interrupt or polling operation. If this flag is set to true, the driver will operate in interrupt mode. If the flag is

set to false, the driver will operate in polled mode. In polled, the driver interrupt state machine gets updated in the SYS_Tasks(). If the driver is configured interrupt mode, the driver interrupt state machine gets updated in the driver interrupt service routine. It is always recommended for the driver to operate in interrupt mode.

Remarks

This constant should always be defined.

Building the Library

This section lists the files that are available in the PIC32MX USB Driver Library.

Description

This section list the files that are available in the `\src` folder of the PIC32MX USB Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/usb/usbfs`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_usbfs.h	This file should be included by any `.c` file which accesses the PIC32MX USB Driver API. This one file contains the prototypes for all driver API.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/dynamic/drv_usbfs.c	This file should always be included in the project when using the PIC3MX USB Driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
/src/dynamic/drv_usbfs_device.c	This file should be included in the project if Device mode operation is required.
/src/dynamic/drv_usbfs_host.c	This file should be included in the project if Host mode operation is required.

Module Dependencies

The PIC32MX USB Driver Library depends on the following modules:

- Interrupt System Service Library

Library Interface

a) System Functions

	Name	Description
	DRV_USBFS_Status	Provides the current status of the USB Driver module.
	DRV_USBFS_Tasks	Maintains the driver's state machine when the driver is configured for Polled mode.
	DRV_USBFS_Tasks_ISR	Maintains the driver's Interrupt state machine and implements its ISR.

b) Client Core Functions

	Name	Description
	DRV_USBFS_ClientEventCallBackSet	This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.
	DRV_USBFS_Close	Closes an opened-instance of the USB Driver.
	DRV_USBFS_Initialize	Initializes the USB Driver.
	DRV_USBFS_Open	Opens the specified USB Driver instance and returns a handle to it.

c) Device Mode Operation Functions

	Name	Description
	DRV_USBFS_DEVICE_AddressSet	This function will set the USB module address that is obtained from the Host.
	DRV_USBFS_DEVICE_Attach	This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.
	DRV_USBFS_DEVICE_CurrentSpeedGet	This function returns the USB speed at which the device is operating.
	DRV_USBFS_DEVICE_Detach	This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.
	DRV_USBFS_DEVICE_EndpointDisable	This function disables an endpoint.
	DRV_USBFS_DEVICE_EndpointDisableAll	This function disables all provisioned endpoints.
	DRV_USBFS_DEVICE_EndpointEnable	This function enables an endpoint for the specified direction and endpoint size.
	DRV_USBFS_DEVICE_EndpointIsEnabled	This function returns the enable/disable status of the specified endpoint and direction.
	DRV_USBFS_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	DRV_USBFS_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.
	DRV_USBFS_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	DRV_USBFS_DEVICE_IRPCancel	This function cancels the specific IRP that are queued and in progress at the specified endpoint.
	DRV_USBFS_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	DRV_USBFS_DEVICE_IRPSubmit	This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.
	DRV_USBFS_DEVICE_RemoteWakeupStart	This function causes the device to start Remote Wakeup Signalling on the bus.
	DRV_USBFS_DEVICE_RemoteWakeupStop	This function causes the device to stop the Remote Wakeup Signalling on the bus.
	DRV_USBFS_DEVICE_SOFNumberGet	This function will return the USB SOF packet number.

d) Host Mode Operation Functions

	Name	Description
	DRV_USBFS_HOST_EventsDisable	Disables Host mode events.
	DRV_USBFS_HOST_EventsEnable	Restores the events to the specified the original value.
	DRV_USBFS_HOST_IRPCancel	Cancels the specified IRP.
	DRV_USBFS_HOST_IRPSubmit	Submits an IRP on a pipe.
	DRV_USBFS_HOST_PipeClose	Closes an open pipe.
	DRV_USBFS_HOST_PipeSetup	Open a pipe with the specified attributes.

e) Root Hub Functions

	Name	Description
	DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet	This function returns the operating speed of the bus to which this root hub is connected.
	DRV_USBFS_HOST_ROOT_HUB_Initialize	This function initializes the root hub driver.
	DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet	Returns the maximum amount of current that this root hub can provide on the bus.
	DRV_USBFS_HOST_ROOT_HUB_OperationEnable	This function enables or disables root hub operation.
	DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled	Returns the operation enabled status of the root hub.
	DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet	Returns the number of ports this root hub contains.
	DRV_USBFS_HOST_ROOT_HUB_PortReset	Resets the specified root hub port.
	DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete	Returns true if the root hub has completed the port reset operation.
	DRV_USBFS_HOST_ROOT_HUB_PortResume	Resumes the specified root hub port.
	DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet	Returns the speed of at which the port is operating.
	DRV_USBFS_HOST_ROOT_HUB_PortSuspend	Suspends the specified root hub port.

f) Data Types and Constants

	Name	Description
	DRV_USBFS_EVENT	Identifies the different events that the USB Driver provides.
	DRV_USBFS_EVENT_CALLBACK	Type of the USB Driver event callback function.
	DRV_USBFS_HOST_PIPE_HANDLE	Defines the USB Driver Host Pipe Handle type.

	DRV_USBFS_INIT	This type definition defines the Driver Initialization Data Structure.
	DRV_USBFS_OPMODES	Identifies the operating modes supported by the USB Driver.
	DRV_USBFS_ROOT_HUB_PORT_INDICATION	USB Root hub Application Hooks (Port Indication).
	DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT	USB Root hub Application Hooks (Port Overcurrent detection).
	DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE	USB Root hub Application Hooks (Port Power Enable/ Disable).
	DRV_USBFS_DEVICE_INTERFACE	USB Driver Device Mode Interface Functions.
	DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE	USB Driver Endpoint Table Entry Size in bytes.
	DRV_USBFS_HOST_INTERFACE	USB Driver Host Mode Interface Functions.
	DRV_USBFS_HOST_PIPE_HANDLE_INVALID	Value of an Invalid Host Pipe Handle.
	DRV_USBFS_INDEX_0	USB Driver Module Index 0 Definition.
	DRV_USBFS_INDEX_1	USB Driver Module Index 1 Definition.

Description

a) System Functions

DRV_USBFS_Status Function

Provides the current status of the USB Driver module.

File

drv_usbfs.h

C

```
SYS_STATUS DRV_USBFS_Status(SYS_MODULE_OBJ object);
```

Returns

- SYS_STATUS_READY - Indicates that the driver is ready.
- SYS_STATUS_UNINITIALIZED - Indicates that the driver has never been initialized.

Description

This function provides the current status of the USB Driver module.

Remarks

None.

Preconditions

The DRV_USBFS_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USBFS_Initialize
SYS_STATUS          status;
DRV_USBFS_INIT moduleInit;

uint8_t __attribute__((aligned(512))) endpointTable[DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE * 2];

usbInitData.usbID                = USB_ID_1;
usbInitData.opMode               = DRV_USBFS_OPMODE_DEVICE;
usbInitData.stopInIdle           = false;
usbInitData.suspendInSleep       = false;
usbInitData.operationSpeed       = USB_SPEED_FULL;
usbInitData.interruptSource      = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize
// function.

DRV_USBFS_Initialize(DRV_USBFS_INDEX_0, (SYS_MODULE_INIT *) &usbInitData);
```

```
// The status of the driver can be checked.
status = DRV_USBFS_Status(object);
if(SYS_STATUS_READY == status)
{
    // Driver is ready to be opened.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USBFS_Initialize function.

Function

SYS_STATUS DRV_USBFS_Status (SYS_MODULE_OBJ object)

DRV_USBFS_Tasks Function

Maintains the driver's state machine when the driver is configured for Polled mode.

File

drv_usbfs.h

C

```
void DRV_USBFS_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Maintains the driver's Polled state machine. This function should be called from the SYS_Tasks function.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks). This function will never block.

Preconditions

The DRV_USBFS_Initialize function must have been called for the specified USB Driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USBFS_Initialize

while (true)
{
    DRV_USBFS_Tasks(object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USBFS_Initialize function).

Function

void DRV_USBFS_Tasks(SYS_MODULE_OBJ object)

DRV_USBFS_Tasks_ISR Function

Maintains the driver's Interrupt state machine and implements its ISR.

File

drv_usbfs.h

C

```
void DRV_USBFS_Tasks_ISR(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal Interrupt state machine and implement its ISR for interrupt-driven implementations.

Remarks

This routine should be called from the USB interrupt service routine. In case of multiple USB modules, it should be ensured that the correct USB driver system module object is passed to this routine.

Preconditions

The DRV_USBFS_Initialize function must have been called for the specified USB Driver instance.

Example

```
SYS_MODULE_OBJ object;     // Returned from DRV_USBFS_Initialize

while (true)
{
    DRV_USBFS_Tasks_ISR (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USBFS_Initialize).

Function

void DRV_USBFS_Tasks_ISR(SYS_MODULE_OBJ object)

b) Client Core Functions

DRV_USBFS_ClientEventCallBackSet Function

This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.

File

drv_usbfs.h

C

```
void DRV_USBFS_ClientEventCallBackSet(DRV_HANDLE handle, uintptr_t hReferenceData, DRV_USB_EVENT_CALLBACK
myEventCallBack);
```

Returns

None.

Description

This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events. The callback is disabled by either not calling this function after the DRV_USBFS_Open function has been called or by setting the myEventCallBack argument as NULL. When the callback function is called, the hReferenceData argument is returned.

Remarks

Typical usage of the USB Driver requires a client to register a callback.

Preconditions

None.

Example

```
// Set the client event callback for the Device Layer.  The
// USBDeviceLayerEventHandler function is the event handler. When this
// event handler is invoked by the driver, the driver returns back the
```

```
// second argument specified in the following function (which in this case
// is the Device Layer data structure). This allows the application
// firmware to identify, as an example, the Device Layer object associated
// with this callback.

DRV_USBFS_ClientEventCallBackSet(myUSBDevice.usbDriverHandle, (uintptr_t)&myUSBDevice,
USBDeviceLayerEventHandler);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
hReferenceData	Object (could be a pointer) that is returned with the callback.
myEventCallBack	Callback function for all USB events.

Function

void DRV_USBFS_ClientEventCallBackSet

(

DRV_HANDLE handle,

uintptr_t hReferenceData,

DRV_USBFS_EVENT_CALLBACK myEventCallBack

);

DRV_USBFS_Close Function

Closes an opened-instance of the USB Driver.

File

drv_usbfs.h

C

```
void DRV_USBFS_Close(DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the USB Driver, invalidating the handle.

Remarks

After calling this function, the handle passed in handle parameter must not be used with any of the other driver functions. A new handle must be obtained by calling DRV_USBFS_Open function before the caller may use the driver again.

Preconditions

The DRV_USBFS_Initialize function must have been called for the specified USB Driver instance. DRV_USBFS_Open function must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_USBFS_Open

DRV_USBFS_Close(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

void DRV_USBFS_Close(DRV_HANDLE handle)

DRV_USBFS_Initialize Function

Initializes the USB Driver.

File

drv_usbfs.h

C

```
SYS_MODULE_OBJ DRV_USBFS_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

- SYS_MODULE_OBJ_INVALID - The driver initialization failed.
- A valid System Module Object - The driver initialization was able to start. It may have not completed and requires the DRV_USBFS_Tasks function to be called periodically. This value will never be the same as SYS_MODULE_OBJ_INVALID.

Description

This function initializes the USB Driver, making it ready for clients to open. The driver initialization does not complete when this function returns. The DRV_USBFS_Tasks function must called periodically to complete the driver initialization. The DRV_USBHS_Open function will fail if the driver was not initialized or if initialization has not completed.

Remarks

This routine must be called before any other USB driver routine is called. This routine should only be called once during system initialization unless DRV_USBFS_Deinitialize is called to deinitialize the driver instance.

Preconditions

None.

Example

```
 // The following code shows an example initialization of the
 // driver. The USB module to be used is USB1.  The module should not
 // automatically suspend when the  microcontroller enters Sleep mode.  The
 // module should continue  operation when the CPU enters Idle mode.  The
 // power state is set to run at full clock speeds. Device Mode operation
 // should be at FULL speed. The size of the endpoint table is set for 2
 // endpoints.

DRV_USBFS_INIT moduleInit;

uint8_t __attribute__((aligned(512))) endpointTable[DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE * 2];

usbInitData.usbID               = USB_ID_1;
usbInitData.opMode              = DRV_USBFS_OPMODE_DEVICE;
usbInitData.stopInIdle          = false;
usbInitData.suspendInSleep      = false;
usbInitData.operationSpeed      = USB_SPEED_FULL;
usbInitData.interruptSource     = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize
// function.

DRV_USBFS_Initialize(DRV_USBFS_INDEX_0, (SYS_MODULE_INIT *) &usbInitData);
```

Parameters

Parameters	Description
drvIndex	Ordinal number of driver instance to be initialized. This should be set to DRV_USBFS_INDEX_0 if driver instance 0 needs to be initialized.
init	Pointer to a data structure containing data necessary to initialize the driver. This should be a DRV_USBFS_INIT structure reference typecast to SYS_MODULE_INIT reference.

Function

SYS_MODULE_OBJ DRV_USBHS_Initialize

(

const SYS_MODULE_INDEX drvIndex,

const SYS_MODULE_INIT * const init

)

DRV_USBFS_Open Function

Opens the specified USB Driver instance and returns a handle to it.

File

drv_usbfs.h

C

```
DRV_HANDLE DRV_USBFS_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

- DRV_HANDLE_INVALID - The driver could not be opened successfully.This can happen if the driver initialization was not complete or if an internal error has occurred.
- A Valid Driver Handle - This is an arbitrary value and is returned if the function was successful. This value will never be the same as DRV_HANDLE_INVALID.

Description

This function opens the specified USB Driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The intent flag should always be DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NON_BLOCKING. Any other setting of the intent flag will return a invalid driver handle. A driver instance can only support one client. Trying to open a driver that has an existing client will result in an unsuccessful function call.

Remarks

The handle returned is valid until the DRV_USBFS_Close function is called. The function will typically return DRV_HANDLE_INVALID if the driver was not initialized. In such a case the client should try to open the driver again.

Preconditions

Function DRV_USBFS_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

// This code assumes that the driver has been initialized.
handle = DRV_USBFS_Open(DRV_USBFS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

if(DRV_HANDLE_INVALID == handle)
{
    // The application should try opening the driver again.
}
```

Parameters

Parameters	Description
drvIndex	Identifies the driver instance to be opened. As an example, this value can be set to DRV_USBFS_INDEX_0 if instance 0 of the driver has to be opened.
intent	Should always be (DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_READWRITE| DRV_IO_INTENT_NON_BLOCKING).

Function

```
DRV_HANDLE DRV_USBFS_Open
(
const    SYS_MODULE_INDEX drvIndex,
const    DRV_IO_INTENT intent
)
```

c) Device Mode Operation Functions

DRV_USBFS_DEVICE_AddressSet Function

This function will set the USB module address that is obtained from the Host.

File

drv_usbfs.h

C

```
void DRV_USBFS_DEVICE_AddressSet(DRV_HANDLE handle, uint8_t address);
```

Returns

None.

Description

This function will set the USB module address that is obtained from the Host in a setup transaction. The address is obtained from the SET_ADDRESS command issued by the Host. The primary (first) client of the driver uses this function to set the module's USB address after decoding the setup transaction from the Host.

Remarks

None.

Preconditions

None.

Example

```
// This function should be called by the first client of the driver,
// which is typically the Device Layer. The address to set is obtained
// from the Host during enumeration.

DRV_USBFS_DEVICE_AddressSet(deviceLayer, 4);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
address	The address of this module on the USB bus.

Function

void DRV_USBFS_DEVICE_AddressSet(DRV_HANDLE handle, uint8_t address);

DRV_USBFS_DEVICE_Attach Function

This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.

File

drv_usbfs.h

C

```
void DRV_USBFS_DEVICE_Attach(DRV_HANDLE handle);
```

Returns

None.

Description

This function enables the pull-up resistors on the D+ or D- lines thus letting the USB Host know that a device has been attached on the bus . This function should be called when the driver client is ready to receive communication from the Host (typically after all initialization is complete). The USB 2.0 specification requires VBUS to be detected before the data line pull-ups are enabled. The application must ensure the same.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// Open the device driver and attach the device to the USB.
handle = DRV_USBFS_Open(DRV_USBFS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

// Register a callback
DRV_USBFS_ClientEventCallBackSet(handle, (uintptr_t)&myDeviceLayer, MyDeviceLayerEventCallback);

// The device can be attached when VBUS Session Valid event occurs
void MyDeviceLayerEventCallback(uintptr_t handle, DRV_USBFS_EVENT event, void * hReferenceData)
{
    switch(event)
    {
        case DRV_USBFS_EVENT_DEVICE_SESSION_VALID:
            // A valid VBUS was detected.
            DRV_USBFS_DEVICE_Attach(handle);
            break;

        case DRV_USBFS_EVENT_DEVICE_SESSION_INVALID:
            // VBUS is not valid anymore. The device can be disconnected.
            DRV_USBFS_DEVICE_Detach(handle);
            break;

        default:
            break;
        }
    }
}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

void DRV_USBFS_DEVICE_Attach(DRV_HANDLE handle);

DRV_USBFS_DEVICE_CurrentSpeedGet Function

This function returns the USB speed at which the device is operating.

File

drv_usbfs.h

C

```
USB_SPEED DRV_USBFS_DEVICE_CurrentSpeedGet(DRV_HANDLE handle);
```

Returns

- USB_SPEED_ERROR - The device speed is not valid.
- USB_SPEED_FULL - The device is operating at Full speed.

Description

This function returns the USB speed at which the device is operating.

Remarks

None.

Preconditions

Only valid after the device is attached to the Host and Host has completed reset signaling.

Example

```
// Get the current speed.
```

```
USB_SPEED deviceSpeed;

deviceSpeed = DRV_USBFS_DEVICE_CurrentSpeedGet(deviceLayer);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

USB_SPEED DRV_USBFS_DEVICE_CurrentSpeedGet(DRV_HANDLE handle);

DRV_USBFS_DEVICE_Detach Function

This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.

File

drv_usbfs.h

C

```
void DRV_USBFS_DEVICE_Detach(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables the pull-up resistors on the D+ or D- lines. This function should be called when the application wants to disconnect the device from the bus (typically to implement a soft detach or switch to Host mode operation). A self-powered device should be detached from the bus when the VBUS is not valid.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// Open the device driver and attach the device to the USB.
handle = DRV_USBFS_Open(DRV_USBFS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

// Register a callback
DRV_USBFS_ClientEventCallBackSet(handle, (uintptr_t)&myDeviceLayer, MyDeviceLayerEventCallback);

// The device can be detached when VBUS Session Invalid event occurs
void MyDeviceLayerEventCallback(uintptr_t handle, DRV_USBFS_EVENT event, void * hReferenceData)
{
    switch(event)
    {
        case DRV_USBFS_EVENT_DEVICE_SESSION_VALID:
            // A valid VBUS was detected.
            DRV_USBFS_DEVICE_Attach(handle);
            break;

        case DRV_USBFS_EVENT_DEVICE_SESSION_INVALID:
            // VBUS is not valid anymore. The device can be disconnected.
            DRV_USBFS_DEVICE_Detach(handle);
            break;

        default:
            break;
        }
    }
}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

void DRV_USBFS_DEVICE_Detach(DRV_HANDLE handle);

DRV_USBFS_DEVICE_EndpointDisable Function

This function disables an endpoint.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_EndpointDisable(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - The endpoint that is being accessed is not a valid endpoint (endpoint was not provisioned through the DRV_USBFS_ENDPOINTS_NUMBER configuration constant) defined for this driver instance.

Description

This function disables an endpoint. If the endpoint type is a control endpoint type, both directions are disabled. For non-control endpoints, the function disables the specified direction only. The direction to be disabled is specified by the Most Significant Bit (MSB) of the endpointAndDirection parameter.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to disable
// a control endpoint. Note that the direction parameter is ignored.
// For a control endpoint, both the directions are disabled.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 0);

DRV_USBFS_DEVICE_EndpointDisable(handle, ep );

// This code shows an example of how to disable a BULK IN
// endpoint

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBFS_DEVICE_EndpointDisable(handle, ep );
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

USB_ERROR DRV_USBFS_DEVICE_EndpointDisable

(

DRV_HANDLE handle,

USB_ENDPOINT endpointAndDirection
)

DRV_USBFS_DEVICE_EndpointDisableAll Function

This function disables all provisioned endpoints.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_EndpointDisableAll(DRV_HANDLE handle);
```

Returns

- USB_ERROR_NONE - The function exited successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is invalid.

Description

This function disables all provisioned endpoints in both directions.

Remarks

This function is typically called by the USB Device Layer to disable all endpoints upon detecting a bus reset.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to disable all endpoints.

DRV_USBFS_DEVICE_EndpointDisableAll(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

USB_ERROR DRV_USBFS_DEVICE_EndpointDisableAll(DRV_HANDLE handle)

DRV_USBFS_DEVICE_EndpointEnable Function

This function enables an endpoint for the specified direction and endpoint size.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_EndpointEnable(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection,
USB_TRANSFER_TYPE transferType, uint16_t endpointSize);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is not a valid endpoint defined for this driver instance. The value of DRV_USBFS_ENDPOINTS_NUMBER configuration constant should be adjusted.
- USB_ERROR_PARAMETER_INVALID - The driver handle is invalid.

Description

This function enables an endpoint for the specified direction and endpoint size. The function will enable the endpoint for communication in one direction at a time. It must be called twice if the endpoint is required to communicate in both the directions, with the exception of control endpoints. If the endpoint type is a control endpoint, the endpoint is always bidirectional and the function needs to be called only once.

The size of the endpoint must match the wMaxPacketSize reported in the endpoint descriptor for this endpoint. A transfer that is scheduled over

this endpoint will be scheduled in wMaxPacketSize transactions. The function does not check if the endpoint is already in use. It is the client's responsibility to make sure that a endpoint is not accidentally reused.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to enable Endpoint
// 0 for control transfers. Note that for a control endpoint, the
// direction parameter is ignored. A control endpoint is always
// bidirectional. Endpoint size is 64 bytes.

uint8_t ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 0);

DRV_USBFS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_CONTROL, 64);

// This code shows an example of how to set up a endpoint
// for BULK IN transfer. For an IN transfer, data moves from device
// to Host. In this example, Endpoint 1 is enabled. The maximum
// packet size is 64.

uint8_t ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBFS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);

// If Endpoint 1 must also be set up for BULK OUT, the
// DRV_USBFS_DEVICE_EndpointEnable function must be called again, as shown
// here.

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_HOST_TO_DEVICE, 1);

DRV_USBFS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.
transferType	Should be USB_TRANSFER_TYPE_CONTROL for control endpoint, USB_TRANSFER_TYPE_BULK for bulk endpoint, USB_TRANSFER_TYPE_INTERRUPT for interrupt endpoint and USB_TRANSFER_TYPE_ISOCHRONOUS for isochronous endpoint.
endpointSize	Maximum size (in bytes) of the endpoint as reported in the endpoint descriptor.

Function

```
USB_ERROR DRV_USBFS_DEVICE_EndpointEnable
(
    DRV_HANDLE handle,
    USB_ENDPOINT endpointAndDirection,
USB_TRANSFER_TYPE transferType,
uint16_t endpointSize
);
```

DRV_USBFS_DEVICE_EndpointIsEnabled Function

This function returns the enable/disable status of the specified endpoint and direction.

File

drv_usbfs.h

C

```
bool DRV_USBFS_DEVICE_EndpointIsEnabled(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection);
```

Returns

- true - The endpoint is enabled.
- false - The endpoint is disabled.

Description

This function returns the enable/disable status of the specified endpoint and direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how the
// DRV_USBFS_DEVICE_EndpointIsEnabled function can be used to obtain the
// status of Endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

if(DRV_USBFS_ENDPOINT_STATE_DISABLED ==
            DRV_USBFS_DEVICE_EndpointIsEnabled(handle, ep))
{
    // Endpoint is disabled. Enable endpoint.

    DRV_USBFS_DEVICE_EndpointEnable(handle, ep, USB_ENDPOINT_TYPE_BULK, 64);

}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

bool DRV_USBFS_DEVICE_EndpointIsEnabled

(

DRV_HANDLE handle,

USB_ENDPOINT endpointAndDirection

)

DRV_USBFS_DEVICE_EndpointIsStalled Function

This function returns the stall status of the specified endpoint and direction.

File

drv_usbfs.h

C

```
bool DRV_USBFS_DEVICE_EndpointIsStalled(DRV_HANDLE client, USB_ENDPOINT endpoint);
```

Returns

- true - The endpoint is stalled.

- false - The endpoint is not stalled.

Description

This function returns the stall status of the specified endpoint and direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how the
// DRV_USBFS_DEVICE_EndpointIsStalled function can be used to obtain the
// stall status of Endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

if(true == DRV_USBFS_DEVICE_EndpointIsStalled (handle, ep))
{
    // Endpoint stall is enabled. Clear the stall.

    DRV_USBFS_DEVICE_EndpointStallClear(handle, ep);

}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

bool DRV_USBFS_DEVICE_EndpointIsStalled

(

DRV_HANDLE handle,

USB_ENDPOINT endpointAndDirection

)

DRV_USBFS_DEVICE_EndpointStall Function

This function stalls an endpoint in the specified direction.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_EndpointStall(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.
- USB_ERROR_OSAL_FUNCTION - An error with an OSAL function called in this function.

Description

This function stalls an endpoint in the specified direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to stall an endpoint. In
// this example, Endpoint 1 IN direction is stalled.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBFS_DEVICE_EndpointStall(handle, ep);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

```
USB_ERROR DRV_USBFS_DEVICE_EndpointStall
(
    DRV_HANDLE handle,
    USB_ENDPOINT endpointAndDirection
)
```

DRV_USBFS_DEVICE_EndpointStallClear Function

This function clears the stall on an endpoint in the specified direction.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_EndpointStallClear(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Description

This function clears the stall on an endpoint in the specified direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to clear a stall. In this
// example, the stall condition on Endpoint 1 IN direction is cleared.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBFS_DEVICE_EndpointStallClear(handle, ep);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

```
  USB_ERROR DRV_USBFS_DEVICE_EndpointStallClear
(
    DRV_HANDLE handle,
    USB_ENDPOINT endpointAndDirection
)
```

DRV_USBFS_DEVICE_IRPCancel Function

This function cancels the specific IRP that are queued and in progress at the specified endpoint.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_IRPCancel(DRV_HANDLE client, USB_DEVICE_IRP * irp);
```

Returns

- USB_ERROR_NONE - The IRP have been canceled successfully.
- USB_ERROR_PARAMETER_INVALID - Invalid parameter or the IRP already has been aborted or completed
- USB_ERROR_OSAL_FUNCTION - An OSAL function called in this function did not execute successfully.

Description

This function attempts to cancel the processing of a queued IRP. An IRP that was in the queue but yet to be processed will be cancelled successfully and the IRP callback function will be called from this function with the USB_DEVICE_IRP_STATUS_ABORTED status. The application can release the data buffer memory used by the IRP when this callback occurs. If the IRP was in progress (a transaction in on the bus) when the cancel function was called, the IRP will be canceled only when an ongoing or the next transaction has completed. The IRP callback function will then be called in an interrupt context. The application should not release the related data buffer unless the IRP callback has occurred.

Remarks

The size returned after the ABORT callback will be always 0 regardless of the amount of data that has been sent or received. The client should not assume any data transaction has happened for an canceled IRP. If the last transaction of the IRP was in progress, the IRP cancel does not have any effect. The first transaction of any ongoing IRP cannot be canceled.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to cancel IRP.  In this example the IRP
// has been scheduled from a device to the Host.

USB_ENDPOINT ep;
USB_DEVICE_IRP irp;

ep.direction = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

irp.data = myDataBufferToSend;
irp.size = 130;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

if (DRV_USBFS_DEVICE_IRPSubmit(handle, ep, &irp) != USB_ERROR_NONE)
{
    // This means there was an error.
}
```

```
else
{
    // Check the status of the IRP.
    if(irp.status != USB_DEVICE_IRP_STATUS_COMPLETED)
    {
        // Cancel the submitted IRP.
        if (DRV_USBFS_DEVICE_IRPCancel(handle, &irp) != USB_ERROR_NONE)
        {
            // The IRP Cancel request submission was successful.
            // IRP cancel status will be notified through the callback
            // function.
        }
        else
        {
            // The IRP may have been completed before IRP cancel operation.
            // could start. No callback notification will be generated.
        }
    }
    else
    {
        // The IRP processing must have been completed before IRP cancel was
        // submitted.
    }
}

void MyIRPCallback(USB_DEVICE_IRP * irp)
{
    // Check if the IRP callback is for a Cancel request
    if(irp->status == USB_DEVICE_IRP_STATUS_ABORTED)
    {
        // IRP cancel completed
    }
 }
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
irp	Pointer to the IRP to cancel.

Function

```
USB_ERROR DRV_USBFS_DEVICE_IRPCancel
(
    DRV_HANDLE client,
    USB_DEVICE_IRP * irp
)
```

DRV_USBFS_DEVICE_IRPCancelAll Function

This function cancels all IRPs that are queued and in progress at the specified endpoint.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_IRPCancelAll(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_OSAL_FUNCTION - An OSAL function called in this function did not execute successfully.

Description

This function cancels all IRPs that are queued and in progress at the specified endpoint.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to cancel all IRPs.

void MyIRPCallback(USB_DEVICE_IRP * irp)
{
    // Check if this is setup command

    if(irp->status == USB_DEVICE_IRP_STATUS_SETUP)
    {
        if(IsSetupCommandSupported(irp->data) == false)
        {
            // This means that this setup command is not
            // supported. Stall the some related endpoint and cancel all
            // queue IRPs.

            DRV_USBFS_DEVICE_EndpointStall(handle, ep);
            DRV_USBFS_DEVICE_IRPCancelAll(handle, ep);
        }
     }
 }
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

```
USB_ERROR DRV_USBFS_DEVICE_IRPCancelAll
(
    DRV_HANDLE client,
    USB_ENDPOINT endpointAndDirection
);
```

DRV_USBFS_DEVICE_IRPSubmit Function

This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_IRPSubmit(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection, USB_DEVICE_IRP *
irp);
```

Returns

- USB_ERROR_NONE - if the IRP was submitted successful.
- USB_ERROR_IRP_SIZE_INVALID - if the size parameter of the IRP is not correct.
- USB_ERROR_PARAMETER_INVALID - If the client handle is not valid.
- USB_ERROR_ENDPOINT_NOT_CONFIGURED - If the endpoint is not enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - The specified endpoint is not valid.
- USB_ERROR_OSAL_FUNCTION - An OSAL call in the function did not complete successfully.

Description

This function submits an I/O Request Packet (IRP) for processing to the USB Driver. The IRP allows a client to send and receive data from the USB Host. The data will be sent or received through the specified endpoint. The direction of the data transfer is indicated by the direction flag in the endpointAndDirection parameter. Submitting an IRP arms the endpoint to either send data to or receive data from the Host. If an IRP is already being processed on the endpoint, the subsequent IRP submit operation will be queued. The contents of the IRP (including the application buffers) should not be changed until the IRP has been processed.

Particular attention should be paid to the size parameter of IRP. The following should be noted:

- The size parameter while sending data to the Host can be less than, greater than, equal to, or be an exact multiple of the maximum packet size for the endpoint. The maximum packet size for the endpoint determines the number of transactions required to process the IRP.
- If the size parameter, while sending data to the Host is less than the maximum packet size, the transfer will complete in one transaction.
- If the size parameter, while sending data to the Host is greater than the maximum packet size, the IRP will be processed in multiple transactions.
- If the size parameter, while sending data to the Host is equal to or an exact multiple of the maximum packet size, the client can optionally ask the driver to send a Zero Length Packet(ZLP) by specifying the USB_DEVICE_IRP_FLAG_DATA_COMPLETE flag as the flag parameter.
- The size parameter, while receiving data from the Host must be an exact multiple of the maximum packet size of the endpoint. If this is not the case, the driver will return a USB_ERROR_IRP_SIZE_INVALID result. If while processing the IRP, the driver receives less than maximum packet size or a ZLP from the Host, the driver considers the IRP as processed. The size parameter at this point contains the actual amount of data received from the Host. The IRP status is returned as USB_DEVICE_IRP_STATUS_COMPLETED_SHORT.
- If a ZLP needs to be sent to Host, the IRP size should be specified as 0 and the flag parameter should be set as USB_DEVICE_IRP_FLAG_DATA_COMPLETE.
- If the IRP size is an exact multiple of the endpoint size, the client can request the driver to not send a ZLP by setting the flag parameter to USB_DEVICE_IRP_FLAG_DATA_PENDING. This flag indicates that there is more data pending in this transfer.
- Specifying a size less than the endpoint size along with the USB_DEVICE_IRP_FLAG_DATA_PENDING flag will cause the driver to return a USB_ERROR_IRP_SIZE_INVALID.
- If the size is greater than but not a multiple of the endpoint size, and the flag is specified as USB_DEVICE_IRP_FLAG_DATA_PENDING, the driver will send multiple of endpoint size number of bytes. For example, if the IRP size is 130 and the endpoint size if 64, the number of bytes sent will 128.

Remarks

This function can be called from the ISR of the USB module to associated with the client.

Preconditions

The Client handle should be valid.

Example

```
// The following code shows an example of how to schedule a IRP to send data
// from a device to the Host. Assume that the max packet size is 64 and
// and this data needs to sent over Endpoint 1. In this example, the
// transfer is processed as three transactions of 64, 64 and 2 bytes.

USB_ENDPOINT ep;
USB_DEVICE_IRP irp;

ep.direction = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

irp.data = myDataBufferToSend;
irp.size = 130;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

if (DRV_USBFS_DEVICE_IRPSubmit(handle, ep, &irp) != USB_ERROR_NONE)
{
    // This means there was an error.
}
else
{
    // The status of the IRP can be checked.
    while(irp.status != USB_DEVICE_IRP_STATUS_COMPLETED)
    {
        // Wait or run a task function.
    }
}

// The following code shows how the client can request
// the driver to send a ZLP when the size is an exact multiple of
```

```
// endpoint size.

irp.data = myDataBufferToSend;
irp.size = 128;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

// Note that while  receiving data from the Host, the size should be an
// exact multiple of the maximum packet size of the endpoint. In the
// following example, the DRV_USBFS_DEVICE_IRPSubmit function will return a
// USB_DEVICE_IRP_SIZE_INVALID value.

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_HOST_TO_DEVICE, 1);

irp.data = myDataBufferToSend;
irp.size = 60; // THIS SIZE IS NOT CORRECT
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.
irp	Pointer to the IRP to be added to the queue for processing.

Function

```
USB_ERROR DRV_USBFS_DEVICE_IRPSubmit
(
    DRV_HANDLE client,
    USB_ENDPOINT endpointAndDirection,
    USB_DEVICE_IRP * irp
);
```

DRV_USBFS_DEVICE_RemoteWakeupStart Function

This function causes the device to start Remote Wakeup Signalling on the bus.

File

drv_usbfs.h

C

```
void DRV_USBFS_DEVICE_RemoteWakeupStart(DRV_HANDLE handle);
```

Returns

None.

Description

This function causes the device to start Remote Wakeup Signalling on the bus. This function should be called when the device, presently placed in suspend mode by the Host, wants to be wakeup. Note that the device can do this only when the Host has enabled the device's Remote Wakeup capability.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
DRV_HANDLE handle;
```

```
// If the Host has enabled the Remote Wakeup capability, and if the device
// is in suspend mode, then start Remote Wakeup signaling.

if(deviceIsSuspended && deviceRemoteWakeupEnabled)
{
    DRV_USBFS_DEVICE_RemoteWakeupStart(handle);
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

void DRV_USBFS_DEVICE_RemoteWakeupStart(DRV_HANDLE handle);

DRV_USBFS_DEVICE_RemoteWakeupStop Function

This function causes the device to stop the Remote Wakeup Signalling on the bus.

File

drv_usbfs.h

C

```
void DRV_USBFS_DEVICE_RemoteWakeupStop(DRV_HANDLE handle);
```

Returns

None.

Description

This function causes the device to stop Remote Wakeup Signalling on the bus. This function should be called after the DRV_USBFS_DEVICE_RemoteWakeupStart function was called to start the Remote Wakeup signaling on the bus.

Remarks

This function should be 1 to 15 milliseconds after the DRV_USBFS_DEVICE_RemoteWakeupStart function was called.

Preconditions

The handle should be valid. The DRV_USBFS_DEVICE_RemoteWakeupStart function was called to start the Remote Wakeup signaling on the bus.

Example

```
DRV_HANDLE handle;

// If the Host has enabled the Remote Wakeup capability, and if the device
// is in suspend mode, then start Remote Wakeup signaling. Wait for 10
// milliseconds and then stop the Remote Wakeup signaling

if(deviceIsSuspended && deviceRemoteWakeupEnabled)
{
    DRV_USBFS_DEVICE_RemoteWakeupStart(handle);
    DelayMilliSeconds(10);
    DRV_USBFS_DEVICE_RemoteWakeupStop(handle);
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

void DRV_USBFS_DEVICE_RemoteWakeupStop(DRV_HANDLE handle);

DRV_USBFS_DEVICE_SOFNumberGet Function

This function will return the USB SOF packet number.

File

drv_usbfs.h

C

```
uint16_t DRV_USBFS_DEVICE_SOFNumberGet(DRV_HANDLE handle);
```

Returns

The SOF packet number.

Description

This function will return the USB SOF packet number..

Remarks

None.

Preconditions

This function will return a valid value only when the device is attached to the bus. The SOF packet count will not increment if the bus is suspended.

Example

```
// This code shows how the DRV_USBFS_DEVICE_SOFNumberGet function is called
// to read the current SOF number.

DRV_HANDLE handle;
uint16_t sofNumber;

sofNumber = DRV_USBFS_DEVICE_SOFNumberGet(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

uint16_t DRV_USBFS_DEVICE_SOFNumberGet(DRV_HANDLE handle);

d) Host Mode Operation Functions

DRV_USBFS_HOST_EventsDisable Function

Disables Host mode events.

File

drv_usbfs.h

C

```
bool DRV_USBFS_HOST_EventsDisable(DRV_HANDLE handle);
```

Returns

- true - Driver event generation was enabled when this function was called.
- false - Driver event generation was not enabled when this function was called.

Description

This function disables the Host mode events. This function is called by the Host Layer when it wants to execute code atomically.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
// This code shows how the DRV_USBFS_HOST_EventsDisable and
// DRV_USBFS_HOST_EventsEnable function can be called to disable and enable
// events.

DRV_HANDLE driverHandle;
bool eventsWereEnabled;

// Disable the driver events.
eventsWereEnabled = DRV_USBFS_HOST_EventsDisable(driverHandle);

// Code in this region will not be interrupted by driver events.

// Enable the driver events.
DRV_USBFS_HOST_EventsEnable(driverHandle, eventsWereEnabled);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

bool DRV_USBFS_HOST_EventsDisable

(

DRV_HANDLE handle

);

DRV_USBFS_HOST_EventsEnable Function

Restores the events to the specified the original value.

File

drv_usbfs.h

C

```
void DRV_USBFS_HOST_EventsEnable(DRV_HANDLE handle, bool eventContext);
```

Returns

None.

Description

This function will restore the enable disable state of the events. The eventRestoreContext parameter should be equal to the value returned by the DRV_USBFS_HOST_EventsDisable function.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
// This code shows how the DRV_USBFS_HOST_EventsDisable and
// DRV_USBFS_HOST_EventsEnable function can be called to disable and enable
// events.

DRV_HANDLE driverHandle;
bool eventsWereEnabled;

// Disable the driver events.
eventsWereEnabled = DRV_USBFS_HOST_EventsDisable(driverHandle);
```

```
// Code in this region will not be interrupted by driver events.

// Enable the driver events.
DRV_USBFS_HOST_EventsEnable(driverHandle, eventsWereEnabled);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
eventRestoreContext	Value returned by the DRV_USBFS_HOST_EventsDisable function.

Function

void DRV_USBFS_HOST_EventsEnable
(
DRV_HANDLE handle
bool eventRestoreContext
);

DRV_USBFS_HOST_IRPCancel Function

Cancels the specified IRP.

File

drv_usbfs.h

C

```
void DRV_USBFS_HOST_IRPCancel(USB_HOST_IRP * inputIRP);
```

Returns

None.

Description

This function attempts to cancel the specified IRP. If the IRP is queued and its processing has not started, it will be cancelled successfully. If the IRP in progress, the ongoing transaction will be allowed to complete.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how a submitted IRP can be cancelled.

USB_HOST_IRP irp;
USB_ERROR result;
USB_HOST_PIPE_HANDLE controlPipe;
USB_SETUP_PACKET setup;
uint8_t controlTransferData[32];

irp.setup = setup;
irp.data = controlTransferData;
irp.size = 32;
irp.flags = USB_HOST_IRP_FLAG_NONE ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

DRV_USBFS_HOST_IRPSubmit(controlPipeHandle, &irp);

// Additional application logic may come here. This logic may decide to
// cancel the submitted IRP.

DRV_USBFS_HOST_IRPCancel(&irp);
```

Parameters

Parameters	Description
inputIRP	Pointer to the IRP to cancel.

Function

void DRV_USBFS_HOST_IRPCancel(USB_HOST_IRP * inputIRP);

DRV_USBFS_HOST_IRPSubmit Function

Submits an IRP on a pipe.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_HOST_IRPSubmit(DRV_USBFS_HOST_PIPE_HANDLE hPipe, USB_HOST_IRP * pinputIRP);
```

Returns

- USB_ERROR_NONE - The IRP was submitted successfully.
- USB_ERROR_PARAMETER_INVALID - The pipe handle is not valid.
- USB_ERROR_OSAL_FUNCTION - An error occurred in an OSAL function called in this function.

Description

This function submits an IRP on the specified pipe. The IRP will be added to the queue and will be processed in turn. The data will be transferred on the bus based on the USB bus scheduling rules. When the IRP has been processed, the callback function specified in the IRP will be called. The IRP status will be updated to reflect the completion status of the IRP.

Remarks

An IRP can also be submitted in an IRP callback function.

Preconditions

The pipe handle should be valid.

Example

```
// The following code shows an example of how the host layer populates
// the IRP object and then submits it. IRP_Callback function is called when an
// IRP has completed processing. The status of the IRP at completion can be
// checked in the status flag. The size field of the irp will contain the amount
// of data transferred.

void IRP_Callback(USB_HOST_IRP * irp)
{
    // irp is pointing to the IRP for which the callback has occurred. In most
    // cases this function will execute in an interrupt context. The application
    // should not perform any hardware access or interrupt un-safe operations in
    // this function.

    switch(irp->status)
    {
        case USB_HOST_IRP_STATUS_ERROR_UNKNOWN:
            // IRP was terminated due to an unknown error
            break;

        case USB_HOST_IRP_STATUS_ABORTED:
            // IRP was terminated by the application
            break;

        case USB_HOST_IRP_STATUS_ERROR_BUS:
            // IRP was terminated due to a bus error
            break;

        case USB_HOST_IRP_STATUS_ERROR_DATA:
            // IRP was terminated due to data error
```

```
            break;

        case USB_HOST_IRP_STATUS_ERROR_NAK_TIMEOUT:
            // IRP was terminated because of a NAK timeout
            break;

        case USB_HOST_IRP_STATUS_ERROR_STALL:
            // IRP was terminated because of a device sent a STALL
            break;

        case USB_HOST_IRP_STATUS_COMPLETED:
            // IRP has been completed
            break;

        case USB_HOST_IRP_STATUS_COMPLETED_SHORT:
            // IRP has been completed but the amount of data processed was less
            // than requested.
            break;

        default:
            break;
    }
}

// In the following code snippet the a control transfer IRP is submitted to a
// control pipe. The setup parameter of the IRP points to the Setup command of
// the control transfer. The direction of the data stage is specified by the
// Setup packet.

USB_HOST_IRP irp;
USB_ERROR result;
USB_HOST_PIPE_HANDLE controlPipe;
USB_SETUP_PACKET setup;
uint8_t controlTransferData[32];

irp.setup = setup;
irp.data = controlTransferData;
irp.size = 32;
irp.flags = USB_HOST_IRP_FLAG_NONE ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

result = DRV_USBFS_HOST_IRPSubmit(controlPipeHandle, &irp);
```

Parameters

Parameters	Description
hPipe	Handle to the pipe to which the IRP has to be submitted.
pInputIRP	Pointer to the IRP.

Function

```
  USB_ERROR DRV_USBFS_HOST_IRPSubmit
(
    DRV_USBFS_HOST_PIPE_HANDLE  hPipe,
    USB_HOST_IRP * pInputIRP
);
```

DRV_USBFS_HOST_PipeClose Function

Closes an open pipe.

File

drv_usbfs.h

C

```
void DRV_USBFS_HOST_PipeClose(DRV_USBFS_HOST_PIPE_HANDLE pipeHandle);
```

Returns

None.

Description

This function closes an open pipe. Any IRPs scheduled on the pipe will be aborted and IRP callback functions will be called with the status as DRV_USB_HOST_IRP_STATE_ABORTED. The pipe handle will become invalid and the pipe will not accept IRPs.

Remarks

None.

Preconditions

The pipe handle should be valid.

Example

```
// This code shows how an open Host pipe can be closed.

DRV_HANDLE driverHandle;
DRV_USBFS_HOST_PIPE_HANDLE pipeHandle;

// Close the pipe.
DRV_USBFS_HOST_PipeClose(pipeHandle);
```

Parameters

Parameters	Description
pipeHandle	Handle to the pipe to close.

Function

void DRV_USBFS_HOST_PipeClose

(

DRV_USBFS_HOST_PIPE_HANDLE pipeHandle

);

DRV_USBFS_HOST_PipeSetup Function

Open a pipe with the specified attributes.

File

drv_usbfs.h

C

```
DRV_USBFS_HOST_PIPE_HANDLE DRV_USBFS_HOST_PipeSetup(DRV_HANDLE client, uint8_t deviceAddress, USB_ENDPOINT endpointAndDirection, uint8_t hubAddress, uint8_t hubPort, USB_TRANSFER_TYPE pipeType, uint8_t bInterval, uint16_t wMaxPacketSize, USB_SPEED speed);
```

Returns

- DRV_USB_HOST_PIPE_HANDLE_INVALID - The pipe could not be created.
- A valid Pipe Handle - The pipe was created successfully. This is an arbitrary value and will never be the same as DRV_USB_HOST_PIPE_HANDLE_INVALID.

Description

This function opens a communication pipe between the Host and the device endpoint. The transfer type and other attributes are specified through the function parameters. The driver does not check for available bus bandwidth, which should be done by the application (the USB Host Layer in this case)

Remarks

None.

Preconditions

The driver handle should be valid.

Example

```
// This code shows how the DRV_USBFS_HOST_PipeSetup function is called for
// create a communication pipe. In this example, Bulk pipe is created
// between the Host and a device. The Device address is 2 and the target
// endpoint on this device is 4 . The direction of the data transfer over
// this pipe is from the Host to the device. The device is connected to Port
// 1 of a Hub, whose USB address is 3. The maximum size of a transaction
// on this pipe is 64 bytes. This is a Bulk Pipe and hence the bInterval
// field is set to 0. The target device is operating at Full Speed.

DRV_HANDLE driverHandle;
DRV_USBFS_HOST_PIPE_HANDLE pipeHandle;

pipeHandle = DRV_USBFS_HOST_PipeSetup(driverHandle, 0x02, 0x14, 0x03, 0x01, USB_TRANSFER_TYPE_BULK, 0, 64,
USB_SPEED_FULL);

if(pipeHandle != DRV_USBFS_HOST_PIPE_HANDLE_INVALID)
{
    // The pipe was created successfully.
}
```

Parameters

Parameters	Description
client	Handle to the driver (returned from DRV_USBFS_Open function).
deviceAddress	USB Address of the device to connect to.
endpoint	Endpoint on the device to connect to.
hubAddress	Address of the hub to which this device is connected. If not connected to a hub, this value should be set to 0.
hubPort	Port number of the hub to which this device is connected.
pipeType	Transfer type of the pipe to open.
bInterval	Polling interval for periodic transfers. This should be specified as defined by the USB 2.0 Specification.
wMaxPacketSize	This should be set to the endpoint size reported by the device in its configuration descriptors. This defines the maximum size of the transaction in a transfer on this pipe.
speed	The speed of the pipe. This should match the speed at which the device connected to the Host.

Function

```
  DRV_USBFS_HOST_PIPE_HANDLE DRV_USBFS_HOST_PipeSetup
(
    DRV_HANDLE client,
uint8_t deviceAddress,
    USB_ENDPOINT endpointAndDirection,
uint8_t hubAddress,
uint8_t hubPort,
USB_TRANSFER_TYPE pipeType,
uint8_t bInterval,
uint16_t wMaxPacketSize,
    USB_SPEED speed
);
```

e) Root Hub Functions

DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet Function

This function returns the operating speed of the bus to which this root hub is connected.

File

drv_usbfs.h

C

```
USB_SPEED DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet(DRV_HANDLE handle);
```

Returns

- USB_SPEED_FULL - The Root hub is connected to a bus that is operating at Full Speed.

Description

This function returns the operating speed of the bus to which this root hub is connected.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet function is
// called to know the operating speed of the bus to which this Root hub is
// connected.

DRV_HANDLE driverHandle;
USB_SPEED speed;

speed = DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

USB_SPEED DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet(DRV_HANDLE handle);

DRV_USBFS_HOST_ROOT_HUB_Initialize Function

This function initializes the root hub driver.

File

drv_usbfs.h

C

```
void DRV_USBFS_HOST_ROOT_HUB_Initialize(DRV_HANDLE handle, USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo);
```

Returns

None.

Description

This function initializes the root hub driver. It is called by the Host Layer at the time of processing the root hub devices. The Host Layer assigns a USB_HOST_DEVICE_INFO reference to this root hub driver. This identifies the relationship between the root hub and the Host Layer.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the USB Host Layer calls the
// DRV_USBFS_HOST_ROOT_HUB_Initialize function. The usbHostDeviceInfo
// parameter is an arbitrary identifier assigned by the USB Host Layer. Its
// interpretation is opaque to the Root hub Driver.

DRV_HANDLE drvHandle;
USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo = 0x10003000;

DRV_USBFS_HOST_ROOT_HUB_Initialize(drvHandle, usbHostDeviceInfo);
```

Parameters

Parameters	Description
handle	Handle to the driver.
usbHostDeviceInfo	Reference provided by the Host.

Function

void DRV_USBFS_HOST_ROOT_HUB_Initialize

(

DRV_HANDLE handle,

USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo,

)

DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet Function

Returns the maximum amount of current that this root hub can provide on the bus.

File

drv_usbfs.h

C

```
uint32_t DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet(DRV_HANDLE handle);
```

Returns

Returns the maximum current (in milliamperes) that the root hub can supply.

Description

This function returns the maximum amount of current that this root hub can provide on the bus.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet
// function is called to obtain the maximum VBUS current that the Root hub
// can supply.

DRV_HANDLE driverHandle;
uint32_t currentMilliAmperes;

currentMilliAmperes = DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

uint32_t DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet(DRV_HANDLE);

DRV_USBFS_HOST_ROOT_HUB_OperationEnable Function

This function enables or disables root hub operation.

File

drv_usbfs.h

C

```
void DRV_USBFS_HOST_ROOT_HUB_OperationEnable(DRV_HANDLE handle, bool enable);
```

Returns

None.

Description

This function enables or disables root hub operation. When enabled, the root hub will detect devices attached to the port and will request the Host Layer to enumerate the device. This function is called by the Host Layer when it is ready to receive enumeration requests from the Host. If the operation is disabled, the root hub will not detect attached devices.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_OperationEnable and the
// DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled functions are called to enable
// the Root hub operation.

DRV_HANDLE driverHandle;

// Enable Root hub operation.
DRV_USBFS_HOST_ROOT_HUB_OperationEnable(driverHandle);

// Wait till the Root hub operation is enabled.
if(DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled(driverHandle) == false)
{
    // The operation has not completed. Call the
    // DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled function again to check if
    // the operation has completed. Note that the DRV_USBFS_Tasks function
    // must be allowed to run at periodic intervals to allow the enable
    // operation to completed.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
enable	If this is set to true, root hub operation is enabled. If this is set to false, root hub operation is disabled.

Function

void DRV_USBFS_HOST_ROOT_HUB_OperationEnable

(

DRV_HANDLE handle,

bool enable

);

DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled Function

Returns the operation enabled status of the root hub.

File

drv_usbfs.h

C

```
bool DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled(DRV_HANDLE handle);
```

Returns

- true - Root hub operation is enabled.
- false - Root hub operation is not enabled.

Description

This function returns true if the DRV_USBFS_HOST_ROOT_HUB_OperationEnable function has completed enabling the Host.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_OperationEnable and the
// DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled functions are called to enable
// the Root hub operation.

DRV_HANDLE driverHandle;

// Enable Root hub operation.
DRV_USBFS_HOST_ROOT_HUB_OperationEnable(driverHandle);

// Wait till the Root hub operation is enabled.
if(DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled(driverHandle) == false)
{
    // The operation has not completed. Call the
    // DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled function again to check if
    // the operation has completed. Note that the DRV_USBFS_Tasks function
    // must be allowed to run at periodic intervals to allow the enable
    // operation to completed.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

bool DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled(DRV_HANDLE handle);

DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet Function

Returns the number of ports this root hub contains.

File

drv_usbfs.h

C

```
uint8_t DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet(DRV_HANDLE handle);
```

Returns

This function will always return 1.

Description

This function returns the number of ports that this root hub contains.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet function can
// be called to obtain the number of Root hub ports.

DRV_HANDLE driverHandle;
uint8_t nPorts;

nPorts = DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

uint8_t DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet(DRV_HANDLE handle);

DRV_USBFS_HOST_ROOT_HUB_PortReset Function

Resets the specified root hub port.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_HOST_ROOT_HUB_PortReset(DRV_HANDLE handle, uint8_t port);
```

Returns

None.

Description

This function resets the root hub port. The reset duration is defined by DRV_USBFS_ROOT_HUB_RESET_DURATION. The status of the reset signaling can be checked using the DRV_USBFS_ROOT_HUB_PortResetIsComplete function.

Remarks

The root hub on the PIC32MZ USB controller contains only one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USB_HOST_ROOT_HUB_PortReset and the
// DRV_USBFS_ROOT_HUB_PortResetIsComplete functions are called to complete a
// port reset sequence.

DRV_HANDLE driverHandle;

// Reset Port 0.
DRV_USB_HOST_ROOT_HUB_PortReset(driverHandle, 0);

// Check if the Reset operation has completed.
if(DRV_USBFS_ROOT_HUB_PortResetIsComplete(driverHandle, 0) == false)
{
    // This means that the Port Reset operation has not completed yet. The
    // DRV_USBFS_ROOT_HUB_PortResetIsComplete function should be called
    // again after some time to check the status.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
port	Port to reset.

Function

void DRV_USBFS_ROOT_HUB_PortReset(DRV_HANDLE handle, uint8_t port);

DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete Function

Returns true if the root hub has completed the port reset operation.

File

drv_usbfs.h

C

```
bool DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete(DRV_HANDLE handle, uint8_t port);
```

Returns

- true - The reset signaling has completed.
- false - The reset signaling has not completed.

Description

This function returns true if the port reset operation has completed. It should be called after the DRV_USB_HOST_ROOT_HUB_PortReset function to check if the reset operation has completed.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USB_HOST_ROOT_HUB_PortReset and the
// DRV_USBFS_ROOT_HUB_PortResetIsComplete functions are called to complete a
// port reset sequence.

DRV_HANDLE driverHandle;

// Reset Port 0.
DRV_USB_HOST_ROOT_HUB_PortReset(driverHandle, 0);

// Check if the Reset operation has completed.
if(DRV_USBFS_ROOT_HUB_PortResetIsComplete(driverHandle, 0) == false)
{
    // This means that the Port Reset operation has not completed yet. The
    // DRV_USBFS_ROOT_HUB_PortResetIsComplete function should be called
    // again after some time to check the status.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
port	Port to check

Function

bool DRV_USBFS_ROOT_HUB_PortResetIsComplete

(

DRV_HANDLE handle,

uint8_t port

);

DRV_USBFS_HOST_ROOT_HUB_PortResume Function

Resumes the specified root hub port.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_HOST_ROOT_HUB_PortResume(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid or the port number does not exist.

Description

This function resumes the root hub. The resume duration is defined by DRV_USBFS_ROOT_HUB_RESUME_DURATION. The status of the resume signaling can be checked using the DRV_USBFS_ROOT_HUB_PortResumeIsComplete function.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_PortResume function is
// called to resume the specified port.

DRV_HANDLE driverHandle;

// Resume Port 0.
DRV_USBFS_HOST_ROOT_HUB_PortResume(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
port	Port to resume.

Function

USB_ERROR DRV_USBFS_HOST_ROOT_HUB_PortResume

(

DRV_HANDLE handle,

uint8_t port

);

DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet Function

Returns the speed of at which the port is operating.

File

drv_usbfs.h

C

```
USB_SPEED DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_SPEED_ERROR - This value is returned if the driver handle is not or if the speed information is not available or if the specified port is not valid.
- USB_SPEED_FULL - A Full Speed device has been connected to the port.

- USB_SPEED_LOW - A Low Speed device has been connected to the port.

Description

This function returns the speed at which the port is operating.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet function is
// called to know the operating speed of the port. This also indicates the
// operating speed of the device connected to this port.

DRV_HANDLE driverHandle;
USB_SPEED speed;

speed = DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
port	Port number of the port to be analyzed..

Function

```
  USB_SPEED DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet
(
    DRV_HANDLE handle,
uint8_t port
);
```

DRV_USBFS_HOST_ROOT_HUB_PortSuspend Function

Suspends the specified root hub port.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_HOST_ROOT_HUB_PortSuspend(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid or the port number does not exist.

Description

This function suspends the root hub port.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_PortSuspend function is
// called to suspend the specified port.

DRV_HANDLE driverHandle;
```

```
// Suspend Port 0.
DRV_USBFS_HOST_ROOT_HUB_PortSuspend(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
port	Port to suspend.

Function

USB_ERROR DRV_USBFS_ROOT_HUB_PortSuspend(DRV_HANDLE handle, uint8_t port);

f) Data Types and Constants

DRV_USBFS_EVENT Enumeration

Identifies the different events that the USB Driver provides.

File

drv_usbfs.h

C

```
typedef enum {
  DRV_USBFS_EVENT_ERROR = DRV_USB_EVENT_ERROR,
  DRV_USBFS_EVENT_RESET_DETECT = DRV_USB_EVENT_RESET_DETECT,
  DRV_USBFS_EVENT_RESUME_DETECT = DRV_USB_EVENT_RESUME_DETECT,
  DRV_USBFS_EVENT_IDLE_DETECT = DRV_USB_EVENT_IDLE_DETECT,
  DRV_USBFS_EVENT_STALL = DRV_USB_EVENT_STALL,
  DRV_USBFS_EVENT_SOF_DETECT = DRV_USB_EVENT_SOF_DETECT,
  DRV_USBFS_EVENT_DEVICE_SESSION_VALID = DRV_USB_EVENT_DEVICE_SESSION_VALID,
  DRV_USBFS_EVENT_DEVICE_SESSION_INVALID = DRV_USB_EVENT_DEVICE_SESSION_INVALID
} DRV_USBFS_EVENT;
```

Members

Members	Description
DRV_USBFS_EVENT_ERROR = DRV_USB_EVENT_ERROR	Bus error occurred and was reported
DRV_USBFS_EVENT_RESET_DETECT = DRV_USB_EVENT_RESET_DETECT	Host has issued a device reset
DRV_USBFS_EVENT_RESUME_DETECT = DRV_USB_EVENT_RESUME_DETECT	Resume detected while USB in suspend mode
DRV_USBFS_EVENT_IDLE_DETECT = DRV_USB_EVENT_IDLE_DETECT	Idle detected
DRV_USBFS_EVENT_STALL = DRV_USB_EVENT_STALL	Stall handshake has occurred
DRV_USBFS_EVENT_SOF_DETECT = DRV_USB_EVENT_SOF_DETECT	Either Device received SOF or SOF threshold was reached in the Host mode operation
DRV_USBFS_EVENT_DEVICE_SESSION_VALID = DRV_USB_EVENT_DEVICE_SESSION_VALID	Session valid
DRV_USBFS_EVENT_DEVICE_SESSION_INVALID = DRV_USB_EVENT_DEVICE_SESSION_INVALID	Session Invalid

Description

USB Driver Events Enumeration.

This enumeration identifies the different events that are generated by the USB Driver.

Remarks

None.

DRV_USBFS_EVENT_CALLBACK Type

Type of the USB Driver event callback function.

File

drv_usbfs.h

C

```
typedef void (* DRV_USBFS_EVENT_CALLBACK)(uintptr_t hClient, DRV_USBFS_EVENT eventType, void * eventData);
```

Returns

None.

Description

Type of the USB Driver Event Callback Function.

Define the type of the USB Driver event callback function. The client should register an event callback function of this type when it intends to receive events from the USB Driver. The event callback function is registered using the DRV_USBFS_ClientEventCallBackSet function.

Remarks

None.

Parameters

Parameters	Description
hClient	Handle to the driver client that registered this callback function.
eventType	This parameter identifies the event that caused the callback function to be called.
eventData	Pointer to a data structure that is related to this event. This value will be NULL if the event has no related data.

DRV_USBFS_HOST_PIPE_HANDLE Type

Defines the USB Driver Host Pipe Handle type.

File

drv_usbfs.h

C

```
typedef uintptr_t DRV_USBFS_HOST_PIPE_HANDLE;
```

Description

USB Driver Host Pipe Handle.

This type definition defines the type of the USB Driver Host Pipe Handle.

Remarks

None.

DRV_USBFS_INIT Structure

This type definition defines the Driver Initialization Data Structure.

File

drv_usbfs.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  USB_MODULE_ID usbID;
  bool stopInIdle;
  bool suspendInSleep;
  INT_SOURCE interruptSource;
  USB_SPEED operationSpeed;
  DRV_USBFS_OPMODES operationMode;
  void * endpointTable;
```

```
  uint32_t rootHubAvailableCurrent;
  DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;
  DRV_USBFS_ROOT_HUB_PORT_INDICATION portIndication;
  DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;
} DRV_USBFS_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System Module Initialization
USB_MODULE_ID usbID;	Identifies the USB peripheral to be used. This should be the USB PLIB module instance identifier.
bool stopInIdle;	This should be set to true if the USB module must stop operation in IDLE mode
bool suspendInSleep;	This should be set to true if the USB module must suspend when the CPU enters sleep mode.
INT_SOURCE interruptSource;	Specify the interrupt source for the USB module. This should be the interrupt source identifier for the USB module instance specified in usbID.
USB_SPEED operationSpeed;	Specify the operational speed of the USB module. This should always be set to USB_SPEED_FULL.
DRV_USBFS_OPMODES operationMode;	Specify the operation mode of the USB module. This specifies if the USB module should operate as a Device, Host, or both (Dual Role operation).
void * endpointTable;	A pointer to the endpoint descriptor table. This should be aligned at 512 byte address boundary. The size of the table is equal to DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE times the number of endpoints needed in the application.
uint32_t rootHubAvailableCurrent;	Root hub available current in milliamperes. This specifies the amount of current that root hub can provide to the attached device. This should be specified in mA. This is required when the driver is required to operate in host mode.
DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;	When operating in Host mode, the application can specify a Root Hub port enable function. This parameter should point to Root Hub port enable function. If this parameter is NULL, it implies that the Port is always enabled.
DRV_USBFS_ROOT_HUB_PORT_INDICATION portIndication;	When operating in Host mode, the application can specify a Root Port Indication. This parameter should point to the Root Port Indication function. If this parameter is NULL, it implies that Root Port Indication is not supported.
DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;	When operating is Host mode, the application can specify a Root Port Overcurrent detection. This parameter should point to the Root Port Indication function. If this parameter is NULL, it implies that Overcurrent detection is not supported.

Description

USB Device Driver Initialization Data.

This structure contains all the data necessary to initialize the USB Driver. A pointer to a structure of this type, containing the desired initialization data, must be passed into the DRV_USBFS_Initialize function.

Remarks

None.

DRV_USBFS_OPMODES Enumeration

Identifies the operating modes supported by the USB Driver.

File

drv_usbfs.h

C

```
typedef enum {
  DRV_USBFS_OPMODE_DUAL_ROLE = DRV_USB_OPMODE_DUAL_ROLE,
  DRV_USBFS_OPMODE_DEVICE = DRV_USB_OPMODE_DEVICE,
  DRV_USBFS_OPMODE_HOST = DRV_USB_OPMODE_HOST,
  DRV_USBFS_OPMODE_OTG = DRV_USB_OPMODE_OTG
} DRV_USBFS_OPMODES;
```

Members

Members	Description
DRV_USBFS_OPMODE_DUAL_ROLE = DRV_USB_OPMODE_DUAL_ROLE	The driver should be able to switch between host and device mode
DRV_USBFS_OPMODE_DEVICE = DRV_USB_OPMODE_DEVICE	The driver should support device mode operation only
DRV_USBFS_OPMODE_HOST = DRV_USB_OPMODE_HOST	The driver should support host mode operation only
DRV_USBFS_OPMODE_OTG = DRV_USB_OPMODE_OTG	The driver should support the OTG protocol

Description

USB Operating Modes Enumeration.

This enumeration identifies the operating modes supported by the USB Driver.

Remarks

None.

DRV_USBFS_ROOT_HUB_PORT_INDICATION Type

USB Root hub Application Hooks (Port Indication).

File

drv_usbfs.h

C

```
typedef void (* DRV_USBFS_ROOT_HUB_PORT_INDICATION)(uint8_t port, USB_HUB_PORT_INDICATOR_COLOR color,
USB_HUB_PORT_INDICATOR_STATE state);
```

Description

USB Root hub Application Hooks (Port Indication).

A function of the type defined here should be provided to the driver root to implement Port Indication. The root hub driver calls this function when it needs to update the state of the port indication LEDs. The application can choose to implement the Amber and Green colors as one LED or two different LEDs. The root hub driver specifies the color and the indicator attribute (on, off or blinking) when it calls this function.

Remarks

None.

DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT Type

USB Root hub Application Hooks (Port Overcurrent detection).

File

drv_usbfs.h

C

```
typedef bool (* DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT)(uint8_t port);
```

Description

USB Root hub Application Hooks (Port Overcurrent detection).

A function of the type defined here should be provided to the driver root hub to check for port over current condition. This function will be called periodically by the root hub driver to check the Overcurrent status of the port. It should continue to return true while the Overcurrent condition exists on the port. It should return false when the Overcurrent condition does not exist.

Remarks

None.

DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE Type

USB Root hub Application Hooks (Port Power Enable/ Disable).

File

drv_usbfs.h

C

```
typedef void (* DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE)(uint8_t port, bool control);
```

Description

USB Root hub Application Hooks (Port Power Enable/ Disable).

A function of the type defined here should be provided to the driver root to control port power. The root hub driver will call this function when it needs to enable port power. If the application circuit contains a VBUS switch, the switch should be accessed and controlled by this function. If the enable parameter is true, the switch should be enabled and VBUS should be available on the port. If the enable parameter is false, the switch should be disabled and VBUS should not be available on the port.

Remarks

None.

DRV_USBFS_DEVICE_INTERFACE Macro

USB Driver Device Mode Interface Functions.

File

drv_usbfs.h

C

```
#define DRV_USBFS_DEVICE_INTERFACE
```

Description

USB Driver Device Mode Interface Functions.

The Device Driver interface in the Device Layer Initialization data structure should be set to this value so that Device Layer can access the USB Driver Device Mode functions.

Remarks

None.

DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE Macro

USB Driver Endpoint Table Entry Size in bytes.

File

drv_usbfs.h

C

```
#define DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE 32
```

Description

USB Driver Endpoint Table Entry Size in bytes.

This constant defines the size (in bytes) of an entry in the endpoint table.

Remarks

None.

DRV_USBFS_HOST_INTERFACE Macro

USB Driver Host Mode Interface Functions.

File

drv_usbfs.h

C

```
#define DRV_USBFS_HOST_INTERFACE
```

Description

USB Driver Host Mode Interface Functions.

The Host Controller Driver interface in the Host Layer Initialization data structure should be set to this value so that Host Layer can access the USB Driver Host Mode functions.

Remarks

None.

DRV_USBFS_HOST_PIPE_HANDLE_INVALID Macro

Value of an Invalid Host Pipe Handle.

File

drv_usbfs.h

C

```
#define DRV_USBFS_HOST_PIPE_HANDLE_INVALID ((DRV_USBFS_HOST_PIPE_HANDLE)(-1))
```

Description

USB Driver Invalid Host Pipe Handle.

This constant defines the value of an Invalid Host Pipe Handle.

Remarks

None.

DRV_USBFS_INDEX_0 Macro

USB Driver Module Index 0 Definition.

File

drv_usbfs.h

C

```
#define DRV_USBFS_INDEX_0 0
```

Description

USB Driver Module Index 0 Definition.

This constant defines the value of USB Driver Index 0. The SYS_MODULE_INDEX parameter of the DRV_USBFS_Initialize and DRV_USBFS_Open functions should be set to this value to identify instance 0 of the driver.

Remarks

These constants should be used in place of hard-coded numeric literals and should be passed into the DRV_USBFS_Initialize and DRV_USBFS_Open functions to identify the driver instance in use. These are not indicative of the number of modules that are actually supported by the microcontroller.

DRV_USBFS_INDEX_1 Macro

USB Driver Module Index 1 Definition.

File

drv_usbfs.h

C

```
#define DRV_USBFS_INDEX_1 1
```

Description

USB Driver Module Index 1 Definition.

This constant defines the value of USB Driver Index 1. The SYS_MODULE_INDEX parameter of the DRV_USBFS_Initialize and DRV_USBFS_Open functions should be set to this value to identify instance 1 of the driver.

Remarks

These constants should be used in place of hard-coded numeric literals and should be passed into the DRV_USBFS_Initialize and DRV_USBFS_Open functions to identify the driver instance in use. These are not indicative of the number of modules that are actually supported by the microcontroller.

Enumerations

	Name	Description
	DRV_USBFS_EVENT	Identifies the different events that the USB Driver provides.
	DRV_USBFS_OPMODES	Identifies the operating modes supported by the USB Driver.

Functions

	Name	Description
	DRV_USBFS_ClientEventCallBackSet	This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.
	DRV_USBFS_Close	Closes an opened-instance of the USB Driver.
	DRV_USBFS_DEVICE_AddressSet	This function will set the USB module address that is obtained from the Host.
	DRV_USBFS_DEVICE_Attach	This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.
	DRV_USBFS_DEVICE_CurrentSpeedGet	This function returns the USB speed at which the device is operating.
	DRV_USBFS_DEVICE_Detach	This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.
	DRV_USBFS_DEVICE_EndpointDisable	This function disables an endpoint.
	DRV_USBFS_DEVICE_EndpointDisableAll	This function disables all provisioned endpoints.
	DRV_USBFS_DEVICE_EndpointEnable	This function enables an endpoint for the specified direction and endpoint size.
	DRV_USBFS_DEVICE_EndpointIsEnabled	This function returns the enable/disable status of the specified endpoint and direction.
	DRV_USBFS_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	DRV_USBFS_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.
	DRV_USBFS_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	DRV_USBFS_DEVICE_IRPCancel	This function cancels the specific IRP that are queued and in progress at the specified endpoint.
	DRV_USBFS_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	DRV_USBFS_DEVICE_IRPSubmit	This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.
	DRV_USBFS_DEVICE_RemoteWakeupStart	This function causes the device to start Remote Wakeup Signalling on the bus.
	DRV_USBFS_DEVICE_RemoteWakeupStop	This function causes the device to stop the Remote Wakeup Signalling on the bus.
	DRV_USBFS_DEVICE_SOFNumberGet	This function will return the USB SOF packet number.

	DRV_USBFS_HOST_EventsDisable	Disables Host mode events.
	DRV_USBFS_HOST_EventsEnable	Restores the events to the specified the original value.
	DRV_USBFS_HOST_IRPCancel	Cancels the specified IRP.
	DRV_USBFS_HOST_IRPSubmit	Submits an IRP on a pipe.
	DRV_USBFS_HOST_PipeClose	Closes an open pipe.
	DRV_USBFS_HOST_PipeSetup	Open a pipe with the specified attributes.
	DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet	This function returns the operating speed of the bus to which this root hub is connected.
	DRV_USBFS_HOST_ROOT_HUB_Initialize	This function initializes the root hub driver.
	DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet	Returns the maximum amount of current that this root hub can provide on the bus.
	DRV_USBFS_HOST_ROOT_HUB_OperationEnable	This function enables or disables root hub operation.
	DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled	Returns the operation enabled status of the root hub.
	DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet	Returns the number of ports this root hub contains.
	DRV_USBFS_HOST_ROOT_HUB_PortReset	Resets the specified root hub port.
	DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete	Returns true if the root hub has completed the port reset operation.
	DRV_USBFS_HOST_ROOT_HUB_PortResume	Resumes the specified root hub port.
	DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet	Returns the speed of at which the port is operating.
	DRV_USBFS_HOST_ROOT_HUB_PortSuspend	Suspends the specified root hub port.
	DRV_USBFS_Initialize	Initializes the USB Driver.
	DRV_USBFS_Open	Opens the specified USB Driver instance and returns a handle to it.
	DRV_USBFS_Status	Provides the current status of the USB Driver module.
	DRV_USBFS_Tasks	Maintains the driver's state machine when the driver is configured for Polled mode.
	DRV_USBFS_Tasks_ISR	Maintains the driver's Interrupt state machine and implements its ISR.

Macros

	Name	Description
	DRV_USBFS_DEVICE_INTERFACE	USB Driver Device Mode Interface Functions.
	DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE	USB Driver Endpoint Table Entry Size in bytes.
	DRV_USBFS_HOST_INTERFACE	USB Driver Host Mode Interface Functions.
	DRV_USBFS_HOST_PIPE_HANDLE_INVALID	Value of an Invalid Host Pipe Handle.
	DRV_USBFS_INDEX_0	USB Driver Module Index 0 Definition.
	DRV_USBFS_INDEX_1	USB Driver Module Index 1 Definition.

Structures

	Name	Description
	DRV_USBFS_INIT	This type definition defines the Driver Initialization Data Structure.

Types

	Name	Description
	DRV_USBFS_EVENT_CALLBACK	Type of the USB Driver event callback function.
	DRV_USBFS_HOST_PIPE_HANDLE	Defines the USB Driver Host Pipe Handle type.
	DRV_USBFS_ROOT_HUB_PORT_INDICATION	USB Root hub Application Hooks (Port Indication).
	DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT	USB Root hub Application Hooks (Port Overcurrent detection).
	DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE	USB Root hub Application Hooks (Port Power Enable/ Disable).

Description

PIC32MX USB Module Driver Interface Header File.

The PIC32MX Full speed USB Module driver provides a simple interface to manage the "USB" peripheral on PIC32MX microcontrollers. This file defines the interface definitions and prototypes for the USB driver. The driver interface meets the requirements of the MPLAB Harmony USB Host and Device Layer.

File Name

drv_usbfs.h

Microchip Technology Inc.

drv_usbfs_config_template.h

USB Full Speed (USBFS) Driver Configuration Template.

Macros

	Name	Description
	DRV_USBFS_DEVICE_SUPPORT	Determines if the USB Device Functionality should be enabled.
	DRV_USBFS_ENDPOINTS_NUMBER	Configures the number of endpoints to be provisioned in the driver.
	DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION	Configures the time duration (in milliseconds) that the driver will wait to re-confirm a device attach.
	DRV_USBFS_HOST_NAK_LIMIT	Configures the NAK Limit for Host Mode Control Transfers.
	DRV_USBFS_HOST_PIPES_NUMBER	Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.
	DRV_USBFS_HOST_RESET_DURATION	Configures the time duration (in milliseconds) of the Reset Signal.
	DRV_USBFS_HOST_SUPPORT	Determines if the USB Host Functionality should be enabled.
	DRV_USBFS_INSTANCES_NUMBER	Specifies the number of driver instances to be enabled in the application.
	DRV_USBFS_INTERRUPT_MODE	Configures the driver for interrupt or polling mode operation.

Description

USB Full Speed Driver Configuration Template.

This file lists all the configurations constants that affect the operation of the USBFS Driver.

PIC32MZ USB Driver

Provides information on the USB Driver specific to PIC32MZ devices.

Description

The PIC32MZ USB Driver in MPLAB Harmony provides API functions that allow the MPLAB Harmony USB Host and Device Stack to access the USB while operating on a PIC32MZ microcontroller. The driver implements the USB Driver Common Interface required by the USB Host and Device Stack. It abstracts the USB module operational details from the Host and Device Stack and provides the stacks with a modular access mechanism to the USB. The PIC32MZ USB Driver features the following:

- USB 2.0 High Speed and Full Speed operation in Peripheral mode
- USB 2.0 High Speed, Full Speed and Low Speed USB Peripheral Support in Host mode
- Designed for Dual Role Operation
- Capable of operating multiple USB modules
- Features non-blocking function and is interoperable with other MPLAB Harmony modules
- Features thread safe functions when operating within an RTOS
- Capable of operating in Polled and Interrupt modes
- Implements the USB Driver Common Interface required by the MPLAB Harmony USB Host and Device Stack
- Completely configurable through the MPLAB Harmony Configurator (MHC)
- Implements feature separation (Host and Device mode functions are implemented across different files)
- Designed to use the module's built-in DMA controller and transfer scheduler

Note: This help section only discusses features that are unique to the PIC32MZ USB Driver and are not a part of the USB Driver Common Interface. The driver functions that implement the USB Driver Common Interface are described in the Common Interface Help section.

While the PIC32MZ USB module supports USB "On-The-Go" (OTG), the PIC32MZ Driver does not currently implement USB OTG protocol support.

This help section only provides relevant information about the operation of the USB. The reader is encouraged to refer to the USB 2.0 Specification available at www.usb.org for a detailed explanation of USB protocol.

Using the Library

This topic describes the basic architecture of the USB PIC32MZ Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_usbhs.h`

The interface to the PIC32MZ USB Driver library is defined in the `drv_usbhs.h` header file.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Library Overview

Provides an overview of the library.

Description

The PIC32MZ USB Driver will typically be used by a USB Host and/or Device Stack. The USB Host and Device Stack operate as driver client applications. The driver is initialized as part of the MPLAB Harmony System Initialization. The driver initialization data structure specifies the operation mode (Host, Device, or Dual Role) of the driver. The driver features task routines to be called in the MPLAB Harmony application tasks function (SYS_Tasks function) and the USB Module Interrupt Service Routine (ISR).

The Host and the Device Stack can open the driver only when initialization has completed. It will continue to return an invalid driver handle while the initialization is in progress. Once opened, the Device Mode function can be called if the driver is operating in Device mode. The Host Mode function can be called if the driver is operating in Host mode. In Dual Role operation mode, the driver supports Host and Device operation in the same application. Even then, the driver will either operate as a USB Host or Device. OTG operation is not supported.

The PIC32MZ USB Driver features RTOS thread-safe functions. This allows the driver client application to safely call driver functions across different RTOS threads. Not all of the driver functions are interrupt-safe.

In addition to the USB Driver, which implements the USB Driver Common Interface, the PIC32MZ USB Driver implements functions which are required for its operation in the MPLAB Harmony framework. The following table lists the different categories of functions in the PIC32MZ USB Driver.

Library Interface Section	Description
System Function	These functions are accessed by the MPLAB Harmony System module. They allow the driver to be initialized, deinitialized and maintained. These functions are implemented in the `drv_usbhs.c` source file.
Client Core Functions	These functions allow the USB Host and Device Stack to open, close and perform other general driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbhs.c` source file.
Device Mode Operation Functions	These functions allow the USB Device Stack to perform USB Device mode specific driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbhs_device.c` source file
Host Mode Operation Functions	These functions allow the USB Host Stack to perform USB Host mode specific driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbhs_host.c` source file.
Root Hub Functions	These functions allow the USB Host Stack to access the driver Root hub operation. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbhs_host.c` source file.

Abstraction Model

Provides information on the abstraction model for the library.

Description

The PIC32MZ USB Driver implements the abstraction model defined by the USB Driver Common interface. This interface abstracts USB module specific details and provides a module independent interface to the driver client applications.

While operating in Device mode, the driver expects the client application (the USB Device Stack) to enable endpoints and then submit I/O request packet (IRP) requests to the enabled endpoints. Multiple IRPs can be queued on an endpoint. The driver calls the IRP callback function when the IRP is processed. The driver allows the client application to also attach and detach the device on the bus. It generates events which indicate USB states.

While operating in Host mode, the driver expects the client application (the USB Host Stack) to open pipes to endpoints on the connected device. The client application can then submit IRPs to the pipes. Multiple IRPs can be queued on a pipe. The driver calls the IRP callback function when the IRP is processed. The driver will call application defined functions to enumerate and denumerate a device. These functions are called when the driver detect device attach and detach respectively. The driver also exports root hub functions to the client application. This allows the client application to treat the driver as a single port hub

Please refer to the PIC32 USB Driver Common Interface help section for more details on the driver abstraction model.

How the Library Works

Provides information on how the library works.

Description

This section only explains aspects of driver operation which are unique to the PIC32MZ USB Driver. Major driver operations are described in the PIC32 USB Driver Common Interface help section.

Driver Initialization

Note: While generating a MPLAB Harmony USB project with MHC, the initialization code for the driver is generated automatically based on selections made in the USB Host stack or Device Stack Configuration trees.

The PIC32MZ USB Driver must be initialized so that a client application can open. The client application will not be able to open the driver if the initialization is in progress or has failed. The driver is initialized by calling the DRV_USBHS_Initialize function. This function is called from the SYS_Initialize function in the MPLAB Harmony application project and accepts two input parameters. The `index` parameter defines the instance of the USB Driver to be initialized. This becomes significant when the PIC32MZ microcontroller has more than one USB module. The `init` parameter is a driver-specific data structure of the type DRV_USBHS_INIT. This structure is shown in the following code example.

```
/* This code show the PIC32MZ USB Driver Initialization data structure.
 * A structure of this type must be provided to the DRV_USBHS_Initialize
 * function. */

typedef struct
{
    /* System Module Initialization */
    SYS_MODULE_INIT moduleInit;

    /* Identifies the USB peripheral to be used. This should be the USB PLIB
       module instance identifier. */
    uint8_t usbID;

    /* This should be set to true if the USB module must stop operation in Idle
       mode */
    bool stopInIdle;

    /* This should be set to true if the USB module must suspend when the CPU
       enters Sleep mode. */
    bool suspendInSleep;

    /* Specify the interrupt source for the USB module. This should be Interrupt
       PLIB Interrupt source identifier for the USB module instance specified in
       usbID. */
    INT_SOURCE interruptSource;

    /* Specify the interrupt source for the USB module specific DMA controller.
     * This should be the PLIB Interrupt source identified for the USB
     * module instance specified in usbID. */
    INT_SOURCE interruptSourceUSBDma;

    /* Specify the operational speed of the USB module. This should always be
       set to USB_SPEED_FULL. */
    USB_SPEED operationSpeed;

    /* Specify the operation mode of the USB module. This defines if the USB
     * module will support Device, Host or Dual Role operation */
    DRV_USBHS_OPMODES operationMode;

    /* A pointer to the endpoint descriptor table. This should be aligned at 512
       byte address boundary. The size of the table is equal to the
       DRV_USBHS_ENDPOINT_TABLE_ENTRY_SIZE times the number of endpoints needed
       in the application. */
    void * endpointTable;

    /* Root hub available current in mA. This specifies the amount of current
       that root hub can provide to the attached device. This should be
       specified in mA. This is required when the driver is required to operate
```

```
        in host mode. */
    uint32_t rootHubAvailableCurrent;

    /* When operating in Host mode, the application can specify a Root Hub port
       enable function. This parameter should point to Root Hub port enable
       function. If this parameter is NULL, it implies that the Port is always
       enabled. */
    DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;

    /* When operating in Host mode, the application can specify a Root Port
       Indication. This parameter should point to the Root Port Indication
       function. If this parameter is NULL, it implies that Root Port Indication
       is not supported. */
    DRV_USBHS_ROOT_HUB_PORT_INDICATION portIndication;

    /* When operating is Host mode, the application can specify a Root Port
       Overcurrent detection. This parameter should point to the Root Port
       Indication function. If this parameter is NULL, it implies that
       Overcurrent detection is not supported. */
    DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;

} DRV_USBHS_INIT;
```

The operationMode parameter defines the driver operation mode. This can be set to DRV_USBFS_OPMODE_DEVICE, DRV_USBFS_OPMODE_HOST, or DRV_USBFS_OPMODE_DUAL_ROLE for Device, Host and Dual Role operation, respectively.

The `rootHubAvailableCurrent` parameter should be set to the maximum current that the VBUS power supply can provide on the bus. The driver does not use this information directly. It provides this data to the client application while operating in Host mode.

The `portPowerEnable` parameter must point to a Port Power Enable function. The driver, while operating in Host mode, will call this function to enable the VBUS switch. This function should activate the VBUS switch if the driver calls this function with the enable parameter set to true. It should deactivate the switch if the driver calls this function with the `enable` parameter set to false. This parameter should be set to NULL if such a switch (of the switch control) is not available in the application.

The `portIndication` parameter must point to a Port Indication function. The driver, while operating in Host mode, will call this function to indicate the current state of the port. The driver will call this function with LED color status as defined in Chapter 11 of the USB 2.0 Specification. This parameter should be set to NULL if such a LED indication is not available in the application.

The `portOverCurrentDetect` parameter must point to a Port Overcurrent Detect function. The driver, while operating in Host mode, will call this function periodically to check if the attached device is overdrawing current. If the function should return true if such a condition exists. This parameter should be set to NULL if such detection is not available in the application.

The following code example shows initialization of the driver for Device mode operation.

```
/* This code shows an example of DRV_USBHS_INIT data structure for
 * Device mode operation. Here the driver is initialized to work with USB0 USB
 * module. */

DRV_USBHS_INIT init;
SYS_MODULE_OBJ usbDriverObj;

const DRV_USBHS_INIT drvUSBInit =
{
    /* Interrupt Source for USB module */
    .interruptSource = INT_SOURCE_USB_1,

    /* DMA Interrupt Source for USB module */
    .interruptSourceUSBDma = INT_SOURCE_USB_1_DMA,

    /* System module initialization */
    .moduleInit = {SYS_MODULE_POWER_RUN_FULL},

    /* Module operate in device mode */
    .operationMode = DRV_USBHS_OPMODE_DEVICE,

    /* Module operated at high speed */
    .operationSpeed = USB_SPEED_HIGH,

    /* Stop in idle */
    .stopInIdle = false,

    /* Suspend in sleep */
    .suspendInSleep = false,
```

```
    /* Identifies peripheral (PLIB-level) ID */
    .usbID = USBHS_ID_0
};

void SYS_Initialize(void)
{
    /* Initialize the USB Driver. Note how the init parameter is typecast to
     * SYS_MODULE_INIT type. The SYS_MODULE_OBJ returned by this function call
     * is passed to the driver tasks routine. DRV_USBHS_INDEX_0 is helper
     * constant defined in drv_usbfs.h */

    usbDriverObj = DRV_USBHS_Initialize(DRV_USBHS_INDEX_0, (SYS_MODULE_INIT *)(drvUSBInit));
}

void SYS_Tasks(void)
{
    /* The polled state of the USB driver is updated by calling the
     * DRV_USBHS_Tasks function in the SYS_Tasks() function. The
     * DRV_USBHS_Tasks() takes the driver module object returned by the
     * DRV_USBHS_Initialize funciton as a parameter. */

    DRV_USBHS_Tasks(usbDriverObj);
}

void __ISR(_USB_VECTOR, ipl4AUTO) _IntHandlerUSBInstance0(void)
{
    /* The DRV_USBHS_Tasks_ISR function update the interrupt state of the USB
     * Driver. If the driver is configured for Polling mode, this function need
     * not be invoked or included in the project. */

    DRV_USBHS_Tasks_ISR(usbDriverObj);
}

void __ISR ( _USB_DMA_VECTOR,ipl4AUTO) _IntHandlerUSBInstance0_USBDMA ( void )
{
    DRV_USBHS_Tasks_ISR_USBDMA(usbDriverObj);
}
```

The following code example shows initialization of the driver for Host mode operation.

```
/* This code shows an example of how the Hi-Speed USB (USBHS) driver can be configured
 * for Host mode operation. In this example, the
 * BSP_USBVBUSSwitchOverCurrentDetect function checks for over current condition
 * and the BSP_USBVBUSPowerEnable function enables the VBUS power. The port
 * indication function is not implemented and hence the portIndication member of
 * the initialization data structure is set to NULL. */

/* The implementation of the port over current detect, indication and the VBUS
 * power supply functions is discussed later in this help section. */

DRV_USBHS_INIT drvUSBHSInit =
{
    /* This should always be set to SYS_MODULE_POWER_RUN_FULL. */
    .moduleInit = {SYS_MODULE_POWER_RUN_FULL},

    /* Interrupt Source for the USB module */
    .interruptSource = INT_SOURCE_USB_1,

    /* Interrupt Source for the USB DMA module */
    .interruptSourceUSBDma = INT_SOURCE_USB_1_DMA,

    /* Configure for host mode operation. */
    .operationMode = DRV_USBHS_OPMODE_HOST,

    /* The driver should run at high speed. */
    .operationSpeed = USB_SPEED_HIGH,

    /* Port indication function is not implemented and is not available */
    .portIndication = NULL,
```

```
    /* This is the VBUS Power enable function */
    .portPowerEnable = BSP_USBVBUSPowerEnable,

    /* This is the over current detect function. */
    .portOverCurrentDetect = BSP_USBVBUSSwitchOverCurrentDetect,

    /* Here we state that the VBUS power supply can provide at most 500 mA of
     * current */
    .rootHubAvailableCurrent = 500,

    /* Moudule will operate in IDLE. */
    .stopInIdle = false,

    /* Module will not suspend automatically in sleep */
    .suspendInSleep = false,

    /* USB Module ID is 1 */
    .usbID = USBHS_ID_0

};

void SYS_Initialize(void)
{
    /* Initialize the USB Driver. Note how the init parameter is typecast to
     * SYS_MODULE_INIT type. The SYS_MODULE_OBJ returned by this function call
     * is passed to the driver tasks routine. DRV_USBHS_INDEX_0 is helper
     * constant defined in drv_usbfs.h */

    usbDriverObj = DRV_USBHS_Initialize(DRV_USBHS_INDEX_0, (SYS_MODULE_INIT *)(drvUSBInit));
}

void SYS_Tasks(void)
{
    /* The polled state of the USB driver is updated by calling the
     * DRV_USBHS_Tasks function in the SYS_Tasks() function. The
     * DRV_USBHS_Tasks takes the driver module object returned by the
     * DRV_USBHS_Initialize funciton as a parameter. */

    DRV_USBHS_Tasks(usbDriverObj);
}

void __ISR( _USB_VECTOR , IPL4AUTO)_IntHandler_USB_stub ( void )
{
    /* The DRV_USBHS_Tasks_ISR function updates the interrupt state of the USB
     * Driver. If the driver is configured for polling mode, this function need
     * not be invoked or included in the project. */

    DRV_USBHS_Tasks_ISR(usbDriverObj);
}

void __ISR ( _USB_DMA_VECTOR, IPL4AUTO)  _IntHandlerUSBInstance0_USBDMA ( void )
{
    /* The DRV_USBHS_Tasks_ISR_USBDMA function update the DMA transfer state of
     * the USB Driver. */

     DRV_USBHS_Tasks_ISR_USBDMA(usbDriverObj);
}
```

The PIC32MX USB Driver requires definition of configuration constants to be available in the `system_config.h` file of the MPLAB Harmony Application Project Configuration. Refer to the Configuring the Library section for details.

Multi-client Operation

The PIC32MZ USB Driver supports multi-client operation. In that, it can be opened by two application clients. This is required where Dual Operation is desired. The following should be noted when using multi-client operation:

- The driver should be initialized for Dual Role Operation mode.
- The DRV_USBHS_Open function can be called at the most twice in the application. The driver supports a maximum of two clients.
- A client can access either the host or device functionality of the driver. It cannot do both.
- It is possible for the two clients to operate in two different threads while operating with an RTOS.

Note: The typical the application clients for PIC32MZ USB Driver would be the MPLAB Harmony USB Host and Device Stack. The complexity of operating the driver in Dual Role mode is handled by the stack operation. The MHC will configure the driver for Dual Role operation when such operation is selected in USB Stack configuration tree.

USB Driver Common Interface

The PIC32MZ USB Driver exports its implementation of the USB Driver Common Interface to the Host and Device Layer via the DRV_USBHS_HOST_INTERFACE and DRV_USBHS_DEVICE_INTERFACE structures. The DRV_USBHS_HOST_INTERFACE structure is defined in the `drv_usbhs_host.c` file. The following code example shows this structure.

```
/*********************************************************
 * This structure is a set of pointer to the USBHS driver
 * functions. It is provided to the host and device layer
 * as the interface to the driver.
 * *******************************************************/

DRV_USB_HOST_INTERFACE gDrvUSBHSHostInterface =
{
    .open = DRV_USBHS_Open,
    .close = DRV_USBHS_Close,
    .eventHandlerSet = DRV_USBHS_ClientEventCallBackSet,
    .hostIRPSubmit = DRV_USBHS_HOST_IRPSubmit,
    .hostIRPCancel = DRV_USBHS_HOST_IRPCancel,
    .hostPipeSetup = DRV_USBHS_HOST_PipeSetup,
    .hostPipeClose = DRV_USBHS_HOST_PipeClose,
    .hostEventsDisable = DRV_USBHS_HOST_EventsDisable,
    .hostEventsEnable = DRV_USBHS_HOST_EventsEnable,
    .rootHubInterface.rootHubPortInterface.hubPortReset = DRV_USBHS_HOST_ROOT_HUB_PortReset,
    .rootHubInterface.rootHubPortInterface.hubPortSpeedGet = DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet,
    .rootHubInterface.rootHubPortInterface.hubPortResetIsComplete =
DRV_USBHS_HOST_ROOT_HUB_PortResetIsComplete,
    .rootHubInterface.rootHubPortInterface.hubPortSuspend = DRV_USBHS_HOST_ROOT_HUB_PortSuspend,
    .rootHubInterface.rootHubPortInterface.hubPortResume = DRV_USBHS_HOST_ROOT_HUB_PortResume,
    .rootHubInterface.rootHubMaxCurrentGet = DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet,
    .rootHubInterface.rootHubPortNumbersGet = DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet,
    .rootHubInterface.rootHubSpeedGet = DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet,
    .rootHubInterface.rootHubInitialize = DRV_USBHS_HOST_ROOT_HUB_Initialize,
    .rootHubInterface.rootHubOperationEnable = DRV_USBHS_HOST_ROOT_HUB_OperationEnable,
    .rootHubInterface.rootHubOperationIsEnabled = DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled,
};
```

The DRV_USBFS_DEVICE_INTERFACE structure is defined in the `drv_usbhs_device.c` file. The following code example shows this structure.

The MPLAB Harmony USB Host and Device stack perform driver independent access through the function pointers contained in these structures.

```
/*****************************************************
 * This structure is a pointer to a set of USB Driver
 * Device mode functions. This set is exported to the
 * device layer when the device layer must use the
 * PIC32MZ USB Controller.
 *****************************************************/

DRV_USB_DEVICE_INTERFACE gDrvUSBHSDeviceInterface =
{
    .open = DRV_USBHS_Open,
    .close = DRV_USBHS_Close,
    .eventHandlerSet = DRV_USBHS_ClientEventCallBackSet,
    .deviceAddressSet = DRV_USBHS_DEVICE_AddressSet,
    .deviceCurrentSpeedGet = DRV_USBHS_DEVICE_CurrentSpeedGet,
    .deviceSOFNumberGet = DRV_USBHS_DEVICE_SOFNumberGet,
    .deviceAttach = DRV_USBHS_DEVICE_Attach,
    .deviceDetach = DRV_USBHS_DEVICE_Detach,
    .deviceEndpointEnable = DRV_USBHS_DEVICE_EndpointEnable,
    .deviceEndpointDisable = DRV_USBHS_DEVICE_EndpointDisable,
    .deviceEndpointStall = DRV_USBHS_DEVICE_EndpointStall,
    .deviceEndpointStallClear = DRV_USBHS_DEVICE_EndpointStallClear,
    .deviceEndpointIsEnabled = DRV_USBHS_DEVICE_EndpointIsEnabled,
    .deviceEndpointIsStalled = DRV_USBHS_DEVICE_EndpointIsStalled,
    .deviceIRPSubmit = DRV_USBHS_DEVICE_IRPSubmit,
    .deviceIRPCancelAll = DRV_USBHS_DEVICE_IRPCancelAll,
    .deviceRemoteWakeupStop = DRV_USBHS_DEVICE_RemoteWakeupStop,
    .deviceRemoteWakeupStart = DRV_USBHS_DEVICE_RemoteWakeupStart,
```

```
    .deviceTestModeEnter = DRV_USBHS_DEVICE_TestModeEnter

};
```

Operation with RTOS

The PIC32MZ USB Driver is designed to operate with a RTOS. The driver implementation uses the MPLAB Harmony Operating System Abstraction Layer (OSAL). This allows the driver to function with entire range of RTOSes supported in MPLAB Harmony. The following points must be considered while using the driver with an RTOS.

- The driver can be opened from different threads
- In Device mode, an enabled endpoint should only be accessed from one thread. For example, if an application requires two endpoints, Endpoint 2 and Endpoint 3, the application could contain two threads, one accessing Endpoint 2 and another accessing Endpoint 3. The thread accessing Endpoint 2 cannot access Endpoint 3.
- While operating in Host mode, endpoint pipes can be opened from different threads. A pipe handle to an open pipe cannot be shared across threads.

USB DMA Operation

The PIC32MZ USB module features a built-in DMA controller. This controller works independently of the PIC32MZ DMA controller. The PIC32MZ USB Driver uses USB DMA controller to expedite transfer of memory from the USB module FIFO to user application memory. The following should be noted for the USB DMA controller:

- If the PIC32MZ USB Driver could not allocate a DMA channel (all channels are busy), it will use the CPU instructions to unload the endpoint FIFOs
- The USB module and the USB DMA controller interrupt priorities should be the same
- The application buffer start address should always be aligned on a 16-byte boundary and should be placed in coherent memory. Refer to the description of the DRV_USBHS_HOST_IRPSubmit and DRV_USBHS_DEVICE_IRPSubmit functions for details on how the user application buffer should be allocated.

Root Hub Operation

The PIC32MZ USB Driver implements a Root Hub Driver Interface. This allows the driver to emulate a hub. The USB Host Stack enumerates the Root Hub as a device. The Host Stack then does not differentiate between an external hub and the root hub. While emulating a hub, the PIC32MZ USB Driver Root Hub appears as a single port hub.

As a part of the Root Hub interface, the PIC32MZ USB Driver requires the application to supply functions for hub features that it does not implement. These features are:

- Port Overcurrent Detect
- VBUS Switch Control
- Port Indication

A pointer to these functions (if implemented) must be supplied through the driver initialization data (of the type DRV_USBHS_INIT) structure at the time of driver initialization. The application has the option of not implementing these functions. In such a case, the function pointers for the unimplemented function, in the initialization data structure should be set to NULL.

The root hub driver must also be able to communicate the maximum current capability of its port to the USB Host Layer. The PIC32MZ USB Controller does not contain built-in (hardware implemented) functionality for controlling the root hub port current. To facilitate this request, the driver will report the current capability that was specified in the `rootHubAvailableCurrent` parameter of the driver initialization data structure. The application must set this parameter to report the current supply capability of the VBUS power supply. The USB Host Layer uses this value to manage the bus current budget. If a connected device reports a configuration that requires more current than what the VBUS power supply can provide, the host will not set the configuration.

Port Overcurrent Detect

The Root Hub operation in PIC32MZ USB Driver will periodically call a Port Overcurrent Detect function to detect if an overcurrent condition is active on the port. The application must supply this function if port overcurrent detection is needed. The PIC32MZ USB Controller does not contain built-in (hardware implemented) functionality for checking overcurrent condition. The overcurrent condition on the port can occur in a case where the attached device has malfunctioned or when the USB VBUS line has short circuited to ground.

The signature of the function and an example implementation is shown in the following code example. The function must return (and must continue to return) true if an overcurrent condition exists on the port.

```
/* This code shows an example implementation of the
 * portOverCurrentDetect function. The PIC32MZ USB Driver will call this
 * function periodically to check if an over current condition exists on the
 * port. In this example, we assume that the over current detect pin from an
 * external circuit in the system, is connected to  port RD0 and the pin logic
 * is active high. The function must return true if an over current condition is
 * present on this pin */

bool BSP_USBVBUSSwitchOverCurrentDetect(uint8_t port)
{
    if(PLIB_PORTS_PinGet(PORTS_ID_0, PORT_CHANNEL_D, 0) == 1)
```

```
    {
        return(true);
    }
    else
    {
        return(false);
    }
}
```

VBUS Switch Control

The PIC32MZ USB Driver Root Hub operation will attempt to control the VBUS power supply to the port. Because the PIC32MZ USB Controller does not contain built-in (hardware implemented) functionality for checking controlling VBUS, such a control function must be supplied by the application. The root hub operation will access this function when the PIC32MX USB Driver will call the portPowerEnable function as a part of the Bus Enable sequence.

The following code shows an example of how this function can be implemented.

```
/* This code shows an example implementation of the VBUS Power Enable
 * function. The PIC32MZ USB Driver will call this function as a part of bus
 * enable function. In this example, it is assumed that system contains an
 * external VBUS power switch and this is control by port RB5.
 */

void BSP_USBVBUSPowerEnable(uint8_t port, bool enable)
{
    if(enable)
    {
        PLIB_PORTS_PinSet(PORTS_ID_0, PORT_CHANNEL_B, PORTS_BIT_POS_5);
    }
    else
    {
        PLIB_PORTS_PinClear(PORTS_ID_0, PORT_CHANNEL_B, PORTS_BIT_POS_5);
    }
}
```

Port Indication Function

The Root Hub Operation in the PIC32MZ USB Driver allows display of Port LED status. If the application requires this indication, it must implement a function which the Root Hub operation would call when a change in the Root Hub port has occurred. The port indication operation is specified in Section 11.5.3 of the USB 2.0 Specification.

```
/* This code shows an example implementation of the port indication
 * function. The PIC32MZ USB Driver call this function when it wants to indicate
 * port status. It is assumed that three function to switch off, blink and
 * switch on an LED are available. It is further assumed that these function
 * accept the color of the LED to operated on. */

void BSP_RootHubPortIndication
(
    uint8_t port,
    USB_HUB_PORT_INDICATOR_COLOR color,
    USB_HUB_PORT_INDICATOR_STATE state
)
{
    /* The color parameter indicates the color of the LED to be affected. The
     * color will be either USB_HUB_PORT_INDICATOR_COLOR_GREEN or
     * USB_HUB_PORT_INDICATOR_COLOR_AMBER. */

    switch (state)
    {
        case USB_HUB_PORT_INDICATOR_STATE_OFF:
            BSP_SwitchLEDOff(color);
            break;
        case USB_HUB_PORT_INDICATOR_STATE_BLINKING:
            BSP_LEDBlink(color);
            break;
        case USB_HUB_PORT_INDICATOR_STATE_ON:
            BSP_SwitchLEDOn(color);
            break;
        default:
            break;
    }
```

```
}
```

Configuring the Library

Provides information on the configuring the library.

Macros

	Name	Description
	DRV_USBHS_DEVICE_SUPPORT	Determines if the USB Device Functionality should be enabled.
	DRV_USBHS_ENDPOINTS_NUMBER	Configures the number of endpoints to be provisioned in the driver.
	DRV_USBHS_HOST_ATTACH_DEBOUNCE_DURATION	Configures the time duration (in milliseconds) that the driver will wait to reconfirm a device attach.
	DRV_USBHS_HOST_NAK_LIMIT	Configures the NAK Limit for Host Mode Control Transfers.
	DRV_USBHS_HOST_PIPES_NUMBER	Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.
	DRV_USBHS_HOST_RESET_DURATION	Configures the time duration (in milliseconds) of the Reset Signal.
	DRV_USBHS_HOST_SUPPORT	Determines if the USB Host Functionality should be enabled.
	DRV_USBHS_INSTANCES_NUMBER	Specifies the number of driver instances to be enabled in the application.
	DRV_USBHS_INTERRUPT_MODE	Configures the driver for interrupt or polling mode operation.

Description

The PIC32MZ USB Driver requires the specification of compile-time configuration macros. These macros define resource usage, feature availability, and dynamic behavior of the driver. These configuration macros should be defined in the `system_config.h` file.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_USBHS_DEVICE_SUPPORT Macro

Determines if the USB Device Functionality should be enabled.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_DEVICE_SUPPORT true
```

Description

Hi-Speed USB Driver Device Mode Support.

This constant should be set to true if USB device support is required in the application. It should be set to false if device support is not required.

Remarks

This constant should always be defined.

DRV_USBHS_ENDPOINTS_NUMBER Macro

Configures the number of endpoints to be provisioned in the driver.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_ENDPOINTS_NUMBER 3
```

Description

Hi-Speed USB Driver Endpoint Numbers.

This constant configures the number of endpoints that the driver needs to manage. When DRV_USBHS_DEVICE_SUPPORT is enabled, this constant should be set to the total number of endpoints to be enabled in the device. When enabled, an endpoint can be used for communication. Using any direction of an endpoint will require that the entire endpoint to be enabled.

Consider the case of a composite USB Device that contains a CDC and MSD function. The CDC function will require one Bulk endpoint (OUT and IN directions) and one Interrupt endpoint (IN direction). The MSD function will require one Bulk endpoint (IN and OUT directions). This design can

be implemented by using four endpoints. Endpoint 0 is used for the mandatory control interface. Endpoint 1 is used for CDC Bulk interface. Endpoint 2 is used for CDC Interrupt interface and Endpoint 3 is used for MSD Bulk Interface. The constant should then be set to 4.

For Host mode operation, this constant should be set to 1. Setting this value to greater than 1 will result in unused data memory allocation.

Remarks

This constant should always be defined.

DRV_USBHS_HOST_ATTACH_DEBOUNCE_DURATION Macro

Configures the time duration (in milliseconds) that the driver will wait to reconfirm a device attach.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_HOST_ATTACH_DEBOUNCE_DURATION 500
```

Description

Hi-Speed USB Driver Host Mode Attach Debounce Duration.

This constant configures the time duration (in milliseconds) that the driver will wait to reconfirm a device attach. When the driver first detects a device attach, it will start a timer for the duration specified by the constant. When the timer expires, the driver will check if the device is still attached. If so, the driver will then signal an attach event to the host stack. The duration allows for the device attach to become electro-mechanically stable.

Remarks

This constant should always be defined when DRV_USBHS_HOST_SUPPORT is set to true.

DRV_USBHS_HOST_NAK_LIMIT Macro

Configures the NAK Limit for Host Mode Control Transfers.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_HOST_NAK_LIMIT 2000
```

Description

Hi-Speed USB Driver Host Mode Control Transfers NAK Limit.

This constant configures the number of NAKs that the driver can accept from the device in the data stage of a control transfer before aborting the control transfer with a USB_HOST_IRP_STATUS_ERROR_NAK_TIMEOUT. Setting this constant to 0 will disable NAK limit checking. This constant should be adjusted to enable USB host compatibility with USB Devices that require more time to process control transfers.

Remarks

This constant should always be defined when DRV_USBHS_HOST_SUPPORT is set to true.

DRV_USBHS_HOST_PIPES_NUMBER Macro

Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_HOST_PIPES_NUMBER 10
```

Description

Hi-Speed USB Driver Host Mode Pipes Number.

This constant configures the maximum number of pipes that can be opened when the driver is operating in Host mode. Calling the DRV_USBHS_HOST_PipeSetup function will cause a pipe to be opened. Calling this function when DRV_USBHS_HOST_PIPES_NUMBER number of pipes have already been opened will cause the function to return an Invalid Pipe Handle. This constant should be configured to account for the maximum number of devices and the device types to be supported by the host application.

For example, if the USB Host application must support two USB Mass Storage devices and one CDC device. A CDC device requires four pipes and a Mass Storage Device requires three pipes. This constant should therefore be set to a value of 9 (four bulk pipes for two Mass Storage devices + two bulk pipes and one Interrupt pipe for one CDC device and two control pipes for two devices). Allocating pipes consumes data memory.

While enabling support for multiple devices, through a Hub, the application should consider the worst case requirement while configuring this constant. For example, a case where devices with the most number of pipe requirements are connected to the hub. At the same time, setting this constant to more than what is required will consume data memory.

Remarks

This constant should always be defined when DRV_USBHS_HOST_SUPPORT is set to true.

DRV_USBHS_HOST_RESET_DURATION Macro

Configures the time duration (in milliseconds) of the Reset Signal.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_HOST_RESET_DURATION 100
```

Description

Hi-Speed USB Driver Host Mode Reset Duration.

This constant configures the duration of the reset signal. The driver generates a reset signal when the USB Host stack requests for a root hub port reset. The driver will generate the reset signal for the duration specified by this constant and will then stop generating the reset signal.

Remarks

This constant should always be defined when DRV_USBHS_HOST_SUPPORT is set to true.

DRV_USBHS_HOST_SUPPORT Macro

Determines if the USB Host Functionality should be enabled.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_HOST_SUPPORT false
```

Description

Hi-Speed USB Driver Host Mode Support.

This constant should be set to true if USB Host mode support is required in the application. It should be set to false if host support is not required.

Remarks

This constant should always be defined.

DRV_USBHS_INSTANCES_NUMBER Macro

Specifies the number of driver instances to be enabled in the application.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_INSTANCES_NUMBER 1
```

Description

Hi-Speed USB Driver Instances Number.

This constant defines the number of driver instances to be enabled in the application. This will be typically be the number of USB controllers to be used in the application. On PIC32MZ microcontrollers that have one USB controller, this value will always be 1. On PIC32MZ microcontrollers that have two USB controllers, this value could be one or two, depending on whether one or two USB segments are required. To conserve data memory, this constant should be set to exactly the number of USB controllers that are required in the system.

Remarks

This constant should always be defined.

DRV_USBHS_INTERRUPT_MODE Macro

Configures the driver for interrupt or polling mode operation.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_INTERRUPT_MODE true
```

Description

Hi-Speed USB Driver Interrupt Mode.

This constant configures the driver for interrupt or polling operation. If this flag is set to true, the driver will operate in Interrupt mode. If the flag is set to false, the driver will operate in Polled mode. In Polled mode, the driver interrupt state machine gets updated in the SYS_Tasks function. If the driver is configured for Interrupt mode, the driver Interrupt state machine gets updated in the driver Interrupt Service Routine(ISR). It is always recommended for the driver to operate in Interrupt mode.

Remarks

This constant should always be defined.

Building the Library

This section lists the files that are available in the PIC32MZ USB Driver Library.

Description

This section list the files that are available in the `\src` folder of the PIC32MZ USB Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/usb/usbhs`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_usbhs.h`	This file should be included by any `.c` file which accesses the PIC32MZ USB Driver API. This one file contains the prototypes for all driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_usbhs.c`	This file should always be included in the project when using the PIC3MZ USB Driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
`/src/dynamic/drv_usbhs_device.c`	This file should be included in the project if Device mode operation is required.
`/src/dynamic/drv_usbhs_host.c`	This file should be included in the project if Host mode operation is required.

Module Dependencies

The PIC32MZ USB Driver Library depends on the following modules:

- Interrupt System Service Library

Library Interface

a) System Functions

	Name	Description
	DRV_USBHS_Initialize	Initializes the Hi-Speed USB Driver.
	DRV_USBHS_Status	Provides the current status of the Hi-Speed USB Driver module.
	DRV_USBHS_Tasks	Maintains the driver's state machine when the driver is configured for Polled mode.
	DRV_USBHS_Tasks_ISR	Maintains the driver's Interrupt state machine and implements its ISR.
	DRV_USBHS_Tasks_ISR_USBDMA	Maintains the driver's DMA Transfer state machine and implements its ISR.

b) Client Core Functions

	Name	Description
	DRV_USBHS_ClientEventCallBackSet	This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.
	DRV_USBHS_Close	Closes an opened-instance of the Hi-Speed USB Driver.
	DRV_USBHS_Open	Opens the specified Hi-Speed USB Driver instance and returns a handle to it.

c) Device Mode Operation Functions

	Name	Description
	DRV_USBHS_DEVICE_AddressSet	This function will set the USB module address that is obtained from the Host.
	DRV_USBHS_DEVICE_Attach	This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.
	DRV_USBHS_DEVICE_CurrentSpeedGet	This function will return the USB speed at which the device is operating.
	DRV_USBHS_DEVICE_Detach	This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.
	DRV_USBHS_DEVICE_EndpointDisable	This function disables an endpoint.
	DRV_USBHS_DEVICE_EndpointDisableAll	This function disables all provisioned endpoints.
	DRV_USBHS_DEVICE_EndpointEnable	This function enables an endpoint for the specified direction and endpoint size.
	DRV_USBHS_DEVICE_EndpointIsEnabled	This function returns the enable/disable status of the specified endpoint and direction.
	DRV_USBHS_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	DRV_USBHS_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.
	DRV_USBHS_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	DRV_USBHS_DEVICE_IRPCancel	This function cancels the specific IRP that are queued and in progress at the specified endpoint.
	DRV_USBHS_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	DRV_USBHS_DEVICE_IRPSubmit	This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.
	DRV_USBHS_DEVICE_RemoteWakeupStart	This function causes the device to start Remote Wakeup Signalling on the bus.
	DRV_USBHS_DEVICE_RemoteWakeupStop	This function causes the device to stop the Remote Wakeup Signalling on the bus.
	DRV_USBHS_DEVICE_SOFNumberGet	This function will return the USB SOF packet number.
	DRV_USBHS_DEVICE_TestModeEnter	This function enables the specified USB 2.0 Test Mode.
	DRV_USBHS_DEVICE_TestModeExit	This function disables the specified USB 2.0 Test Mode.

d) Host Mode Operation Functions

	Name	Description
	DRV_USBHS_HOST_EventsDisable	Disables Host mode events.
	DRV_USBHS_HOST_EventsEnable	Restores the events to the specified the original value.
	DRV_USBHS_HOST_IRPCancel	Cancels the specified IRP.
	DRV_USBHS_HOST_IRPSubmit	Submits an IRP on a pipe.
	DRV_USBHS_HOST_PipeClose	Closes an open pipe.
	DRV_USBHS_HOST_PipeSetup	Open a pipe with the specified attributes.

e) Root Hub Functions

	Name	Description
	DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet	This function returns the operating speed of the bus to which this root hub is connected.
	DRV_USBHS_HOST_ROOT_HUB_Initialize	This function initializes the root hub driver.
	DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet	Returns the maximum amount of current that this root hub can provide on the bus.
	DRV_USBHS_HOST_ROOT_HUB_OperationEnable	This function enables or disables root hub operation.
	DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled	Returns the operation enabled status of the root hub.
	DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet	Returns the number of ports this root hub contains.
	DRV_USBHS_HOST_ROOT_HUB_PortReset	Resets the specified root hub port.
	DRV_USBHS_HOST_ROOT_HUB_PortResetIsComplete	Returns true if the root hub has completed the port reset operation.
	DRV_USBHS_HOST_ROOT_HUB_PortResume	Resumes the specified root hub port.
	DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet	Returns the speed of at which the port is operating.
	DRV_USBHS_HOST_ROOT_HUB_PortSuspend	Suspends the specified root hub port.

f) Data Types and Constants

	Name	Description
	DRV_USBHS_EVENT	Identifies the different events that the Hi-Speed USB Driver provides.
	DRV_USBHS_EVENT_CALLBACK	Type of the Hi-Speed USB Driver event callback function.
	DRV_USBHS_HOST_PIPE_HANDLE	Defines the Hi-Speed USB Driver Host Pipe Handle type.
	DRV_USBHS_INIT	This type definition defines the Driver Initialization Data Structure.
	DRV_USBHS_OPMODES	Identifies the operating modes supported by the Hi-Speed USB Driver.
	DRV_USBHS_ROOT_HUB_PORT_INDICATION	USB Root hub Application Hooks (Port Indication).
	DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT	USB Root hub Application Hooks (Port Overcurrent detection).
	DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE	USB Root hub Application Hooks (Port Power Enable/ Disable).
	DRV_USBHS_DEVICE_INTERFACE	Hi-Speed USB Driver Device Mode Interface Functions.
	DRV_USBHS_HOST_INTERFACE	Hi-Speed USB Driver Host Mode Interface Functions.
	DRV_USBHS_HOST_PIPE_HANDLE_INVALID	Value of an Invalid Host Pipe Handle.
	DRV_USBHS_INDEX_0	Hi-Speed USB Driver Module Index 0 Definition.

Description

a) System Functions

DRV_USBHS_Initialize Function

Initializes the Hi-Speed USB Driver.

File

drv_usbhs.h

C

```
SYS_MODULE_OBJ DRV_USBHS_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

- SYS_MODULE_OBJ_INVALID - The driver initialization failed.
- A valid System Module Object - The driver initialization was able to start. It may have not completed and requires the DRV_USBHS_Tasks function to be called periodically. This value will never be the same as SYS_MODULE_OBJ_INVALID.

Description

This function initializes the Hi-Speed USB Driver, making it ready for clients to open. The driver initialization does not complete when this function returns. The DRV_USBHS_Tasks function must called periodically to complete the driver initialization. The DRV_USBHS_Open function will fail if the driver was not initialized or if initialization has not completed.

Remarks

This function must be called before any other Hi-Speed USB Driver function is called. This function should only be called once during system initialization unless DRV_USBHS_Deinitialize is called to deinitialize the driver instance.

Preconditions

None.

Example

```
// The following code shows an example initialization of the
// driver. The USB module to be used is USB1.  The module should not
// automatically suspend when the  microcontroller enters Sleep mode.  The
// module should continue  operation when the module enters Idle mode.  The
// power state is set to run at full clock speeds. Device Mode operation
// should be at FULL speed. The size of the endpoint table is set for two
// endpoints.

DRV_USBHS_INIT moduleInit;

usbInitData.usbID               = USBHS_ID_0;
usbInitData.opMode              = DRV_USBHS_OPMODE_DEVICE;
usbInitData.stopInIdle          = false;
usbInitData.suspendInSleep      = false;
usbInitData.operationSpeed      = USB_SPEED_FULL;
usbInitData.interruptSource     = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize
// function.

DRV_USBHS_Initialize(DRV_USBHS_INDEX_0, (SYS_MODULE_INIT *) &usbInitData);
```

Parameters

Parameters	Description
drvIndex	Ordinal number of driver instance to be initialized. This should be set to DRV_USBHS_INDEX_0 if driver instance 0 needs to be initialized.
init	Pointer to a data structure containing data necessary to initialize the driver. This should be a DRV_USBHS_INIT structure reference typecast to SYS_MODULE_INIT reference.

Function

SYS_MODULE_OBJ DRV_USBHS_Initialize
(
const SYS_MODULE_INDEX drvIndex,
const SYS_MODULE_INIT * const init
)

DRV_USBHS_Status Function

Provides the current status of the Hi-Speed USB Driver module.

File

drv_usbhs.h

C

```
SYS_STATUS DRV_USBHS_Status(SYS_MODULE_OBJ object);
```

Returns

- SYS_STATUS_READY - Indicates that the driver is ready.
- SYS_STATUS_UNINITIALIZED - Indicates that the driver has never been initialized.

Description

This function provides the current status of the Hi-Speed USB Driver module.

Remarks

None.

Preconditions

The DRV_USBHS_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USBHS_Initialize
SYS_STATUS          status;
DRV_USBHS_INIT moduleInit;

usbInitData.usbID               = USBHS_ID_0;
usbInitData.opMode              = DRV_USBHS_OPMODE_DEVICE;
usbInitData.stopInIdle          = false;
usbInitData.suspendInSleep      = false;
usbInitData.operationSpeed      = USB_SPEED_FULL;
usbInitData.interruptSource     = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize
// function.

DRV_USBHS_Initialize(DRV_USBHS_INDEX_0, (SYS_MODULE_INIT *) &usbInitData);

// The status of the driver can be checked.
status = DRV_USBHS_Status(object);
if(SYS_STATUS_READY == status)
{
    // Driver is ready to be opened.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USBHS_Initialize function.

Function

SYS_STATUS DRV_USBHS_Status (SYS_MODULE_OBJ object)

DRV_USBHS_Tasks Function

Maintains the driver's state machine when the driver is configured for Polled mode.

File

drv_usbhs.h

C

```
void DRV_USBHS_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Maintains the driver's Polled state machine. This function should be called from the SYS_Tasks function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function (SYS_Tasks). This function will never block.

Preconditions

The DRV_USBHS_Initialize function must have been called for the specified Hi-Speed USB Driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USBHS_Initialize
```

```
while (true)
{
    DRV_USBHS_Tasks(object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USBHS_Initialize function).

Function

void DRV_USBHS_Tasks(SYS_MODULE_OBJ object)

DRV_USBHS_Tasks_ISR Function

Maintains the driver's Interrupt state machine and implements its ISR.

File

drv_usbhs.h

C

```
void DRV_USBHS_Tasks_ISR(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal Interrupt state machine and implement its ISR for interrupt-driven implementations.

Remarks

This function should be called from the USB ISR. For multiple USB modules, it should be ensured that the correct Hi-Speed USB Driver system module object is passed to this function.

Preconditions

The DRV_USBHS_Initialize function must have been called for the specified Hi-Speed USB Driver instance.

Example

```
SYS_MODULE_OBJ object;     // Returned from DRV_USBHS_Initialize

while (true)
{
    DRV_USBHS_Tasks_ISR (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USBHS_Initialize).

Function

void DRV_USBHS_Tasks_ISR(SYS_MODULE_OBJ object)

DRV_USBHS_Tasks_ISR_USBDMA Function

Maintains the driver's DMA Transfer state machine and implements its ISR.

File

drv_usbhs.h

C

```
void DRV_USBHS_Tasks_ISR_USBDMA(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal DMA Transfer state machine and implement its ISR for interrupt-driven implementations.

Remarks

This function should be called from the USB DMA ISR. For multiple USB modules, it should be ensured that the correct Hi-Speed USB Driver system module object is passed to this function.

Preconditions

The DRV_USBHS_Initialize function must have been called for the specified Hi-Speed USB Driver instance.

Example

```
SYS_MODULE_OBJ object;     // Returned from DRV_USBHS_Initialize

while (true)
{
    DRV_USBHS_Tasks_ISR_USBDMA (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USBHS_Initialize).

Function

void DRV_USBHS_Tasks_ISR_USBDMA(SYS_MODULE_OBJ object)

b) Client Core Functions

DRV_USBHS_ClientEventCallBackSet Function

This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.

File

drv_usbhs.h

C

```
void DRV_USBHS_ClientEventCallBackSet(DRV_HANDLE handle, uintptr_t hReferenceData, DRV_USB_EVENT_CALLBACK
myEventCallBack);
```

Returns

None.

Description

This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events. The callback is disabled by either not calling this function after the DRV_USBHS_Open function has been called or by setting the myEventCallBack argument as NULL. When the callback function is called, the hReferenceData argument is returned.

Remarks

Typical usage of the Hi-Speed USB Driver requires a client to register a callback.

Preconditions

None.

Example

```
// Set the client event callback for the Device Layer.  The
// USBDeviceLayerEventHandler function is the event handler. When this
// event handler is invoked by the driver, the driver returns back the
// second argument specified in the following function (which in this case
// is the Device Layer data structure). This allows the application
// firmware to identify, as an example, the Device Layer object associated
// with this callback.

DRV_USBHS_ClientEventCallBackSet(myUSBDevice.usbDriverHandle, (uintptr_t)&myUSBDevice,
USBDeviceLayerEventHandler);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
hReferenceData	Object (could be a pointer) that is returned with the callback.
myEventCallBack	Callback function for all USB events.

Function

void DRV_USBHS_ClientEventCallBackSet

(

DRV_HANDLE handle,

uintptr_t hReferenceData,

DRV_USBHS_EVENT_CALLBACK myEventCallBack

);

DRV_USBHS_Close Function

Closes an opened-instance of the Hi-Speed USB Driver.

File

drv_usbhs.h

C

```
void DRV_USBHS_Close(DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the Hi-Speed USB Driver, invalidating the handle.

Remarks

After calling this function, the handle passed in handle parameter must not be used with any of the other driver functions. A new handle must be obtained by calling DRV_USBHS_Open function before the caller may use the driver again.

Preconditions

The DRV_USBHS_Initialize function must have been called for the specified Hi-Speed USB Driver instance. DRV_USBHS_Open function must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_USBHS_Open

DRV_USBHS_Close(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

void DRV_USBHS_Close(DRV_HANDLE handle)

DRV_USBHS_Open Function

Opens the specified Hi-Speed USB Driver instance and returns a handle to it.

File

drv_usbhs.h

C

```
DRV_HANDLE DRV_USBHS_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

- DRV_HANDLE_INVALID - The driver could not be opened successfully.This can

happen if the driver initialization was not complete or if an internal error has occurred.

- A Valid Driver Handle - This is an arbitrary value and is returned if the function was successful. This value will never be the same as DRV_HANDLE_INVALID.

Description

This function opens the specified Hi-Speed USB Driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The intent flag should always be DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NON_BLOCKING. Any other setting of the intent flag will return a invalid driver handle. A driver instance can only support one client. Trying to open a driver that has an existing client will result in an unsuccessful function call.

Remarks

The handle returned is valid until the DRV_USBHS_Close function is called. The function will typically return DRV_HANDLE_INVALID if the driver was not initialized. In such a case the client should try to open the driver again.

Preconditions

Function DRV_USBHS_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

// This code assumes that the driver has been initialized.
handle = DRV_USBHS_Open(DRV_USBHS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

if(DRV_HANDLE_INVALID == handle)
{
    // The application should try opening the driver again.
}
```

Parameters

Parameters	Description
drvIndex	Identifies the driver instance to be opened. As an example, this value can be set to DRV_USBHS_INDEX_0 if instance 0 of the driver has to be opened.
intent	Should always be (DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_READWRITE| DRV_IO_INTENT_NON_BLOCKING).

Function

```
DRV_HANDLE DRV_USBHS_Open
(
const    SYS_MODULE_INDEX drvIndex,
const    DRV_IO_INTENT intent
)
```

c) Device Mode Operation Functions

DRV_USBHS_DEVICE_AddressSet Function

This function will set the USB module address that is obtained from the Host.

File

drv_usbhs.h

C

```
void DRV_USBHS_DEVICE_AddressSet(DRV_HANDLE handle, uint8_t address);
```

Returns

None.

Description

This function will set the USB module address that is obtained from the Host in a setup transaction. The address is obtained from the SET_ADDRESS command issued by the Host. The primary (first) client of the driver uses this function to set the module's USB address after decoding the setup transaction from the Host.

Remarks

None.

Preconditions

None.

Example

```
// This function should be called by the first client of the driver,
// which is typically the Device Layer. The address to set is obtained
// from the Host during enumeration.

DRV_USBHS_DEVICE_AddressSet(deviceLayer, 4);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
address	The address of this module on the USB bus.

Function

void DRV_USBHS_DEVICE_AddressSet(DRV_HANDLE handle, uint8_t address);

DRV_USBHS_DEVICE_Attach Function

This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.

File

drv_usbhs.h

C

```
void DRV_USBHS_DEVICE_Attach(DRV_HANDLE handle);
```

Returns

None.

Description

This function enables the pull-up resistors on the D+ or D- lines thus letting the USB Host know that a device has been attached on the bus . This function should be called when the driver client is ready to receive communication from the Host (typically after all initialization is complete). The USB 2.0 specification requires VBUS to be detected before the data line pull-ups are enabled. The application must ensure the same.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// Open the device driver and attach the device to the USB.
handle = DRV_USBHS_Open(DRV_USBHS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

// Register a callback
DRV_USBHS_ClientEventCallBackSet(handle, (uintptr_t)&myDeviceLayer, MyDeviceLayerEventCallback);

// The device can be attached when VBUS Session Valid event occurs
void MyDeviceLayerEventCallback(uintptr_t handle, DRV_USBHS_EVENT event, void * hReferenceData)
{
    switch(event)
    {
        case DRV_USBHS_EVENT_DEVICE_SESSION_VALID:
            // A valid VBUS was detected.
            DRV_USBHS_DEVICE_Attach(handle);
            break;

        case DRV_USBHS_EVENT_DEVICE_SESSION_INVALID:
            // VBUS is not valid anymore. The device can be disconnected.
            DRV_USBHS_DEVICE_Detach(handle);
            break;

        default:
            break;
        }
    }
}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

void DRV_USBHS_DEVICE_Attach(DRV_HANDLE handle);

DRV_USBHS_DEVICE_CurrentSpeedGet Function

This function will return the USB speed at which the device is operating.

File

drv_usbhs.h

C

```
USB_SPEED DRV_USBHS_DEVICE_CurrentSpeedGet(DRV_HANDLE handle);
```

Returns

Returns a member of the USB_SPEED type.

Description

This function will return the USB speed at which the device is operating.

Remarks

None.

Preconditions

Only valid after the device is attached to the Host and Host has completed reset signaling.

Example

```
// Get the current speed.
```

```
USB_SPEED deviceSpeed;

deviceSpeed = DRV_USBHS_DEVICE_CurrentSpeedGet(deviceLayer);

if(deviceLayer == USB_SPEED_HIGH)
{
    // Possibly adjust buffers for higher throughput.
}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

USB_SPEED DRV_USBHS_DEVICE_CurrentSpeedGet(DRV_HANDLE handle);

DRV_USBHS_DEVICE_Detach Function

This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.

File

drv_usbhs.h

C

```
void DRV_USBHS_DEVICE_Detach(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables the pull-up resistors on the D+ or D- lines. This function should be called when the application wants to disconnect the device from the bus (typically to implement a soft detach or switch to Host mode operation). A self-powered device should be detached from the bus when the VBUS is not valid.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// Open the device driver and attach the device to the USB.
handle = DRV_USBHS_Open(DRV_USBHS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

// Register a callback
DRV_USBHS_ClientEventCallBackSet(handle, (uintptr_t)&myDeviceLayer, MyDeviceLayerEventCallback);

// The device can be detached when VBUS Session Invalid event occurs
void MyDeviceLayerEventCallback(uintptr_t handle, DRV_USBHS_EVENT event, void * hReferenceData)
{
    switch(event)
    {
        case DRV_USBHS_EVENT_DEVICE_SESSION_VALID:
            // A valid VBUS was detected.
            DRV_USBHS_DEVICE_Attach(handle);
            break;

        case DRV_USBHS_EVENT_DEVICE_SESSION_INVALID:
            // VBUS is not valid anymore. The device can be disconnected.
            DRV_USBHS_DEVICE_Detach(handle);
            break;

        default:
```

```
            break;
        }
    }
}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

void DRV_USBHS_DEVICE_Detach(DRV_HANDLE handle);

DRV_USBHS_DEVICE_EndpointDisable Function

This function disables an endpoint.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_EndpointDisable(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - The endpoint that is being accessed is not a valid endpoint (endpoint was not provisioned through the DRV_USBHS_ENDPOINTS_NUMBER configuration constant) defined for this driver instance.

Description

This function disables an endpoint. If the endpoint type is a control endpoint type, both directions are disabled. For non-control endpoints, the function disables the specified direction only. The direction to be disabled is specified by the Most Significant Bit (MSB) of the endpointAndDirection parameter.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to disable
// a control endpoint. Note that the direction parameter is ignored.
// For a control endpoint, both the directions are disabled.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 0);

DRV_USBHS_DEVICE_EndpointDisable(handle, ep );

// This code shows an example of how to disable a BULK IN
// endpoint

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBHS_DEVICE_EndpointDisable(handle, ep );
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

USB_ERROR DRV_USBHS_DEVICE_EndpointDisable
(
DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection
)

DRV_USBHS_DEVICE_EndpointDisableAll Function

This function disables all provisioned endpoints.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_EndpointDisableAll(DRV_HANDLE handle);
```

Returns

- USB_ERROR_NONE - The function exited successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is invalid.

Description

This function disables all provisioned endpoints in both directions.

Remarks

This function is typically called by the USB Device Layer to disable all endpoints upon detecting a bus reset.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to disable all endpoints.

DRV_USBHS_DEVICE_EndpointDisableAll(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

USB_ERROR DRV_USBHS_DEVICE_EndpointDisableAll(DRV_HANDLE handle)

DRV_USBHS_DEVICE_EndpointEnable Function

This function enables an endpoint for the specified direction and endpoint size.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_EndpointEnable(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection,
USB_TRANSFER_TYPE transferType, uint16_t endpointSize);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is not a valid endpoint defined for this driver instance. The value of DRV_USBHS_ENDPOINTS_NUMBER configuration constant should be adjusted.
- USB_ERROR_PARAMETER_INVALID - The driver handle is invalid.

Description

This function enables an endpoint for the specified direction and endpoint size. The function will enable the endpoint for communication in one direction at a time. It must be called twice if the endpoint is required to communicate in both the directions, with the exception of control endpoints. If the endpoint type is a control endpoint, the endpoint is always bidirectional and the function needs to be called only once.

The size of the endpoint must match the wMaxPacketSize reported in the endpoint descriptor for this endpoint. A transfer that is scheduled over this endpoint will be scheduled in wMaxPacketSize transactions. The function does not check if the endpoint is already in use. It is the client's responsibility to make sure that a endpoint is not accidentally reused.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to enable Endpoint
// 0 for control transfers. Note that for a control endpoint, the
// direction parameter is ignored. A control endpoint is always
// bidirectional. Endpoint size is 64 bytes.

uint8_t ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 0);

DRV_USBHS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_CONTROL, 64);

// This code shows an example of how to set up a endpoint
// for BULK IN transfer. For an IN transfer, data moves from device
// to Host. In this example, Endpoint 1 is enabled. The maximum
// packet size is 64.

uint8_t ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBHS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);

// If Endpoint 1 must also be set up for BULK OUT, the
// DRV_USBHS_DEVICE_EndpointEnable function must be called again, as shown
// here.

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_HOST_TO_DEVICE, 1);

DRV_USBHS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.
transferType	Should be USB_TRANSFER_TYPE_CONTROL for control endpoint, USB_TRANSFER_TYPE_BULK for bulk endpoint, USB_TRANSFER_TYPE_INTERRUPT for interrupt endpoint and USB_TRANSFER_TYPE_ISOCHRONOUS for isochronous endpoint.
endpointSize	Maximum size (in bytes) of the endpoint as reported in the endpoint descriptor.

Function

```
USB_ERROR DRV_USBHS_DEVICE_EndpointEnable
(
    DRV_HANDLE handle,
    USB_ENDPOINT endpointAndDirection,
USB_TRANSFER_TYPE transferType,
uint16_t endpointSize
);
```

DRV_USBHS_DEVICE_EndpointIsEnabled Function

This function returns the enable/disable status of the specified endpoint and direction.

File

drv_usbhs.h

C

```
bool DRV_USBHS_DEVICE_EndpointIsEnabled(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection);
```

Returns

- true - The endpoint is enabled.
- false - The endpoint is disabled.

Description

This function returns the enable/disable status of the specified endpoint and direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how the
// DRV_USBHS_DEVICE_EndpointIsEnabled function can be used to obtain the
// status of Endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

if(DRV_USBHS_ENDPOINT_STATE_DISABLED ==
            DRV_USBHS_DEVICE_EndpointIsEnabled(handle, ep))
{
    // Endpoint is disabled. Enable endpoint.

    DRV_USBHS_DEVICE_EndpointEnable(handle, ep, USB_ENDPOINT_TYPE_BULK, 64);

}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

bool DRV_USBHS_DEVICE_EndpointIsEnabled

(

DRV_HANDLE handle,

USB_ENDPOINT endpointAndDirection

)

DRV_USBHS_DEVICE_EndpointIsStalled Function

This function returns the stall status of the specified endpoint and direction.

File

drv_usbhs.h

C

```
bool DRV_USBHS_DEVICE_EndpointIsStalled(DRV_HANDLE client, USB_ENDPOINT endpoint);
```

Returns

- true - The endpoint is stalled.
- false - The endpoint is not stalled.

Description

This function returns the stall status of the specified endpoint and direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how the
// DRV_USBHS_DEVICE_EndpointIsStalled function can be used to obtain the
// stall status of Endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

if(true == DRV_USBHS_DEVICE_EndpointIsStalled (handle, ep))
{
    // Endpoint stall is enabled. Clear the stall.

    DRV_USBHS_DEVICE_EndpointStallClear(handle, ep);

}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

bool DRV_USBHS_DEVICE_EndpointIsStalled

(

DRV_HANDLE handle,

USB_ENDPOINT endpointAndDirection

)

DRV_USBHS_DEVICE_EndpointStall Function

This function stalls an endpoint in the specified direction.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_EndpointStall(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

- USB_ERROR_OSAL_FUNCTION - An error with an OSAL function called in this function.

Description

This function stalls an endpoint in the specified direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to stall an endpoint. In
// this example, Endpoint 1 IN direction is stalled.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBHS_DEVICE_EndpointStall(handle, ep);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

```
USB_ERROR DRV_USBHS_DEVICE_EndpointStall
(
    DRV_HANDLE handle,
    USB_ENDPOINT endpointAndDirection
)
```

DRV_USBHS_DEVICE_EndpointStallClear Function

This function clears the stall on an endpoint in the specified direction.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_EndpointStallClear(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Description

This function clears the stall on an endpoint in the specified direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to clear a stall. In this
// example, the stall condition on Endpoint 1 IN direction is cleared.
```

```
USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBHS_DEVICE_EndpointStallClear(handle, ep);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

```
  USB_ERROR DRV_USBHS_DEVICE_EndpointStallClear
(
    DRV_HANDLE handle,
    USB_ENDPOINT endpointAndDirection
)
```

DRV_USBHS_DEVICE_IRPCancel Function

This function cancels the specific IRP that are queued and in progress at the specified endpoint.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_IRPCancel(DRV_HANDLE client, USB_DEVICE_IRP * irp);
```

Returns

- USB_ERROR_NONE - The IRP have been canceled successfully.
- USB_ERROR_PARAMETER_INVALID - Invalid parameter or the IRP already has been aborted or completed
- USB_ERROR_OSAL_FUNCTION - An OSAL function called in this function did not execute successfully.

Description

This function attempts to cancel the processing of a queued IRP. An IRP that was in the queue but yet to be processed will be cancelled successfully and the IRP callback function will be called from this function with the USB_DEVICE_IRP_STATUS_ABORTED status. The application can release the data buffer memory used by the IRP when this callback occurs. If the IRP was in progress (a transaction in on the bus) when the cancel function was called, the IRP will be canceled only when an ongoing or the next transaction has completed. The IRP callback function will then be called in an interrupt context. The application should not release the related data buffer unless the IRP callback has occurred.

Remarks

The size returned after the ABORT callback will be always 0 regardless of the amount of data that has been sent or received. The client should not assume any data transaction has happened for an canceled IRP. If the last transaction of the IRP was in progress, the IRP cancel does not have any effect. The first transaction of any ongoing IRP cannot be canceled.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to cancel IRP.  In this example the IRP
// has been scheduled from a device to the Host.

USB_ENDPOINT ep;
USB_DEVICE_IRP irp;

ep.direction = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

irp.data = myDataBufferToSend;
irp.size = 130;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
```

```
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

if (DRV_USBHS_DEVICE_IRPSubmit(handle, ep, &irp) != USB_ERROR_NONE)
{
    // This means there was an error.
}
else
{
    // Check the status of the IRP.
    if(irp.status != USB_DEVICE_IRP_STATUS_COMPLETED)
    {
        // Cancel the submitted IRP.
        if (DRV_USBHS_DEVICE_IRPCancel(handle, &irp) != USB_ERROR_NONE)
        {
            // The IRP Cancel request submission was successful.
            // IRP cancel status will be notified through the callback
            // function.
        }
        else
        {
            // The IRP may have been completed before IRP cancel operation.
            // could start. No callback notification will be generated.
        }
    }
    else
    {
        // The IRP processing must have been completed before IRP cancel was
        // submitted.
    }
}

void MyIRPCallback(USB_DEVICE_IRP * irp)
{
    // Check if the IRP callback is for a Cancel request
    if(irp->status == USB_DEVICE_IRP_STATUS_ABORTED)
    {
        // IRP cancel completed
    }
 }
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
irp	Pointer to the IRP to cancel.

Function

USB_ERROR DRV_USBHS_DEVICE_IRPCancel
(
DRV_HANDLE client,
USB_DEVICE_IRP * irp
)

DRV_USBHS_DEVICE_IRPCancelAll Function

This function cancels all IRPs that are queued and in progress at the specified endpoint.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_IRPCancelAll(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.

- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_OSAL_FUNCTION - An OSAL function called in this function did not execute successfully.

Description

This function cancels all IRPs that are queued and in progress at the specified endpoint.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to cancel all IRPs.

void MyIRPCallback(USB_DEVICE_IRP * irp)
{
    // Check if this is setup command

    if(irp->status == USB_DEVICE_IRP_STATUS_SETUP)
    {
        if(IsSetupCommandSupported(irp->data) == false)
        {
            // This means that this setup command is not
            // supported. Stall the some related endpoint and cancel all
            // queue IRPs.

            DRV_USBHS_DEVICE_EndpointStall(handle, ep);
            DRV_USBHS_DEVICE_IRPCancelAll(handle, ep);
        }
     }
 }
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

```
USB_ERROR DRV_USBHS_DEVICE_IRPCancelAll
(
    DRV_HANDLE client,
    USB_ENDPOINT endpointAndDirection
);
```

DRV_USBHS_DEVICE_IRPSubmit Function

This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_IRPSubmit(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection, USB_DEVICE_IRP *
irp);
```

Returns

- USB_ERROR_NONE - if the IRP was submitted successful.
- USB_ERROR_IRP_SIZE_INVALID - if the size parameter of the IRP is not correct.
- USB_ERROR_PARAMETER_INVALID - If the client handle is not valid.

- USB_ERROR_ENDPOINT_NOT_CONFIGURED - If the endpoint is not enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - The specified endpoint is not valid.
- USB_ERROR_OSAL_FUNCTION - An OSAL call in the function did not complete successfully.

Description

This function submits an I/O Request Packet (IRP) for processing to the USB Driver. The IRP allows a client to send and receive data from the USB Host. The data will be sent or received through the specified endpoint. The direction of the data transfer is indicated by the direction flag in the endpointAndDirection parameter. Submitting an IRP arms the endpoint to either send data to or receive data from the Host. If an IRP is already being processed on the endpoint, the subsequent IRP submit operation will be queued. The contents of the IRP (including the application buffers) should not be changed until the IRP has been processed.

Particular attention should be paid to the size parameter of IRP. The following should be noted:

- The size parameter while sending data to the Host can be less than, greater than, equal to, or be an exact multiple of the maximum packet size for the endpoint. The maximum packet size for the endpoint determines the number of transactions required to process the IRP.
- If the size parameter, while sending data to the Host is less than the maximum packet size, the transfer will complete in one transaction.
- If the size parameter, while sending data to the Host is greater than the maximum packet size, the IRP will be processed in multiple transactions.
- If the size parameter, while sending data to the Host is equal to or an exact multiple of the maximum packet size, the client can optionally ask the driver to send a Zero Length Packet(ZLP) by specifying the USB_DEVICE_IRP_FLAG_DATA_COMPLETE flag as the flag parameter.
- The size parameter, while receiving data from the Host must be an exact multiple of the maximum packet size of the endpoint. If this is not the case, the driver will return a USB_ERROR_IRP_SIZE_INVALID result. If while processing the IRP, the driver receives less than maximum packet size or a ZLP from the Host, the driver considers the IRP as processed. The size parameter at this point contains the actual amount of data received from the Host. The IRP status is returned as USB_DEVICE_IRP_STATUS_COMPLETED_SHORT.
- If a ZLP needs to be sent to Host, the IRP size should be specified as 0 and the flag parameter should be set as USB_DEVICE_IRP_FLAG_DATA_COMPLETE.
- If the IRP size is an exact multiple of the endpoint size, the client can request the driver to not send a ZLP by setting the flag parameter to USB_DEVICE_IRP_FLAG_DATA_PENDING. This flag indicates that there is more data pending in this transfer.
- Specifying a size less than the endpoint size along with the USB_DEVICE_IRP_FLAG_DATA_PENDING flag will cause the driver to return a USB_ERROR_IRP_SIZE_INVALID.
- If the size is greater than but not a multiple of the endpoint size, and the flag is specified as USB_DEVICE_IRP_FLAG_DATA_PENDING, the driver will send multiple of endpoint size number of bytes. For example, if the IRP size is 130 and the endpoint size if 64, the number of bytes sent will 128.

Remarks

This function can be called from the ISR of the USB module to associated with the client.

Preconditions

The Client handle should be valid.

Example

```
// The following code shows an example of how to schedule a IRP to send data
// from a device to the Host. Assume that the max packet size is 64 and
// and this data needs to sent over Endpoint 1. In this example, the
// transfer is processed as three transactions of 64, 64 and 2 bytes.

USB_ENDPOINT ep;
USB_DEVICE_IRP irp;

ep.direction = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

irp.data = myDataBufferToSend;
irp.size = 130;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

if (DRV_USBHS_DEVICE_IRPSubmit(handle, ep, &irp) != USB_ERROR_NONE)
{
    // This means there was an error.
}
else
{
    // The status of the IRP can be checked.
    while(irp.status != USB_DEVICE_IRP_STATUS_COMPLETED)
    {
        // Wait or run a task function.
    }
```

```
}

// The following code shows how the client can request
// the driver to send a ZLP when the size is an exact multiple of
// endpoint size.

irp.data = myDataBufferToSend;
irp.size = 128;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

// Note that while  receiving data from the Host, the size should be an
// exact multiple of the maximum packet size of the endpoint. In the
// following example, the DRV_USBHS_DEVICE_IRPSubmit function will return a
// USB_DEVICE_IRP_SIZE_INVALID value.

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_HOST_TO_DEVICE, 1);

irp.data = myDataBufferToSend;
irp.size = 60; // THIS SIZE IS NOT CORRECT
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.
irp	Pointer to the IRP to be added to the queue for processing.

Function

```
USB_ERROR DRV_USBHS_DEVICE_IRPSubmit
(
    DRV_HANDLE client,
    USB_ENDPOINT endpointAndDirection,
    USB_DEVICE_IRP * irp
);
```

DRV_USBHS_DEVICE_RemoteWakeupStart Function

This function causes the device to start Remote Wakeup Signalling on the bus.

File

drv_usbhs.h

C

```
void DRV_USBHS_DEVICE_RemoteWakeupStart(DRV_HANDLE handle);
```

Returns

None.

Description

This function causes the device to start Remote Wakeup Signalling on the bus. This function should be called when the device, presently placed in suspend mode by the Host, wants to be wakeup. Note that the device can do this only when the Host has enabled the device's Remote Wakeup capability.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
DRV_HANDLE handle;

// If the Host has enabled the Remote Wakeup capability, and if the device
// is in suspend mode, then start Remote Wakeup signaling.

if(deviceIsSuspended && deviceRemoteWakeupEnabled)
{
    DRV_USBHS_DEVICE_RemoteWakeupStart(handle);
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

void DRV_USBHS_DEVICE_RemoteWakeupStart(DRV_HANDLE handle);

DRV_USBHS_DEVICE_RemoteWakeupStop Function

This function causes the device to stop the Remote Wakeup Signalling on the bus.

File

drv_usbhs.h

C

```
void DRV_USBHS_DEVICE_RemoteWakeupStop(DRV_HANDLE handle);
```

Returns

None.

Description

This function causes the device to stop Remote Wakeup Signalling on the bus. This function should be called after the DRV_USBHS_DEVICE_RemoteWakeupStart function was called to start the Remote Wakeup signaling on the bus.

Remarks

This function should be 1 to 15 milliseconds after the DRV_USBHS_DEVICE_RemoteWakeupStart function was called.

Preconditions

The handle should be valid. The DRV_USBHS_DEVICE_RemoteWakeupStart function was called to start the Remote Wakeup signaling on the bus.

Example

```
DRV_HANDLE handle;

// If the Host has enabled the Remote Wakeup capability, and if the device
// is in suspend mode, then start Remote Wakeup signaling. Wait for 10
// milliseconds and then stop the Remote Wakeup signaling

if(deviceIsSuspended && deviceRemoteWakeupEnabled)
{
    DRV_USBHS_DEVICE_RemoteWakeupStart(handle);
    DelayMilliSeconds(10);
    DRV_USBHS_DEVICE_RemoteWakeupStop(handle);
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

void DRV_USBHS_DEVICE_RemoteWakeupStop(DRV_HANDLE handle);

DRV_USBHS_DEVICE_SOFNumberGet Function

This function will return the USB SOF packet number.

File

drv_usbhs.h

C

```
uint16_t DRV_USBHS_DEVICE_SOFNumberGet(DRV_HANDLE handle);
```

Returns

The SOF packet number.

Description

This function will return the USB SOF packet number..

Remarks

None.

Preconditions

This function will return a valid value only when the device is attached to the bus. The SOF packet count will not increment if the bus is suspended.

Example

```
// This code shows how the DRV_USBHS_DEVICE_SOFNumberGet function is called
// to read the current SOF number.

DRV_HANDLE handle;
uint16_t sofNumber;

sofNumber = DRV_USBHS_DEVICE_SOFNumberGet(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

uint16_t DRV_USBHS_DEVICE_SOFNumberGet(DRV_HANDLE handle);

DRV_USBHS_DEVICE_TestModeEnter Function

This function enables the specified USB 2.0 Test Mode.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_TestModeEnter(DRV_HANDLE handle, USB_TEST_MODE_SELECTORS testMode);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The handle or the value of testMode parameter is not valid.

Description

This function causes the device to enter the specified USB 2.0 defined test mode. It is called in response to Set Feature command from the host. The wValue field of this command specifies the Test Mode to enter. The USB module will perform the action identified by the testMode parameter.

Remarks

This function should be called only when the USB device has attached to the Host at High speed and only in response to the Set Feature

command from the Host.

Preconditions

The handle should be valid.

Example

```
DRV_HANDLE handle;

// This code shows how the DRV_USBHS_DEVICE_TestModeEnter function is
// called to make the USB device enter the Test_J test mode.

DRV_USBHS_DEVICE_TestModeEnter(handle, USB_TEST_MODE_SELECTOR_TEST_J);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
testMode	This parameter identifies the USB 2.0 specification test mode (see table 9-7 of the USB 2.0 specification).

Function

```
USB_ERROR DRV_USBHS_DEVICE_TestModeEnter
(
    DRV_HANDLE handle,
USB_TEST_MODE_SELECTORS testMode
);
```

DRV_USBHS_DEVICE_TestModeExit Function

This function disables the specified USB 2.0 Test Mode.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_TestModeExit(DRV_HANDLE handle, USB_TEST_MODE_SELECTORS testMode);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The handle or the value of testMode parameter is not valid.

Description

This function causes the device to stop the specified USB 2.0 defined test mode. This function can be called after calling the DRV_USBHS_DEVICE_TestModeEnter function to stop the test mode execution.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
DRV_HANDLE handle;

// This code shows how the DRV_USBHS_DEVICE_TestModeEnter function is
// called to make the USB device enter the Test_J test mode.

DRV_USBHS_DEVICE_TestModeEnter(handle, USB_TEST_MODE_SELECTOR_TEST_J);

// Now the DRV_USBHS_DEVICE_TestModeExit function is called to stop the
// Test_J test mode.

DRV_USBHS_DEVICE_TestModeExit(handle, USB_TEST_MODE_SELECTOR_TEST_J);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
testMode	This parameter identifies the USB 2.0 specification test mode (see table 9-7 of the USB 2.0 specification).

Function

```
  USB_ERROR DRV_USBHS_DEVICE_TestModeExit
(
    DRV_HANDLE handle,
USB_TEST_MODE_SELECTORS testMode
);
```

d) Host Mode Operation Functions

DRV_USBHS_HOST_EventsDisable Function

Disables Host mode events.

File

drv_usbhs.h

C

```
bool DRV_USBHS_HOST_EventsDisable(DRV_HANDLE handle);
```

Returns

- true - Driver event generation was enabled when this function was called.
- false - Driver event generation was not enabled when this function was called.

Description

This function disables the Host mode events. This function is called by the Host Layer when it wants to execute code atomically.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
// This code shows how the DRV_USBHS_HOST_EventsDisable and
// DRV_USBHS_HOST_EventsEnable function can be called to disable and enable
// events.

DRV_HANDLE driverHandle;
bool eventsWereEnabled;

// Disable the driver events.
eventsWereEnabled = DRV_USBHS_HOST_EventsDisable(driverHandle);

// Code in this region will not be interrupted by driver events.

// Enable the driver events.
DRV_USBHS_HOST_EventsEnable(driverHandle, eventsWereEnabled);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

bool DRV_USBHS_HOST_EventsDisable
(
DRV_HANDLE handle
);

DRV_USBHS_HOST_EventsEnable Function

Restores the events to the specified the original value.

File

drv_usbhs.h

C

```
void DRV_USBHS_HOST_EventsEnable(DRV_HANDLE handle, bool eventContext);
```

Returns

None.

Description

This function will restore the enable disable state of the events. The eventRestoreContext parameter should be equal to the value returned by the DRV_USBHS_HOST_EventsDisable function.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
// This code shows how the DRV_USBHS_HOST_EventsDisable and
// DRV_USBHS_HOST_EventsEnable function can be called to disable and enable
// events.

DRV_HANDLE driverHandle;
bool eventsWereEnabled;

// Disable the driver events.
eventsWereEnabled = DRV_USBHS_HOST_EventsDisable(driverHandle);

// Code in this region will not be interrupted by driver events.

// Enable the driver events.
DRV_USBHS_HOST_EventsEnable(driverHandle, eventsWereEnabled);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
eventRestoreContext	Value returned by the DRV_USBHS_HOST_EventsDisable function.

Function

void DRV_USBHS_HOST_EventsEnable
(
DRV_HANDLE handle
bool eventRestoreContext
);

DRV_USBHS_HOST_IRPCancel Function

Cancels the specified IRP.

File

drv_usbhs.h

C

```
void DRV_USBHS_HOST_IRPCancel(USB_HOST_IRP * inputIRP);
```

Returns

None.

Description

This function attempts to cancel the specified IRP. If the IRP is queued and its processing has not started, it will be cancelled successfully. If the IRP in progress, the ongoing transaction will be allowed to complete.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how a submitted IRP can be cancelled.

USB_HOST_IRP irp;
USB_ERROR result;
USB_HOST_PIPE_HANDLE controlPipe;
USB_SETUP_PACKET setup;
uint8_t controlTransferData[32];

irp.setup = setup;
irp.data = controlTransferData;
irp.size = 32;
irp.flags = USB_HOST_IRP_FLAG_NONE ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

DRV_USBHS_HOST_IRPSubmit(controlPipeHandle, &irp);

// Additional application logic may come here. This logic may decide to
// cancel the submitted IRP.

DRV_USBHS_HOST_IRPCancel(&irp);
```

Parameters

Parameters	Description
inputIRP	Pointer to the IRP to cancel.

Function

void DRV_USBHS_HOST_IRPCancel(USB_HOST_IRP * inputIRP);

DRV_USBHS_HOST_IRPSubmit Function

Submits an IRP on a pipe.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_HOST_IRPSubmit(DRV_USBHS_HOST_PIPE_HANDLE hPipe, USB_HOST_IRP * pinputIRP);
```

Returns

- USB_ERROR_NONE - The IRP was submitted successfully.
- USB_ERROR_PARAMETER_INVALID - The pipe handle is not valid.
- USB_ERROR_OSAL_FUNCTION - An error occurred in an OSAL function called in this function.

Description

This function submits an IRP on the specified pipe. The IRP will be added to the queue and will be processed in turn. The data will be transferred on the bus based on the USB bus scheduling rules. When the IRP has been processed, the callback function specified in the IRP will be called. The IRP status will be updated to reflect the completion status of the IRP.

Remarks

An IRP can also be submitted in an IRP callback function.

Preconditions

The pipe handle should be valid.

Example

```
// The following code shows an example of how the host layer populates
// the IRP object and then submits it. IRP_Callback function is called when an
// IRP has completed processing. The status of the IRP at completion can be
// checked in the status flag. The size field of the irp will contain the amount
// of data transferred.

void IRP_Callback(USB_HOST_IRP * irp)
{
    // irp is pointing to the IRP for which the callback has occurred. In most
    // cases this function will execute in an interrupt context. The application
    // should not perform any hardware access or interrupt un-safe operations in
    // this function.

    switch(irp->status)
    {
        case USB_HOST_IRP_STATUS_ERROR_UNKNOWN:
            // IRP was terminated due to an unknown error
            break;

        case USB_HOST_IRP_STATUS_ABORTED:
            // IRP was terminated by the application
            break;

        case USB_HOST_IRP_STATUS_ERROR_BUS:
            // IRP was terminated due to a bus error
            break;

        case USB_HOST_IRP_STATUS_ERROR_DATA:
            // IRP was terminated due to data error
            break;

        case USB_HOST_IRP_STATUS_ERROR_NAK_TIMEOUT:
            // IRP was terminated because of a NAK timeout
            break;

        case USB_HOST_IRP_STATUS_ERROR_STALL:
            // IRP was terminated because of a device sent a STALL
            break;

        case USB_HOST_IRP_STATUS_COMPLETED:
            // IRP has been completed
            break;

        case USB_HOST_IRP_STATUS_COMPLETED_SHORT:
            // IRP has been completed but the amount of data processed was less
            // than requested.
            break;

        default:
```

```
            break;
        }
    }

    // In the following code snippet the a control transfer IRP is submitted to a
    // control pipe. The setup parameter of the IRP points to the Setup command of
    // the control transfer. The direction of the data stage is specified by the
    // Setup packet.

    USB_HOST_IRP irp;
    USB_ERROR result;
    USB_HOST_PIPE_HANDLE controlPipe;
    USB_SETUP_PACKET setup;
    uint8_t controlTransferData[32];

    irp.setup = setup;
    irp.data = controlTransferData;
    irp.size = 32;
    irp.flags = USB_HOST_IRP_FLAG_NONE ;
    irp.userData = &someApplicationObject;
    irp.callback = IRP_Callback;

    result = DRV_USBHS_HOST_IRPSubmit(controlPipeHandle, &irp);
```

Parameters

Parameters	Description
hPipe	Handle to the pipe to which the IRP has to be submitted.
pInputIRP	Pointer to the IRP.

Function

```
  USB_ERROR DRV_USBHS_HOST_IRPSubmit
(
    DRV_USBHS_HOST_PIPE_HANDLE  hPipe,
    USB_HOST_IRP * pInputIRP
);
```

DRV_USBHS_HOST_PipeClose Function

Closes an open pipe.

File

drv_usbhs.h

C

```
void DRV_USBHS_HOST_PipeClose(DRV_USBHS_HOST_PIPE_HANDLE pipeHandle);
```

Returns

None.

Description

This function closes an open pipe. Any IRPs scheduled on the pipe will be aborted and IRP callback functions will be called with the status as DRV_USB_HOST_IRP_STATE_ABORTED. The pipe handle will become invalid and the pipe and will not accept IRPs.

Remarks

None.

Preconditions

The pipe handle should be valid.

Example

```
// This code shows how an open Host pipe can be closed.

DRV_HANDLE driverHandle;
```

```
DRV_USBHS_HOST_PIPE_HANDLE pipeHandle;

// Close the pipe.
DRV_USBHS_HOST_PipeClose(pipeHandle);
```

Parameters

Parameters	Description
pipeHandle	Handle to the pipe to close.

Function

void DRV_USBHS_HOST_PipeClose

(

DRV_USBHS_HOST_PIPE_HANDLE pipeHandle

);

DRV_USBHS_HOST_PipeSetup Function

Open a pipe with the specified attributes.

File

drv_usbhs.h

C

```
DRV_USBHS_HOST_PIPE_HANDLE DRV_USBHS_HOST_PipeSetup(DRV_HANDLE client, uint8_t deviceAddress, USB_ENDPOINT
endpointAndDirection, uint8_t hubAddress, uint8_t hubPort, USB_TRANSFER_TYPE pipeType, uint8_t bInterval,
uint16_t wMaxPacketSize, USB_SPEED speed);
```

Returns

- DRV_USB_HOST_PIPE_HANDLE_INVALID - The pipe could not be created.
- A valid Pipe Handle - The pipe was created successfully. This is an arbitrary value and will never be the same as DRV_USB_HOST_PIPE_HANDLE_INVALID.

Description

This function opens a communication pipe between the Host and the device endpoint. The transfer type and other attributes are specified through the function parameters. The driver does not check for available bus bandwidth, which should be done by the application (the USB Host Layer in this case)

Remarks

None.

Preconditions

The driver handle should be valid.

Example

```
// This code shows how the DRV_USBHS_HOST_PipeSetup function is called for
// create a communication pipe. In this example, Bulk pipe is created
// between the Host and a device. The Device address is 2 and the target
// endpoint on this device is 4 . The direction of the data transfer over
// this pipe is from the Host to the device. The device is connected to Port
// 1 of a Hub, whose USB address is 3. The maximum size of a transaction
// on this pipe is 64 bytes. This is a Bulk Pipe and hence the bInterval
// field is set to 0. The target device is operating at Full Speed.

DRV_HANDLE driverHandle;
DRV_USBHS_HOST_PIPE_HANDLE pipeHandle;

pipeHandle = DRV_USBHS_HOST_PipeSetup(driverHandle, 0x02, 0x14, 0x03, 0x01, USB_TRANSFER_TYPE_BULK, 0, 64,
USB_SPEED_FULL);

if(pipeHandle != DRV_USBHS_HOST_PIPE_HANDLE_INVALID)
{
    // The pipe was created successfully.
}
```

Parameters

Parameters	Description
client	Handle to the driver (returned from DRV_USBHS_Open function).
deviceAddress	USB Address of the device to connect to.
endpoint	Endpoint on the device to connect to.
hubAddress	Address of the hub to which this device is connected. If not connected to a hub, this value should be set to 0.
hubPort	Port number of the hub to which this device is connected.
pipeType	Transfer type of the pipe to open.
bInterval	Polling interval for periodic transfers. This should be specified as defined by the USB 2.0 Specification.
wMaxPacketSize	This should be set to the endpoint size reported by the device in its configuration descriptors. This defines the maximum size of the transaction in a transfer on this pipe.
speed	The speed of the pipe. This should match the speed at which the device connected to the Host.

Function

```
    DRV_USBHS_HOST_PIPE_HANDLE DRV_USBHS_HOST_PipeSetup
(
        DRV_HANDLE client,
    uint8_t deviceAddress,
        USB_ENDPOINT endpointAndDirection,
    uint8_t hubAddress,
    uint8_t hubPort,
    USB_TRANSFER_TYPE pipeType,
    uint8_t bInterval,
    uint16_t wMaxPacketSize,
        USB_SPEED speed
);
```

e) Root Hub Functions

DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet Function

This function returns the operating speed of the bus to which this root hub is connected.

File

drv_usbhs.h

C

```
USB_SPEED DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet(DRV_HANDLE handle);
```

Returns

- USB_SPEED_HIGH - The Root hub is connected to a bus that is operating at High Speed.
- USB_SPEED_FULL - The Root hub is connected to a bus that is operating at Full Speed.

Description

This function returns the operating speed of the bus to which this root hub is connected.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet function is
// called to know the operating speed of the bus to which this Root hub is
// connected.

DRV_HANDLE driverHandle;
USB_SPEED speed;

speed = DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

USB_SPEED DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet(DRV_HANDLE handle);

DRV_USBHS_HOST_ROOT_HUB_Initialize Function

This function initializes the root hub driver.

File

drv_usbhs.h

C

```
void DRV_USBHS_HOST_ROOT_HUB_Initialize(DRV_HANDLE handle, USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo);
```

Returns

None.

Description

This function initializes the root hub driver. It is called by the Host Layer at the time of processing the root hub devices. The Host Layer assigns a USB_HOST_DEVICE_INFO reference to this root hub driver. This identifies the relationship between the root hub and the Host Layer.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the USB Host Layer calls the
// DRV_USBHS_HOST_ROOT_HUB_Initialize function. The usbHostDeviceInfo
// parameter is an arbitrary identifier assigned by the USB Host Layer. Its
// interpretation is opaque to the Root hub Driver.

DRV_HANDLE drvHandle;
USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo = 0x10003000;

DRV_USBHS_HOST_ROOT_HUB_Initialize(drvHandle, usbHostDeviceInfo);
```

Parameters

Parameters	Description
handle	Handle to the driver.
usbHostDeviceInfo	Reference provided by the Host.

Function

void DRV_USBHS_HOST_ROOT_HUB_Initialize

(

DRV_HANDLE handle,

USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo,
)

DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet Function

Returns the maximum amount of current that this root hub can provide on the bus.

File

drv_usbhs.h

C

```
uint32_t DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet(DRV_HANDLE handle);
```

Returns

Returns the maximum current (in milliamperes) that the root hub can supply.

Description

This function returns the maximum amount of current that this root hub can provide on the bus.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet
// function is called to obtain the maximum VBUS current that the Root hub
// can supply.

DRV_HANDLE driverHandle;
uint32_t currentMilliAmperes;

currentMilliAmperes = DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

uint32_t DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet(DRV_HANDLE);

DRV_USBHS_HOST_ROOT_HUB_OperationEnable Function

This function enables or disables root hub operation.

File

drv_usbhs.h

C

```
void DRV_USBHS_HOST_ROOT_HUB_OperationEnable(DRV_HANDLE handle, bool enable);
```

Returns

None.

Description

This function enables or disables root hub operation. When enabled, the root hub will detect devices attached to the port and will request the Host Layer to enumerate the device. This function is called by the Host Layer when it is ready to receive enumeration requests from the Host. If the operation is disabled, the root hub will not detect attached devices.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_OperationEnable and the
// DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled functions are called to enable
// the Root hub operation.

DRV_HANDLE driverHandle;

// Enable Root hub operation.
DRV_USBHS_HOST_ROOT_HUB_OperationEnable(driverHandle);

// Wait till the Root hub operation is enabled.
if(DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled(driverHandle) == false)
{
    // The operation has not completed. Call the
    // DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled function again to check if
    // the operation has completed. Note that the DRV_USBHS_Tasks function
    // must be allowed to run at periodic intervals to allow the enable
    // operation to completed.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
enable	If this is set to true, root hub operation is enabled. If this is set to false, root hub operation is disabled.

Function

void DRV_USBHS_HOST_ROOT_HUB_OperationEnable

(

DRV_HANDLE handle,

bool enable

);

DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled Function

Returns the operation enabled status of the root hub.

File

drv_usbhs.h

C

```
bool DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled(DRV_HANDLE handle);
```

Returns

- true - Root hub operation is enabled.
- false - Root hub operation is not enabled.

Description

This function returns true if the DRV_USBHS_HOST_ROOT_HUB_OperationEnable function has completed enabling the Host.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_OperationEnable and the
// DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled functions are called to enable
```

```
// the Root hub operation.

DRV_HANDLE driverHandle;

// Enable Root hub operation.
DRV_USBHS_HOST_ROOT_HUB_OperationEnable(driverHandle);

// Wait till the Root hub operation is enabled.
if(DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled(driverHandle) == false)
{
    // The operation has not completed. Call the
    // DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled function again to check if
    // the operation has completed. Note that the DRV_USBHS_Tasks function
    // must be allowed to run at periodic intervals to allow the enable
    // operation to completed.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

bool DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled(DRV_HANDLE handle);

DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet Function

Returns the number of ports this root hub contains.

File

drv_usbhs.h

C

```
uint8_t DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet(DRV_HANDLE handle);
```

Returns

This function will always return 1.

Description

This function returns the number of ports that this root hub contains.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet function can
// be called to obtain the number of Root hub ports.

DRV_HANDLE driverHandle;
uint8_t nPorts;

nPorts = DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

uint8_t DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet(DRV_HANDLE handle);

DRV_USBHS_HOST_ROOT_HUB_PortReset Function

Resets the specified root hub port.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_HOST_ROOT_HUB_PortReset(DRV_HANDLE handle, uint8_t port);
```

Returns

None.

Description

This function resets the root hub port. The reset duration is defined by DRV_USBHS_ROOT_HUB_RESET_DURATION. The status of the reset signaling can be checked using the DRV_USBHS_ROOT_HUB_PortResetIsComplete function.

Remarks

The root hub on the PIC32MZ USB controller contains only one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USB_HOST_ROOT_HUB_PortReset and the
// DRV_USBHS_ROOT_HUB_PortResetIsComplete functions are called to complete a
// port reset sequence.

DRV_HANDLE driverHandle;

// Reset Port 0.
DRV_USB_HOST_ROOT_HUB_PortReset(driverHandle, 0);

// Check if the Reset operation has completed.
if(DRV_USBHS_ROOT_HUB_PortResetIsComplete(driverHandle, 0) == false)
{
    // This means that the Port Reset operation has not completed yet. The
    // DRV_USBHS_ROOT_HUB_PortResetIsComplete function should be called
    // again after some time to check the status.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
port	Port to reset.

Function

void DRV_USBHS_ROOT_HUB_PortReset(DRV_HANDLE handle, uint8_t port);

DRV_USBHS_HOST_ROOT_HUB_PortResetIsComplete Function

Returns true if the root hub has completed the port reset operation.

File

drv_usbhs.h

C

```
bool DRV_USBHS_HOST_ROOT_HUB_PortResetIsComplete(DRV_HANDLE handle, uint8_t port);
```

Returns

- true - The reset signaling has completed.

- false - The reset signaling has not completed.

Description

This function returns true if the port reset operation has completed. It should be called after the DRV_USB_HOST_ROOT_HUB_PortReset function to check if the reset operation has completed.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USB_HOST_ROOT_HUB_PortReset and the
// DRV_USBHS_ROOT_HUB_PortResetIsComplete functions are called to complete a
// port reset sequence.

DRV_HANDLE driverHandle;

// Reset Port 0.
DRV_USB_HOST_ROOT_HUB_PortReset(driverHandle, 0);

// Check if the Reset operation has completed.
if(DRV_USBHS_ROOT_HUB_PortResetIsComplete(driverHandle, 0) == false)
{
    // This means that the Port Reset operation has not completed yet. The
    // DRV_USBHS_ROOT_HUB_PortResetIsComplete function should be called
    // again after some time to check the status.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
port	Port to check

Function

bool DRV_USBHS_ROOT_HUB_PortResetIsComplete

(

DRV_HANDLE handle,

uint8_t port

);

DRV_USBHS_HOST_ROOT_HUB_PortResume Function

Resumes the specified root hub port.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_HOST_ROOT_HUB_PortResume(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid or the port number does not exist.

Description

This function resumes the root hub. The resume duration is defined by DRV_USBHS_ROOT_HUB_RESUME_DURATION. The status of the resume signaling can be checked using the DRV_USBHS_ROOT_HUB_PortResumeIsComplete function.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_PortResume function is
// called to resume the specified port.

DRV_HANDLE driverHandle;

// Resume Port 0.
DRV_USBHS_HOST_ROOT_HUB_PortResume(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
port	Port to resume.

Function

```
USB_ERROR DRV_USBHS_HOST_ROOT_HUB_PortResume
(
    DRV_HANDLE handle,
uint8_t port
);
```

DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet Function

Returns the speed of at which the port is operating.

File

drv_usbhs.h

C

```
USB_SPEED DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_SPEED_ERROR - This value is returned if the driver handle is not or if the speed information is not available or if the specified port is not valid.
- USB_SPEED_HIGH - A High Speed device has been connected to the port.
- USB_SPEED_FULL - A Full Speed device has been connected to the port.
- USB_SPEED_LOW - A Low Speed device has been connected to the port.

Description

This function returns the speed at which the port is operating.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet function is
// called to know the operating speed of the port. This also indicates the
// operating speed of the device connected to this port.

DRV_HANDLE driverHandle;
USB_SPEED speed;

speed = DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
port	Port number of the port to be analyzed..

Function

USB_SPEED DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet
(
DRV_HANDLE handle,
uint8_t port
);

DRV_USBHS_HOST_ROOT_HUB_PortSuspend Function

Suspends the specified root hub port.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_HOST_ROOT_HUB_PortSuspend(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid or the port number does not exist.

Description

This function suspends the root hub port.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_PortSuspend function is
// called to suspend the specified port.

DRV_HANDLE driverHandle;

// Suspend Port 0.
DRV_USBHS_HOST_ROOT_HUB_PortSuspend(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
port	Port to suspend.

Function

USB_ERROR DRV_USBHS_ROOT_HUB_PortSuspend(DRV_HANDLE handle, uint8_t port);

f) Data Types and Constants

DRV_USBHS_EVENT Enumeration

Identifies the different events that the Hi-Speed USB Driver provides.

File

drv_usbhs.h

C

```
typedef enum {
  DRV_USBHS_EVENT_ERROR = DRV_USB_EVENT_ERROR,
  DRV_USBHS_EVENT_RESET_DETECT = DRV_USB_EVENT_RESET_DETECT,
  DRV_USBHS_EVENT_RESUME_DETECT = DRV_USB_EVENT_RESUME_DETECT,
  DRV_USBHS_EVENT_IDLE_DETECT = DRV_USB_EVENT_IDLE_DETECT,
  DRV_USBHS_EVENT_STALL = DRV_USB_EVENT_STALL,
  DRV_USBHS_EVENT_SOF_DETECT = DRV_USB_EVENT_SOF_DETECT,
  DRV_USBHS_EVENT_DEVICE_SESSION_VALID = DRV_USB_EVENT_DEVICE_SESSION_VALID,
  DRV_USBHS_EVENT_DEVICE_SESSION_INVALID = DRV_USB_EVENT_DEVICE_SESSION_INVALID
} DRV_USBHS_EVENT;
```

Members

Members	Description
DRV_USBHS_EVENT_ERROR = DRV_USB_EVENT_ERROR	Bus error occurred and was reported
DRV_USBHS_EVENT_RESET_DETECT = DRV_USB_EVENT_RESET_DETECT	Host has issued a device reset
DRV_USBHS_EVENT_RESUME_DETECT = DRV_USB_EVENT_RESUME_DETECT	Resume detected while USB in suspend mode
DRV_USBHS_EVENT_IDLE_DETECT = DRV_USB_EVENT_IDLE_DETECT	Idle detected
DRV_USBHS_EVENT_STALL = DRV_USB_EVENT_STALL	Stall handshake has occurred
DRV_USBHS_EVENT_SOF_DETECT = DRV_USB_EVENT_SOF_DETECT	Device received SOF operation
DRV_USBHS_EVENT_DEVICE_SESSION_VALID = DRV_USB_EVENT_DEVICE_SESSION_VALID	VBUS voltage had Session valid
DRV_USBHS_EVENT_DEVICE_SESSION_INVALID = DRV_USB_EVENT_DEVICE_SESSION_INVALID	Session Invalid

Description

Hi-Speed USB Driver Events Enumeration.

This enumeration identifies the different events that are generated by the Hi-Speed USB Driver.

Remarks

None.

DRV_USBHS_EVENT_CALLBACK Type

Type of the Hi-Speed USB Driver event callback function.

File

drv_usbhs.h

C

```
typedef void (* DRV_USBHS_EVENT_CALLBACK)(uintptr_t hClient, DRV_USBHS_EVENT eventType, void * eventData);
```

Returns

None.

Description

Type of the Hi-Speed USB Driver Event Callback Function.

Define the type of the Hi-Speed USB Driver event callback function. The client should register an event callback function of this type when it intends to receive events from the Hi-Speed USB Driver. The event callback function is registered using the DRV_USBHS_ClientEventCallBackSet function.

Remarks

None.

Parameters

Parameters	Description
hClient	Handle to the driver client that registered this callback function.
eventType	This parameter identifies the event that caused the callback function to be called.
eventData	Pointer to a data structure that is related to this event. This value will be NULL if the event has no related data.

DRV_USBHS_HOST_PIPE_HANDLE Type

Defines the Hi-Speed USB Driver Host Pipe Handle type.

File

drv_usbhs.h

C

```
typedef uintptr_t DRV_USBHS_HOST_PIPE_HANDLE;
```

Description

Hi-Speed USB Driver Host Pipe Handle.

This type definition defines the type of the Hi-Speed USB Driver Host Pipe Handle.

Remarks

None.

DRV_USBHS_INIT Structure

This type definition defines the Driver Initialization Data Structure.

File

drv_usbhs.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  USBHS_MODULE_ID usbID;
  bool stopInIdle;
  bool suspendInSleep;
  INT_SOURCE interruptSource;
  INT_SOURCE interruptSourceUSBDma;
  USB_SPEED operationSpeed;
  DRV_USBHS_OPMODES operationMode;
  void * endpointTable;
  uint32_t rootHubAvailableCurrent;
  DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;
  DRV_USBHS_ROOT_HUB_PORT_INDICATION portIndication;
  DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;
} DRV_USBHS_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System Module Initialization
USBHS_MODULE_ID usbID;	Identifies the USB peripheral to be used. This should be the USB PLIB module instance identifier.
bool stopInIdle;	This should be set to true if the USB module must stop operation in Idle mode
bool suspendInSleep;	This should be set to true if the USB module must suspend when the CPU enters Sleep mode.
INT_SOURCE interruptSource;	Specify the interrupt source for the USB module. This should be the interrupt source for the USB module instance specified in usbID.

INT_SOURCE interruptSourceUSBDma;	Specify the interrupt source for the USB module specific DMA controller. This should be the USB DMA interrupt source for the USB Module instance specified in usbID.
USB_SPEED operationSpeed;	Specify the operational speed of the USB module. This should always be set to USB_SPEED_FULL.
DRV_USBHS_OPMODES operationMode;	Specify the operation mode of the USB module. This specifies if the USB module should operate as a Device, Host, or both (Dual Role operation).
void * endpointTable;	A pointer to the endpoint descriptor table. This should be aligned at 512 byte address boundary. The size of the table is equal to the DRV_USBHS_ENDPOINT_TABLE_ENTRY_SIZE times the number of endpoints needed in the application.
uint32_t rootHubAvailableCurrent;	Root hub available current in milliamperes. This specifies the amount of current that root hub can provide to the attached device. This should be specified in mA. This is required when the driver is required to operate in Host mode.
DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;	When operating in Host mode, the application can specify a Root hub port enable function. This parameter should point to Root hub port enable function. If this parameter is NULL, it implies that the port is always enabled.
DRV_USBHS_ROOT_HUB_PORT_INDICATION portIndication;	When operating in Host mode, the application can specify a Root Port Indication. This parameter should point to the Root Port Indication function. If this parameter is NULL, it implies that Root Port Indication is not supported.
DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;	When operating is Host mode, the application can specify a Root Port Overcurrent detection. This parameter should point to the Root Port Indication function. If this parameter is NULL, it implies that Overcurrent detection is not supported.

Description

USB Device Driver Initialization Data.

This structure contains all the data necessary to initialize the Hi-Speed USB Driver. A pointer to a structure of this type, containing the desired initialization data, must be passed into the DRV_USBHS_Initialize function.

Remarks

None.

DRV_USBHS_OPMODES Enumeration

Identifies the operating modes supported by the Hi-Speed USB Driver.

File

drv_usbhs.h

C

```
typedef enum {
  DRV_USBHS_OPMODE_DUAL_ROLE = DRV_USB_OPMODE_DUAL_ROLE,
  DRV_USBHS_OPMODE_DEVICE = DRV_USB_OPMODE_DEVICE,
  DRV_USBHS_OPMODE_HOST = DRV_USB_OPMODE_HOST,
  DRV_USBHS_OPMODE_OTG = DRV_USB_OPMODE_OTG
} DRV_USBHS_OPMODES;
```

Members

Members	Description
DRV_USBHS_OPMODE_DUAL_ROLE = DRV_USB_OPMODE_DUAL_ROLE	The driver should be able to switch between Host and Device mode
DRV_USBHS_OPMODE_DEVICE = DRV_USB_OPMODE_DEVICE	The driver should support Device mode operation only
DRV_USBHS_OPMODE_HOST = DRV_USB_OPMODE_HOST	The driver should support Host mode operation only
DRV_USBHS_OPMODE_OTG = DRV_USB_OPMODE_OTG	The driver should support the OTG protocol

Description

USB Operating Modes Enumeration.

This enumeration identifies the operating modes supported by the Hi-Speed USB Driver.

Remarks

None.

DRV_USBHS_ROOT_HUB_PORT_INDICATION Type

USB Root hub Application Hooks (Port Indication).

File

drv_usbhs.h

C

```
typedef void (* DRV_USBHS_ROOT_HUB_PORT_INDICATION)(uint8_t port, USB_HUB_PORT_INDICATOR_COLOR color,
USB_HUB_PORT_INDICATOR_STATE state);
```

Description

USB Root hub Application Hooks (Port Indication).

A function of the type defined here should be provided to the driver root to implement Port Indication. The root hub driver calls this function when it needs to update the state of the port indication LEDs. The application can choose to implement the Amber and Green colors as one LED or two different LEDs. The root hub driver specifies the color and the indicator attribute (on, off or blinking) when it calls this function.

Remarks

None.

DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT Type

USB Root hub Application Hooks (Port Overcurrent detection).

File

drv_usbhs.h

C

```
typedef bool (* DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT)(uint8_t port);
```

Description

USB Root hub Application Hooks (Port Overcurrent detection).

A function of the type defined here should be provided to the driver root hub to check for port over current condition. This function will be called periodically by the root hub driver to check the Overcurrent status of the port. It should continue to return true while the Overcurrent condition exists on the port. It should return false when the Overcurrent condition does not exist.

Remarks

None.

DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE Type

USB Root hub Application Hooks (Port Power Enable/ Disable).

File

drv_usbhs.h

C

```
typedef void (* DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE)(uint8_t port, bool control);
```

Description

USB Root hub Application Hooks (Port Power Enable/ Disable).

A function of the type defined here should be provided to the driver root to control port power. The root hub driver will call this function when it needs to enable port power. If the application circuit contains a VBUS switch, the switch should be accessed and controlled by this function. If the enable parameter is true, the switch should be enabled and VBUS should be available on the port. If the enable parameter is false, the switch should be disabled and VBUS should not be available on the port.

Remarks

None.

DRV_USBHS_DEVICE_INTERFACE Macro

Hi-Speed USB Driver Device Mode Interface Functions.

File

drv_usbhs.h

C

```
#define DRV_USBHS_DEVICE_INTERFACE
```

Description

Hi-Speed USB Driver Device Mode Interface Functions.

The Device Controller Driver Interface member of the Device Stack Initialization data structure should be set to this value so that the Device Stack can access the Hi-Speed USB Driver Device Mode functions.

Remarks

None.

DRV_USBHS_HOST_INTERFACE Macro

Hi-Speed USB Driver Host Mode Interface Functions.

File

drv_usbhs.h

C

```
#define DRV_USBHS_HOST_INTERFACE
```

Description

Hi-Speed USB Driver Host Mode Interface Functions.

The Host Controller Driver Interface member of the Host Layer Initialization data structure should be set to this value so that the Host Layer can access the Hi-Speed USB Driver Host Mode functions.

Remarks

None.

DRV_USBHS_HOST_PIPE_HANDLE_INVALID Macro

Value of an Invalid Host Pipe Handle.

File

drv_usbhs.h

C

```
#define DRV_USBHS_HOST_PIPE_HANDLE_INVALID
```

Description

Hi-Speed USB Driver Invalid Host Pipe Handle.

This constant defines the value of an Invalid Host Pipe Handle.

Remarks

None.

DRV_USBHS_INDEX_0 Macro

Hi-Speed USB Driver Module Index 0 Definition.

File

drv_usbhs.h

C

```
#define DRV_USBHS_INDEX_0 0
```

Description

Hi-Speed USB Driver Module Index 0 Definition.

This constant defines the value of Hi-Speed USB Driver Index 0. The SYS_MODULE_INDEX parameter of the DRV_USBHS_Initialize and DRV_USBHS_Open functions should be set to this value to identify instance 0 of the driver.

Remarks

These constants should be used in place of hard-coded numeric literals and should be passed into the DRV_USBHS_Initialize and DRV_USBHS_Open functions to identify the driver instance in use. These are not indicative of the number of modules that are actually supported by the microcontroller.

Enumerations

	Name	Description
	DRV_USBHS_EVENT	Identifies the different events that the Hi-Speed USB Driver provides.
	DRV_USBHS_OPMODES	Identifies the operating modes supported by the Hi-Speed USB Driver.

Functions

	Name	Description
	DRV_USBHS_ClientEventCallBackSet	This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.
	DRV_USBHS_Close	Closes an opened-instance of the Hi-Speed USB Driver.
	DRV_USBHS_DEVICE_AddressSet	This function will set the USB module address that is obtained from the Host.
	DRV_USBHS_DEVICE_Attach	This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.
	DRV_USBHS_DEVICE_CurrentSpeedGet	This function will return the USB speed at which the device is operating.
	DRV_USBHS_DEVICE_Detach	This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.
	DRV_USBHS_DEVICE_EndpointDisable	This function disables an endpoint.
	DRV_USBHS_DEVICE_EndpointDisableAll	This function disables all provisioned endpoints.
	DRV_USBHS_DEVICE_EndpointEnable	This function enables an endpoint for the specified direction and endpoint size.
	DRV_USBHS_DEVICE_EndpointIsEnabled	This function returns the enable/disable status of the specified endpoint and direction.
	DRV_USBHS_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	DRV_USBHS_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.
	DRV_USBHS_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	DRV_USBHS_DEVICE_IRPCancel	This function cancels the specific IRP that are queued and in progress at the specified endpoint.

	DRV_USBHS_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	DRV_USBHS_DEVICE_IRPSubmit	This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.
	DRV_USBHS_DEVICE_RemoteWakeupStart	This function causes the device to start Remote Wakeup Signalling on the bus.
	DRV_USBHS_DEVICE_RemoteWakeupStop	This function causes the device to stop the Remote Wakeup Signalling on the bus.
	DRV_USBHS_DEVICE_SOFNumberGet	This function will return the USB SOF packet number.
	DRV_USBHS_DEVICE_TestModeEnter	This function enables the specified USB 2.0 Test Mode.
	DRV_USBHS_DEVICE_TestModeExit	This function disables the specified USB 2.0 Test Mode.
	DRV_USBHS_HOST_EventsDisable	Disables Host mode events.
	DRV_USBHS_HOST_EventsEnable	Restores the events to the specified the original value.
	DRV_USBHS_HOST_IRPCancel	Cancels the specified IRP.
	DRV_USBHS_HOST_IRPSubmit	Submits an IRP on a pipe.
	DRV_USBHS_HOST_PipeClose	Closes an open pipe.
	DRV_USBHS_HOST_PipeSetup	Open a pipe with the specified attributes.
	DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet	This function returns the operating speed of the bus to which this root hub is connected.
	DRV_USBHS_HOST_ROOT_HUB_Initialize	This function initializes the root hub driver.
	DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet	Returns the maximum amount of current that this root hub can provide on the bus.
	DRV_USBHS_HOST_ROOT_HUB_OperationEnable	This function enables or disables root hub operation.
	DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled	Returns the operation enabled status of the root hub.
	DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet	Returns the number of ports this root hub contains.
	DRV_USBHS_HOST_ROOT_HUB_PortReset	Resets the specified root hub port.
	DRV_USBHS_HOST_ROOT_HUB_PortResetIsComplete	Returns true if the root hub has completed the port reset operation.
	DRV_USBHS_HOST_ROOT_HUB_PortResume	Resumes the specified root hub port.
	DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet	Returns the speed of at which the port is operating.
	DRV_USBHS_HOST_ROOT_HUB_PortSuspend	Suspends the specified root hub port.
	DRV_USBHS_Initialize	Initializes the Hi-Speed USB Driver.
	DRV_USBHS_Open	Opens the specified Hi-Speed USB Driver instance and returns a handle to it.
	DRV_USBHS_Status	Provides the current status of the Hi-Speed USB Driver module.
	DRV_USBHS_Tasks	Maintains the driver's state machine when the driver is configured for Polled mode.
	DRV_USBHS_Tasks_ISR	Maintains the driver's Interrupt state machine and implements its ISR.
	DRV_USBHS_Tasks_ISR_USBDMA	Maintains the driver's DMA Transfer state machine and implements its ISR.

Macros

	Name	Description
	DRV_USBHS_DEVICE_INTERFACE	Hi-Speed USB Driver Device Mode Interface Functions.
	DRV_USBHS_HOST_INTERFACE	Hi-Speed USB Driver Host Mode Interface Functions.
	DRV_USBHS_HOST_PIPE_HANDLE_INVALID	Value of an Invalid Host Pipe Handle.
	DRV_USBHS_INDEX_0	Hi-Speed USB Driver Module Index 0 Definition.

Structures

	Name	Description
	DRV_USBHS_INIT	This type definition defines the Driver Initialization Data Structure.

Types

	Name	Description
	DRV_USBHS_EVENT_CALLBACK	Type of the Hi-Speed USB Driver event callback function.
	DRV_USBHS_HOST_PIPE_HANDLE	Defines the Hi-Speed USB Driver Host Pipe Handle type.
	DRV_USBHS_ROOT_HUB_PORT_INDICATION	USB Root hub Application Hooks (Port Indication).
	DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT	USB Root hub Application Hooks (Port Overcurrent detection).
	DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE	USB Root hub Application Hooks (Port Power Enable/ Disable).

Description

PIC32MZ USB Module Driver Interface Header File

The PIC32MZ Hi-Speed USB Module driver provides a simple interface to manage the "USB" peripheral on the PIC32MZ microcontroller. This file defines the interface definitions and prototypes for the Hi-Speed USB Driver. The driver interface meets the requirements of the MPLAB Harmony USB Host and Device Layer.

File Name

drv_usbhs.h

Company

Microchip Technology Inc.

drv_usbhs_config_template.h

Hi-Speed USB (USBHS) Driver Configuration Template.

Macros

	Name	Description
	DRV_USBHS_DEVICE_SUPPORT	Determines if the USB Device Functionality should be enabled.
	DRV_USBHS_ENDPOINTS_NUMBER	Configures the number of endpoints to be provisioned in the driver.
	DRV_USBHS_HOST_ATTACH_DEBOUNCE_DURATION	Configures the time duration (in milliseconds) that the driver will wait to reconfirm a device attach.
	DRV_USBHS_HOST_NAK_LIMIT	Configures the NAK Limit for Host Mode Control Transfers.
	DRV_USBHS_HOST_PIPES_NUMBER	Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.
	DRV_USBHS_HOST_RESET_DURATION	Configures the time duration (in milliseconds) of the Reset Signal.
	DRV_USBHS_HOST_SUPPORT	Determines if the USB Host Functionality should be enabled.
	DRV_USBHS_INSTANCES_NUMBER	Specifies the number of driver instances to be enabled in the application.
	DRV_USBHS_INTERRUPT_MODE	Configures the driver for interrupt or polling mode operation.

Description

Hi-Speed USB Driver Configuration Template

This file lists all the configurations constants that affect the operation of the USBHS Driver.

USART Driver Library

This section describes the USART Driver Library.

Introduction

This section introduces the MPLAB Harmony USART Driver.

Description

The MPLAB Harmony USART Driver (also referred to as the USART Driver) provides a high-level interface to the USART and UART peripherals on Microchip's PIC32 microcontrollers. This driver provides application ready routines to read and write data to the UART using common data transfer models, which eliminates the need for the application to implement this code. The USART driver features the following:

- Provides byte transfer, read/write, and buffer queue data transfer models
- Supports Interrupt and Polled modes of operation
- Supports point-to-point data communication
- Supports multi-client and multi-instance operation
- Provides data transfer events
- Supports blocking and non-blocking operation with the read/write data transfer model

- Features thread-safe functions for use in RTOS applications
- Supports DMA transfers
- Supports high baud rate setting
- Major features are implemented in separate source code files and can be included only if needed. This helps optimize overall application code size.

Using the Library

This topic describes the basic architecture of the USART Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_usart.h`

The interface to the USART library is defined in the `drv_usart.h` header file.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the USART Driver Library.

Library Interface Section	Description
System Routines	These routines are accessed by the MPLAB Harmony system module. They allow the driver to be initialized, deinitialized and maintained.
Core Client Routines	These routines allow the application client to open and close the driver.
Communication Management Client Routines	These routines allow the client to change the properties of the communication channel (such as baud, parity, etc.).
Buffer Queue Read/Write Client Routines	These routines allow the client to use the buffer queue data transfer model.
File I/O Type Read/Write Routines	These routines allow the client to use the file I/O type read/write routines.
Byte Transfer Routines	These routines allow the client to use the byte data transfer model.

The USART driver must be first initialized. One or more application clients can then open the USART Driver in Blocking or non-Blocking mode. The Open function returns a handle which allows the client to access the driver client functionality. The Driver tasks routines should be invoked regularly from the SYS_Tasks routine in case of Polled mode operation or from USART Driver Interrupt Service Routine (ISR), in case of Interrupt mode.

The driver implementation is split across multiple files to optimize the application project code size. The application project must include the `drv_usart.c` file if the USART driver is needed in the application. If DMA-enabled data transfers are required, the `drv_usart_dma.c` file should be included into the project instead of the `drv_usart.c` file. These files implement the system and core Client routines. Other driver files can be included based on the required driver features.

The USART Driver API, unless otherwise specified, should not be called from an interrupt context. That is, they should not be called from an ISR or from event handlers that are executing within an ISR context.

Abstraction Model

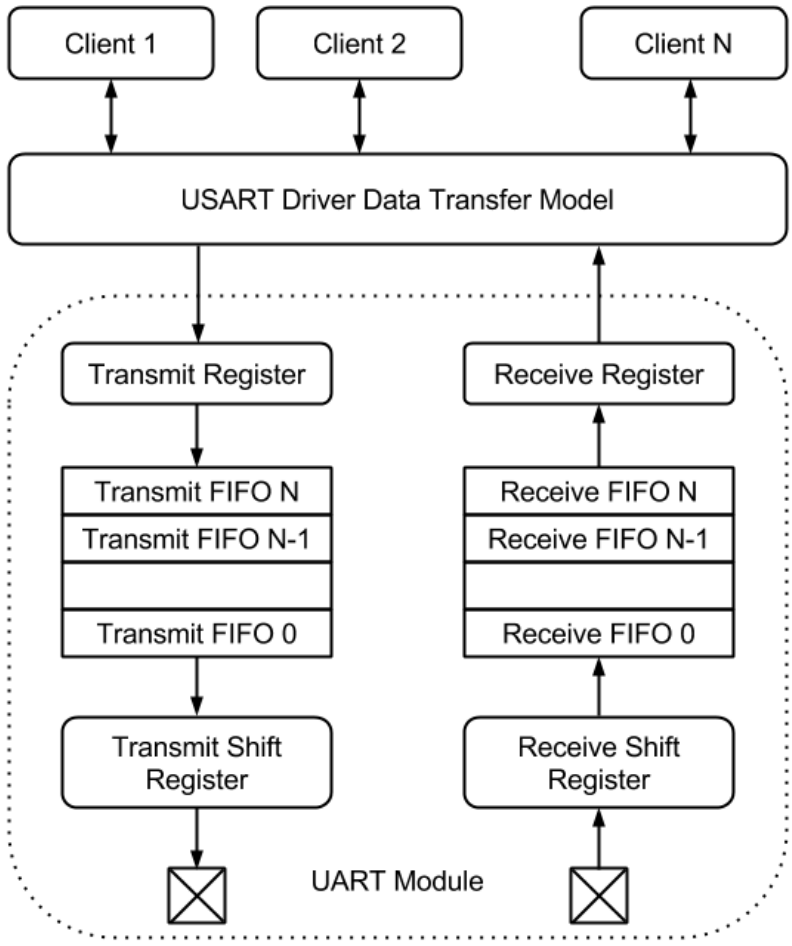
This section describes how the USART Driver abstracts the USART peripheral features.

Description

The USART driver features routines to perform the following functions:

- Driver initialization
- Transfer data
- Manage communication properties of the module

The Driver initialization routines allow the system to initialize the driver. The driver must be initialized before it can be opened by a client. The data transfer routines allow the application to receive and transmit data through the USART. The driver also provides routines to change the communication properties such as USART baud or line control settings.



As seen in the previous figure, the USART driver clients transfer data through the USART Driver Data Transfer model. The driver abstracts out the hardware details of the UART module FIFO mechanism and shift registers, and provides a low overhead data transfer mechanism to the application. The USART driver provides three different data transfer models for transferring data.

- The Byte Transfer Model
- The File I/O Type Read/Write Transfer Model
- Buffer Queue Transfer Model

Byte Transfer Model:

The byte transfer model allows the application to transfer data through USART driver one byte at a time. With this model, the driver reads one byte from the receive FIFO or writes one byte to the transmit FIFO. The application must check if data has been received before reading the data. Similarly, it must check if the transmit FIFO is not full before writing to the FIFO. The byte transfer model places the responsibility of maintaining the USART peripheral on the Application. The driver cannot support other data transfer models if support for this data transfer model is enabled. The byte transfer model is only recommended for simple data transfer applications.

To use the byte transfer model, the `drv_usart_byte_model.c` file must be included in the project and the DRV_USART_BYTE_MODEL_SUPPORT configuration macro should be set to true.

File I/O Type Read/Write Transfer Model:

This data transfer model is similar to file read and write API model in a UNIX operating system application. The application calls the USART driver read and write routines to transfer data through the USART. Unlike the byte transfer model, the read/write data model can process a block of data. Depending on the mode (blocking or non-blocking) in which the client opened the driver, the driver will either block until all of the data is transferred or will immediately return with the number of bytes transferred. The application does not have to check the FIFO status while using this mode. The application can instead use the return status (number of bytes transferred) to maintain its logic and complete the data transfer. The read/write model can be used with the non-DMA buffer queue model. It cannot be used with the byte transfer model and the DMA-enabled buffer queue model in the same application.

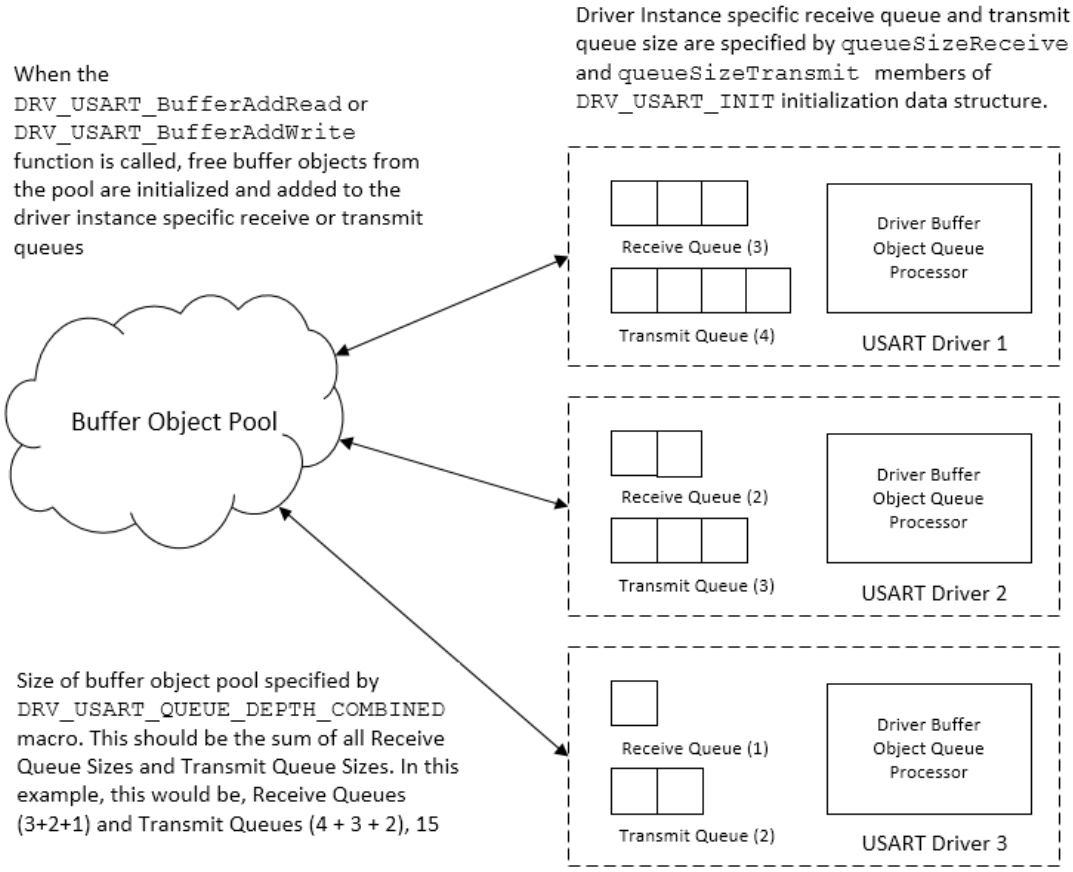
To use the file I/O type read/write data transfer model, the `drv_usart_read_write.c` file must be included in the project and the DRV_USART_READ_WRITE_MODEL_SUPPORT configuration macro should be set to true.

See File I/O Type Read/Write Data Transfer Modef for additional information.

Buffer Queue Transfer Model:

The buffer queue data transfer model allows clients to queue data transfers for processing. This data transfer model is always non-blocking. The USART driver returns a buffer handle for a queued request. The clients can track the completion of a buffer through events and API. If the USART driver is busy processing a data transfer, other data transfer requests are queued. This allows the clients to optimize their application logic and increase throughput. To optimize memory usage, the USART driver implements a shared buffer object pool concept to add a data transfer request to the queue. The following figure shows a conceptual representation of the buffer queue model.

Buffer Queue Transfer Model



As shown in the previous figure, each USART driver hardware instance has a read and write queue. The system designer must configure the sizes of these read and write queues. The USART driver additionally employs a global pool of buffer queue objects. This pool is common to all USART Driver hardware instances and its size is defined by the DRV_USART_QUEUE_DEPTH_COMBINED configuration macro. When a client places a request to add a data transfer, the driver performs the following actions:

- It checks if a buffer object is free in the global pool. If not, the driver rejects the request.
- It then checks if the hardware instance specific queue is full. If not, the buffer object from the global pool is added to the hardware instance specific queue. If the queue is full, the driver rejects the request.

The buffer queue model can be used along with the file I/O type read/write data transfer model.

To use the Buffer Queue Data Transfer model, the `drv_usart_buffer_queue.c` file must be included in the project and DRV_USART_BUFFER_QUEUE_SUPPORT configuration macro should be set to true.

The USART Driver DMA feature is only available while using the Buffer Queue Model. If enabled, the USART Driver uses the DMA module channels to transfer data directly from application memory to USART transmit or receive registers. This reduces CPU resource consumption and improves system performance. To use the buffer queue model with DMA, the `drv_usart_buffer_queue_dma.c` file should be included in the project instead of `drv_usart_buffer_queue.c`.

See Buffer Queue Transfer Model for additional information.

Communication Management

The USART Driver API contains functions to control the USART Driver communication properties. These functions allow the client to change the parity, stop bits, number of data bits and the communication baud rate. A change in the communication setting affects all ongoing communication and all driver clients.

How the Library Works

This section describes how to use the USART Driver.

Description

Prior to using the USART Driver, the application must decide on which USART data transfer models are required. The application project should then include the USART Driver files, required to support the data transfer model into the application project. Additionally, the application design must consider the need for USART Driver to be opened in blocking or non blocking modes. This will also affect the application flow.

Initializing the USART Driver

Describes how to initialize the USART Driver.

Description

The USART Driver must be configured and initialized for clients to be able to open the driver. The driver build time configuration is defined by the configuration macros. Refer to the Building the Library section for the location of and more information on the various configuration macros and how these macros should be designed. The driver initialization is configured through the DRV_USART_INIT data structure that is passed to the DRV_USART_Initialize function. The initialization parameters include the USART baud, the USART Peripheral, USART interrupts and read queue and write queue sizes (which are applicable only when buffer queue data transfer is used). The following code shows an example of initializing the USART driver for 300 bps and uses USART2. If the driver is configured for Interrupt mode of operation, the priority of the USART interrupts needs to be specified.

```
/* The following code shows an example of designing the
 * DRV_USART_INIT data structure. It also shows how an example
 * usage of the DRV_USART_Initialize() function and how Interrupt
 * System Service routines are used to set USART Interrupt
 * priority. */

DRV_USART_INIT usartInit;
SYS_MODULE_OBJ usartModule1;

/* Set the baud to 300 */
usartInit.baud = 300;

/* Auto Baud detection or Stop Idle is not needed */
usartInit.flags = DRV_USART_INIT_FLAG_NONE;

/* Handshaking is not needed */
usartInit.handshake = DRV_USART_HANDSHAKE_NONE;

/* USART Error Interrupt source for this USART
 * driver instance. Note that INT_SOURCE_USART_2_ERROR
 * value is defined by the Interrupt System Service and
 * is the error interrupt for USART 2*/
usartInit.interruptError = INT_SOURCE_USART_2_ERROR;

/* USART Receive Interrupt source for this USART
 * driver instance. Note that INT_SOURCE_USART_2_RECEIVE
 * value is defined by the Interrupt System Service and
 * is the error interrupt for USART 2 */
usartInit.interruptReceive = INT_SOURCE_USART_2_RECEIVE;

/* USART Transmit Interrupt source for this USART
 * driver instance. Note that INT_SOURCE_USART_2_TRANSMIT
 * value is defined by the Interrupt System Service and
 * is the error interrupt for USART 2 */
usartInit.interruptTransmit = INT_SOURCE_USART_2_TRANSMIT;

/* Line control mode */
usartInit.lineControl = DRV_USART_LINE_CONTROL_8NONE1;

/* Operation mode is normal. Loopback or addressed is not
 * needed */
usartInit.mode = DRV_USART_OPERATION_MODE_NORMAL;

/* Peripheral Bus clock frequency at which the USART is
 * operating */
usartInit.brgClock = 80000000;

/* System module power setting. Typically set to
 * SYS_MODULE_POWER_RUN_FULL */
usartInit.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
```

```
/* Receive buffer queue size. In this case a maximum of 2
 * receive buffers can be queued. Only applicable if the
 * Buffer Queue Data Transfer Model is included in the
 * application. */
usartInit.queueSizeReceive = 2;

/* Transmit buffer queue size. In this case a maximum of 3
 * transmit buffers can be queued. Only applicable if the
 * Buffer Queue Data Transfer Model is included in the
 * application. */
usartInit.queueSizeTransmit = 3;

/* The USART peripheral instance index associated with this
 * driver instance. Note that this value is defined by the
 * USART Peripheral Library */
usartInit.usartID = USART_ID_2;

/* Initialize USART Driver Instance 0 */
usartModule1 = DRV_USART_Initialize(DRV_USART_0, (SYS_MODULE_INIT*)&usartInit);

/* The result of the driver initialization can be checked */
if(SYS_MODULE_OBJ_INVALID == usartModule1)
{
    /* There was an error in initialization. */
}

/* If the USART driver is configured for interrupt mode of
 * operation, the interrupt priorities should be configured.
 * Here the Interrupt System Service is used to set the
 * priority to level 4 */

/* Initialize the interrupt system service */
SYS_INT_Initialize();

/* Set the USART 2 module interrupt priority to 4*/
SYS_INT_VectorPrioritySet(INT_VECTOR_UART2, INT_PRIORITY_LEVEL4);

/* Set the USART 2 module interrupt sub-priority to 0*/
SYS_INT_VectorSubprioritySet(INT_VECTOR_UART2, INT_SUBPRIORITY_LEVEL0);

/* Enable global interrupt */
SYS_INT_Enable();
```

The USART Driver can be configured to transfer data through the DMA. In such a case, the DMA channels to be used for USART transmit and receive need to be specified. The USART Driver depends on the DMA System Service to access the DMA module. The DMA channels to be used for transmit and receive transfers should be specified in the DRV_USART_INIT data structure.

The following code shows an example of using the USART Driver initialization to use DMA for transferring data. The code also shows example initialization of the DMA System Service.

```
/* The following code shows an example of designing the
 * DRV_USART_INIT data structure. It also shows how an example
 * usage of the DRV_USART_Initialize() function and how Interrupt
 * System Service routines are used to set USART Interrupt
 * priority. */

DRV_USART_INIT usartInit;
SYS_DMA_INIT dmaInit;
SYS_MODULE_OBJ usartModule1;
SYS_MODULE_OBJ dmaModule;

/* Set the baud to 300 */
usartInit.baud = 300;

/* Auto Baud detection or Stop Idle is not needed */
usartInit.flags = DRV_USART_INIT_FLAG_NONE;

/* Handshaking is not needed */
usartInit.handshake = DRV_USART_HANDSHAKE_NONE;
```

```
/* USART Error Interrupt source for this USART
 * driver instance. Note that INT_SOURCE_USART_2_ERROR
 * value is defined by the Interrupt System Service and
 * is the error interrupt for USART2*/
usartInit.interruptError = INT_SOURCE_USART_2_ERROR;

/* USART Receive Interrupt source for this USART
 * driver instance. Note that INT_SOURCE_USART_2_RECEIVE
 * value is defined by the Interrupt System Service and
 * is the receive interrupt for USART2 */
usartInit.interruptReceive = INT_SOURCE_USART_2_RECEIVE;

/* USART Transmit Interrupt source for this USART
 * driver instance. Note that INT_SOURCE_USART_2_TRANSMIT
 * value is defined by the Interrupt System Service and
 * is the transmit interrupt for USART2 */
usartInit.interruptTransmit = INT_SOURCE_USART_2_TRANSMIT;

/* Line control mode */
usartInit.lineControl = DRV_USART_LINE_CONTROL_8NONE1;

/* Operation mode is normal. Loopback or addressed is not
 * needed */
usartInit.mode = DRV_USART_OPERATION_MODE_NORMAL;

/* Peripheral Bus clock frequency at which the USART is
 * operating */
usartInit.brgClock = 80000000;

/* System module power setting. Typically set to
 * SYS_MODULE_POWER_RUN_FULL */
usartInit.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;

/* Receive buffer queue size. In this case a maximum of 2
 * receive buffers can be queued. Only applicable if the
 * Buffer Queue Data Transfer Model is included in the
 * application. */
usartInit.queueSizeReceive = 2;

/* Transmit buffer queue size. In this case a maximum of 3
 * transmit buffers can be queued. Only applicable if the
 * Buffer Queue Data Transfer Model is included in the
 * application. */
usartInit.queueSizeTransmit = 3;

/* The USART peripheral instance index associated with this
 * driver instance. Note that this value is defined by the
 * USART Peripheral Library */
usartInit.usartID = USART_ID_2;

/* Use DMA channel 1 for transmit. If transmit via DMA is
 * not required, set this to DMA_CHANNEL_NONE. These values
 * are defined by the DMA System Service. */
usartInit.dmaChannelTransmit = DMA_CHANNEL_1;

/* Use DMA channel 2 for receive. If receive via DMA is
 * not required, set this to DMA_CHANNEL_NONE. These values
 * are defined by the DMA System Service. */
usartInit.dmaChannelReceive = DMA_CHANNEL_2;

/* Set the interrupt source for the Transmit DMA channel.
 * This parameter is ignored if the dmaChannelTransmit
 * parameter is set to DMA_CHANNEL_NONE. */
usartInit.dmaInterruptTransmit = INT_SOURCE_DMA_1;

/* Set the interrupt source for the Receive DMA channel.
 * This parameter is ignored if the dmaChannelReceive
 * parameter is set to DMA_CHANNEL_NONE. */
usartInit.dmaInterruptReceive = INT_SOURCE_DMA_2;
```

```
/********* End of DRV_USART_INIT Initialization *************/

/* If the USART driver is configured for interrupt mode of
 * operation, the interrupt priorities should be configured.
 * Here the Interrupt System Service is used to set the
 * priority to level 4 */

/* Initialize the interrupt system service */
SYS_INT_Initialize();

/* Set the USART 2 module interrupt priority to 4*/
SYS_INT_VectorPrioritySet(INT_VECTOR_UART2, INT_PRIORITY_LEVEL4);

/* Set the USART 2 module interrupt sub-priority to 0*/

/* Set the DMA 2 channel interrupt priority to 4*/
SYS_INT_VectorPrioritySet(INT_VECTOR_DMA2, INT_PRIORITY_LEVEL4);

/* Set the DMA 2 channel interrupt sub-priority to 0*/
SYS_INT_VectorSubprioritySet(INT_VECTOR_DMA2, INT_SUBPRIORITY_LEVEL0);

/* Enable global interrupt */
SYS_INT_Enable();

/* This is the DMA System Service Initialization */
dmaInit.sidl = SYS_DMA_SIDL_DISABLE;
dmaModule = SYS_DMA_Initialize((SYS_MODULE_INIT*)&dmaInit);

/* The result of the DMA System Service initialization can be checked */
if(SYS_MODULE_OBJ_INVALID == dmaModule)
{
    /* DMA System Service initialization was not successful */
}

/* Initialize USART Driver Instance 0 */
usartModule1 = DRV_USART_Initialize(DRV_USART_0, (SYS_MODULE_INIT*)&usartInit);

/* The result of the driver initialization can be checked */
if(SYS_MODULE_OBJ_INVALID == usartModule1)
{
    /* There was an error in initialization. */
}
```

Opening the USART Driver

Describes how to open the USART Driver.

Description

To use the USART driver, the application must open the driver. This is done by calling the DRV_USART_Open function. Calling this function with DRV_IO_INTENT_NONBLOCKING will cause the driver to be opened in non blocking mode. The DRV_USART_Read and DRV_USART_Write functions when called by this client will be non blocking. . Calling this function with DRV_IO_INTENT_BLOCKING will cause the driver to be opened in blocking mode. The DRV_USART_Read and DRV_USART_Write functions when called by this client will be blocking.

If successful, the DRV_USART_Open function will return a valid handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_USART_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in other (error) cases as well.

The following code shows an example of the driver being opened in different modes.

```
DRV_HANDLE usartHandle1, usartHandle2;
```

```
/* Client 1 opens the USART driver in non blocking mode */
usartHandle1 = DRV_USART_Open(DRV_USART_0, DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NONBLOCKING);

/* Check if the handle is valid */
if(DRV_HANDLE_INVALID == usartHandle1)
{
    /* The driver was not opened successfully. The client
     * can try opening it again */
}

/* Client 2 opens the USART driver in blocking mode */
usartHandle2 = DRV_USART_Open(DRV_USART_0, DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_BLOCKING);

/* Check if the handle is valid */
if(DRV_HANDLE_INVALID == usartHandle2)
{
    /* The driver was not opened successfully. The client
     * can try opening it again */
}

/* The client can also open the USART driver in read only mode
 * (DRV_IO_INTENT_READ), write only mode (DRV_IO_INTENT_WRITE)
 * and exclusive mode (DRV_IO_INTENT_EXCLUSIVE). If the driver
 * has been opened exclusively by a client, it cannot be opened
 * again by another client */
```

Byte Transfer Model

Describes the USART Driver byte transfer model.

Description

To use the byte transfer model, the DRV_USART_BYTE_MODEL_SUPPORT configuration macro should be true. The `drv_usart_byte_model.c` function should be included in the application project. The application cannot support the read/write and buffer queue data transfer model when the byte model is enabled.

The following code shows an example of how the DRV_USART_WriteByte function and the DRV_USART_ReadByte function are used.

```
 /* Client uses the a byte model API to write a byte*/
if(!DRV_USART_TransmitBufferIsFull(usartHandle1))
{
    byte = '1';
    DRV_USART_WriteByte(usartHandle1,byte);
}

/* Client waits until data is available and then reads
 * byte */
 while(DRV_USART_ReceiverBufferIsEmpty(usartHandle1));
        byte = DRV_USART_ReadByte(usartHandle1);
```

File I/O Type Read/Write Data Transfer Model

This topic describes the file I/O type read/write data transfer model.

Description

To use the file I/O type read/write data transfer model, the DRV_USART_READ_WRITE_MODEL_SUPPORT configuration macro should be 'true'. The file `drv_usart_read_write.c` file should be included in the application project. The driver can support the non-DMA buffer queue data transfer model along with the file I/O type read/write data transfer model. The byte transfer model and DMA buffer queue model cannot be enabled if the file I/O type read/write data transfer model is enabled.

The DRV_USART_Read and DRV_USART_Write function represent the file I/O type read/write data transfer model. The functional behavior of these API is affected by the mode in which the client opened the driver. If the client opened the driver in blocking mode these API will block. In blocking mode, the DRV_USART_Read and DRV_USART_Write functions will not return until the requested number of bytes have been read or written. When operating in a RTOS application, the application thread that has opened driver in blocking mode, will enter a blocked state when it calls DRV_USART_Write or DRV_USART_Read function. This will allow the RTOS scheduler to schedule other threads which are ready to run. If the client opened the driver in non-blocking mode these API will not block. In non-blocking mode, the DRV_USART_Read and DRV_USART_Write functions will return immediately with the amount of data that could be read or written.

Note: Do not open the driver in Blocking mode when the driver is configured for polling operation (DRV_USART_INTERRUPT_MODE is false) in a bare-metal (non-RTOS) application. This will cause the system to enter an infinite loop condition when the DRV_USART_Read or DRV_USART_Write function is called.

The following code shows an example of file I/O type read/write data transfer model usage when the driver is opened in Blocking mode.

```
/* This code shows the functionality of the DRV_USART_Write and
 * DRV_USART_Read function when the driver is opened in blocking mode */

DRV_HANDLE usartHandle1;
uint8_t myData[10];
size_t bytesProcessed;

/* The driver is opened in blocking mode */
usartHandle1 = DRV_USART_Open(DRV_USART_0, DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_BLOCKING);

/* Check if the driver was opened successfully */
if(DRV_HANDLE_INVALID == usartHandle1)
{
    /* The driver could not be opened successfully */
}

/* Transmit 10 bytes from the myData array. Function will not return until 10 bytes
 * have been accepted by the driver. This is because the client opened the driver
 * in blocking mode. */

bytesProcessed = DRV_USART_Write(usartHandle1, myData, 10);

/* Read 10 bytes from the myData array. Function will not return until all 10 bytes
 * have been received by the driver. This is because the client opened the driver
 * in blocking mode. */

bytesProcessed = DRV_USART_Read(usartHandle1, myData, 10);
```

In non-Blocking mode, the driver uses the internal USART hardware FIFO as storage. The DRV_USART_Read function checks if bytes are available in USART receive hardware FIFO. If bytes are available, these are read and the number of bytes read is returned. The DRV_USART_Write function checks if USART transmit hardware FIFO has empty location. If locations are empty, the bytes to be transmitted are queued up in the FIFO and the number of queued bytes is returned. In either case, the number of bytes read or written may be less than the number requested by the client. The client can, in such a case, call the DRV_USART_Read and/or the DRV_USART_Write functions again to process the pending bytes. The following code shows how this can be done.

```
/* This code shows the functionality of the DRV_USART_Write and
 * DRV_USART_Read functions when the driver is opened in non-blocking mode */

DRV_HANDLE usartHandle1;
uint8_t myData[10];
size_t bytesProcessed;

/* The driver is opened in non-blocking mode */
usartHandle1 = DRV_USART_Open(DRV_USART_0,
        DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NONBLOCKING);

/* Check if the driver was opened successfully */
if(DRV_HANDLE_INVALID == usartHandle1)
{
    /* The driver could not be opened successfully */
}

/* The following code call the DRV_USART_Write function
 * multiple times to write 10 bytes completely. Note how the
 * function return value is used to update the location of
 * user source data. */

bytesProcessed = 0;
do
{
    /* Write data to the USART and use the return value to
     * update the source data pointer and pending bytes number. */
    bytesProcessed += DRV_USART_Write(usartHandle1,
            myData + bytesProcessed, (10 - bytesProcessed));
```

```
} while(bytesProcessed < 10);

/* The following code calls the DRV_USART_Read function multiple times to read
 * 10 bytes completely. Note how the function return value is used to update the
 * location of user destination array. */

bytesProcessed = 0;
do
{
    /* Read data from the USART and use the return value to update the
     * destination pointer and pending bytes number. */
    bytesProcessed += DRV_USART_Read(usartHandle1,
            myData + bytesProcessed, (10 - bytesProcessed));

}while (bytesProcessed < 10);
```

Buffer Queue Transfer Model

This topic describes the buffer queue data transfer model.

Description

To use the buffer queue data transfer model, the DRV_USART_BUFFER_QUEUE_SUPPORT configuration macro should be true. The file, `drv_usart_buffer_queue.c`, should be included in the application project. If the DMA-enabled buffer queue model is required, the `drv_usart_buffer_queue_dma.c` file (*and not* the `drv_usart_buffer_queue.c`) should be included in the application project. The DMA and non-DMA buffer queue model API is the same. The driver can support the non-DMA buffer queue data transfer model along with the file I/O type read/write data transfer model. The byte transfer model cannot be enabled if the buffer queue data transfer model is enabled.

The DRV_USART_BufferAddRead and DRV_USART_BufferAddWrite functions represent the buffer queue data transfer model. These functions are always non-blocking. The Buffer Queue Data Transfer Model employs queuing of read and write request. Each driver instance contains a read and write queue. The size of the read queue is determined by the queueSizeRead member of the DRV_USART_INIT data structure. The size of the write queue is determined by the queueSizeWrite member of the DRV_USART_INIT data structure. The driver provides driver events (DRV_USART_BUFFER_EVENT) that indicates termination of the buffer requests.

When the driver is configured for Interrupt mode operation (that is defined and registered by the driver client), the buffer event handler executes in an interrupt context. Calling computationally intensive or hardware polling routines within the event handlers is not recommended. Calling interrupt unsafe functions in the event handler when the driver is configured for Interrupt mode could result in unpredictable system behavior.

When the driver adds request to the queue, it returns a buffer handle. This unique handle allows the client to track the request as it progresses through the queue. The buffer handle is returned with the buffer event and expires when the event associated with the buffer has been generated and the event handler returns. The following code shows an example of using the buffer queue data transfer model.

```
/* This code shows an example of using the
 * Buffer Queue Data Transfer Model. */
DRV_HANDLE usartHandle1;
uint8_t myData1[10], myData2[10];
uint8_t myData3[10], myData4[10];
size_t bytesProcessed;
DRV_USART_BUFFER_HANDLE bufferHandle1, bufferHandle2;
DRV_USART_BUFFER_HANDLE bufferHandle3, bufferHandle4;

/* The driver is opened in non blocking mode */
usartHandle1 = DRV_USART_Open(DRV_USART_0,
        DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NONBLOCKING);

/* Check if the driver was opened successfully */
if(DRV_HANDLE_INVALID == usartHandle1)
{
    /* The driver could not be opened successfully */
}

/* Register a Buffer Event Handler with USART driver.
 * This event handler function will be called whenever
 * there is a buffer event.  An application defined
 * context can also be specified. This is returned when
 * the event handler is called.
 * */
DRV_USART_BufferEventHandlerSet(usartHandle1,
        APP_USARTBufferEventHandler, NULL);
```

```
/* Queue up two buffers for transmit */
DRV_USART_BufferAddWrite(usartHandle1, &bufferHandle1, myData1, 10);
DRV_USART_BufferAddWrite(usartHandle1, &bufferHandle2, myData2, 10);

/* Queue up two buffers for receive */
DRV_USART_BufferAddRead(usartHandle1, &bufferHandle3, myData3, 10);
DRV_USART_BufferAddRead(usartHandle1, &bufferHandle4, myData4, 10);

/* This is application USART Driver Buffer Event Handler */

void APP_USARTBufferEventHandler(DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:
            /* This means the data was transferred */
            break;
        case DRV_USART_BUFFER_EVENT_ERROR:
            /* Error handling here. */
            break;
        default:
            break;
    }
}
```

Driver Tasks Routine

This topic describes the Driver "Task" routines.

Description

The USART driver contains three task routines, DRV_USART_TasksTransmit, DRV_USART_TasksReceive and DRV_USART_TasksError. These task routines implement the USART Driver state machines for transmit, receive and error related operations. If the driver is configured for polling operation, the required task routine should be called in SYS_Tasks routine of the system. If the driver is configured for interrupt mode of operation, the task routine should be called from the ISR. The following code shows an example of both.

```
/* The following code shows an example of
 * USART2 Interrupt Service Routine. This function
 * will be called when a USART2 interrupt occurs
 * and the driver is configured for interrupt mode
 * operation */

void __ISR ( _UART_2_VECTOR,ipl4 ) _InterruptHandler_USART ( void )
{
    /* usartModule1 is the System Module Object
     * that was returned by the DRV_USART_Initialize
     * function. */

    DRV_USART_TasksTransmit(usartModule1);
    DRV_USART_TasksReceive(usartModule1);
    DRV_USART_TasksError(usartModule1);

}

/* In case of Polled mode, the tasks routines are
 * invoked from the SYS_Tasks() routine. */

void SYS_Tasks(void)
{
    DRV_USART_TasksTransmit(usartModule1);
    DRV_USART_TasksReceive(usartModule1);
    DRV_USART_TasksError(usartModule1);
}

/* The SYS_Tasks routine is invoked from the main
 * application while(1) loop. */

while(1)
{
```

```
    SYS_Tasks();
}
```

Using the USART Driver with DMA

This topic provides information on using the USART Driver with DMA.

Description

To use the USART Driver with DMA, the following should be noted:

- Include `drv_usart_dma.c` in the project. Do not include `drv_usart.c`.
- Include `drv_usart_buffer_queue_dma.c` in the project. Do not include `drv_usart_buffer_queue.c`.
- Initialize the driver to use DMA. Refer to Initializing the USART Driver for details.
- Refer to the DMA System Service section for details on initializing and using the DMA system service in Polling or Interrupt mode
- The DRV_USART_INTERRUPT_MODE configuration macro should be set to 'true'
- Do not directly invoke the DRV_USART_TasksTransmit and DRV_USART_TasksReceive functions

Configuring the Library

Macros

	Name	Description
	DRV_USART_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_USART_INDEX	USART Static Index selection.
	DRV_USART_INTERRUPT_MODE	Macro controls interrupt based operation of the driver.
	DRV_USART_INTERRUPT_SOURCE_ERROR	Defines the error interrupt source for the static driver.
	DRV_USART_PERIPHERAL_ID	Configures the USART PLIB Module ID.
	DRV_USART_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_USART_BUFFER_QUEUE_SUPPORT	Specifies if the Buffer Queue support should be enabled.
	DRV_USART_BYTE_MODEL_SUPPORT	Specifies if the Byte Model support should be enabled.
	DRV_USART_INTERRUPT_SOURCE_RECEIVE	Defines the Receive interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_RECEIVE_DMA	Defines the Receive DMA Channel interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_TRANSMIT	Defines the Transmit interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_TRANSMIT_DMA	Defines the Transmit DMA Channel interrupt source for the static driver.
	DRV_USART_QUEUE_DEPTH_COMBINED	Defines the number of entries of all queues in all instances of the driver.
	DRV_USART_READ_WRITE_MODEL_SUPPORT	Specifies if Read/Write Model support should be enabled.
	DRV_USART_RECEIVE_DMA	Defines the USART Driver Receive DMA Channel for the static driver.
	DRV_USART_TRANSMIT_DMA	Defines the USART Driver Transmit DMA Channel in case of static driver.
	DRV_USART_BAUD_RATE_IDXn	Specifies the USART Baud at which the USART driver is initialized.
	DRV_USART_BYTE_MODEL_BLOCKING	Enables or Disables DRV_USART_ByteWrite function blocking behavior.
	DRV_USART_BYTE_MODEL_CALLBACK	Enables or Disables Callback Feature of the Byte Transfer Model.
	DRV_USART_RCV_QUEUE_SIZE_IDXn	Sets the USART Driver Receive Queue Size while using the Buffer Queue Data Transfer Model.
	DRV_USART_XMIT_QUEUE_SIZE_IDXn	Sets the USART Driver Transmit Queue Size while using the Buffer Queue Data Transfer Model.

Description

The USART Driver requires the specification of compile-time configuration macros. These macros define resource usage, feature availability, and dynamic behavior of the driver. These configuration macros should be defined in the `system_config.h` file.

This header can be placed anywhere in the application specific folders and the path of this header needs to be presented to the include search for a successful build. Refer to the Applications Help section for more details.

Note: Initialization overrides are not supported in this version.

```
/* In this configuration example, the USART driver
 * must manage only on USART peripheral instance.
 * This macro can be greater than one if more
```

```
 * USART peripherals are needed. Not defining this
 * macro will cause the driver to be built in
 * static mode */
#define DRV_USART_INSTANCES_NUMBER 1

/* There will be 3 different client that use the
 * one instance of the USART peripheral. Note that
 * this macro configures the total (combined) number of clients
 * across all instance of the USART driver. Not defining
 * this macro will cause the driver to be configured
 * for single client operation */
#define DRV_USART_CLIENTS_NUMBER 3

/* USART Driver should be built for interrupt mode.
 * Set this to false for Polled mode operation */
#define DRV_USART_INTERRUPT_MODE true

/* Combined buffer queue depth is 5. Refer to the
 * description of the Buffer Queue data transfer model
 * and the DRV_USART_QUEUE_DEPTH_COMBINED macro
 * for more details on how this is configured. */
#define DRV_USART_QUEUE_DEPTH_COMBINED 5

/* Set this macro to true is Buffer Queue data
 * transfer model is to be enabled. */
#define DRV_USART_BUFFER_QUEUE_SUPPORT true

/* Set this macro to true if Byte by Byte data
 * transfer model is to be enabled. */
#define DRV_USART_BYTE_MODEL_SUPPORT false

/* Set this macro to true File IO type Read Write
 * data transfer model is to be enabled */
#define DRV_USART_READ_WRITE_MODEL_SUPPORT false
```

DRV_USART_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_usart_config_template.h

C

```
#define DRV_USART_CLIENTS_NUMBER 4
```

Description

USART Client Count Configuration

This macro sets up the maximum number of clients that can be connected to any hardware instance. This value represents the total number of clients to be supported across all hardware instances. Therefore, if USART1 will be accessed by two clients and USART2 will accessed by three clients, this number should be 5. It is recommended that this value be set exactly equal to the number of expected clients, as client support consumes RAM memory space. If this macro is not defined and the DRV_USART_INSTANCES_NUMBER macro is not defined, the driver will be built for static - single client operation. If this macro is defined and the DRV_USART_INSTANCES_NUMBER macro is not defined, the driver will be built for static - multi client operation.

Remarks

None.

DRV_USART_INDEX Macro

USART Static Index selection.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INDEX DRV_USART_INDEX_2
```

Description

Index - Used for static drivers

USART Static Index selection for the driver object reference. This macro defines the driver index for static and static multi-client builds. For example, if this macro is set to DRV_USART_INDEX_2, the static driver APIs would be DRV_USART2_Initialize, DRV_USART2_Open, etc. When building static drivers, this macro should be different for each static build of the USART driver that needs to be included in the project.

Remarks

This index is required to make a reference to the driver object

DRV_USART_INTERRUPT_MODE Macro

Macro controls interrupt based operation of the driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_MODE true
```

Description

USART Interrupt Mode Operation Control

This macro controls the interrupt based operation of the driver. The possible values are:

- true - Enables the interrupt mode
- false - Enables the polling mode

If the macro value is true, the Interrupt Service Routine (ISR) for the interrupt should be defined in the system. The DRV_USART_Tasks routine should be called in the ISR. While using the USART driver with DMA, this flag should always be true.

Remarks

None.

DRV_USART_INTERRUPT_SOURCE_ERROR Macro

Defines the error interrupt source for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_SOURCE_ERROR INT_SOURCE_USART_2_ERROR
```

Description

Error Interrupt Source

This macro defines the Error interrupt source for the static driver. The interrupt source defined by this macro will override the errorInterruptSource member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the USART module error interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_USART_PERIPHERAL_ID Macro

Configures the USART PLIB Module ID.

File

drv_usart_config_template.h

C

```
#define DRV_USART_PERIPHERAL_ID USART_ID_2
```

Description

USART Peripheral Library Module ID

This macro configures the PLIB ID if the driver is built statically. This value will override the usartID member of the DRV_USART_INIT initialization data structure. In that when the driver is built statically, the usartID member of the DRV_USART_INIT data structure will be ignored by the driver initialization routine and this macro will be considered. This should be set to the PLIB ID of USART module (USART_ID_1, USART_ID_2, and so on).

Remarks

None.

DRV_USART_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INSTANCES_NUMBER 2
```

Description

USART driver objects configuration

This macro sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of USART modules that are needed by the application, as hardware Instance support consumes RAM memory space. If this macro is not defined, the driver will be built statically.

Remarks

None

DRV_USART_BUFFER_QUEUE_SUPPORT Macro

Specifies if the Buffer Queue support should be enabled.

File

drv_usart_config_template.h

C

```
#define DRV_USART_BUFFER_QUEUE_SUPPORT true
```

Description

USART Driver Buffer Queue Support

This macro defines whether or not Buffer Queue support should be enabled. Setting this macro to true will enable buffer queue support and all buffer related driver function. The driver should be built along with the drv_usart_buffer_queue.c file, which contains the functional implementation for buffer queues. If buffer queue operation is enabled, the DRV_USART_BYTE_MODEL_SUPPORT function should not be true. If this macro is set to false, the behavior of the USART Driver Buffer Queue API is not defined. While using the USART driver with DMA, the driver supports Buffer Queue Data transfer model regardless of the value of this configuration macro.

Remarks

None.

DRV_USART_BYTE_MODEL_SUPPORT Macro

Specifies if the Byte Model support should be enabled.

File

drv_usart_config_template.h

C

```
#define DRV_USART_BYTE_MODEL_SUPPORT false
```

Description

USART Driver Byte Model Support

This macro defines whether or Byte Model support should be enabled. Setting this macro to true will enable byte model support and all byte operation related driver functions. The driver should be built along with the drv_usart_byte_model.c file, which contains the functional implementation for byte model operation. If byte model operation is enabled, the driver will not support buffer queue and read write models. The

behavior of the byte mode API when this macro is set to false is not defined.

Remarks

None.

DRV_USART_INTERRUPT_SOURCE_RECEIVE Macro

Defines the Receive interrupt source for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_SOURCE_RECEIVE INT_SOURCE_USART_2_RECEIVE
```

Description

Receive Interrupt Source

This macro defines the Receive interrupt source for the static driver. The interrupt source defined by this macro will override the rxInterruptSource member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the USART module receive interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_USART_INTERRUPT_SOURCE_RECEIVE_DMA Macro

Defines the Receive DMA Channel interrupt source for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_SOURCE_RECEIVE_DMA
```

Description

Receive DMA Channel Interrupt Source

This macro defines the Receive DMA Channel interrupt source for the static driver. The interrupt source defined by this macro will override the dmaInterruptReceive member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_USART_INTERRUPT_SOURCE_TRANSMIT Macro

Defines the Transmit interrupt source for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_SOURCE_TRANSMIT INT_SOURCE_USART_2_TRANSMIT
```

Description

Transmit Interrupt Source

This macro defines the TX interrupt source for the static driver. The interrupt source defined by this macro will override the txInterruptSource member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the USART module transmit interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_USART_INTERRUPT_SOURCE_TRANSMIT_DMA Macro

Defines the Transmit DMA Channel interrupt source for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_SOURCE_TRANSMIT_DMA
```

Description

Transmit DMA Channel Interrupt Source

This macro defines the TX DMA Channel interrupt source for the static driver. The interrupt source defined by this macro will override the dmaInterruptTransmit member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_USART_QUEUE_DEPTH_COMBINED Macro

Defines the number of entries of all queues in all instances of the driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_QUEUE_DEPTH_COMBINED 16
```

Description

USART Driver Instance combined queue depth.

This macro defines the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for transmit and receive operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build). The hardware instance transmit buffer queue will queue transmit buffers submitted by the DRV_USART_BufferAddWrite function. The hardware instance receive buffer queue will queue receive buffers submitted by the DRV_USART_BufferAddRead function.

A buffer queue will contain buffer queue entries, with each related to a BufferAdd request. This configuration macro defines the total number of buffer entries that will be available for use between all USART driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking read and write requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. The greater the number of buffer entries, the greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its transmit and receive buffer queue size.

For example, consider the case of static single client driver application where full duplex non blocking operation is desired without queuing, the minimum transmit queue depth and minimum receive queue depth should be 1. Therefore, the total number of buffer entries should be 2.

As another example, consider the case of a dynamic driver (i.e., two instances) where instance 1 will queue up to three write requests and up to two read requests, and instance 2 will queue up to two write requests and up to six read requests, the value of this macro should be: 13 (2 + 3 + 2 + 6).

Remarks

None.

DRV_USART_READ_WRITE_MODEL_SUPPORT Macro

Specifies if Read/Write Model support should be enabled.

File

drv_usart_config_template.h

C

```
#define DRV_USART_READ_WRITE_MODEL_SUPPORT true
```

Description

USART Driver Read Write Model Support

This macro defines whether or not Read Write Model support should be enabled. Setting this macro to true will enable read write model support and all read/write related driver functions. The driver should be built along with the drv_usart_read_write.c file, which contains the functional implementation for byte model operation. If read/write model operation is enabled, the DRV_USART_BYTE_MODEL_SUPPORT macro should not be true. The behavior of the Read Write Model API when this macro is set to false is not defined.

Remarks

None.

DRV_USART_RECEIVE_DMA Macro

Defines the USART Driver Receive DMA Channel for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_RECEIVE_DMA
```

Description

USART Driver Receive DMA Channel

This macro defines the USART Receive DMA Channel for the static driver. The DMA channel defined by this macro will override the dmaReceive member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel in the DMA PLIB for the microcontroller.

Remarks

None.

DRV_USART_TRANSMIT_DMA Macro

Defines the USART Driver Transmit DMA Channel in case of static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_TRANSMIT_DMA
```

Description

USART Driver Transmit DMA Channel

This macro defines the USART Transmit DMA Channel for the static driver. The DMA channel defined by this macro will override the dmaTransmit member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel in the DMA PLIB for the microcontroller.

Remarks

None.

DRV_USART_BAUD_RATE_IDXn Macro

Specifies the USART Baud at which the USART driver is initialized.

File

drv_usart_config_template.h

C

```
#define DRV_USART_BAUD_RATE_IDXn
```

Description

USART Driver Baud Selection.

This configuration constant specifies the baud rate at which the USART Driver is initialized. This is the baud rate at which the USART module will operate when the driver initialization has completed. The driver client can call the DRV_USART_BaudSet function after opening the driver to change the USART baud rate after initialization has completed.

Remarks

This constant is automatically generated by MHC and its value is set to the value specified in USART Driver Baud Selection field.

DRV_USART_BYTE_MODEL_BLOCKING Macro

Enables or Disables DRV_USART_ByteWrite function blocking behavior.

File

drv_usart_config_template.h

C

```
#define DRV_USART_BYTE_MODEL_BLOCKING
```

Description

USART Driver Byte Write Blocking Behavior

This USART Driver MHC option controls the blocking behavior of the DRV_USART_ByteWrite function and is only applicable when the USART Driver Byte Transfer model is selected. Selecting this option will cause the DRV_USART_ByteWrite function to block until the byte has been written to the USART Transmit FIFO. Blocking behavior is enabled by default (to enable backward compatibility with previous versions of the driver). This option can be used for simple applications where interoperability with other MPLAB Harmony modules is not a design concern.

If the application uses several other MPLAB Harmony modules (Middleware, File System, etc.), it is recommended to disable this option and use the non-blocking DRV_USART_ByteWrite function. This requires the application to call the DRV_USART_TransmitBufferIsFull function to check if the byte can be written to the USART, as shown in the following code example.

```
if(!DRV_USART_TransmitBufferIsFull(usartHandle1))
{
    byte = '1';
    DRV_USART_WriteByte(usartHandle1,byte);
}
```

Using the non-blocking implementation results in improved application interoperability with other MPLAB Harmony modules.

Remarks

The DRV_USART_BYTE_MODEL_BLOCKING constant is specified for documentation purposes only. It does not affect the configuration of the driver.

DRV_USART_BYTE_MODEL_CALLBACK Macro

Enables or Disables Callback Feature of the Byte Transfer Model.

File

drv_usart_config_template.h

C

```
#define DRV_USART_BYTE_MODEL_CALLBACK
```

Description

USART Driver Byte Model Callback Feature.

This USART Driver MHC option controls the Callback feature of the Byte Transfer model. Selecting this option allows an application to register Byte Transfer Event Callback functions with the driver. These callback functions are invoked on the occurrence of Byte Transfer events. Callback functions can be registered to Byte Transmit, Byte Receive, and USART Error events, as shown in the following code example.

```
// This code shows how a callback function is
// registered for the Byte Receive event.
DRV_USART_ByteReceiveCallbackSet(DRV_USART_INDEX_0, APP_USARTReceiveEventHandler);

// Event Processing Technique. Event is received when
// a byte is received.

void APP_USARTReceiveEventHandler(const SYS_MODULE_INDEX index)
{
```

```
        // Byte has been Received. Handle the event.
        // Read byte using DRV_USART_ReadByte.
    }
```

When operating in Interrupt mode, the callback functions are invoked in an interrupt context. If this option is not selected, the application must use the DRV_USART_TransmitBufferIsFull, DRV_USART_ReceiverBufferIsEmpty, and DRV_USART_ErrorGet functions to check the status of Byte transmit or receive.

Remarks

The DRV_USART_BYTE_MODEL_CALLBACK constant is specified for documentation purposes only. It does not affect the configuration of the driver.

DRV_USART_RCV_QUEUE_SIZE_IDXn Macro

Sets the USART Driver Receive Queue Size while using the Buffer Queue Data Transfer Model.

File

drv_usart_config_template.h

C

```
#define DRV_USART_RCV_QUEUE_SIZE_IDXn
```

Description

USART Driver Receive Queue Size Selection.

This constant sets the USART Driver Receive queue size when using the Buffer Queue Data Transfer Model. It affects the queuing capacity of the DRV_USART_BufferAddRead function for the selected driver instance. For example, if this option is set to 5 for USART Driver 0, USART Driver 0 can then queue up to a maximum of five driver client receive buffer requests from any driver clients.

Therefore, if USART Driver 0 has two clients and if client 1 has queued up three buffers for receive, client 2 can only queue up to two buffers. If the client attempts to queue up more buffers, DRV_USART_BufferAddRead will not accept the request and will generate an invalid buffer handle (DRV_USART_BUFFER_HANDLE_INVALID).

Remarks

This constant is automatically generated by MHC and its value is set to the value specified in USART Driver Receive Queue Size field.

DRV_USART_XMIT_QUEUE_SIZE_IDXn Macro

Sets the USART Driver Transmit Queue Size while using the Buffer Queue Data Transfer Model.

File

drv_usart_config_template.h

C

```
#define DRV_USART_XMIT_QUEUE_SIZE_IDXn
```

Description

USART Driver Transmit Queue Size Selection.

This constant sets the USART Driver Transmit queue size when using the Buffer Queue Data Transfer Model. It affects the queuing capacity of the DRV_USART_BufferAddWrite function, for the selected driver instance. For example, if this option is set to 5 for USART Driver 0, USART Driver 0 can then queue up to a maximum of five driver client transmit buffer requests from any driver clients.

Therefore if USART Driver 0 has two clients and if client 1 has queued up three buffers for transmit, client 2 can only queue up to two buffers. If the client attempts to queue up more buffers, DRV_USART_BufferAddWrite will not accept the request and will generate an invalid buffer handle (DRV_USART_BUFFER_HANDLE_INVALID).

Remarks

This constant is automatically generated by MHC and its value is set to the value specified in USART Driver Transmit Queue Size field.

Building the Library

This section lists the files that are available in the USART Driver Library.

Description

This section list the files that are available in the \src folder of the USART Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/usart`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_usart.h`	This file should be included by any .c file which accesses the USART Driver API. This one file contains the prototypes for all driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_usart.c`	This file should always be included in the project when using the USART Driver.
`/src/dynamic/drv_usart_dma.c`	This file should always be included in the project when using the USART driver with DMA.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
`/src/dynamic/drv_usart_byte_model.c`	This file should be included in the project if the USART Driver Byte Model API is required.
`/src/dynamic/drv_usart_buffer_queue.c`	This file should be included in the project if the USART Driver Buffer Queue Model API (without DMA) is required.
`/src/dynamic/drv_usart_read_write.c`	This file should be included in the project if the USART Driver Read Write Model API is required.
`/src/dynamic/drv_usart_buffer_queue_dma.c`	This file should be included in the project if the USART Driver Buffer Queue Model API with DMA is required.

Module Dependencies

The USART Driver Library depends on the following modules:

- Interrupt System Service Library
- DMA System Service Library (if USART Driver is configured to use DMA)

Library Interface

a) System Functions

	Name	Description
	DRV_USART_Initialize	Initializes the USART instance for the specified driver index. **Implementation:** Static/Dynamic
	DRV_USART_Deinitialize	Deinitializes the specified instance of the USART driver module. **Implementation:** Static/Dynamic
	DRV_USART_Status	Gets the current status of the USART driver module. **Implementation:** Static/Dynamic
	DRV_USART_TasksReceive	Maintains the driver's receive state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_USART_TasksTransmit	Maintains the driver's transmit state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_USART_TasksError	Maintains the driver's error state machine and implements its ISR. **Implementation:** Static/Dynamic

b) Core Client Functions

	Name	Description
	DRV_USART_Open	Opens the specified USART driver instance and returns a handle to it. **Implementation:** Static/Dynamic
	DRV_USART_Close	Closes an opened-instance of the USART driver. **Implementation:** Static/Dynamic
	DRV_USART_ClientStatus	Gets the current client-specific status the USART driver. **Implementation:** Static/Dynamic
	DRV_USART_ErrorGet	This function returns the error(if any) associated with the last client request. **Implementation:** Static/Dynamic

c) Communication Management Client Functions

	Name	Description
	DRV_USART_BaudSet	This function changes the USART module baud to the specified value. **Implementation:** Static/Dynamic
	DRV_USART_LineControlSet	This function changes the USART module line control to the specified value. **Implementation:** Static/Dynamic

d) Buffer Queue Read/Write Client Functions

	Name	Description
	DRV_USART_BufferAddRead	Schedule a non-blocking driver read operation. **Implementation:** Static/Dynamic
	DRV_USART_BufferAddWrite	Schedule a non-blocking driver write operation. **Implementation:** Static/Dynamic
	DRV_USART_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. **Implementation:** Static/Dynamic
	DRV_USART_BufferProcessedSizeGet	This API will be deprecated and not recommended to use. Use DRV_USART_BufferCompletedBytesGet to get the number of bytes processed for the specified buffer.
	DRV_USART_AddressedBufferAddWrite	Schedule a non-blocking addressed driver write operation. **Implementation:** Dynamic
	DRV_USART_BufferCompletedBytesGet	Returns the number of bytes that have been processed for the specified buffer. **Implementation:** Static/Dynamic
	DRV_USART_BufferRemove	Removes a requested buffer from the queue. **Implementation:** Static/Dynamic

e) File I/O Type Read/Write Functions

	Name	Description
	DRV_USART_Read	Reads data from the USART. **Implementation:** Static/Dynamic
	DRV_USART_Write	Writes data to the USART. **Implementation:** Static/Dynamic

f) Byte Transfer Functions

	Name	Description
	DRV_USART_ReadByte	Reads a byte of data from the USART. **Implementation:** Static/Dynamic
	DRV_USART_WriteByte	Writes a byte of data to the USART. **Implementation:** Static/Dynamic
	DRV_USART_TransmitBufferSizeGet	Returns the size of the transmit buffer. **Implementation:** Static/Dynamic
	DRV_USART_ReceiverBufferSizeGet	Returns the size of the receive buffer. **Implementation:** Static/Dynamic
	DRV_USART_TransferStatus	Returns the transmitter and receiver transfer status. **Implementation:** Static/Dynamic
	DRV_USART_TransmitBufferIsFull	Provides the status of the driver's transmit buffer. **Implementation:** Static/Dynamic

	DRV_USART_ReceiverBufferIsEmpty	Provides the status of the driver's receive buffer. **Implementation:** Static/Dynamic
	DRV_USART_ByteErrorCallbackSet	Registers callback to handle for byte error events.
	DRV_USART_ByteReceiveCallbackSet	Registers receive callback function for byte receive event.
	DRV_USART_ByteTransmitCallbackSet	Registers a callback function for byte transmit event.

g) Data Types and Constants

	Name	Description
	DRV_USART_CLIENT_STATUS	Defines the client-specific status of the USART driver.
	DRV_USART_INIT	Defines the data required to initialize or reinitialize the USART driver
	DRV_USART_INIT_FLAGS	Flags identifying features that can be enabled when the driver is initialized.
	DRV_USART_TRANSFER_STATUS	Specifies the status of the receive or transmit
	DRV_USART_INDEX_0	USART driver index definitions
	DRV_USART_INDEX_1	This is macro DRV_USART_INDEX_1.
	DRV_USART_INDEX_2	This is macro DRV_USART_INDEX_2.
	DRV_USART_INDEX_3	This is macro DRV_USART_INDEX_3.
	DRV_USART_INDEX_4	This is macro DRV_USART_INDEX_4.
	DRV_USART_INDEX_5	This is macro DRV_USART_INDEX_5.
	DRV_USART_BAUD_SET_RESULT	Identifies the handshaking modes supported by the USART driver.
	DRV_USART_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_USART_BUFFER_EVENT_HANDLER	Pointer to a USART Driver Buffer Event handler function
	DRV_USART_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.
	DRV_USART_ERROR	Defines the possible errors that can occur during driver operation.
	DRV_USART_LINE_CONTROL_SET_RESULT	Identifies the results of the baud set function.
	DRV_USART_OPERATION_MODE_DATA	Defines the initialization data required for different operation modes of USART.
	DRV_USART_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_USART_COUNT	Number of valid USART drivers
	DRV_USART_READ_ERROR	USART Driver Read Error.
	DRV_USART_WRITE_ERROR	USART Driver Write Error.
	DRV_USART_LINE_CONTROL	Identifies the line control modes supported by the USART driver.
	DRV_USART_OPERATION_MODE	Identifies the modes of the operation of the USART module
	DRV_USART_BYTE_EVENT_HANDLER	Pointer to a USART Driver Byte Event handler function
	DRV_USART_BUFFER_RESULT	Identifies the possible result of the buffer processing.

Description

This section describes the functions of the USART Driver Library.

Refer to each section for a detailed description.

a) System Functions

DRV_USART_Initialize Function

Initializes the USART instance for the specified driver index.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
SYS_MODULE_OBJ DRV_USART_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the USART driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data

is specified by the init parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the USART module ID. For example, driver instance 0 can be assigned to USART2. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_USART_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other USART routine is called.

This routine should only be called once during system initialization unless DRV_USART_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
// The following code snippet shows an example USART driver initialization.
// The driver is initialized for normal mode and a baud of 300. The
// receive queue size is set to 2 and transmit queue size is set to 3.

DRV_USART_INIT              usartInit;
SYS_MODULE_OBJ              objectHandle;

usartInit.baud  = 300;
usartInit.mode  = DRV_USART_OPERATION_MODE_NORMAL;
usartInit.flags = DRV_USART_INIT_FLAG_NONE;
usartInit.usartID   = USART_ID_2;
usartInit.brgClock  = 80000000;
usartInit.handshake = DRV_USART_HANDSHAKE_NONE;
usartInit.lineControl       = DRV_USART_LINE_CONTROL_8NONE1;
usartInit.interruptError    = INT_SOURCE_USART_2_ERROR;
usartInit.interruptReceive  = INT_SOURCE_USART_2_RECEIVE;
usartInit.queueSizeReceive  = 2;
usartInit.queueSizeTransmit = 3;
usartInit.interruptTransmit = INT_SOURCE_USART_2_TRANSMIT;
usartInit.moduleInit.value  = SYS_MODULE_POWER_RUN_FULL;

objectHandle = DRV_USART_Initialize(DRV_USART_INDEX_1, (SYS_MODULE_INIT*)&usartInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_USART_Initialize

(

const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init

)

DRV_USART_Deinitialize Function

Deinitializes the specified instance of the USART driver module.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the USART driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This routine will NEVER block waiting for hardware.

Preconditions

Function DRV_USART_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_USART_Initialize
SYS_STATUS          status;

DRV_USART_Deinitialize(object);

status = DRV_USART_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USART_Initialize routine

Function

void DRV_USART_Deinitialize(SYS_MODULE_OBJ object)

DRV_USART_Status Function

Gets the current status of the USART driver module.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
SYS_STATUS DRV_USART_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_DEINITIALIZED - Indicates that the driver has been deinitialized

Description

This routine provides the current status of the USART driver module.

Remarks

A driver can opened only when its status is SYS_STATUS_READY.

Preconditions

Function DRV_USART_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USART_Initialize
SYS_STATUS          usartStatus;

usartStatus = DRV_USART _Status(object);
```

```
if (SYS_STATUS_READY == usartStatus)
{
    // This means the driver can be opened using the
    // DRV_USART_Open() function.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USART_Initialize routine

Function

SYS_STATUS DRV_USART_Status(SYS_MODULE_OBJ object)

DRV_USART_TasksReceive Function

Maintains the driver's receive state machine and implements its ISR.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_TasksReceive(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal receive state machine and implement its receive ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks function. In interrupt mode, this function should be called in the receive interrupt service routine of the USART that is associated with this USART driver hardware instance.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USART_Initialize

while (true)
{
    DRV_USART_TasksReceive (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USART_Initialize)

Function

void DRV_USART_TasksReceive (SYS_MODULE_OBJ object);

DRV_USART_TasksTransmit Function

Maintains the driver's transmit state machine and implements its ISR.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_TasksTransmit(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal transmit state machine and implement its transmit ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks function. In interrupt mode, this function should be called in the transmit interrupt service routine of the USART that is associated with this USART driver hardware instance.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USART_Initialize

while (true)
{
    DRV_USART_TasksTransmit (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USART_Initialize)

Function

void DRV_USART_TasksTransmit (SYS_MODULE_OBJ object);

DRV_USART_TasksError Function

Maintains the driver's error state machine and implements its ISR.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_TasksError(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal error state machine and implement its error ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks function. In interrupt mode, this function should be called in the error interrupt service routine of the USART that is associated with this USART driver hardware instance.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USART_Initialize

while (true)
{
    DRV_USART_TasksError (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USART_Initialize)

Function

void DRV_USART_TasksError (SYS_MODULE_OBJ object);

b) Core Client Functions

DRV_USART_Open Function

Opens the specified USART driver instance and returns a handle to it.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_HANDLE DRV_USART_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Error can occur

- if the number of client objects allocated via DRV_USART_CLIENTS_NUMBER is insufficient.
- if the client is trying to open the driver but driver has been opened exclusively by another client.
- if the driver hardware instance being opened is not initialized or is invalid.
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.
- if the driver is not ready to be opened, typically when the initialize routine has not completed execution.

Description

This routine opens the specified USART driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The DRV_IO_INTENT_BLOCKING and DRV_IO_INTENT_NONBLOCKING ioIntent options additionally affect the behavior of the DRV_USART_Read and DRV_USART_Write functions. If the ioIntent is DRV_IO_INTENT_NONBLOCKING, then these function will not block even if the required amount of data could not be processed. If the ioIntent is DRV_IO_INTENT_BLOCKING, these functions will block until the required amount of data is processed. If the driver is configured for polling and bare-metal operation, it will not support DRV_IO_INTENT_BLOCKING. The driver will operation will always be non-blocking.

If ioIntent is DRV_IO_INTENT_READ, the client will only be able to read from the driver. If ioIntent is DRV_IO_INTENT_WRITE, the client will only be able to write to the driver. If the ioIntent is DRV_IO_INTENT_READWRITE, the client will be able to do both, read and write.

Specifying a DRV_IO_INTENT_EXCLUSIVE will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Remarks

The handle returned is valid until the DRV_USART_Close routine is called. This routine will NEVER block waiting for hardware.If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application.

Preconditions

Function DRV_USART_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_USART_Open(DRV_USART_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver. See function description for details.

Function

```
  DRV_HANDLE DRV_USART_Open
(
const    SYS_MODULE_INDEX index,
const    DRV_IO_INTENT ioIntent
)
```

DRV_USART_Close Function

Closes an opened-instance of the USART driver.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This routine closes an opened-instance of the USART driver, invalidating the handle. Any buffers in the driver queue that were submitted by this client will be removed. After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines (with one possible exception described in the "Remarks" section). A new handle must be obtained by calling DRV_USART_Open before the caller may use the driver again

Remarks

Usually there is no need for the client to verify that the Close operation has completed. The driver will abort any ongoing operations when this routine is called. However, if it requires additional time to do so in a non-blocking environment, it will still return from the Close operation but the handle is now a zombie handle. The client can only call the DRV_USART_ClientStatus on a zombie handle to track the completion of the Close operation. The DRV_USART_ClientStatus routine will return DRV_CLIENT_STATUS_CLOSED when the close operation has completed.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_USART_Open

DRV_USART_Close(handle);
```

```
// After this point, the handle cannot be used with any other function
// except the DRV_USART_ClientStatus function, which can be used to query
// the success status of the DRV_USART_Close function.

while(DRV_USART_CLIENT_STATUS_CLOSED != DRV_USART_ClientStatus(handle));
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_USART_Close(DRV_Handle handle)

DRV_USART_ClientStatus Function

Gets the current client-specific status the USART driver.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_CLIENT_STATUS DRV_USART_ClientStatus(DRV_HANDLE handle);
```

Returns

A DRV_USART_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the USART driver associated with the given handle. This function can be used to check the status of client after the DRV_USART_Close() function has been called.

Remarks

This function will not block for hardware access and will immediately return the current status. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize function must have been called.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE              handle;  // Returned from DRV_USART_Open
DRV_USART_CLIENT_STATUS   status;

status = DRV_USART_ClientStatus(handle);
if( DRV_USART_CLIENT_STATUS_CLOSED != status )
{
    // The client had not closed.
}
```

Parameters

Parameters	Description
handle	Handle returned from the driver's open function.

Function

DRV_USART_CLIENT_STATUS DRV_USART_ClientStatus(DRV_HANDLE handle)

DRV_USART_ErrorGet Function

This function returns the error(if any) associated with the last client request.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_ERROR DRV_USART_ErrorGet(const DRV_HANDLE client);
```

Returns

A DRV_USART_ERROR type indicating last known error status.

Description

This function returns the error(if any) associated with the last client request. DRV_USART_Read and DRV_USART_Write will update the client error status when these functions return DRV_USART_TRANSFER_ERROR. If the driver send a DRV_USART_BUFFER_EVENT_ERROR to the client, the client can call this function to know the error cause. The error status will be updated on every operation and should be read frequently (ideally immediately after the driver operation has completed) to know the relevant error status.

Remarks

It is the client's responsibility to make sure that the error status is obtained frequently. The driver will update the client error status regardless of whether this has been examined by the client. This function is thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver. This is done once.

DRV_USART_BufferEventHandlerSet( myUSARTHandle, APP_USARTBufferEventHandle,
                                 (uintptr_t)&myAppObj );

bufferHandle = DRV_USART_BufferAddRead( myUSARThandle,
                                        myBuffer, MY_BUFFER_SIZE );

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler( DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle )
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;
    size_t processedBytes;

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_SUCCESS:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_FAILURE:
```

```
            // Error handling here.
            // We can find out how many bytes were processed in this
            // buffer before the error occurred. We can also find
            // the error cause.

            processedBytes = DRV_USART_BufferCompletedBytesGet(bufferHandle);
            if(DRV_USART_ERROR_RECEIVE_OVERRUN == DRV_USART_ErrorGet(myUSARTHandle))
            {
                // There was an receive over flow error.
                // Do error handling here.
            }

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferhandle	Handle of the buffer of which the processed number of bytes to be obtained.

Function

DRV_USART_ERROR DRV_USART_ErrorGet(DRV_HANDLE client);

c) Communication Management Client Functions

DRV_USART_BaudSet Function

This function changes the USART module baud to the specified value.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_BAUD_SET_RESULT DRV_USART_BaudSet(const DRV_HANDLE client, uint32_t baud);
```

Returns

None.

Description

This function changes the USART module baud to the specified value. Any queued buffer requests will be processed at the updated baud. The USART driver operates at the baud specified in DRV_USART_Initialize function unless the DRV_USART_BaudSet function is called to change the baud.

Remarks

The implementation of this function, in this release of the driver, changes the baud immediately. This may interrupt on-going data transfer. It is recommended that the driver be opened exclusively if this function is to be called. This function is thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

DRV_USART_BaudSet(myUSARTHandle, 9600);
```

Parameters

Parameters	Description
handle	client handle returned by DRV_USART_Open function.
baud	desired baud.

Function

void DRV_USART_BaudSet(DRV_HANDLE client, uint32_t baud);

DRV_USART_LineControlSet Function

This function changes the USART module line control to the specified value.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_LINE_CONTROL_SET_RESULT DRV_USART_LineControlSet(const DRV_HANDLE client, const
DRV_USART_LINE_CONTROL lineControl);
```

Returns

DRV_USART_LINE_CONTROL_SET_SUCCESS if the function was successful. Returns DRV_HANDLE_INVALID if the client handle is not valid.

Description

This function changes the USART module line control parameters to the specified value. Any queued buffer requests will be processed at the updated line control parameters. The USART driver operates at the line control parameters specified in DRV_USART_Initialize function unless the DRV_USART_LineControlSet function is called to change the line control parameters.

Remarks

The implementation of this function, in this release of the driver, changes the line control immediately. This may interrupt on-going data transfer. It is recommended that the driver be opened exclusively if this function is to be called. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

DRV_USART_LineControlSet(myUSARTHandle, DRV_USART_LINE_CONTROL_8NONE1);
```

Parameters

Parameters	Description
handle	client handle returned by DRV_USART_Open function.
lineControl	line control parameters.

Function

void DRV_USART_LineControlSet

(

DRV_HANDLE client,

DRV_USART_LINE_CONTROL lineControl

);

d) Buffer Queue Read/Write Client Functions

DRV_USART_BufferAddRead Function

Schedule a non-blocking driver read operation.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_BufferAddRead(const DRV_HANDLE handle, DRV_USART_BUFFER_HANDLE * const bufferHandle, void *
buffer, const size_t size);
```

Returns

The buffer handle is returned in the bufferHandle argument. This is DRV_USART_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation. The function returns with a valid buffer handle in the bufferHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance receive queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_USART_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_USART_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_USART_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the USART Driver Buffer Event Handler that is registered by the client. It should not be called in the event handler associated with another USART driver instance. It should not be called directly in an ISR.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART device instance and the DRV_USART_Status must have returned SYS_STATUS_READY.

DRV_USART_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_USART_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_USART_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver

DRV_USART_BufferEventHandlerSet(myUSARTHandle,
                APP_USARTBufferEventHandler, (uintptr_t)&myAppObj);

DRV_USART_BufferAddRead(myUSARThandle, &bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler(DRV_USART_BUFFER_EVENT event,
```

```
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the communication channel as returned by the DRV_USART_Open function.
buffer	Buffer where the received data will be stored.
size	Buffer size in bytes.

Function

void DRV_USART_BufferAddRead
(
const DRV_HANDLE handle,
DRV_USART_BUFFER_HANDLE * bufferHandle,
void * buffer,
const size_t size
)

DRV_USART_BufferAddWrite Function

Schedule a non-blocking driver write operation.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_BufferAddWrite(const DRV_HANDLE handle, DRV_USART_BUFFER_HANDLE * bufferHandle, void *
buffer, const size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_USART_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking write operation. The function returns with a valid buffer handle in the bufferHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance transmit queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. On returning, the bufferHandle parameter may be DRV_USART_BUFFER_HANDLE_INVALID for the following reasons:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read-only
- if the buffer size is 0

- if the transmit queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_USART_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or a DRV_USART_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the USART Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another USART driver instance. It should not otherwise be called directly in an ISR.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART device instance and the DRV_USART_Status must have returned SYS_STATUS_READY.

DRV_USART_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_USART_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver

DRV_USART_BufferEventHandlerSet(myUSARTHandle,
                APP_USARTBufferEventHandler, (uintptr_t)&myAppObj);

DRV_USART_BufferAddWrite(myUSARThandle, &bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler(DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the communication channel as return by the DRV_USART_Open function.
bufferHandle	Pointer to an argument that will contain the return buffer handle.

buffer	Data to be transmitted.
size	Buffer size in bytes.

Function

void DRV_USART_BufferAddWrite
(
const DRV_HANDLE handle,
DRV_USART_BUFFER_HANDLE * bufferHandle,
void * buffer,
size_t size
);

DRV_USART_BufferEventHandlerSet Function

Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_BufferEventHandlerSet(const DRV_HANDLE handle, const DRV_USART_BUFFER_EVENT_HANDLER
eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. When a client calls either the DRV_USART_BufferAddRead or DRV_USART_BufferAddWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "buffer add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued buffer transfer has completed, it does not need to register a callback. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_USART_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver. This is done once

DRV_USART_BufferEventHandlerSet( myUSARTHandle, APP_USARTBufferEventHandle,
                                 (uintptr_t)&myAppObj );

DRV_USART_BufferAddRead(myUSARThandle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
```

```
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler(DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_SUCCESS:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_FAILURE:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_USART_BufferEventHandlerSet

(

const DRV_HANDLE handle,

const DRV_USART_BUFFER_EVENT_HANDLER eventHandler,

const uintptr_t context

)

DRV_USART_BufferProcessedSizeGet Function

This API will be deprecated and not recommended to use. Use DRV_USART_BufferCompletedBytesGet to get the number of bytes processed for the specified buffer.

File

drv_usart.h

C

```
size_t DRV_USART_BufferProcessedSizeGet(DRV_USART_BUFFER_HANDLE bufferHandle);
```

Returns

None.

Description

None.

Remarks

None.

Preconditions

None.

Example

None.

Function

size_t DRV_USART_BufferProcessedSizeGet

(

DRV_USART_BUFFER_HANDLE bufferHandle

);

DRV_USART_AddressedBufferAddWrite Function

Schedule a non-blocking addressed driver write operation.

Implementation: Dynamic

File

drv_usart.h

C

```
void DRV_USART_AddressedBufferAddWrite(const DRV_HANDLE hClient, DRV_USART_BUFFER_HANDLE * bufferHandle,
uint8_t address, void * source, size_t nWords);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_USART_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking addressed write operation. The function returns with a valid buffer handle in the bufferHandle argument if the addressed write request was scheduled successfully. The function adds the request to the hardware instance transmit queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. On returning, the bufferHandle parameter may be DRV_USART_BUFFER_HANDLE_INVALID for the following reasons:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read-only
- if the buffer size is 0
- if the transmit queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_USART_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or a DRV_USART_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the USART Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another USART driver instance. It should not otherwise be called directly in an ISR.

The source buffer should be a 16-bit word aligned buffer. The 9th bit of the higher byte 16-bit buffer is used to indicate data/address.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART device instance and the DRV_USART_Status must have returned SYS_STATUS_READY.

DRV_USART_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_USART_Open call.

The operation mode of the driver must be DRV_USART_OPERATION_MODE_ADDRESSED.

Example

```
MY_APP_OBJ myAppObj;
uint16_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;
```

```
uint8_t clientAddress;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver

clientAddress = 0x60;
DRV_USART_BufferEventHandlerSet(myUSARTHandle,
                APP_USARTBufferEventHandler, (uintptr_t)&myAppObj);

DRV_USART_AddressedBufferAddWrite(myUSARThandle, &bufferHandle, clientAddress
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler(DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
hClient	Handle of the communication channel as return by the DRV_USART_Open function.
bufferHandle	Pointer to an argument that will contain the return buffer handle.
address	Address of the receiver client
source	Data to be transmitted.
size	Buffer size in 16-bit words.

Function

void DRV_USART_AddressedBufferAddWrite
(
const DRV_HANDLE hClient,
DRV_USART_BUFFER_HANDLE * bufferHandle,
uint8_t address,
void * source,
size_t nWords
);

DRV_USART_BufferCompletedBytesGet Function

Returns the number of bytes that have been processed for the specified buffer.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
size_t DRV_USART_BufferCompletedBytesGet(DRV_USART_BUFFER_HANDLE bufferHandle);
```

Returns

Returns the number of bytes that have been processed for this buffer.

Returns DRV_USART_BUFFER_HANDLE_INVALID for an invalid or an expired buffer handle.

Description

This function returns number of bytes that have been processed for the specified buffer. The client can use this function, in a case where the buffer has terminated due to an error, to obtain the number of bytes that have been processed. Or in any other use case.

Remarks

This function is thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Either the DRV_USART_BufferAddRead or DRV_USART_BufferAddWrite function must have been called and a valid buffer handle returned.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver. This is done once

DRV_USART_BufferEventHandlerSet( myUSARTHandle, APP_USARTBufferEventHandle,
                                 (uintptr_t)&myAppObj );

bufferHandle = DRV_USART_BufferAddRead( myUSARTHandle,
                                        myBuffer, MY_BUFFER_SIZE );

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler( DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle )
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;
    size_t processedBytes;

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_SUCCESS:
```

```
            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_FAILURE:

            // Error handling here.
            // We can find out how many bytes were processed in this
            // buffer before the error occurred.

            processedBytes = DRV_USART_BufferCompletedBytesGet(bufferHandle);

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferhandle	Handle for the buffer of which the processed number of bytes to be obtained.

Function

size_t DRV_USART_BufferCompletedBytesGet

(

DRV_USART_BUFFER_HANDLE bufferHandle

);

DRV_USART_BufferRemove Function

Removes a requested buffer from the queue.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_BUFFER_RESULT DRV_USART_BufferRemove(DRV_USART_BUFFER_HANDLE bufferHandle);
```

Returns

DRV_USART_BUFFER_RESULT_HANDLE_INVALID - Buffer handle is invalid.

DRV_USART_BUFFER_RESULT_HANDLE_EXPIRED - Buffer handle is expired.

DRV_USART_BUFFER_RESULT_REMOVED_SUCCESFULLY - Buffer is removed from the queue successfully.

DRV_USART_BUFFER_RESULT_REMOVAL_FAILED - Failed to remove buffer from the queue because of mutex timeout in RTOS environment.

Description

This function removes a specified buffer from the queue. The client can use this function to delete

1. An unwated stalled buffer.
2. Queued buffers on timeout.

or in any other use case.

Remarks

This function is thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Either the DRV_USART_BufferAddRead or DRV_USART_BufferAddWrite function must have been called and a valid buffer handle returned.

Example

```
// myAppObj is an application specific object.
```

```
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver. This is done once

DRV_USART_BufferEventHandlerSet( myUSARTHandle, APP_USARTBufferEventHandle,
                                 (uintptr_t)&myAppObj );

bufferHandle = DRV_USART_BufferAddRead( myUSARThandle,
                                        myBuffer, MY_BUFFER_SIZE );

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler( DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle )
{
    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_SUCCESS:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_FAILURE:

            // Error handling here.

            break;

        default:
            break;
    }
}

// Timeout function, where remove queued buffer if it still exists.
void APP_TimeOut(void)
{
    DRV_USART_BUFFER_RESULT bufferResult;
    bufferResult = DRV_USART_BufferRemove(bufferHandle);

    if(DRV_USART_BUFFER_RESULT_REMOVED_SUCCESFULLY == bufferResult)
    {
        //Buffer removed succesfully from the queue
    }
    else
    {
        //Either buffer is invalid or expired.
        //Or not able to acquire mutex in RTOS mode.
    }
}
```

Parameters

Parameters	Description
bufferhandle	Handle of the buffer to delete.

Function

DRV_USART_BUFFER_RESULT DRV_USART_BufferRemove(DRV_USART_BUFFER_HANDLE bufferHandle)

e) File I/O Type Read/Write Functions

DRV_USART_Read Function

Reads data from the USART.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
size_t DRV_USART_Read(const DRV_HANDLE handle, void * buffer, const size_t numbytes);
```

Returns

Number of bytes actually copied into the caller's buffer. Returns DRV_USART_READ_ERROR in case of an error.

Description

This routine reads data from the USART. This function is blocking if the driver was opened by the client for blocking operation. This function will not block if the driver was opened by the client for non blocking operation. If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_BLOCKING, this function will only return when (or will block until) numbytes of bytes have been received or if an error occurred. If there are buffers queued for receiving data, these buffers will be serviced first. The function will not return until the requested number of bytes have been read.

If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_NON_BLOCKING, this function will return with the number of bytes that were actually read. The function will not wait until numBytes of bytes have been read. If there are buffer queued for reading data, then the function will not block and will return immediately with 0 bytes read.

Remarks

This function is thread safe in a RTOS application. If the driver is configured for polled operation, this it will not support blocking operation in a bare metal (non-RTOS) application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_USART_Open call.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
char            myBuffer[MY_BUFFER_SIZE];
unsigned int    count;
unsigned int    total;

total = 0;
do
{
    count  = DRV_USART_Read(myUSARTHandle, &myBuffer[total], MY_BUFFER_SIZE - total);
    if(count == DRV_USART_READ_ERROR)
    {
       // There was an error. The DRV_USART_ErrorGet() function
       // can be called to find the exact error.
    }
    total += count;

    // Do something else...

} while( total < MY_BUFFER_SIZE );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
buffer	Buffer into which the data read from the USART instance will be placed.

numbytes	Total number of bytes that need to be read from the module instance (must be equal to or less than the size of the buffer)

Function

size_t DRV_USART_Read
(
const DRV_HANDLE handle,
void * buffer,
const size_t numbytes
)

DRV_USART_Write Function

Writes data to the USART.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
size_t DRV_USART_Write(const DRV_HANDLE handle, void * buffer, const size_t numbytes);
```

Returns

Number of bytes actually written to the driver. Return DRV_USART_WRITE_ERROR in case of an error.

Description

This routine writes data to the USART. This function is blocking if the driver was opened by the client for blocking operation. This function will not block if the driver was opened by the client for non blocking operation. If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_BLOCKING, this function will only return when (or will block until) numbytes of bytes have been transmitted or if an error occurred. If there are buffers queued for writing, the function will wait until all the preceding buffers are completed. Ongoing buffer transmit operations will not be affected.

If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_NON_BLOCKING, this function will return with the number of bytes that were actually accepted for transmission. The function will not wait until numBytes of bytes have been transmitted. If there a buffers queued for transmit, the function will not wait and will return immediately with 0 bytes.

Remarks

This function is thread safe in a RTOS application. This function is thread safe in a RTOS application. If the driver is configured for polled operation, this it will not support blocking operation in a bare metal (non-RTOS) application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_USART_Open call.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
char            myBuffer[MY_BUFFER_SIZE];
int    count;
unsigned int    total;

total = 0;
do
{
    count  = DRV_USART_Write(myUSARTHandle, &myBuffer[total],
                                            MY_BUFFER_SIZE - total);
    total += count;

    // Do something else...

} while( total < MY_BUFFER_SIZE );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
buffer	Buffer containing the data to written.
numbytes	size of the buffer

Function

size_t DRV_USART_Write
(
const DRV_HANDLE handle,
void * buffer,
const size_t numbytes
)

f) Byte Transfer Functions

DRV_USART_ReadByte Function

Reads a byte of data from the USART.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
uint8_t DRV_USART_ReadByte(const DRV_HANDLE handle);
```

Returns

A data byte received by the driver.

Description

This routine reads a byte of data from the USART.

Remarks

This function is thread safe when called in a RTOS application. Note that DRV_USART_WriteByte and DRV_USART_ReadByte function cannot co-exist with DRV_USART_BufferAddRead, DRV_USART_BufferAddWrite, DRV_USART_Read and DRV_USART_Write functions in a application. Calling the DRV_USART_ReadByte and DRV_USART_WriteByte functions will disrupt the processing of any queued buffers.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

The transfer status should be checked to see if the receiver is not empty before calling this function.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
char            myBuffer[MY_BUFFER_SIZE];
unsigned int    numBytes;

numBytes = 0;
do
{
    if( DRV_USART_TRANSFER_STATUS_RECEIVER_DATA_PRESENT & DRV_USART_TransferStatus(myUSARTHandle) )
    {
        myBuffer[numBytes++] = DRV_USART_ReadByte(myUSARTHandle);
    }

    // Do something else...

} while( numBytes < MY_BUFFER_SIZE);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint8_t DRV_USART_ReadByte(const DRV_HANDLE handle)

DRV_USART_WriteByte Function

Writes a byte of data to the USART.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_WriteByte(const DRV_HANDLE handle, const uint8_t byte);
```

Returns

None.

Description

This routine writes a byte of data to the USART.

Remarks

This function is thread safe when called in a RTOS application. Note that DRV_USART_WriteByte and DRV_USART_ReadByte function cannot co-exist with DRV_USART_BufferAddRead, DRV_USART_BufferAddWrite, DRV_USART_Read and DRV_USART_Write functions in a application. Calling the DRV_USART_ReadByte and DRV_USART_WriteByte function will disrupt the processing of any queued buffers.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

The transfer status should be checked to see if transmitter is not full before calling this function.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
char            myBuffer[MY_BUFFER_SIZE];
unsigned int    numBytes;

// Preinitialize myBuffer with MY_BUFFER_SIZE bytes of valid data.

numBytes = 0;
while( numBytes < MY_BUFFER_SIZE );
{
    if( !(DRV_USART_TRANSFER_STATUS_TRANSMIT_FULL & DRV_USART_TransferStatus(myUSARTHandle)) )
    {
        DRV_USART_WriteByte(myUSARTHandle, myBuffer[numBytes++]);
    }

    // Do something else...
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
byte	Data byte to write to the USART

Function

void DRV_USART_WriteByte(const DRV_HANDLE handle, const uint8_t byte)

DRV_USART_TransmitBufferSizeGet Function

Returns the size of the transmit buffer.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
unsigned int DRV_USART_TransmitBufferSizeGet(const DRV_HANDLE handle);
```

Returns

Size of the driver's transmit buffer, in bytes.

Description

This routine returns the size of the transmit buffer and can be used by the application to determine the number of bytes to write with the DRV_USART_WriteByte function.

Remarks

Does not account for client queued buffers. This function is thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
const uint8_t   writeBuffer[5];
unsigned int    size, numBytes = 0;
unsigned int    writeBufferLen = sizeof(writeBuffer);

size     = DRV_USART_TransmitBufferSizeGet (myUSARTHandle);

// Do something based on the transmitter buffer size
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

unsigned int DRV_USART_TransmitBufferSizeGet (const DRV_HANDLE handle)

DRV_USART_ReceiverBufferSizeGet Function

Returns the size of the receive buffer.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
unsigned int DRV_USART_ReceiverBufferSizeGet(const DRV_HANDLE handle);
```

Returns

Size of the driver's receive buffer, in bytes.

Description

This routine returns the size of the receive buffer.

Remarks

Does not account for client queued buffers. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
const uint8_t   readBuffer[5];
unsigned int    size, numBytes = 0;
unsigned int    readbufferLen = sizeof(readBuffer);

size     = DRV_USART_ReceiverBufferSizeGet(myUSARTHandle);

// Do something based on the receiver buffer size
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

unsigned int DRV_USART_ReceiverBufferSizeGet(const DRV_HANDLE handle)

DRV_USART_TransferStatus Function

Returns the transmitter and receiver transfer status.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_TRANSFER_STATUS DRV_USART_TransferStatus(const DRV_HANDLE handle);
```

Returns

A DRV_USART_TRANSFER_STATUS value describing the current status of the transfer.

Description

This returns the transmitter and receiver transfer status.

Remarks

The returned status may contain a value with more than one of the bits specified in the DRV_USART_TRANSFER_STATUS enumeration set. The caller should perform an "AND" with the bit of interest and verify if the result is non-zero (as shown in the example) to verify the desired status bit. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open

if (DRV_USART_TRANSFER_STATUS_RECEIVER_DATA_PRESENT & DRV_USART_TransferStatus(myUSARTHandle))
{
    // Data has been received that can be read
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_USART_TRANSFER_STATUS DRV_USART_TransferStatus(const DRV_HANDLE handle)

DRV_USART_TransmitBufferIsFull Function

Provides the status of the driver's transmit buffer.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
bool DRV_USART_TransmitBufferIsFull(const DRV_HANDLE handle);
```

Returns

true - if the transmit buffer is full

false - if the transmit buffer is not full

Description

This routine identifies if the driver's transmit buffer is full or not. This function can be used in conjunction with the DRV_USART_Write and DRV_USART_WriteByte functions.

Remarks

Does not account for client queued buffers. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
unsigned int    numBytes;
int             bytesToWrite;
const uint8_t   writeBuffer[35] = "1234567890ABCDEFGHIJKLMNOPn" ;
int             writebufferLen = strlen((char *)writeBuffer);

numBytes = 0;
while( numBytes < writebufferLen )
{
    if (DRV_USART_TransmitBufferisFull())
    {
        // Do something else until there is some room in the driver's Transmit buffer.
    }
    else
    {
        DRV_USART_WriteByte(myUSARTHandle, writeBuffer[numBytes++]);
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

bool DRV_USART_TransmitBufferIsFull(const DRV_HANDLE handle)

DRV_USART_ReceiverBufferIsEmpty Function

Provides the status of the driver's receive buffer.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
bool DRV_USART_ReceiverBufferIsEmpty(const DRV_HANDLE handle);
```

Returns

true - if the driver's receive buffer is empty

false - if the driver's receive buffer is not empty

Description

This routine indicates if the driver's receiver buffer is empty. This function can be used in conjunction with the DRV_USART_Read and DRV_USART_ReadByte functions.

Remarks

Does not account for client queued buffers. This function is safe thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE               myUSARTHandle;    // Returned from DRV_USART_Open
char                     myBuffer[MY_BUFFER_SIZE];
unsigned int             numBytes;

numBytes = 0;
while( numBytes < MY_BUFFER_SIZE );
{
    if ( !DRV_USART_ReceiverBufferIsEmpty(myUSARTHandle) )
    {
        if( numBytes < MY_BUFFER_SIZE )
        {
            myBuffer[numBytes++] = DRV_USART_ReadByte (myUSARTHandle);
        }
        else
        {
            break;
        }
    }

    // Do something else while more data is received.
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

bool DRV_USART_ReceiverBufferIsEmpty(const DRV_HANDLE handle)

DRV_USART_ByteErrorCallbackSet Function

Registers callback to handle for byte error events.

File

drv_usart.h

C

```
void DRV_USART_ByteErrorCallbackSet(const SYS_MODULE_INDEX index, const DRV_USART_BYTE_EVENT_HANDLER
eventHandler);
```

Returns

None.

Description

This function allows a callback function to be registered with the driver to handle the error events occurring in the transmit/receive path during byte transfers.

The callback function should be registered as part of the initialization. The callback functionality is available only in the interrupt mode of operation. The driver clears the interrupt after invoking the callback function.

Remarks

None

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];

// myUSARTHandle is the handle returned by the DRV_USART_Open function.
myUSARTHandle = DRV_USART_Open(DRV_USART_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
                                (uintptr_t)&myAppObj );

// Register an event handler with driver. This is done once
DRV_USART_ByteErrorCallbackSet (DRV_USART_INDEX_0, APP_USARTErrorEventHandler);

// Event Processing Technique.
void APP_USARTErrorEventHandler(const SYS_MODULE_INDEX index)
{
    // Error has occurred. Handle the event.
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
eventHandler	Pointer to the event handler function.

Function

void DRV_USART_ByteErrorCallbackSet

(

const SYS_MODULE_INDEX index,

const DRV_USART_BYTE_EVENT_HANDLER eventHandler

)

DRV_USART_ByteReceiveCallbackSet Function

Registers receive callback function for byte receive event.

File

drv_usart.h

C

```
void DRV_USART_ByteReceiveCallbackSet(const SYS_MODULE_INDEX index, const DRV_USART_BYTE_EVENT_HANDLER
eventHandler);
```

Returns

None.

Description

This function allows a receive callback function to be registered with the driver. The callback function is invoked when a byte has been received. The received byte can then be read using DRV_USART_ReadByte() function.

The callback function should be registered with the driver as part of the initialization. The callback functionality is available only in the interrupt mode of operation. The driver clears the interrupt after invoking the callback function.

Remarks

None

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];

// myUSARTHandle is the handle returned by the DRV_USART_Open function.
myUSARTHandle = DRV_USART_Open(DRV_USART_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
                                (uintptr_t)&myAppObj );

// Register an event handler with driver. This is done once
DRV_USART_ByteReceiveCallbackSet(DRV_USART_INDEX_0, APP_USARTReceiveEventHandler);

// Event Processing Technique. Event is received when
// a byte is received.

void APP_USARTReceiveEventHandler(const SYS_MODULE_INDEX index)
{
    // Byte has been Received. Handle the event.
    // Read byte using DRV_USART_ReadByte ()
    // DRV_USART_ReceiverBufferIsEmpty() function can be used to
    // check if the receiver buffer is empty.
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
eventHandler	Pointer to the event handler function.

Function

void DRV_USART_ByteReceiveCallbackSet

(

const SYS_MODULE_INDEX index,

const DRV_USART_BYTE_EVENT_HANDLER eventHandler

)

DRV_USART_ByteTransmitCallbackSet Function

Registers a callback function for byte transmit event.

File

drv_usart.h

C

```
void DRV_USART_ByteTransmitCallbackSet(const SYS_MODULE_INDEX index, const DRV_USART_BYTE_EVENT_HANDLER
eventHandler);
```

Returns

None.

Description

This function allows a transmit callback function to be registered with the driver. The callback function is invoked when a byte has been transmitted using DRV_USART_WriteByte () function.

The callback function should be registered with the driver prior to any writes to the driver. The callback functionality is available only in the interrupt mode of operation. The driver clears the interrupt after invoking the callback function.

Remarks

None

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];

// myUSARTHandle is the handle returned by the DRV_USART_Open function.
myUSARTHandle = DRV_USART_Open(DRV_USART_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
                                (uintptr_t)&myAppObj );

// Register an event handler with driver. This is done once
DRV_USART_ByteTransmitCallbackSet (DRV_USART_INDEX_0, APP_USARTTransmitEventHandler);

DRV_USART_WriteByte (myUSARThandle, myBuffer[0]);

// Event Processing Technique. Event is received when
// the byte is transmitted.

void APP_USARTTransmitEventHandler (const SYS_MODULE_INDEX index)
{
    // Byte has been transmitted. Handle the event.
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
eventHandler	Pointer to the event handler function.

Function

void DRV_USART_ByteTransmitCallbackSet

(

const SYS_MODULE_INDEX index,

const DRV_USART_BYTE_EVENT_HANDLER eventHandler

)

g) Data Types and Constants

DRV_USART_CLIENT_STATUS Enumeration

Defines the client-specific status of the USART driver.

File

drv_usart.h

C

```
typedef enum {
  DRV_USART_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR,
  DRV_USART_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED,
  DRV_USART_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY,
  DRV_USART_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY
} DRV_USART_CLIENT_STATUS;
```

Members

Members	Description
DRV_USART_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR	An error has occurred.
DRV_USART_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED	The driver is closed, no operations for this client are ongoing, and/or the given handle is invalid.
DRV_USART_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY	The driver is currently busy and cannot start additional operations.
DRV_USART_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY	The module is running and ready for additional operations

Description

USART Client-Specific Driver Status

This enumeration defines the client-specific status codes of the USART driver.

Remarks

Returned by the DRV_USART_ClientStatus function.

DRV_USART_INIT Structure

Defines the data required to initialize or reinitialize the USART driver

File

drv_usart.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  USART_MODULE_ID usartID;
  DRV_USART_OPERATION_MODE mode;
  DRV_USART_OPERATION_MODE_DATA modeData;
  DRV_USART_INIT_FLAGS flags;
  uint32_t brgClock;
  DRV_USART_LINE_CONTROL lineControl;
  uint32_t baud;
  DRV_USART_HANDSHAKE handshake;
  INT_SOURCE interruptTransmit;
  INT_SOURCE interruptReceive;
  INT_SOURCE interruptError;
  unsigned int queueSizeReceive;
  unsigned int queueSizeTransmit;
  DMA_CHANNEL dmaChannelTransmit;
  DMA_CHANNEL dmaChannelReceive;
  INT_SOURCE dmaInterruptTransmit;
  INT_SOURCE dmaInterruptReceive;
} DRV_USART_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization data
USART_MODULE_ID usartID;	Identifies USART hardware module (PLIB-level) ID. For a static build of the driver, this is overridden by DRV_USART_MODULE_ID macro in the system_config.h header file.
DRV_USART_OPERATION_MODE mode;	Identifies the Operation mode of the USART driver. For a static build of the driver, this is overridden by DRV_USART_MODE_SELECT macro in the system_config.h header file.
DRV_USART_OPERATION_MODE_DATA modeData;	Data required by the operation mode of the driver. For a static build of the driver, this is overridden by DRV_USART_MODE_DATA macro in the system_config.h header file.
DRV_USART_INIT_FLAGS flags;	Flags to enable specific features. Refer to the description of DRV_USART_INIT_FLAGS for more details. For a static build of the driver, this is overridden by DRV_USART_FLAGS macro in the system_config.h header file.
uint32_t brgClock;	USART module Baud Rate Generator Clock. This typically the peripheral bus clock frequency. For a static build of the driver, this is overridden by DRV_USART_BRG_CLOCK macro in the system_config.h header file.
DRV_USART_LINE_CONTROL lineControl;	The initial USART line control settings. For a static build of the driver this is overridden by the DRV_USART_LINE_CONTROL_SET macro in the system_config.h header file.

uint32_t baud;	Baud Rate value to be used, if not using auto baud. For a static build of the driver, this is overridden by the DRV_USART_BAUD macro in the system_config.h header file.
DRV_USART_HANDSHAKE handshake;	Handshaking mode. For a static build of the driver, this is overridden by the DRV_USART_HANDSHAKE_SET macro in the system_config.h header file.
INT_SOURCE interruptTransmit;	Interrupt source ID for the transmitter interrupt. For a static build of the driver, this is overridden by the DRV_USART_TRANSMIT_INTERRUPT_SOURCE macro in the system_config.h header.
INT_SOURCE interruptReceive;	Interrupt source ID for the receiver interrupt. For a static build of the driver, this is overridden by the DRV_USART_RECEIVE_INTERRUPT_SOURCE macro in the system_config.h header.
INT_SOURCE interruptError;	Interrupt source ID for the error Interrupt. For a static build of the driver, this is overridden by the DRV_USART_ERROR_INTERRUPT_SOURCE macro in the system_config.h header.
unsigned int queueSizeReceive;	This is the receive buffer queue size. This is the maximum number of read requests that driver will queue. For a static build of the driver, this is overridden by the DRV_USART_RECEIVE_QUEUE_SIZE macro in system_config.h
unsigned int queueSizeTransmit;	This is the transmit buffer queue size. This is the maximum number of write requests that driver will queue. For a static build of the driver, this is overridden by the DRV_USART_TRANSMIT_QUEUE_SIZE macro in system_config.h
DMA_CHANNEL dmaChannelTransmit;	This is the USART transmit DMA channel. This is applicable only if DRV_USART_SUPPORT_TRANSMIT_DMA is defined as true. For a static build of the driver, this is overridden by the DRV_USART_TRANSMIT_DMA_CHANNEL macro in system_config.h
DMA_CHANNEL dmaChannelReceive;	This is the USART receive DMA channel. This is applicable only if DRV_USART_SUPPORT_RECEIVE_DMA is defined as true. For a static build of the driver, this is overridden by the DRV_USART_RECEIVE_DMA_CHANNEL macro in system_config.h
INT_SOURCE dmaInterruptTransmit;	This is the USART transmit DMA channel interrupt. This is applicable only if DRV_USART_SUPPORT_TRANSMIT_DMA is defined as true. For a static build of the driver, this is overridden by the DRV_USART_INTERRUPT_SOURCE_TRANSMIT_DMA_CHANNEL macro in system_config.h
INT_SOURCE dmaInterruptReceive;	This is the USART receive DMA channel interrupt. This is applicable only if DRV_USART_SUPPORT_RECEIVE_DMA is defined as true. For a static build of the driver, this is overridden by the DRV_USART_INTERRUPT_SOURCE_RECEIVE_DMA_CHANNEL macro in system_config.h

Description

USART Driver Initialization Data

This data type defines the data required to initialize or reinitialize the USART driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

DRV_USART_INIT_FLAGS Enumeration

Flags identifying features that can be enabled when the driver is initialized.

File

drv_usart.h

C

```
typedef enum {
  DRV_USART_INIT_FLAG_AUTO_BAUD,
  DRV_USART_INIT_FLAG_STOP_IN_IDLE
} DRV_USART_INIT_FLAGS;
```

Members

Members	Description
DRV_USART_INIT_FLAG_AUTO_BAUD	Flag to enable auto baud detection. If supported and enabled, this feature will allow the USART to automatically detect the baud rate in use.
DRV_USART_INIT_FLAG_STOP_IN_IDLE	Flag to enable stop in idle. If supported and enabled , this feature will allow the USART to stop when the CPU enters Idle mode

Description

USART Initialization flags

This enumeration defines flags identifying features that can be enabled when the driver is initialized.

Remarks

These flags can be logically ORed together. They are passed into the DRV_USART_Initialize function through the "flags" member of the DRV_USART_INIT structure.

DRV_USART_TRANSFER_STATUS Enumeration

Specifies the status of the receive or transmit

File

drv_usart.h

C

```
typedef enum {
  DRV_USART_TRANSFER_STATUS_RECEIVER_DATA_PRESENT,
  DRV_USART_TRANSFER_STATUS_RECEIVER_EMPTY,
  DRV_USART_TRANSFER_STATUS_TRANSMIT_FULL,
  DRV_USART_TRANSFER_STATUS_TRANSMIT_EMPTY
} DRV_USART_TRANSFER_STATUS;
```

Members

Members	Description
DRV_USART_TRANSFER_STATUS_RECEIVER_DATA_PRESENT	Indicates that at least one byte of Data has been received
DRV_USART_TRANSFER_STATUS_RECEIVER_EMPTY	Indicates that the core driver receiver buffer is empty
DRV_USART_TRANSFER_STATUS_TRANSMIT_FULL	Indicates that the core driver transmitter buffer is full
DRV_USART_TRANSFER_STATUS_TRANSMIT_EMPTY	Indicates that the core driver transmitter buffer is empty

Description

USART Driver Transfer Flags

This type specifies the status of the receive or transmit operation.

Remarks

More than one of these values may be OR'd together to create a complete status value. To test a value of this type, the bit of interest must be ANDed with the value and checked to see if the result is non-zero.

DRV_USART_INDEX_0 Macro

USART driver index definitions

File

drv_usart.h

C

```
#define DRV_USART_INDEX_0 0
```

Description

Driver USART Module Index

These constants provide USART driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_USART_Initialize and DRV_USART_Open routines to identify the driver instance in use.

DRV_USART_INDEX_1 Macro

File

drv_usart.h

C

```
#define DRV_USART_INDEX_1 1
```

Description

This is macro DRV_USART_INDEX_1.

DRV_USART_INDEX_2 Macro

File

drv_usart.h

C

```
#define DRV_USART_INDEX_2 2
```

Description

This is macro DRV_USART_INDEX_2.

DRV_USART_INDEX_3 Macro

File

drv_usart.h

C

```
#define DRV_USART_INDEX_3 3
```

Description

This is macro DRV_USART_INDEX_3.

DRV_USART_INDEX_4 Macro

File

drv_usart.h

C

```
#define DRV_USART_INDEX_4 4
```

Description

This is macro DRV_USART_INDEX_4.

DRV_USART_INDEX_5 Macro

File

drv_usart.h

C

```
#define DRV_USART_INDEX_5 5
```

Description

This is macro DRV_USART_INDEX_5.

DRV_USART_BAUD_SET_RESULT Enumeration

Identifies the handshaking modes supported by the USART driver.

File

drv_usart.h

C

```
typedef enum {
} DRV_USART_BAUD_SET_RESULT;
```

Description

USART Handshake Modes

This data type identifies the handshaking modes supported by the USART driver.

Remarks

Not all modes are available on all devices. Refer to the specific device data sheet to determine availability.

DRV_USART_BUFFER_EVENT Enumeration

Identifies the possible events that can result from a buffer add request.

File

drv_usart.h

C

```
typedef enum {
  DRV_USART_BUFFER_EVENT_COMPLETE,
  DRV_USART_BUFFER_EVENT_ERROR,
  DRV_USART_BUFFER_EVENT_ABORT
} DRV_USART_BUFFER_EVENT;
```

Members

Members	Description
DRV_USART_BUFFER_EVENT_COMPLETE	All data from or to the buffer was transferred successfully.
DRV_USART_BUFFER_EVENT_ERROR	There was an error while processing the buffer transfer request.
DRV_USART_BUFFER_EVENT_ABORT	Data transfer aborted (Applicable in DMA mode)

Description

USART Driver Buffer Events

This enumeration identifies the possible events that can result from a buffer add request caused by the client calling either the DRV_USART_BufferAddRead or DRV_USART_BufferAddWrite functions.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that the client registered with the driver by calling the DRV_USART_BufferEventHandlerSet function when a buffer transfer request is completed.

DRV_USART_BUFFER_EVENT_HANDLER Type

Pointer to a USART Driver Buffer Event handler function

File

drv_usart.h

C

```
typedef void (* DRV_USART_BUFFER_EVENT_HANDLER)(DRV_USART_BUFFER_EVENT event, DRV_USART_BUFFER_HANDLE
bufferHandle, uintptr_t context);
```

Returns

None.

Description

USART Driver Buffer Event Handler Function Pointer

This data type defines the required function signature for the USART driver buffer event handling callback function. A client must register a pointer to a buffer event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive buffer related event calls back from the driver.

The parameters and return values and are described here and a partial example implementation is provided.

Remarks

If the event is DRV_USART_BUFFER_EVENT_COMPLETE, it means that the data was transferred successfully.

If the event is DRV_USART_BUFFER_EVENT_ERROR, it means that the data was not transferred successfully. The DRV_USART_ErrorGet function can be called to know the error. The DRV_USART_BufferCompletedBytesGet function can be called to find out how many bytes were

processed.

The bufferHandle parameter contains the buffer handle of the buffer that associated with the event.

The context parameter contains the a handle to the client context, provided at the time the event handling function was registered using the DRV_USART_BufferEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the buffer add request.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

The DRV_USART_BufferAddRead and DRV_USART_BufferAddWrite functions can be called in the event handler to add a buffer to the driver queue. These functions can only be called to add buffers to the driver whose event handler is running. For example, buffers cannot be added USART2 driver in USART1 driver event handler.

Example

```
void APP_MyBufferEventHandler( DRV_USART_BUFFER_EVENT event,
                               DRV_USART_BUFFER_HANDLE bufferHandle,
                               uintptr_t context )
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_USART_BUFFER_EVENT_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
bufferHandle	Handle identifying the buffer to which the vent relates
context	Value identifying the context of the application that registered the event handling function.

DRV_USART_BUFFER_HANDLE Type

Handle identifying a read or write buffer passed to the driver.

File

drv_usart.h

C

```
typedef uintptr_t DRV_USART_BUFFER_HANDLE;
```

Description

USART Driver Buffer Handle

A buffer handle value is returned by a call to the DRV_USART_BufferAddRead or DRV_USART_BufferAddWrite functions. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from the "buffer add" function is returned back to the client by the "event handler callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None

DRV_USART_ERROR Enumeration

Defines the possible errors that can occur during driver operation.

File

drv_usart.h

C

```
typedef enum {
  DRV_USART_ERROR_ADDRESS
} DRV_USART_ERROR;
```

Members

Members	Description
DRV_USART_ERROR_ADDRESS	Channel address error (Applicable in DMA mode)

Description

USART Driver Errors.

This data type defines the possible errors that can occur when occur during USART driver operation. These values are returned by DRV_USART_ErrorGet function.

Remarks

None

DRV_USART_LINE_CONTROL_SET_RESULT Enumeration

Identifies the results of the baud set function.

File

drv_usart.h

C

```
typedef enum {
} DRV_USART_LINE_CONTROL_SET_RESULT;
```

Description

USART Line Control Set Result

This data type identifies the results of the DRV_USART_LineControlSet function.

Remarks

None.

DRV_USART_OPERATION_MODE_DATA Union

Defines the initialization data required for different operation modes of USART.

File

drv_usart.h

C

```
typedef union {
  struct {
    uint8_t address;
  } AddressedModeInit;
} DRV_USART_OPERATION_MODE_DATA;
```

Members

Members	Description
struct { uint8_t address; } AddressedModeInit;	Initialization for Addressed mode

uint8_t address;	Address of the device.

Description

Operation Mode Initialization Data

This data type defines the initialization data required for different operation modes of the USART.

Remarks

None

DRV_USART_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_usart.h

C

```
#define DRV_USART_BUFFER_HANDLE_INVALID
```

Description

USART Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_USART_BufferAddRead and DRV_USART_BufferAddWrite functions if the buffer add request was not successful.

Remarks

None

DRV_USART_COUNT Macro

Number of valid USART drivers

File

drv_usart.h

C

```
#define DRV_USART_COUNT
```

Description

USART Driver Module Count

This constant identifies the maximum number of USART Driver instances that should be defined in the system. Defining more instances than this constant will waste RAM memory space.

This constant can also be used by the system and application to identify the number of USART instances on this microcontroller.

Remarks

This value is part-specific.

DRV_USART_READ_ERROR Macro

USART Driver Read Error.

File

drv_usart.h

C

```
#define DRV_USART_READ_ERROR
```

Description

USART Driver Read Error

This constant is returned by DRV_USART_Read() function when an error occurs.

Remarks

None.

DRV_USART_WRITE_ERROR Macro

USART Driver Write Error.

File

drv_usart.h

C

```
#define DRV_USART_WRITE_ERROR
```

Description

USART Driver Write Error

This constant is returned by DRV_USART_Write() function when an error occurs.

Remarks

None.

DRV_USART_LINE_CONTROL Enumeration

Identifies the line control modes supported by the USART driver.

File

drv_usart.h

C

```
typedef enum {
} DRV_USART_LINE_CONTROL;
```

Description

USART Line Control Modes

This data type identifies the line control modes supported by the USART driver. Line control modes define the number of data bits, parity mode, and the number of stop bits in a USART transmit and receive frames.

Remarks

The abbreviations used in the labels for the values of this enumeration follow the format , where:is the number of data bitsis either "NONE" (for no parity), "EVEN" for 1 parity bit added to obtain an even number of bits, or "ODD" for one bit added to obtain an odd number of bits.is the number of Stop bits

DRV_USART_OPERATION_MODE Enumeration

Identifies the modes of the operation of the USART module

File

drv_usart.h

C

```
typedef enum {
  DRV_USART_OPERATION_MODE_IRDA,
  DRV_USART_OPERATION_MODE_NORMAL,
  DRV_USART_OPERATION_MODE_ADDRESSED,
  DRV_USART_OPERATION_MODE_LOOPBACK
} DRV_USART_OPERATION_MODE;
```

Members

Members	Description
DRV_USART_OPERATION_MODE_IRDA	USART works in IRDA mode

DRV_USART_OPERATION_MODE_NORMAL	This is the normal point to point communication mode where the USART communicates directly with another USART by connecting it's Transmit signal to the external USART's Receiver signal and vice versa. An external transceiver may be connected to obtain RS-232 signal levels. This type of connection is typically full duplex.
DRV_USART_OPERATION_MODE_ADDRESSED	This is a multi-point bus mode where the USART can communicate with many other USARTS on a bus using an address-based protocol such as RS-485. This mode is typically half duplex and the physical layer may require a transceiver. In this mode every USART on the bus is assigned an address and the number of data bits is 9 bits
DRV_USART_OPERATION_MODE_LOOPBACK	Loopback mode internally connects the Transmit signal to the Receiver signal, looping data transmission back into this USART's own input. It is useful primarily as a test mode.

Description

USART Modes of Operation

This data type identifies the modes of the operation of the USART module.

Remarks

Not all modes are available on all devices. Refer to the specific device data sheet to determine availability.

DRV_USART_BYTE_EVENT_HANDLER Type

Pointer to a USART Driver Byte Event handler function

File

drv_usart.h

C

```
typedef void (* DRV_USART_BYTE_EVENT_HANDLER)(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

USART Driver Byte Event Handler Function Pointer

This data type defines the required function signature for the USART driver byte event handling callback function. A client must register a pointer to a byte event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive byte related event calls back from the driver.

Remarks

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended that the application not perform process intensive or blocking operations with in this function.

Example

```
void APP_MyUsartTxEventHandler(void)
{
    // Handle the transmit byte event
}
```

Parameters

Parameters	Description
index	Identifier for the instance

DRV_USART_BUFFER_RESULT Enumeration

Identifies the possible result of the buffer processing.

File

drv_usart.h

C

```
typedef enum {
  DRV_USART_BUFFER_RESULT_HANDLE_INVALID,
  DRV_USART_BUFFER_RESULT_HANDLE_EXPIRED,
  DRV_USART_BUFFER_RESULT_REMOVED_SUCCESFULLY,
```

```
    DRV_USART_BUFFER_RESULT_REMOVAL_FAILED
} DRV_USART_BUFFER_RESULT;
```

Members

Members	Description
DRV_USART_BUFFER_RESULT_HANDLE_INVALID	Buffer handle is not valid
DRV_USART_BUFFER_RESULT_HANDLE_EXPIRED	Buffer handle has expired.
DRV_USART_BUFFER_RESULT_REMOVED_SUCCESFULLY	Buffer is removed from the queue succesfully
DRV_USART_BUFFER_RESULT_REMOVAL_FAILED	Buffer removal failed because of unable to acquire the mutex • This is applicable in RTOS mode only

Description

USART Driver Buffer Result

This enumeration identifies the possible result of the buffer processing.

Remarks

DRV_USART_BUFFER_RESULT_HANDLE_EXPIRED is the state of the buffer which is in the free buffer pool.

Files

USART Driver Interface Header File

Enumerations

	Name	Description
	DRV_USART_BAUD_SET_RESULT	Identifies the handshaking modes supported by the USART driver.
	DRV_USART_BUFFER_EVENT	Identifies the possible events that can result from a buffer add request.
	DRV_USART_BUFFER_RESULT	Identifies the possible result of the buffer processing.
	DRV_USART_CLIENT_STATUS	Defines the client-specific status of the USART driver.
	DRV_USART_ERROR	Defines the possible errors that can occur during driver operation.
	DRV_USART_INIT_FLAGS	Flags identifying features that can be enabled when the driver is initialized.
	DRV_USART_LINE_CONTROL	Identifies the line control modes supported by the USART driver.
	DRV_USART_LINE_CONTROL_SET_RESULT	Identifies the results of the baud set function.
	DRV_USART_OPERATION_MODE	Identifies the modes of the operation of the USART module
	DRV_USART_TRANSFER_STATUS	Specifies the status of the receive or transmit

Functions

	Name	Description
	DRV_USART_AddressedBufferAddWrite	Schedule a non-blocking addressed driver write operation. **Implementation:** Dynamic
	DRV_USART_BaudSet	This function changes the USART module baud to the specified value. **Implementation:** Static/Dynamic
	DRV_USART_BufferAddRead	Schedule a non-blocking driver read operation. **Implementation:** Static/Dynamic
	DRV_USART_BufferAddWrite	Schedule a non-blocking driver write operation. **Implementation:** Static/Dynamic
	DRV_USART_BufferCompletedBytesGet	Returns the number of bytes that have been processed for the specified buffer. **Implementation:** Static/Dynamic

	DRV_USART_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. **Implementation:** Static/Dynamic
	DRV_USART_BufferProcessedSizeGet	This API will be deprecated and not recommended to use. Use DRV_USART_BufferCompletedBytesGet to get the number of bytes processed for the specified buffer.
	DRV_USART_BufferRemove	Removes a requested buffer from the queue. **Implementation:** Static/Dynamic
	DRV_USART_ByteErrorCallbackSet	Registers callback to handle for byte error events.
	DRV_USART_ByteReceiveCallbackSet	Registers receive callback function for byte receive event.
	DRV_USART_ByteTransmitCallbackSet	Registers a callback function for byte transmit event.
	DRV_USART_ClientStatus	Gets the current client-specific status the USART driver. **Implementation:** Static/Dynamic
	DRV_USART_Close	Closes an opened-instance of the USART driver. **Implementation:** Static/Dynamic
	DRV_USART_Deinitialize	Deinitializes the specified instance of the USART driver module. **Implementation:** Static/Dynamic
	DRV_USART_ErrorGet	This function returns the error(if any) associated with the last client request. **Implementation:** Static/Dynamic
	DRV_USART_Initialize	Initializes the USART instance for the specified driver index. **Implementation:** Static/Dynamic
	DRV_USART_LineControlSet	This function changes the USART module line control to the specified value. **Implementation:** Static/Dynamic
	DRV_USART_Open	Opens the specified USART driver instance and returns a handle to it. **Implementation:** Static/Dynamic
	DRV_USART_Read	Reads data from the USART. **Implementation:** Static/Dynamic
	DRV_USART_ReadByte	Reads a byte of data from the USART. **Implementation:** Static/Dynamic
	DRV_USART_ReceiverBufferIsEmpty	Provides the status of the driver's receive buffer. **Implementation:** Static/Dynamic
	DRV_USART_ReceiverBufferSizeGet	Returns the size of the receive buffer. **Implementation:** Static/Dynamic
	DRV_USART_Status	Gets the current status of the USART driver module. **Implementation:** Static/Dynamic
	DRV_USART_TasksError	Maintains the driver's error state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_USART_TasksReceive	Maintains the driver's receive state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_USART_TasksTransmit	Maintains the driver's transmit state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_USART_TransferStatus	Returns the transmitter and receiver transfer status. **Implementation:** Static/Dynamic
	DRV_USART_TransmitBufferIsFull	Provides the status of the driver's transmit buffer. **Implementation:** Static/Dynamic
	DRV_USART_TransmitBufferSizeGet	Returns the size of the transmit buffer. **Implementation:** Static/Dynamic
	DRV_USART_Write	Writes data to the USART. **Implementation:** Static/Dynamic
	DRV_USART_WriteByte	Writes a byte of data to the USART. **Implementation:** Static/Dynamic

Macros

	Name	Description
	DRV_USART_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_USART_COUNT	Number of valid USART drivers
	DRV_USART_INDEX_0	USART driver index definitions
	DRV_USART_INDEX_1	This is macro DRV_USART_INDEX_1.

	DRV_USART_INDEX_2	This is macro DRV_USART_INDEX_2.
	DRV_USART_INDEX_3	This is macro DRV_USART_INDEX_3.
	DRV_USART_INDEX_4	This is macro DRV_USART_INDEX_4.
	DRV_USART_INDEX_5	This is macro DRV_USART_INDEX_5.
	DRV_USART_READ_ERROR	USART Driver Read Error.
	DRV_USART_WRITE_ERROR	USART Driver Write Error.

Structures

	Name	Description
	DRV_USART_INIT	Defines the data required to initialize or reinitialize the USART driver

Types

	Name	Description
	DRV_USART_BUFFER_EVENT_HANDLER	Pointer to a USART Driver Buffer Event handler function
	DRV_USART_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.
	DRV_USART_BYTE_EVENT_HANDLER	Pointer to a USART Driver Byte Event handler function

Unions

	Name	Description
	DRV_USART_OPERATION_MODE_DATA	Defines the initialization data required for different operation modes of USART.

Description

USART Driver Interface Header File

The USART device driver provides a simple interface to manage the USART or UART modules on Microchip microcontrollers. This file provides the interface definition for the USART driver.

File Name

drv_usart.h

Company

Microchip Technology Inc.

drv_usart_config_template.h

USART Driver Configuration Template.

Macros

	Name	Description
	DRV_USART_BAUD_RATE_IDXn	Specifies the USART Baud at which the USART driver is initialized.
	DRV_USART_BUFFER_QUEUE_SUPPORT	Specifies if the Buffer Queue support should be enabled.
	DRV_USART_BYTE_MODEL_BLOCKING	Enables or Disables DRV_USART_ByteWrite function blocking behavior.
	DRV_USART_BYTE_MODEL_CALLBACK	Enables or Disables Callback Feature of the Byte Transfer Model.
	DRV_USART_BYTE_MODEL_SUPPORT	Specifies if the Byte Model support should be enabled.
	DRV_USART_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_USART_INDEX	USART Static Index selection.
	DRV_USART_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_USART_INTERRUPT_MODE	Macro controls interrupt based operation of the driver.
	DRV_USART_INTERRUPT_SOURCE_ERROR	Defines the error interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_RECEIVE	Defines the Receive interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_RECEIVE_DMA	Defines the Receive DMA Channel interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_TRANSMIT	Defines the Transmit interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_TRANSMIT_DMA	Defines the Transmit DMA Channel interrupt source for the static driver.
	DRV_USART_PERIPHERAL_ID	Configures the USART PLIB Module ID.
	DRV_USART_QUEUE_DEPTH_COMBINED	Defines the number of entries of all queues in all instances of the driver.

	DRV_USART_RCV_QUEUE_SIZE_IDXn	Sets the USART Driver Receive Queue Size while using the Buffer Queue Data Transfer Model.
	DRV_USART_READ_WRITE_MODEL_SUPPORT	Specifies if Read/Write Model support should be enabled.
	DRV_USART_RECEIVE_DMA	Defines the USART Driver Receive DMA Channel for the static driver.
	DRV_USART_TRANSMIT_DMA	Defines the USART Driver Transmit DMA Channel in case of static driver.
	DRV_USART_XMIT_QUEUE_SIZE_IDXn	Sets the USART Driver Transmit Queue Size while using the Buffer Queue Data Transfer Model.

Description

USART Driver Configuration Template

These file provides the list of all the configurations that can be used with the driver. This file should not be included in the driver.

Microchip Technology Inc.

Wi-Fi Driver Libraries

This section describes the Wi-Fi Driver Libraries available in MPLAB Harmony.

Description

Additional information including documentation is available from the Microchip website:

MRF24WG0MA Wi-Fi G PICtail/PICtail Plus Daughter Board: Part number - AC164149

http://www.microchip.com/Developmenttools/ProductDetails.aspx?PartNO=AC164149

MRF24WN0MA Wi-Fi PICtail/PICtail Plus Daughter Board: Part number - AC164153

http://www.microchip.com/Developmenttools/ProductDetails.aspx?PartNO=AC164153

The following table lists the library files available for the Wi-Fi Drivers.

	Target MCU Device		
Wi-Fi Library File Matrix	PIC32MX795F512L	PIC32MZ2048ECH144	PIC32MZ2048EFM144
Wi-Fi Device			
MRF24WG	NA	NA	NA
MRF24WN	wdrvext_mx.a	wdrvext_mz_ec.a	wdrvext_mz_ef.a

Configuring DMA SPI

Provides information on how to enable or disable DMA SPI for the MRF24WG Wi-Fi Driver and MRF24WN Wi-Fi Driver.

Description

The DMA SPI option is configurable through the MPLAB Harmony Configurator for FreeRTOS projects only. DMA SPI is not available for non-FreeRTOS projects.

Enabling DMA SPI

Provides information on how to enable DMA SPI for a Wi-Fi Driver.

Description

The DMA SPI option is configurable through the MPLAB Harmony Configurator only for RTOS projects, and DMA SPI is not available for non-RTOS projects.

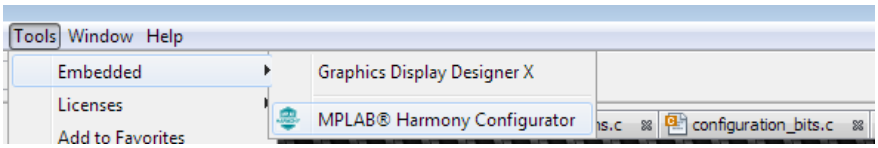
Enabling DMA

Using MHC, perform the following four step process to enable DMA SPI:

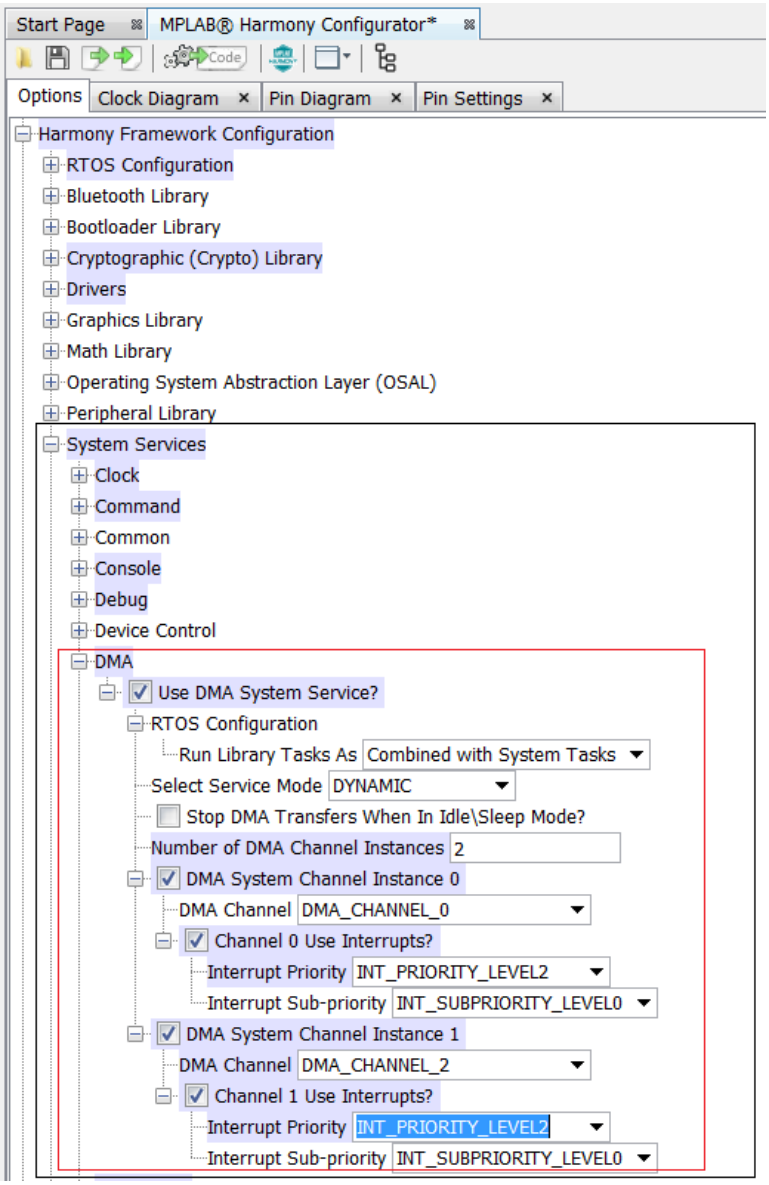
Step 1: Open the MPLAB Harmony Configurator in MPLAB X IDE

1. Open your project in MPLAB X IDE.

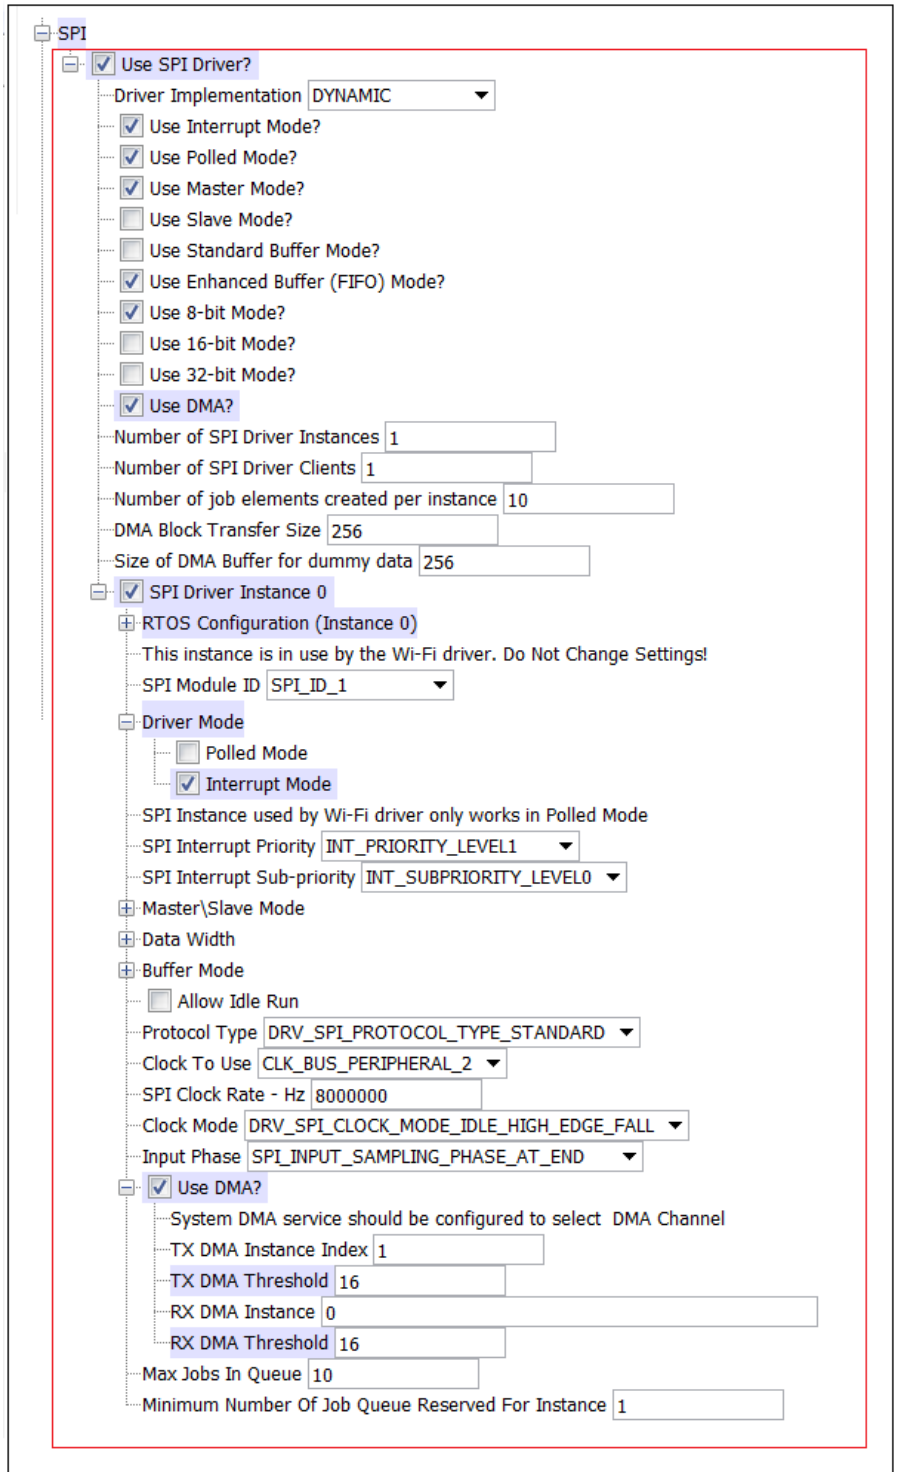
2. Start the MHC by selecting *Tools* > *Embedded* > *MPLAB Harmony Configurator*.



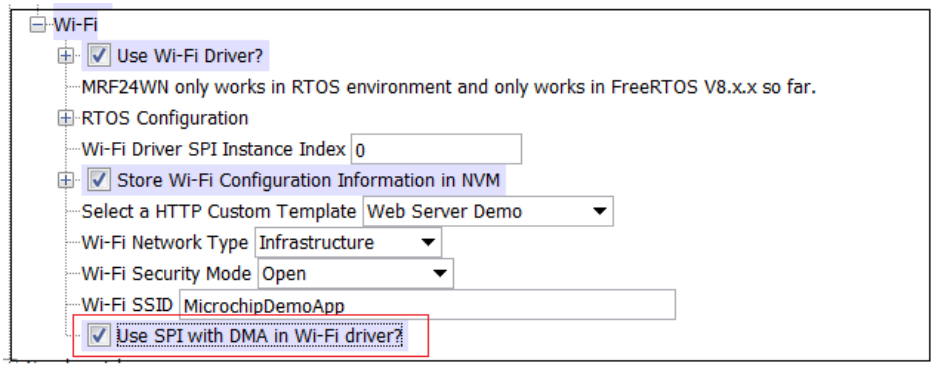
Step 2: Configure the DMA System Service



Step 3: Configure the SPI Driver



Step 4: Configure the Wi-Fi Driver



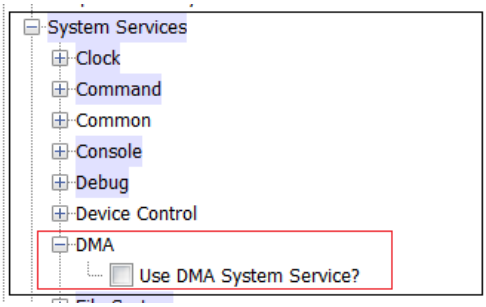
Disabling DMA SPI

Provides information on disabling DMA SPI for a Wi-Fi Driver.

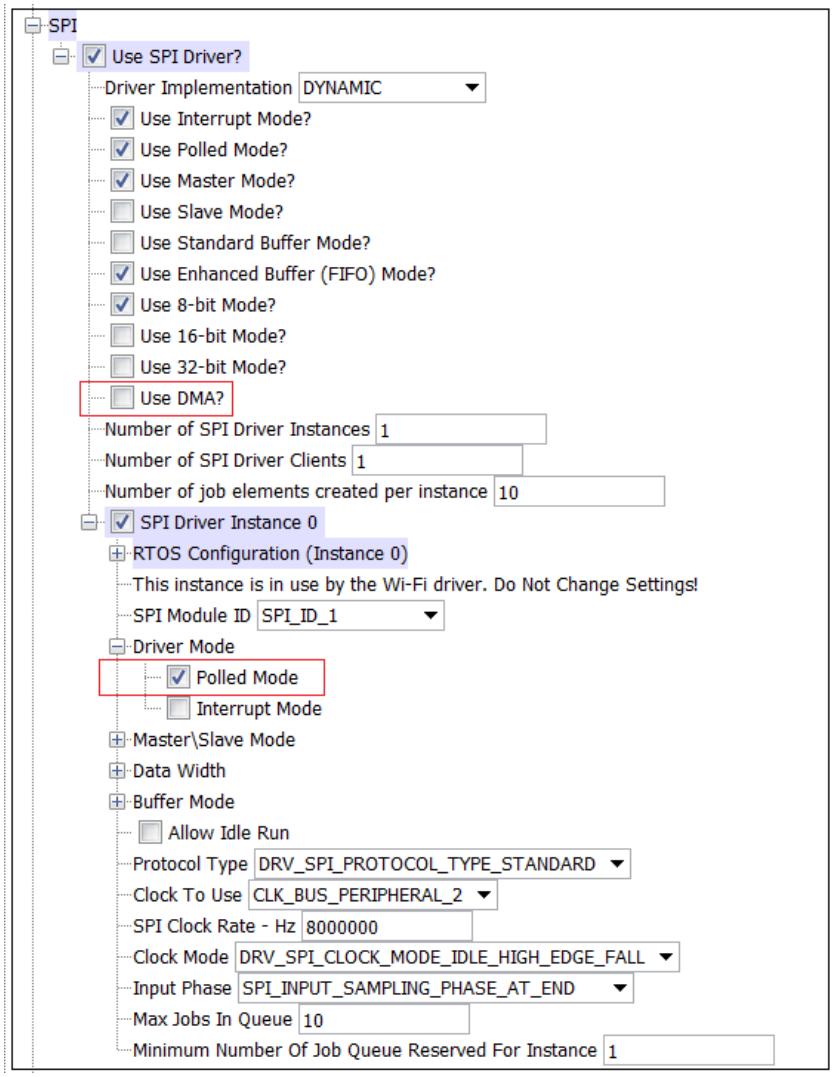
Description

Use the MHC to disable DMA SPI, as follows.

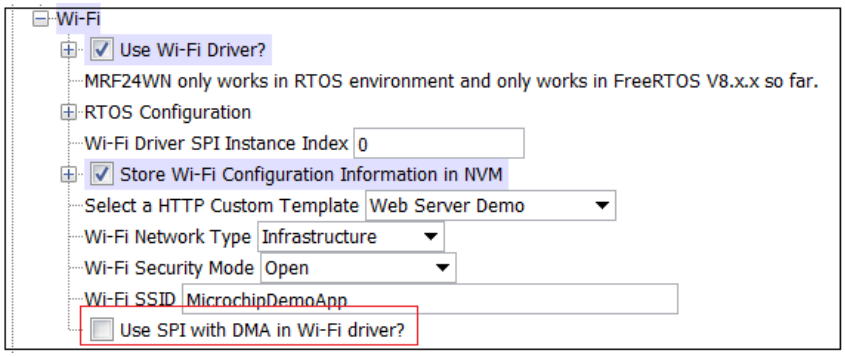
Step 1: Configure the System Services



Step2: Configure the SPI Driver



Step 3: Configure the Wi-Fi Driver



MRF24WG Wi-Fi Driver Library

This topic describes the MRF24WG Wi-Fi Driver Library.

Introduction

This library provides a low-level abstraction of the MRF24WG Wi-Fi Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

The Wi-Fi software library, in conjunction with the MRF24WG0MA module, allows an application to:

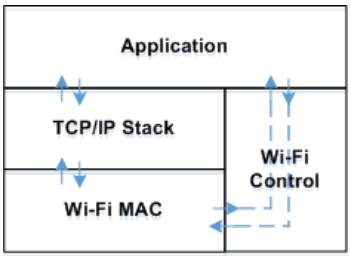
- Join an existing 802.11 Wi-Fi network
- Create a 802.11 Wi-Fi network

The following application services are provided by the Wi-Fi library:

- Configuring Wi-Fi connection (SSID, security mode, channel list, etc.)
- Join an existing network or create an "AdHoc" Wi-Fi network
- Scan for other Wi-Fi devices in the area
- Getting Wi-Fi network status
- Wi-Fi power control

The MAC layer services are not directly accessible to the application; this portion of the code resides under the TCP/IP Stack MAC module software layers and is used by stack services to transmit and receive data over a Wi-Fi network. The following diagram shows the interaction of the primary software blocks in a Wi-Fi application.

Wi-Fi Software Block Diagram



Network Connection Matrix

The following table provides information that includes network mode and security mode support by MRF24WG Wi-Fi Driver.

MRF24WG Network Connection Matrix	Network Mode		
	Infrastructure	Soft AP	Ad Hoc
Security Mode			
Open	YES	YES	YES
WEP40	YES	YES	YES
WEP104	YES	YES	YES
WPA-PSK	YES	NA	NA
WPA2-PSK	YES	NA	NA
WPA-PSK/WPA2-PSK Auto	YES	NA	NA
WPS Push Button	YES	NA	NA
WPS PIN	YES	NA	NA

Using the Library

This topic describes the basic architecture of the MRF24WG Wi-Fi Driver Library and provides information and examples on its use.

Description

Interface Header Files: `drv_wifi.h` and `drv_wifi_iwpriv.h`

The interface to the MRF24WG Wi-Fi Driver Library is defined in the `drv_wifi.h` and `drv_wifi_iwpriv.h` header files.

Please refer to the Understanding MPLAB Harmony section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the MRF24WG Wi-Fi module with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The MRF24WG Wi-Fi Library provides the following functionality:

- Wi-Fi library initialization
- Wi-Fi network configuration
- Wi-Fi network connection
- Scanning for existing Wi-Fi networks
- Wi-Fi event processing

- Wi-Fi status

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The Library Interface functions are divided into various sub-sections, which address one of the blocks or the overall operation of the MRF24WG Wi-FI Driver.

Library Interface Section	Description
Wi-Fi Initialization Functions	This section provides functions that initialize the MRF24WG Wi-Fi Driver Library and allow its API to be used.
Wi-Fi Network General Configuration Functions	This section provides functions that configure the MRF24WG Wi-Fi Driver interface for use.
Wi-Fi Network Security Configuration Functions	This section provides functions that configure the security mode of the MRF24WG Wi-Fi Driver connection.
Wi-Fi Network Power Configuration Functions	This section provides functions that configure max TX power, as well as power-saving modes for a MRF24WG Wi-Fi Driver connection.
Wi-Fi Network Multicast Filter Configuration Functions	This section provides functions that configure the MRF24WG Wi-Fi Driver software multi-cast filter to receive multi-cast address packets.
Wi-Fi Network Connection Functions	This section provides functions that begin the MRF24WG Wi-Fi Driver connection and disconnection processes.
Wi-Fi Network Configuration - Other Functions	This section provides additional miscellaneous functions for configuring the MRF24WG Wi-Fi Driver connection.
Wi-Fi Scanning Functions	This section provides MRF24WG Wi-Fi Driver functions that initiate a Wi-Fi scan and allow retrieval of the scan results.
Wi-Fi Event Processing Functions	This section provides callback functions that inform the application of MRF24WG Wi-Fi Driver related events.
Wi-Fi Data Configuration Functions	This section provides functions that save and restore MRF24WG Wi-Fi Driver configuration data.
Wi-Fi Status Functions	This section provides functions that retrieve the MRF24WG Wi-Fi Driver connection status.

How the Library Works

This section describes how the MRF24WG Wi-Fi Driver Library operates.

Description

Before the driver is ready for use, its should be configured (compile time configuration). Refer to the Configuring the Library section for more details on how to configure the driver.

There are few run-time configuration items that are done during initialization of the driver instance, and a few that are client-specific and are done using dedicated functions.

To use the MRF24WG Wi-Fi Driver, initialization and client functions should be invoked in a specific sequence to ensure correct operation.

System Initialization

This section describes initialization and reinitialization features.

Description

Wi-Fi initialization configures the MRF24WG module and then directs it to join (or create) a Wi-Fi network. The MRF24WG module defaults to open security and scans all channels in the domain. Therefore, to initialize and connect with the minimum function call overhead in an open security network, the following functions can be used:

```
DRV_WIFI_SsidSet("MySsidName");
DRV_WIFI_Connect();           // start the connection process
```

Alternatively, the following functions could be used to achieve the same effect:

```
DRV_WIFI_ChannelListSet(0);   // 0 = all channels in domain
DRV_WIFI_NetworkTypeSet(DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE);
DRV_WIFI_SecurityOpenSet(DRV_WIFI_SECURITY_OPEN);
DRV_WIFI_SsidSet("MySsidName");
DRV_WIFI_Connect();
```

Client Functionality

This section describes core operation.

Description

From the client perspective, once MRF24WG Wi-Fi Driver initialization is complete and the connection process has started, the client responds to Wi-Fi events. The client is notified of events by the callback function DRV_WIFI_ProcessEvent. The parameters into that function are `event` and `eventInfo`, where `event` is the event code and `eventInfo` is additional information about the event.

Wi-Fi Connection Events

Event Type	Description
DRV_WIFI_EVENT_CONNECTION_SUCCESSFUL	A MRF24WG Wi-Fi Driver connection attempt has completed successfully.
DRV_WIFI_EVENT_CONNECTION_FAILED	A MRF24WG Wi-Fi Driver connection attempt has failed.
DRV_WIFI_EVENT_CONNECTION_TEMPORARILY_LOST	An existing MRF24WG Wi-Fi Driver connection has been temporarily lost (and MRF24WG module is attempting to reconnect).
DRV_WIFI_EVENT_CONNECTION_PERMANENTLY_LOST	An existing MRF24WG Wi-Fi Driver connection has been permanently lost.
DRV_WIFI_EVENT_CONNECTION_REESTABLISHED	A MRF24WG Wi-Fi Driver connection that was temporarily lost has been regained.
DRV_WIFI_EVENT_DISCONNECT_DONE	An application MRF24WG Wi-Fi Driver disconnect request has completed.

Scan Events

Event Type	Description
DRV_WIFI_EVENT_SCAN_RESULTS_READY	The MRF24WG Wi-Fi Driver scan is complete and scan results are ready to be read.

Key Events

Event Type	Description
DRV_WIFI_EVENT_KEY_CALCULATION_REQUEST	The MRF24WG Wi-Fi Driver request key calculation is complete and the binary key is ready to send to the MRF24WG module.

Error Events

Event Type	Description
DRV_WIFI_EVENT_ERROR	A MRF24WG Wi-Fi Driver driver error has occurred.

For some of the event types previously listed, there is an `eventInfo` parameter that provides additional information about the event. Not all event types require the `eventInfo` parameter. The tables in DRV_WIFI_CONNECTION_TEMPORARILY_LOST provide additional detail about the `eventInfo` parameter for those events that use it.

DRV_WIFI_CONNECTION_TEMPORARILY_LOST

`eventInfo` is defined as:

15:8	7	6	5:0
Not used	Deauth	Disassoc	Event Data

Bits 15:8 are not used.

If Deauth = 1 or Disassoc = 1, Event Data is:

Table 1: Deauth or Disassoc Event Data

DRV_WIFI_UNSPECIFIED	1
DRV_WIFI_PREV_AUTH_NOT_VALID	2
DRV_WIFI_DISASSOC_DUE_TO_INACTIVITY	3
DRV_WIFI_DISASSOC_AP_BUSY	4
DRV_WIFI_CLASS2_FRAME_FROM_NONAUTH_STA	6
DRV_WIFI_CLASS3_FRAME_FROM_NONASSOC_STA	7

DRV_WIFI_WPS_DEV_BUSY	14
DRV_WIFI_WPS_SETUP_LOCKED	15

Configuring the Library

The configuration of the MRF24WG Wi-Fi Driver is based on the file `drv_wifi_config.h` and `drv_wifi_iwpriv.h` files.

This header file contains the configuration selection for the MRF24WG Wi-Fi Driver. Based on the selections made, the MRF24WG Wi-Fi Driver may support the selected features. These configuration settings will apply to all instances of the MRF24WG Wi-Fi Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Configuring DMA SPI

Please refer to Configuring DMA SPI for information on enabling and disabling DMA SPI for FreeRTOS projects.

Sample Functionality

Please refer to the Wi-Fi demonstrations for examples of how to use the various features in the MRF24WG Wi-Fi Driver Library.

Building the Library

This section lists the files that are available in the MRF24WG Wi-Fi Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/wifi/mrf24w`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_wifi.h`	Contains all data types, define constants, and function prototypes for interfacing to the MRF24WG Wi-Fi Driver.
`/drv_wifi_iwpriv.h`	Contains optional (private) parameters to configure the MRF24WG Wi-Fi Driver.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
drv_wifi_com.c	MRF24WG Wi-FI Driver com layer. Provides access to the MRF24W Wi-Fi Driver controller.
drv_wifi_commands.c	MRF24WG Wi-Fi Driver commands (based on system commander) implementation. Provides access to the MRF24WG Wi-Fi Driver controller.
drv_wifi_config_data.c	MRF24WG Wi-FI Driver configuration data. Stores and retrieves MRF24WG Wi-Fi Driver configuration information to Non-volatile Memory (NVM).
drv_wifi_connect.c	MRF24WG Wi-Fi Driver connection support. Functions in this module support the connection process for the MRF24WG Wi-Fi Driver.
drv_wifi_connection_algorithm.c	MRF24WG Wi-Fi Driver connection algorithm. Provides access to the MRF24WG Wi-Fi Driver controller.
drv_wifi_connection_manager.c	MRF24WG Wi-FI Driver connection manager. Provides access to the MRF24W Wi-Fi Driver controller.
drv_wifi_connection_profile.c	MRF24WG Wi-Fi Driver connection profile. Provides access to the MRF24W Wi-Fi Driver controller.
drv_wifi_debug_output.c	MRF24WG Driver Wi-Fi debug console. Provides access to the MRF24W Wi-Fi Driver debug console.
drv_wifi_easy_config.c	MRF24WG Wi-Fi Driver EasyConfig functions. Provides MRF24WG Wi-Fi Driver connection support for Ad hoc and SoftAP mode.
drv_wifi_eint.c	MRF24WG Wi-Fi Driver interface functions support for external interrupts.
drv_wifi_event_handler.c	MRF24WG Wi-Fi Driver event handler. Provides access to the MRF24WG Wi-Fi Driver controller.
drv_wifi_events.c	MRF24WG Wi-Fi Driver MAC events implementation. Processes MRF2WG Wi-Fi Driver events via callback functions.
drv_wifi_init.c	MRF24WG W-Fi Driver initialization. Provides access to the MRF24WG Wi-Fi Driver initialization function.
drv_wifi_mac.c	MRF24WG W-Fi Driver Medium Access Control (MAC) layer. Provides access to the MRF24WG Wi-Fi Driver MAC layer.
drv_wifi_mac_pic32.c	MRF24WG Wi-FI Driver Medium Access Control (MAC) layer.
drv_wifi_mgmt_msg.c	MRF24WG Wi-Fi Driver management message functions.
drv_wifi_param_msg.c	MRF24WG Wi-Fi Driver management Set/Get parameter messages.
drv_wifi_pbkdf2.c	MRF24WG Wi-Fi Driver WPA supplicant. SHA1 Hash implementation and interface functions.
drv_wifi_power_save.c	MRF24WG Wi-Fi Driver power-saving functions.
drv_wifi_raw.c	MRF24WG Wi-Fi Driver raw functions for accessing the MAC layer.
drv_wifi_scan.c	MRF24WG Wi-Fi Driver scan functions.
drv_wifi_spi.c	MRF24WG Wi-Fi Driver SPI functions.
drv_wifi_spi_init.c	MRF24WG Driver SPI interface routines. Initializes the SPI hardware used to communicate with the MRF24WG module.
drv_wifi_tx_power.c	MRF24WG Wi-Fi Driver Transmit (TX) Power functions.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	There are no optional files.

Module Dependencies

The MRF24W Wi-Fi Driver Library depends on the following modules:

- SPI Driver Library
- NVM Driver Library
- Operating System Abstraction Layer (OSAL) Library Help

- Clock System Service Library
- System Service Library Introduction
- Console System Service Library
- File System Service Library
- Interrupt System Service Library
- Timer System Service Library
- Debug System Service Library
- Ports System Service Library

Console Commands

This section describes the console commands available for the MRF24WG Wi-Fi Driver.

Description

Both the Web Server and the EasyConfig demonstrations support the followings commands, which enable control over the Wi-Fi settings.

Command: eraseconf

Parameters	Description
None.	Wi-Fi console command to erase saved Wi-Fi configuration in memory.

Command: iwconfig

Parameters	Description
[ssid <name>]	name: Specifies the name of the SSID (1-32 ASCII characters).
[mode <idle | managed>]	idle: Disconnected from the current configuration. managed: Connects in infrastructure mode to the currently set SSID.
[power <enable | disable>]	enable: Enables all Power-Saving features (PS_POLL). Will wake up to check for all types of traffic (unicast, multicast, and broadcast). disable: Disables any Power-Saving features. Will always be in an active power state.
[security <mode>]	mode: open/wep40/wep104/wpa/wpa2/pin/pbc. For example: iwconfig security open iwconfig security wep40 <key> iwconfig security wep104 <key> iwconfig security wpa <key> iwconfig security wpa2 <key> iwconfig security pin <pin> iwconfig security pbc
[scan]	Starts a Wi-Fi scan.
[scanget <scan_index>]	scan_index: Retrieves the scan result after the scan completes (1 - n).

Command: mac

Parameters	Description
None.	Wi-Fi console command to retrieve the MAC address of the MRF24WN module.

Command: readconf

Parameters	Description
None.	Wi-Fi console command to read saved Wi-Fi configuration in memory.

Command: saveconf

Parameters	Description
None.	Wi-Fi console command to save Wi-Fi configuration to memory.

Library Interface

a) Wi-Fi Initialization Functions

	Name	Description
	DRV_WIFI_Initialize	Initializes the MRF24WG Wi-Fi driver. **Implementation:** Dynamic
	DRV_WIFI_Deinitialize	De-initializes the MRF24WG Wi-Fi driver. **Implementation:** Dynamic
	DRV_WIFI_MRF24W_ISR	MRF24WG Wi-Fi driver interrupt service routine. **Implementation:** Dynamic
	DRV_WIFI_Deferred_ISR	Implements MRF24WG Wi-Fi driver deferred ISR. **Implementation:** Dynamic
	DRV_WIFI_DeferredISR_SemGive	Gives semaphore to Wi-Fi deferred ISR. **Implementation:** Dynamic
	DRV_WIFI_InitTask	Implements MRF24WG Wi-Fi driver initialization RTOS task. **Implementation:** Dynamic
	DRV_WIFI_MACTask	Implements MRF24WG Wi-Fi driver MAC process RTOS task. **Implementation:** Dynamic

b) Wi-Fi Network General Configuration Functions

	Name	Description
	DRV_WIFI_ChannelListSet	Sets the channel list. **Implementation:** Dynamic
	DRV_WIFI_NetworkTypeSet	Sets the Wi-Fi network type. **Implementation:** Dynamic
	DRV_WIFI_ReconnectModeSet	Sets the Wi-Fi reconnection mode. **Implementation:** Dynamic
	DRV_WIFI_SsidSet	Sets the SSID. **Implementation:** Dynamic
	DRV_WIFI_AdhocContextSet	Sets the Ad-Hoc context. **Implementation:** Dynamic
	DRV_WIFI_LinkDownThresholdSet	Sets number of consecutive Wi-Fi TX failures before link is considered down. **Implementation:** Dynamic
	DRV_WIFI_ContextLoad	Loads Wi-Fi context to MRF24WG. **Implementation:** Dynamic

c) Wi-Fi Network Security Configuration Functions

	Name	Description
	DRV_WIFI_SetPSK	Sets the binary WPA PSK code in WPS. **Implementation:** Dynamic
	DRV_WIFI_SecurityOpenSet	Sets Wi-Fi security to open (no security). **Implementation:** Dynamic
	DRV_WIFI_SecurityWpaSet	Sets Wi-Fi security to use WPA or WPA2. **Implementation:** Dynamic
	DRV_WIFI_SecurityWpsSet	Sets Wi-Fi security to use WPS. **Implementation:** Dynamic
	DRV_WIFI_SecurityWepSet	Sets Wi-Fi security to use WEP. **Implementation:** Dynamic

d) Wi-Fi Network Power Configuration Functions

	Name	Description
	DRV_WIFI_HibernateEnable	Puts the MRF24WG module into hibernate mode. **Implementation:** Dynamic
	DRV_WIFI_HibernateModeClear	Clears current Hibernate mode. **Implementation:** Dynamic
	DRV_WIFI_PsPollDisable	Disables PS-Poll mode. **Implementation:** Dynamic

	DRV_WIFI_PsPollEnable	Enables PS Poll mode. **Implementation:** Dynamic

e) Wi-Fi Network Multicast Filter Configuration Functions

	Name	Description
	DRV_WIFI_MulticastFilterSet	Sets a multicast address filter using one of the software multicast filters. **Implementation:** Dynamic

f) Wi-Fi Network Connection Functions

	Name	Description
	DRV_WIFI_Connect	Directs the MRF24WG to connect to a Wi-Fi network. **Implementation:** Dynamic
	DRV_WIFI_Disconnect	Directs the MRF24WG to disconnect from a Wi-Fi network. **Implementation:** Dynamic

g) Wi-Fi Network Configuration - Other Functions

	Name	Description
	DRV_WIFI_BssidSet	Sets the Basic Service Set Identifier (BSSID). **Implementation:** Dynamic
	DRV_WIFI_MacAddressSet	Uses a different MAC address for the MRF24WG. **Implementation:** Dynamic
	DRV_WIFI_RtsThresholdSet	Sets the RTS Threshold. **Implementation:** Dynamic
	DRV_WIFI_ScanContextSet	Sets the Wi-Fi scan context. **Implementation:** Dynamic
	DRV_WIFI_TxModeSet	Configures 802.11 TX mode. **Implementation:** Dynamic
	DRV_WIFI_RssiSet	Sets RSSI restrictions when connecting. **Implementation:** Dynamic
	DRV_WIFI_RSSI_Cache_FromRxDataRead	Caches RSSI value from RX data packet. **Implementation:** Dynamic
	DRV_WIFI_RSSI_Get_FromRxDataRead	Reads RSSI value from RX data packet. **Implementation:** Dynamic
	DRV_WIFI_INT_Handle	MRF24WG Wi-Fi driver interrupt handle. **Implementation:** Dynamic
	DRV_WIFI_SpiClose	Closes SPI object for MRF24WG Wi-Fi driver. **Implementation:** Dynamic
	DRV_WIFI_TaskSyncInit	Initializes RTOS Semaphore and Mutex for MRF24WG Wi-Fi driver. **Implementation:** Dynamic

h) Wi-Fi Scanning Functions

	Name	Description
	DRV_WIFI_Scan	Commands the MRF24WG module to start a scan operation. This will generate the WF_EVENT_SCAN_RESULTS_READY event. **Implementation:** Dynamic
	DRV_WIFI_ScanContextGet	Gets the Wi-Fi scan context. **Implementation:** Dynamic

i) Wi-Fi Event Processing Functions

	Name	Description
	DRV_WIFI_ProcessEvent	Processes Wi-Fi event. **Implementation:** Dynamic
	DRV_WIFI_SoftApEventInfoGet	Gets the stored Soft AP event info. **Implementation:** Dynamic
	DRV_WIFI_SoftAPContextSet	Sets the Soft AP context. **Implementation:** Dynamic

j) Wi-Fi Data Configuration Functions

	Name	Description
	DRV_WIFI_ConfigDataLoad	Loads configuration data from the board EEPROM. **Implementation:** Dynamic
	DRV_WIFI_ConfigDataSave	Save configuration data to the board EEPROM. **Implementation:** Dynamic
	DRV_WIFI_ConfigDataDelete	Erases configuration data from the board EEPROM. **Implementation:** Dynamic

k) Wi-Fi Status Functions

	Name	Description
	DRV_WIFI_BssidGet	Gets the BSSID set in DRV_WIFI_BssidSet(). **Implementation:** Dynamic
	DRV_WIFI_ChannelListGet	Gets the channel list. **Implementation:** Dynamic
	DRV_WIFI_ConnectContextGet	Gets the current Wi-Fi connection context. **Implementation:** Dynamic
	DRV_WIFI_ConnectionStateGet	Gets the current Wi-Fi connection state. **Implementation:** Dynamic
	DRV_WIFI_DeviceInfoGet	Retrieves MRF24WG device information. **Implementation:** Dynamic
	DRV_WIFI_MacAddressGet	Retrieves the MRF24WG MAC address. **Implementation:** Dynamic
	DRV_WIFI_MacStatsGet	Gets MAC statistics. **Implementation:** Dynamic
	DRV_WIFI_NetworkTypeGet	Gets the Wi-Fi network type. **Implementation:** Dynamic
	DRV_WIFI_PowerSaveStateGet	Gets the current power-saving state.
	DRV_WIFI_ReconnectModeGet	Gets the Wi-Fi reconnection mode. **Implementation:** Dynamic
	DRV_WIFI_RegionalDomainGet	Retrieves the MRF24WG Regional domain. **Implementation:** Dynamic
	DRV_WIFI_RtsThresholdGet	Gets the RTS Threshold. **Implementation:** Dynamic
	DRV_WIFI_SecurityGet	Gets the current Wi-Fi security setting. **Implementation:** Dynamic
	DRV_WIFI_SsidGet	Gets the SSID. **Implementation:** Dynamic
	DRV_WIFI_TxModeGet	Gets 802.11 TX mode. **Implementation:** Dynamic
	DRV_WIFI_WepKeyTypeGet	Gets the WEP Key type. **Implementation:** Dynamic
	DRV_WIFI_WPSCredentialsGet	Gets the WPS credentials. **Implementation:** Dynamic
	DRV_WIFI_RssiGet	Gets RSSI value set in DRV_WIFI_RssiSet(). **Implementation:** Dynamic
	DRV_WIFI_SecurityTypeGet	Gets the current Wi-Fi security type. **Implementation:** Dynamic
	DRV_WIFI_TxPowerFactoryMaxGet	Retrieves the factory-set max TX power from the MRF24WG module. **Implementation:** Dynamic
	DRV_WIFI_TxPowerMaxGet	Gets the TX max power on the MRF24WG0M. **Implementation:** Dynamic
	DRV_WIFI_TxPowerMaxSet	Sets the TX max power on the MRF24WG0M. **Implementation:** Dynamic
	DRV_WIFI_ScanResultGet	Read selected scan results back from MRF24WG. **Implementation:** Dynamic

	DRV_WIFI_InHibernateMode	Checks if MRF24WG is in hibernate mode. **Implementation:** Dynamic

l) Wi-Fi SPI Functions

	Name	Description
	DRV_WIFI_SpiDmaRx	SPI RX API using DMA. **Implementation:** Dynamic
	DRV_WIFI_SpiDmaTx	SPI TX API using DMA. **Implementation:** Dynamic
	DRV_WIFI_SpiInit	Initializes SPI object for MRF24WG Wi-Fi driver. **Implementation:** Dynamic
	DRV_WIFI_SpiRx	SPI Rx API. **Implementation:** Dynamic
	DRV_WIFI_SpiTx	SPI TX API **Implementation:** Dynamic

m) Private Configuration Functions

	Name	Description
	iwpriv_adhocctx_set	Sets the Ad-Hoc network context information. **Implementation:** Dynamic
	iwpriv_config_read	Reads the Wi-Fi context configuration. **Implementation:** Dynamic

n) Data Types and Constants

	Name	Description
	DRV_WIFI_BSSID_LENGTH	This is macro DRV_WIFI_BSSID_LENGTH.
	DRV_WIFI_DEAUTH_REASONCODE_MASK	This is macro DRV_WIFI_DEAUTH_REASONCODE_MASK.
	DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD	ms
	DRV_WIFI_DEFAULT_ADHOC_HIDDEN_SSID	Default values for Wi-Fi Ad-Hoc settings.
	DRV_WIFI_DEFAULT_ADHOC_MODE	This is macro DRV_WIFI_DEFAULT_ADHOC_MODE.
	DRV_WIFI_DEFAULT_PS_DTIM_ENABLED	DTIM wake-up enabled (normally the case)
	DRV_WIFI_DEFAULT_PS_DTIM_INTERVAL	number of beacon periods
	DRV_WIFI_DEFAULT_PS_LISTEN_INTERVAL	100 ms multiplier, e.g., 1 * 100 ms = 100 ms
	DRV_WIFI_DEFAULT_SCAN_COUNT	Default values for Wi-Fi scan context
	DRV_WIFI_DEFAULT_SCAN_MAX_CHANNEL_TIME	ms
	DRV_WIFI_DEFAULT_SCAN_MIN_CHANNEL_TIME	ms
	DRV_WIFI_DEFAULT_SCAN_PROBE_DELAY	us
	DRV_WIFI_DEFAULT_WEP_KEY_TYPE	This is macro DRV_WIFI_DEFAULT_WEP_KEY_TYPE.
	DRV_WIFI_DISABLED	This is macro DRV_WIFI_DISABLED.
	DRV_WIFI_DISASSOC_REASONCODE_MASK	This is macro DRV_WIFI_DISASSOC_REASONCODE_MASK.
	DRV_WIFI_ENABLED	Do not make this an enumerated type!
	DRV_WIFI_MAX_CHANNEL_LIST_LENGTH	This is macro DRV_WIFI_MAX_CHANNEL_LIST_LENGTH.
	DRV_WIFI_MAX_NUM_RATES	This is macro DRV_WIFI_MAX_NUM_RATES.
	DRV_WIFI_MAX_SECURITY_KEY_LENGTH	This is macro DRV_WIFI_MAX_SECURITY_KEY_LENGTH.
	DRV_WIFI_MAX_SSID_LENGTH	This is macro DRV_WIFI_MAX_SSID_LENGTH.
	DRV_WIFI_MAX_WEP_KEY_LENGTH	This is macro DRV_WIFI_MAX_WEP_KEY_LENGTH.
	DRV_WIFI_MAX_WPA_PASS_PHRASE_LENGTH	must exclude string terminator
	DRV_WIFI_MIN_WPA_PASS_PHRASE_LENGTH	must exclude string terminator
	DRV_WIFI_NETWORK_TYPE_ADHOC	This is macro DRV_WIFI_NETWORK_TYPE_ADHOC.
	DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE	Selection of different Wi-Fi network types.
	DRV_WIFI_NETWORK_TYPE_SOFT_AP	This is macro DRV_WIFI_NETWORK_TYPE_SOFT_AP.
	DRV_WIFI_NO_ADDITIONAL_INFO	eventInfo define for DRV_WIFI_ProcessEvent() when no additional info is supplied
	DRV_WIFI_RETRY_ADHOC	This is macro DRV_WIFI_RETRY_ADHOC.
	DRV_WIFI_RETRY_FOREVER	This is macro DRV_WIFI_RETRY_FOREVER.
	DRV_WIFI_RTS_THRESHOLD_MAX	maximum RTS threshold size in bytes

	DRV_WIFI_SECURITY_OPEN	Selection of different Wi-Fi security types
	DRV_WIFI_SECURITY_WEP_104	This is macro DRV_WIFI_SECURITY_WEP_104.
	DRV_WIFI_SECURITY_WEP_40	This is macro DRV_WIFI_SECURITY_WEP_40.
	DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY	This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY.
	DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE	This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE.
	DRV_WIFI_SECURITY_WPA_WITH_KEY	This is macro DRV_WIFI_SECURITY_WPA_WITH_KEY.
	DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE	This is macro DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE.
	DRV_WIFI_SECURITY_WPA2_WITH_KEY	This is macro DRV_WIFI_SECURITY_WPA2_WITH_KEY.
	DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE	This is macro DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE.
	DRV_WIFI_SECURITY_WPS_PIN	This is macro DRV_WIFI_SECURITY_WPS_PIN.
	DRV_WIFI_SECURITY_WPS_PUSH_BUTTON	This is macro DRV_WIFI_SECURITY_WPS_PUSH_BUTTON.
	DRV_WIFI_WEP104_KEY_LENGTH	4 keys of 13 bytes each
	DRV_WIFI_WEP40_KEY_LENGTH	4 keys of 5 bytes each
	DRV_WIFI_WPA_KEY_LENGTH	This is macro DRV_WIFI_WPA_KEY_LENGTH.
	DRV_WIFI_WPS_PIN_LENGTH	7 digits + checksum byte
	DRV_WIFI_ADHOC_MODES	Selection of different Ad-Hoc connection modes.
	DRV_WIFI_ADHOC_NETWORK_CONTEXT	Contains data pertaining to Wi-Fi Ad-Hoc context.
	DRV_WIFI_CONNECTION_CONTEXT	Contains data pertaining to MRF24WG connection context.
	DRV_WIFI_CONNECTION_STATES	Wi-Fi Connection States
	DRV_WIFI_DEVICE_INFO	Contains data pertaining to MRF24WG device type and version number.
	DRV_WIFI_DOMAIN_CODES	Wi-Fi Regional Domain Codes
	DRV_WIFI_EVENT_CONN_TEMP_LOST_CODES	Selection of different codes when Wi-Fi connection is temporarily lost.
	DRV_WIFI_EVENT_INFO	Selection of different EventInfo types.
	DRV_WIFI_EVENTS	Selections for events that can occur.
	DRV_WIFI_GENERAL_ERRORS	This is type DRV_WIFI_GENERAL_ERRORS.
	DRV_WIFI_HIBERNATE_STATES	Wi-Fi Hibernate States
	DRV_WIFI_MAC_STATS	Wi-Fi MIB states
	DRV_WIFI_MGMT_ERRORS	Error codes returned when a management message is sent to the MRF24WG module.
	DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT	Contains data pertaining to Wi-Fi Soft AP event.
	DRV_WIFI_MULTICAST_FILTER_IDS	Selections for software Multicast filter IDs.
	DRV_WIFI_MULTICAST_FILTERS	Selections for Software Multicast Filters.
	DRV_WIFI_POWER_SAVE_STATES	Wi-Fi Power-Saving States
	DRV_WIFI_PS_POLL_CONTEXT	Contains data pertaining to Wi-Fi PS-Poll context.
	DRV_WIFI_REASON_CODES	Selection of different codes when a deauthorization or disassociation event has occurred.
	DRV_WIFI_RECONNECT_MODES	Selection of different reconnection modes.
	DRV_WIFI_SCAN_CONTEXT	Contains data pertaining to Wi-Fi scan context.
	DRV_WIFI_SCAN_RESULT	Contains data pertaining to Wi-Fi scan results.
	DRV_WIFI_SCAN_TYPES	Selection of different Wi-Fi scan types.
	DRV_WIFI_SOFT_AP_EVENT_REASON_CODES	Wi-Fi Soft AP Event Reason Codes
	DRV_WIFI_SOFT_AP_STATES	Wi-Fi Soft AP Events
	DRV_WIFI_STATUS_CODES	Selection of different codes when Wi-Fi connection fails due to association or authentication failure.
	DRV_WIFI_TX_MODES	Selections for Wi-Fi TX Mode
	DRV_WIFI_WEP_CONTEXT	Contains data pertaining to Wi-Fi WEP context.
	DRV_WIFI_WEP_KEY_TYPE	Selections for WEP key type when using WEP security.
	DRV_WIFI_WPA_CONTEXT	Contains data pertaining to Wi-Fi WPA.
	DRV_WIFI_WPA_KEY_INFO	Contains data pertaining to Wi-Fi WPA Key.
	DRV_WIFI_WPS_AUTH_TYPES	Selection of WPS Authorization Types
	DRV_WIFI_WPS_CONTEXT	Contains data pertaining to Wi-Fi WPS security.
	DRV_WIFI_WPS_CREDENTIAL	Contains data pertaining to Wi-Fi WPS Credentials.

	DRV_WIFI_WPS_ENCODE_TYPES	Selection of WPS Encoding Types
	adhocMode	Selection of different Ad-Hoc connection modes.
	DRV_WIFI_WPS_ERROR_CONFIG_CODES	Selection of different codes when a WPS connection fails.
	DRV_WIFI_WPS_STATE_CODES	Selection of different codes when a Extensible Authentication Protocol is used.
	DRV_WIFI_DEFAULT_WEP_KEY_INDEX	see DRV_WIFI_SecurityWepSet() and DRV_WIFI_WEP_CONTEXT
	DRV_WIFI_SOFTAP_NETWORK_CONTEXT	Contains data pertaining to Wi-Fi Soft AP context.
	DRV_WIFI_DEFAULT_SOFTAP_HIDDEN_SSID	Default values for Wi-Fi Soft AP settings.
	DRV_WIFI_MULTICAST_CONFIG	Contains data pertaining to Wi-Fi software multicast filter configuration.
	DRV_WIFI_APCONFIG_BIT_PREAMBLE_LONG	This is macro DRV_WIFI_APCONFIG_BIT_PREAMBLE_LONG.
	DRV_WIFI_APCONFIG_BIT_PRIVACY	apConfig bit
	DRV_WIFI_APCONFIG_BIT_WPA	This is macro DRV_WIFI_APCONFIG_BIT_WPA.
	DRV_WIFI_APCONFIG_BIT_WPA2	This is macro DRV_WIFI_APCONFIG_BIT_WPA2.
	DRV_WIFI_DEVICE_TYPE	Codes for MRF Wi-Fi Device Type

Description

This section describes the Application Programming Interface (API) functions of the MRF24WG Wi-Fi Driver.

Refer to each section for a detailed description.

a) Wi-Fi Initialization Functions

DRV_WIFI_Initialize Function

Initializes the MRF24WG Wi-Fi driver.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_Initialize();
```

Returns

None.

Description

This function initializes the MRF24WG driver, making it ready for clients to use.

Remarks

This function must be called before any other Wi-Fi routine is called. The real work of Wi-Fi initialization takes place in an internal state machine, whose state is set to the initial value by this function.

Preconditions

None.

Function

void DRV_WIFI_Initialize(void)

DRV_WIFI_Deinitialize Function

De-initializes the MRF24WG Wi-Fi driver.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_Deinitialize();
```

Returns

None.

Description

This function de-initializes the MRF24WG driver. It also saves the Wi-Fi parameters in non-volatile storage.

Remarks

None.

Preconditions

None.

Function

void DRV_WIFI_Deinitialize(void)

DRV_WIFI_MRF24W_ISR Function

MRF24WG Wi-Fi driver interrupt service routine.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_MRF24W_ISR(SYS_MODULE_OBJ index);
```

Returns

None.

Description

This function is MRF24WG Wi-Fi driver interrupt service routine.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Function

void DRV_WIFI_MRF24W_ISR(SYS_MODULE_OBJ index)

DRV_WIFI_Deferred_ISR Function

Implements MRF24WG Wi-Fi driver deferred ISR.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_Deferred_ISR(void * p_arg);
```

Returns

None.

Description

This function implements MRF24WG Wi-Fi driver deferred ISR.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void DRV_WIFI_Deferred_ISR(void *p_arg)

DRV_WIFI_DeferredISR_SemGive Function

Gives semaphore to Wi-Fi deferred ISR.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_DeferredISR_SemGive();
```

Returns

None.

Description

This function gives semaphore to Wi-Fi Deferred ISR.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void DRV_WIFI_DeferredISR_SemGive(void)

DRV_WIFI_InitTask Function

Implements MRF24WG Wi-Fi driver initialization RTOS task.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_InitTask(void * p_arg);
```

Returns

None.

Description

This function implements MRF24WG Wi-Fi driver initialization RTOS task.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void DRV_WIFI_InitTask(void *p_arg)

DRV_WIFI_MACTask Function

Implements MRF24WG Wi-Fi driver MAC process RTOS task.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_MACTask(void * p_arg);
```

Returns

None.

Description

This function implements MRF24WG Wi-Fi driver MAC process RTOS task.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void DRV_WIFI_MACTask(void *p_arg)

b) Wi-Fi Network General Configuration Functions

DRV_WIFI_ChannelListSet Function

Sets the channel list.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ChannelListSet(uint8_t * p_channelList, uint8_t numChannels);
```

Returns

None.

Description

This function sets the channel list that the MRF24WG will use when scanning or connecting.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t channelList[1, 6, 11];

DRV_WIFI_ChannelListSet(channelList, sizeof(channelList));
```

Parameters

Parameters	Description
p_channelList	list of channels

numChannels	number of channels in list; if set to 0, then MRF24WG will set its channel list to all valid channels in its regional domain

Function

void DRV_WIFI_ChannelListSet(uint8_t *p_channelList, uint8_t numChannels)

DRV_WIFI_NetworkTypeSet Function

Sets the Wi-Fi network type.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_NetworkTypeSet(uint8_t networkType);
```

Returns

None.

Description

This function selects the Wi-Fi network type.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_NetworkTypeSet(DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE);
```

Parameters

Parameters	Description
networkType	one of the following: DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE DRV_WIFI_NETWORK_TYPE_ADHOC DRV_WIFI_NETWORK_TYPE_SOFT_AP

Function

void DRV_WIFI_NetworkTypeSet(uint8_t networkType)

DRV_WIFI_ReconnectModeSet Function

Sets the Wi-Fi reconnection mode.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ReconnectModeSet(uint8_t retryCount, uint8_t deauthAction, uint8_t beaconTimeout, uint8_t
beaconTimeoutAction);
```

Returns

None.

Description

This function controls how the MRF24WG behaves when an existing Wi-Fi connection is lost. The MRF24WG can lose an existing connection in one of two ways: 1) Beacon timeout; 2) Deauthorization received from AP.

There are two options with respect to regaining a lost Wi-Fi connection: 1) MRF24WG informs the host that the connection was temporarily lost and then the MRF24WG retries N times (or forever) to regain the connection. 2) MRF24WG simply informs the host application that the connection is lost, and it is up to the host to regain the connection via the API.

Remarks

The retryCount parameter also applies when initially connecting. That is, the retryCount tells the MRF24WG how many time to try to connect to a Wi-Fi network before giving up and generating the DRV_WIFI_EVENT_CONNECTION_FAILED event.

'retryCount' field	Description
0	Do not try to regain a connection (simply report event to host)
1:254	Number of times MRF24WG should try to regain the connection
255	MRF24WG will retry forever (do not use for Ad-Hoc connections)

'deauthAction' field	Description
DRV_WIFI_DO_NOT_ATTEMPT_TO_RECONNECT	Do not attempt to reconnect after a deauth
DRV_WIFI_ATTEMPT_TO_RECONNECT	Attempt to reconnect after a deauth

'beaconTimeout' field	Description
0	MRF24WG will not monitor the beacon timeout condition
1:255	Number of missed beacons before designating the connection as lost.

'beaconTimeoutAction' field	Description
DRV_WIFI_DO_NOT_ATTEMPT_TO_RECONNECT	Do not attempt to reconnect after a beacon timeout
DRV_WIFI_ATTEMPT_TO_RECONNECT	Attempt to reconnect after a beacon timeout

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
// Example 1: MRF24WG should retry forever if either a deauth or beacon
// timeout occurs (beacon timeout is 3 beacon periods).
DRV_WIFI_ReconnectModeSet(WF_RETRY_FOREVER,
                          WF_ATTEMPT_TO_RECONNECT,
                          3,
                          WF_ATTEMPT_TO_RECONNECT);

// Example 2: MRF24WG should not do any connection retries and only report
// deauthorization events to the host.
DRV_WIFI_ReconnectModeSet(0,
                          WF_DO_NOT_ATTEMPT_TO_RECONNECT,
                          0,
                          WF_DO_NOT_ATTEMPT_TO_RECONNECT);

// Example 3: MRF24WG should not do any connection retries, but report deauthorization
// and beacon timeout events to host.  Beacon timeout should be 5 beacon periods.
DRV_WIFI_ReconnectModeSet(0,
                          WF_DO_NOT_ATTEMPT_TO_RECONNECT,
                          5,
                          WF_DO_NOT_ATTEMPT_TO_RECONNECT);

// Example 4: MRF24WG should ignore beacon timeouts, but attempt to
// reconnect 3 times if a deauthorization occurs.
DRV_WIFI_ReconnectModeSet(3,
                          WF_ATTEMPT_TO_RECONNECT,
                          0,
                          WF_DO_NOT_ATTEMPT_TO_RECONNECT);
```

Parameters

Parameters	Description
retryCount	number of times the MRF24WG should try to regain the connection (see description)
deauthAction	in the event of a deauthorization from the AP, the action the MRF24WG should take (see description)
beaconTimeout	number of missed beacons before the MRF24WG designates the connection as lost (see description)
beaconTimeoutAction	in the event of a beacon timeout, the action the MRF24WG should take (see description)

Function

void DRV_WIFI_ReconnectModeSet(uint8_t retryCount, uint8_t deauthAction,

uint8_t beaconTimeout, uint8_t beaconTimeoutAction)

DRV_WIFI_SsidSet Function

Sets the SSID.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SsidSet(uint8_t * p_ssid, uint8_t ssidLen);
```

Returns

None.

Description

Sets the SSID and SSID Length. Note that an Access Point can have either a visible or hidden SSID. If an Access Point uses a hidden SSID then an active scan must be used.

Remarks

Do not include a string terminator in the SSID length. SSIDs are case-sensitive. SSID length must be less than or equal to DRV_WIFI_MAX_SSID_LENGTH.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t ssid[] = "MySSIDName";
uint8_t ssidLength = strlen(ssid);

DRV_WIFI_SsidSet(ssid, &ssidLen);
```

Parameters

Parameters	Description
p_ssid	pointer to SSID buffer
ssidLength	number of bytes in SSID

Function

void DRV_WIFI_SsidSet(uint8_t *p_ssid, uint8_t ssidLen)

DRV_WIFI_AdhocContextSet Function

Sets the Ad-Hoc context.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_AdhocContextSet(DRV_WIFI_ADHOC_NETWORK_CONTEXT * p_context);
```

Returns

None.

Description

This function sets the Ad-Hoc context. It is only applicable when the DRV_WIFI_NETWORK_TYPE_ADHOC has been selected in DRV_WIFI_NetworkTypeSet.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_ADHOC_NETWORK_CONTEXT adHocContext;

adHocContext.mode = DRV_WIFI_ADHOC_CONNECT_THEN_START;
adHocContext.hiddenSsid = false;
adHocContext.beaconPeriod = DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD;

DRV_WIFI_AdhocContextSet(&adHocContext);
```

Parameters

Parameters	Description
p_context	pointer to Ad-Hoc context data; see definition for the DRV_WIFI_ADHOC_NETWORK_CONTEXT structure.

Function

void DRV_WIFI_AdhocContextSet(DRV_WIFI_ADHOC_NETWORK_CONTEXT *p_context)

DRV_WIFI_LinkDownThresholdSet Function

Sets number of consecutive Wi-Fi TX failures before link is considered down.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_LinkDownThresholdSet(uint8_t threshold);
```

Returns

None.

Description

This function allows the application to set the number of MRF24WG consecutive TX failures before the connection failure event (DRV_WIFI_LINK_LOST) is reported to the host application.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_LinkDownThresholdSet(0); // disable link down threshold
```

Parameters

Parameters	Description
threshold	0: disabled (default)
1-255	number of consecutive TX failures before connection failure event is reported

Function

void DRV_WIFI_LinkDownThresholdSet(uint8_t threshold)

DRV_WIFI_ContextLoad Function

Loads Wi-Fi context to MRF24WG.

Implementation: Dynamic

File

drv_wifi.h

C

```
TCPIP_MAC_RES DRV_WIFI_ContextLoad();
```

Returns

TCP/IP stack MAC result.

Description

This function loads Wi-Fi context to MRF24WG.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

TCPIP_MAC_RES DRV_WIFI_ContextLoad(void)

c) Wi-Fi Network Security Configuration Functions

DRV_WIFI_SetPSK Function

Sets the binary WPA PSK code in WPS.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SetPSK(uint8_t * p_psk);
```

Returns

None.

Description

This function is used in conjunction with DRV_WIFI_YieldPassphraseToHost. It sends the binary key to the MRF24WG after the host has converted an ASCII passphrase to a binary key.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_YieldPassphraseToHost(&info);
```

Parameters

Parameters	Description
p_psk	pointer to the binary key

Function

void DRV_WIFI_SetPSK(uint8_t *p_psk)

DRV_WIFI_SecurityOpenSet Function

Sets Wi-Fi security to open (no security).

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SecurityOpenSet();
```

Returns

None.

Description

This function sets the Wi-Fi security to open. One can only connect to an AP that is running in open mode.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete. Must be in an unconnected state.

Example

```
DRV_WIFI_SecurityOpenSet();
```

Function

void DRV_WIFI_SecurityOpenSet(void)

DRV_WIFI_SecurityWpaSet Function

Sets Wi-Fi security to use WPA or WPA2.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SecurityWpaSet(DRV_WIFI_WPA_CONTEXT* p_context);
```

Returns

None.

Description

This function sets the Wi-Fi security to WPA or WPA2. One can only connect to an AP that is running the same WPA mode.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete. Must be in an unconnected state.

Example

```
DRV_WIFI_WPA_CONTEXT context;

context.wpaSecurityType  = DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE
context.keyInfo.key[]    = "MySecretWPAPassPhrase";
context.keyInfo.keyLenth = strlen(context.keyInfo.key);
DRV_WIFI_SecurityWpaSet(&context);
```

Parameters

Parameters	Description
p_context	desired WPA context, see DRV_WIFI_WPA_CONTEXT structure

Function

DRV_WIFI_SecurityWpaSet(DRV_WIFI_WPA_CONTEXT* p_context)

DRV_WIFI_SecurityWpsSet Function

Sets Wi-Fi security to use WPS.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SecurityWpsSet(DRV_WIFI_WPS_CONTEXT * p_context);
```

Returns

None.

Description

This function sets the Wi-Fi security to WPS. One can only connect to an AP that supports WPS.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete. Must be in an unconnected state.

Example

```
DRV_WIFI_WPS_CONTEXT context;
uint8_t wpsPin[8] = {1, 2, 3, 9, 0, 2, 1, 2};

context.wpsSecurityType = DRV_WIFI_SECURITY_WPS_PUSH_BUTTON;
memcpy(context.wpsPin, wpsPin, sizeof(wpsPin));
context.wpsPinLength = 8;
DRV_WIFI_SecurityWpsSet(&context);
```

Parameters

Parameters	Description
p_context	desired WPA context, see DRV_WIFI_WPS_CONTEXT structure

Function

void DRV_WIFI_SecurityWpsSet(DRV_WIFI_WPS_CONTEXT *p_context)

DRV_WIFI_SecurityWepSet Function

Sets Wi-Fi security to use WEP.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SecurityWepSet(DRV_WIFI_WEP_CONTEXT * p_context);
```

Returns

None.

Description

This function sets the Wi-Fi security to WEP. One can only connect to an AP that is running the same WEP mode.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete. Must be in an unconnected state.

Example

```
DRV_WIFI_WEP_CONTEXT context;

context.wepSecurityType = DRV_WIFI_SECURITY_WEP_40;
context.wepKey[] = {0x5a, 0xfb, 0x6c, 0x8e, 0x77,
                    0xc1, 0x04, 0x49, 0xfd, 0x4e,
                    0x43, 0x18, 0x2b, 0x33, 0x88,
                    0xb0, 0x73, 0x69, 0xf4, 0x78};

context.wepKeyLength = 20;
context.wepKeyType = DRV_WIFI_SECURITY_WEP_OPENKEY;
DRV_WIFI_SecurityOpenSet(&context);
```

Parameters

Parameters	Description
p_context	desired WEP context, see DRV_WIFI_WEP_CONTEXT structure

Function

void DRV_WIFI_SecurityWepSet(DRV_WIFI_WEP_CONTEXT *p_context)

d) Wi-Fi Network Power Configuration Functions

DRV_WIFI_HibernateEnable Function

Puts the MRF24WG module into hibernate mode.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_HibernateEnable();
```

Returns

None.

Description

This function enables hibernate mode on the MRF24WG module, which effectively turns off the device for maximum power savings.

MRF24WG module state is not maintained when it transitions to hibernate mode.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_HibernateEnable();
```

Function

void DRV_WIFI_HibernateEnable(void)

DRV_WIFI_HibernateModeClear Function

Clears current Hibernate mode.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_HibernateModeClear();
```

Returns

None.

Description

This function clears the current Hibernate mode.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Function

bool DRV_WIFI_HibernateModeClear(void)

DRV_WIFI_PsPollDisable Function

Disables PS-Poll mode.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_PsPollDisable();
```

Returns

None.

Description

Disables PS Poll mode. The MRF24WG module will stay active and not go to sleep.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_PsPollDisable(&context);
```

Function

void DRV_WIFI_PsPollDisable(void)

DRV_WIFI_PsPollEnable Function

Enables PS Poll mode.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_PsPollEnable(DRV_WIFI_PS_POLL_CONTEXT * p_context);
```

Returns

None.

Description

Enables PS Poll mode. PS Poll (Power-Save Poll) is a mode allowing for longer battery life. The MRF24WG module coordinates with the Access Point to go to sleep and wake up at periodic intervals to check for data messages, which the Access Point will buffer. The listenInterval in the Connection Algorithm defines the sleep interval. By default, PS Poll mode is disabled.

When PS Poll is enabled, the Wi-Fi Host Driver will automatically force the MRF24WG module to wake up each time the Host sends TX data or a control message to the module. When the Host message transaction is complete the MRF24WG driver will automatically re-enable PS Poll mode.

When the application is likely to experience a high volume of data traffic then PS Poll mode should be disabled for two reasons:

1. No power savings will be realized in the presence of heavy data traffic.
2. Performance will be impacted adversely as the Wi-Fi Host Driver continually activates and deactivates PS Poll mode via SPI messages.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_PS_POLL_CONTEXT context;

context.listenInterval = DRV_WIFI_DEFAULT_PS_LISTEN_INTERVAL;
context.dtimInterval = DRV_WIFI_DEFAULT_PS_DTIM_INTERVAL;
context.useDtim = DRV_WIFI_DEFAULT_PS_DTIM_ENABLED;

DRV_WIFI_PsPollEnable(&context);
```

Parameters

Parameters	Description
p_context	pointer to PS Poll context, see DRV_WIFI_PS_POLL_CONTEXT structure

Function

void DRV_WIFI_PsPollEnable(DRV_WIFI_PS_POLL_CONTEXT *p_context)

e) Wi-Fi Network Multicast Filter Configuration Functions

DRV_WIFI_MulticastFilterSet Function

Sets a multicast address filter using one of the software multicast filters.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_MulticastFilterSet(DRV_WIFI_MULTICAST_CONFIG * p_config);
```

Returns

None.

Description

This function allows the application to configure up to two Multicast Address Filters on the MRF24WG module. If two active multicast filters are set up they are ORed together - the module will receive and pass to the Host CPU received packets from either multicast address. The allowable values in p_config are:

filterId -- DRV_WIFI_MULTICAST_FILTER_1 through DRV_WIFI_MULTICAST_FILTER_16

action -- DRV_WIFI_MULTICAST_DISABLE_ALL (default) The Multicast Filter discards all received multicast messages - they will not be forwarded to the Host PIC. The remaining fields in this structure are ignored.

DRV_WIFI_MULTICAST_ENABLE_ALL The Multicast Filter forwards all received multicast messages to the Host PIC. The remaining fields in this structure are ignored.

DRV_WIFI_MULTICAST_USE_FILTERS The MAC filter will be used and the remaining fields in this structure configure which Multicast messages are forwarded to the Host PIC.

macBytes -- Array containing the MAC address to filter on (using the destination address of each incoming 802.11 frame). Specific bytes with the MAC address can be designated as "don't care" bytes. See macBitMask. This field in only used if action = DRV_WIFI_MULTICAST_USE_FILTERS.

macBitMask -- A byte where bits 5:0 correspond to macBytes[5:0]. If the bit is zero then the corresponding MAC byte must be an exact match for the frame to be forwarded to the Host PIC. If the bit is one then the corresponding MAC byte is a "don't care" and not used in the Multicast filtering process. This field in only used if action = DRV_WIFI_MULTICAST_USE_FILTERS.

Remarks

Cannot mix hardware and software multicast filters.

Preconditions

MRF24WG Wi-Fi initialization must be complete. DRV_WIFI_MultiCastFilterEnable() must have been called previously.

Example

```
DRV_WIFI_MULTICAST_CONFIG config;
uint8_t macMask[] = {01, 00, 5e, ff, ff, ff};  // (0xff(s) are the don't care bytes)

// configure software multicast filter 1 to filter multicast addresses that
// start with 01:00:5e
config.action = DRV_WIFI_MULTICAST_USE_FILTERS;
config->filterId = DRV_WIFI_MULTICAST_FILTER_1;
memcpy(config->macBytes, macMask, 6);
config->macBitMask = 0x38; // bits 5:3 = 1 (don't care on bytes 3,4,5)
                           // bits 2:0 = 0 (exact match required on bytes 0, 1, 2)
```

Function

void DRV_WIFI_MulticastFilterSet(DRV_WIFI_MULTICAST_CONFIG *p_config)

f) Wi-Fi Network Connection Functions

DRV_WIFI_Connect Function

Directs the MRF24WG to connect to a Wi-Fi network.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_Connect();
```

Returns

None.

Description

This function causes the MRF24WG to connect to a Wi-Fi network. Upon connection, or a failure to connect, an event will be generated.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete and relevant connection parameters must have been set.

Example

```
DRV_WIFI_Connect();
```

Function

void DRV_WIFI_Connect(void)

DRV_WIFI_Disconnect Function

Directs the MRF24WG to disconnect from a Wi-Fi network.

Implementation: Dynamic

File

drv_wifi.h

C

```
uint16_t DRV_WIFI_Disconnect();
```

Returns

DRV_WIFI_SUCCESS or DRV_WIFI_ERROR_DISCONNECT_FAILED.

Description

This function causes the MRF24WG to disconnect from a Wi-Fi network. No event is generated when a connection is terminated via the function call.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete and a connection must be in progress.

Example

```
DRV_WIFI_Disconnect();
```

Function

uint16_t DRV_WIFI_Disconnect(void)

g) Wi-Fi Network Configuration - Other Functions

DRV_WIFI_BssidSet Function

Sets the Basic Service Set Identifier (BSSID).

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_BssidSet(uint8_t * p_bssid);
```

Returns

None.

Description

This sets 6 byte (48-bit) MAC address of the Access Point that is being scanned for. It is optional to use this. Where it is useful is if there are two

APs with the same ID; the BSSID is used to connect to the specified AP. This setting can be used in lieu of the SSID. Set each byte to 0xFF (default) if the BSSID is not being used. Not typically needed.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t bssid[6];

bssid[0] = 0x00;
bssid[1] = 0xe8;
bssid[2] = 0xc0;
bssid[3] = 0x11;
bssid[4] = 0x22;
bssid[5] = 0x33;

DRV_WIFI_BssidSet(bssid);
```

Parameters

Parameters	Description
p_context	pointer to BSSID

Function

void DRV_WIFI_BssidSet(uint8_t *p_bssid)

DRV_WIFI_MacAddressSet Function

Uses a different MAC address for the MRF24WG.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_MacAddressSet(uint8_t * p_mac);
```

Returns

None.

Description

Directs the MRF24WG module to use the input MAC address instead of its factory-default MAC address. This function does not overwrite the factory default, which is in Flash memory.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete. Cannot be called when the MRF24WG is in a connected state.

Example

```
uint8_t mac[6] = {0x00, 0x1e, 0xc0, 0x11, 0x22, 0x33};

DRV_WIFI_MacAddressSet(mac);
```

Parameters

Parameters	Description
p_mac	pointer to 6 byte MAC that will be sent to MRF24WG

Function

void DRV_WIFI_MacAddressSet(uint8_t *p_mac)

DRV_WIFI_RtsThresholdSet Function

Sets the RTS Threshold.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_RtsThresholdSet(uint16_t rtsThreshold);
```

Returns

None.

Description

This function sets the RTS/CTS packet size threshold for when RTS/CTS frame will be sent. The default is 2347 bytes - the maximum for 802.11. It is recommended that the user leave the default at 2347 until they understand the performance and power ramifications of setting it smaller. Valid values are from 0 to DRV_WIFI_RTS_THRESHOLD_MAX (2347).

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_RtsThresholdSet(DRV_WIFI_RTS_THRESHOLD_MAX);
```

Parameters

Parameters	Description
rtsThreshold	Value of the packet size threshold

Function

void DRV_WIFI_RtsThresholdSet(uint16_t rtsThreshold)

DRV_WIFI_ScanContextSet Function

Sets the Wi-Fi scan context.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ScanContextSet(DRV_WIFI_SCAN_CONTEXT * p_context);
```

Returns

None.

Description

This function sets the Wi-Fi scan context. The MRF24WG defaults are fine for most applications, but they can be changed by this function.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_SCAN_CONTEXT context;
```

```
context.scantype = DRV_WIFI_ACTIVE_SCAN;
context.scanCount      = 1;
context.minChannelTime = 200; // ms
context.maxChannelTime = 400; // ms
context.probeDelay     = 20; // uS

DRV_WIFI_ScanContextSet(&context);
```

Parameters

Parameters	Description
p_context	pointer to scan context, see DRV_WIFI_SCAN_CONTEXT structure.

Function

void DRV_WIFI_ScanContextSet(DRV_WIFI_SCAN_CONTEXT *p_context)

DRV_WIFI_TxModeSet Function

Configures 802.11 TX mode.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_TxModeSet(uint8_t mode);
```

Returns

None.

Description

This function sets the MRF24WG TX mode.

mode	Description
DRV_WIFI_TXMODE_G_RATES	Use all 802.11g rates (default)
DRV_WIFI_TXMODE_B_RATES	Use only 802.11b rates
DRV_WIFI_TXMODE_LEGACY_RATES	Use only 1 and 2 Mbps rates

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_TxModeSet(DRV_WIFI_TXMODE_G_RATES);
```

Parameters

Parameters	Description
mode	TX mode value (see description)

Function

void DRV_WIFI_TxModeSet(uint8_t mode)

DRV_WIFI_RssiSet Function

Sets RSSI restrictions when connecting.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_RssiSet(uint8_t rssi);
```

Returns

None.

Description

This setting is only used if: 1) Neither an SSID or BSSID has been configured or 2) An SSID is defined and multiple APs are discovered with the same SSID.

rssi	Description
0	Connect to first network found
1-254	Only connect to network if the RSSI is greater or equal to this value
255	Connect to the highest RSSI found (default)

Remarks

Rarely needed.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_RssiSet(255);
```

Parameters

Parameters	Description
rssi	see description

Function

void DRV_WIFI_RssiSet(uint8_t rssi)

DRV_WIFI_RSSI_Cache_FromRxDataRead Function

Caches RSSI value from RX data packet.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_RSSI_Cache_FromRxDataRead(uint16_t rssi);
```

Returns

None.

Description

This function caches RSSI value from RX data packet.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Parameters

Parameters	Description
rssi	RSSI value read from RX data packet

Function

void DRV_WIFI_RSSI_Cache_FromRxDataRead(uint16_t rssi)

DRV_WIFI_RSSI_Get_FromRxDataRead Function

Reads RSSI value from RX data packet.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_RSSI_Get_FromRxDataRead(uint16_t * mean, uint16_t * last);
```

Returns

- mean - the calculated mean RSSI
- last - the total count of RSSI values

Description

This function reads RSSI value from RX data packet.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Parameters

Parameters	Description
mean	pointer to where the average mean RSSI value to be stored
last	pointer to where the total count of RSSI values to be stored

Function

void DRV_WIFI_RSSI_Get_FromRxDataRead(uint16_t *mean, uint16_t *last)

DRV_WIFI_INT_Handle Function

MRF24WG Wi-Fi driver interrupt handle.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_INT_Handle();
```

Returns

None.

Description

This function is the interrupt handle of MRF24WG Wi-Fi driver.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Function

void DRV_WIFI_INT_Handle(void)

DRV_WIFI_SpiClose Function

Closes SPI object for MRF24WG Wi-Fi driver.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SpiClose();
```

Returns

None.

Description

This function closes SPI object for MRF24WG Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void DRV_WIFI_SpiClose(void)

DRV_WIFI_TaskSyncInit Function

Initializes RTOS Semaphore and Mutex for MRF24WG Wi-Fi driver.

Implementation: Dynamic

File

drv_wifi.h

C

```
bool DRV_WIFI_TaskSyncInit();
```

Returns

- true - Initialization was successful
- false - Initialization was not successful

Description

This function initializes RTOS Semaphore and Mutex for MRF24WG Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

bool DRV_WIFI_TaskSyncInit(void)

h) Wi-Fi Scanning Functions

DRV_WIFI_Scan Function

Commands the MRF24WG module to start a scan operation. This will generate the WF_EVENT_SCAN_RESULTS_READY event.

Implementation: Dynamic

File

drv_wifi.h

C

```
uint16_t DRV_WIFI_Scan(bool scanAll);
```

Returns

None.

Description

This function directs the MRF24WG module to initiate a scan operation. The Host Application will be notified that the scan results are ready when it receives the WF_EVENT_SCAN_RESULTS_READY event. The eventInfo field for this event will contain the number of scan results. Once the scan results are ready they can be retrieved with DRV_WIFI_ScanResultGet().

Scan results are retained on the MRF24WG until:

1. Calling DRV_WIFI_Scan() again (after scan results returned from previous call).
2. MRF24WG reset.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_Scan(true);
```

Parameters

Parameters	Description
scanAll	If false: • If SSID defined then only scan results with that SSID are retained. • If SSID not defined then all scanned SSIDs will be retained. • Only scan results from Infrastructure or Ad-Hoc networks are retained. • The channel list that is scanned will be determined from the channels passed in via DRV_WIFI_ChannelListSet().
If true	• All scan results are retained (both Infrastructure and Ad-Hoc networks). • All channels within the MRF24WG's regional domain will be scanned.

Function

uint16_t DRV_WIFI_Scan(bool scanAll)

DRV_WIFI_ScanContextGet Function

Gets the Wi-Fi scan context.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ScanContextGet(DRV_WIFI_SCAN_CONTEXT * p_context);
```

Returns

None.

Description

This function gets the Wi-Fi scan context.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_SCAN_CONTEXT context;

DRV_WIFI_ScanContextSet(&context);
```

Parameters

Parameters	Description
p_context	pointer to where scan context will be written, see DRV_WIFI_SCAN_CONTEXT structure

Function

void DRV_WIFI_ScanContextGet(DRV_WIFI_SCAN_CONTEXT *p_context)

i) Wi-Fi Event Processing Functions

DRV_WIFI_ProcessEvent Function

Processes Wi-Fi event.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ProcessEvent(uint16_t event, uint16_t eventInfo);
```

Returns

None.

Description

This function is called to process a Wi-Fi event.

Remarks

None.

Preconditions

TCPIP stack should be initialized.

Parameters

Parameters	Description
event	event code
eventInfo	additional information about the event; not all events have associated info, in which case this value will be set to DRV_WIFI_NO_ADDITIONAL_INFO (0xff)

Function

void DRV_WIFI_ProcessEvent(uint16_t event, uint16_t eventInfo)

DRV_WIFI_SoftApEventInfoGet Function

Gets the stored Soft AP event info.

Implementation: Dynamic

File

drv_wifi.h

C

```
DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT * DRV_WIFI_SoftApEventInfoGet();
```

Returns

None.

Description

This function retrieves the additional event info after a Soft AP event has occurred.

Remarks

None.

Preconditions

Soft AP event must have occurred.

Example

```
DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT info;

DRV_WIFI_WPSCredentialsGet(&info);
```

Parameters

Parameters	Description
p_event	pointer to where event info is written, see DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT structure

Function

DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT *DRV_WIFI_SoftApEventInfoGet(void)

DRV_WIFI_SoftAPContextSet Function

Sets the Soft AP context.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SoftAPContextSet(DRV_WIFI_SOFTAP_NETWORK_CONTEXT * p_context);
```

Returns

None.

Description

None.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_SOFTAP_NETWORK_CONTEXT SoftAPContext;

//SoftAPContext.mode = DRV_WIFI_ADHOC_CONNECT_THEN_START;
SoftAPContext.hiddenSsid = false;
//SoftAPContext.beaconPeriod = DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD;

DRV_WIFI_SoftAPContextSet(&SoftAPContext);
```

Parameters

Parameters	Description
p_context	pointer to Soft AP context data; see definition for the DRV_WIFI_SOFTAP_NETWORK_CONTEXT structure

Function

void DRV_WIFI_SoftAPContextSet(DRV_WIFI_SOFTAP_NETWORK_CONTEXT *p_context)

j) Wi-Fi Data Configuration Functions

DRV_WIFI_ConfigDataLoad Function

Loads configuration data from the board EEPROM.

Implementation: Dynamic

File

drv_wifi.h

C

```
bool DRV_WIFI_ConfigDataLoad();
```

Returns

- true - Configuration data was loaded
- false - Configuration data was not loaded

Description

This function loads configuration data from the board EEPROM. If not present or corrupted then default values will be used.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

bool DRV_WIFI_ConfigDataLoad(void)

DRV_WIFI_ConfigDataSave Function

Save configuration data to the board EEPROM.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ConfigDataSave();
```

Returns

None.

Description

This function saves configuration data to the board EEPROM.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void DRV_WIFI_ConfigDataSave(void)

DRV_WIFI_ConfigDataDelete Function

Erases configuration data from the board EEPROM.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ConfigDataDelete();
```

Returns

None.

Description

This function erases configuration data from the board EEPROM.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void DRV_WIFI_ConfigDataDelete(void)

k) Wi-Fi Status Functions

DRV_WIFI_BssidGet Function

Gets the BSSID set in DRV_WIFI_BssidSet().

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_BssidGet(uint8_t * p_bssid);
```

Returns

None.

Description

Retrieves the BSSID set in the previous call to DRV_WIFI_BssidSet().

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t bssid[6];

DRV_WIFI_BssidGet(bssid);
```

Parameters

Parameters	Description
p_context	pointer to where BSSID will be written

Function

void DRV_WIFI_BssidGet(uint8_t *p_bssid)

DRV_WIFI_ChannelListGet Function

Gets the channel list.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ChannelListGet(uint8_t * p_channelList, uint8_t * p_numChannels);
```

Returns

None.

Description

This function gets the current channel list.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t channelList[DRV_WIFI_MAX_CHANNEL_LIST_LENGTH];
uint8_t numChannels;

DRV_WIFI_ChannelListGet(channelList, &numChannels);
```

Parameters

Parameters	Description
p_channelList	pointer to where channel list will be written
numChannels	pointer to where number of channels in the list will be written

Function

void RV_WIFI_ChannelListGet(uint8_t *p_channelList, uint8_t *p_numChannels)

DRV_WIFI_ConnectContextGet Function

Gets the current Wi-Fi connection context.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ConnectContextGet(DRV_WIFI_CONNECTION_CONTEXT * p_ctx);
```

Returns

None.

Description

This function gets the current Wi-Fi connection context.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_CONNECTION_CONTEXT ctx;

DRV_WIFI_ConnectContextGet(&ctx);
```

Parameters

Parameters	Description
p_ctx	pointer to where connection context is written, see DRV_WIFI_CONNECTION_CONTEXT structure

Function

void DRV_WIFI_ConnectContextGet(DRV_WIFI_CONNECTION_CONTEXT *p_ctx)

DRV_WIFI_ConnectionStateGet Function

Gets the current Wi-Fi connection state.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ConnectionStateGet(uint8_t * p_state);
```

Returns

None

Description

This function gets the current Wi-Fi connection state.

*p_state	Description
DRV_WIFI_CSTATE_NOT_CONNECTED	No Wi-Fi connection exists
DRV_WIFI_CSTATE_CONNECTION_IN_PROGRESS	Wi-Fi connection in progress
DRV_WIFI_CSTATE_CONNECTED_INFRASTRUCTURE	Wi-Fi connected in infrastructure mode
DRV_WIFI_CSTATE_CONNECTED_ADHOC	Wi-Fi connected in Ad-Hoc mode
DRV_WIFI_CSTATE_RECONNECTION_IN_PROGRESS	Wi-Fi in process of reconnecting
DRV_WIFI_CSTATE_CONNECTION_PERMANENTLY_LOST	Wi-Fi connection permanently lost

Remarks

None

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t state;

DRV_WIFI_ConnectionStateGet(&state);
```

Parameters

Parameters	Description
p_state	pointer to where state is written (see description)

Function

void DRV_WIFI_ConnectionStateGet(uint8_t *p_state)

DRV_WIFI_DeviceInfoGet Function

Retrieves MRF24WG device information.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_DeviceInfoGet(DRV_WIFI_DEVICE_INFO * p_deviceInfo);
```

Returns

None.

Description

This function retrieves MRF24WG device information. See DRV_WIFI_DEVICE_INFO structure.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_DEVICE_INFO info;

DRV_WIFI_DeviceInfoGet(&info);
```

Parameters

Parameters	Description
p_deviceInfo	pointer where device info will be written

Function

void DRV_WIFI_DeviceInfoGet(DRV_WIFI_DEVICE_INFO *p_deviceInfo)

DRV_WIFI_MacAddressGet Function

Retrieves the MRF24WG MAC address.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_MacAddressGet(uint8_t * p_mac);
```

Returns

None.

Description

This function retrieves the MRF24WG MAC address.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t mac[6];

DRV_WIFI_MacAddressGet(mac);
```

Parameters

Parameters	Description
p_mac	pointer where mac address will be written (must point to a 6 byte buffer)

Function

void DRV_WIFI_MacAddressGet(uint8_t *p_mac)

DRV_WIFI_MacStatsGet Function

Gets MAC statistics.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_MacStatsGet(DRV_WIFI_MAC_STATS * p_macStats);
```

Returns

None.

Description

This function gets the various MAC layer stats as maintained by the MRF24WG.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_MAC_STATS macStats;

DRV_WIFI_MacStatsGet(&macStats);
```

Parameters

Parameters	Description
p_macStats	pointer to where MAC statistics are written, see DRV_WIFI_MAC_STATS structure.

Function

void DRV_WIFI_MacStatsGet(DRV_WIFI_MAC_STATS *p_macStats)

DRV_WIFI_NetworkTypeGet Function

Gets the Wi-Fi network type.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_NetworkTypeGet(uint8_t * p_networkType);
```

Returns

None.

Description

This function gets the Wi-Fi network type.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t networkType;

DRV_WIFI_NetworkTypeGet(&networkType);
```

Parameters

Parameters	Description
p_networkType	pointer to where the network type will be written. One of the following: DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE DRV_WIFI_NETWORK_TYPE_ADHOC DRV_WIFI_NETWORK_TYPE_SOFT_AP

Function

void DRV_WIFI_NetworkTypeGet(uint8_t *p_networkType)

DRV_WIFI_PowerSaveStateGet Function

Gets the current power-saving state.

File

drv_wifi.h

C

```
void DRV_WIFI_PowerSaveStateGet(uint8_t * p_powerSaveState);
```

Returns

None.

Description

This function gets the current MRF24WG power-saving state.

powerSaveState	Definition
DRV_WIFI_PS_HIBERNATE	MRF24WG in hibernate state
DRV_WIFI_PS_PS_POLL_DTIM_ENABLED	MRF24WG in PS-Poll mode with DTIM enabled
DRV_WIFI_PS_PS_POLL_DTIM_DISABLED	MRF24WG in PS-Poll mode with DTIM disabled
DRV_WIFI_PS_POLL_OFF	MRF24WG is not in any power-saving state

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t state;
```

```
DRV_WIFI_PowerSaveStateGet(&state);
```

Parameters

Parameters	Description
p_powerSaveState	pointer to where power state is written (see description)

Function

void DRV_WIFI_PowerSaveStateGet(uint8_t *p_powerSaveState)

DRV_WIFI_ReconnectModeGet Function

Gets the Wi-Fi reconnection mode.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ReconnectModeGet(uint8_t * p_retryCount, uint8_t * p_deauthAction, uint8_t * p_beaconTimeout,
uint8_t * p_beaconTimeoutAction);
```

Returns

None.

Description

This function gets the reconnection mode parameters set in DRV_WIFI_ReconnectModeGet.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t retryCount, deauthAction, beaconTimeout, beaconTimeoutAction;

DRV_WIFI_ReconnectModeGet(&retryCount,
                          &deauthAction,
                          &beaconTimeout,
                          &beaconTimeoutAction);
```

Parameters

Parameters	Description
p_retryCount	pointer where retry count is written
p_deauthAction	pointer where deauthorization action is written
p_beaconTimeout	pointer where beacon timeout is written
p_beaconTimeoutAction	pointer where beacon timeout action is written

Function

void DRV_WIFI_ReconnectModeGet(uint8_t *p_retryCount, uint8_t *p_deauthAction,
uint8_t *p_beaconTimeout, uint8_t *p_beaconTimeoutAction)

DRV_WIFI_RegionalDomainGet Function

Retrieves the MRF24WG Regional domain.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_RegionalDomainGet(uint8_t * p_regionalDomain);
```

Returns

None.

Description

This function returns the regional domain on the MRF24WG. Values are:

- DRV_WIFI_DOMAIN_FCC
- DRV_WIFI_DOMAIN_ETSI
- DRV_WIFI_DOMAIN_JAPAN
- DRV_WIFI_DOMAIN_OTHER

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t domain;

DRV_WIFI_RegionalDomainGet(&domain);
```

Parameters

Parameters	Description
p_regionalDomain	pointer where the regional domain value will be written

Function

void DRV_WIFI_RegionalDomainGet(uint8_t *p_regionalDomain)

DRV_WIFI_RtsThresholdGet Function

Gets the RTS Threshold.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_RtsThresholdGet(uint16_t * p_rtsThreshold);
```

Returns

None.

Description

This function returns the RTS/CTS packet size threshold.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint16_t threshold;

DRV_WIFI_RtsThresholdGet(&threshold);
```

Parameters

Parameters	Description
p_rtsThreshold	pointer to where RTS threshold is written

Function

void DRV_WIFI_RtsThresholdGet(uint16_t *p_rtsThreshold)

DRV_WIFI_SecurityGet Function

Gets the current Wi-Fi security setting.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SecurityGet(uint8_t * p_securityType, uint8_t * p_securityKey, uint8_t * p_securityKeyLength);
```

Returns

None.

Description

This function gets the current Wi-Fi security setting.

'securityType' Field	Key	Length
DRV_WIFI_SECURITY_OPEN	N/A	N/A
DRV_WIFI_SECURITY_WEP_40	binary	4 keys, 5 bytes each (total of 20 bytes)
DRV_WIFI_SECURITY_WEP_104	binary	4 keys, 13 bytes each (total of 52 bytes)
DRV_WIFI_SECURITY_WPA_WITH_KEY	binary	32 bytes
DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE	ascii	8-63 ascii characters
DRV_WIFI_SECURITY_WPA2_WITH_KEY	binary	32 bytes
DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE	ascii	8-63 ascii characters
DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY	binary	32 bytes
DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE	ascii	8-63 ascii characters

Remarks

If security was initially set with a passphrase that the MRF24WG used to generate a binary key, this function returns the binary key, not the passphrase.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t securityType;
uint8_t securityKey[DRV_WIFI_MAX_SECURITY_KEY_LENGTH];
uint8_t keyLength;

DRV_WIFI_SecurityGet(&securityType, securityKey, &keyLength);
```

Parameters

Parameters	Description
p_securityType	value corresponding to the security type desired (see description)
p_securityKey	binary key or passphrase (not used if security is DRV_WIFI_SECURITY_OPEN)
p_securityKeyLength	number of bytes in p_securityKey (not used if security is DRV_WIFI_SECURITY_OPEN)

Function

void DRV_WIFI_SecurityGet(uint8_t *p_securityType,
uint8_t *p_securityKey,
uint8_t *p_securityKeyLength)

DRV_WIFI_SsidGet Function

Gets the SSID.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SsidGet(uint8_t * p_ssid, uint8_t * p_ssidLength);
```

Returns

None.

Description

Gets the SSID and SSID Length.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t ssid[DRV_WIFI_MAX_SSID_LENGTH];
uint8_t ssidLength;

DRV_WIFI_SsidGet(ssid, &ssidLength);
```

Parameters

Parameters	Description
p_ssid	pointer to buffer where SSID will be written
ssidLength	number of bytes in SSID

Function

void DRV_WIFI_SsidGet(uint8_t *p_ssid, uint8_t *p_ssidLength)

DRV_WIFI_TxModeGet Function

Gets 802.11 TX mode.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_TxModeGet(uint8_t * p_mode);
```

Returns

None.

Description

This function gets the MRF24WG TX mode.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t mode;

DRV_WIFI_TxModeGet(&mode);
```

Function

void DRV_WIFI_TxModeGet(uint8_t *p_mode)

DRV_WIFI_WepKeyTypeGet Function

Gets the WEP Key type.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_WepKeyTypeGet(uint8_t * p_wepKeyType);
```

Returns

None.

Description

This function gets the WEP key type:

- DRV_WIFI_SECURITY_WEP_SHAREDKEY
- DRV_WIFI_SECURITY_WEP_OPENKEY

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t wepKeyType;

DRV_WIFI_WepKeyTypeGet(&wepKeyType);
```

Function

void DRV_WIFI_WepKeyTypeGet(uint8_t *p_keyType)

DRV_WIFI_WPSCredentialsGet Function

Gets the WPS credentials.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_WPSCredentialsGet(DRV_WIFI_WPS_CREDENTIAL * p_cred);
```

Returns

None.

Description

This function gets the WPS credentials from the MRF24WG.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_WPS_CREDENTIAL cred;

DRV_WIFI_WPSCredentialsGet(&cred);
```

Function

void DRV_WIFI_WPSCredentialsGet(DRV_WIFI_WPS_CREDENTIAL *p_cred)

DRV_WIFI_RssiGet Function

Gets RSSI value set in DRV_WIFI_RssiSet().

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_RssiGet(uint8_t * p_rssi);
```

Returns

None.

Description

This function retrieves the value set in Gets RSSI value set in DRV_WIFI_RssiSet(). It does not retrieve the current connection RSSI value. The scan result will yield the current RSSI.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t rssi;

DRV_WIFI_RssiGet(&rssi);
```

Parameters

Parameters	Description
p_rssi	pointer where rssi value is written

Function

void DRV_WIFI_RssiGet(uint8_t *p_rssi)

DRV_WIFI_SecurityTypeGet Function

Gets the current Wi-Fi security type.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_SecurityTypeGet(uint8_t * p_securityType);
```

Returns

None.

Description

This function gets the current Wi-Fi security type.

'securityType' Field
DRV_WIFI_SECURITY_OPEN
DRV_WIFI_SECURITY_WEP_40
DRV_WIFI_SECURITY_WEP_104
DRV_WIFI_SECURITY_WPA_WITH_KEY
DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE
DRV_WIFI_SECURITY_WPA2_WITH_KEY
DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE
DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY
DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t securityType;

DRV_WIFI_SecurityTypeGet(&securityType);
```

Parameters

Parameters	Description
p_securityType	value corresponding to the security type desired (see description)

Function

void DRV_WIFI_SecurityTypeGet(uint8_t *p_securityType)

DRV_WIFI_TxPowerFactoryMaxGet Function

Retrieves the factory-set max TX power from the MRF24WG module.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_TxPowerFactoryMaxGet(uint8_t * p_factoryMaxTxPower);
```

Returns

None.

Description

This function retrieves the factory-set max TX power from the MRF24WG.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t maxPower;

DRV_WIFI_TxPowerFactoryMaxGet(&maxPower);
```

Parameters

Parameters	Description
p_factoryMaxTxPower	pointer to where factory max power is written (dbM)

Function

void DRV_WIFI_TxPowerFactoryMaxGet(int8_t *p_factoryMaxTxPower)

DRV_WIFI_TxPowerMaxGet Function

Gets the TX max power on the MRF24WG0M.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_TxPowerMaxGet(uint8_t * p_maxTxPower);
```

Returns

None.

Description

Gets the TX max power setting from the MRF24WG.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
uint8_t maxPower;

DRV_WIFI_TxPowerMaxGet(&maxPower);
```

Parameters

Parameters	Description
p_maxTxPower	pointer to where max power setting is written (dBm)

Function

void DRV_WIFI_TxPowerMaxGet(uint8_t *p_maxTxPower)

DRV_WIFI_TxPowerMaxSet Function

Sets the TX max power on the MRF24WG0M.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_TxPowerMaxSet(uint8_t maxTxPower);
```

Returns

None.

Description

After initialization the MRF24WG0M max TX power is determined by a factory-set value. This function can set a different maximum TX power levels. However, this function can never set a maximum TX power greater than the factory-set value, which can be read via DRV_WIFI_TxPowerFactoryMaxGet.

Remarks

No conversion of units needed, input to MRF24WG0M is in dBm.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
DRV_WIFI_TxPowerMaxSet(8); // set max TX power to 8dBm
```

Parameters

Parameters	Description
maxTxPower	valid range (0 to 17 dBm)

Function

void DRV_WIFI_TxPowerMaxSet(uint8_t maxTxPower)

DRV_WIFI_ScanResultGet Function

Read selected scan results back from MRF24WG.

Implementation: Dynamic

File

drv_wifi.h

C

```
void DRV_WIFI_ScanResultGet(uint8_t listIndex, DRV_WIFI_SCAN_RESULT * p_scanResult);
```

Returns

None.

Description

After a scan has completed this function is used to read one scan result at a time from the MRF24WG.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete. WF_EVENT_SCAN_RESULTS_READY event must have already occurred.

Example

```
DRV_WIFI_SCAN_RESULT scanResult;

DRV_WIFI_ScanResultGet(0, &scanResult); // get first scan result in list
```

Parameters

Parameters	Description
listIndex	index (0 based list) of the scan entry to retrieve
p_scanResult	pointer to where scan result is written, see DRV_WIFI_SCAN_RESULT structure

Function

void DRV_WIFI_ScanResultGet(uint8_t listIndex, t_wfScanResult *p_scanResult)

DRV_WIFI_InHibernateMode Function

Checks if MRF24WG is in hibernate mode.

Implementation: Dynamic

File

drv_wifi.h

C

```
bool DRV_WIFI_InHibernateMode();
```

Returns

- true - MRF24WG is in hibernate mode
- false - MRF24WG is not in hibernate mode

Description

This function checks if the MRF24WG is in hibernate mode.

Remarks

None.

Preconditions

MRF24WG Wi-Fi initialization must be complete.

Example

```
bool flag;

flag = DRV_WIFI_InHibernateMode();
```

Function

bool DRV_WIFI_InHibernateMode(void)

l) Wi-Fi SPI Functions

DRV_WIFI_SpiDmaRx Function

SPI RX API using DMA.

Implementation: Dynamic

File

drv_wifi.h

C

```
bool DRV_WIFI_SpiDmaRx(unsigned char * buf, uint32_t size);
```

Returns

- true - Data was received
- false - Data was not received

Description

This function receives data from the module using DMA over SPI bus.

Remarks

None.

Preconditions

TCP/IP stack should be initialized.

Parameters

Parameters	Description
buf	buffer pointer to the data to be received
size	the data size

Function

DRV_WIFI_SpiDmaRx(unsigned char *buf, uint32_t size)

DRV_WIFI_SpiDmaTx Function

SPI TX API using DMA.

Implementation: Dynamic

File

drv_wifi.h

C

```
bool DRV_WIFI_SpiDmaTx(unsigned char * buf, uint32_t size);
```

Returns

- true - Data was sent
- false - Data was not sent

Description

This function sends data to the module using DMA over SPI bus.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
buf	buffer pointer to the data to be sent
size	the data size

Function

bool DRV_WIFI_SpiDmaTx(unsigned char *buf, uint32_t size)

DRV_WIFI_SpiInit Function

Initializes SPI object for MRF24WG Wi-Fi driver.

Implementation: Dynamic

File

drv_wifi.h

C

```
bool DRV_WIFI_SpiInit(bool (*rx)(unsigned char *buf, uint32_t size), bool (*tx)(unsigned char *buf,
uint32_t size));
```

Returns

- true - The SPI object was initialized
- false - The SPI object was not initialized

Description

This function initializes SPI object for MRF24WG Wi-Fi driver.

Remarks

None.

Preconditions

TCP/IP stack should be initialized.

Parameters

Parameters	Description
rx	function pointer to RX API
tx	function pointer to TX API

Function

bool DRV_WIFI_SpiInit(bool (*rx)(unsigned char *buf, uint32_t size),
bool (*tx)(unsigned char *buf, uint32_t size))

DRV_WIFI_SpiRx Function

SPI Rx API.

Implementation: Dynamic

File

drv_wifi.h

C

```
bool DRV_WIFI_SpiRx(unsigned char * buf, uint32_t size);
```

Returns

- true - Data was received
- false - Data was not received

Description

This function receives data from the module over SPI bus.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
buf	buffer pointer to the data to be received
size	the data size

Function

DRV_WIFI_SpiRx(unsigned char *buf, uint32_t size)

DRV_WIFI_SpiTx Function

SPI TX API

Implementation: Dynamic

File

drv_wifi.h

C

```
bool DRV_WIFI_SpiTx(unsigned char * buf, uint32_t size);
```

Returns

- true - Data was sent

- false - Data was not sent

Description

This function sends data to the module over SPI bus.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
buf	buffer pointer to the data to be sent
size	the data size

Function

bool DRV_WIFI_SpiTx(unsigned char *buf, uint32_t size)

m) Private Configuration Functions

iwpriv_adhocctx_set Function

Sets the Ad-Hoc network context information.

Implementation: Dynamic

File

drv_wifi_iwpriv.h

C

```
void iwpriv_adhocctx_set(DRV_WIFI_ADHOC_NETWORK_CONTEXT * p_context);
```

Returns

None.

Description

This function sets the current Ad-Hoc network context information by reading from a passed pointer.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
p_context	pointer to where the Ad-Hoc network context is stored

Function

void iwpriv_adhocctx_set(DRV_WIFI_ADHOC_NETWORK_CONTEXT *p_context)

iwpriv_config_read Function

Reads the Wi-Fi context configuration.

Implementation: Dynamic

File

drv_wifi_iwpriv.h

C

```
void iwpriv_config_read(DRV_WIFI_CONFIG_DATA * wifi_config);
```

Returns

None.

Description

This function reads the current Wi-Fi context configuration, copies and stores the whole structure to the pointer passed to the function.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
wifi_config	pointer to where the context configuration is written

Function

void iwpriv_config_read(DRV_WIFI_CONFIG_DATA *wifi_config)

n) Data Types and Constants

DRV_WIFI_BSSID_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_BSSID_LENGTH (6)
```

Description

This is macro DRV_WIFI_BSSID_LENGTH.

DRV_WIFI_DEAUTH_REASONCODE_MASK Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEAUTH_REASONCODE_MASK ((uint8_t)0x80)
```

Description

This is macro DRV_WIFI_DEAUTH_REASONCODE_MASK.

DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD (100)   // ms
```

Description

ms

DRV_WIFI_DEFAULT_ADHOC_HIDDEN_SSID Macro

Default values for Wi-Fi Ad-Hoc settings.

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_ADHOC_HIDDEN_SSID false
```

Description

Wi-Fi Ad-Hoc default settings.

These defines identify various default Wi-Fi Ad-Hoc settings that can be used in the DRV_WIFI_ADHOC_NETWORK_CONTEXT structure.

DRV_WIFI_DEFAULT_ADHOC_MODE Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_ADHOC_MODE DRV_WIFI_ADHOC_CONNECT_THEN_START
```

Description

This is macro DRV_WIFI_DEFAULT_ADHOC_MODE.

DRV_WIFI_DEFAULT_PS_DTIM_ENABLED Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_PS_DTIM_ENABLED true            // DTIM wake-up enabled (normally the case)
```

Description

DTIM wake-up enabled (normally the case)

DRV_WIFI_DEFAULT_PS_DTIM_INTERVAL Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_PS_DTIM_INTERVAL ((uint16_t)2)   // number of beacon periods
```

Description

number of beacon periods

DRV_WIFI_DEFAULT_PS_LISTEN_INTERVAL Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_PS_LISTEN_INTERVAL ((uint16_t)1)   // 100 ms multiplier, e.g., 1 * 100 ms = 100 ms
```

Description

100 ms multiplier, e.g., 1 * 100 ms = 100 ms

DRV_WIFI_DEFAULT_SCAN_COUNT Macro

Default values for Wi-Fi scan context

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_SCAN_COUNT (1)
```

Description

Wi-Fi Scan Context default settings

These defines identify the default Wi-Fi scan context values that can be used in the DRV_WIFI_SCAN_CONTEXT structure.

DRV_WIFI_DEFAULT_SCAN_MAX_CHANNEL_TIME Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_SCAN_MAX_CHANNEL_TIME (400) // ms
```

Description

ms

DRV_WIFI_DEFAULT_SCAN_MIN_CHANNEL_TIME Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_SCAN_MIN_CHANNEL_TIME (200) // ms
```

Description

ms

DRV_WIFI_DEFAULT_SCAN_PROBE_DELAY Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_SCAN_PROBE_DELAY (20)  // us
```

Description

us

DRV_WIFI_DEFAULT_WEP_KEY_TYPE Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_WEP_KEY_TYPE DRV_WIFI_SECURITY_WEP_OPENKEY
```

Description

This is macro DRV_WIFI_DEFAULT_WEP_KEY_TYPE.

DRV_WIFI_DISABLED Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DISABLED (0)
```

Description

This is macro DRV_WIFI_DISABLED.

DRV_WIFI_DISASSOC_REASONCODE_MASK Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DISASSOC_REASONCODE_MASK ((uint8_t)0x40)
```

Description

This is macro DRV_WIFI_DISASSOC_REASONCODE_MASK.

DRV_WIFI_ENABLED Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_ENABLED (1)
```

Description

Do not make this an enumerated type!

DRV_WIFI_MAX_CHANNEL_LIST_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_MAX_CHANNEL_LIST_LENGTH (14)
```

Description

This is macro DRV_WIFI_MAX_CHANNEL_LIST_LENGTH.

DRV_WIFI_MAX_NUM_RATES Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_MAX_NUM_RATES (8)
```

Description

This is macro DRV_WIFI_MAX_NUM_RATES.

DRV_WIFI_MAX_SECURITY_KEY_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_MAX_SECURITY_KEY_LENGTH (64)
```

Description

This is macro DRV_WIFI_MAX_SECURITY_KEY_LENGTH.

DRV_WIFI_MAX_SSID_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_MAX_SSID_LENGTH (32)
```

Description

This is macro DRV_WIFI_MAX_SSID_LENGTH.

DRV_WIFI_MAX_WEP_KEY_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_MAX_WEP_KEY_LENGTH (DRV_WIFI_WEP104_KEY_LENGTH)
```

Description

This is macro DRV_WIFI_MAX_WEP_KEY_LENGTH.

DRV_WIFI_MAX_WPA_PASS_PHRASE_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_MAX_WPA_PASS_PHRASE_LENGTH (63)    // must exclude string terminator
```

Description

must exclude string terminator

DRV_WIFI_MIN_WPA_PASS_PHRASE_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_MIN_WPA_PASS_PHRASE_LENGTH (8)     // must exclude string terminator
```

Description

must exclude string terminator

DRV_WIFI_NETWORK_TYPE_ADHOC Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_NETWORK_TYPE_ADHOC (2)
```

Description

This is macro DRV_WIFI_NETWORK_TYPE_ADHOC.

DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE Macro

Selection of different Wi-Fi network types.

File

drv_wifi.h

C

```
#define DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE (1)
```

Description

Wi-Fi Network Types

This enumeration identifies the Wi-Fi network types that can be selected. Do NOT make these an enumerated type as they are used as a compile switch.

DRV_WIFI_NETWORK_TYPE_SOFT_AP Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_NETWORK_TYPE_SOFT_AP (4)
```

Description

This is macro DRV_WIFI_NETWORK_TYPE_SOFT_AP.

DRV_WIFI_NO_ADDITIONAL_INFO Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_NO_ADDITIONAL_INFO ((uint16_t)0xffff)
```

Description

eventInfo define for DRV_WIFI_ProcessEvent() when no additional info is supplied

DRV_WIFI_RETRY_ADHOC Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_RETRY_ADHOC (3)
```

Description

This is macro DRV_WIFI_RETRY_ADHOC.

DRV_WIFI_RETRY_FOREVER Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_RETRY_FOREVER (255)
```

Description

This is macro DRV_WIFI_RETRY_FOREVER.

DRV_WIFI_RTS_THRESHOLD_MAX Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_RTS_THRESHOLD_MAX (2347)  /* maximum RTS threshold size in bytes */
```

Description

maximum RTS threshold size in bytes

DRV_WIFI_SECURITY_OPEN Macro

Selection of different Wi-Fi security types

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_OPEN (0)
```

Description

Wi-Fi Security Types

This enumeration identifies the Wi-Fi security types that can be selected. Do NOT make these an enumerated type as they are used as a compile switch.

DRV_WIFI_SECURITY_WEP_104 Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_WEP_104 (2)
```

Description

This is macro DRV_WIFI_SECURITY_WEP_104.

DRV_WIFI_SECURITY_WEP_40 Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_WEP_40 (1)
```

Description

This is macro DRV_WIFI_SECURITY_WEP_40.

DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY (7)
```

Description

This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY.

DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE (8)
```

Description

This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE.

DRV_WIFI_SECURITY_WPA_WITH_KEY Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_WPA_WITH_KEY (3)
```

Description

This is macro DRV_WIFI_SECURITY_WPA_WITH_KEY.

DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE (4)
```

Description

This is macro DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE.

DRV_WIFI_SECURITY_WPA2_WITH_KEY Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_WPA2_WITH_KEY (5)
```

Description

This is macro DRV_WIFI_SECURITY_WPA2_WITH_KEY.

DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE (6)
```

Description

This is macro DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE.

DRV_WIFI_SECURITY_WPS_PIN Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_WPS_PIN (10)
```

Description

This is macro DRV_WIFI_SECURITY_WPS_PIN.

DRV_WIFI_SECURITY_WPS_PUSH_BUTTON Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_SECURITY_WPS_PUSH_BUTTON (9)
```

Description

This is macro DRV_WIFI_SECURITY_WPS_PUSH_BUTTON.

DRV_WIFI_WEP104_KEY_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_WEP104_KEY_LENGTH (52)    // 4 keys of 13 bytes each
```

Description

4 keys of 13 bytes each

DRV_WIFI_WEP40_KEY_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_WEP40_KEY_LENGTH (20)    // 4 keys of 5 bytes each
```

Description

4 keys of 5 bytes each

DRV_WIFI_WPA_KEY_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_WPA_KEY_LENGTH (32)
```

Description

This is macro DRV_WIFI_WPA_KEY_LENGTH.

DRV_WIFI_WPS_PIN_LENGTH Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_WPS_PIN_LENGTH 8       // 7 digits + checksum byte
```

Description

7 digits + checksum byte

DRV_WIFI_ADHOC_MODES Enumeration

Selection of different Ad-Hoc connection modes.

File

drv_wifi.h

C

```
typedef enum adhocMode {
  DRV_WIFI_ADHOC_CONNECT_THEN_START = 0,
  DRV_WIFI_ADHOC_CONNECT_ONLY = 1,
  DRV_WIFI_ADHOC_START_ONLY = 2
} DRV_WIFI_ADHOC_MODES;
```

Members

Members	Description
DRV_WIFI_ADHOC_CONNECT_THEN_START = 0	try to connect existing Ad-Hoc network, if not found then start network
DRV_WIFI_ADHOC_CONNECT_ONLY = 1	only connect to existing Ad-Hoc network
DRV_WIFI_ADHOC_START_ONLY = 2	only start a new Ad-Hoc network

Description

Ad-Hoc Modes

This enumeration identifies the Ad-Hoc modes that can be selected when connecting in Ad-Hoc mode.

DRV_WIFI_ADHOC_NETWORK_CONTEXT Structure

Contains data pertaining to Wi-Fi Ad-Hoc context.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t mode;
  bool hiddenSsid;
  uint16_t beaconPeriod;
} DRV_WIFI_ADHOC_NETWORK_CONTEXT;
```

Members

Members	Description
uint8_t mode;	Defines how to start the Ad-Hoc network. See DRV_WIFI_ADHOC_MODE. Default is DRV_WIFI_ADHOC_CONNECT_THEN_START.
bool hiddenSsid;	When starting an Ad-Hoc network, the SSID can be hidden in the beacons. Set true to hide the SSID, else false. Default is false.
uint16_t beaconPeriod;	Sets the beacon period, in ms. Default is 100 ms.

Description

This structure contains MRF24WG Ad-Hoc context data. See DRV_WIFI_AdhocContextSet.

DRV_WIFI_CONNECTION_CONTEXT Structure

Contains data pertaining to MRF24WG connection context.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t channel;
  uint8_t bssid[6];
} DRV_WIFI_CONNECTION_CONTEXT;
```

Members

Members	Description
uint8_t channel;	channel number of current connection
uint8_t bssid[6];	bssid of connected AP

Description

This structure contains MRF24WG connection context data. See DRV_WIFI_ConnectContextGet.

DRV_WIFI_CONNECTION_STATES Enumeration

Wi-Fi Connection States

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_CSTATE_NOT_CONNECTED = 1,
  DRV_WIFI_CSTATE_CONNECTION_IN_PROGRESS = 2,
  DRV_WIFI_CSTATE_CONNECTED_INFRASTRUCTURE = 3,
  DRV_WIFI_CSTATE_CONNECTED_ADHOC = 4,
  DRV_WIFI_CSTATE_RECONNECTION_IN_PROGRESS = 5,
  DRV_WIFI_CSTATE_CONNECTION_PERMANENTLY_LOST = 6
} DRV_WIFI_CONNECTION_STATES;
```

Members

Members	Description
DRV_WIFI_CSTATE_NOT_CONNECTED = 1	No Wi-Fi connection exists
DRV_WIFI_CSTATE_CONNECTION_IN_PROGRESS = 2	Wi-Fi connection in progress
DRV_WIFI_CSTATE_CONNECTED_INFRASTRUCTURE = 3	Wi-Fi connected in infrastructure mode
DRV_WIFI_CSTATE_CONNECTED_ADHOC = 4	Wi-Fi connected in adHoc mode
DRV_WIFI_CSTATE_RECONNECTION_IN_PROGRESS = 5	Wi-Fi in process of reconnecting
DRV_WIFI_CSTATE_CONNECTION_PERMANENTLY_LOST = 6	Wi-Fi connection permanently lost

Description

This enumeration identifies Wi-Fi Connection states. See DRV_WIFI_ConnectionStateGet.

DRV_WIFI_DEVICE_INFO Structure

Contains data pertaining to MRF24WG device type and version number.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t deviceType;
  uint8_t romVersion;
  uint8_t patchVersion;
} DRV_WIFI_DEVICE_INFO;
```

Members

Members	Description
uint8_t deviceType;	MRF24W device type: DRV_WIFI_DEVICE_TYPE
uint8_t romVersion;	MRF24WG ROM version number
uint8_t patchVersion;	MRF24WG patch version number

Description

This structure contains MRF24WG device type and version number. See DRV_WIFI_DeviceInfoGet.

DRV_WIFI_DOMAIN_CODES Enumeration

Wi-Fi Regional Domain Codes

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_DOMAIN_FCC = 0,
  DRV_WIFI_DOMAIN_ETSI = 2,
  DRV_WIFI_DOMAIN_JAPAN = 7,
  DRV_WIFI_DOMAIN_OTHER = 7
} DRV_WIFI_DOMAIN_CODES;
```

Members

Members	Description
DRV_WIFI_DOMAIN_FCC = 0	FCC, available channels: 1 - 11
DRV_WIFI_DOMAIN_ETSI = 2	ESTI, available Channels: 1 - 13
DRV_WIFI_DOMAIN_JAPAN = 7	Japan, available Channels: 1 - 14
DRV_WIFI_DOMAIN_OTHER = 7	Other, available Channels: 1 - 14

Description

This enumeration identifies Wi-Fi regional domain codes. The regional domain can be determined by calling DRV_WIFI_RegionalDomainGet.

DRV_WIFI_EVENT_CONN_TEMP_LOST_CODES Enumeration

Selection of different codes when Wi-Fi connection is temporarily lost.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_BEACON_TIMEOUT = 1,
  DRV_WIFI_DEAUTH_RECEIVED = 2,
```

```
  DRV_WIFI_DISASSOCIATE_RECEIVED = 3
} DRV_WIFI_EVENT_CONN_TEMP_LOST_CODES;
```

Members

Members	Description
DRV_WIFI_BEACON_TIMEOUT = 1	connection temporarily lost due to beacon timeout
DRV_WIFI_DEAUTH_RECEIVED = 2	connection temporarily lost due to deauthorization received from AP
DRV_WIFI_DISASSOCIATE_RECEIVED = 3	connection temporarily lost due to disassociation received from AP

Description

'Connection Temporarily Lost' event codes.

This enumeration identifies the codes for a connection temporarily lost. These codes are used in DRV_WIFI_ProcessEvent, case DRV_WIFI_EVENT_CONNECTION_TEMPORARILY_LOST.

DRV_WIFI_EVENT_INFO Enumeration

Selection of different EventInfo types.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_JOIN_FAILURE = 2,
  DRV_WIFI_AUTHENTICATION_FAILURE = 3,
  DRV_WIFI_ASSOCIATION_FAILURE = 4,
  DRV_WIFI_WEP_HANDSHAKE_FAILURE = 5,
  DRV_WIFI_PSK_CALCULATION_FAILURE = 6,
  DRV_WIFI_PSK_HANDSHAKE_FAILURE = 7,
  DRV_WIFI_ADHOC_JOIN_FAILURE = 8,
  DRV_WIFI_SECURITY_MISMATCH_FAILURE = 9,
  DRV_WIFI_NO_SUITABLE_AP_FOUND_FAILURE = 10,
  DRV_WIFI_RETRY_FOREVER_NOT_SUPPORTED_FAILURE = 11,
  DRV_WIFI_LINK_LOST = 12,
  DRV_WIFI_TKIP_MIC_FAILURE = 13,
  DRV_WIFI_RSN_MIXED_MODE_NOT_SUPPORTED = 14,
  DRV_WIFI_RECV_DEAUTH = 15,
  DRV_WIFI_RECV_DISASSOC = 16,
  DRV_WIFI_WPS_FAILURE = 17,
  DRV_WIFI_LINK_DOWN = 19
} DRV_WIFI_EVENT_INFO;
```

Description

EventInfo Types

This enumeration identifies the eventInfo types used in DRV_WIFI_ProcessEvent, case DRV_WIFI_EVENT_CONNECTION_FAILED.

DRV_WIFI_EVENTS Enumeration

Selections for events that can occur.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_EVENT_NONE = 0,
  DRV_WIFI_EVENT_CONNECTION_SUCCESSFUL = 1,
  DRV_WIFI_EVENT_CONNECTION_FAILED = 2,
  DRV_WIFI_EVENT_CONNECTION_TEMPORARILY_LOST = 3,
  DRV_WIFI_EVENT_CONNECTION_PERMANENTLY_LOST = 4,
  DRV_WIFI_EVENT_CONNECTION_REESTABLISHED = 5,
  DRV_WIFI_EVENT_FLASH_UPDATE_SUCCESSFUL = 6,
  DRV_WIFI_EVENT_FLASH_UPDATE_FAILED = 7,
  DRV_WIFI_EVENT_KEY_CALCULATION_REQUEST = 8,
  DRV_WIFI_EVENT_INVALID_WPS_PIN = 9,
  DRV_WIFI_EVENT_SCAN_RESULTS_READY = 10,
  DRV_WIFI_EVENT_IE_RESULTS_READY = 11,
```

```
  DRV_WIFI_EVENT_SOFT_AP = 12,
  DRV_WIFI_EVENT_DISCONNECT_DONE = 13,
  DRV_WIFI_EVENT_UPDATE = 14,
  DRV_WIFI_EVENT_ERROR = 15
} DRV_WIFI_EVENTS;
```

Members

Members	Description
DRV_WIFI_EVENT_NONE = 0	No event has occurred
DRV_WIFI_EVENT_CONNECTION_SUCCESSFUL = 1	Connection attempt to network successful
DRV_WIFI_EVENT_CONNECTION_FAILED = 2	Connection attempt failed
DRV_WIFI_EVENT_CONNECTION_TEMPORARILY_LOST = 3	Connection lost; MRF24WG attempting to reconnect
DRV_WIFI_EVENT_CONNECTION_PERMANENTLY_LOST = 4	Connection lost; MRF24WG no longer trying to connect
DRV_WIFI_EVENT_CONNECTION_REESTABLISHED = 5	Connection has been reestablished
DRV_WIFI_EVENT_FLASH_UPDATE_SUCCESSFUL = 6	Update to FLASH successful
DRV_WIFI_EVENT_FLASH_UPDATE_FAILED = 7	Update to FLASH failed
DRV_WIFI_EVENT_KEY_CALCULATION_REQUEST = 8	Key calculation is required
DRV_WIFI_EVENT_INVALID_WPS_PIN = 9	Invalid WPS pin was entered
DRV_WIFI_EVENT_SCAN_RESULTS_READY = 10	Scan results are ready
DRV_WIFI_EVENT_IE_RESULTS_READY = 11	IE data ready
DRV_WIFI_EVENT_SOFT_AP = 12	Client connection events
DRV_WIFI_EVENT_DISCONNECT_DONE = 13	Disconnect done event
DRV_WIFI_EVENT_UPDATE = 14	Wi-Fi update event occurred
DRV_WIFI_EVENT_ERROR = 15	Wi-Fi error event occurred

Description

Wi-Fi Events

This enumeration identifies the Wi-Fi events that can occur and will be sent to DRV_WIFI_ProcessEvent.

DRV_WIFI_GENERAL_ERRORS Enumeration

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_ERROR_IN_HIBERNATE_MODE = 100
} DRV_WIFI_GENERAL_ERRORS;
```

Members

Members	Description
DRV_WIFI_ERROR_IN_HIBERNATE_MODE = 100	invalid operation while MRF24WG is in hibernate mode

Description

This is type DRV_WIFI_GENERAL_ERRORS.

DRV_WIFI_HIBERNATE_STATES Enumeration

Wi-Fi Hibernate States

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_HB_NO_SLEEP = 0,
  DRV_WIFI_HB_ENTER_SLEEP = 1,
```

```
  DRV_WIFI_HB_WAIT_WAKEUP = 2
} DRV_WIFI_HIBERNATE_STATES;
```

Description

This enumeration identifies Wi-Fi hibernate states.

DRV_WIFI_MAC_STATS Structure

Wi-Fi MIB states

File

drv_wifi.h

C

```
typedef struct {
  uint32_t MibWEPExcludeCtr;
  uint32_t MibTxBytesCtr;
  uint32_t MibTxMulticastCtr;
  uint32_t MibTxFailedCtr;
  uint32_t MibTxRtryCtr;
  uint32_t MibTxMultRtryCtr;
  uint32_t MibTxSuccessCtr;
  uint32_t MibRxDupCtr;
  uint32_t MibRxCtsSuccCtr;
  uint32_t MibRxCtsFailCtr;
  uint32_t MibRxAckFailCtr;
  uint32_t MibRxBytesCtr;
  uint32_t MibRxFragCtr;
  uint32_t MibRxMultCtr;
  uint32_t MibRxFCSErrCtr;
  uint32_t MibRxWEPUndecryptCtr;
  uint32_t MibRxFragAgedCtr;
  uint32_t MibRxMICFailureCtr;
} DRV_WIFI_MAC_STATS;
```

Members

Members	Description
uint32_t MibWEPExcludeCtr;	Number of frames received with the Protected Frame sub-field of the Frame Control field set to zero and the value of dot11ExcludeUnencrypted causes that frame to be discarded.
uint32_t MibTxBytesCtr;	Total number of TX bytes that have been transmitted
uint32_t MibTxMulticastCtr;	Number of frames successfully transmitted that had the multicast bit set in the destination MAC address
uint32_t MibTxFailedCtr;	Number of TX frames that failed due to the number of transmits exceeding the retry count
uint32_t MibTxRtryCtr;	Number of times a transmitted frame needed to be retried.
uint32_t MibTxMultRtryCtr;	Number of times a frame was successfully transmitted after more than one retransmission.
uint32_t MibTxSuccessCtr;	Number of TX frames successfully transmitted.
uint32_t MibRxDupCtr;	Number of frames received where the Sequence Control field indicates a duplicate.
uint32_t MibRxCtsSuccCtr;	Number of CTS frames received in response to an RTS frame.
uint32_t MibRxCtsFailCtr;	Number of times an RTS frame was not received in response to a CTS frame.
uint32_t MibRxAckFailCtr;	Number of times an ACK was not received in response to a TX frame.
uint32_t MibRxBytesCtr;	Total number of Rx bytes received.
uint32_t MibRxFragCtr;	Number of successful received frames (management or data).
uint32_t MibRxMultCtr;	Number of frames received with the multicast bit set in the destination MAC address.
uint32_t MibRxFCSErrCtr;	Number of frames received with an invalid Frame Checksum (FCS).
uint32_t MibRxWEPUndecryptCtr;	Number of frames received where the Protected Frame sub-field of the Frame Control Field is set to one and the WEPOn value for the key mapped to the transmitter's MAC address indicates the frame should not have been encrypted.
uint32_t MibRxFragAgedCtr;	Number of times that fragments aged out, or were not received in the allowable time.
uint32_t MibRxMICFailureCtr;	Number of MIC failures that have occurred.

Description

Wi-Fi MIB states

This structure contains all the MIB data returned from the MRF24WG when DRV_WIFI_MacStatsGet() is called.

DRV_WIFI_MGMT_ERRORS Enumeration

Error codes returned when a management message is sent to the MRF24WG module.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_SUCCESS = 1,
  DRV_WIFI_ERROR_INVALID_SUBTYPE = 2,
  DRV_WIFI_ERROR_OPERATION_CANCELLED = 3,
  DRV_WIFI_ERROR_FRAME_END_OF_LINE_OCCURRED = 4,
  DRV_WIFI_ERROR_FRAME_RETRY_LIMIT_EXCEEDED = 5,
  DRV_WIFI_ERROR_EXPECTED_BSS_VALUE_NOT_IN_FRAME = 6,
  DRV_WIFI_ERROR_FRAME_SIZE_EXCEEDS_BUFFER_SIZE = 7,
  DRV_WIFI_ERROR_FRAME_ENCRYPT_FAILED = 8,
  DRV_WIFI_ERROR_INVALID_PARAM = 9,
  DRV_WIFI_ERROR_AUTH_REQ_ISSUED_WHILE_IN_AUTH_STATE = 10,
  DRV_WIFI_ERROR_ASSOC_REQ_ISSUED_WHILE_IN_ASSOC_STATE = 11,
  DRV_WIFI_ERROR_INSUFFICIENT_RESOURCES = 12,
  DRV_WIFI_ERROR_TIMEOUT_OCCURRED = 13,
  DRV_WIFI_ERROR_BAD_EXCHANGE_ENCOUNTERED_IN_FRAME_RECEPTION = 14,
  DRV_WIFI_ERROR_AUTH_REQUEST_REFUSED = 15,
  DRV_WIFI_ERROR_ASSOCIATION_REQUEST_REFUSED = 16,
  DRV_WIFI_ERROR_PRIOR_MGMT_REQUEST_IN_PROGRESS = 17,
  DRV_WIFI_ERROR_NOT_IN_JOINED_STATE = 18,
  DRV_WIFI_ERROR_NOT_IN_ASSOCIATED_STATE = 19,
  DRV_WIFI_ERROR_NOT_IN_AUTHENTICATED_STATE = 20,
  DRV_WIFI_ERROR_SUPPLICANT_FAILED = 21,
  DRV_WIFI_ERROR_UNSUPPORTED_FEATURE = 22,
  DRV_WIFI_ERROR_REQUEST_OUT_OF_SYNC = 23,
  DRV_WIFI_ERROR_CP_INVALID_ELEMENT_TYPE = 24,
  DRV_WIFI_ERROR_CP_INVALID_PROFILE_ID = 25,
  DRV_WIFI_ERROR_CP_INVALID_DATA_LENGTH = 26,
  DRV_WIFI_ERROR_CP_INVALID_SSID_LENGTH = 27,
  DRV_WIFI_ERROR_CP_INVALID_SECURITY_TYPE = 28,
  DRV_WIFI_ERROR_CP_INVALID_SECURITY_KEY_LENGTH = 29,
  DRV_WIFI_ERROR_CP_INVALID_WEP_KEY_ID = 30,
  DRV_WIFI_ERROR_CP_INVALID_NETWORK_TYPE = 31,
  DRV_WIFI_ERROR_CP_INVALID_ADHOC_MODE = 32,
  DRV_WIFI_ERROR_CP_INVALID_SCAN_TYPE = 33,
  DRV_WIFI_ERROR_CP_INVALID_CP_LIST = 34,
  DRV_WIFI_ERROR_CP_INVALID_CHANNEL_LIST_LENGTH = 35,
  DRV_WIFI_ERROR_NOT_CONNECTED = 36,
  DRV_WIFI_ERROR_ALREADY_CONNECTING = 37,
  DRV_WIFI_ERROR_DISCONNECT_FAILED = 38,
  DRV_WIFI_ERROR_NO_STORED_BSS_DESCRIPTOR = 39,
  DRV_WIFI_ERROR_INVALID_MAX_POWER = 40,
  DRV_WIFI_ERROR_CONNECTION_TERMINATED = 41,
  DRV_WIFI_ERROR_HOST_SCAN_NOT_ALLOWED = 42,
  DRV_WIFI_ERROR_INVALID_WPS_PIN = 44
} DRV_WIFI_MGMT_ERRORS;
```

Members

Members	Description
DRV_WIFI_ERROR_DISCONNECT_FAILED = 38	Disconnect failed. Disconnect is allowed only when module is in connected state.
DRV_WIFI_ERROR_NO_STORED_BSS_DESCRIPTOR = 39	No stored scan results.
DRV_WIFI_ERROR_HOST_SCAN_NOT_ALLOWED = 42	Host Scan Failed. Host scan is allowed only in idle or connected state
DRV_WIFI_ERROR_INVALID_WPS_PIN = 44	WPS pin was invalid.

Description

Management Message Error Codes

This enumeration identifies the errors that can occur when a DRV_WIFI API function call results in a management message being sent, via SPI, to the MRF24WG module.

DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT Structure

Contains data pertaining to Wi-Fi Soft AP event.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t reason;
  uint8_t address[6];
} DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT;
```

Members

Members	Description
uint8_t reason;	reason code
uint8_t address[6];	MAC address

Description

This structure contains data pertaining to Soft AP event. See DRV_WIFI_SoftApEventInfoGet.

DRV_WIFI_MULTICAST_FILTER_IDS Enumeration

Selections for software Multicast filter IDs.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_MULTICAST_FILTER_1 = 4,
  DRV_WIFI_MULTICAST_FILTER_2 = 5,
  DRV_WIFI_MULTICAST_FILTER_3 = 6,
  DRV_WIFI_MULTICAST_FILTER_4 = 7,
  DRV_WIFI_MULTICAST_FILTER_5 = 8,
  DRV_WIFI_MULTICAST_FILTER_6 = 9,
  DRV_WIFI_MULTICAST_FILTER_7 = 10,
  DRV_WIFI_MULTICAST_FILTER_8 = 11,
  DRV_WIFI_MULTICAST_FILTER_9 = 12,
  DRV_WIFI_MULTICAST_FILTER_10 = 13,
  DRV_WIFI_MULTICAST_FILTER_11 = 14,
  DRV_WIFI_MULTICAST_FILTER_12 = 15,
  DRV_WIFI_MULTICAST_FILTER_13 = 16,
  DRV_WIFI_MULTICAST_FILTER_14 = 17,
  DRV_WIFI_MULTICAST_FILTER_15 = 18,
  DRV_WIFI_MULTICAST_FILTER_16 = 19
} DRV_WIFI_MULTICAST_FILTER_IDS;
```

Description

Multicast Filter IDs

This enumeration identifies the multicast filters that can be selected. See DRV_WIFI_MulticastFilterSet.

DRV_WIFI_MULTICAST_FILTERS Enumeration

Selections for Software Multicast Filters.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_MULTICAST_DISABLE_ALL = 0,
  DRV_WIFI_MULTICAST_ENABLE_ALL = 1,
  DRV_WIFI_MULTICAST_USE_FILTERS = 2
} DRV_WIFI_MULTICAST_FILTERS;
```

Members

Members	Description
DRV_WIFI_MULTICAST_DISABLE_ALL = 0	Discard all received multicast messages.
DRV_WIFI_MULTICAST_ENABLE_ALL = 1	Forward all multicast messages to host MCU.
DRV_WIFI_MULTICAST_USE_FILTERS = 2	Use the MAC filtering capability for multicast messages.

Description

Multicast Filter Modes

This enumeration identifies the mode of multicast filters that can be selected. See DRV_WIFI_MulticastFilterSet().

DRV_WIFI_POWER_SAVE_STATES Enumeration

Wi-Fi Power-Saving States

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_PS_HIBERNATE = 1,
  DRV_WIFI_PS_PS_POLL_DTIM_ENABLED = 2,
  DRV_WIFI_PS_PS_POLL_DTIM_DISABLED = 3,
  DRV_WIFI_PS_OFF = 4
} DRV_WIFI_POWER_SAVE_STATES;
```

Members

Members	Description
DRV_WIFI_PS_HIBERNATE = 1	enable hibernate mode
DRV_WIFI_PS_PS_POLL_DTIM_ENABLED = 2	enable power-saving mode with DTIM enabled
DRV_WIFI_PS_PS_POLL_DTIM_DISABLED = 3	enable power-saving mode with DTIM disabled
DRV_WIFI_PS_OFF = 4	disable power-saving mode

Description

This enumeration identifies Wi-Fi power-saving states. See DRV_WIFI_PsPollEnable.

DRV_WIFI_PS_POLL_CONTEXT Structure

Contains data pertaining to Wi-Fi PS-Poll context.

File

drv_wifi.h

C

```
typedef struct {
  uint16_t listenInterval;
  uint16_t dtimInterval;
  bool useDtim;
} DRV_WIFI_PS_POLL_CONTEXT;
```

Members

Members	Description
uint16_t listenInterval;	Number of 100ms intervals between instances when the MRF24WG wakes up to received buffered messages from the network. Each count represents 100ms. For example, 1 = 100ms, 2 = 200ms, etc. The default is 1 (100ms).
uint16_t dtimInterval;	Only used if useDtim is true. The DTIM period indicates how often clients serviced by the access point should check for buffered multicast or broadcast messages awaiting pickup on the access point. The DTIM interval is measured in number of beacon periods. Default for DTIM period is 2.
bool useDtim;	True: (default) check for buffered multicast or broadcast messages on the dtimInterval. False: check for buffered multicast or broadcast messages on the listenInterval

Description

This structure contains MRF24WG PS-Poll context data. See DRV_WIFI_PsPollEnable.

DRV_WIFI_REASON_CODES Enumeration

Selection of different codes when a deauthorization or disassociation event has occurred.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_UNSPECIFIED = 1,
  DRV_WIFI_REASON_PREV_AUTH_NOT_VALID = 2,
  DRV_WIFI_DEAUTH_LEAVING = 3,
  DRV_WIFI_DISASSOC_DUE_TO_INACTIVITY = 4,
  DRV_WIFI_DISASSOC_AP_BUSY = 5,
  DRV_WIFI_CLASS2_FRAME_FROM_NONAUTH_STA = 6,
  DRV_WIFI_CLASS3_FRAME_FROM_NONASSOC_STA = 7,
  DRV_WIFI_DISASSOC_STA_HAS_LEFT = 8,
  DRV_WIFI_STA_REQ_ASSOC_WITHOUT_AUTH = 9,
  DRV_WIFI_INVALID_IE = 13,
  DRV_WIFI_MIC_FAILURE = 14,
  DRV_WIFI_4WAY_HANDSHAKE_TIMEOUT = 15,
  DRV_WIFI_GROUP_KEY_HANDSHAKE_TIMEOUT = 16,
  DRV_WIFI_IE_DIFFERENT = 17,
  DRV_WIFI_INVALID_GROUP_CIPHER = 18,
  DRV_WIFI_INVALID_PAIRWISE_CIPHER = 19,
  DRV_WIFI_INVALID_AKMP = 20,
  DRV_WIFI_UNSUPP_RSN_VERSION = 21,
  DRV_WIFI_INVALID_RSN_IE_CAP = 22,
  DRV_WIFI_IEEE8021X_FAILED = 23,
  DRV_WIFI_CIPHER_SUITE_REJECTED = 24
} DRV_WIFI_REASON_CODES;
```

Description

Deauthorization/Disassociate Reason Codes

This enumeration identifies the reason codes for a connection lost due to a deauthorization or disassociation from the AP.

DRV_WIFI_RECONNECT_MODES Enumeration

Selection of different reconnection modes.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_DO_NOT_ATTEMPT_TO_RECONNECT = 0,
  DRV_WIFI_ATTEMPT_TO_RECONNECT = 1
} DRV_WIFI_RECONNECT_MODES;
```

Description

Wi-Fi Reconnect Modes

This enumeration identifies the reconnection modes that can be used in DRV_WIFI_ReconnectModeSet.

DRV_WIFI_SCAN_CONTEXT Structure

Contains data pertaining to Wi-Fi scan context.

File

drv_wifi.h

C

```
typedef struct {
```

```
  uint8_t scanType;
  uint8_t scanCount;
  uint16_t minChannelTime;
  uint16_t maxChannelTime;
  uint16_t probeDelay;
} DRV_WIFI_SCAN_CONTEXT;
```

Members

Members	Description
uint8_t scanType;	802.11 allows for active scanning, where the device sends out a broadcast probe request seeking an access point. Also allowed is passive scanning where the device only listens to beacons being broadcast from access points. Set to DRV_WIFI_ACTIVE_SCAN (default) or DRV_WIFI_PASSIVE_SCAN
uint8_t scanCount;	The number of times to scan a channel while attempting to find a particular access point. Default is 1
uint16_t minChannelTime;	The minimum time (in milliseconds) the MRF24WG will wait for a probe response after sending a probe request. If no probe responses are received in minChannelTime, the MRF24WG will go on to the next channel, if any are left to scan, or quit. Default is 200ms.
uint16_t maxChannelTime;	If a probe response is received within minChannelTime, the MRF24WG will continue to collect any additional probe responses up to maxChannelTime before going to the next channel in the channelList. Units are in milliseconds. Default is 400ms.
uint16_t probeDelay;	The number of microseconds to delay before transmitting a probe request following the channel change during scanning. Default is 20uS.

Description

This structure contains MRF24WG scan context data. See DRV_WIFI_ScanContextSet.

DRV_WIFI_SCAN_RESULT Structure

Contains data pertaining to Wi-Fi scan results.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t bssid[DRV_WIFI_BSSID_LENGTH];
  uint8_t ssid[DRV_WIFI_MAX_SSID_LENGTH];
  uint8_t apConfig;
  uint8_t reserved;
  uint16_t beaconPeriod;
  uint16_t atimWindow;
  uint8_t basicRateSet[DRV_WIFI_MAX_NUM_RATES];
  uint8_t rssi;
  uint8_t numRates;
  uint8_t dtimPeriod;
  uint8_t bssType;
  uint8_t channel;
  uint8_t ssidLen;
} DRV_WIFI_SCAN_RESULT;
```

Members

Members	Description
uint8_t bssid[DRV_WIFI_BSSID_LENGTH];	Network BSSID value
uint8_t ssid[DRV_WIFI_MAX_SSID_LENGTH];	Network SSID value
uint8_t apConfig;	Access Point configuration (see description)
uint8_t reserved;	not used
uint16_t beaconPeriod;	Network beacon interval
uint16_t atimWindow;	Only valid if bssType = DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE

uint8_t basicRateSet[DRV_WIFI_MAX_NUM_RATES];	List of Network basic rates. Each rate has the following format: Bit 7 • 0: rate is not part of the basic rates set • 1: rate is part of the basic rates set Bits 6:0 Multiple of 500kbps giving the supported rate. For example, a value of 2 (2 * 500kbps) indicates that 1mbps is a supported rate. A value of 4 in this field indicates a 2mbps rate (4 * 500kbps).
uint8_t rssi;	Signal strength of received frame beacon or probe response. Will range from a low of 43 to a high of 128.
uint8_t numRates;	Number of valid rates in basicRates
uint8_t dtimPeriod;	Part of TIM element
uint8_t bssType;	DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE or DRV_WIFI_NETWORK_TYPE_ADHOC
uint8_t channel;	Channel number
uint8_t ssidLen;	Number of valid characters in ssid

Description

This structure contains the result of Wi-Fi scan operation. See DRV_WIFI_ScanResultGet.

apConfig Bit Mask

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
WPA2	WPA	Preamble	Privacy	Reserved	Reserved	Reserved	IE

IE	1 if AP broadcasting one or more Information Elements, else 0
Privacy	0 : AP is open (no security) 1: AP using security, if neither WPA and WPA2 set then security is WEP.
Preamble	0: AP transmitting with short preamble 1: AP transmitting with long preamble
WPA	Only valid if Privacy is 1. 0: AP does not support WPA 1: AP supports WPA
WPA2	Only valid if Privacy is 1. 0: AP does not support WPA2 1: AP supports WPA2

DRV_WIFI_SCAN_TYPES Enumeration

Selection of different Wi-Fi scan types.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_ACTIVE_SCAN = 1,
  DRV_WIFI_PASSIVE_SCAN = 2
} DRV_WIFI_SCAN_TYPES;
```

Description

Wi-Fi Scan Types

This enumeration identifies the Wi-Fi scan types that can be selected.

DRV_WIFI_SOFT_AP_EVENT_REASON_CODES Enumeration

Wi-Fi Soft AP Event Reason Codes

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_SOFTAP_EVENT_LINK_LOST = 0,
  DRV_WIFI_SOFTAP_EVENT_RECEIVED_DEAUTH = 1
} DRV_WIFI_SOFT_AP_EVENT_REASON_CODES;
```

Description

This enumeration identifies Wi-Fi Soft AP events.

DRV_WIFI_SOFT_AP_STATES Enumeration

Wi-Fi Soft AP Events

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_SOFTAP_EVENT_CONNECTED = 0,
  DRV_WIFI_SOFTAP_EVENT_DISCONNECTED = 1
} DRV_WIFI_SOFT_AP_STATES;
```

Description

This enumeration identifies Wi-Fi Soft AP events.

DRV_WIFI_STATUS_CODES Enumeration

Selection of different codes when Wi-Fi connection fails due to association or authentication failure.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_UNSPECIFIED_FAILURE = 1,
  DRV_WIFI_CAPS_UNSUPPORTED = 10,
  DRV_WIFI_REASSOC_NO_ASSOC = 11,
  DRV_WIFI_ASSOC_DENIED_UNSPEC = 12,
  DRV_WIFI_NOT_SUPPORTED_AUTH_ALG = 13,
  DRV_WIFI_UNKNOWN_AUTH_TRANSACTION = 14,
  DRV_WIFI_CHALLENGE_FAIL = 15,
  DRV_WIFI_AUTH_TIMEOUT = 16,
  DRV_WIFI_AP_UNABLE_TO_HANDLE_NEW_STA = 17,
  DRV_WIFI_ASSOC_DENIED_RATES = 18,
  DRV_WIFI_ASSOC_DENIED_NOSHORTPREAMBLE = 19,
  DRV_WIFI_ASSOC_DENIED_NOPBCC = 20,
  DRV_WIFI_ASSOC_DENIED_NOAGILITY = 21,
  DRV_WIFI_ASSOC_DENIED_NOSHORTTIME = 25,
  DRV_WIFI_ASSOC_DENIED_NODSSSOFDM = 26,
  DRV_WIFI_S_INVALID_IE = 40,
  DRV_WIFI_S_INVALID_GROUPCIPHER = 41,
  DRV_WIFI_S_INVALID_PAIRWISE_CIPHER = 42,
  DRV_WIFI_S_INVALID_AKMP = 43,
  DRV_WIFI_UNSUPPORTED_RSN_VERSION = 44,
  DRV_WIFI_S_INVALID_RSN_IE_CAP = 45,
  DRV_WIFI_S_CIPHER_SUITE_REJECTED = 46,
  DRV_WIFI_TIMEOUT = 47
} DRV_WIFI_STATUS_CODES;
```

Description

Status codes for connection for association or authentication failure.

This enumeration identifies the codes for a connection failure due to association or authentication failure. These codes are used in DRV_WIFI_ProcessEvent, case DRV_WIFI_EVENT_CONNECTION_FAILED.

DRV_WIFI_TX_MODES Enumeration

Selections for Wi-Fi TX Mode

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_TXMODE_G_RATES = 0,
  DRV_WIFI_TXMODE_B_RATES = 1,
  DRV_WIFI_TXMODE_LEGACY_RATES = 2
} DRV_WIFI_TX_MODES;
```

Members

Members	Description
DRV_WIFI_TXMODE_G_RATES = 0	Use 802.11 'g' rates
DRV_WIFI_TXMODE_B_RATES = 1	Use only 802.11 'b' rates
DRV_WIFI_TXMODE_LEGACY_RATES = 2	Use only 1 and 2 Mbps rates

Description

TX Modes

This enumeration identifies the choices the MRF24WG TX mode. It is recommended to use the DRV_WIFI_TXMODE_G_RATES for best performance. See DRV_WIFI_TxModeSet.

DRV_WIFI_WEP_CONTEXT Structure

Contains data pertaining to Wi-Fi WEP context.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t wepSecurityType;
  uint8_t wepKey[DRV_WIFI_MAX_WEP_KEY_LENGTH];
  uint8_t wepKeyLength;
  uint8_t wepKeyType;
} DRV_WIFI_WEP_CONTEXT;
```

Members

Members	Description
uint8_t wepSecurityType;	DRV_WIFI_SECURITY_WEP_40 or DRV_WIFI_SECURITY_WEP_104
uint8_t wepKey[DRV_WIFI_MAX_WEP_KEY_LENGTH];	Array containing four WEP binary keys. This will be four, 5-byte keys for WEP-40 or four, thirteen-byte keys for WEP-104.
uint8_t wepKeyLength;	number of bytes pointed to by p_wepKey
uint8_t wepKeyType;	DRV_WIFI_SECURITY_WEP_OPENKEY (default) or DRV_WIFI_SECURITY_WEP_SHAREDKEY

Description

This structure contains MRF24WG WEP context. See DRV_WIFI_SecurityWepSet.

DRV_WIFI_WEP_KEY_TYPE Enumeration

Selections for WEP key type when using WEP security.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_SECURITY_WEP_SHAREDKEY = 0,
  DRV_WIFI_SECURITY_WEP_OPENKEY = 1
} DRV_WIFI_WEP_KEY_TYPE;
```

Members

Members	Description
DRV_WIFI_SECURITY_WEP_SHAREDKEY = 0	use WEP shared key
DRV_WIFI_SECURITY_WEP_OPENKEY = 1	use WEP open key (default)

Description

WEP Key Types

This enumeration identifies the choices for the WEP key type when using WEP security. The recommended key type (and default) is Open key.

DRV_WIFI_WPA_CONTEXT Structure

Contains data pertaining to Wi-Fi WPA.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t wpaSecurityType;
  DRV_WIFI_WPA_KEY_INFO keyInfo;
} DRV_WIFI_WPA_CONTEXT;
```

Members

Members	Description
uint8_t wpaSecurityType;	desired security type (see description)
DRV_WIFI_WPA_KEY_INFO keyInfo;	see DRV_WIFI_WPA_KEY_INFO

Description

This structure contains MRF24WG WPA context. See DRV_WIFI_SecurityWpaSet.

DRV_WIFI_SECURITY_WPA_WITH_KEY	Select WPA with binary key
DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE	Select WPA with passphrase
DRV_WIFI_SECURITY_WPA2_WITH_KEY	Select WPA2 with binary key
DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE	Select WPA2 with passphrase
DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY	Auto-select between WPA/WPA2 with binary key
DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE	Auto-select between WPA/WPA2 with passphrase

DRV_WIFI_WPA_KEY_INFO Structure

Contains data pertaining to Wi-Fi WPA Key.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t key[DRV_WIFI_MAX_WPA_PASS_PHRASE_LENGTH];
  uint8_t keyLength;
} DRV_WIFI_WPA_KEY_INFO;
```

Members

Members	Description
uint8_t key[DRV_WIFI_MAX_WPA_PASS_PHRASE_LENGTH];	binary key or passphrase
uint8_t keyLength;	number of bytes in binary key (always 32) or passphrase

Description

This structure contains MRF24WG WPA key info. This structure is used in the DRV_WIFI_WPA_CONTEXT and DRV_WIFI_WPS_CONTEXT structures.

DRV_WIFI_WPS_AUTH_TYPES Enumeration

Selection of WPS Authorization Types

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_WPS_AUTH_OPEN = 0x01,
  DRV_WIFI_WPS_AUTH_WPA_PSK = 0x02,
  DRV_WIFI_WPS_AUTH_SHARED = 0x04,
  DRV_WIFI_WPS_AUTH_WPA = 0x08,
  DRV_WIFI_WPS_AUTH_WPA2 = 0x10,
  DRV_WIFI_WPS_AUTH_WPA2_PSK = 0x20
} DRV_WIFI_WPS_AUTH_TYPES;
```

Description

Wi-Fi WPS authorization types.

This enumeration identifies the WPS authorization types.

DRV_WIFI_WPS_CONTEXT Structure

Contains data pertaining to Wi-Fi WPS security.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t wpsSecurityType;
  uint8_t wpsPin[DRV_WIFI_WPS_PIN_LENGTH];
  uint8_t wpsPinLength;
} DRV_WIFI_WPS_CONTEXT;
```

Members

Members	Description
uint8_t wpsSecurityType;	DRV_WIFI_SECURITY_WPS_PUSH_BUTTON or DRV_WIFI_SECURITY_WPS_PIN
uint8_t wpsPin[DRV_WIFI_WPS_PIN_LENGTH];	if using DRV_WIFI_SECURITY_WPS_PIN then pointer to 8-digit pin
uint8_t wpsPinLength;	should always be 8 if used, 0 if not used

Description

This structure contains MRF24WG WPS security context. See DRV_WIFI_SecurityWpsSet.

DRV_WIFI_WPS_CREDENTIAL Structure

Contains data pertaining to Wi-Fi WPS Credentials.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t ssid[DRV_WIFI_MAX_SSID_LENGTH];
  uint8_t netKey[DRV_WIFI_MAX_SECURITY_KEY_LENGTH];
  uint16_t authType;
  uint16_t encType;
  uint8_t netIdx;
  uint8_t ssidLen;
  uint8_t keyIdx;
  uint8_t keyLen;
  uint8_t bssid[DRV_WIFI_BSSID_LENGTH];
} DRV_WIFI_WPS_CREDENTIAL;
```

Members

Members	Description
uint8_t ssid[DRV_WIFI_MAX_SSID_LENGTH];	network SSID

uint8_t netKey[DRV_WIFI_MAX_SECURITY_KEY_LENGTH];	binary security key (not used if security is open)
uint16_t authType;	WPS authorization type (see description)
uint16_t encType;	encoding type (see description)
uint8_t netIdx;	not used
uint8_t ssidLen;	number of bytes in SSID
uint8_t keyIdx;	Only valid encType = WF_ENC_WEP. This is the index of the WEP key being used.
uint8_t keyLen;	number of bytes in netKey
uint8_t bssid[DRV_WIFI_BSSID_LENGTH];	MAC address of AP

Description

This structure contains data pertaining to the configuration of the Wi-Fi WPS credentials.

'authType' Field	Description
DRV_WIFI_WPS_AUTH_OPEN	Open Security
DRV_WIFI_WPS_AUTH_WPA_PSK	WPA with PSK
DRV_WIFI_WPS_AUTH_SHARED	Shared Key
DRV_WIFI_WPS_AUTH_WPA	WPA
DRV_WIFI_WPS_AUTH_WPA2	WPA2
DRV_WIFI_WPS_AUTH_WPA2_PSK	WPA2 with PSK

'encType' Field	Description
DRV_WIFI_WPS_ENC_NONE	No encoding
DRV_WIFI_WPS_ENC_WEP	WEP encoding
DRV_WIFI_WPS_ENC_TKIP	TKIP encoding
DRV_WIFI_ENC_AES	AES encoding

DRV_WIFI_WPS_ENCODE_TYPES Enumeration

Selection of WPS Encoding Types

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_WPS_ENC_NONE = 0x01,
  DRV_WIFI_WPS_ENC_WEP = 0x02,
  DRV_WIFI_WPS_ENC_TKIP = 0x04,
  DRV_WIFI_ENC_AES = 0x08
} DRV_WIFI_WPS_ENCODE_TYPES;
```

Description

Wi-Fi WPS encoding types.

This enumeration identifies the WPS encoding types.

DRV_WIFI_WPS_ERROR_CONFIG_CODES Enumeration

Selection of different codes when a WPS connection fails.

File

drv_wifi.h

C

```
typedef enum {
```

```
  DRV_WIFI_WPS_NOERR = 0,
  DRV_WIFI_WPS_SESSION_OVERLAPPED = 1,
  DRV_WIFI_WPS_DECRYPT_CRC_FAILURE = 2,
  DRV_WIFI_WPS_24G_NOT_SUPPORTED = 3,
  DRV_WIFI_WPS_RETRY_FAILURE = 4,
  DRV_WIFI_WPS_INVALID_MSG = 5,
  DRV_WIFI_WPS_AUTH_FAILURE = 6,
  DRV_WIFI_WPS_ASSOC_FAILURE = 7,
  DRV_WIFI_WPS_MSG_TIMEOUT = 8,
  DRV_WIFI_WPS_SESSION_TIMEOUT = 9,
  DRV_WIFI_WPS_DEVPASSWD_AUTH_FAILURE = 10,
  DRV_WIFI_WPS_NO_CONN_TOREG = 11,
  DRV_WIFI_WPS_MULTI_PBC_DETECTED = 12,
  DRV_WIFI_WPS_EAP_FAILURE = 13,
  DRV_WIFI_WPS_DEV_BUSY = 14,
  DRV_WIFI_WPS_SETUP_LOCKED = 15
} DRV_WIFI_WPS_ERROR_CONFIG_CODES;
```

Description

WPS Config Error Codes

This enumeration identifies the codes that can take place when WPS fails.

DRV_WIFI_WPS_STATE_CODES Enumeration

Selection of different codes when a Extensible Authentication Protocol is used.

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_EAPOL_START = 1,
  DRV_WIFI_EAP_REQ_IDENTITY = 2,
  DRV_WIFI_EAP_RSP_IDENTITY = 3,
  DRV_WIFI_EAP_WPS_START = 4,
  DRV_WIFI_EAP_RSP_M1 = 5,
  DRV_WIFI_EAP_REQ_M2 = 6,
  DRV_WIFI_EAP_RSP_M3 = 7,
  DRV_WIFI_EAP_REQ_M4 = 8,
  DRV_WIFI_EAP_RSP_M5 = 9,
  DRV_WIFI_EAP_REQ_M6 = 10,
  DRV_WIFI_EAP_RSP_M7 = 11,
  DRV_WIFI_EAP_REQ_M8 = 12,
  DRV_WIFI_EAP_RSP_DONE = 13,
  DRV_WIFI_EAP_FAILURE = 14
} DRV_WIFI_WPS_STATE_CODES;
```

Description

WPS State Codes

This enumeration identifies the codes that can take place when using EAPOL.

DRV_WIFI_DEFAULT_WEP_KEY_INDEX Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_WEP_KEY_INDEX 0
```

Description

see DRV_WIFI_SecurityWepSet() and DRV_WIFI_WEP_CONTEXT

DRV_WIFI_SOFTAP_NETWORK_CONTEXT Structure

Contains data pertaining to Wi-Fi Soft AP context.

File

drv_wifi.h

C

```
typedef struct {
  bool hiddenSsid;
} DRV_WIFI_SOFTAP_NETWORK_CONTEXT;
```

Members

Members	Description
bool hiddenSsid;	When starting an Soft AP network, the SSID can be hidden in the beacons. Set true to hide the SSID, else false. Default is false.

Description

This structure contains MRF24WG Soft AP context data. See DRV_WIFI_SoftAPContextSet.

DRV_WIFI_DEFAULT_SOFTAP_HIDDEN_SSID Macro

Default values for Wi-Fi Soft AP settings.

File

drv_wifi.h

C

```
#define DRV_WIFI_DEFAULT_SOFTAP_HIDDEN_SSID false
```

Description

Wi-Fi Soft AP default settings.

These defines identify various default Wi-Fi Soft AP settings that can be used in the DRV_WIFI_SOFTAP_NETWORK_CONTEXT structure.

DRV_WIFI_MULTICAST_CONFIG Structure

Contains data pertaining to Wi-Fi software multicast filter configuration.

File

drv_wifi.h

C

```
typedef struct {
  uint8_t filterId;
  uint8_t action;
  uint8_t macBytes[6];
  uint8_t macBitMask;
} DRV_WIFI_MULTICAST_CONFIG;
```

Members

Members	Description
uint8_t filterId;	DRV_WIFI_MULTICAST_FILTER_1 through DRV_WIFI_MULTICAST_FILTER_16
uint8_t action;	configures the multicast filter (see description)
uint8_t macBytes[6];	Array containing the MAC address to filter on (using the destination address of each incoming 802.11 frame). Specific bytes within the MAC address can be designated as "don't care" bytes. See macBitMask. This field in only used if action = WF_MULTICAST_USE_FILTERS.
uint8_t macBitMask;	A byte where bits 5:0 correspond to macBytes[5:0]. If the bit is zero then the corresponding MAC byte must be an exact match for the frame to be forwarded to the Host PIC. If the bit is one then the corresponding MAC byte is a "don't care" and not used in the Multicast filtering process. This field in only used if action = WF_MULTICAST_USE_FILTERS.

Description

This structure contains data pertaining to the configuration of the software multicast config filter.

'action' Field	Description
DRV_WIFI_MULTICAST_DISABLE_ALL	Multicast filter discards all received multicast messages.
DRV_WIFI_MULTICAST_ENABLE_ALL	Multicast filter forwards all received multicast messages to host.
DRV_WIFI_MULTICAST_USE_FILTERS	The MAC filter will be used and the remaining fields define the filter.

DRV_WIFI_APCONFIG_BIT_PREAMBLE_LONG Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_APCONFIG_BIT_PREAMBLE_LONG (0x20)
```

Description

This is macro DRV_WIFI_APCONFIG_BIT_PREAMBLE_LONG.

DRV_WIFI_APCONFIG_BIT_PRIVACY Macro

apConfig bit

File

drv_wifi.h

C

```
#define DRV_WIFI_APCONFIG_BIT_PRIVACY (0x10)
```

Description

apConfig bit

DRV_WIFI_APCONFIG_BIT_WPA Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_APCONFIG_BIT_WPA (0x40)
```

Description

This is macro DRV_WIFI_APCONFIG_BIT_WPA.

DRV_WIFI_APCONFIG_BIT_WPA2 Macro

File

drv_wifi.h

C

```
#define DRV_WIFI_APCONFIG_BIT_WPA2 (0x80)
```

Description

This is macro DRV_WIFI_APCONFIG_BIT_WPA2.

DRV_WIFI_DEVICE_TYPE Enumeration

Codes for MRF Wi-Fi Device Type

File

drv_wifi.h

C

```
typedef enum {
  DRV_WIFI_MRF24WB0M_DEVICE = 1,
  DRV_WIFI_MRF24WG0M_DEVICE = 2
} DRV_WIFI_DEVICE_TYPE;
```

Description

MRF Wi-Fi devices type.

This enumeration identifies MRF Wi-Fi device type. The only device supported with this driver is DRV_WIFI_MRF24WG0M_DEVICE.

Files

Files

Name	Description
drv_wifi.h	MRF24WG Wi-Fi Driver Interface File
drv_wifi_iwpriv.h	Configure optional (private) parameters of MRF24WG driver.

Description

This section lists the source and header files used by the MRF24W Wi-Fi Driver Library.

drv_wifi.h

MRF24WG Wi-Fi Driver Interface File

Enumerations

	Name	Description
	adhocMode	Selection of different Ad-Hoc connection modes.
	DRV_WIFI_ADHOC_MODES	Selection of different Ad-Hoc connection modes.
	DRV_WIFI_CONNECTION_STATES	Wi-Fi Connection States
	DRV_WIFI_DEVICE_TYPE	Codes for MRF Wi-Fi Device Type
	DRV_WIFI_DOMAIN_CODES	Wi-Fi Regional Domain Codes
	DRV_WIFI_EVENT_CONN_TEMP_LOST_CODES	Selection of different codes when Wi-Fi connection is temporarily lost.
	DRV_WIFI_EVENT_INFO	Selection of different EventInfo types.
	DRV_WIFI_EVENTS	Selections for events that can occur.
	DRV_WIFI_GENERAL_ERRORS	This is type DRV_WIFI_GENERAL_ERRORS.
	DRV_WIFI_HIBERNATE_STATES	Wi-Fi Hibernate States
	DRV_WIFI_MGMT_ERRORS	Error codes returned when a management message is sent to the MRF24WG module.
	DRV_WIFI_MULTICAST_FILTER_IDS	Selections for software Multicast filter IDs.
	DRV_WIFI_MULTICAST_FILTERS	Selections for Software Multicast Filters.
	DRV_WIFI_POWER_SAVE_STATES	Wi-Fi Power-Saving States
	DRV_WIFI_REASON_CODES	Selection of different codes when a deauthorization or disassociation event has occurred.
	DRV_WIFI_RECONNECT_MODES	Selection of different reconnection modes.
	DRV_WIFI_SCAN_TYPES	Selection of different Wi-Fi scan types.
	DRV_WIFI_SOFT_AP_EVENT_REASON_CODES	Wi-Fi Soft AP Event Reason Codes
	DRV_WIFI_SOFT_AP_STATES	Wi-Fi Soft AP Events
	DRV_WIFI_STATUS_CODES	Selection of different codes when Wi-Fi connection fails due to association or authentication failure.
	DRV_WIFI_TX_MODES	Selections for Wi-Fi TX Mode
	DRV_WIFI_WEP_KEY_TYPE	Selections for WEP key type when using WEP security.
	DRV_WIFI_WPS_AUTH_TYPES	Selection of WPS Authorization Types
	DRV_WIFI_WPS_ENCODE_TYPES	Selection of WPS Encoding Types
	DRV_WIFI_WPS_ERROR_CONFIG_CODES	Selection of different codes when a WPS connection fails.
	DRV_WIFI_WPS_STATE_CODES	Selection of different codes when a Extensible Authentication Protocol is used.

Functions

	Name	Description
	DRV_WIFI_AdhocContextSet	Sets the Ad-Hoc context. **Implementation:** Dynamic
	DRV_WIFI_BssidGet	Gets the BSSID set in DRV_WIFI_BssidSet(). **Implementation:** Dynamic
	DRV_WIFI_BssidSet	Sets the Basic Service Set Identifier (BSSID). **Implementation:** Dynamic
	DRV_WIFI_ChannelListGet	Gets the channel list. **Implementation:** Dynamic
	DRV_WIFI_ChannelListSet	Sets the channel list. **Implementation:** Dynamic
	DRV_WIFI_ConfigDataDelete	Erases configuration data from the board EEPROM. **Implementation:** Dynamic
	DRV_WIFI_ConfigDataLoad	Loads configuration data from the board EEPROM. **Implementation:** Dynamic
	DRV_WIFI_ConfigDataSave	Save configuration data to the board EEPROM. **Implementation:** Dynamic
	DRV_WIFI_Connect	Directs the MRF24WG to connect to a Wi-Fi network. **Implementation:** Dynamic
	DRV_WIFI_ConnectContextGet	Gets the current Wi-Fi connection context. **Implementation:** Dynamic
	DRV_WIFI_ConnectionStateGet	Gets the current Wi-Fi connection state. **Implementation:** Dynamic
	DRV_WIFI_ContextLoad	Loads Wi-Fi context to MRF24WG. **Implementation:** Dynamic
	DRV_WIFI_Deferred_ISR	Implements MRF24WG Wi-Fi driver deferred ISR. **Implementation:** Dynamic
	DRV_WIFI_DeferredISR_SemGive	Gives semaphore to Wi-Fi deferred ISR. **Implementation:** Dynamic
	DRV_WIFI_Deinitialize	De-initializes the MRF24WG Wi-Fi driver. **Implementation:** Dynamic
	DRV_WIFI_DeviceInfoGet	Retrieves MRF24WG device information. **Implementation:** Dynamic
	DRV_WIFI_Disconnect	Directs the MRF24WG to disconnect from a Wi-Fi network. **Implementation:** Dynamic
	DRV_WIFI_HibernateEnable	Puts the MRF24WG module into hibernate mode. **Implementation:** Dynamic
	DRV_WIFI_HibernateModeClear	Clears current Hibernate mode. **Implementation:** Dynamic
	DRV_WIFI_InHibernateMode	Checks if MRF24WG is in hibernate mode. **Implementation:** Dynamic
	DRV_WIFI_Initialize	Initializes the MRF24WG Wi-Fi driver. **Implementation:** Dynamic
	DRV_WIFI_InitTask	Implements MRF24WG Wi-Fi driver initialization RTOS task. **Implementation:** Dynamic
	DRV_WIFI_INT_Handle	MRF24WG Wi-Fi driver interrupt handle. **Implementation:** Dynamic
	DRV_WIFI_LinkDownThresholdSet	Sets number of consecutive Wi-Fi TX failures before link is considered down. **Implementation:** Dynamic
	DRV_WIFI_MacAddressGet	Retrieves the MRF24WG MAC address. **Implementation:** Dynamic
	DRV_WIFI_MacAddressSet	Uses a different MAC address for the MRF24WG. **Implementation:** Dynamic
	DRV_WIFI_MacStatsGet	Gets MAC statistics. **Implementation:** Dynamic

	DRV_WIFI_MACTask	Implements MRF24WG Wi-Fi driver MAC process RTOS task. **Implementation:** Dynamic
	DRV_WIFI_MRF24W_ISR	MRF24WG Wi-Fi driver interrupt service routine. **Implementation:** Dynamic
	DRV_WIFI_MulticastFilterSet	Sets a multicast address filter using one of the software multicast filters. **Implementation:** Dynamic
	DRV_WIFI_NetworkTypeGet	Gets the Wi-Fi network type. **Implementation:** Dynamic
	DRV_WIFI_NetworkTypeSet	Sets the Wi-Fi network type. **Implementation:** Dynamic
	DRV_WIFI_PowerSaveStateGet	Gets the current power-saving state.
	DRV_WIFI_ProcessEvent	Processes Wi-Fi event. **Implementation:** Dynamic
	DRV_WIFI_PsPollDisable	Disables PS-Poll mode. **Implementation:** Dynamic
	DRV_WIFI_PsPollEnable	Enables PS Poll mode. **Implementation:** Dynamic
	DRV_WIFI_ReconnectModeGet	Gets the Wi-Fi reconnection mode. **Implementation:** Dynamic
	DRV_WIFI_ReconnectModeSet	Sets the Wi-Fi reconnection mode. **Implementation:** Dynamic
	DRV_WIFI_RegionalDomainGet	Retrieves the MRF24WG Regional domain. **Implementation:** Dynamic
	DRV_WIFI_RSSI_Cache_FromRxDataRead	Caches RSSI value from RX data packet. **Implementation:** Dynamic
	DRV_WIFI_RSSI_Get_FromRxDataRead	Reads RSSI value from RX data packet. **Implementation:** Dynamic
	DRV_WIFI_RssiGet	Gets RSSI value set in DRV_WIFI_RssiSet(). **Implementation:** Dynamic
	DRV_WIFI_RssiSet	Sets RSSI restrictions when connecting. **Implementation:** Dynamic
	DRV_WIFI_RtsThresholdGet	Gets the RTS Threshold. **Implementation:** Dynamic
	DRV_WIFI_RtsThresholdSet	Sets the RTS Threshold. **Implementation:** Dynamic
	DRV_WIFI_Scan	Commands the MRF24WG module to start a scan operation. This will generate the WF_EVENT_SCAN_RESULTS_READY event. **Implementation:** Dynamic
	DRV_WIFI_ScanContextGet	Gets the Wi-Fi scan context. **Implementation:** Dynamic
	DRV_WIFI_ScanContextSet	Sets the Wi-Fi scan context. **Implementation:** Dynamic
	DRV_WIFI_ScanResultGet	Read selected scan results back from MRF24WG. **Implementation:** Dynamic
	DRV_WIFI_SecurityGet	Gets the current Wi-Fi security setting. **Implementation:** Dynamic
	DRV_WIFI_SecurityOpenSet	Sets Wi-Fi security to open (no security). **Implementation:** Dynamic
	DRV_WIFI_SecurityTypeGet	Gets the current Wi-Fi security type. **Implementation:** Dynamic
	DRV_WIFI_SecurityWepSet	Sets Wi-Fi security to use WEP. **Implementation:** Dynamic
	DRV_WIFI_SecurityWpaSet	Sets Wi-Fi security to use WPA or WPA2. **Implementation:** Dynamic
	DRV_WIFI_SecurityWpsSet	Sets Wi-Fi security to use WPS. **Implementation:** Dynamic
	DRV_WIFI_SetPSK	Sets the binary WPA PSK code in WPS. **Implementation:** Dynamic

	DRV_WIFI_SoftAPContextSet	Sets the Soft AP context. **Implementation:** Dynamic
	DRV_WIFI_SoftApEventInfoGet	Gets the stored Soft AP event info. **Implementation:** Dynamic
	DRV_WIFI_SpiClose	Closes SPI object for MRF24WG Wi-Fi driver. **Implementation:** Dynamic
	DRV_WIFI_SpiDmaRx	SPI RX API using DMA. **Implementation:** Dynamic
	DRV_WIFI_SpiDmaTx	SPI TX API using DMA. **Implementation:** Dynamic
	DRV_WIFI_SpiInit	Initializes SPI object for MRF24WG Wi-Fi driver. **Implementation:** Dynamic
	DRV_WIFI_SpiRx	SPI Rx API. **Implementation:** Dynamic
	DRV_WIFI_SpiTx	SPI TX API **Implementation:** Dynamic
	DRV_WIFI_SsidGet	Gets the SSID. **Implementation:** Dynamic
	DRV_WIFI_SsidSet	Sets the SSID. **Implementation:** Dynamic
	DRV_WIFI_TaskSyncInit	Initializes RTOS Semaphore and Mutex for MRF24WG Wi-Fi driver. **Implementation:** Dynamic
	DRV_WIFI_TxModeGet	Gets 802.11 TX mode. **Implementation:** Dynamic
	DRV_WIFI_TxModeSet	Configures 802.11 TX mode. **Implementation:** Dynamic
	DRV_WIFI_TxPowerFactoryMaxGet	Retrieves the factory-set max TX power from the MRF24WG module. **Implementation:** Dynamic
	DRV_WIFI_TxPowerMaxGet	Gets the TX max power on the MRF24WG0M. **Implementation:** Dynamic
	DRV_WIFI_TxPowerMaxSet	Sets the TX max power on the MRF24WG0M. **Implementation:** Dynamic
	DRV_WIFI_WepKeyTypeGet	Gets the WEP Key type. **Implementation:** Dynamic
	DRV_WIFI_WPSCredentialsGet	Gets the WPS credentials. **Implementation:** Dynamic

Macros

	Name	Description
	DRV_WIFI_APCONFIG_BIT_PREAMBLE_LONG	This is macro DRV_WIFI_APCONFIG_BIT_PREAMBLE_LONG.
	DRV_WIFI_APCONFIG_BIT_PRIVACY	apConfig bit
	DRV_WIFI_APCONFIG_BIT_WPA	This is macro DRV_WIFI_APCONFIG_BIT_WPA.
	DRV_WIFI_APCONFIG_BIT_WPA2	This is macro DRV_WIFI_APCONFIG_BIT_WPA2.
	DRV_WIFI_BSSID_LENGTH	This is macro DRV_WIFI_BSSID_LENGTH.
	DRV_WIFI_DEAUTH_REASONCODE_MASK	This is macro DRV_WIFI_DEAUTH_REASONCODE_MASK.
	DRV_WIFI_DEFAULT_ADHOC_BEACON_PERIOD	ms
	DRV_WIFI_DEFAULT_ADHOC_HIDDEN_SSID	Default values for Wi-Fi Ad-Hoc settings.
	DRV_WIFI_DEFAULT_ADHOC_MODE	This is macro DRV_WIFI_DEFAULT_ADHOC_MODE.
	DRV_WIFI_DEFAULT_PS_DTIM_ENABLED	DTIM wake-up enabled (normally the case)
	DRV_WIFI_DEFAULT_PS_DTIM_INTERVAL	number of beacon periods
	DRV_WIFI_DEFAULT_PS_LISTEN_INTERVAL	100 ms multiplier, e.g., 1 * 100 ms = 100 ms
	DRV_WIFI_DEFAULT_SCAN_COUNT	Default values for Wi-Fi scan context
	DRV_WIFI_DEFAULT_SCAN_MAX_CHANNEL_TIME	ms
	DRV_WIFI_DEFAULT_SCAN_MIN_CHANNEL_TIME	ms
	DRV_WIFI_DEFAULT_SCAN_PROBE_DELAY	us
	DRV_WIFI_DEFAULT_SOFTAP_HIDDEN_SSID	Default values for Wi-Fi Soft AP settings.

	DRV_WIFI_DEFAULT_WEP_KEY_INDEX	see DRV_WIFI_SecurityWepSet() and DRV_WIFI_WEP_CONTEXT
	DRV_WIFI_DEFAULT_WEP_KEY_TYPE	This is macro DRV_WIFI_DEFAULT_WEP_KEY_TYPE.
	DRV_WIFI_DISABLED	This is macro DRV_WIFI_DISABLED.
	DRV_WIFI_DISASSOC_REASONCODE_MASK	This is macro DRV_WIFI_DISASSOC_REASONCODE_MASK.
	DRV_WIFI_ENABLED	Do not make this an enumerated type!
	DRV_WIFI_MAX_CHANNEL_LIST_LENGTH	This is macro DRV_WIFI_MAX_CHANNEL_LIST_LENGTH.
	DRV_WIFI_MAX_NUM_RATES	This is macro DRV_WIFI_MAX_NUM_RATES.
	DRV_WIFI_MAX_SECURITY_KEY_LENGTH	This is macro DRV_WIFI_MAX_SECURITY_KEY_LENGTH.
	DRV_WIFI_MAX_SSID_LENGTH	This is macro DRV_WIFI_MAX_SSID_LENGTH.
	DRV_WIFI_MAX_WEP_KEY_LENGTH	This is macro DRV_WIFI_MAX_WEP_KEY_LENGTH.
	DRV_WIFI_MAX_WPA_PASS_PHRASE_LENGTH	must exclude string terminator
	DRV_WIFI_MIN_WPA_PASS_PHRASE_LENGTH	must exclude string terminator
	DRV_WIFI_NETWORK_TYPE_ADHOC	This is macro DRV_WIFI_NETWORK_TYPE_ADHOC.
	DRV_WIFI_NETWORK_TYPE_INFRASTRUCTURE	Selection of different Wi-Fi network types.
	DRV_WIFI_NETWORK_TYPE_SOFT_AP	This is macro DRV_WIFI_NETWORK_TYPE_SOFT_AP.
	DRV_WIFI_NO_ADDITIONAL_INFO	eventInfo define for DRV_WIFI_ProcessEvent() when no additional info is supplied
	DRV_WIFI_RETRY_ADHOC	This is macro DRV_WIFI_RETRY_ADHOC.
	DRV_WIFI_RETRY_FOREVER	This is macro DRV_WIFI_RETRY_FOREVER.
	DRV_WIFI_RTS_THRESHOLD_MAX	maximum RTS threshold size in bytes
	DRV_WIFI_SECURITY_OPEN	Selection of different Wi-Fi security types
	DRV_WIFI_SECURITY_WEP_104	This is macro DRV_WIFI_SECURITY_WEP_104.
	DRV_WIFI_SECURITY_WEP_40	This is macro DRV_WIFI_SECURITY_WEP_40.
	DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY	This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_KEY.
	DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE	This is macro DRV_WIFI_SECURITY_WPA_AUTO_WITH_PASS_PHRASE.
	DRV_WIFI_SECURITY_WPA_WITH_KEY	This is macro DRV_WIFI_SECURITY_WPA_WITH_KEY.
	DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE	This is macro DRV_WIFI_SECURITY_WPA_WITH_PASS_PHRASE.
	DRV_WIFI_SECURITY_WPA2_WITH_KEY	This is macro DRV_WIFI_SECURITY_WPA2_WITH_KEY.
	DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE	This is macro DRV_WIFI_SECURITY_WPA2_WITH_PASS_PHRASE.
	DRV_WIFI_SECURITY_WPS_PIN	This is macro DRV_WIFI_SECURITY_WPS_PIN.
	DRV_WIFI_SECURITY_WPS_PUSH_BUTTON	This is macro DRV_WIFI_SECURITY_WPS_PUSH_BUTTON.
	DRV_WIFI_WEP104_KEY_LENGTH	4 keys of 13 bytes each
	DRV_WIFI_WEP40_KEY_LENGTH	4 keys of 5 bytes each
	DRV_WIFI_WPA_KEY_LENGTH	This is macro DRV_WIFI_WPA_KEY_LENGTH.
	DRV_WIFI_WPS_PIN_LENGTH	7 digits + checksum byte

Structures

	Name	Description
	DRV_WIFI_ADHOC_NETWORK_CONTEXT	Contains data pertaining to Wi-Fi Ad-Hoc context.
	DRV_WIFI_CONNECTION_CONTEXT	Contains data pertaining to MRF24WG connection context.
	DRV_WIFI_DEVICE_INFO	Contains data pertaining to MRF24WG device type and version number.
	DRV_WIFI_MAC_STATS	Wi-Fi MIB states
	DRV_WIFI_MGMT_INDICATE_SOFT_AP_EVENT	Contains data pertaining to Wi-Fi Soft AP event.
	DRV_WIFI_MULTICAST_CONFIG	Contains data pertaining to Wi-Fi software multicast filter configuration.
	DRV_WIFI_PS_POLL_CONTEXT	Contains data pertaining to Wi-Fi PS-Poll context.
	DRV_WIFI_SCAN_CONTEXT	Contains data pertaining to Wi-Fi scan context.
	DRV_WIFI_SCAN_RESULT	Contains data pertaining to Wi-Fi scan results.
	DRV_WIFI_SOFTAP_NETWORK_CONTEXT	Contains data pertaining to Wi-Fi Soft AP context.
	DRV_WIFI_WEP_CONTEXT	Contains data pertaining to Wi-Fi WEP context.
	DRV_WIFI_WPA_CONTEXT	Contains data pertaining to Wi-Fi WPA.
	DRV_WIFI_WPA_KEY_INFO	Contains data pertaining to Wi-Fi WPA Key.
	DRV_WIFI_WPS_CONTEXT	Contains data pertaining to Wi-Fi WPS security.

	DRV_WIFI_WPS_CREDENTIAL	Contains data pertaining to Wi-Fi WPS Credentials.

Description

Contains all data types, define constants, and function prototypes for interfacing to the MRF24WG Wi-Fi driver.

File Name

drv_wifi.h

Company

Microchip Technology Inc.

drv_wifi_iwpriv.h

Configure optional (private) parameters of MRF24WG driver.

Functions

	Name	Description
	iwpriv_adhocctx_set	Sets the Ad-Hoc network context information. **Implementation:** Dynamic
	iwpriv_config_read	Reads the Wi-Fi context configuration. **Implementation:** Dynamic

Description

MRF24WG Private Configuration Support

Functions in this module support the connection process for the MRF24WG.

MRF24WN Wi-Fi Driver Library

This topic describes the MRF24WN Wi-Fi Driver Library.

Description

The following table lists the library files available for the MRF24WN Wi-Fi Driver.

	Target MCU Device		
Wi-Fi Library File Matrix	PIC32MX795F512L	PIC32MZ2048ECH144	PIC32MZ2048EFM144
Wi-Fi Device MRF24WN	wdrvext_mx.a	wdrvext_mz_ec.a	wdrvext_mz_ef.a

Introduction

This library provides a low-level abstraction of the MRF24WN Wi-Fi Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

The MRF24WN Wi-Fi Driver Library, in conjunction with the MRF24WN module, allows an application to:

- Join an existing 802.11 Wi-Fi Infrastructure network
- Create a 802.11 Wi-Fi Ad Hoc or Soft AP network

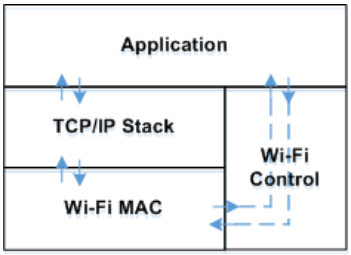
The following application services are provided by the Wi-Fi library:

- Configuring Wi-Fi connection (SSID, security mode, channel list, etc.)
- Join an existing Wi-Fi Infrastructure network
- Create a Wi-Fi Ad Hoc or Soft AP network
- Scan for Wi-Fi Access Point (AP) or Soft AP
- Getting Wi-Fi network status
- Wi-Fi power control

- Wi-Fi console commands

The MAC layer services are not directly accessible to the application; this portion of the code resides under the TCP/IP Stack MAC module software layers and is used by stack services to transmit and receive data over a Wi-Fi network. The following diagram shows the interaction of the primary software blocks in a Wi-Fi application.

Wi-Fi Software Block Diagram



The following table provides information that includes network mode and security mode support by MRF24WN Wi-Fi Driver.

MRF24WN Network Connection Matrix	Network Mode	
	Infrastructure	Soft AP
Security Mode		
Open	YES	YES
WEP40	YES	YES
WEP104	YES	YES
WPA-PSK	YES	YES
WPA2-PSK	YES	YES
WPS Push Button	YES	NA
WPS PIN	YES	NA

Using the Library

This topic describes the basic architecture of the MRF24WN Wi-Fi Driver Library and provides information and examples on its use.

Description

Interface Header Files: `wdrv_mrf24wn_common.h` and `wdrv_mrf24wn_api.h`

The interface to the MRF24WN Wi-Fi Driver Library is defined in the `wdrv_mrf24wn_common.h` and wdrv_mrf24wn_api.h header files.

Please refer to the Understanding MPLAB Harmony section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the MRF24WN Wi-Fi module with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The MRF24WN Wi-Fi Library provides the following functionality:

- Wi-Fi library initialization
- Wi-Fi network configuration
- Wi-Fi network connection
- Scanning for existing Wi-Fi networks
- Wi-Fi event processing
- Wi-Fi status
- Wi-FI console commands

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The Library Interface functions are divided into various sub-sections, which address one of the blocks or the overall operation of the Wi-Fi module.

Library Interface Section	Description
Wi-Fi Initialization Functions	This section provides functions that initialize the Wi-Fi library and allow its API to be used.

Wi-Fi Status Functions	This section provides functions that retrieve the Wi-Fi connection status.
Wi-Fi External Functions	This section provides public functions accessible to TCP/IP applications.
Other Functions	This section provides additional miscellaneous functions for configuring the Wi-Fi connection.

How the Library Works

This section describes how the MRF24WN Wi-Fi Driver Library operates.

Description

Before the driver is ready for use, its should be configured (compile time configuration).

There are few run-time configuration items that are done during initialization of the driver instance, and a few that are client-specific and are done using dedicated functions.

To use the MRF24WN Wi-Fi Driver, initialization and client functions should be invoked in a specific sequence to ensure correct operation.

System Initialization

This section describes initialization and reinitialization features.

Description

Wi-Fi initialization configures the MRF24WN module and then directs it to join (or create) a Wi-Fi network. The MRF24WN module defaults to open security and scans all channels in the domain. Therefore, to initialize and connect with the minimum function call overhead in an open security network, the following functions can be used:

```
WDRV_EXT_CmdSSIDSet("MySsidName",strlen("MySsidName");
WDRV_EXT_CmdConnect();        // start the connection process
```

Alternatively, the following functions could be used to achieve the same effect:

```
WDRV_EXT_CmdNetModeBSSSet();
WDRV_EXT_CmdSecNoneSet();
WDRV_EXT_CmdSSIDSet("MySsidName",strlen("MySsidName");
WDRV_EXT_CmdConnect();
```

Client Functionality

This section describes core operation.

Description

From the client perspective, once Wi-Fi initialization is complete and the connection process has started, the client responds to Wi-Fi events. The client is notified of events by the callback function WDRV_ProcessEvent. The parameters into that function are `event` and `eventInfo`, where `event` is the event code and `eventInfo` is additional information about the event.

Wi-Fi Connection Events

```
/*No Wi-Fi connection exists*/
WDRV_CSTATE_NOT_CONNECTED = 1,

/*Wi-Fi connection in progress*/
WDRV_CSTATE_CONNECTION_IN_PROGRESS = 2,

/*Wi-Fi connected in infrastructure mode*/
WDRV_CSTATE_CONNECTED_INFRASTRUCTURE = 3,

/*Wi-Fi connected in adHoc mode*/
WDRV_CSTATE_CONNECTED_ADHOC = 4,

/*Wi-Fi in process of reconnecting*/
WDRV_CSTATE_RECONNECTION_IN_PROGRESS = 5,

/*Wi-Fi connection temporarily lost*/
WDRV_CSTATE_CONNECTION_TEMPORARY_LOST = 6,
```

```
/*Wi-Fi connection permanently lost*/
WDRV_CSTATE_CONNECTION_PERMANENTLY_LOST = 7
```

Scan Events

```
WDRV_SOFTAP_EVENT_CONNECTED = 0,
WDRV_SOFTAP_EVENT_DISCONNECTED = 1
```

Key Events

```
WDRV_SOFTAP_EVENT_LINK_LOST = 0,
WDRV_SOFTAP_EVENT_RECEIVED_DEAUTH = 1
```

Disconnect Events

```
WDRV_DISCONNECT_REASON_NO_NETWORK_AVAIL = 0x01,
WDRV_DISCONNECT_REASON_LOST_LINK = 0x02,
WDRV_DISCONNECT_REASON_DISCONNECT_CMD = 0x03,
WDRV_DISCONNECT_REASON_BSS_DISCONNECTED = 0x04,
WDRV_DISCONNECT_REASON_AUTH_FAILED = 0x05,
WDRV_DISCONNECT_REASON_ASSOC_FAILED = 0x06,
WDRV_DISCONNECT_REASON_NO_RESOURCES_AVAIL = 0x07,
WDRV_DISCONNECT_REASON_CONNECTION_DENIED = 0x08,
WDRV_DISCONNECT_REASON_INVALID_PROFILE = 0x0A,
WDRV_DISCONNECT_REASON_PROFILE_MISMATCH = 0x0C,
WDRV_DISCONNECT_REASON_CONNECTION_EVICTED = 0x0d
```

Configuring the Library

The configuration of the MRF24WN Wi-Fi Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the Wi-Fi Driver. Based on the selections made, the MRF24WN Wi-Fi Driver may support the selected features. These configuration settings will apply to all instances of the MRF24WN Wi-Fi Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Configuring DMA SPI

Please refer to Configuring DMA SPI for information on enabling and disabling DMA SPI for FreeRTOS projects.

Sample Functionality

The following code provides an example of Wi-Fi Driver configuration.

```
/*** Wi-Fi Driver Configuration ***/

#define WIFI_USE_RTOS

#define WDRV_EXT_INIT_TASK_STACK_SIZE 512u
#define WDRV_EXT_INIT_TASK_PRIO 6u
#define WDRV_EXT_MAIN_TASK_STACK_SIZE 2048u
#define WDRV_EXT_MAIN_TASK_PRIO 7u

#define WDRV_ASSERT(condition, msg) WDRV_Assert(condition, msg, __FILE__, __LINE__)

#define DRV_WIFI_SPI_INDEX 0
#define DRV_WIFI_SPI_INSTANCE sysObj.spiObjectIdx0

#define DRV_WIFI_NVM_SPACE_ENABLE
#define DRV_WIFI_NVM_SPACE_ADDR (48*1024)

#define MRF_INT_SOURCE INT_SOURCE_EXTERNAL_1
#define MRF_INT_VECTOR INT_VECTOR_INT1

// IO mapping for general control pins, including CS, RESET and HIBERNATE
// MRF24W in SPI 1 slot
#define WF_CS_PORT_CHANNEL PORT_CHANNEL_E
#define WF_CS_BIT_POS      9
```

```
#define WF_RESET_PORT_CHANNEL PORT_CHANNEL_F
#define WF_RESET_BIT_POS      0

#define WF_HIBERNATE_PORT_CHANNEL PORT_CHANNEL_F
#define WF_HIBERNATE_BIT_POS      1

#define WF_INT_PRIORITY     3
#define WF_INT_SUBPRIORITY  1
#define WF_INT_PORT_CHANNEL PORT_CHANNEL_E
#define WF_INT_BIT_POS      8

#define WDRV_DEFAULT_NETWORK_TYPE WDRV_NETWORK_TYPE_INFRASTRUCTURE
#define WDRV_DEFAULT_SSID_NAME "MicrochipDemoApp"

#define WDRV_DEFAULT_WIFI_SECURITY_MODE WDRV_SECURITY_OPEN
#define WDRV_DEFAULT_WEP_KEYS_40 "5AFB6C8E77" // default WEP40 key
#define WDRV_DEFAULT_WEP_KEYS_104 "90E96780C739409DA50034FCAA" // default WEP104 key
#define WDRV_DEFAULT_PSK_PHRASE "Microchip 802.11 Secret PSK Password" // default WPA-PSK or WPA2-PSK
passphrase
#define WDRV_DEFAULT_WPS_PIN "12390212" // default WPS PIN

#define WDRV_DEFAULT_CHANNEL 6
#define WDRV_DEFAULT_POWER_SAVE WDRV_FUNC_DISABLED
```

Building the Library

This section lists the files that are available in the MRF24WN Wi-Fi Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/wifi/mrf24wn`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`wdrv_mrf24wn_common.h`	Contains all data types, define constants for the MRF24WN Wi-Fi Driver.
`wdrv_mrf24wn_api.h`	Contains function prototypes for interfacing to the MRF24WN Wi-Fi Driver.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`wdrv_mrf24wn_cli.c`	Provides access to MRF24WN Wi-Fi Driver controller.
`wdrv_mrf24wn_config_data.c`	Stores and retrieves MRF24WN Wi-Fi Driver configuration information in Non-volatile Memory (NVM).
`wdrv_mrf24wn_connmgr.c`	Provides access to MRF24WN Wi-Fi Driver controller for connection manager.
`wdrv_mrf24wn_events.c`	Provides access to MRF24WN Wi-Fi Driver controller for MAC events.
`wdrv_mrf24wn_iwpriv.c`	Provides functions to configure optional (private) parameters of the MRF24WN Wi-Fi Driver.
`wdrv_mrf24wn_main.c`	Module for Microchip TCP/IP Stack PIC32 implementation for multiple Wi-Fi MAC support.
`wdrv_mrf24wn_misc.c`	Miscellaneous support functions and data types for the MRF24WN Wi-Fi Driver.
`wdrv_mrf24wn_osal.c`	RTOS wrapper functions for the MRF24WN Wi-Fi Driver.
`wdrv_mrf24wn_scan_helper.c`	Provides helper functions to access scan results.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	The MRF24WN Wi-Fi Driver controller has no optional files.

Module Dependencies

The MRF24WN Wi-Fi Driver Library depends on the following modules:

- SPI Driver Library
- NVM Driver Library
- UART Driver Library
- USB Driver Library
- Operating System Abstraction Layer (OSAL) Library Help
- Clock System Service Library
- System Service Library Introduction
- Console System Service Library
- File System Service Library
- Interrupt System Service Library
- Timer System Service Library
- Debug System Service Library
- Ports System Service Library
- FreeRTOS Library Help
- Crypto Library
- Peripheral Libraries

Console Commands

This section describes the console commands available for the MRF24WN Wi-Fi Driver.

Description

Both the Web Server and the EasyConfig demonstrations support the followings commands, which enable control over the Wi-Fi settings.

Command: eraseconf

Parameters	Description
None.	Wi-Fi console command to erase saved Wi-Fi configuration in memory.

Command: iwconfig

Parameters	Description
[ssid <name>]	name: Specifies the name of the SSID (1-32 ASCII characters).
[mode <idle | managed>]	idle: Disconnected from the current configuration. managed: Connects in infrastructure mode to the currently set SSID.
[power <enable | disable>]	enable: Enables all Power-Saving features (PS_POLL). Will wake up to check for all types of traffic (unicast, multicast, and broadcast). disable: Disables any Power-Saving features. Will always be in an active power state.

[security <mode>]	mode: open/wep40/wep104/wpa/wpa2/pin/pbc. For example:
	`iwconfig security open`
	`iwconfig security wep40 <key>`
	`iwconfig security wep104 <key>`
	`iwconfig security wpa <key>`
	`iwconfig security wpa2 <key>`
	`iwconfig security pin <pin>`
	`iwconfig security pbc`

[scan]	Starts a Wi-Fi scan.
[scanget <scan_index>]	scan_index: Retrieves the scan result after the scan completes (1 - n).

Command: mac

Parameters	Description
None.	Wi-Fi console command to retrieve the MAC address of the MRF24WN module.

Command: readconf

Parameters	Description
None.	Wi-Fi console command to read saved Wi-Fi configuration in memory.

Command: rftest

Parameters	Description
[rate < packet_count | packet_size | channel header_type >]	Wi-Fi console command to perform regulatory test. rate (in Mbps): • 0 = 1 • 1 = 2 • 2 = 5.5 • 3 = 11 • 4 = 6 • 5 = 9 • 6 = 12 • 7 = 18 • 8 = 24 • 9 = 36 • 10 = 48 • 11 = 54 • 12 = 6.5 • 13 = 13 • 14 = 19.5 • 15 = 26 • 16 = 39 • 17 = 52 • 18 = 58.5 packet_count: Number of transmits (1 through 14). packet_size: Payload size (0 to 1400). channel: 1 through 14. header_type: 0 - Beacon frame; 1 - QoS data frame; 2 through 4 Address data frame.

Command: saveconf

Parameters	Description
None.	Wi-Fi console command to save Wi-Fi configuration to memory.

Library Interface

a) Wi-Fi Initialization Functions

	Name	Description
	WDRV_CLI_Init	Initializes the console CLI interface. **Implementation:** Dynamic
	WDRV_INTR_Deinit	Deinitializes interrupts for Wi-Fi driver. **Implementation:** Dynamic
	WDRV_INTR_Init	Initializes interrupts for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_INTR_SourceDisable	Disables interrupts from the module. **Implementation:** Dynamic

	WDRV_INTR_SourceEnable	Enables interrupts from the module. **Implementation:** Dynamic
	WDRV_SPI_Deinit	Deinitializes the SPI object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_SPI_Init	Initializes the SPI object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_SPI_In	Receives data from the module through the SPI bus. **Implementation:** Dynamic
	WDRV_SPI_Out	Sends data out to the module through the SPI bus. **Implementation:** Dynamic
	WDRV_HibernateDisable	Wakes MRF24WN up from hibernate mode. **Implementation:** Dynamic
	WDRV_HibernateEnable	Hibernates MRF24WN module. **Implementation:** Dynamic
	WDRV_InHibernateMode	Checks if MRF24WN is in hibernate mode. **Implementation:** Dynamic

b) Wi-Fi Status Functions

	Name	Description
	WDRV_EXT_CmdConnectContextChannelGet	Gets the AP channel **Implementation:** Dynamic
	WDRV_EXT_CmdMacAddressGet	Retrieves the MRF24WN MAC address. **Implementation:** Dynamic
	WDRV_EXT_CmdScanGet	Reads the number of scan results from the MRF24WN module. **Implementation:** Dynamic
	WDRV_EXT_CmdSecGet	Gets the current Wi-Fi security type. **Implementation:** Dynamic
	WDRV_EXT_CmdSSIDGet	Gets the SSID. **Implementation:** Dynamic
	WDRV_EXT_CmdConnectContextBssidGet	Gets the BSSID. **Implementation:** Dynamic
	WDRV_EXT_CmdPowerSaveGet	Retrieves current power save status. **Implementation:** Dynamic
	WDRV_EXT_WPSResultsRead	Reads the WPS process results back from the MRF24WN module and updates the configuration data. **Implementation:** Dynamic

c) External Functions

	Name	Description
	WDRV_EXT_CmdConnect	Directs the MRF24WN to connect to a Wi-Fi network. **Implementation:** Dynamic
	WDRV_EXT_CmdDisconnect	Directs the MRF24WN to disconnect from a Wi-Fi network. **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeAPSet	Sets the Wi-Fi network type to SoftAP. **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeBSSSet	Sets the Wi-Fi network type to Infrastructure. **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeIBSSSet	Sets the Wi-Fi network type to Adhoc. **Implementation:** Dynamic
	WDRV_EXT_CmdScanStart	Directs the MRF24WN module to start a scan. **Implementation:** Dynamic
	WDRV_EXT_CmdSecNoneSet	Sets Wi-Fi security to open (no security). **Implementation:** Dynamic
	WDRV_EXT_CmdSecWEPSet	Sets Wi-Fi security to use WEP. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWPA2Set	Sets Wi-Fi security to use WPA2. **Implementation:** Dynamic

	WDRV_EXT_CmdSecWPASet	Sets Wi-Fi security to use WPA. **Implementation:** Dynamic
	WDRV_EXT_CmdSSIDSet	Sets the SSID. **Implementation:** Dynamic
	WDRV_EXT_DataSend	Sends data packets to MRF24WN module. **Implementation:** Dynamic
	WDRV_EXT_Deinitialize	Deinitializes the MRF24WN Wi-Fi driver. **Implementation:** Dynamic
	WDRV_EXT_HWInterruptHandler	Wi-Fi driver (MRF24WN-specific) interrupt service routine. **Implementation:** Dynamic
	WDRV_EXT_PowerUpDown	Powers the MRF24WN module up or down. **Implementation:** Dynamic
	WDRV_EXT_ScanDoneSet	Indicates when a scan has completed. **Implementation:** Dynamic
	WDRV_EXT_CmdChannelSet	Sets the channel on which to operate. **Implementation:** Dynamic
	WDRV_EXT_CmdFWUpdate	Directs the module to start firmware download and upgrade. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWpsSet	Sets Wi-Fi security to use WPS. **Implementation:** Dynamic
	WDRV_EXT_CmdPowerSavePut	Puts the module in IEEE power save mode. **Implementation:** Dynamic
	WDRV_EXT_ScanIsInProgress	Check whether host scan is now in progress or not. **Implementation:** Dynamic
	WDRV_EXT_Misc_Config	Configures miscellaneous parameters. **Implementation:** Dynamic
	WDRV_EXT_CmdRFTest	Performs RF test for regulatory test purposes. **Implementation:** Dynamic
	WDRV_EXT_CmdTxPowerSet	Sets the TX Power. **Implementation:** Dynamic
	WDRV_EXT_ScanResultGet	Reads the selected scan results back from the MRF24WN module. **Implementation:** Dynamic
	WDRV_EXT_Initialize	Initializes the MRF24WN Wi-Fi driver. **Implementation:** Dynamic

d) GPIO Functions

	Name	Description
	WDRV_MRF24WN_ISR	Wi-Fi driver (MRF24WN-specific) interrupt service routine. **Implementation:** Dynamic
	WDRV_GPIO_MRF24WG_Disable	Disables the MRF24WG module on Multimedia Expansion Board II (MEB II). **Implementation:** Dynamic
	WDRV_GPIO_DeInit	Deinitializes the GPIO object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_GPIO_Init	Initializes the GPIO object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_GPIO_OutHigh	Pulls GPIO high. **Implementation:** Dynamic
	WDRV_GPIO_OutLow	Pulls gpio low. **Implementation:** Dynamic
	WDRV_GPIO_PowerDown	Powers down the MRF24WN module. **Implementation:** Dynamic
	WDRV_GPIO_PowerUp	Powers on the MRF24WN module. **Implementation:** Dynamic

e) Private Configuration Functions

	Name	Description
	iwpriv_adhocctx_set	Sets the Ad-Hoc network context information. **Implementation:** Dynamic

	iwpriv_config_read	Reads the Wi-Fi context configuration. **Implementation:** Dynamic
	iwpriv_config_write	Writes to the Wi-Fi context configuration which is currently used by Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_connstatus_get	Gets the Wi-Fi connection status. **Implementation:** Dynamic
	iwpriv_devinfo_get	Gets the device information. **Implementation:** Dynamic
	iwpriv_initialconn_set	Sets the initial connection status of Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_initstatus_get	Gets the initialization status of Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_is_servermode	Checks if the passed Wi-Fi context configuration is operating in server mode. **Implementation:** Dynamic
	iwpriv_leftclient_get	Gets the left client's information. **Implementation:** Dynamic
	iwpriv_mcastfilter_set	Adds a MAC address to the multi-cast filter. **Implementation:** Dynamic
	iwpriv_nettype_get	Gets the current network type. **Implementation:** Dynamic
	iwpriv_nettype_set	Sets the current network type. **Implementation:** Dynamic
	iwpriv_numberofscanresults_get	Gets the number of scan results. **Implementation:** Dynamic
	iwpriv_powersave_config	Enables or disables Power Save mode in Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_prescan_start	Starts prescan. **Implementation:** Dynamic
	iwpriv_scan_start	Starts scan. **Implementation:** Dynamic
	iwpriv_scanresults_display	Outputs all of the scan results. **Implementation:** Dynamic
	iwpriv_scanresult_get	Gets one scan result. **Implementation:** Dynamic
	iwpriv_scanresults_save	Saves all of the scan results. **Implementation:** Dynamic
	iwpriv_scanstatus_get	Gets the prescan status. **Implementation:** Dynamic
	iwpriv_ssid_get	Gets the current SSID. **Implementation:** Dynamic
	iwpriv_ssid_set	Sets the current SSID. **Implementation:** Dynamic
	iwpriv_execute	This is function iwpriv_execute.
	iwpriv_get	This is function iwpriv_get.
	iwpriv_prescan_isfinished	Checks if the prescan is complete. **Implementation:** Dynamic
	iwpriv_prescan_option_get	To see if prescan will run before next connection. **Implementation:** Dynamic
	iwpriv_prescan_option_set	To run prescan or not. **Implementation:** Dynamic
	iwpriv_set	This is function iwpriv_set.

f) Data Types and Constants

	Name	Description
	IWPRIV_CONN_STATUS	This is type IWPRIV_CONN_STATUS.
	IWPRIV_STATUS	This is type IWPRIV_STATUS.
	IWPRIV_CMD	This is type IWPRIV_CMD.
	IWPRIV_EXECUTE_PARAM	This is type IWPRIV_EXECUTE_PARAM.

	IWPRIV_GET_PARAM	This is type IWPRIV_GET_PARAM.
	IWPRIV_PARAM_CLIENTINFO	This is type IWPRIV_PARAM_CLIENTINFO.
	IWPRIV_PARAM_CONTEXT	This is type IWPRIV_PARAM_CONTEXT.
	IWPRIV_PARAM_DEVICEINFO	This is type IWPRIV_PARAM_DEVICEINFO.
	IWPRIV_SCAN_STATUS	This is type IWPRIV_SCAN_STATUS.
	IWPRIV_SET_PARAM	This is type IWPRIV_SET_PARAM.
	IWPRIV_PARAM_CONFIG	This is type IWPRIV_PARAM_CONFIG.
	IWPRIV_PARAM_CONNECT	This is type IWPRIV_PARAM_CONNECT.
	IWPRIV_PARAM_DRIVERSTATUS	This is type IWPRIV_PARAM_DRIVERSTATUS.
	IWPRIV_PARAM_MULTICASTFILTER	This is type IWPRIV_PARAM_MULTICASTFILTER.
	IWPRIV_PARAM_NETWORKTYPE	This is type IWPRIV_PARAM_NETWORKTYPE.
	IWPRIV_PARAM_OPERATIONMODE	This is type IWPRIV_PARAM_OPERATIONMODE.
	IWPRIV_PARAM_POWERSAVE	This is type IWPRIV_PARAM_POWERSAVE.
	IWPRIV_PARAM_SCAN	This is type IWPRIV_PARAM_SCAN.
	IWPRIV_PARAM_SSID	This is type IWPRIV_PARAM_SSID.

Description

This section describes the Application Programming Interface (API) functions of the MRF24WN Wi-Fi Driver.

Refer to each section for a detailed description.

a) Wi-Fi Initialization Functions

WDRV_CLI_Init Function

Initializes the console CLI interface.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
bool WDRV_CLI_Init();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function initializes the console CLI interface.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

bool WDRV_CLI_Init(void)

WDRV_INTR_Deinit Function

Deinitializes interrupts for Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_INTR_Deinit();
```

Returns

None.

Description

This function deinitializes interrupts for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_INTR_Deinit(void)

WDRV_INTR_Init Function

Initializes interrupts for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_INTR_Init();
```

Returns

None.

Description

This function initializes interrupts for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_INTR_Init(void)

WDRV_INTR_SourceDisable Function

Disables interrupts from the module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_INTR_SourceDisable();
```

Returns

None.

Description

This function disables interrupts from the module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_INTR_SourceDisable(void)

WDRV_INTR_SourceEnable Function

Enables interrupts from the module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_INTR_SourceEnable();
```

Returns

None.

Description

This function enables interrupts from the module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_INTR_SourceEnable(void)

WDRV_SPI_Deinit Function

Deinitializes the SPI object for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_SPI_Deinit();
```

Returns

None.

Description

This function deinitializes the SPI object for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_SPI_Deinit(void)

WDRV_SPI_Init Function

Initializes the SPI object for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_SPI_Init();
```

Returns

None.

Description

This function initializes the SPI object for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_SPI_Init(void)

WDRV_SPI_In Function

Receives data from the module through the SPI bus.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_SPI_In(uint8_t *const OutBuf, uint16_t OutSize, uint8_t *const InBuf, uint16_t InSize);
```

Returns

None.

Description

This function receives data from the module through the SPI bus.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
bufOut	buffer pointer of output command
OutSize	the command size
InBuf	buffer pointer of input data
InSize	the input data size

Function

void WDRV_SPI_In(uint8_t const *const OutBuf, uint16_t OutSize,
uint8_t *const InBuf, uint16_t InSize)

WDRV_SPI_Out Function

Sends data out to the module through the SPI bus.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_SPI_Out(uint8_t *const bufOut, uint16_t OutSize);
```

Returns

None.

Description

This function sends data out to the module through the SPI bus.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
bufOut	buffer pointer of output data
OutSize	the data size

Function

void WDRV_SPI_Out(uint8_t const *const bufOut, uint16_t OutSize)

WDRV_HibernateDisable Function

Wakes MRF24WN up from hibernate mode.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_HibernateDisable();
```

Returns

None.

Description

This function wakes MRF24WN up from hibernate mode.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_HibernateDisable(void)

WDRV_HibernateEnable Function

Hibernates MRF24WN module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_HibernateEnable();
```

Returns

None.

Description

This function hibernates the MRF24WN module.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_HibernateEnable(void)

WDRV_InHibernateMode Function

Checks if MRF24WN is in hibernate mode.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
bool WDRV_InHibernateMode();
```

Returns

- 0 - Indicates that MRF24WN is in hibernate mode
- Non-zero value - Indicates that MRF24WN is not in hibernate mode

Description

This function checks if MRF24WN is in hibernate mode.

Remarks

None.

Function

bool WDRV_InHibernateMode(void)

b) Wi-Fi Status Functions

WDRV_EXT_CmdConnectContextChannelGet Function

Gets the AP channel

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdConnectContextChannelGet(uint16_t * bssChannel);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function gets the current AP channel.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
bssChannel	pointer where the current AP channel will be written

Function

uint32_t WDRV_EXT_CmdConnectContextChannelGet(uint16_t *bssChannel)

WDRV_EXT_CmdMacAddressGet Function

Retrieves the MRF24WN MAC address.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdMacAddressGet(uint8_t * MacAddr);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function retrieves the MRF24WN MAC address.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
MacAddr	Pointer where MAC address will be written (must point to a 6 bytes buffer)

Function

uint32_t WDRV_EXT_CmdMacAddressGet(uint8_t *MacAddr)

WDRV_EXT_CmdScanGet Function

Reads the number of scan results from the MRF24WN module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdScanGet(uint16_t * numOfResults);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function reads the number of scan results from the MRF24WN module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
numOfResults	pointer where the number of scan results will be written

Function

uint32_t WDRV_EXT_CmdScanGet(uint16_t *numOfResults)

WDRV_EXT_CmdSecGet Function

Gets the current Wi-Fi security type.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdSecGet(uint32_t * SecurityType);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function gets the current Wi-Fi security type.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
SecurityType	pointer where the security type will be written

Function

uint32_t WDRV_EXT_CmdSecGet(uint32_t *SecurityType)

WDRV_EXT_CmdSSIDGet Function

Gets the SSID.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdSSIDGet(uint8_t * ssid, uint8_t * length);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function returns the SSID and SSID Length.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
ssid	pointer to buffer where SSID will be written
length	number of bytes in SSID

Function

uint32_t WDRV_EXT_CmdSSIDGet(uint8_t *ssid, uint8_t *length)

WDRV_EXT_CmdConnectContextBssidGet Function

Gets the BSSID.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdConnectContextBssidGet(uint8_t * bssId);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function gets the current AP's BSSID.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
bssId	pointer where the current AP's BSSID will be written

Function

uint32_t WDRV_EXT_CmdConnectContextBssidGet(uint8_t *bssId)

WDRV_EXT_CmdPowerSaveGet Function

Retrieves current power save status.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdPowerSaveGet(bool * enabled);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function retrieves the current power save status.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
enabled	pointer where the current power save status will be written

Function

uint32_t WDRV_EXT_CmdPowerSaveGet(bool *enabled)

WDRV_EXT_WPSResultsRead Function

Reads the WPS process results back from the MRF24WN module and updates the configuration data.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_EXT_WPSResultsRead(WDRV_CONFIG_DATA * config, uint32_t * status);
```

Returns

None.

Description

After the WPS process has completed, this function is used to read the WPS process results from the MRF24WN module and update the configuration data.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
config	pointer to where configuration data will be updated
status	pointer to where WPS process status will be written

Function

void WDRV_EXT_WPSResultsRead(WDRV_CONFIG_DATA *config, uint32_t *status)

c) External Functions

WDRV_EXT_CmdConnect Function

Directs the MRF24WN to connect to a Wi-Fi network.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdConnect();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function causes the MRF24WN to connect to a Wi-Fi network. Upon connection, or a failure to connect, an event will be generated.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and relevant connection parameters must have been set.

Function

uint32_t WDRV_EXT_CmdConnect(void)

WDRV_EXT_CmdDisconnect Function

Directs the MRF24WN to disconnect from a Wi-Fi network.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdDisconnect();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function causes the MRF24WN to disconnect from a Wi-Fi network.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and a connection must be in progress.

Function

uint32_t WDRV_EXT_CmdDisconnect(void)

WDRV_EXT_CmdNetModeAPSet Function

Sets the Wi-Fi network type to SoftAP.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdNetModeAPSet();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi network type to SoftAP.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

uint32_t WDRV_EXT_CmdNetModeAPSet(void)

WDRV_EXT_CmdNetModeBSSSet Function

Sets the Wi-Fi network type to Infrastructure.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdNetModeBSSSet();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi network type to Infrastructure.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

uint32_t WDRV_EXT_CmdNetModeBSSSet(void)

WDRV_EXT_CmdNetModeIBSSSet Function

Sets the Wi-Fi network type to Adhoc.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdNetModeIBSSSet();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi network type to Adhoc.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

uint32_t WDRV_EXT_CmdNetModeIBSSSet(void)

WDRV_EXT_CmdScanStart Function

Directs the MRF24WN module to start a scan.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdScanStart();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function directs the MRF24WN module to start a scan.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

uint32_t WDRV_EXT_CmdScanStart(void)

WDRV_EXT_CmdSecNoneSet Function

Sets Wi-Fi security to open (no security).

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdSecNoneSet();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi security to open. One can only connect to an AP that is running in open mode.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and in an unconnected state.

Function

uint32_t WDRV_EXT_CmdSecNoneSet(void)

WDRV_EXT_CmdSecWEPSet Function

Sets Wi-Fi security to use WEP.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdSecWEPSet(uint8_t * key, uint16_t len);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi security to WEP. One can only connect to an AP that is running the same WEP mode.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and in an unconnected state.

Parameters

Parameters	Description
key	pointer to the WEP key buffer
len	WEP key length

Function

uint32_t WDRV_EXT_CmdSecWEPSet(uint8_t *key, uint16_t len)

WDRV_EXT_CmdSecWPA2Set Function

Sets Wi-Fi security to use WPA2.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdSecWPA2Set(uint8_t * key, uint16_t len);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi security to WPA2. One can only connect to an AP that is running the same WPA2 mode.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and in an unconnected state.

Parameters

Parameters	Description
key	pointer to the WPA2 key buffer
len	WPA2 key length

Function

uint32_t WDRV_EXT_CmdSecWPA2Set(uint8_t *key, uint16_t len)

WDRV_EXT_CmdSecWPASet Function

Sets Wi-Fi security to use WPA.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdSecWPASet(uint8_t * key, uint16_t len);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi security to WPA. One can only connect to an AP that is running the same WPA mode.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and in an unconnected state.

Parameters

Parameters	Description
key	pointer to the WPA key buffer
len	WPA key length

Function

uint32_t WDRV_EXT_CmdSecWPASet(uint8_t *key, uint16_t len)

WDRV_EXT_CmdSSIDSet Function

Sets the SSID.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdSSIDSet(uint8_t * ssid, uint16_t len);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the SSID and SSID length.

Remarks

Do not include a string terminator in the SSID length. SSIDs are case-sensitive. SSID length must be less than or equal to 32.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
ssid	pointer to SSID buffer
len	number of bytes in SSID

Function

uint32_t WDRV_EXT_CmdSSIDSet(uint8_t *ssid, uint16_t len)

WDRV_EXT_DataSend Function

Sends data packets to MRF24WN module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_DataSend(uint16_t segSize, uint8_t * p_segData);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sends data packets to the MRF24WN module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
seqSize	data size
p_seqData	pointer to the data buffer

Function

uint32_t WDRV_EXT_DataSend(uint16_t segSize, uint8_t *p_segData)

WDRV_EXT_Deinitialize Function

Deinitializes the MRF24WN Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_EXT_Deinitialize();
```

Returns

None.

Description

This function deinitializes the MRF24WN driver.

Remarks

None

Preconditions

None.

Function

void WDRV_EXT_Deinitialize(void)

WDRV_EXT_HWInterruptHandler Function

Wi-Fi driver (MRF24WN-specific) interrupt service routine.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_EXT_HWInterruptHandler(void const * pointer);
```

Returns

None.

Description

This function is the Wi-Fi driver (MRF24WN-specific) interrupt service routine.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_HWInterruptHandler(void const *pointer)

WDRV_EXT_PowerUpDown Function

Powers the MRF24WN module up or down.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_PowerUpDown(uint32_t up);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function powers the MRF24WN module up or down.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
up	1: power up; 0: power down

Function

uint32_t WDRV_EXT_PowerUpDown(uint32_t up)

WDRV_EXT_ScanDoneSet Function

Indicates when a scan has completed.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_EXT_ScanDoneSet();
```

Returns

None.

Description

This function indicates when a scan has completed.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_ScanDoneSet(void)

WDRV_EXT_CmdChannelSet Function

Sets the channel on which to operate.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdChannelSet(uint16_t channel);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the channel on which to operate.

Remarks

This works only with SoftAP mode. Do not call this in other modes.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
channel	target channel

Function

WDRV_EXT_CmdChannelSet(uint16_t channel)

WDRV_EXT_CmdFWUpdate Function

Directs the module to start firmware download and upgrade.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_EXT_CmdFWUpdate();
```

Returns

None.

Description

This function directs the module to start the firmware download and upgrade.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_CmdFWUpdate(void)

WDRV_EXT_CmdSecWpsSet Function

Sets Wi-Fi security to use WPS.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdSecWpsSet(bool pinMode, uint8_t * key, uint16_t keyLen);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi security to WPS. One can only connect to an AP that supports WPS.

Remarks

None

Preconditions

Wi-Fi initialization must be complete and in an unconnected state.

Parameters

Parameters	Description
pinMode	0: PBC mode; 1: PIN mode

key	pointer of the PIN buffer
keyLen	PIN length

Function

int32_t WDRV_EXT_CmdSecWpsSet(bool pinMode, uint8_t *key, uint16_t keyLen)

WDRV_EXT_CmdPowerSavePut Function

Puts the module in IEEE power save mode.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdPowerSavePut(bool enable);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

The function places the module in IEEE power save mode.

Remarks

This works only with Infrastructure mode. Do not call this in other modes.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
enable	true will put the module in IEEE power save mode

Function

uint32_t WDRV_EXT_CmdPowerSavePut(bool enable)

WDRV_EXT_ScanIsInProgress Function

Check whether host scan is now in progress or not.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
bool WDRV_EXT_ScanIsInProgress();
```

Returns

- true - Host scan is in progress
- false - Host scan is not in progress

Description

Check whether host scan is now in progress or not.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_ScanIsInProgress(void)

WDRV_EXT_Misc_Config Function

Configures miscellaneous parameters.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_EXT_Misc_Config(uint32_t * config);
```

Returns

None.

Description

This function configures miscellaneous parameters.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
config	pointer to the parameter array

Function

void WDRV_EXT_Misc_Config(uint32_t *config)

WDRV_EXT_CmdRFTest Function

Performs RF test for regulatory test purposes.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdRFTest(uint32_t argc, char * argv[]);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function performs a RF test for regulatory test purposes.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Example

Use the arguments in this order:

rate packet_count packet_size channel header_type rate: 0 = 1mbps, 1 = 2mbps, 2 = 5.5mbps, 3 = 11mbps, 4 = 6mbps, 5 = 9mbps, 6 = 12mbps, 7 = 18mbps, 8 = 24mbps, 9 = 36mbps, 10 = 48mbps, 11 = 54mbps, 12 = 6.5mbps, 13 = 13mbps, 14 = 19.5mbps, 15 = 26mbps, 16 = 39mbps, 17

= 52mbps, 18 = 58.5mbps packet_count: number of transmits 1 - 14 packet_size: payload size 0 to 1400 channel: 1 - 14 header_type: 0 - beacon frame; 1 - QOS data frame; 2 - 4 address data frame

Parameters

Parameters	Description
argc	argument count
argv	argument vector

Function

int32_t WDRV_EXT_CmdRFTest(int32_t argc, char *argv[])

WDRV_EXT_CmdTxPowerSet Function

Sets the TX Power.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdTxPowerSet(uint32_t dbm);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

The function sets the module's TX power.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
dbm	value of tx power

Function

uint32_t WDRV_EXT_CmdTxPowerSet(uint32_t dbm)

WDRV_EXT_ScanResultGet Function

Reads the selected scan results back from the MRF24WN module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_EXT_ScanResultGet(uint8_t listIndex, WDRV_SCAN_RESULT * p_scanResult);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

After a scan has completed this function is used to read one scan result at a time from the MRF24WN module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
listIndex	index (0 based list) of the scan entry to retrieve
p_scanResult	pointer to where scan result is written

Function

void WDRV_EXT_ScanResultGet(uint8_t listIndex, WDRV_SCAN_RESULT *p_scanResult)

WDRV_EXT_Initialize Function

Initializes the MRF24WN Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
int32_t WDRV_EXT_Initialize(WDRV_CALLBACKS const *const CB);
```

Returns

- 0 - Indicates success
- non-zero value - Indicates failure

Description

This function initializes the MRF24WN Wi-Fi driver, making it ready for clients to use.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
CB	pointer to callback functions

Function

int32_t WDRV_EXT_Initialize(WDRV_CALLBACKS const *const CB)

d) GPIO Functions

WDRV_MRF24WN_ISR Function

Wi-Fi driver (MRF24WN-specific) interrupt service routine.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_MRF24WN_ISR(SYS_MODULE_OBJ index);
```

Returns

None.

Description

This function is the Wi-Fi driver (MRF24WN-specific) interrupt service routine.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_MRF24WN_ISR(SYS_MODULE_OBJ index)

WDRV_GPIO_MRF24WG_Disable Function

Disables the MRF24WG module on Multimedia Expansion Board II (MEB II).

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_MRF24WG_Disable();
```

Returns

None.

Description

This function disables MRF24WG module on MEB II.

Remarks

The MEB II is configured with a built-in MRF24WG module. The MRF24WG module shares the same SPI bus lines with the MRF24WN module, which results in a bus collision. To avoid the collision, it is required to disable the MRF24WG module on the MEB II.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_GPIO_MRF24WG_Disable(void)

WDRV_GPIO_DeInit Function

Deinitializes the GPIO object for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_DeInit();
```

Returns

None.

Description

This function deinitializes the GPIO object for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_GPIO_DeInit(void)

WDRV_GPIO_Init Function

Initializes the GPIO object for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_Init(GPIO_OUTLOW_T L, GPIO_OUTHIGH_T H);
```

Returns

None.

Description

This function initializes the GPIO object for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
L	function pointer to the function drives GPIO low
H	function pointer to the function drives GPIO high

Function

void WDRV_GPIO_Init(GPIO_OUTLOW_T L, GPIO_OUTHIGH_T H)

WDRV_GPIO_OutHigh Function

Pulls GPIO high.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_OutHigh(uint32_t channel, uint32_t bit_pos);
```

Returns

None.

Description

This function pulls GPIO high.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
channel	port channel
bit_pos	bit position in the channel

Function

void WDRV_GPIO_OutHigh(uint32_t channel, uint32_t bit_pos)

WDRV_GPIO_OutLow Function

Pulls gpio low.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_OutLow(uint32_t channel, uint32_t bit_pos);
```

Returns

None.

Description

Pulls gpio low.

Remarks

None.

Preconditions

TCP/IP stack should be initialized.

Parameters

Parameters	Description
channel	port channel
bit_pos	bit position in the channel

Function

void WDRV_GPIO_OutLow(uint32_t channel, uint32_t bit_pos)

WDRV_GPIO_PowerDown Function

Powers down the MRF24WN module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_PowerDown();
```

Returns

None.

Description

This function powers down the MRF24WN module.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_GPIO_PowerDown(void)

WDRV_GPIO_PowerUp Function

Powers on the MRF24WN module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_PowerUp();
```

Returns

None.

Description

This function powers on the MRF24WN module.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_GPIO_PowerUp(void)

e) Private Configuration Functions

iwpriv_adhocctx_set Function

Sets the Ad-Hoc network context information.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_adhocctx_set(WDRV_ADHOC_NETWORK_CONTEXT * p_context);
```

Returns

None.

Description

This function sets the current Ad-Hoc network context information by reading from a passed pointer.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
p_context	pointer to where the Ad-Hoc network context is stored

Function

void iwpriv_adhocctx_set(DRV_WIFI_ADHOC_NETWORK_CONTEXT *p_context)

iwpriv_config_read Function

Reads the Wi-Fi context configuration.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_config_read(WDRV_CONFIG_DATA * wifi_config);
```

Returns

None.

Description

This function reads the current Wi-Fi context configuration, copies and stores the whole structure to the pointer passed to the function.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
wifi_config	pointer to where the context configuration is written

Function

void iwpriv_config_read(DRV_WIFI_CONFIG_DATA *wifi_config)

iwpriv_config_write Function

Writes to the Wi-Fi context configuration which is currently used by Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_config_write(void * wifi_config);
```

Returns

None.

Description

This function reads from a passed pointer, copies everything from it, and writes to the Wi-Fi context configuration, which is currently used by the Wi-Fi driver.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
wifi_config	pointer to where the context configuration is stored

Function

void iwpriv_config_write(void *wifi_config)

iwpriv_connstatus_get Function

Gets the Wi-Fi connection status.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
IWPRIV_CONN_STATUS iwpriv_connstatus_get();
```

Returns

Status of current Wi-Fi connection. See the definition for the IWPRIV_CONN_STATUS structure.

Description

This function gets the Wi-Fi connection status.

Remarks

IWPRIV_CONNECTION_FAILED does not necessarily mean that the module fails to connect to the network. It stands on the application's perspective, and actually can be customized. For example, in the Web Server demonstrations's use case, WDRV_CSTATE_CONNECTION_PERMANENTLY_LOST is treated as a fail case and will trigger the application to restart.

Preconditions

Wi-Fi initialization must be complete.

Function

IWPRIV_CONN_STATUS iwpriv_connstatus_get(void)

iwpriv_devinfo_get Function

Gets the device information.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_devinfo_get(void * info);
```

Returns

None.

Description

This function returns the device information, which is either MRF24WG or MRF24WN.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
info	pointer to where the device information is written

Function

void iwpriv_devinfo_get(void *info)

iwpriv_initialconn_set Function

Sets the initial connection status of Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_initialconn_set(bool connect);
```

Returns

None.

Description

This function sets the initial connection status of Wi-Fi driver. After Wi-Fi initialization, it decides whether or not to start the Wi-Fi connection.

Remarks

This function is mainly used to implement prescan. It has to be called before Wi-Fi driver's initialization is finished to be effective.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
connect	boolean value which indicates whether or not to start an initial connect

Function

void iwpriv_initialconn_set(bool connect)

iwpriv_initstatus_get Function

Gets the initialization status of Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
uint8_t iwpriv_initstatus_get();
```

Returns

Current initialization status of the Wi-Fi driver (IWPRIV_READY or IWPRIV_IN_PROGRESS).

Description

This function returns the initialization status of the Wi-Fi driver.

Remarks

None.

Preconditions

None.

Function

uint8_t iwpriv_initstatus_get(void)

iwpriv_is_servermode Function

Checks if the passed Wi-Fi context configuration is operating in server mode.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
bool iwpriv_is_servermode();
```

Returns

- true - Wi-Fi context configuration is operating in server mode
- false - Wi-Fi context configuration is not operating in server mode

Description

This function checks if the passed Wi-Fi context configuration is operating in server mode, which includes Ad-Hoc mode and Soft AP mode.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

bool iwpriv_is_servermode(void)

iwpriv_leftclient_get Function

Gets the left client's information.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_leftclient_get(bool * updated, TCPIP_MAC_ADDR * addr);
```

Returns

None.

Description

This function returns the left client's information when the Wi-Fi module works in server mode and has the DHCP Server enabled.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
updated	if the left client's information needs to be updated
addr	MAC address of the left client

Function

void iwpriv_leftclient_get(bool *updated, TCPIP_MAC_ADDR *addr)

iwpriv_mcastfilter_set Function

Adds a MAC address to the multi-cast filter.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
IWPRIV_STATUS iwpriv_mcastfilter_set(uint8_t * addr);
```

Returns

Status of the set operation, IWPRIV_READY or IWPRIV_ERROR. See definition for the IWPRIV_STATUS structure.

Description

This function adds a MAC address to the multi-cast filter.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
addr	pointer to where the MAC address is stored

Function

IWPRIV_STATUS iwpriv_mcastfilter_set(uint8_t *addr)

iwpriv_nettype_get Function

Gets the current network type.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_nettype_get(uint8_t * netType);
```

Returns

None.

Description

This function returns the current network type.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
netType	pointer to where the network type is written

Function

void iwpriv_nettype_get(uint8_t *netType)

iwpriv_nettype_set Function

Sets the current network type.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_nettype_set(uint8_t netType);
```

Returns

None.

Description

This function sets the current network type.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
netType	the network type to set

Function

void iwpriv_nettype_set(uint8_t netType)

iwpriv_numberofscanresults_get Function

Gets the number of scan results.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
uint16_t iwpriv_numberofscanresults_get();
```

Returns

Number of scan results.

Description

This function gets the number of scan results.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

uint16_t iwpriv_numberofscanresults_get(void)

iwpriv_powersave_config Function

Enables or disables Power Save mode in Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_powersave_config(bool enabled);
```

Returns

None.

Description

This function enables or disables Power Save mode in Wi-Fi driver, which depends on the passed boolean value.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
enabled	boolean value which indicates to enable or disable Power Save mode in Wi-Fi driver

Function

void iwpriv_powersave_config(bool enabled)

iwpriv_prescan_start Function

Starts prescan.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_prescan_start();
```

Returns

None.

Description

This function directs the Wi-Fi driver to start a prescan.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void iwpriv_prescan_start(void)

iwpriv_scan_start Function

Starts scan.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_scan_start();
```

Returns

None.

Description

The function starts a Wi-Fi scan.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void iwpriv_scan_start(void)

iwpriv_scanresults_display Function

Outputs all of the scan results.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
IWPRIV_STATUS iwpriv_scanresults_display();
```

Returns

Status of the output operation, IWPRIV_IN_PROGRESS or IWPRIV_READY. See definition for the IWPRIV_STATUS structure.

Description

This function outputs all of the scan results to the console terminal.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

IWPRIV_STATUS iwpriv_scanresults_display(void)

iwpriv_scanresult_get Function

Gets one scan result.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void * iwpriv_scanresult_get(uint16_t index);
```

Returns

Pointer to where the scan result is written. It uses the g_scanResults[] array to store results, which eliminates the need to allocate additional memory.

Description

This function gets one scan result, which includes the detailed information of an AP.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
index	index of the scan result

Function

void *iwpriv_scanresult_get(uint16_t index)

iwpriv_scanresults_save Function

Saves all of the scan results.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
IWPRIV_STATUS iwpriv_scanresults_save();
```

Returns

Status of the save operation, IWPRIV_IN_PROGRESS or IWPRIV_READY. See definition for the IWPRIV_STATUS structure.

Description

This function saves all of the scan results to the console terminal.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

IWPRIV_STATUS iwpriv_scanresults_save(void)

iwpriv_scanstatus_get Function

Gets the prescan status.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
IWPRIV_SCAN_STATUS iwpriv_scanstatus_get();
```

Returns

Prescan status: IWPRIV_SCAN_IDLE, IWPRIV_SCAN_IN_PROGRESS, IWPRIV_SCAN_NO_AP_FOUND or IWPRIV_SCAN_SUCCESSFUL. See the definition for the IWPRIV_SCAN_STATUS structure.

Description

This function gets the prescan status.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

IWPRIV_SCAN_STATUS iwpriv_scanstatus_get(void)

iwpriv_ssid_get Function

Gets the current SSID.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_ssid_get(uint8_t * ssid, uint8_t * ssidLen);
```

Returns

None.

Description

This function returns the current SSID.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
ssid	pointer to where the SSID is written
ssidLen	pointer to where the SSID length is written

Function

void iwpriv_ssid_get(uint8_t *ssid, uint8_t *ssidLen)

iwpriv_ssid_set Function

Sets the current SSID.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_ssid_set(uint8_t * ssid, uint8_t ssidLen);
```

Returns

None.

Description

This function sets the current SSID.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
ssid	pointer to where the SSID is stored

ssidLen	pointer to where the SSID length is stored

Function

void iwpriv_ssid_set(uint8_t *ssid, uint8_t ssidLen)

iwpriv_execute Function

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_execute(IWPRIV_CMD cmd, IWPRIV_EXECUTE_PARAM * params);
```

Description

This is function iwpriv_execute.

iwpriv_get Function

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_get(IWPRIV_CMD cmd, IWPRIV_GET_PARAM * params);
```

Description

This is function iwpriv_get.

iwpriv_prescan_isfinished Function

Checks if the prescan is complete.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
bool iwpriv_prescan_isfinished();
```

Returns

None.

Description

This function checks if the prescan is complete.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

bool iwpriv_prescan_isfinished(void)

iwpriv_prescan_option_get Function

To see if prescan will run before next connection.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
bool iwpriv_prescan_option_get();
```

Returns

None.

Description

This function checks whether or not the prescan will run before next connection.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

bool iwpriv_prescan_option_get(void)

iwpriv_prescan_option_set Function

To run prescan or not.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_prescan_option_set(bool scan);
```

Returns

None.

Description

This function controls whether or not to run prescan.

Remarks

Prescan means the scan runs before the module is connected. It needs to use multiple functions in this file. Please refer to the Easy Configuration demonstration to see the correct usage of prescan.

After the the module is connected, MRF24WN module can also do regular scans. But it cannot perform a scan when the connection is in progress.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
scan	true: run prescan before next connection
false	do not run prescan before next connection

Function

void iwpriv_prescan_option_set(bool scan)

iwpriv_set Function

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_set(IWPRIV_CMD cmd, IWPRIV_SET_PARAM * params);
```

Description

This is function iwpriv_set.

f) Data Types and Constants

IWPRIV_CONN_STATUS Enumeration

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef enum {
  IWPRIV_CONNECTION_FAILED = -1,
  IWPRIV_CONNECTION_SUCCESSFUL,
  IWPRIV_CONNECTION_IDLE,
  IWPRIV_CONNECTION_IN_PROGRESS,
  IWPRIV_CONNECTION_REESTABLISHED
} IWPRIV_CONN_STATUS;
```

Description

This is type IWPRIV_CONN_STATUS.

IWPRIV_STATUS Enumeration

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef enum {
  IWPRIV_ERROR = -1,
  IWPRIV_READY,
  IWPRIV_IN_PROGRESS
} IWPRIV_STATUS;
```

Description

This is type IWPRIV_STATUS.

IWPRIV_CMD Enumeration

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef enum {
  PRESCAN_OPTION_GET,
  PRESCAN_OPTION_SET,
  PRESCAN_START,
  PRESCAN_ISFINISHED_GET,
  SCAN_START,
  SCANSTATUS_GET,
  SCANRESULT_GET,
  SCANRESULTS_COUNT_GET,
  SCANRESULTS_DISPLAY,
  SCANRESULTS_SAVE,
  CONFIG_GET,
  CONFIG_SET,
  SSID_GET,
  SSID_SET,
  NETWORKTYPE_GET,
  NETWORKTYPE_SET,
  CONNSTATUS_GET,
  CLIENTINFO_GET,
  DEVICEINFO_GET,
```

```
  INITSTATUS_GET,
  OPERATIONMODE_GET,
  INITCONN_OPTION_SET,
  ADHOCCTX_SET,
  MULTICASTFILTER_SET,
  POWERSAVE_SET
} IWPRIV_CMD;
```

Description

This is type IWPRIV_CMD.

IWPRIV_EXECUTE_PARAM Union

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef union {
  IWPRIV_PARAM_SCAN scan;
} IWPRIV_EXECUTE_PARAM;
```

Description

This is type IWPRIV_EXECUTE_PARAM.

IWPRIV_GET_PARAM Union

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef union {
  IWPRIV_PARAM_SCAN scan;
  IWPRIV_PARAM_CONFIG config;
  IWPRIV_PARAM_SSID ssid;
  IWPRIV_PARAM_NETWORKTYPE netType;
  IWPRIV_PARAM_CONNECT conn;
  IWPRIV_PARAM_CLIENTINFO clientInfo;
  IWPRIV_PARAM_DEVICEINFO devInfo;
  IWPRIV_PARAM_DRIVERSTATUS driverStatus;
  IWPRIV_PARAM_OPERATIONMODE opMode;
} IWPRIV_GET_PARAM;
```

Description

This is type IWPRIV_GET_PARAM.

IWPRIV_PARAM_CLIENTINFO Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  uint8_t * addr;
  bool updated;
} IWPRIV_PARAM_CLIENTINFO;
```

Members

Members	Description
uint8_t * addr;	it usually points to a MAC address, which is an array of 6 uint8_t elements

Description

This is type IWPRIV_PARAM_CLIENTINFO.

IWPRIV_PARAM_CONTEXT Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  void * data;
} IWPRIV_PARAM_CONTEXT;
```

Description

This is type IWPRIV_PARAM_CONTEXT.

IWPRIV_PARAM_DEVICEINFO Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  void * data;
} IWPRIV_PARAM_DEVICEINFO;
```

Description

This is type IWPRIV_PARAM_DEVICEINFO.

IWPRIV_SCAN_STATUS Enumeration

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef enum {
  IWPRIV_SCAN_SUCCESSFUL,
  IWPRIV_SCAN_IDLE,
  IWPRIV_SCAN_IN_PROGRESS,
  IWPRIV_SCAN_NO_AP_FOUND
} IWPRIV_SCAN_STATUS;
```

Description

This is type IWPRIV_SCAN_STATUS.

IWPRIV_SET_PARAM Union

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef union {
  IWPRIV_PARAM_SCAN scan;
  IWPRIV_PARAM_CONFIG config;
  IWPRIV_PARAM_SSID ssid;
  IWPRIV_PARAM_NETWORKTYPE netType;
  IWPRIV_PARAM_CONNECT conn;
  IWPRIV_PARAM_CONTEXT ctx;
  IWPRIV_PARAM_MULTICASTFILTER multicast;
  IWPRIV_PARAM_POWERSAVE powerSave;
} IWPRIV_SET_PARAM;
```

Description

This is type IWPRIV_SET_PARAM.

IWPRIV_PARAM_CONFIG Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  void * data;
} IWPRIV_PARAM_CONFIG;
```

Description

This is type IWPRIV_PARAM_CONFIG.

IWPRIV_PARAM_CONNECT Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  bool initConnAllowed;
  IWPRIV_CONN_STATUS status;
} IWPRIV_PARAM_CONNECT;
```

Description

This is type IWPRIV_PARAM_CONNECT.

IWPRIV_PARAM_DRIVERSTATUS Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  uint8_t initStatus;
} IWPRIV_PARAM_DRIVERSTATUS;
```

Description

This is type IWPRIV_PARAM_DRIVERSTATUS.

IWPRIV_PARAM_MULTICASTFILTER Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  uint8_t * addr;
  IWPRIV_STATUS status;
} IWPRIV_PARAM_MULTICASTFILTER;
```

Members

Members	Description
uint8_t * addr;	it usually points to a MAC address, which is an array of 6 uint8_t elements

Description

This is type IWPRIV_PARAM_MULTICASTFILTER.

IWPRIV_PARAM_NETWORKTYPE Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  uint8_t type;
} IWPRIV_PARAM_NETWORKTYPE;
```

Description

This is type IWPRIV_PARAM_NETWORKTYPE.

IWPRIV_PARAM_OPERATIONMODE Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  bool isServer;
} IWPRIV_PARAM_OPERATIONMODE;
```

Description

This is type IWPRIV_PARAM_OPERATIONMODE.

IWPRIV_PARAM_POWERSAVE Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  bool enabled;
} IWPRIV_PARAM_POWERSAVE;
```

Description

This is type IWPRIV_PARAM_POWERSAVE.

IWPRIV_PARAM_SCAN Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  void * data;
  bool prescanAllowed;
  bool prescanFinished;
  IWPRIV_SCAN_STATUS scanStatus;
  uint16_t numberOfResults;
  uint16_t index;
  IWPRIV_STATUS displayStatus;
  IWPRIV_STATUS saveStatus;
} IWPRIV_PARAM_SCAN;
```

Description

This is type IWPRIV_PARAM_SCAN.

IWPRIV_PARAM_SSID Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  uint8_t * ssid;
  uint8_t ssidLen;
} IWPRIV_PARAM_SSID;
```

Description

This is type IWPRIV_PARAM_SSID.

wdrv_mrf24wn_api.h

MRF24WN Interface Functions

Functions

	Name	Description
	WDRV_CLI_Init	Initializes the console CLI interface. **Implementation:** Dynamic
	WDRV_EXT_CmdChannelSet	Sets the channel on which to operate. **Implementation:** Dynamic
	WDRV_EXT_CmdConnect	Directs the MRF24WN to connect to a Wi-Fi network. **Implementation:** Dynamic
	WDRV_EXT_CmdConnectContextBssidGet	Gets the BSSID. **Implementation:** Dynamic
	WDRV_EXT_CmdConnectContextChannelGet	Gets the AP channel **Implementation:** Dynamic
	WDRV_EXT_CmdDisconnect	Directs the MRF24WN to disconnect from a Wi-Fi network. **Implementation:** Dynamic
	WDRV_EXT_CmdFWUpdate	Directs the module to start firmware download and upgrade. **Implementation:** Dynamic
	WDRV_EXT_CmdMacAddressGet	Retrieves the MRF24WN MAC address. **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeAPSet	Sets the Wi-Fi network type to SoftAP. **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeBSSSet	Sets the Wi-Fi network type to Infrastructure. **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeIBSSSet	Sets the Wi-Fi network type to Adhoc. **Implementation:** Dynamic
	WDRV_EXT_CmdPowerSaveGet	Retrieves current power save status. **Implementation:** Dynamic
	WDRV_EXT_CmdPowerSavePut	Puts the module in IEEE power save mode. **Implementation:** Dynamic

	WDRV_EXT_CmdRFTest	Performs RF test for regulatory test purposes. **Implementation:** Dynamic
	WDRV_EXT_CmdScanGet	Reads the number of scan results from the MRF24WN module. **Implementation:** Dynamic
	WDRV_EXT_CmdScanStart	Directs the MRF24WN module to start a scan. **Implementation:** Dynamic
	WDRV_EXT_CmdSecGet	Gets the current Wi-Fi security type. **Implementation:** Dynamic
	WDRV_EXT_CmdSecNoneSet	Sets Wi-Fi security to open (no security). **Implementation:** Dynamic
	WDRV_EXT_CmdSecWEPSet	Sets Wi-Fi security to use WEP. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWPA2Set	Sets Wi-Fi security to use WPA2. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWPASet	Sets Wi-Fi security to use WPA. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWpsSet	Sets Wi-Fi security to use WPS. **Implementation:** Dynamic
	WDRV_EXT_CmdSSIDGet	Gets the SSID. **Implementation:** Dynamic
	WDRV_EXT_CmdSSIDSet	Sets the SSID. **Implementation:** Dynamic
	WDRV_EXT_CmdTxPowerSet	Sets the TX Power. **Implementation:** Dynamic
	WDRV_EXT_DataSend	Sends data packets to MRF24WN module. **Implementation:** Dynamic
	WDRV_EXT_Deinitialize	Deinitializes the MRF24WN Wi-Fi driver. **Implementation:** Dynamic
	WDRV_EXT_HWInterruptHandler	Wi-Fi driver (MRF24WN-specific) interrupt service routine. **Implementation:** Dynamic
	WDRV_EXT_Initialize	Initializes the MRF24WN Wi-Fi driver. **Implementation:** Dynamic
	WDRV_EXT_Misc_Config	Configures miscellaneous parameters. **Implementation:** Dynamic
	WDRV_EXT_PowerUpDown	Powers the MRF24WN module up or down. **Implementation:** Dynamic
	WDRV_EXT_ScanDoneSet	Indicates when a scan has completed. **Implementation:** Dynamic
	WDRV_EXT_ScanIsInProgress	Check whether host scan is now in progress or not. **Implementation:** Dynamic
	WDRV_EXT_ScanResultGet	Reads the selected scan results back from the MRF24WN module. **Implementation:** Dynamic
	WDRV_EXT_WPSResultsRead	Reads the WPS process results back from the MRF24WN module and updates the configuration data. **Implementation:** Dynamic
	WDRV_GPIO_DeInit	Deinitializes the GPIO object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_GPIO_Init	Initializes the GPIO object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_GPIO_MRF24WG_Disable	Disables the MRF24WG module on Multimedia Expansion Board II (MEB II). **Implementation:** Dynamic
	WDRV_GPIO_OutHigh	Pulls GPIO high. **Implementation:** Dynamic
	WDRV_GPIO_OutLow	Pulls gpio low. **Implementation:** Dynamic
	WDRV_GPIO_PowerDown	Powers down the MRF24WN module. **Implementation:** Dynamic

	WDRV_GPIO_PowerUp	Powers on the MRF24WN module. **Implementation:** Dynamic
	WDRV_HibernateDisable	Wakes MRF24WN up from hibernate mode. **Implementation:** Dynamic
	WDRV_HibernateEnable	Hibernates MRF24WN module. **Implementation:** Dynamic
	WDRV_InHibernateMode	Checks if MRF24WN is in hibernate mode. **Implementation:** Dynamic
	WDRV_INTR_Deinit	Deinitializes interrupts for Wi-Fi driver. **Implementation:** Dynamic
	WDRV_INTR_Init	Initializes interrupts for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_INTR_SourceDisable	Disables interrupts from the module. **Implementation:** Dynamic
	WDRV_INTR_SourceEnable	Enables interrupts from the module. **Implementation:** Dynamic
	WDRV_MRF24WN_ISR	Wi-Fi driver (MRF24WN-specific) interrupt service routine. **Implementation:** Dynamic
	WDRV_SPI_Deinit	Deinitializes the SPI object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_SPI_In	Receives data from the module through the SPI bus. **Implementation:** Dynamic
	WDRV_SPI_Init	Initializes the SPI object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_SPI_Out	Sends data out to the module through the SPI bus. **Implementation:** Dynamic

Microchip Technology Inc.

wdrv_mrf24wn_iwpriv.h

Configure optional (private) parameters of MRF24WN driver.

Enumerations

	Name	Description
	IWPRIV_CMD	This is type IWPRIV_CMD.
	IWPRIV_CONN_STATUS	This is type IWPRIV_CONN_STATUS.
	IWPRIV_SCAN_STATUS	This is type IWPRIV_SCAN_STATUS.
	IWPRIV_STATUS	This is type IWPRIV_STATUS.

Functions

	Name	Description
	iwpriv_adhocctx_set	Sets the Ad-Hoc network context information. **Implementation:** Dynamic
	iwpriv_config_read	Reads the Wi-Fi context configuration. **Implementation:** Dynamic
	iwpriv_config_write	Writes to the Wi-Fi context configuration which is currently used by Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_connstatus_get	Gets the Wi-Fi connection status. **Implementation:** Dynamic

	iwpriv_devinfo_get	Gets the device information. **Implementation:** Dynamic
	iwpriv_execute	This is function iwpriv_execute.
	iwpriv_get	This is function iwpriv_get.
	iwpriv_initialconn_set	Sets the initial connection status of Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_initstatus_get	Gets the initialization status of Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_is_servermode	Checks if the passed Wi-Fi context configuration is operating in server mode. **Implementation:** Dynamic
	iwpriv_leftclient_get	Gets the left client's information. **Implementation:** Dynamic
	iwpriv_mcastfilter_set	Adds a MAC address to the multi-cast filter. **Implementation:** Dynamic
	iwpriv_nettype_get	Gets the current network type. **Implementation:** Dynamic
	iwpriv_nettype_set	Sets the current network type. **Implementation:** Dynamic
	iwpriv_numberofscanresults_get	Gets the number of scan results. **Implementation:** Dynamic
	iwpriv_powersave_config	Enables or disables Power Save mode in Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_prescan_isfinished	Checks if the prescan is complete. **Implementation:** Dynamic
	iwpriv_prescan_option_get	To see if prescan will run before next connection. **Implementation:** Dynamic
	iwpriv_prescan_option_set	To run prescan or not. **Implementation:** Dynamic
	iwpriv_prescan_start	Starts prescan. **Implementation:** Dynamic
	iwpriv_scan_start	Starts scan. **Implementation:** Dynamic
	iwpriv_scanresult_get	Gets one scan result. **Implementation:** Dynamic
	iwpriv_scanresults_display	Outputs all of the scan results. **Implementation:** Dynamic
	iwpriv_scanresults_save	Saves all of the scan results. **Implementation:** Dynamic
	iwpriv_scanstatus_get	Gets the prescan status. **Implementation:** Dynamic
	iwpriv_set	This is function iwpriv_set.
	iwpriv_ssid_get	Gets the current SSID. **Implementation:** Dynamic
	iwpriv_ssid_set	Sets the current SSID. **Implementation:** Dynamic

Structures

	Name	Description
	IWPRIV_PARAM_CLIENTINFO	This is type IWPRIV_PARAM_CLIENTINFO.
	IWPRIV_PARAM_CONFIG	This is type IWPRIV_PARAM_CONFIG.
	IWPRIV_PARAM_CONNECT	This is type IWPRIV_PARAM_CONNECT.
	IWPRIV_PARAM_CONTEXT	This is type IWPRIV_PARAM_CONTEXT.
	IWPRIV_PARAM_DEVICEINFO	This is type IWPRIV_PARAM_DEVICEINFO.
	IWPRIV_PARAM_DRIVERSTATUS	This is type IWPRIV_PARAM_DRIVERSTATUS.
	IWPRIV_PARAM_MULTICASTFILTER	This is type IWPRIV_PARAM_MULTICASTFILTER.
	IWPRIV_PARAM_NETWORKTYPE	This is type IWPRIV_PARAM_NETWORKTYPE.
	IWPRIV_PARAM_OPERATIONMODE	This is type IWPRIV_PARAM_OPERATIONMODE.

	IWPRIV_PARAM_POWERSAVE	This is type IWPRIV_PARAM_POWERSAVE.
	IWPRIV_PARAM_SCAN	This is type IWPRIV_PARAM_SCAN.
	IWPRIV_PARAM_SSID	This is type IWPRIV_PARAM_SSID.

Unions

	Name	Description
	IWPRIV_EXECUTE_PARAM	This is type IWPRIV_EXECUTE_PARAM.
	IWPRIV_GET_PARAM	This is type IWPRIV_GET_PARAM.
	IWPRIV_SET_PARAM	This is type IWPRIV_SET_PARAM.

Description

MRF24WN Private Configuration Support

Functions in this module support the connection process for the MRF24WN.

File Name

wdrv_mrf24wn_iwpriv.h

Company

Microchip Technology Inc.

Graphics Libraries Help

This section provides information on the Graphics Libraries that are available in MPLAB Harmony.

MPLAB Harmony Graphics Library

This section provides information on the MPLAB Harmony Graphics Library.

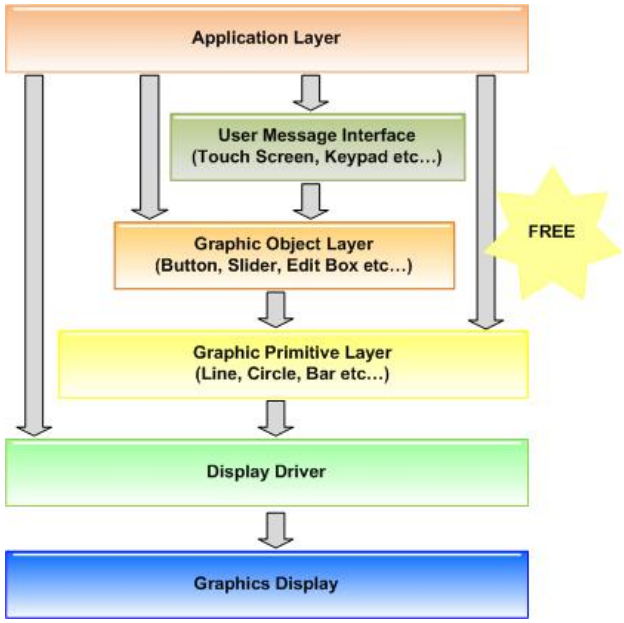
Introduction

This topic provides an overview of the Graphics Library.

Description

The Graphics Library is a free, modular library optimized for Microchip microcontrollers. The library structure is shown in the following figure.

Graphics Library Architecture



- Application Layer - This is the program that utilizes the Graphics Library
- User Message Interface - This is a layer that should be implemented by the user to provide messages for the library
- Graphics Object Layer - This layer renders the control objects such as button, list box, progress bar, meter, and so on
- Graphics Primitives Layer - This layer implements the primitive rendering functions
- Device Display Driver - This layer is the graphics display driver component that is optimized to the actual display module used
- Graphics Display Module - This is the actual display module

The library includes features such as alpha blending, gradient fills, and anti-aliased fonts. These features can be enabled or disabled through build configurations. Applications can take advantage of these features to enhance the user experience while delivering performance required by the application.

Graphics Library Porting Guide

This topic provides porting information for the Graphics Library.

Introduction

This section provides information for porting from the Microchip Library of Applications (MLA) version of the Graphics Library to the Graphics Library within MPLAB Harmony.

Upgrading from the MLA Graphics Library to the MPLAB Harmony Graphics Library

The MPLAB Harmony Graphics Library is a completely new distribution, which is included as part of the MPLAB Harmony installation. No files need to be maintained from an existing MLA Graphics Library installation.

MPLAB Harmony Graphics Library Key Features

This topic provides a description of the key features of the MPLAB Harmony Graphics Library.

Description

Note: The MPLAB Harmony Graphics Library *does not* support any Microchip 16-bit family devices.

The following are the key features of the MPLAB Harmony Graphics Library:

- Multiple instances
- Fully dynamic:
- Stack initialization/deinitialization
- Resource management
- Configurable
- Improved modularity and stack layout
- Interrupt driven operation
- RTOS friendly, with easy RTOS integration

MPLAB Harmony Graphics Library Structure

This topic describes the structure of the MPLAB Harmony Graphics Library.

Description

The MPLAB Harmony Graphics Library consists of a graphic widget and primitive library, a display layer, a graphics driver, and demonstration applications, all of which support the following structure:

- Lowercase file names
- Underscores are used
- System services are used instead of direct access to peripherals
- Interrupts
- Drivers
- Timer Services
- File System
- Board Support Package (BSP)

By default, the Graphics Library and its corresponding display drivers, Board Support Package (BSP) and demonstration applications are placed into the following locations during installation of MPLAB Harmony:

- `/microchip/harmony/<version>/framework/gfx`
- `/microchip/harmony/<version>/framework/driver/gfx`
- `/microchip/harmony/<version>/apps/gfx`

MPLAB Harmony Graphics Library Design

This topic discusses the design of the MPLAB Harmony Graphics Library.

Description

The MPLAB Harmony Graphics Library is designed as a part of a system running other applications, middleware, etc. Therefore, it makes use of the system services that are available to other modules in the system or to the application, such as:

- File System
- System Interrupts
- System Driver Services
- System Timers
- System Device Drivers
- System Command Processor
- System Console
- System Debug Services
- Header files located in `./framework/gfx/src/system` that expose the system-wide available API

MPLAB Harmony Graphics Library API Changes

This topic discusses the reasons behind the API changes to the MPLAB Harmony Graphics Library.

Description

The API is backward compatible in functionality only. All function names and type definitions have changed to reflect the MPLAB Harmony philosophy.

The changes in the library API have been minimized so that the porting process is straightforward and integration with other dependents is made simple. New functionality has been added because of new features, such as dynamic configuration and non-block of the library. Other than these new features, the changes to the API were also made to support commonality between the MPLAB Harmony Graphics Library and the 16-bit Graphics Library.

The API changes are at all layers of the Graphics Library which include the GOL, Primitive, and Driver layers.

MPLAB Harmony Graphics Library Access Changes

This topic describes the stack access updates that were made to the MPLAB Harmony Graphics Library.

Description

The Graphics Library provides the `gfx.h` and `gfx.c` file as the central interface to the library.

The Graphics Library can provide mutually exclusive access to multiple clients. Each client calls the GFX_Initialize function using a client index and appropriate initialization parameters.

The GFX_Initialize function should be called before using the Graphics Object Layer and Primitive Layer.

The Graphics Library no longer initializes the display driver, but requires the application to initialize the driver before calling any Graphics Library functions. For example: GFX_DRV_lcc_Initialize

Note: Direct access to the Graphics Driver rendering functions *is not* supported.

Graphic Primitive Layer Changes

This topic discusses the changes made to the MLA Graphics Library `primitive.h` file to produce the equivalent MPLAB Harmony Graphics Library `gfx_primitive.h` file.

Description

Changes

The changes are as follows:

- *Prefix:*
- `GFX_` is the generic prefix for functions
- `gfx_` is the generic prefix for primitive level files
- Multi-instance support - all re-entrant functions require a client instance index to be passed in as a parameter

Graphic Object Layer (GOL) Changes

This topic discusses the changes made to the MLA Graphics Library `GOL.h` file to produce the equivalent MPLAB Harmony Graphics Library `gfx_gol.h` file.

Description

Changes

The changes are as follows.

- *Prefix:*
- `GFX_GOL_` is the generic prefix for all Graphic Object Level functions
- `gfx_gol_` is the generic prefix for all Graphic Object Level files
- Pre-emption Level support - a three-level self preemption configuration has been added for time-critical rendering
- Multi-instance support - all re-entrant functions require a client instance index to be passed in as a parameter

Graphic Display Driver Layer Changes

This topic discusses the changes made to the `DisplayDriver.h` file.

This topic discusses the changes made to the MLA Graphics Library `DisplayDriver.h` file to produce the equivalent MPLAB Harmony Graphics Library `drv_gfx_display.h` file.

Description

Changes

The changes are as follows:

- *Prefix:*
- `DRV_GFX` is the generic prefix for all Graphics Driver level functions
- `drv_gfx` is the generic prefix for all Graphics Driver level files
- *Common API Interface* – This interface establishes the basic set of driver functions and parameters required by the Graphics Primitive Layer to display graphics content on a Liquid Crystal Display. It also lists the initialization and deinitialization functions and parameters required by the application to establish a driver.

MPLAB Harmony Graphics Library Initialization Changes

This topic describes the initialization updates to the MPLAB Harmony Graphics Library.

Description

The Graphics Library include header files, `gfx_gol.h` and `gfx_primitive.h`, have been updated as follows.

To initialize the library the call is now: `GFX_Initialize`

The default Graphics Library configuration is provided with the library distribution and consists of selecting **Graphics Library** through the MHC Options tab.

New MPLAB Harmony Graphics Library API Functions

This topic describes some of the important new API functions in the MPLAB Harmony Graphics Library.

Description

There are many new functions available that have been introduced to support the MPLAB Harmony philosophy. However, there is no concern for the porting process regarding the new API calls as the previous library implementation did not support this kind of service.

Existing applications will not port without using the new APIs:

- Initialization
- Steady State

MPLAB Harmony Graphics Library Utilities

This topic describes the MPLAB Harmony Graphics Library utilities.

Description

The MPLAB Harmony Graphics Library includes the following utilities:

- Graphics Display Designer X (GDDX) - This utility can be used for designing and building graphical user interfaces (GUIs) from graphics objects
- Graphics Resource Converter (GRC) - This utility can be used for converting data into logically deployable entities that can be used in a graphics application

Porting Applications from the MLA Graphics Library to the MPLAB Harmony Graphics Library

Porting an application from the MLA Graphics Library into the Graphics Library within MPLAB Harmony consists of updating existing Graphics Library function names in your application to the new MPLAB Harmony function names.

MPLAB Harmony Graphics Library File Name Compliance

This topic provides header file name mapping tables that show the MLA Graphics Library file name and the compliant name within the MPLAB Harmony Graphics Library.

Description

The replacement names chosen to make existing Graphics Library functions compliant with MPLAB Harmony are shown in individual tables per header file name.

The files listed in the tables are located in the following two MPLAB Harmony installation folders:

`.\harmony\<version>\framework\gfx`

`.\harmony\<version>\framework\gfx\src`

The following table shows the original and new names used. Note that other than name changes, no other modifications were made to the middleware functions.

MLA Graphics Library File Name	MPLAB Harmony Graphics Library File Name
AnalogClock.h	gfx_gol_analog_clock.h
Button.h	gfx_gol_button.h
Chart.h	gfx_gol_chart.h
CheckBox.h	gfx_gol_check_box.h
DigitalMeter.h	gfx_gol_digital_meter.h
EditBox.h	gfx_gol_edit_box.h
GOL.h	gfx_gol.h
Graphics.h	gfx.h
Grid.h	gfx_gol_grid.h (not supported in this release)
GroupBox.h	gfx_gol_group_box.h
ListBox.h	gfx_gol_list_box.h
Meter.h	gfx_gol_meter.h
Palette.h	gfx_palette.h
Picture.h	gfx_gol_picture.h
Primitive.h	gfx_primitive.h
ProgressBar.h	gfx_gol_progress_bar.h
Radiobutton.h	gfx_gol_radio_button.h
RoundDial.h	gfx_gol_round_dial.h
Slider.h	gfx_gol_scroll_bar.h
StaticText.h	gfx_gol_static_text.h
TextEntry.h	gfx_gol_text_entry.h
Transitions.h	gfx_transitions.h
Window.h	gfx_gol_window.h

MPLAB Harmony Graphics Library Function Name Compliance

This topic provides header file function mapping tables that show the MLA Graphics Library function name and the compliant name within the MPLAB Harmony Graphics Library.

Description

The replacement function names chosen to make the existing MLA Graphics Library function compliant with MPLAB Harmony are shown in individual tables per header file name.

The files listed in the tables are located in the following MPLAB Harmony installation folder: `./harmony/<version>/framework/gfx`.

Header File: `gfx_display_driver.h`

MLA Graphics Library Function Name	MPLAB Harmony Graphics Library Function Name
InitGraph()	GFX_PixelsPut()
PutPixel	GFX_BarFill()
GetPixel()	GFX_PixelArrayPut()
SetColor()	GFX_PixelArrayGet()

WndTranslateMsg()	GFX_GOL_WindowActionGet()

Using the Library

This topic describes the architecture of the Graphics Library and the components in the Primitive and Object Layers. Information on how to use the

Primitive Layer and Object Layer is also provided.

Description

The Graphics Library is composed of the following layers:

- Application Layer - This is the program that utilizes the Graphics Library
- User Message Interface - This is a layer should be implemented by user to provide messages for the library
- Graphics Object Layer - This layer renders the control objects such as button, list box, progress bar, meter and so on
- Graphics Primitives Layer - This layer implements the primitive rendering functions
- Device Display Driver - This layer is the graphics display driver component that is optimized to the actual display module used
- Graphics Display Module - This is the actual display module

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Graphics Library.

Library Interface Section	Description
Graphics Primitive Layer Functions	Functions for managing the Primitive Layer of the Graphics Library
Graphics Object Layer Functions	Functions for managing the Object Layer of the Graphics Library
Graphics Functions	Graphics Library configuration functions.

Graphics Objects

This section describes the basics of the Graphics Object Layer.

Description

The Graphics Object Layer is composed of objects that can act as control widgets in an application. There are several predefined objects in the library. Users are not limited to these predefined objects. It is possible to create custom objects. Creating custom objects will require a deeper understanding of the library's architecture. Creating custom objects is described in the Microchip application note, AN1136 *"How to Use Widgets in Microchip Graphics Library*" (DS01136).

Each object will have its own create function. In the create function the following functions are initialized:

- DRAW_FUNC - This is the function that renders the object on the screen
- FREE_FUNC - This is the function that frees the memory used by the object when the object is removed from memory
- ACTIONGET_FUNC - This optional function returns the a translated action of the object. A translated action is actually a planned action that indicates the intended change in the state of the object. The translated action is basically the response of the object to the user interaction on the object. For example, when a user presses on a button object on a screen, a valid planned action of the object is to change its state to a pressed state. Translated actions are specific to each object. See the GFX_GOL_TRANSLATED_ACTION enumeration for the listing of all translated actions of all objects in the library. This list does not include user-defined actions. Translated actions are determined using the messaging scheme of the library. Messaging is discussed in a separate section of this documentation. When this function is not defined, the create function of the object must set the function pointer to NULL.
- ACTIONSET_FUNC - This optional function performs the translated action returned by the ACTIONGET_FUNC. This is the actual function that changes the state of the object. When this function is not defined, the create function of the object must set the function pointer to NULL.

Each of these functions are implemented in each object. The draw function of the object is specific to the object. The draw function should not be called directly by the application. Instead, applications should use the GFX_GOL_ObjectListDraw function so that the management of the object rendering will be done by the Graphics Object Layer.

Object Layer Rendering

This section describes how objects are rendered.

Description

Object List Rendering

Initially, an application will create the objects that it will use by calling the create function of the objects. As the objects are created, a linked list of objects is also created. This linked list of objects is the list that the library will use to manage the rendering of the objects. The application will only need to call the GFX_GOL_ObjectListDraw function to execute the rendering of all the objects. It is also through this list that the library is able to parse all the objects to determine if an object is affected by the user action. This is discussed in the Object Layer Messaging section.

Each object, has a state variable that is composed of state bits. There are two main groups in the state bits:

- Property State bits - define the general shape of the object
- Draw State bits - determine if the object will be redrawn. The redrawing can be a full object redraw or partial object redraw. Depending on the

object, definition, a partial redraw means that only portion of the object is redrawn. This makes the redraw of the object fast and efficient. For example, redrawing the full progress bar object will be longer than just updating the level of the progress bar.

The Property State bits are usually defined once at the object creation. Conversely, the Draw State bits, dynamically change and usually change because of user action on the object. These user actions are encoded as messages. The messages are created in user interface drivers such as touch screen or key pads on the system (see the Object Layer Messaging section for details).

The objects in the library implements the rendering sequence using rendering state machine. The rendering state is not to be confused with the Draw State Bits of the objects. Rendering states are defined in each object's rendering function. An object is basically drawn using combination of primitive calls. Bars, lines, and text can be drawn to represent an object. The purpose of these rendering states is to divide the primitive calls into steps. By doing this, each primitive call is now a step in the process. If one of the primitive call cannot proceed due to busy hardware resource, the object's rendering sequence can be paused. Since, the length of the delay in the rendering cannot be predicted, it is best to pause the rendering of the object and give back control of the CPU to application. Each of the object's rendering function coupled with GFX_GOL_ObjectListDraw, has this capability. This effectively pauses the rendering of the object.

For the rendering to continue, GFX_GOL_ObjectListDraw is called again by the application. When this is called, the specific object rendering function that was called is then resumed and in the object rendering function, the specific step (or primitive call) is executed again. This basically continues the rendering exactly where it left off.

Object Draw Callback Feature

To an allow application to control the rendering of the objects, a callback function is provided (see GFX_GOL_DRAW_CALLBACK_FUNC). The callback function is an application implemented function. The library provides the GFX_GOL_DrawCallbackSet(GFX_GOL_DRAW_CALLBACK_FUNC) API to set the callback function. GFX_GOL_DRAW_CALLBACK_FUNC parameter in this function is the pointer to the defined callback.

The callback allows the application to insert application defined rendering.

For example, a digital signal is sampled on a pin. The value of the signal determines if a scroll bar will increment or decrement its value. To implement the change in the value of a scroll bar, a callback function can be implemented to do that.

```
void App_Tasks()
{
   switch(appData.state)
    {
        case APP_STATE_GFX_READY:
            if ( GFX_Status (gfxObject) == SYS_STATUS_READY )
                appData.state = APP_STATE_GFX_INIT;

            break;

        case APP_STATE_GFX_INIT:

            GFX_GOL_MessageCallbackSet(GFX_INDEX_0, &GFX_GOL_MessageCallback);
            GFX_GOL_DrawCallbackSet(GFX_INDEX_0, &GFX_GOL_DrawCallback);

            appData.state = APP_STATE_RUNNING;
            break;
    }
}

//*****************************************************************
// The draw callback is called within GFX_GOL_ObjectListDraw()
//*****************************************************************
bool APP_ObjectDrawCallback(void)
{
// assume pScrollBar is pointer to the scroll bar
bool signalAssert;
// assume signal is sampled at a pin RC1
if (PORTCbits.RC1 == 1)
signalAssert = true;
else
signalAssert - false;
if (signalAssert == true)
{
// increment the value
GFX_GOL_ScrollBarPositionIncrement(pScrollBar);
}
else
{
// increment the value
GFX_GOL_ScrollBarPositionDecrement(pScrollBar);
}
// redraw only the thumb
GFX_GOL_ObjectStateSet(pScrollBar, GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE);
```

```
return (true);
}
```

Since the callback is called in GFX_GOL_ObjectListDraw and GFX_GOL_ObjectListDraw is called in the main loop, the callback can potentially be executed unnecessarily if the sampled signal frequency of change is slow. To counter that, the callback can be modified to be sampling the signal after some predefined time delay.

```
//*****************************************************************
// The draw callback is called within GFX_GOL_ObjectListDraw()
//*****************************************************************
bool APP_ObjectDrawCallback(void)
{
// assume pScrollBar is pointer to the scrollbar
// assume tick is a system counter, DEFINED_DELAY is
// a predefined delay tuned to the signal frequency
bool signalAssert;
static uint32_t prevtick = 0;
if (tick - prevtick > DEFINED_DELAY)
{
prevtick = tick;
// assume signal is sampled at a pin RC1
if (PORTCbits.RC1 == 1)
signalAssert = true;
else
signalAssert - false;
if (signalAssert == true)
{
// increment the value
GFX_GOL_ScrollBarPositionIncrement(pScrollBar);
}
else
{
// increment the value
GFX_GOL_ScrollBarPositionDecrement(pScrollBar);
}
// redraw only the thumb
GFX_GOL_ObjectStateSet(pScrollBar, GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE);
}
return (true);
```

Object Layer Messaging

This section describes the basics of object messages.

Description

User inputs can also change the state of objects. This is done through messaging. The library passes user action to the objects using the message structure (see GFX_GOL_MESSAGE). The purpose of the messaging is to translate user action (i.e., a user press on a touch screen) to a change in state of the objects in the screen. At the same time, this user action will cause an application function to execute.

For example, a press on a button on the screen will result in an LED being turned on. While pressing on the button, the button on the screen also changes states and is redrawn to a pressed state. When the user releases the button, the button redraws back to an unpressed state and the LED turns off.

The mechanism of messaging and object state change is explained in the next section.

Messaging Structure

The messages are encoded in the GFX_GOL_MESSAGE structure.

```
    typedef struct
    {
        uint8_t type;           // Specifies the type of input device.
        uint8_t uiEvent;        // An event that occurred in the input device.
        int16_t param1;         // Parameter 1, definition and usage is
                                // dependent on the type of input device.
        int16_t param2;         // Parameter 2, definition and usage is
                                // dependent on the type of input device.
    } GFX_GOL_MESSAGE;
```

The type defines the type of input device. See INPUT_DEVICE_TYPE for the currently supported type of devices. The uiEvent is also a set of predefined events. See INPUT_DEVICE_EVENT for a list of supported events. The two parameters, param1 and param2, change in usage depending on the type of input device and event.

The messages are encoded in the drivers for the input devices. The drivers provide functions for the application to call. These functions should

return the message whenever there is a valid user action on the input device.

The following code example shows TouchGetMsg as the function provided by the touch screen driver to retrieve user inputs on the touchscreen.

```
    // GOL message structure
    GFX_GOL_MESSAGE msg;

    ...
    // set the message callback function pointer
    GFX_GOL_MessageCallbackSet(APP_ObjectMessageCallback);
    ...

    uint16_t nQSizes[] = SYS_MSG_BUFFER_SIZES;

    sSysMsgInit.nQSizes = nQSizes;
    hSysMsg = SYS_MSG_Initialize(iSysMsg,(SYS_OBJ_HANDLE)&sSysMsgInit);
    hMsgType = SYS_MSG_TypeCreate(iSysMsg, TYPE_TOUCHSCREEN , 0);
    hMailbox = SYS_MSB_MailboxOpen( iSysMsg, (SYS_MSG_RECEIVE_CALLBACK)&TouchMessageCallback );
    SYS_MSG_MailboxMsgAdd(hMailbox, hMsgType);

void TouchMessageCallback(SYS_MSG_OBJECT *pMsg)
{
    static GFX_GOL_MESSAGE gMsg;

    gMsg.type = pMsg->nMessageTypeID;
    gMsg.uiEvent = pMsg->param0;
    gMsg.param1 = pMsg->param1;
    gMsg.param2 = pMsg->param2;

    GFX_GOL_ObjectMessage(GFX_INDEX_0, &gMsg);
}
```

Graphics Object Message Function

After the input device driver encodes the message, the message is sent by the application to the Graphics Library through the GFX_GOL_ObjectMessage. This function parses the active list of objects and determines if the message affects one or more of the objects. The mechanism to check each object is simple: the GFX_GOL_ObjectMessage calls each of the object's ACTIONGET_FUNC. The ACTIONGET_FUNC of an object is the function that determines if the message affects the object. This function returns a translated action (see the GFX_GOL_TRANSLATED_ACTION enumeration).

If the object is not affected it replies with GFX_GOL_OBJECT_ACTION_INVALID. If the object is affected, it replies with the appropriate translated action.

Object Message Callback Feature

If the object is affected, GFX_GOL_ObjectMessage() then calls the message callback function. The message callback function is an application defined function. This is set initially using the GFX_GOL_MessageCallbackSet(GFX_GOL_MESSAGE_CALLBACK_FUNC) call where GFX_GOL_MESSAGE_CALLBACK_FUNC is a pointer to the defined callback function.

The message callback is an opportunity for the application to respond to user inputs. It is also an opportunity to block the library from performing default state change to objects. See the callback function documentation for details.

The message callback returns true if the application wants to perform the default action set of the objects. If the callback returns false, the application assumes all changes in the states of the object.

After the callback is executed, with a return value of true, the ACTIONSET_FUNC of the affected object is called by GFX_GOL_ObjectMessage. This function performs the state change of the object due to the user input. The object is then redrawn when GFX_GOL_ObjectListDraw is called by the application.

The following code example demonstrates usage of the message callback function. A scroll bar is incremented and decremented by two buttons.

```
//*****************************************************************
// The message callback is called within GFX_GOL_ObjectMessage()
//*****************************************************************

// assume that two buttons and a scroll bar are present in the system
bool APP_MsgCallback(
            uint16_t objMsg,
            GFX_GOL_OBJ_HEADER *pObj,
            GFX_GOL_MESSAGE *pMsg)
{
    uint16_t objectID;
    GFX_GOL_SCROLLBAR *pScrollBar;
    objectID = GFX_GOL_ObjectIDGet(pObj);
    if(objectID == ID_BTN1)
    {
```

```
            // check if button is pressed
            if(objMsg == GFX_GOL_BUTTON_ACTION_PRESSED)
            {
                // find slider pointer
                pScrollBar = (GFX_GOL_SCROLLBAR *)GFX_GOL_ObjectFind(ID_SLD1);
                // decrement the slider position
                GFX_GOL_ScrollBarPositionDecrement(pScrollBar);
                // redraw only the thumb
                GFX_GOL_ObjectStateSet(pScrollBar, GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE);
            }
        }
        if(objectID == ID_BTN2)
        {
            if(objMsg == GFX_GOL_BUTTON_ACTION_PRESSED)
            {
                // find slider pointer
                pScrollBar = (GFX_GOL_SCROLLBAR *)GFX_GOL_ObjectFind(ID_SLD1);
                // increment the slider position
                GFX_GOL_ScrollBarPositionIncrement(pScrollBar);
                // redraw only the thumb
                GFX_GOL_ObjectStateSet(pScrollBar, GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE);
            }
        }
        return (true);
    }
```

Notice that the callback does not check if the scroll bar was affected by the message. Since the callback returns true, the scroll bar ACTIONSET_FUNC will be the one that will perform the state change of the scroll bar if the user directly interacted with the scroll bar.

Graphics Object Action Get and Action Set Functions

Each object has a predefined translated actions (see the GFX_GOL_TRANSLATED_ACTION enumeration). These actions are returned by the object's ACTIONGET_FUNC. The ACTIONGET_FUNC is called by the GFX_GOL_ObjectMessage function.

ACTIONGET_FUNC evaluates the message to determine if the user action affected the object. If the object is affected, it replies with one of the predefined translated action of the object.

For a button object the following translated actions are returned when the button is affected:

- GFX_GOL_BUTTON_ACTION_PRESSED - button is pressed
- GFX_GOL_BUTTON_ACTION_STILLPRESSED - button is continuously pressed
- GFX_GOL_BUTTON_ACTION_RELEASED - button is released
- GFX_GOL_BUTTON_ACTION_CANCELPRESS - button press canceled

When the button is not affected it returns:

- GFX_GOL_OBJECT_ACTION_INVALID - invalid message response

All objects returns GFX_GOL_OBJECT_ACTION_INVALID when they are not affected by the message.

the ACTIONSET_FUNC on the other hand performs the actual state change of the object. The draw state bits of the object are modified to indicate that the object will be redrawn in the next call to the GFX_GOL_ObjectListDraw.

How the Library Works

This section describes how the Graphics Library works and how the Primitive and Object layers are used.

Using the Primitive Layer

This section contains information on how to use the Primitive Layer of the Graphics Library.

Line Rendering

This section describes how to render lines.

Description

When rendering lines, two things need to be set:

- Set the color (GFX_ColorSet)
- Set the line style (GFX_LineStyleSet)

After the color and style is set, GFX_LineDraw can be called to render the line. GFX_LineDraw can be called multiple times to render lines that have the same color and line style. GFX_ColorSet and GFX_LineStyleSet will only be called when the color or the line style needs to be changed. For example, when one of the lines to be rendered has to change color, the GFX_ColorSet function must be called to change the

color.

Note: Alpha blended lines as well as anti-aliased lines are not yet supported.

Polygon Rendering

This section describes how to render polygons.

Unfilled Polygon Rendering

This section describes how to render unfilled polygons.

Description

Unfilled polygons are rectangles and rounded rectangles. Circles is a special case of a rounded rectangle. Rendering unfilled polygons uses the line styles.

Similar to rendering lines, two things need to be set and one action performed:

- Set the color (GFX_ColorSet)
- Set the line style (GFX_LineStyleSet)
- Call the specific polygon function

Filled Polygon Rendering

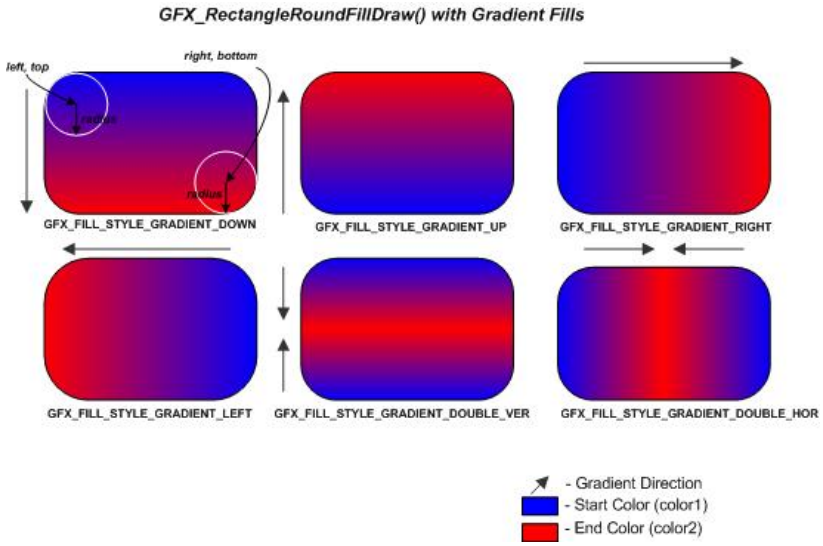
This section describes how to render filled polygons.

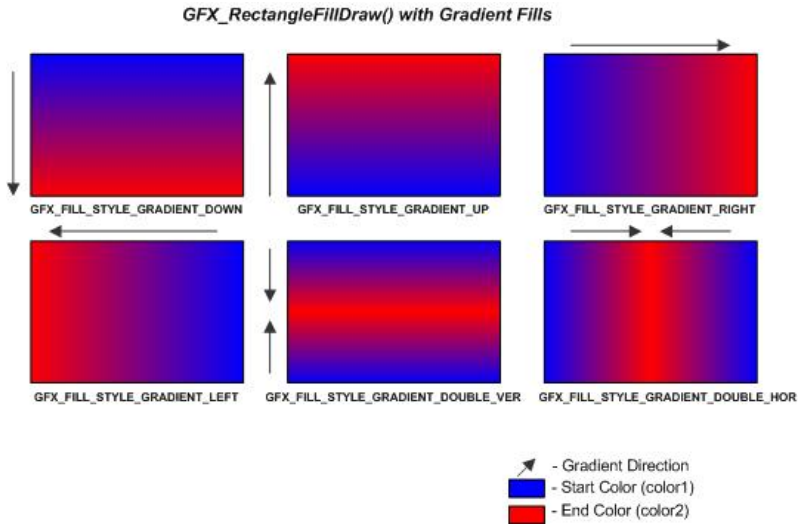
Description

Filled polygons are filled rectangles and filled rounded rectangles. Bar is a special case of a filled rectangle and filled circle is a special case of a filled rounded rectangle.

For filled polygons, the fill styles can be set:

Fill Style	Description
GFX_FILL_STYLE_NONE	The fill will be set to no color.
GFX_FILL_STYLE_ALPHA_COLOR	Sets that the fill style is alpha blended. The alpha blending effect will be dependent on the background type set (see GFX_BackgroundTypeSet). The level of alpha blending will depend on the last GFX_AlphaBlendingValueSet call.
GFX_FILL_STYLE_GRADIENT_DOWN	The effect is a gradient fill in the vertical down direction.
GFX_FILL_STYLE_GRADIENT_UP	The effect is a gradient fill in the vertical up direction.
GFX_FILL_STYLE_GRADIENT_RIGHT	The effect is a gradient fill in the horizontal right direction.
GFX_FILL_STYLE_GRADIENT_LEFT	The effect is a gradient fill in the horizontal left direction.
GFX_FILL_STYLE_GRADIENT_DOUBLE_VER	The effect is a gradient fill in the vertical direction but with two transitions.
GFX_FILL_STYLE_GRADIENT_DOUBLE_HOR	The effect is a gradient fill in the horizontal direction but with two transitions.





To render alpha blended filled polygons:

1. Set the color (GFX_ColorSet).
2. Set the background type (GFX_BackgroundTypeSet).
3. Set the alpha blending value (GFX_AlphaBlendingValueSet).
4. Set the fill style to alpha blending (GFX_FillStyleSet).
5. Call the specific polygon fill function:

- GFX_RectangleFillDraw
- GFX_RectangleRoundFillDraw
- GFX_BarDraw
- GFX_CircleFillDraw

To render gradient filled polygons:

1. Set the color (GFX_ColorSet).
2. Set the two gradient start and end colors (GFX_GradientColorSet).
3. Set the fill style to one of the gradient fill types (GFX_FillStyleSet).
4. Call the specific polygon fill function:

- GFX_RectangleFillDraw
- GFX_RectangleRoundFillDraw
- GFX_BarDraw
- GFX_CircleFillDraw

The following functions renders the same shapes:

- GFX_RectangleRoundDraw(x, y, x, y, radius) is equivalent to GFX_CircleDraw(x, y, radius).
- GFX_RectangleRoundFillDraw(x, y, x, y, radius) is equivalent to GFX_CircleFillDraw(x, y, radius).
- GFX_RectangleFillDraw(x1, y1, x2, y2) is equivalent to GFX_BarDraw(x1, y1, x2, y2).

Notes:

1. Alpha blended unfilled polygons are not yet supported.
2. Anti-aliased unfilled polygons are not yet supported.
3. Alpha blended, gradient fills are not yet supported.
4. Background is not needed when using gradient fills.

Text Rendering and Font Features

This section describes how to render text and strings and other features that are available for font resources.

Text Rendering

This section describes how to render text and strings.

Description

Text rendering in the Graphics Library requires a font table. The font table is considered one of the resources that is used in the library (see GFX_RESOURCE_FONT of the GFX_RESOURCE_HDR structure).

Once the font resource is available, text rendering can be performed by one of the following functions:

- GFX_TextCharDraw - Use to render a single character
- GFX_TextStringDraw - Use to render a string of characters
- GFX_TextStringBoxDraw - Use to render formatted string of characters

Character Rendering

To render a character:

1. Set the color (GFX_ColorSet).
2. Set the font resource to use (GFX_FontSet).
3. Set the location where the character will be rendered (GFX_TextCursorPositionSet).
4. Render the character (GFX_TextCharDraw).

String Rendering

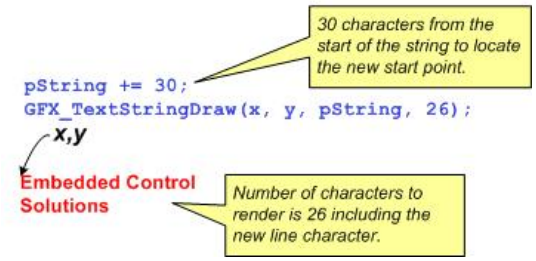
To render a string:

1. Set the color (GFX_ColorSet).
2. Set the font resource to use (GFX_FontSet).
3. Render the string (GFX_TextStringDraw).

GFX_TextStringDraw parameters sets the location where the string will be rendered. The length parameter allows versatility in rendering. When this parameter is set to '0', the rendering will terminate when the string terminator is encountered. When the length is non-zero, the rendering can be performed with the length as the terminating condition. This allows applications to render a portion of a longer string.

```
GFX_XCHAR Text[] =
"Microchip Technology Inc.
The Embedded Control
Solutions Company";
GFX_XCHAR *pString = Text;

GFX_TextStringDraw(x, y, pString, 0);
```



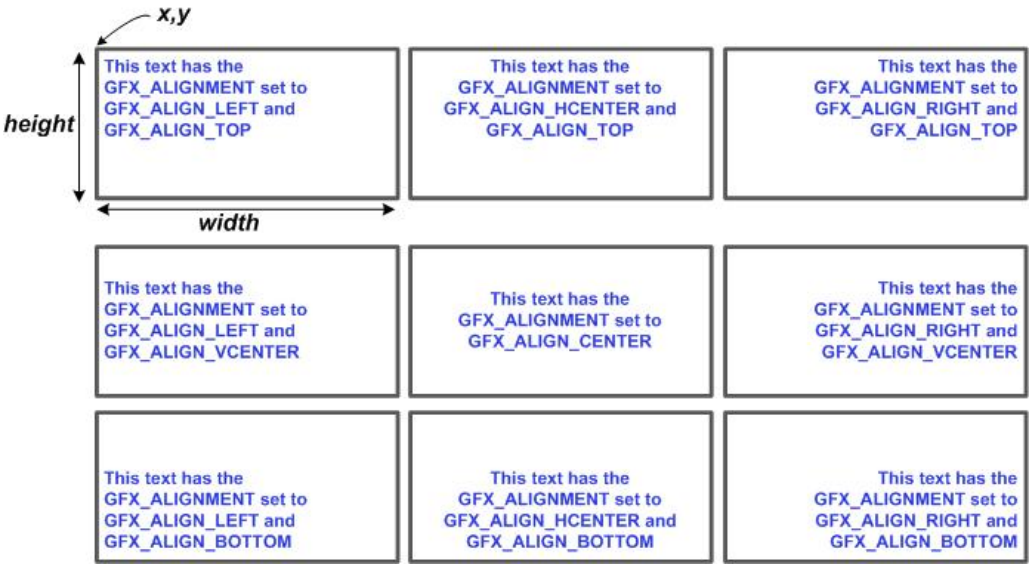
Multiple lines of strings are also supported. The string can contain the new line characters and rendering results in multiple lines of text. The use GFX_TextStringDraw will always render strings left aligned. To render text with alignment use GFX_TextStringBoxDraw.

Formatted String Rendering

To render string with formatting:

1. Set the color (GFX_ColorSet).
2. Set the font resource to use (GFX_FontSet).
3. Render the string (GFX_TextStringBoxDraw).

Parameters of GFX_TextStringBoxDraw determines the rectangular area where the string will be rendered. The alignment (see GFX_ALIGNMENT) specifies how the text will be aligned in the defined text area. The termination of the rendering is the same as the GFX_TextStringDraw where the length parameter can be used to determine how many characters will be rendered.



Added to these rendering functions, support functions are also provided for versatility:

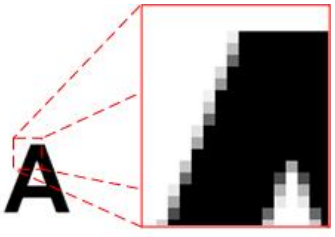
- GFX_TextStringWidthGet - Use to get the length of a string in pixels
- GFX_TextStringHeightGet - Use to get the height of the given font. All characters in a given font resource will have a constant height.
- GFX_FontSet - Use to set the font resource to use
- GFX_FontGet - Use to check the currently used font resource

Anti-aliased Fonts

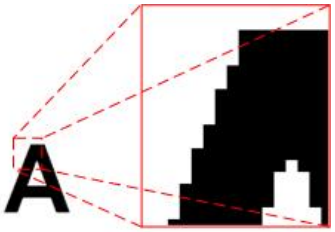
This section describes the anti-aliasing feature of the library.

Description

The Graphics Library supports rendering of anti-aliased font resource. Anti-aliasing is a technique used to make the edges of text appear smooth. This is useful especially with characters like 'A', 'O', etc., which has slant or curved lines. Since the pixels of the display are arranged in rectangular fashion, slant edges cannot be represented smoothly. To make them appear smooth, a pixel adjacent to the pixels is painted with an average of the foreground and background colors as depicted in the following figure.



When anti-aliasing is turned off, the pixels abruptly changes from background color to foreground color shown in the following figure. To implement anti-aliasing, adjacent pixels transitions from background to foreground color using 25% or 75% mid-color values from background to foreground colors. This feature in fonts will require roughly twice the size of memory storage required for font glyphs with no anti-aliasing.



Since the average of foreground and background colors needs to be calculated at runtime, the rendering of anti-aliased fonts take more time than rendering normal fonts.

Anti-aliasing transparency can be set to one of the following using GFX_FontAntiAliasSet (see GFX_FONT_ANTIALIAS_TYPE):

- GFX_FONT_ANTIALIAS_OPAQUE - Mid colors are calculated once while rendering each character which is ideal for rendering text over a constant background. This is the default setting of the library.
- GFX_FONT_ANTIALIAS_TRANSLUCENT - The mid values are calculated for every pixel and this feature is useful while rendering text over an image or on a non-constant color background.

As a result, rendering anti-aliased text takes longer with translucent type than compared to opaque type.

To use anti-aliasing, the font resource must contain glyphs that are anti-aliased enabled. The Graphics Resource Converter (GRC) tool that comes with the installation of the Graphics Library can generate such font resources.

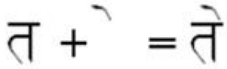
Note: An application may use anti-aliased and non-anti-aliased fonts at the same time.

Extended Glyphs

This section describes the extended glyphs feature of the library.

Description

Extended glyphs are needed to render characters of certain languages which use more than one byte to represent a single character. For example: Asian languages like Thai, Hindi, etc. In these character sets, more than one glyph overlaps each other to form a single character of that language, as shown in the following figure.



Extended glyph fonts can be generated using the Graphics Resource Converter (GRC) utility that is included with the installation of the Graphics Library.

Note: The fonts used with extended glyphs are normal ANSI fonts and not Unicode fonts.

Using the Graphics Object Layer

This section contains information on how to use the Graphics Object Layer of the Graphics Library.

Object Rendering and Style Schemes

This section describes how style schemes are used in rendering the objects of the Graphics Library.

Description

Style Scheme

All of the objects in the library utilize the style scheme to define how the object will be rendered on the screen. The style scheme defines the colors, images, fonts, and text that will be used. Choosing the appropriate colors and settings allows the object to be rendered in many ways.

Style schemes are applied to the objects by assigning the style scheme pointer to the object at creation. When the objects are rendered, the current settings of the style scheme will then be used to render the object. Objects cannot be created without a valid style scheme. This means that it cannot be null or undefined when the object is created. Style scheme can be modified anytime. It can be replaced using the GFX_GOL_ObjectStyleSchemeSet.

Style scheme is divided into these groups (See GFX_GOL_OBJ_SCHEME for details):

Text - The parameter that defines the text used in the object

- pFont - defines the font used in the style of the object

Colors - The parameters that defines the shape of the object

- EmbossDkColor - defines the dark emboss color
- EmbossLtColor - defines the light emboss color
- TextColor0 - defines the first text color option
- TextColor1 - defines the second text color option
- TextColorDisabled - defines the third text color option
- Color0 - defines the first face color option
- Color1 - defines the second face color option
- ColorDisabled - defines the third face color option
- EmbossDkColor - defines the dark emboss color

Background - The parameters that describes the background of the object. The background information defines how the object will be drawn with the background taken into account.

- CommonBkColor - Background color used to hide when the background type (GFX_BACKGROUND_TYPE) is set to GFX_BACKGROUND_COLOR or GFX_BACKGROUND_NONE
- CommonBkLeft - the horizontal starting position of the background
- CommonBkTop - the vertical starting position of the background
- CommonBkType - specifies the type of background to use
- pCommonBkImage - pointer to the background image used when the background type is set to GFX_BACKGROUND_IMAGE

Fill - The parameters that defines how the fill will be performed.

- fillStyle - specifies the fill style to be used (see GFX_FILL_STYLE)
- AlphaValue - alpha value used for alpha blending. This will be used then fillStyle is set to GFX_FILL_STYLE_ALPHA_COLOR.
- gradientStartColor - start color of the gradient fill. This will be used then fillStyle is set to any of the gradient fill styles.
- gradientEndColor - end color of the gradient fill. This will be used then fillStyle is set to any of the gradient fill styles.

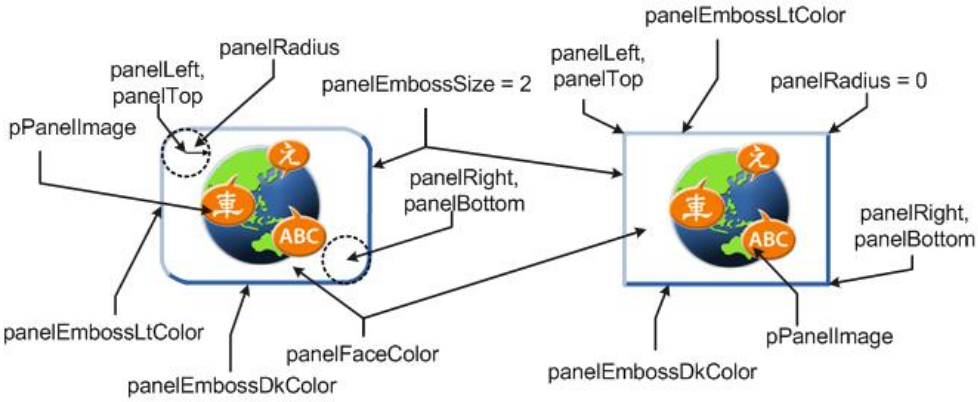
Style - The parameter that defines the 3-D effect of the object.

- EmbossSize - defines the emboss size of the panel for 3-D effect. This parameter should be set to '0' when not used.

Object Panel

Most of the objects in the Graphics Library utilizes a generic panel to define the object's shape. When using the provided objects in the library, the details of how the panel is utilized can be transparent to the users. In cases, where users defines their own objects the following detailed discussion of the panel is important.

A panel is a rectangular shape that is utilized by the objects to define its dimension. The panel is then drawn with the GOL_PANEL_PARAM to define the shape's colors. The colors are taken from the currently assigned style scheme to the object.



Panel Style

The assignment of the panel colors from the style scheme is shown in the following table.

Style Scheme to Panel Assignment

Style Scheme Parameter	Panel Parameter
EmbossDkColor	panelEmbossDkColor
EmbossLtColor	panelEmbossLtColor
Color0, Color1, ColorDisabled	panelFaceColor
fillStyle	panelFillStyle
EmbossSize	panelEmbossSize

TextColor0, TextColor1, TextColorDisabled, pFont, CommonBkColor, CommonBkLeft, CommonBkTop, CommonBkType, pCommonBkImage	Not set in the panel.
AlphaValue,	panelApha - use is dependent on the panelFillStyle setting
gradientStartColor,	panelGradientStartColor - use is dependent on the panelFillStyle setting
gradientEndColor	panelGradientEndColor - use is dependent on the panelFillStyle setting
N/A	panelImage - set by the object that supports images

The text parameters are not handled in the panel. These are handled by each object that supports text.

Refer to Panel Object for the summary of APIs that support panel rendering.

Background Feature

The Primitive Layer provides a global background information variable. This allows users to set a background and easily refresh parts of the screen that the background occupies (see GFX_BACKGROUND for details). The style scheme of the objects also allows association of the object to a background. This feature allows the objects to be easily refreshed on the screen.

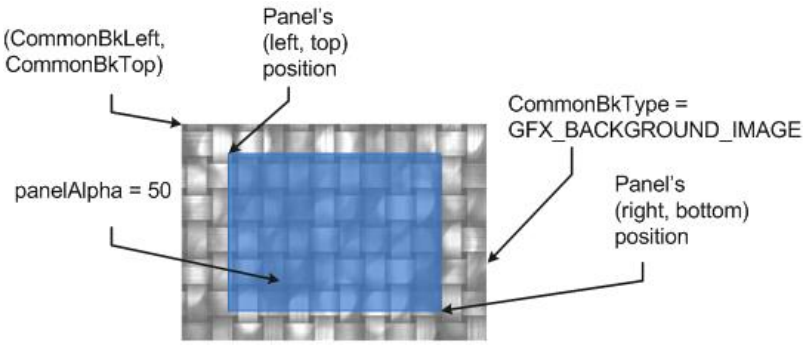
The requirement of the background feature is that the background should encompass the object. In other words, all the pixels of the object should be within the background dimension. Once this requirement is fulfilled, the parameters of the object that defines the location of the object (left, top, right bottom) is used to refresh the background pixels. Because of this Alpha blending, hiding or basic refresh of the object is optimized.

To add background information on the object the following style scheme parameters should be set:

- CommonBkLeft - The left most pixel location of the background
- CommonBkTop - The top most pixel location of the background
- CommonBkType - Should be set to one of the GFX_BACKGROUND_TYPE
- pCommonBkImage - If the CommonBkType is set to GFX_BACKGROUND_IMAGE, this should be set to the location of the image resource

Alpha Blending

When alpha blending is enabled, the object can be alpha blended with the background. Objects can also be removed from the screen easily by redrawing only the areas that the object occupies.



Alpha Blended Panel

Alpha Blending Objects

To implement an alpha blended object the following style scheme parameters should be set:

- fillStyle - Set to GFX_FILL_STYLE_ALPHA_COLOR
- AlphaValue - Set the alpha blending value. Set to 25, 50 or 75 when using primitive layer implementation of alpha blending

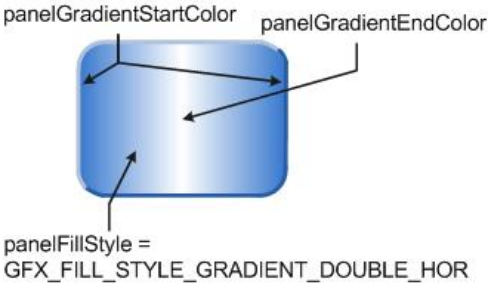
Gradient Fills

Objects can also be rendered with gradient fill on the panels. However, enabling gradient fill that are alpha blended is not supported yet. When AlphaValue is not 0 or 100 and fillStyle set to any of the gradient fill types, the alpha value will be ignored and assumed to be 100.

To implement an gradient filled object the following style scheme parameters should be set:

- fillStyle - Set to any of the gradient fill style (see GFX_FILL_STYLE for details):
- GFX_FILL_STYLE_GRADIENT_DOWN
- GFX_FILL_STYLE_GRADIENT_UP
- GFX_FILL_STYLE_GRADIENT_RIGHT
- GFX_FILL_STYLE_GRADIENT_LEFT
- GFX_FILL_STYLE_GRADIENT_DOUBLE_VER
- GFX_FILL_STYLE_GRADIENT_DOUBLE_HOR

- gradientStartColor - Set the gradient fill start color.
- gradientEndColor - Set the gradient fill end color.



Gradient Filled Panel

Notes:

1. Use of alpha blending on overlapping objects is not supported.
2. Alpha blended gradient fills is not supported.
3. Background feature can only be used if the background encompass the dimension of the object.
4. Certain objects do not support alpha blending and/or gradient fills. Refer to specific object documentation for details.

Double-Buffering Features

This section describes how to enable and use double buffering in the Graphics Primitive Layer.

Description

Manipulating pixels on the screen requires direct writes to the Frame Buffer. While these changes are being executed, the screen is also being refreshed. This means that the changes are displayed immediately as the frame buffer is being updated.

This is not a suitable scheme when the changes are slow, for example, decoding an image or having a large number of widgets on a screen. The display may appear slow in that case. One solution to this problem is to use a double-buffering scheme supported by the Microchip Graphics Library.

The double-buffering scheme does not render directly to the Frame Buffer, instead, rendering is performed to a separate buffer, called the Draw Buffer. After all the changes are made, the Draw Buffer and Frame Buffer are swapped. After the swap, the Draw Buffer becomes the new Frame Buffer and the Frame Buffer becomes the new Draw Buffer. This swapping appears as an instant change in the contents of the screen.

The time it takes to render to the Draw Buffer does not change; however, since rendering occurs in the buffer that is not shown on the screen, the user will not see the pixels being changed. Instead, what a user sees is the instant switch of the screen contents when the two buffers are swapped. The net effect is that the user experience is better since the user does not see the slow rendering.

The next rendering will now occur on the new Draw Buffer while the user views the screen with pixels from the Frame Buffer. The cycle of rendering to the Draw Buffer and displaying the Frame Buffer continues whenever new pixels are being drawn.

The use of the double-buffering feature will double the requirement of the memory for the buffers. Since this feature is dependent on the availability of the memory resources for buffers, the feature can only be used when the Display Driver Layer of the library supports double-buffering features.

The feature is enabled by default in configurations where double-buffering is supported. To disable the feature, define GFX_CONFIG_DOUBLE_BUFFERING_DISABLE in the `graphics_config.h` header file.

The following steps show how the double-buffering feature is enabled and used when rendering primitive shapes. However, for synchronization, there are two ways to perform it, which is differentiated in step 3. There are two ways to use the feature in rendering primitive shapes. Method A - use this method when the driver layer that implements the management of the swapping of buffers, uses some synchronization timing to perform the swap (usually timed to the vertical synchronization period of the display):

1. Enable the feature (GFX_DoubleBufferEnable)
2. Render primitive shapes. When rendering the shapes there are two ways to perform rendering and synchronization.

- Render and register each new area
- Render an area
- Register the rectangular area that was modified (GFX_DoubleBufferAreaMark)
- Render all primitives and rectangular areas and register the whole screen. This method will take more time since more pixels are being synchronized.
- Render shapes and areas
- Register the whole screen to be updated (GFX_DoubleBufferSyncAllStatusSet)

3. Synchronize the buffers so they will contain the same pixel information. There are also two ways to perform this.

- Synchronize using a defined synchronization point. In this method, the driver is set up to perform the point of synchronization. For TFT displays, the vertical synchronization period is the best place to perform this since it will remove any possibility of showing portion of the screen with different data. This will happen when the refresh is in the middle of the screen and the buffers are swapped.
- GFX_DoubleBufferSynchronizeRequest
- Wait until the synchronization has finished using GFX_DoubleBufferSynchronizeStatusGet (i.e.,

```
while(GFX_DoubleBufferSynchronizeStatusGet() == GFX_FEATURE_ENABLED);
```

- Synchronize the buffers immediately
- GFX_DoubleBufferSynchronize

4. Repeat steps 2-3 for more rendering sequences.

If double buffering is disabled during run time, simply call GFX_DoubleBufferDisable. This function will perform one last synchronization to update the screen with recent rendering since the last synchronization.

Multi-instance Support

This section describes how to use two instances of the library.

Description

The application layer is considered a client of the Graphics Library. When GFX_Initialize is called it creates data structures for a single client referenced by the SYSTEM_MODULE_INDEX parameter (GFX client index). Each function of the library distinguishes each client through the use of the client index.

Multi-instance support is helpful when more than one driver and display is required. Multi-instance support is also helpful when two portions of a single display are to be rendered to separately.

Multi-instance support increases the code size of the application. If only one instance is to be used, configure GFX_INSTANCES_NUMBER to '0'. If multiple instances are to be used configure the macro accordingly.

```
#define GFX_INSTANCES_NUMBER 1
GFX_Initialize(GFX_INDEX_0, (SYS_MODULE_INIT*)&gfxInit1);
GFX_Initialize(GFX_INDEX_1, (SYS_MODULE_INIT*)&gfxInit2);
GFX_Tasks(GFX_INDEX_0);
GFX_Tasks(GFX_INDEX_1);
GFX_ColorSet(GFX_INDEX_0, CORAL);
GFX_ColorSet(GFX_INDEX_1, CYAN);
GFX_RectangleFillDraw(GFX_INDEX_0, 0,0,MaxXGet(),MaxYGet()/2);
GFX_RectangleFillDraw(GFX_INDEX_1,0,MaxYGet()/2,MaxXGet(), MaxYGet());
```

Surface Object

This section describes the Surface object.

Description

The Surface object provides a canvas onto which primitives and other objects can be drawn. The canvas can be the extent of the display or a smaller rectangular region. It can have a transparent, alpha-blended, or color background. It supports all draw and render states like all other GOL objects. An application can create multiple surfaces.

Unique to the Surface object is its callback function. The callback function allows the application to render application specific content onto the surface - which includes primitives. Because the Surface object is an Object, its drawing is rendered in sequence with all other objects.

Note: Refer to the Release Notes for any known limitations or restrictions. A PDF copy of the release notes is provided in the `<install-dir>/doc` folder of your installation.

Library Dependencies

This section lists any other modules (by name) that are required to build the Graphics module.

Description

To build the Graphics Library you must include the modules listed in the following table.

Library Name	Location (<install-dir>/framework/)
Interrupt Peripheral Library	peripheral/int
Clock System Service Library	system/clk
DMA System Service Library	system/dma
Common System Service Library	system/common
Timer System Service Library	system/tmr
Interrupt System Service Library	system/int
Ports System Service Library	system/ports
SPI Driver Library	driver/spi

Timer Driver Library	driver/tmr

Configuring the Library

Macros

	Name	Description
	GFX_CONFIG_ALPHABLEND_DISABLE	Macro that disables the Alpha Blending feature.
	GFX_CONFIG_COLOR_DEPTH	Macro that sets the color depth of the application.
	GFX_CONFIG_DOUBLE_BUFFERING_DISABLE	Macro disables the support for double buffering in rendering of pixels to the frame buffer.
	GFX_CONFIG_FOCUS_DISABLE	Macro that disables the focus feature in objects.
	GFX_CONFIG_FONT_ANTIALIASED_DISABLE	Macro that disables the use of anti-aliased fonts.
	GFX_CONFIG_FONT_CHAR_SIZE	Macro that sets the size of the characters used in the fonts.
	GFX_CONFIG_FONT_EXTERNAL_DISABLE	Macro that disables sourcing of font resources from external sources.
	GFX_CONFIG_FONT_FLASH_DISABLE	Macro that disables sourcing of font resources from internal flash memory.
	GFX_CONFIG_FONT_RAM_DISABLE	Macro that disables sourcing of font resources from RAM sources.
	GFX_CONFIG_GRADIENT_DISABLE	Macro that disables the gradient fill feature.
	GFX_CONFIG_IMAGE_EXTERNAL_DISABLE	Macro that disables sourcing of image resources from external sources.
	GFX_CONFIG_IMAGE_PADDING_DISABLE	Macro disables the padding of bits on images converted by the Graphics Resource Converter (GRC).
	GFX_CONFIG_IMAGE_RAM_DISABLE	Macro that disables sourcing of image resources from RAM sources.
	GFX_CONFIG_IPU_DECODE_DISABLE	Macro that disables RLE compression of images.
	GFX_CONFIG_PALETTE_DISABLE	Macro that disables the palette feature.
	GFX_CONFIG_PALETTE_EXTERNAL_DISABLE	Macro that disables the palette feature that are sourced in external resources.
	GFX_CONFIG_RLE_DECODE_DISABLE	Macro that disables RLE compression of images.
	GFX_CONFIG_TRANSPARENT_COLOR_DISABLE	Macro that disables the use of anti-aliased fonts.
	GFX_CONFIG_USE_KEYBOARD_DISABLE	This macro disables the keyboard support in objects.
	GFX_CONFIG_USE_TOUCHSCREEN_DISABLE	This macro disables the resistive touchscreen support in objects.
	GFX_EXTERNAL_FONT_RASTER_BUFFER_SIZE	Macro sets the size of the external font raster buffer.
	GFX_free	Macro that defines the free function for versatility when using Operating Systems.
	GFX_malloc	Macro that defines the malloc function for versatility when using Operating Systems.
	GFX_CONFIG_IMAGE_FLASH_DISABLE	Macro that disables sourcing of image resources from internal flash memory.
	GFX_INSTANCES_NUMBER	Macro to specify the number of possible client modules.

Description

The library can be configured to be used with a specific combination of features. This section enumerates the available configuration options as well as examples of combination of configurations.

GFX_CONFIG_ALPHABLEND_DISABLE Macro

Macro that disables the Alpha Blending feature.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_ALPHABLEND_DISABLE
```

Description

Macro: GFX_CONFIG_ALPHABLEND_DISABLE

Alpha blending feature is available to fill functions.

To disable the alpha blending feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_COLOR_DEPTH Macro

Macro that sets the color depth of the application.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_COLOR_DEPTH
```

Description

Macro: GFX_CONFIG_COLOR_DEPTH

This macro sets the color depth used in the application. The library functions are also set to use the set color depth. The valid values for the color depth are the following: 1, 4, 8, 16 and 24 bpp. Usage of each is dependent on the support available on the display driver used. See the specific display driver documentation to verify support of the chosen color depth.

If this macro is not set, a build error will be generated.

Remarks

None.

GFX_CONFIG_DOUBLE_BUFFERING_DISABLE Macro

Macro disables the support for double buffering in rendering of pixels to the frame buffer.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_DOUBLE_BUFFERING_DISABLE
```

Description

Macro: GFX_CONFIG_DOUBLE_BUFFERING_DISABLE

In cases where display drivers has the resources for more than one display buffer, double buffering can be implemented in the driver. This allows application to hide the rendering effects by rendering on a hidden buffer and displaying another one. Once the rendering is done, the buffer are swapped. This gives an instantaneous change in the buffers which makes the change in the screen contents fast. The display driver must support the feature for this mode to work.

In drivers where this feature is not supported, this macro has no effect. In drivers that supports this feature, adding this macro will disable the feature.

Remarks

None.

GFX_CONFIG_FOCUS_DISABLE Macro

Macro that disables the focus feature in objects.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_FOCUS_DISABLE
```

Description

Macro: GFX_CONFIG_FOCUS_DISABLE

This compile option allows keyboard input focus.

- GFX_GOL_ObjectFocusSet()
- GFX_GOL_ObjectFocusGet()

- GFX_GOL_ObjectFocusNextGet()
- GFX_GOL_ObjectFocusPrevGet()

functions will be available. Focus is also changed by touch screen.

To disable the focus feature in objects, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_FONT_ANTIALIASED_DISABLE Macro

Macro that disables the use of anti-aliased fonts.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_FONT_ANTIALIASED_DISABLE
```

Description

Macro: GFX_CONFIG_FONT_ANTIALIASED_DISABLE

Anti-aliased fonts are supported in the library. The fonts must be generated using the Graphics Resource Converter (GRC). The GRC is a utility used in the Graphics Library to generate application resources.

To disable the anti-aliased fonts feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_FONT_CHAR_SIZE Macro

Macro that sets the size of the characters used in the fonts.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_FONT_CHAR_SIZE
```

Description

Macro: GFX_CONFIG_FONT_CHAR_SIZE

This configuration sets the text character size used in the library.

To enable support for unicode fonts, GFX_CONFIG_FONT_CHAR_SIZE must be defined as 16 (size is 16 bits). For standard ascii fonts, this can be defined as 8. This changes the GFX_XCHAR definition. See GFX_XCHAR for details.

Set in configuration	GFX_XCHAR	Description
#define GFX_CONFIG_FONT_CHAR_SIZE 16	#define GFX_XCHAR uint16_t	Use multi-byte characters (0-2^16 range).
#define GFX_CONFIG_FONT_CHAR_SIZE 8	#define GFX_XCHAR uint8_t	Use byte characters (0-255 range).

If this macro is not set, the default size used is 8-bits.

```
// example to set characters to use 16 bits
#define GFX_CONFIG_FONT_CHAR_SIZE 16

// example to set characters to use 8 bits
#define GFX_CONFIG_FONT_CHAR_SIZE 8
```

Remarks

None.

GFX_CONFIG_FONT_EXTERNAL_DISABLE Macro

Macro that disables sourcing of font resources from external sources.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_FONT_EXTERNAL_DISABLE
```

Description

Macro: GFX_CONFIG_FONT_EXTERNAL_DISABLE

Font data can be placed in multiple locations. They can be placed in FLASH memory, RAM and external memory. To reduce code size, any one of these locations, when not used, can be disabled by defining the macros at build time.

This macro disables the use of font resources from external memory.

To disable this feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_FONT_FLASH_DISABLE Macro

Macro that disables sourcing of font resources from internal flash memory.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_FONT_FLASH_DISABLE
```

Description

Macro: GFX_CONFIG_FONT_FLASH_DISABLE

Font data can be placed in multiple locations. They can be placed in FLASH memory, RAM and external memory. To reduce code size, any one of these locations, when not used, can be disabled by defining the macros at build time.

This macro disables the use of font resources from internal flash memory.

To disable this feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_FONT_RAM_DISABLE Macro

Macro that disables sourcing of font resources from RAM sources.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_FONT_RAM_DISABLE
```

Description

Macro: GFX_CONFIG_FONT_RAM_DISABLE

Font data can be placed in multiple locations. They can be placed in FLASH memory, RAM and external memory. To reduce code size, any one of these locations, when not used, can be disabled by defining the macros at build time.

This macro disables the use of font resources from RAM.

To disable this feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_GRADIENT_DISABLE Macro

Macro that disables the gradient fill feature.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_GRADIENT_DISABLE
```

Description

Macro: GFX_CONFIG_GRADIENT_DISABLE

Gradient fill is available to fill functions.

To disable the gradient feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_IMAGE_EXTERNAL_DISABLE Macro

Macro that disables sourcing of image resources from external sources.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_IMAGE_EXTERNAL_DISABLE
```

Description

Macro: GFX_CONFIG_IMAGE_EXTERNAL_DISABLE

Images can be placed in multiple locations. They can be placed in FLASH memory, RAM and external memory. To reduce code size, any one of these locations, when not used, can be disabled by defining the macros at build time.

This macro disables the use of image resources from external memory.

To disable this feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_IMAGE_PADDING_DISABLE Macro

Macro disables the padding of bits on images converted by the Graphics Resource Converter (GRC).

File

gfx_config_template.h

C

```
#define GFX_CONFIG_IMAGE_PADDING_DISABLE
```

Description

Macro: GFX_CONFIG_IMAGE_PADDING_DISABLE

When converting images for use in the Graphics Library, the Graphics Resource Converter has an option to set the images to be padded or not padded. When images are padded, each horizontal line will start on a byte boundary.

Unpadded images allows the least resource space for an image. Unpadded images also allows support for display controllers with windowing and auto-increment features.

The images are created with padding by default. When the images are set to be not padded, application must define the macro in the configuration to correctly process the images.

Padded and unpadded images cannot be combined in one application.

Remarks

None.

GFX_CONFIG_IMAGE_RAM_DISABLE Macro

Macro that disables sourcing of image resources from RAM sources.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_IMAGE_RAM_DISABLE
```

Description

Macro: GFX_CONFIG_IMAGE_RAM_DISABLE

Images can be placed in multiple locations. They can be placed in FLASH memory, RAM and external memory. To reduce code size, any one of these locations, when not used, can be disabled by defining the macros at build time.

This macro disables the use of image resources from RAM.

To disable this feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_IPU_DECODE_DISABLE Macro

Macro that disables RLE compression of images.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_IPU_DECODE_DISABLE
```

Description

Macro: GFX_CONFIG_IPU_DECODE_DISABLE

Images can also be compressed using the DEFLATE algorithm. Using the drivers that supports DEFLATE (IPU of PIC24FJ256DA210 Family of devices), GFX_ImageDraw() will be able to render these images. This feature is enabled by default.

To disable this feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_PALETTE_DISABLE Macro

Macro that disables the palette feature.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_PALETTE_DISABLE
```

Description

Macro: GFX_CONFIG_PALETTE_DISABLE

The use of a palette is an option to run the application with 256 16, or 2 colors only. When using this feature, the color depth set for the application should be 8, 4 or 1 bpp (see GFX_CONFIG_COLOR_DEPTH for color depth settings).

To disable the palette feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_PALETTE_EXTERNAL_DISABLE Macro

Macro that disables the palette feature that are sourced in external resources.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_PALETTE_EXTERNAL_DISABLE
```

Description

Macro: GFX_CONFIG_PALETTE_EXTERNAL_DISABLE

Similar to fonts and images, Palettes are considered resources. The use of palette also allow the application to locate the palette resources in external sources. This macro disables the code that implements externally sourced palettes.

To disable the palette to be sourced from external resources, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_RLE_DECODE_DISABLE Macro

Macro that disables RLE compression of images.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_RLE_DECODE_DISABLE
```

Description

Macro: GFX_CONFIG_RLE_DECODE_DISABLE

Images that have 8bpp or 4 bpp color depth has the option to be RLE compressed. GFX_ImageDraw() will be able to render these images. This feature is enabled by default.

```
    // example to use images that are NOT RLE encoded and sourced from
    // internal flash only
    #define GFX_CONFIG_RLE_DECODE_DISABLE
    #define GFX_CONFIG_IMAGE_EXTERNAL_DISABLE
    #define GFX_CONFIG_IMAGE_RAM_DISABLE
```

To disable this feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_TRANSPARENT_COLOR_DISABLE Macro

Macro that disables the use of anti-aliased fonts.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_TRANSPARENT_COLOR_DISABLE
```

Description

Macro: GFX_CONFIG_TRANSPARENT_COLOR_DISABLE

Transparent color is a feature in GFX_ImageDraw() where pixels that equals the color set in the transparent color variable will not be rendered. This is useful in rendering rounded icons or images to the screen with complex background.

To disable the transparent color in images, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_USE_KEYBOARD_DISABLE Macro

This macro disables the keyboard support in objects.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_USE_KEYBOARD_DISABLE
```

Description

Macro: GFX_CONFIG_USE_KEYBOARD_DISABLE

Depending on the input devices used, messages that objects will process are encoded in the input device drivers. The keyboard is one of the input devices that is supported in selected objects.

This support is enabled by default. To disable this feature, add this macro in the configuration.

Remarks

None.

GFX_CONFIG_USE_TOUCHSCREEN_DISABLE Macro

This macro disables the resistive touchscreen support in objects.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_USE_TOUCHSCREEN_DISABLE
```

Description

Macro: GFX_CONFIG_USE_TOUCHSCREEN_DISABLE

Depending on the input devices used, messages that objects will process are encoded in the input device drivers. The resistive touchscreen is one of the input devices that is supported in selected objects.

This support is enabled by default. To disable this feature, add this macro in the configuration.

Remarks

None.

GFX_EXTERNAL_FONT_RASTER_BUFFER_SIZE Macro

Macro sets the size of the external font raster buffer.

File

gfx_config_template.h

C

```
#define GFX_EXTERNAL_FONT_RASTER_BUFFER_SIZE
```

Description

Macro: GFX_EXTERNAL_FONT_RASTER_BUFFER_SIZE

This macro sets the size of the external font raster buffer. This buffer is used to store the character glyph when the glyph is being read from external source. The value that is needed will be calculated by the Graphics Resource Converter (GRC). The value will be shown in the external resource reference c file that the GRC generates.

```
// example to set the buffer size.
// value is taken from the output of the GRC
#define GFX_EXTERNAL_FONT_RASTER_BUFFER_SIZE 100
```

A warning will be issued when building the application when:

- when the configuration do not define this macro
- when the defined value is less than the required size

This macro will have no effect when fonts that are sourced externally is not used.

Remarks

None.

GFX_free Macro

Macro that defines the free function for versatility when using Operating Systems.

File

gfx_config_template.h

C

```
#define GFX_free(pObj) free(pObj)
```

Description

Macro: GFX_free()

This macro definition allows the application to replace the free function to an equivalent function implemented in the operating system used.

When using the library with object layer and without any replacement functions for the malloc function, this macro must be defined as:

```
    #define GFX_free(pObj)      free(pObj)
```

Remarks

None.

GFX_malloc Macro

Macro that defines the malloc function for versatility when using Operating Systems.

File

gfx_config_template.h

C

```
#define GFX_malloc(size) malloc(size)
```

Description

Macro: GFX_malloc()

This macro definition allows the application to replace the malloc function to an equivalent function implemented in the operating system used.

When using the library with object layer and without any replacement functions for the malloc function, this macro must be defined as:

```
    #define GFX_malloc(size)    malloc(size)
```

Remarks

None.

GFX_CONFIG_IMAGE_FLASH_DISABLE Macro

Macro that disables sourcing of image resources from internal flash memory.

File

gfx_config_template.h

C

```
#define GFX_CONFIG_IMAGE_FLASH_DISABLE
```

Description

Macro: GFX_CONFIG_IMAGE_FLASH_DISABLE

Images can be placed in multiple locations. They can be placed in FLASH memory, RAM and external memory. To reduce code size, any one of these locations, when not used, can be disabled by defining the macros at build time.

This macro disables the use of image resources from internal flash memory.

To disable this feature, add this macro in the configuration.

Remarks

None.

GFX_INSTANCES_NUMBER Macro

Macro to specify the number of possible client modules.

File

gfx_config_template.h

C

```
#define GFX_INSTANCES_NUMBER
```

Description

Macro: GFX_INSTANCES_NUMBER

This macro sets the maximum number of possible instances that can be created.

To set the maximum number of clients, add this macro in the configuration and the appropriate number.

Remarks

The number will affect memory usage.

None.

Configuration Examples

This section shows example of configuration combination when using the library.

Example 1

Configuration example 1.

Description

- Non-blocking is enabled on accelerated functions
- Alpha blending
- Gradient fills
- Palette is not used
- Focus on objects that supports it is enabled
- Double buffering is disabled
- Characters size is 16 bits to support UNICODE characters
- Fonts are sourced from two places:
- Internal Flash
- External memory
- Fonts from RAM are disabled
- Fonts that are anti-aliased are enabled
- Fonts sourced from external memory are allocated 51 bytes of buffer
- Images are sourced from two places:
- Internal Flash
- External memory
- Fonts from RAM is disabled
- Images that are RLE encoded are enabled
- Images that are DEFLATE (for IPU module) encoded are enabled
- Images can be rendered with transparent color feature
- Touch screen support is enabled
- Keyboard support is enabled
- GFX_malloc and GFX_free functions are used to manage memory for object layer

```
// Note: Configuration to disable the features are commented out
// to show the specific macros that disables them.

//#define GFX_CONFIG_NONBLOCKING_DISABLE
//#define GFX_CONFIG_ALPHABLEND_DISABLE
//#define GFX_CONFIG_GRADIENT_DISABLE
//#define GFX_CONFIG_FOCUS_DISABLE
#define GFX_CONFIG_PALETTE_DISABLE
#define GFX_CONFIG_PALETTE_EXTERNAL_DISABLE
#define GFX_CONFIG_DOUBLE_BUFFERING_DISABLE

#define GFX_CONFIG_FONT_CHAR_SIZE 16
#define GFX_CONFIG_COLOR_DEPTH 16

//#define GFX_CONFIG_FONT_FLASH_DISABLE
//#define GFX_CONFIG_FONT_EXTERNAL_DISABLE
```

```
#define GFX_CONFIG_FONT_RAM_DISABLE
//#define GFX_CONFIG_FONT_ANTIALIASED_DISABLE

//#define GFX_CONFIG_IMAGE_FLASH_DISABLE
//#define GFX_CONFIG_IMAGE_EXTERNAL_DISABLE
#define GFX_CONFIG_IMAGE_RAM_DISABLE

//#define GFX_CONFIG_RLE_DECODE_DISABLE
//#define GFX_CONFIG_IPU_DECODE_DISABLE

//#define GFX_CONFIG_TRANSPARENT_COLOR_DISABLE
#define GFX_EXTERNAL_FONT_RASTER_BUFFER_SIZE 51

//#define GFX_CONFIG_USE_TOUCHSCREEN_DISABLE
//#define GFX_CONFIG_USE_KEYBOARD_DISABLE

#define GFX_malloc(size) malloc(size)
#define GFX_free(pObj) free(pObj)
```

Example 2

Configuration example 2.

Description

- All primitive functions are blocking
- The following are disabled:
- Alpha blending
- Gradient fills
- Palette
- Focus on objects
- Double buffering
- Anti-aliased fonts
- RLE and DEFLATE encoded images
- Transparent color
- Touchscreen
- Keyboard
- Characters size is 8 bits
- Images are sourced only from internal Flash
- Fonts are sourced only from internal Flash and since fonts are sourced from internal Flash, the external font raster buffer is not needed
- Object layer is not used so GFX_malloc and GFX_free are never referenced

```
// Note: Configuration to disable the features are commented out
//       to show the specific macros that disables them.

#define GFX_CONFIG_NONBLOCKING_DISABLE
#define GFX_CONFIG_ALPHABLEND_DISABLE
#define GFX_CONFIG_GRADIENT_DISABLE
#define GFX_CONFIG_FOCUS_DISABLE
#define GFX_CONFIG_PALETTE_DISABLE
#define GFX_CONFIG_PALETTE_EXTERNAL_DISABLE
#define GFX_CONFIG_DOUBLE_BUFFERING_DISABLE

#define GFX_CONFIG_FONT_CHAR_SIZE 8
#define GFX_CONFIG_COLOR_DEPTH 16

//#define GFX_CONFIG_FONT_FLASH_DISABLE
#define GFX_CONFIG_FONT_EXTERNAL_DISABLE
#define GFX_CONFIG_FONT_RAM_DISABLE
#define GFX_CONFIG_FONT_ANTIALIASED_DISABLE

//#define GFX_CONFIG_IMAGE_FLASH_DISABLE
#define GFX_CONFIG_IMAGE_EXTERNAL_DISABLE
#define GFX_CONFIG_IMAGE_RAM_DISABLE

#define GFX_CONFIG_RLE_DECODE_DISABLE
#define GFX_CONFIG_IPU_DECODE_DISABLE
```

```
#define GFX_CONFIG_TRANSPARENT_COLOR_DISABLE
//#define GFX_EXTERNAL_FONT_RASTER_BUFFER_SIZE 51

#define GFX_CONFIG_USE_TOUCHSCREEN_DISABLE
#define GFX_CONFIG_USE_KEYBOARD_DISABLE

//#define GFX_malloc(size)    malloc(size)
//#define GFX_free(pObj)      free(pObj)
```

Building the Library

This section lists the files that are available in the Graphics Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/gfx`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
gfx.h	Graphics Library initialization header file.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

The following table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build the LCC Library.

Source File Name	Description
/src/drv_gfx_lcc_int.c	LCC Driver Library small buffer internal memory framebuffer driver.
/src/drv_gfx_lcc_int_pe.c	LCC Driver Library large buffer internal memory framebuffer driver.
/src/drv_gfx_lcc_ext.c	LCC Driver Library external memory framebuffer driver for wqvga.
/src/drv_gfx_lcc_ext_wvga.c	LCC Driver Library external memory framebuffer driver for wvga.

the following table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build the Graphics Library.

Source File Name	Description
gfx.h	Graphics Library initialization header file.
/src/gfx.c	Graphics Library initialization implementation.
gfx_primitive.h	Primitive Layer run-time header file.
/src/gfx_primitive.c	Primitive Layer run-time implementation.
gfx_gol.h	Object Layer run-time header.
/src/gfx_gol.c	Object Layer run-time implementation.

Optional File(s)

This table lists and describes the source and header files that may optionally be included for the Graphics Library if required for the desired implementation.

Source File Name	Description
gfx_colors.h	Default color definitions
gfx_colors_w3.h	W3 color definitions
gfx_colors_x11.h	X11 color definitions
gfx_gol_button.h	Button widget header
/src/gfx_gol_button.c	Button widget implementation

gfx_gol_check_box.h	Check Box widget header
/src/gfx_gol_check_box.c	Check Box widget implementation
gfx_gol_custom_control.h	Custom control widget header
/src/gfx_gol_custom_control.c	Custom control widget implementation
gfx_gol_digital_meter.h	Digital meter widget header
/src/gfx_gol_digital_meter.c	Digital meter widget header
gfx_gol_edit_box.h	Edit Box widget header
/src/gfx_gol_edit_box.c	Edit Box widget implementation
gfx_gol_group_box.h	Group Box widget header
/src/gfx_gol_group_box.c	Group Box widget implementation
gfx_gol_list_box.h	List Box widget implementation
/src/gfx_gol_list_box.c	List Box widget implementation
gfx_gol_meter.h	Analog meter widget header
/src/gfx_gol_meter_c	Analog meter widget implementation
gfx_gol_picture.h	Picture widget header
/src/gfx_gol_picture.c	Picture widget implementation
gfx_gol_progress_bar.h	Progress Bar widget header
/src/gfx_gol_progress_bar.c	Progress Bar widget implementation
gfx_gol_radio_button.h	Radio Button widget header
/src/gfx_gol_radio_button.c	Radio Button widget implementation
gfx_gol_scan_codes.h	Keyboard codes header
gfx_gol_scheme.h	Object style scheme header
/src/gfx_gol_scheme_default.c	Object style scheme implementation
gfx_gol_scroll_bar.h	Scroll bar widget header
/src/gfx_gol_scroll_bar.c	Scroll bar widget implementation
gfx_gol_static_text.h	Static Text widget header
/src/gfx_gol_static_text.c	Static Text widget implementation
/src/gfx_gol_surface.h	Surface object widget header
/src/gfx_gol_surface.c	Surface object widget implementation
/src/gfx_gol_text_entry.c	Text Entry widget header
/src/gfx_gol_text_entry.c	Text Entry widget implementation
gfx_gol_window.h	Window widget header
/src/gfx_gol_window.c	Window widget implementation
gfx_image_decoder.h	Image decoder header
/src/gfx_image_decoder.c	Image decoder implementation
gfx_types_font.h	Font types
gfx_types_image.h	Image types
gfx_types_macros.h	GFX system wide types and macros
gfx_types_palette.h	Palette types
gfx_types_resource.h	Resource types for images fonts palette and binary types

Module Dependencies

The File System Service Library depends on the following modules:

- Graphics Driver Library

Library Interface

This section describes the Application Programming Interface (API) functions of the Graphics Library.

Refer to each section for a detailed description.

Graphics Primitive Layer

This section describes the API and usage of the Graphics Library Primitive Layer.

Graphics Primitive Layer API

Application Programming Interface functions for the Primitive Layer of the Graphics Library.

Initialization Functions

Functions

	Name	Description
	GFX_PRIMITIVE_Initialize	Initialize the GFX PRIMITIVE HAL Library.
	GFX_PRIMITIVE_Deinitialize	Deinitializes the specified instance of the GFX Module.
	GFX_PRIMITIVE_Close	Closes an instance of the primitive layer specified by handle.
	GFX_PRIMITIVE_Open	Opens a client instance of the primitive layer specified by index.
	GFX_ScreenClear	Clears the screen to the currently set color (GFX_ColorSet()).

Description

Graphics Library Primitive Layer initialization API.

GFX_PRIMITIVE_Initialize Function

Initialize the GFX PRIMITIVE HAL Library.

File

gfx_primitive.h

C

```
SYS_MODULE_OBJ GFX_PRIMITIVE_Initialize(const SYS_MODULE_INDEX moduleIndex, const SYS_MODULE_INIT * const moduleInit);
```

Returns

If successful, returns a valid handle to a primitive object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the GFX Library Primitive HAL.

Remarks

This routine must be called before other GFX PRIMITIVE HAL functions.

This function initialize the Graphics Library primitive layer. The following default settings are set when this function is called.

1. font - Set to NULL. GFX_FontSet() must be called prior to any text rendering.
2. line type - Set to GFX_LINE_TYPE_THIN_SOLID (see GFX_LINE_STYLE).
3. fill type - Set to GFX_FILL_TYPE_COLOR (see GFX_FILL_STYLE).
4. text anti-alias type - Set to GFX_FONT_ANTIALIAS_OPAQUE (see GFX_FONT_ANTIALIAS_TYPE). This only affects fonts with anti-aliasing enabled.
5. Set transparent color feature in image draw functions

to be disabled.

6. Set alpha blending value to 100 (or no alpha blending) if

alpha-blending feature is enabled.

7. Set background information to no background.

This function does not clear the screen and does not assign any color to the currently set color. Application should set the color and clear the screen.

Preconditions

None.

Example

```
GFX_PRIMITIVE_INIT gfxInit;
```

```
SYS_MODULE_OBJ primObj;

// GFX Module initialization
primObj = GFX_PRIMITIVE_Initialize(GFX_PRIMITIVE_INDEX_0, &gfxInit);

if (SYS_MODULE_OBJ_INVALID == primObj)
{
    // Handle error
}
```

Parameters

Parameters	Description
moduleIndex	client instance request.
moduleInit	initialization data for the instance.

Function

void GFX_PRIMITIVE_Initialize (const SYS_MODULE_INDEX moduleIndex,
const SYS_MODULE_INIT * const moduleInit);

GFX_PRIMITIVE_Deinitialize Function

Deinitializes the specified instance of the GFX Module.

File

gfx_primitive.h

C

```
void GFX_PRIMITIVE_Deinitialize(SYS_MODULE_OBJ moduleObject);
```

Returns

None.

Description

Deinitializes the specified instance of the GFX Module. All internal data structures will be reset.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This routine will not block waiting for hardware.

Preconditions

Function GFX_GOL_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from GFX_PRIMITIVE_Initialize
SYS_STATUS          status;

GFX_PRIMITIVE_Deinitialize(object);

status = GFX_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	GFX layer object handle, returned from the GFX_PRIMITIVE_Initialize routine

Function

void GFX_PRIMITIVE_Deinitialize(SYS_MODULE_OBJ object)

GFX_PRIMITIVE_Close Function

Closes an instance of the primitive layer specified by handle.

File

gfx_primitive.h

C

```
void GFX_PRIMITIVE_Close(GFX_PRIMITIVE_HANDLE handle);
```

Description

This function closes the client instance.

Parameters

Parameters	Description
handle	primitive handle

Function

void GFX_PRIMITIVE_Close(GFX_PRIMITIVE_HANDLE handle)

GFX_PRIMITIVE_Open Function

Opens a client instance of the primitive layer specified by index.

File

gfx_primitive.h

C

```
GFX_PRIMITIVE_HANDLE GFX_PRIMITIVE_Open(const SYS_MODULE_INDEX index);
```

Returns

GFX_PRIMITIVE HANDLE - handle to the primitive layer.

Description

This function opens a client instance. THe user must have called GFX_PRIMITIVE_Initialize prior to calling this functions. It opens the graphics driver.

Parameters

Parameters	Description
index	instance of the driver

Function

GFX_PRIMITIVE_HANDLE GFX_PRIMITIVE_Open(const SYS_MODULE_INDEX index)

GFX_ScreenClear Function

Clears the screen to the currently set color (GFX_ColorSet()).

File

gfx_primitive.h

C

```
GFX_STATUS GFX_ScreenClear(SYS_MODULE_INDEX gfxIndex);
```

Returns

The status of the screen clearing. GFX_STATUS_SUCCESS - screen was cleared. GFX_STATUS_FAILURE - screen is not yet cleared

Description

This function clears the screen with the current color and sets the line cursor position to (0, 0).

If color is not set, before this function is called, the output is undefined.

If the function returns GFX_STATUS_FAILURE, clearing is not yet finished. Application must call the function again to continue the clearing.

Preconditions

Color must be set by GFX_ColorSet().

None.

Example

```
GFX_ColorSet(GFX_INDEX_0, BLACK);
GFX_ScreenClear(GFX_INDEX_0);
```

Function

GFX_STATUS GFX_ScreenClear(SYS_MODULE_INDEX gfxIndex)

Display Functions

Functions

	Name	Description
	GFX_MaxXGet	This function returns the maximum horizontal pixel coordinate.
	GFX_MaxYGet	This function returns the maximum vertical pixel coordinate.

Description

GFX_MaxXGet Function

This function returns the maximum horizontal pixel coordinate.

File

gfx_primitive.h

C

```
inline uint16_t GFX_MaxXGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

Maximum horizontal pixel coordinate.

Description

This function returns the maximum horizontal pixel coordinate of the chosen display. The value returned is equal to the horizontal dimension minus 1. The horizontal dimension is also dependent on the rotation of the screen. Rotation can be set in the hardware configuration.

Preconditions

None.

Example

None.

****

#if (DISP_ORIENTATION == 90) #define GFX_MaxXGet() (DISP_VER_RESOLUTION - 1) #elif (DISP_ORIENTATION == 270) #define GFX_MaxXGet() (DISP_VER_RESOLUTION - 1) #elif (DISP_ORIENTATION == 10) #define GFX_MaxXGet() (DISP_HOR_RESOLUTION - 1) #elif (DISP_ORIENTATION == 180) #define GFX_MaxXGet() (DISP_HOR_RESOLUTION - 1) #endif

Function

uint16_t GFX_MaxXGet(void)

GFX_MaxYGet Function

This function returns the maximum vertical pixel coordinate.

File

gfx_primitive.h

C

```
inline uint16_t GFX_MaxYGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

Maximum vertical pixel coordinate.

Description

This function returns the maximum vertical pixel coordinate of the chosen display. The value returned is equal to the vertical dimension minus 1. The vertical dimension is also dependent on the rotation of the screen. Rotation can be set in the hardware configuration.

Preconditions

None.

Example

None.

****

#if (DISP_ORIENTATION == 90) #define GFX_MaxYGet() (DISP_HOR_RESOLUTION - 1) #elif (DISP_ORIENTATION == 270) #define GFX_MaxYGet() (DISP_HOR_RESOLUTION - 1) #elif (DISP_ORIENTATION == 10) #define GFX_MaxYGet() (DISP_VER_RESOLUTION - 1) #elif (DISP_ORIENTATION == 180) #define GFX_MaxYGet() (DISP_VER_RESOLUTION - 1) #endif

Function

uint16_t GFX_MaxYGet(void)

Line Rendering Functions

Functions

	Name	Description
	GFX_LineDraw	This function renders a line from x1,y1 to x2,y2 using the currently set line style (see GFX_LineStyleSet()).
	GFX_LinePositionRelativeSet	This function sets the line cursor to a new position relative to the current position.
	GFX_LinePositionSet	This function sets the line cursor to a new position.
	GFX_LinePositionXGet	This function returns the current x position of the line cursor.
	GFX_LinePositionYGet	This function returns the current y position of the line cursor.
	GFX_LineToDraw	This function renders a line from current line cursor position (x,y) to (x2,y2) using the currently set line style (see GFX_LineStyleSet()).
	GFX_LineToRelativeDraw	This function renders a line from current line cursor position (x,y) to (x+dX,y+dY) using the currently set line style (see GFX_LineStyleSet()).

Description

Graphics Library Primitive Layer line rendering API.

GFX_LineDraw Function

This function renders a line from x1,y1 to x2,y2 using the currently set line style (see GFX_LineStyleSet()).

File

gfx_primitive.h

C

```
GFX_STATUS GFX_LineDraw(SYS_MODULE_INDEX gfxIndex, uint16_t x1, uint16_t y1, uint16_t x2, uint16_t y2);
```

Returns

Status of the line rendering. GFX_STATUS_SUCCESS - line rendering done. GFX_STATUS_FAILURE - line rendering is not done.

Description

This function renders a line from x1,y1 to x2,y2 using the currently set line style set by GFX_LineStyleSet(). The color used is the color set by the last call to GFX_ColorSet().

If x1,y1 and/or x2,y2 is not on the frame buffer, then the behavior is undefined. If color is not set, before this function is called, the output is undefined.

Preconditions

Color must be set by GFX_ColorSet(). Line style must be set by GFX_LineStyleSet().

Example

```
GFX_ColorSet(GFX_INDEX_0, BRIGHTRED);
```

```
GFX_LineStyleSet(GFX_INDEX_0, GFX_LINE_STYLE_THIN_DOTTED);
GFX_LineDraw(GFX_INDEX_0, 10, 10,100,  10);
```

Parameters

Parameters	Description
x1	x coordinate of the line start point.
y1	y coordinate of the line start point.
x2	x coordinate of the line end point.
y2	y coordinate of the line end point.

Function

GFX_STATUS GFX_LineDraw(
SYS_MODULE_INDEX gfxIndex,
uint16_t x1,
uint16_t y1,
uint16_t x2,
uint16_t y2)

GFX_LinePositionRelativeSet Function

This function sets the line cursor to a new position relative to the current position.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_LinePositionRelativeSet(SYS_MODULE_INDEX gfxIndex, int16_t x, int16_t y);
```

Returns

Status of the relative line position set. GFX_STATUS_SUCCESS - relative line position set done. GFX_STATUS_FAILURE - relative line position set not done.

Description

This function sets the line cursor to a new (x,y) position relative to the current cursor position. The new position is calculated by (x+dX, y + dY).

Line cursor is used as a starting point of the line rendered by the GFX_LineToDraw() and GFX_LineToRelativeDraw() functions. Note that the parameters dX and dY are signed integers. This allows the new line cursor position to be placed to any direction from the current line cursor position.

If (x+dX) and/or (y+dY) results in a position that is not on the frame buffer, then the behavior of GFX_LineToDraw() and GFX_LineToRelativeDraw() functions are undefined. If color is not set, before this function is called, the output is undefined.

Preconditions

None.

Example

See GFX_LineToDraw().

Parameters

Parameters	Description
dX	the offset for the x position that will define the new x-coordinate position of the line cursor.
dY	the offset for the y position that will define the new y-coordinate position of the line cursor.

Function

GFX_STATUS GFX_LinePositionRelativeSet(
SYS_MODULE_INDEX gfxIndex,
int16_t dX,
int16_t dY)

GFX_LinePositionSet Function

This function sets the line cursor to a new position.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_LinePositionSet(SYS_MODULE_INDEX gfxIndex, uint16_t x, uint16_t y);
```

Returns

Status of the line position set. GFX_STATUS_SUCCESS - line position set done. GFX_STATUS_FAILURE - line position set not done.

Description

This function sets the line cursor to a new (x,y) position. Line cursor is used as a starting point of the line rendered by the GFX_LineToDraw() and GFX_LineToRelativeDraw() functions.

If x and/or y does not lie on the frame buffer, then the behavior of GFX_LineToDraw() and GFX_LineToRelativeDraw() functions are undefined.

Preconditions

None.

Example

See GFX_LinePositionXGet().

Parameters

Parameters	Description
x	new x coordinate position of the line cursor.
y	new y coordinate position of the line cursor.

Function

GFX_STATUS GFX_LinePositionSet(
SYS_MODULE_INDEX gfxIndex,
uint16_t x,
uint16_t y)

GFX_LinePositionXGet Function

This function returns the current x position of the line cursor.

File

gfx_primitive.h

C

```
int16_t GFX_LinePositionXGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current line cursor x position.

Description

This function returns the current x position of the line cursor. Line cursor is used as a starting point of the line rendered by the GFX_LineToDraw() and GFX_LineToRelativeDraw() functions.

Preconditions

None.

Example

```
// implementation of the GFX_LineToRelativeDraw()
GFX_STATUS GFX_LineToRelativeDraw(
                                GFX_INDEX_0,
                                int16_t dX,
                                int16_t dY)
{
    return (GFX_LineDraw(
                            GFX_INDEX_0,
                            GFX_LinePositionXGet(gfxIndex),
                            GFX_LinePositionYGet(gfxIndex),
                            GFX_LinePositionXGet(gfxIndex) + dX,
```

```
                                    GFX_LinePositionYGet(gfxIndex) + dY));
    }
```

Function

int16_t GFX_LinePositionXGet(SYS_MODULE_INDEX gfxIndex)

GFX_LinePositionYGet Function

This function returns the current y position of the line cursor.

File

gfx_primitive.h

C

```
int16_t GFX_LinePositionYGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current line cursor y position.

Description

This function returns the current y position of the line cursor. Line cursor is used as a starting point of the line rendered by the GFX_LineToDraw() and GFX_LineToRelativeDraw() functions.

Preconditions

None.

Example

See GFX_LinePositionXGet().

Function

int16_t GFX_LinePositionYGet(SYS_MODULE_INDEX gfxIndex)

GFX_LineToDraw Function

This function renders a line from current line cursor position (x,y) to (x2,y2) using the currently set line style (see GFX_LineStyleSet()).

File

gfx_primitive.h

C

```
GFX_STATUS GFX_LineToDraw(SYS_MODULE_INDEX gfxIndex, int16_t x2, int16_t y2);
```

Returns

Status of the line rendering. GFX_STATUS_SUCCESS - line rendering done. GFX_STATUS_FAILURE - line rendering is not done.

Description

This function renders a line from current line cursor position (x,y) to (x2,y2) using the currently set line style set by GFX_LineStyleSet(). The color used is the color set by the last call to GFX_ColorSet().

If x2 and/or y2 does not lie on the frame buffer, then the behavior is undefined. If color is not set, before this function is called, the output is undefined.

Preconditions

Color must be set by GFX_ColorSet(). Line style must be set by GFX_LineStyleSet().

Example

```
    GFX_ColorSet(GFX_INDEX_0, BRIGHTRED);
    GFX_LineStyleSet(GFX_INDEX_0, GFX_LINE_STYLE_THICK_DOTTED);

    GFX_LinePositionSet(GFX_INDEX_0, 100, 100);
    GFX_LineToDraw(GFX_INDEX_0, 100,  10);
    GFX_LinePositionRelativeSet(GFX_INDEX_0, -90,  0);
    GFX_LineToDraw(GFX_INDEX_0, 100,  10);
    GFX_LinePositionRelativeSet(GFX_INDEX_0,   0, 90);
    GFX_LineToDraw(GFX_INDEX_0,  10, 100);
    GFX_LinePositionRelativeSet(GFX_INDEX_0,  90,-90);
    GFX_LineToDraw(GFX_INDEX_0,  10, 100);
```

```
GFX_LinePositionRelativeSet(GFX_INDEX_0,   0,-90);
GFX_LineToDraw(GFX_INDEX_0, 100, 100);
GFX_LinePositionRelativeSet(GFX_INDEX_0,  -90, 0);
GFX_LineToDraw(GFX_INDEX_0, 10,  10);
```

Parameters

Parameters	Description
x2	x coordinate of the line end point.
y2	y coordinate of the line end point.

Function

GFX_STATUS GFX_LineToDraw(
SYS_MODULE_INDEX gfxIndex,
int16_t x2,
int16_t y2)

GFX_LineToRelativeDraw Function

This function renders a line from current line cursor position (x,y) to (x+dX,y+dY) using the currently set line style (see GFX_LineStyleSet()).

File

gfx_primitive.h

C

```
GFX_STATUS GFX_LineToRelativeDraw(SYS_MODULE_INDEX gfxIndex, int16_t dX, int16_t dY);
```

Returns

Status of the line rendering. GFX_STATUS_SUCCESS - line rendering done. GFX_STATUS_FAILURE - line rendering is not done.

Description

This function renders a line from current line cursor position (x,y) to (x+dX,y+dY) using the currently set line style set by GFX_LineStyleSet(). The color used is the color set by the last call to GFX_ColorSet(). Note that the parameters dX and dY are signed integers. This allows the line to be drawn from the line cursor to any direction.

If (x+dX) and/or (y+dY) results in a position that is not on the frame buffer, then the behavior is undefined. If color is not set, before this function is called, the output is undefined.

Preconditions

Color must be set by GFX_ColorSet(). Line style must be set by GFX_LineStyleSet().

Example

```
GFX_ColorSet(GFX_INDEX_0, BRIGHTRED);
GFX_LineStyleSet(GFX_INDEX_0, GFX_LINE_STYLE_THIN_DOTTED);

GFX_LinePositionSet(GFX_INDEX_0, 100, 100);
GFX_LineToRelativeDraw(GFX_INDEX_0,   0, -90);
GFX_LineToRelativeDraw(GFX_INDEX_0, -90,   0);
GFX_LineToRelativeDraw(GFX_INDEX_0,  90,  90);
GFX_LineToRelativeDraw(GFX_INDEX_0, -90,   0);
GFX_LineToRelativeDraw(GFX_INDEX_0,  90, -90);
GFX_LinePositionSet(GFX_INDEX_0, 10, 10);
GFX_LineToRelativeDraw(GFX_INDEX_0,  0,  90);
```

Parameters

Parameters	Description
dX	the offset for the x starting position that will define the x-coordinate of the end of the line.
dY	the offset for the y starting position that will define the y-coordinate of the end of the line.

Function

GFX_STATUS GFX_LineToRelativeDraw(
SYS_MODULE_INDEX gfxIndex,
int16_t dX,
int16_t dY)

Polygon Rendering Functions

Functions

	Name	Description
	GFX_CircleDraw	This function renders a circular shape using the currently set line style and color.
	GFX_PolygonDraw	This function renders a polygon using the currently set line style and color.
	GFX_RectangleDraw	This function renders a rectangular shape using the currently set line style and color.
	GFX_RectangleRoundDraw	This function renders a rounded corner rectangular shape using the currently set line style and color.

Description

Graphics Library Primitive Layer polygon rendering API.

GFX_CircleDraw Function

This function renders a circular shape using the currently set line style and color.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_CircleDraw(SYS_MODULE_INDEX gfxIndex, uint16_t x, uint16_t y, uint16_t radius);
```

Returns

Status of the circle rendering. GFX_STATUS_SUCCESS - circle rendering done. GFX_STATUS_FAILURE - circle rendering is not done.

Description

This function renders a circular shape using the center (x,y) and radius. The shape is rendered using the currently set line style by GFX_LineStyleSet(). The color used is the color set by the last call to GFX_ColorSet().

When x,y falls outside the buffer, the behavior is undefined. When color is not set before this function is called, the behavior is undefined. When any of the following x+radius, x-radius, y+radius and y-radius falls outside the buffer, the behavior is undefined.

Preconditions

Color must be set by GFX_ColorSet(). Line style must be set by GFX_LineStyleSet().

Example

```
// draw a circle using bright red solid line
GFX_LineStyleSet(GFX_INDEX_0, GFX_LINE_STYLE_THIN_SOLID);
GFX_ColorSet(GFX_INDEX_0, BRIGHTRED);
GFX_CircleDraw(GFX_INDEX_0, 50, 50, 40);
```

Parameters

Parameters	Description
x	defines the x-coordinate position of the center of the circle.
y	defines the y-coordinate position of the center of the circle.
radius	defines the radius of the circle.

Function

GFX_STATUS GFX_CircleDraw(
SYS_MODULE_INDEX gfxIndex,
uint16_t x,
uint16_t y,
uint16_t radius)

GFX_PolygonDraw Function

This function renders a polygon using the currently set line style and color.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_PolygonDraw(SYS_MODULE_INDEX gfxIndex, uint16_t numPoints, uint16_t * polyPoints);
```

Returns

Status of the polygon rendering. GFX_STATUS_SUCCESS - polygon rendering done. GFX_STATUS_FAILURE - polygon rendering is not done.

Description

This function renders a polygon using the currently set line style (see GFX_LineStyleSet()) and color (see GFX_ColorSet()). The shape of the polygon is determined by the polygon points (an ordered array of x,y pairs) where the pair count is equal to the parameter sides.

If any of the x,y pairs do not lie on the frame buffer, then the behavior is undefined. If color is not set, before this function is called, the output is undefined.

Preconditions

Color must be set by GFX_ColorSet(). Line style must be set by GFX_LineStyleSet().

Example

```
uint16_t OpenShapeXYPoints[6] = {10, 10, 20, 10, 20, 20};
uint16_t ClosedShapeXYPoints[8] = {10, 10, 20, 10, 20, 20, 10, 10};

GFX_ColorSet(GFX_INDEX_0, WHITE);                        // set color
SetLineType(GFX_INDEX_0, GFX_LINE_STYLE_THIN_DOTTED);    // set line style
GFX_PolygonDraw(GFX_INDEX_0, 3, OpenShapeXYPoints); // draw an open shape
GFX_PolygonDraw(GFX_INDEX_0, 4, ClosedShapeXYPoints);    // draw a  closed shape
```

Parameters

Parameters	Description
sides	the number of sides of the polygon.
pPoints	Pointer to the array of polygon points. The array defines the x,y points of the polygon. The sequence should be x0, y0, x1, y1, x2, y2, ... xn, yn where n is the # of polygon sides.

Function

GFX_STATUS GFX_PolygonDraw(

SYS_MODULE_INDEX gfxIndex,

uint16_t sides,

uint16_t *pPoints)

GFX_RectangleDraw Function

This function renders a rectangular shape using the currently set line style and color.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_RectangleDraw(SYS_MODULE_INDEX gfxIndex, uint16_t left, uint16_t top, uint16_t right,
uint16_t bottom);
```

Returns

Status of the rectangle rendering. GFX_STATUS_SUCCESS - rectangle rendering done. GFX_STATUS_FAILURE - rectangle rendering is not done.

Description

This function renders a rectangular shape using the given left, top, right and bottom parameters to define the shape dimension. The shape is rendered using the currently set line style by GFX_LineStyleSet(). The color used is the color set by the last call to GFX_ColorSet().

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left,top, right,bottom falls outside the frame buffer.
- Color is not set, before this function is called.
- right < left
- bottom < top

Preconditions

Color must be set by GFX_ColorSet(). Line style must be set by GFX_LineStyleSet().

Example

```
// draw a bright red rectangle
GFX_LineStyleSet(GFX_INDEX_0, GFX_LINE_STYLE_THIN_SOLID);
GFX_ColorSet(GFX_INDEX_0, BRIGHTRED);
GFX_RectangleDraw(GFX_INDEX_0, 30, 30, 88, 88, 15);

// draw a bright blue round rectangle
GFX_LineStyleSet(GFX_INDEX_0, GFX_LINE_STYLE_THIN_DASHED);
GFX_ColorSet(GFX_INDEX_0, BRIGHTBLUE);
GFX_RectangleRoundDraw(GFX_INDEX_0, 130, 30, 188, 88, 15);
```

Parameters

Parameters	Description
left	defines the left most pixel of the shape.
top	defines the top most pixel of the shape.
right	defines the right most pixel of the shape.
bottom	defines the bottom most pixel of the shape.

Function

GFX_STATUS GFX_RectangleDraw(
SYS_MODULE_INDEX gfxIndex,
uint16_t left,
uint16_t top,
uint16_t right,
uint16_t bottom)

GFX_RectangleRoundDraw Function

This function renders a rounded corner rectangular shape using the currently set line style and color.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_RectangleRoundDraw(SYS_MODULE_INDEX gfxIndex, uint16_t left, uint16_t top, uint16_t right,
uint16_t bottom, uint16_t radius);
```

Returns

Status of the rectangle rendering. GFX_STATUS_SUCCESS - rectangle rendering done. GFX_STATUS_FAILURE - rectangle rendering is not done.

Description

This function renders a rectangular shape with rounded corner using the given left, top, right, bottom and radius parameters to define the shape dimension. radius defines the rounded corner shape. The shape is rendered using the currently set line style by GFX_LineStyleSet(). The color used is the color set by the last call to GFX_ColorSet().

Left most pixel location is defined by left - radius. Top most pixel location is defined by top - radius. Right most pixel location is defined by right + radius. Bottom most pixel location is defined by bottom + radius. When radius = 0, there are no rounded corners. In this case (left,top) will define the left, top corner and (right,bottom) will define the right, bottom corner of the shape.

When left = right and top = bottom, with radius > 0, a circular object is drawn. When left < right and top < bottom and radius = 0, a rectangular object is drawn.

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left-rad , top-rad, right+rad, bottom+rad falls outside the frame buffer.
- Color is not set, before this function is called.
- right < left
- bottom < top

Preconditions

Color must be set by GFX_ColorSet(). Line style must be set by GFX_LineStyleSet().

Example

```
// draw a bright red rectangle
GFX_LineStyleSet(GFX_INDEX_0, GFX_LINE_STYLE_THIN_SOLID);
```

```
GFX_ColorSet(GFX_INDEX_0, BRIGHTRED);
GFX_RectangleDraw(GFX_INDEX_0, 30, 30, 88, 88, 15);

// draw a bright blue round rectangle
GFX_LineStyleSet(GFX_INDEX_0, GFX_LINE_STYLE_THIN_DASHED);
GFX_ColorSet(GFX_INDEX_0, BRIGHTBLUE);
GFX_RectangleRoundDraw(GFX_INDEX_0, 130, 30, 188, 88, 15);
```

Parameters

Parameters	Description
left	Along with rad (left - rad), defines the left most pixel of the shape.
top	Along with rad (top - rad), defines the top most pixel of the shape.
right	Along with rad (right + rad), defines the right most pixel of the shape.
bottom	Along with rad (bottom + rad), defines the bottom most pixel of the shape.
radius	defines the rounded corners. When this is set to zero, there will be no rounded corners.

Function

GFX_STATUS GFX_RectangleRoundDraw(
SYS_MODULE_INDEX gfxIndex,
uint16_t left,
uint16_t top,
uint16_t right,
uint16_t bottom,
uint16_t radius)

Polygon Fill Rendering Functions

Functions

	Name	Description
	GFX_BarDraw	This function renders a bar shape using the currently set fill style and color.
	GFX_CircleFillDraw	This function renders a filled circle shape using the currently set fill style and colors.
	GFX_RectangleFillDraw	This function renders a filled rectangular shape using the currently set fill style and colors.
	GFX_RectangleRoundFillDraw	This function renders a filled rectangular shape with round corners using the currently set fill style and colors.

Description

Graphics Library Primitive Layer polygon fill rendering API.

GFX_BarDraw Function

This function renders a bar shape using the currently set fill style and color.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_BarDraw(SYS_MODULE_INDEX gfxIndex, uint16_t left, uint16_t top, uint16_t right, uint16_t
bottom);
```

Returns

Status of the bar rendering. GFX_STATUS_SUCCESS - bar rendering done. GFX_STATUS_FAILURE - bar rendering failed.

Description

This function renders a bar shape with the currently set fill style (See GFX_FillStyleGet() and GFX_FillStyleSet() for details of fill style):

- solid color - when the fill style is set to GFX_FILL_STYLE_COLOR
- alpha blended fill - when the fill style is set to GFX_FILL_STYLE_ALPHA_COLOR.

Any other selected fill style will be ignored and will assume a solid color fill will be used. The parameters left, top, right bottom will define the shape dimension.

When fill style is set to GFX_FILL_STYLE_ALPHA_COLOR, the bar can also be rendered with an option to select the type of background. GFX_BACKGROUND_NONE - the bar will be rendered with no alpha blending. GFX_BACKGROUND_COLOR - the bar will be alpha blended with the currently set background color. GFX_BACKGROUND_IMAGE - the bar will be alpha blended with the currently set background image. GFX_BACKGROUND_DISPLAY_BUFFER - the bar will be alpha blended with the current contents of the frame buffer.

The background type is set by the GFX_BackgroundTypeSet().

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left,top or right,bottom falls outside the frame buffer.
- Colors are not set before this function is called.
- When right < left
- When bottom < top
- When pixel locations defined by left, top and/or right, bottom are not on the frame buffer.

Preconditions

Fill style must be set by GFX_FillStyleSet() when alpha blended fill is desired. Color must be set by GFX_ColorSet().

Example

```
// assume RED is a macro that define GFX_COLOR types
GFX_STATUS status;
// assume BackGroundImage is a valid image already draw
// on the screen
GFX_RESOURCE_HDR *pMyBackgroundImage = &BackGroundImage;

// render a RED bar
GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_COLOR);
GFX_ColorSet(GFX_INDEX_0, RED);
status = GFX_BarDraw(GFX_INDEX_0, 10, 110, 100, 200);

// render an alpha blended bar with
// the current contents of the frame buffer
GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_ALPHA_COLOR);
GFX_BackgroundTypeSet(GFX_INDEX_0, GFX_BACKGROUND_DISPLAY_BUFFER);
GFX_ColorSet(GFX_INDEX_0, RED);
status = GFX_BarDraw(GFX_INDEX_0, 10, 110, 100, 200);

// render an alpha blended bar with a background image
GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_ALPHA_COLOR);

// color value here has no effect since the background set
// is type GFX_BACKGROUND_IMAGE
GFX_BackgroundSet(GFX_INDEX_0, 0, 0, pMyBackGroundImage, 0);

GFX_BackgroundTypeSet(GFX_INDEX_0, GFX_BACKGROUND_IMAGE);
GFX_ColorSet(GFX_INDEX_0, RED);
status = GFX_BarDraw(GFX_INDEX_0, 10, 110, 100, 200);
```

Parameters

Parameters	Description
left	defines the left most pixel of the shape.
top	defines the top most pixel of the shape.
right	defines the right most pixel of the shape.
bottom	defines the bottom most pixel of the shape.

Function

GFX_STATUS GFX_BarDraw(
SYS_MODULE_INDEX gfxIndex,
uint16_t left,
uint16_t top,
uint16_t right,
uint16_t bottom)

GFX_CircleFillDraw Function

This function renders a filled circle shape using the currently set fill style and colors.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_CircleFillDraw(SYS_MODULE_INDEX gfxIndex, uint16_t x, uint16_t y, uint16_t radius);
```

Returns

Status of the circle rendering. GFX_STATUS_SUCCESS - circle fill rendering done. GFX_STATUS_FAILURE - circle fill rendering is not done.

Description

This function renders a filled circle shape with the currently set fill style (see GFX_FILL_STYLE) with the given left, top, right and bottom parameters to define the shape dimension. The shape is rendered depending on the fill style. If a flat color is used, color must be set (see GFX_ColorSet()) before calling this function. If gradient color is used, gradient start and end color must be set (see GFX_GradientColorSet()) before calling this function. After the fill style and colors are set, multiple calls to this function can be performed.

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left,top or right,bottom falls outside the frame buffer.
- Fill style is not set (GFX_FillStyleSet(), before this function is called.
- Colors are not set before this function is called.
- When the center defined by x,y is not on the frame buffer.

Preconditions

Fill style must be set by GFX_FillStyleSet(). Color must be set by GFX_ColorSet().

Example

```
// assume BLUE and RED are macros that define GFX_COLOR types
GFX_STATUS status;

GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_GRADIENT_UP);
GFX_GradientColorSet(GFX_INDEX_0, BLUE, RED);
status = GFX_CircleFillDraw(GFX_INDEX_0, 50, 110, 150, 200, 20);
if (status == GFX_STATUS_SUCCESS)
    // Filled circle was drawn.
else
    // Filled circle is not drawn or not yet
    // finished rendering. To finish the rendering call the
    // function again with the same parameters.
```

Parameters

Parameters	Description
x	defines the x-coordinate position of the center of the circle.
y	defines the y-coordinate position of the center of the circle.
radius	defines the radius of the circle.

Function

GFX_STATUS GFX_CircleFillDraw(
SYS_MODULE_INDEX gfxIndex,
uint16_t x,
uint16_t y,
uint16_t radius)

GFX_RectangleFillDraw Function

This function renders a filled rectangular shape using the currently set fill style and colors.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_RectangleFillDraw(SYS_MODULE_INDEX gfxIndex, uint16_t left, uint16_t top, uint16_t right,
uint16_t bottom);
```

Returns

Status of the rectangle rendering. GFX_STATUS_SUCCESS - rectangle fill rendering done. GFX_STATUS_FAILURE - rectangle fill rendering is not done.

Description

This function renders a filled rectangular shape with the currently set fill style (see GFX_FILL_STYLE) with the given left, top, right, and bottom parameters to define the shape dimension. The shape is rendered depending on the fill style. If a flat color is used, color must be set (see GFX_ColorSet()) before calling this function. If gradient color is used, gradient start and end color must be set (see GFX_GradientColorSet()) before calling this function. After the fill style and colors are set, multiple calls to this function can be performed.

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left,top or right,bottom falls outside the frame buffer.
- Fill style is not set (GFX_FillStyleSet(), before this function is called.
- Colors are not set before this function is called.
- When right < left
- When bottom < top
- When pixel locations defined by left, top and/or right, bottom are not on the frame buffer.

Preconditions

Fill style must be set by GFX_FillStyleSet(). Color must be set by GFX_ColorSet().

Example

```
// assume BLUE and RED are macros that define GFX_COLOR types
GFX_STATUS status;

// render a rectangle with gradient colors from BLUE to RED
GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_GRADIENT_LEFT);
GFX_GradientColorSet(GFX_INDEX_0, BLUE, RED);
status = GFX_RectangleFillDraw(GFX_INDEX_0, 10, 110, 100, 200);

// render an alpha blended rounded rectangle with
// the current contents of the frame buffer
GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_ALPHA_COLOR);
GFX_AlphaBlendingValueSet(GFX_INDEX_0, 50);
GFX_BackgroundTypeSet(GFX_INDEX_0, GFX_BACKGROUND_DISPLAY_BUFFER);
GFX_ColorSet(GFX_INDEX_0, RED);
status = GFX_RectangleRoundFillDraw(GFX_INDEX_0, 10, 110, 100, 200, 10);

// render an alpha blended rectangle with an image
GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_ALPHA_COLOR);
GFX_AlphaBlendingValueSet(5GFX_INDEX_0, 0);
GFX_BackgroundTypeSet(GFX_INDEX_0, GFX_BACKGROUND_IMAGE);
GFX_ColorSet(GFX_INDEX_0, RED);
status = GFX_RectangleFillDraw(GFX_INDEX_0, 10, 110, 100, 200);

// render a plain RED rounded rectangle
GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_COLOR);
GFX_ColorSet(GFX_INDEX_0, RED);
status = GFX_RectangleFillDraw(GFX_INDEX_0, 10, 110, 100, 200);
```

Parameters

Parameters	Description
left	defines the left most pixel of the shape.
top	defines the top most pixel of the shape.
right	defines the right most pixel of the shape.
bottom	defines the bottom most pixel of the shape.

Function

GFX_STATUS GFX_RectangleFillDraw(
SYS_MODULE_INDEX gfxIndex,
uint16_t left,
uint16_t top,
uint16_t right,
uint16_t bottom)

GFX_RectangleRoundFillDraw Function

This function renders a filled rectangular shape with round corners using the currently set fill style and colors.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_RectangleRoundFillDraw(SYS_MODULE_INDEX gfxIndex, uint16_t left, uint16_t top, uint16_t
right, uint16_t bottom, uint16_t radius);
```

Returns

Status of the rectangle rendering. GFX_STATUS_SUCCESS - rectangle fill rendering done. GFX_STATUS_FAILURE - rectangle fill rendering is not done.

Description

This function renders a filled rounded rectangular shape with the currently set fill style (see GFX_FILL_STYLE) with the given left, top, right, bottom and radius parameters to define the shape dimension. The shape is rendered depending on the fill style. If a flat color is used, color must be set (see GFX_ColorSet()) before calling this function. If gradient color is used, gradient start and end color must be set (see GFX_GradientColorSet()) before calling this function. After the fill style and colors are set, multiple calls to this function can be performed.

When left = right and top = bottom, with radius > 0, a circular object is drawn. When left < right and top < bottom and radius = 0, a rectangular object is drawn.

The rendering of this shape becomes undefined when any one of the following is true:

- Any of the following pixel locations left,top or right,bottom falls outside the frame buffer.
- Fill style is not set (GFX_FillStyleSet(), before this function is called.
- Colors are not set before this function is called.
- When right < left
- When bottom < top
- When pixel locations defined by left, top and/or right, bottom are not on the frame buffer.

Preconditions

Fill style must be set by GFX_FillStyleSet(). Color must be set by GFX_ColorSet().

Example

```
// assume BLUE and RED are macros that define GFX_COLOR types
GFX_STATUS status;

GFX_FillStyleSet(GFX_FILL_STYLE_GRADIENT_DOUBLE_VER);
GFX_GradientColorSet(BLUE, RED);
status = GFX_RectangleFillDraw(50, 110, 150, 200, 20);
if (status == GFX_STATUS_SUCCESS)
    // Filled rounded rectangle shape was drawn.
else
    // Filled rounded rectangle shape is not drawn or not yet
    // finished rendering. To finish the rendering call the
    // function again with the same parameters.
```

Parameters

Parameters	Description
left	defines the left most pixel of the shape.
top	defines the top most pixel of the shape.
right	defines the right most pixel of the shape.
bottom	defines the bottom most pixel of the shape.
radius	defines the radius of the rounded corner. A zero value will result in a rectangular shape drawn.

Function

GFX_STATUS GFX_RectangleRoundFillDraw(
SYS_MODULE_INDEX gfxIndex,
uint16_t left,
uint16_t top,
uint16_t right,
uint16_t bottom,
uint16_t radius)

Image Rendering Functions

Functions

	Name	Description
	GFX_ImageDraw	This function renders an image to the frame buffer.
	GFX_ImageHeaderGet	This function fills the given bitmap header with the image's header information.
	GFX_ImageHeightGet	This function returns the height of the given image.
	GFX_ImagePartialDraw	This function renders a portion of an image to the frame buffer.
	GFX_ImageWidthGet	This function returns the width of the given image.

Description

Graphics Library Primitive Layer image rendering API.

GFX_ImageDraw Function

This function renders an image to the frame buffer.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_ImageDraw(SYS_MODULE_INDEX gfxIndex, uint16_t left, uint16_t top, GFX_RESOURCE_HDR * pImage);
```

Returns

Status of the image rendering. GFX_STATUS_SUCCESS - image rendering done. GFX_STATUS_FAILURE - image rendering failed.

Description

This function renders an image to the frame buffer with the left-top corner of the image located at given left, top parameters.

The rendering of this shape becomes undefined when any one of the following is true:

- left, top pixel position falls outside the frame buffer.
- pointer is not properly initialized to a GFX_RESOURCE_HDR object.

Preconditions

None.

Example

```
// assume the backgroundImage has dimension of 320x240 pixels.
GFX_RESOURCE_HDR *pBackgroundImage;

pBackgroundImage = (GFX_RESOURCE_HDR *)&backgroundImage;

// Render the image starting from (10,10) x,y position

// corner of the image
GFX_ImageDraw(  GFX_INDEX_0, 10, 10,
                pBackgroundImage);
```

Parameters

Parameters	Description
left	Horizontal starting position of the image.
top	Vertical starting position of the image.
pImage	Pointer to the image to be rendered.

Function

```
GFX_STATUS GFX_ImageDraw(
                SYS_MODULE_INDEX gfxIndex,
uint16_t left,
uint16_t top,
                GFX_RESOURCE_HDR *pImage)
```

GFX_ImageHeaderGet Function

This function fills the given bitmap header with the image's header information.

File

gfx_primitive.h

C

```
inline void GFX_ImageHeaderGet(GFX_RESOURCE_HDR * pImage, GFX_MCHP_BITMAP_HEADER * pBitmapHdr);
```

Returns

None.

Description

This function fills the given bitmap header with the image's header information. This function results in an undefined behavior if the pointer to the image is invalid.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
pImage	Pointer to the image.
pBitmap	Pointer to the destination of the header information.

Function

GFX_STATUS GFX_ImageHeaderGet(
GFX_RESOURCE_HDR *pImage,
GFX_MCHP_BITMAP_HEADER *pBitmapHdr)

GFX_ImageHeightGet Function

This function returns the height of the given image.

File

gfx_primitive.h

C

```
inline int16_t GFX_ImageHeightGet(GFX_RESOURCE_HDR * pImage);
```

Returns

The image height in pixels.

Description

This function returns the height of the given image in pixels. This function results in an undefined behavior if the pointer to the image is invalid.

This function return value is undefined if the given pointer does not point to a valid image resource.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
pImage	Pointer to the image.

Function

GFX_STATUS GFX_ImageHeightGet(
GFX_RESOURCE_HDR *pImage)

GFX_ImagePartialDraw Function

This function renders a portion of an image to the frame buffer.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_ImagePartialDraw(SYS_MODULE_INDEX gfxIndex, uint16_t destination_x, uint16_t destination_y,
uint16_t source_x_offset, uint16_t source_y_offset, uint16_t source_width, uint16_t source_height,
GFX_RESOURCE_HDR * pImage);
```

Returns

Status of the image rendering. GFX_STATUS_SUCCESS - image rendering done. GFX_STATUS_FAILURE - image rendering failed.

Description

This function renders an image or a portion of an image to the frame buffer with the top, left corner of the image located at destination_x, destination_y. To render a full image, source_x_offset, source_y_offset, width and height are set to all 0. Using the actual image's width and height will also work if these are known. If they are not known, avoid the extra extra step to get the image's width and height by assigning 0 to the parameters. Another way to render a full image is to use the GFX_ImageDraw(). The image to be rendered is defined by the pointer pImage.

The rendering of this shape becomes undefined when any one of the following is true:

- destination_x, destination_y pixel position falls outside the frame buffer.
- source_x_offset, source_y_offset results in a starting position beyond the image's dimension.
- source_width and/or source_height is larger than the actual image's width and height.
- pointer is not properly initialized to a GFX_RESOURCE_HDR object.

Preconditions

None.

Example

```
// assume the backgroundImage has dimension of 320x240 pixels.
GFX_RESOURCE_HDR *pBackgroundImage;

pBackgroundImage = (GFX_RESOURCE_HDR *)&backgroundImage;

// Render only 1/4 of the image. Render the lower right
// corner of the image
GFX_ImagePartialDraw(   GFX_INDEX_0, 10, 10,
                        320/2,
                        240/2,
                        320/2,
                        240/2,
                        pBackgroundImage);
```

Parameters

Parameters	Description
destination_x	Horizontal starting position of the image.
destination_y	Vertical starting position of the image.
source_x_offset	Horizontal offset in pixels of the starting position of the partial area of the image to be rendered. Set to 0 along with source_y_offset when rendering the full image.
source_y_offset	Vertical offset in pixels of the starting position of the partial area of the image to be rendered. Set to 0 along with source_x_offset when rendering the full image.GFX_ImageDraw
source_width	The width of the partial area of the image to be rendered. Set to 0 along with source_height when rendering the full image.
source_height	The height of the partial area of the image to be rendered. Set to 0 along with source_width when rendering the full image.
pImage	Pointer to the image to be rendered.

Function

GFX_STATUS GFX_ImagePartialDraw(

SYS_MODULE_INDEX gfxIndex,

uint16_t destination_x,

uint16_t destination_y,

uint16_t source_x_offset,
uint16_t source_y_offset,
uint16_t source_width,
uint16_t source_height,
GFX_RESOURCE_HDR *pImage)

GFX_ImageWidthGet Function

This function returns the width of the given image.

File

gfx_primitive.h

C

```
inline int16_t GFX_ImageWidthGet(GFX_RESOURCE_HDR * pImage);
```

Returns

The image width in pixels.

Description

This function returns the width of the given image in pixels. This function results in an undefined behavior if the pointer to the image is invalid.

This function return value is undefined if the given pointer does not point to a valid image resource.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
pImage	Pointer to the image.

Function

GFX_STATUS GFX_ImageWidthGet(
GFX_RESOURCE_HDR *pImage)

Text Rendering Functions

Functions

	Name	Description
	GFX_FontAntiAliasGet	This function returns the current font font anti-aliasing mode.
	GFX_FontAntiAliasSet	This function sets the font anti-aliasing mode.
	GFX_FontSet	This function sets the current font used when rendering strings and characters.
	GFX_FontGet	This function returns the current font used when rendering strings and characters.
	GFX_TextCharDraw	This function renders the given character using the currently set color using the currently set font.
	GFX_TextCursorPositionSet	This function sets the text cursor to a new position.
	GFX_TextCursorPositionXGet	This function returns the current x position of the text cursor.
	GFX_TextCursorPositionYGet	This function returns the current y position of the text cursor.
	GFX_TextStringBoxDraw	This function renders the given string using the currently set color and font into a rectangular area.
	GFX_TextStringDraw	This function renders the given string of character using the currently set color using the currently set font.
	GFX_TextStringHeightGet	This function returns the height of the given font.
	GFX_TextStringWidthGet	This function returns the width of the given string using the given font.
	GFX_TextCursorDraw	This is function GFX_TextCursorDraw.
	GFX_TextCursorTypeGet	This is function GFX_TextCursorTypeGet.
	GFX_TextCursorTypeSet	This is function GFX_TextCursorTypeSet.
	GFX_TextCursorWidthGet	This is function GFX_TextCursorWidthGet.

Description

Graphics Library Primitive Layer text rendering API.

GFX_FontAntiAliasGet Function

This function returns the current font font anti-aliasing mode.

File

gfx_primitive.h

C

```
GFX_FONT_ANTIALIAS_TYPE GFX_FontAntiAliasGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The font anti-aliasing mode used.

Description

This function returns the font anti-aliasing mode used when rendering anti-aliased strings and characters. Default setting at initialization is GFX_FONT_ANTIALIAS_OPAQUE.

Preconditions

None.

Example

```
extern const GFX_RESOURCE_HDR antiAliasedFont25;
uint16_t width, height;
GFX_XCHAR myString[] = "Microchip Technology Inc.";

if (GFX_FontAntiAliasGet(GFX_INDEX_0) != GFX_FONT_ANTIALIAS_OPAQUE)
    GFX_FontAntiAliasSet(GFX_INDEX_0, GFX_FONT_ANTIALIAS_OPAQUE);

GFX_FontSet(GFX_INDEX_0, (GFX_RESOURCE_HDR*) &antiAliasedFont25);
GFX_ColorSet(GFX_INDEX_0, GFX_X11_GREEN);
width = GFX_TextStringWidthGet(myString, (GFX_RESOURCE_HDR*) &Font25);
height = GFX_TextStringHeightGet((GFX_RESOURCE_HDR*) &antiAliasedFont25);

GFX_TextStringDraw( GFX_INDEX_0, (GFX_MaxXGet() - width) >> 1,
                    (GFX_MaxYGet() - height) >> 1,
                    myString,
                    0);
```

Function

GFX_FONT_ANTIALIAS_TYPE GFX_FontAntiAliasGet(SYS_MODULE_INDEX gfxIndex)

GFX_FontAntiAliasSet Function

This function sets the font anti-aliasing mode.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_FontAntiAliasSet(SYS_MODULE_INDEX gfxIndex, GFX_FONT_ANTIALIAS_TYPE type);
```

Returns

The status of the set anti-aliasing mode action.

Description

This function sets the font anti-aliasing mode used when rendering anti-aliased strings and characters.

Preconditions

None.

Example

```
extern const GFX_RESOURCE_HDR antiAliasedFont25;
uint16_t width, height;
```

```
GFX_XCHAR myString[] = "Microchip Technology Inc.";

GFX_FontAntiAliasSet(GFX_INDEX_0, GFX_FONT_ANTIALIAS_TRANSLUCENT);
GFX_FontSet(GFX_INDEX_0, (GFX_RESOURCE_HDR*) &antiAliasedFont25);
GFX_ColorSet(GFX_INDEX_0, GFX_X11_GREEN);
width = GFX_TextStringWidthGet( myString,
                                (GFX_RESOURCE_HDR*) &Font25);
height = GFX_TextStringHeightGet((GFX_RESOURCE_HDR*) &antiAliasedFont25);

GFX_TextStringDraw( GFX_INDEX_0, (GFX_MaxXGet() - width) >> 1,
                    (GFX_MaxYGet() - height) >> 1,
                    myString,
                    0);
```

Parameters

Parameters	Description
type	anti-aliasing mode selected. See GFX_FONT_ANTIALIAS_TYPE for details.

Function

GFX_STATUS GFX_FontAntiAliasSet(
SYS_MODULE_INDEX gfxIndex,
GFX_FONT_ANTIALIAS_TYPE type)

GFX_FontSet Function

This function sets the current font used when rendering strings and characters.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_FontSet(SYS_MODULE_INDEX gfxIndex, GFX_RESOURCE_HDR * pFont);
```

Returns

The status of the set font action.

Description

This function sets the current font used to render strings and characters.

Preconditions

None.

Example

```
extern const GFX_RESOURCE_HDR Font25;
uint16_t width, height;
GFX_XCHAR myString[] = "Microchip Technology Inc.";

GFX_FontSet(GFX_INDEX_0, (GFX_RESOURCE_HDR*) &Font25);
GFX_ColorSet(GFX_INDEX_0, GFX_X11_GREEN);
width = GFX_TextStringWidthGet(myString, (GFX_RESOURCE_HDR*) &Font25);
height = GFX_TextStringHeightGet((GFX_RESOURCE_HDR*) &Font25);

GFX_TextStringDraw( GFX_INDEX_0, (GFX_MaxXGet() - width) >> 1,
                    (GFX_MaxYGet() - height) >> 1,
                    myString,
                    0);
```

Parameters

Parameters	Description
pFont	pointer to the font to be used.

Function

GFX_STATUS GFX_FontSet(
SYS_MODULE_INDEX gfxIndex,
GFX_RESOURCE_HDR *pFont)

GFX_FontGet Function

This function returns the current font used when rendering strings and characters.

File

gfx_primitive.h

C

```
GFX_RESOURCE_HDR* GFX_FontGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The pointer to the current font used in rendering strings and characters.

Description

This function returns the current font used to render strings and characters.

Preconditions

GFX_FontSet() must be called prior to any call to this function. If this function is called first, the returned value is undefined.

Example

None.

Function

GFX_RESOURCE_HDR GFX_FontGet(SYS_MODULE_INDEX gfxIndex)

GFX_TextCharDraw Function

This function renders the given character using the currently set color using the currently set font.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_TextCharDraw(SYS_MODULE_INDEX gfxIndex, GFX_XCHAR ch);
```

Returns

The status of the character rendering. GFX_STATUS_SUCCESS - the character was rendered GFX_STATUS_FAILURE - the character was not rendered, function must be called again to render the character. GFX_STATUS_ERROR - the character ID passed is not a valid or points to the character glyph that does does not exist on the font table.

Description

This function renders the given character using the currently set font, and color to the location defined by the text cursor position. The color is set by GFX_ColorSet() while the font is set by GFX_FontSet(). The text cursor position is set by GFX_TextCursorPositionSet()

The rendering of the character becomes undefined when any one of the following is true:

- Text cursor position is set to locations outside the frame buffer.
- Color is not set, before this function is called.
- Font is not set, before this function is called.

Preconditions

Color must be set by GFX_ColorSet(). Font must be set by GFX_FontSet(). Text cursor position must be set by GFX_TextCursorPositionSet().

Example

```
// assume textString is a string of characters
// assume WHITE is a valid GFX_COLOR data
// assume pMyFont is a valid initialized font resource pointer
static uint16_t counter = 0;
GFX_XCHAR   ch;
GFX_STATUS  status;

GFX_ColorSet(GFX_INDEX_0, WHITE);
GFX_FontSet(GFX_INDEX_0, pMyFont);

// render characters until null character
while((GFX_XCHAR)(ch = *(textString + counter)) != 0)
{
```

```
        status = GFX_TextCharDraw(GFX_INDEX_0, ch);
        if (status != GFX_STATUS_SUCCESS)
            return (GFX_STATUS_FAILURE);
        counter++;
    }
```

Parameters

Parameters	Description
ch	character ID that of the character that will be rendered.

Function

GFX_STATUS GFX_TextCharDraw(
SYS_MODULE_INDEX gfxIndex,
GFX_XCHAR ch)

GFX_TextCursorPositionSet Function

This function sets the text cursor to a new position.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_TextCursorPositionSet(SYS_MODULE_INDEX gfxIndex, int16_t x, int16_t y);
```

Returns

Status of the text cursor position set. GFX_STATUS_SUCCESS - text cursor position set done. GFX_STATUS_FAILURE - text cursor position set is not done.

Description

This function sets the text cursor to a new (x,y) position. Text cursor is used as a starting point of the character rendered by the GFX_TextCharDraw() function.

If x and/or y does not lie on the frame buffer, then the behavior of GFX_TextCharDraw() function is undefined.

Preconditions

None.

Example

```
GFX_TextCursorPositionSet(GFX_INDEX_0, 10,10);
// write letter 'A' starting from 10, 10 position
GFX_TextCharDraw(GFX_INDEX_0, 'A');
```

Parameters

Parameters	Description
x	new x coordinate position of the text cursor.
y	new y coordinate position of the text cursor.

Function

GFX_STATUS GFX_TextCursorPositionSet(
SYS_MODULE_INDEX gfxIndex,
int16_t x,
int16_t y)

GFX_TextCursorPositionXGet Function

This function returns the current x position of the text cursor.

File

gfx_primitive.h

C

```
int16_t GFX_TextCursorPositionXGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current text cursor x position.

Description

This function returns the current x position of the text cursor. Text cursor is used as a starting point of the line rendered by the GFX_TextCharDraw() function.

Preconditions

None.

Example

None.

Function

int16_t GFX_TextCursorPositionXGet(SYS_MODULE_INDEX gfxIndex)

GFX_TextCursorPositionYGet Function

This function returns the current y position of the text cursor.

File

gfx_primitive.h

C

```
int16_t GFX_TextCursorPositionYGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current text cursor y position.

Description

This function returns the current y position of the text cursor. Text cursor is used as a starting point of the line rendered by the GFX_TextCharDraw() function.

Preconditions

None.

Example

None.

Function

int16_t GFX_TextCursorPositionYGet(SYS_MODULE_INDEX gfxIndex)

GFX_TextStringBoxDraw Function

This function renders the given string using the currently set color and font into a rectangular area.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_TextStringBoxDraw(SYS_MODULE_INDEX gfxIndex, uint16_t x, uint16_t y, uint16_t width,
uint16_t height, GFX_XCHAR * pString, uint16_t length, GFX_ALIGNMENT align);
```

Returns

The status of the string rendering. GFX_STATUS_SUCCESS - the string was rendered GFX_STATUS_FAILURE - the string was not rendered, or is not yet finished. The function must be called again to render the remaining characters or lines.

Description

This function renders the given string using the currently color and font into the rectangular area defined by the given parameters x,y, width and height. The x,y parameters defines the left, top pixel position of the rectangular area. The width and height defines the size of the rectangular area. The rectangular area will define the area where the text will be rendered. Meaning all pixels EXCLUSIVE of the defined rectangle will be the rendering area for the text. If the given string exceeds the rectangular area, any pixels falling outside and along the defined rectangle (INCLUSIVE of the rectangle) will not be drawn.

The color is set by GFX_ColorSet() while the font is set by GFX_FontSet().

Multiple lines of strings can be rendered. To define string composed of multiple lines, end each line with a new line character (character ID 0x0A). Each line will be rendered according to the text alignment (See GFX_TEXT_ALIGNMENT).

When the length parameter is set to 0, the string will be rendered until the null character is reached. When the length parameter is greater than 0, the string will be rendered until one of the following cases occurs:

- null character is reached before the total rendered characters is less than the value of length
- total rendered characters is equal to the value of length before the null character is reached.

The rendering of the character becomes undefined when any one of the following is true:

- x, y, width and height defines an area partially or fully outside outside the frame buffer.
- Color is not set, before this function is called.
- Font is not set, before this function is called.

Preconditions

Color must be set by GFX_ColorSet(). Font must be set by GFX_FontSet().

Example

```
// assume APP_DEMO_FONT to be a valid font resource
GFX_XCHAR StringMsg[] = "Hello World";

GFX_ColorSet(GFX_INDEX_0, BLACK);
GFX_ScreenClear(GFX_INDEX_0);

GFX_ColorSet(GFX_INDEX_0, WHITE);
GFX_FontSet(GFX_INDEX_0, (GFX_RESOURCE_HDR*)&APP_DEMO_FONT);

// displayed message will be centered on the screen
while(GFX_TextStringBoxDraw( GFX_INDEX_0, 0, 0,
                             GFX_MaxXGet(), GFX_MaxYGet(),
                             StringMsg,
                             0, GFX_ALIGN_CENTER) !=
        GFX_STATUS_SUCCESS);
```

Parameters

Parameters	Description
x	Horizontal starting position of the rectangular area.
y	Vertical position position of the rectangular area.
width	Defines the width of the rectangular area.
height	Defines the height of the rectangular area.
pString	Pointer to the location of the string that will be rendered. String can have multiple lines where each line is terminated by a new line character.
length	Total number of characters to be rendered. When set to 0, the function will terminate until the null character is detected.
align	The alignment of the rendered text.

Function

```
GFX_STATUS FX_TextStringBoxDraw(
                SYS_MODULE_INDEX gfxIndex,
uint16_t x,
uint16_t y,
uint16_t width,
uint16_t height,
                GFX_XCHAR *pString,
uint16_t length,
                GFX_ALIGNMENT align)
```

GFX_TextStringDraw Function

This function renders the given string of character using the currently set color using the currently set font.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_TextStringDraw(SYS_MODULE_INDEX gfxIndex, uint16_t x, uint16_t y, GFX_XCHAR * pString,
uint16_t length);
```

Returns

The status of the string rendering. GFX_STATUS_SUCCESS - the string was rendered GFX_STATUS_FAILURE - the string was not rendered, or is not yet finished. The function must be called again to render the remaining characters.

Description

This function renders the given string of character using the currently set font, and color to the location defined by the given x,y position. The color is set by GFX_ColorSet() while the font is set by GFX_FontSet().

The text rendered by this function is always left aligned. When a newline character is encountered, the next character after the newline character will be rendered left aligned on the next line. The next line position is determined by the height of the font used.

When the length parameter is set to 0, the string will be rendered until the null character is reached. When the length parameter is greater than 0, the string will be rendered until one of the following cases occurs:

- null character is reached before the total rendered characters is less than the value of length
- total rendered characters is equal to the value of length before the null character is reached.

The rendering of the character becomes undefined when any one of the following is true:

- x,y position is set to locations outside the frame buffer.
- Color is not set, before this function is called.
- Font is not set, before this function is called.

Preconditions

Color must be set by GFX_ColorSet(). Font must be set by GFX_FontSet().

Example

```
// assume WHITE is a valid GFX_COLOR data
// assume pMyFont is a valid initialized font resource pointer

static uint16_t counter = 0;
GFX_XCHAR   charArray[] = "Test String";
GFX_XCHAR   pChar = NULL;
GFX_STATUS  status;

GFX_ColorSet(GFX_INDEX_0, WHITE);
GFX_FontSet(GFX_INDEX_0, pMyFont);

// render the whole string
GFX_TextStringDraw(GFX_INDEX_0, 10, 10, charArray, 0);

// render ONLY the "Test" portion of the string
GFX_TextStringDraw(GFX_INDEX_0, 10, 30, charArray, 4);

// render ONLY the "String" portion of the string
pChar = charArray;
pChar += 5;
GFX_TextStringDraw(GFX_INDEX_0, 10, 50, pChar, 0);

// doing this also renders ONLY the "String" portion of the string
GFX_TextStringDraw(GFX_INDEX_0, 10, 70, pChar, 6);
```

Parameters

Parameters	Description
x	Horizontal starting position of the string.
y	Vertical position position of the string.
pString	Pointer to the location of the string that will be rendered.
length	Total number of characters to be rendered. When set to 0, the function will terminate until the null character is detected.

Function

GFX_STATUS GFX_TextStringDraw(
SYS_MODULE_INDEX gfxIndex,

uint16_t x,
uint16_t y,
GFX_XCHAR *pString,
uint16_t length)

GFX_TextStringHeightGet Function

This function returns the height of the given font.

File

gfx_primitive.h

C

```
inline uint16_t GFX_TextStringHeightGet(GFX_RESOURCE_HDR * pFont);
```

Returns

The height of the specified font in pixels.

Description

This function returns the height of the given font in pixels. The given font must be present in the system.

This function return value is undefined if the given pointer does not point to a valid font.

Preconditions

None.

Example

```
// assume pMyFont is a pointer initialized to a valid font
uint16_t height, x, y;

// center the text on the screen

height = GFX_TextStringHeightGet(pMyFont);
width  = GFX_TextStringWidthGet (   (GFX_XCHAR *)"Hello World",
                                     pMyFont
                                 );
y = (GFX_MaxYGet() - height) >> 1;
x = (GFX_MaxXGet() - width) >> 1;
GFX_TextStringDraw(GFX_INDEX_0, x, y, (GFX_XCHAR *)"Hello World");

GFX_TextStringDraw(GFX_INDEX_0, x, y, (GFX_XCHAR *)"Hello World");
```

Parameters

Parameters	Description
pFont	Pointer to the specified font.

Function

uint16_t GFX_TextStringHeightGet(
GFX_RESOURCE_HDR *pFont);

GFX_TextStringWidthGet Function

This function returns the width of the given string using the given font.

File

gfx_primitive.h

C

```
uint16_t GFX_TextStringWidthGet(GFX_XCHAR * textString, GFX_RESOURCE_HDR * pFont);
```

Returns

The width of the specified string using the specified font in pixels.

Description

This function returns the width of the given string using the given font in pixels. The given font must be present in the system.

The pixel length is measured from the first printable character until the last printable character. This means that if the string is composed of

multiple lines, the length returned is only valid for the first line of characters.

This function return value is undefined if the given pointer does not point to a valid font or one or more characters in the given string does not exist on the given font.

Preconditions

None.

Example

```
// assume pMyFont is a pointer initialized to a valid font
uint16_t height, x, y;

// center the text on the screen

height = GFX_TextStringHeightGet(GFX_INDEX_0, pMyFont);
width  = GFX_TextStringWidthGet (GFX_INDEX_0,    (GFX_XCHAR *)"Hello World",
                                      pMyFont
                                );
y = (GFX_MaxYGet() - height) >> 1;
x = (GFX_MaxXGet() - width) >> 1;
GFX_TextStringDraw(GFX_INDEX_0, x, y, (GFX_XCHAR *)"Hello World");
```

Parameters

Parameters	Description
pString	Pointer to the specified string.
pFont	Pointer to the specified font.

Function

uint16_t GFX_TextStringWidthGet(
GFX_XCHAR* pString,
GFX_RESOURCE_HDR *pFont);

GFX_TextCursorDraw Function

File

gfx_primitive.h

C

```
GFX_STATUS GFX_TextCursorDraw(SYS_MODULE_INDEX gfxIndex, uint16_t x, uint16_t y, uint16_t cursorWidth,
uint16_t cursorHeight);
```

Description

This is function GFX_TextCursorDraw.

GFX_TextCursorTypeGet Function

File

gfx_primitive.h

C

```
GFX_TEXT_CURSOR_TYPE GFX_TextCursorTypeGet(SYS_MODULE_INDEX gfxIndex);
```

Description

This is function GFX_TextCursorTypeGet.

GFX_TextCursorTypeSet Function

File

gfx_primitive.h

C

```
GFX_STATUS GFX_TextCursorTypeSet(SYS_MODULE_INDEX gfxIndex, GFX_TEXT_CURSOR_TYPE textCursorType);
```

Description

This is function GFX_TextCursorTypeSet.

GFX_TextCursorWidthGet Function

File

gfx_primitive.h

C

```
int16_t GFX_TextCursorWidthGet(SYS_MODULE_INDEX gfxIndex);
```

Description

This is function GFX_TextCursorWidthGet.

Rendering Style Functions

Functions

	Name	Description
	GFX_FillStyleGet	Return the fill style used when rendering filled shapes.
	GFX_FillStyleSet	Set the fill style to be used when rendering filled shapes.
	GFX_AlphaBlendingValueGet	This function returns the current alpha value set for alpha blending rendering.
	GFX_AlphaBlendingValueSet	This function sets the alpha value for alpha blending rendering.
	GFX_GradientColorSet	Sets the gradient fill start and end color.
	GFX_GradientEndColorGet	Return the gradient end color when rendering gradient filled shapes.
	GFX_GradientStartColorGet	Return the gradient start color when rendering gradient filled shapes.
	GFX_LineStyleGet	Return the line style used when rendering lines.
	GFX_LineStyleSet	Set the line style to be used when rendering lines.

Description

Graphics Library Primitive Layer rendering style API.

GFX_FillStyleGet Function

Return the fill style used when rendering filled shapes.

File

gfx_primitive.h

C

```
GFX_FILL_STYLE GFX_FillStyleGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current fill style used (see GFX_FILL_STYLE).

Description

This function returns the fill style used (see GFX_FILL_STYLE) when rendering filled shapes.

Preconditions

None.

Example

None.

Function

GFX_FILL_STYLE GFX_FillStyleGet(SYS_MODULE_INDEX gfxIndex)

GFX_FillStyleSet Function

Set the fill style to be used when rendering filled shapes.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_FillStyleSet(SYS_MODULE_INDEX gfxIndex, GFX_FILL_STYLE style);
```

Returns

Status of the fill style set. GFX_STATUS_SUCCESS - fill style set done. GFX_STATUS_FAILURE - fill style set failed.

Description

This function sets the fill style to be used (see GFX_FILL_STYLE) when rendering filled shapes. All calls to the following:

- GFX_RectangleFillDraw()
- GFX_RectangleRoundFillDraw()
- GFX_CircleFillDraw()

will use the fill style set by this function.

Preconditions

None.

Example

```
GFX_GradientColorSet(BRIGHTRED, BRIGHTBLUE);

GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_GRADIENT_DOWN);
GFX_RectangleFillDraw(GFX_INDEX_0,   10, 10,  100,  100);

GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_GRADIENT_UP);
GFX_RectangleFillDraw(GFX_INDEX_0,  110, 10,  200,  100);

GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_GRADIENT_RIGHT);
GFX_RectangleFillDraw( GFX_INDEX_0, 210, 10,  300,  100);

GFX_FillStyleSet(GFX_INDEX_0, GFX_FILL_STYLE_GRADIENT_LEFT);
GFX_RectangleFillDraw(GFX_INDEX_0,   10, 110,  100,  200);
```

Parameters

Parameters	Description
style	The specified fill style to be used.

Function

GFX_STATUS GFX_FillStyleSet(
SYS_MODULE_INDEX gfxIndex,
GFX_FILL_STYLE style)

GFX_AlphaBlendingValueGet Function

This function returns the current alpha value set for alpha blending rendering.

File

gfx_primitive.h

C

```
uint16_t GFX_AlphaBlendingValueGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The alpha blending value.

Description

This function returns the current alpha value set for alpha blending rendering. See GFX_AlphaBlendingValueSet() for details of alpha blending values.

Preconditions

None.

Example

None.

Function

uint16_t GFX_AlphaBlendingValueGet(SYS_MODULE_INDEX gfxIndex)

GFX_AlphaBlendingValueSet Function

This function sets the alpha value for alpha blending rendering.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_AlphaBlendingValueSet(SYS_MODULE_INDEX gfxIndex, uint16_t alpha);
```

Returns

Status of the alpha value set action. Return GFX_STATUS_ERROR when the alpha value set is unsupported.

Description

This function sets the alpha value for alpha blending rendering. Accepted values are dependent on the used alpha blending routines at build time. When using the software routines in the Primitive Layer, accepted values are 0, 25, 50, 75 and 100.

If using a specific implementation in the display driver used, implementation may support the full range (0-100). When this is the case, refer to the driver alpha blending solution for details.

Function operation will ignore unsupported values of alpha.

Preconditions

None.

Example

```
// render a bar with no alpha blending
GFX_AlphaBlendingValueSet(GFX_INDEX_0, 100);
while(GFX_RectangleFillDraw(GFX_INDEX_0, 10,10,30,30) != GFX_STATUS_SUCCESS);

// render a bar with 50% alpha blending to a
// background with RED color
GFX_BackgroundSet(GFX_INDEX_0, x, y, pBgImage, RED);
GFX_BackgroundTypeSet(GFX_INDEX_0, GFX_BACKGROUND_COLOR);

GFX_AlphaBlendingValueSet(GFX_INDEX_0, 50);
while(GFX_RectangleFillDraw(GFX_INDEX_0, 10,40,30,60) != GFX_STATUS_SUCCESS);
```

Parameters

Parameters	Description
alpha	Defines the alpha blending percentage to be used for alpha blending routines. Accepted values are dependent on the alpha blending routines used. For Primitive Layer
implementation accepted values are	• 100 : no alpha blending, last color set by GFX_ColorSet() will replace the pixels. • 75 : 75% of the last color set by GFX_ColorSet() will be alpha blended to the existing pixel. • 50 : 50% of the last color set by GFX_ColorSet() will be alpha blended to the existing pixel. • 25 : 25% of the last color set by GFX_ColorSet() will be alpha blended to the existing pixel. • 0 : 0% of the last color set by GFX_ColorSet() will be alpha blended to the existing pixel. This means the existing pixel color will not change.

Function

GFX_STATUS GFX_AlphaBlendingValueSet(
SYS_MODULE_INDEX gfxIndex, uint16_t alpha)

GFX_GradientColorSet Function

Sets the gradient fill start and end color.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_GradientColorSet(SYS_MODULE_INDEX gfxIndex, GFX_COLOR startColor, GFX_COLOR endColor);
```

Returns

Status of the color set. GFX_STATUS_SUCCESS - gradient color set done. GFX_STATUS_FAILURE - gradient color set failed.

Description

This function sets the gradient fill start and end colors (see GFX_FILL_STYLE) when rendering gradient filled shapes. All subsequent calls to the following using gradient fills:

- GFX_RectangleFillDraw()
- GFX_RectangleRoundFillDraw()
- GFX_CircleFillDraw()

will use the start and end colors set by this function.

Preconditions

None.

Example

See GFX_FillStyleSet().

Parameters

Parameters	Description
startColor	Gradient start color to be used.
endColor	Gradient end color to be used.

Function

GFX_STATUS GFX_GradientColorSet(
SYS_MODULE_INDEX gfxIndex,
GFX_COLOR startColor,
GFX_COLOR endColor)

GFX_GradientEndColorGet Function

Return the gradient end color when rendering gradient filled shapes.

File

gfx_primitive.h

C

```
GFX_COLOR GFX_GradientEndColorGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current gradient end color used.

Description

This function returns the end color used when rendering gradient filled shapes.

Preconditions

None.

Example

None.

Function

GFX_COLOR GFX_GradientEndColorGet(void)

GFX_GradientStartColorGet Function

Return the gradient start color when rendering gradient filled shapes.

File

gfx_primitive.h

C

```
GFX_COLOR GFX_GradientStartColorGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current gradient start color used.

Description

This function returns the start color used when rendering gradient filled shapes.

Preconditions

None.

Example

None.

Function

GFX_COLOR GFX_GradientStartColorGet(SYS_MODULE_INDEX gfxIndex)

GFX_LineStyleGet Function

Return the line style used when rendering lines.

File

gfx_primitive.h

C

```
GFX_LINE_STYLE GFX_LineStyleGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current line style used (see GFX_LINE_STYLE).

Description

This function returns the line style used (see GFX_LINE_STYLE) when rendering lines.

Preconditions

None.

Example

None.

Function

GFX_LINE_STYLE GFX_LineStyleGet(SYS_MODULE_INDEX gfxIndex)

GFX_LineStyleSet Function

Set the line style to be used when rendering lines.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_LineStyleSet(SYS_MODULE_INDEX gfxIndex, GFX_LINE_STYLE style);
```

Returns

Status of the line style set. GFX_STATUS_SUCCESS - line setting done. GFX_STATUS_FAILURE - line setting not done.

Description

This function sets the line style to be used (see GFX_LINE_STYLE) when rendering lines. All calls to the following functions

- GFX_LineDraw()
- GFX_LineToDraw()
- GFX_LineToRelativeDraw()
- GFX_CircleDraw()
- GFX_RectangleDraw()
- GFX_PolygonDraw()

will use the line style set by this function. In addition, all unfilled shapes that does specify the line style to be used will use the line style specified by this function.

Preconditions

None.

Example

```
GFX_ColorSet(GFX_INDEX_0, BRIGHTRED);
GFX_LineStyleSet(GFX_INDEX_0, GFX_LINE_STYLE_THIN_SOLID);
GFX_LineDraw(GFX_INDEX_0, 10, 10,100,  10);
```

Parameters

Parameters	Description
style	The specified line style to be used.

Function

GFX_STATUS GFX_LineStyleSet(
SYS_MODULE_INDEX gfxIndex,
GFX_LINE_STYLE style)

Color Functions

Functions

	Name	Description
	GFX_ColorGet	This function returns the color currently set to render primitive shapes and text.
	GFX_ColorSet	This function sets the color to be used in rendering primitive shapes and text.
	GFX_TransparentColorDisable	This function disables the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.
	GFX_TransparentColorEnable	This function sets the transparent color used in GFX_ImageDraw() functions and enables the transparent color feature.
	GFX_TransparentColorGet	This returns the current transparent color set for the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.
	GFX_TransparentColorStatusGet	This returns the current state of the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.

Description

Graphics Library Primitive Layer color API.

GFX_ColorGet Function

This function returns the color currently set to render primitive shapes and text.

File

gfx_primitive.h

C

```
GFX_COLOR GFX_ColorGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The currently set color.

Description

This function returns the color currently set to render primitive shapes and text (See GFX_ColorSet() for more information).

Preconditions

None.

Example

None.

Function

void GFX_ColorGet(SYS_MODULE_INDEX gfxIndex)

GFX_ColorSet Function

This function sets the color to be used in rendering primitive shapes and text.

File

gfx_primitive.h

C

```
void GFX_ColorSet(SYS_MODULE_INDEX gfxIndex, GFX_COLOR newColor);
```

Returns

None.

Description

This function sets the color to be used to render primitive shapes and text. Any primitive shape that is set to any of the following line style and fill style will be rendering using the set color.

GFX_LINE_STYLE:

- GFX_LINE_STYLE_THIN_SOLID
- GFX_LINE_STYLE_THIN_DOTTED
- GFX_LINE_STYLE_THIN_DASHED
- GFX_LINE_STYLE_THICK_SOLID
- GFX_LINE_STYLE_THICK_DOTTED
- GFX_LINE_STYLE_THICK_DASHED

GFX_FILL_STYLE:

- GFX_FILL_STYLE_COLOR

Rendering text using the following text rendering functions will also use the set color:

- GFX_TextCharDraw()
- GFX_TextStringDraw()
- GFX_TextStringBoxDraw()

Preconditions

None.

Example

None.

Parameters

Parameters	Description
color	the rendering color set to render primitive shapes.

Function

void GFX_ColorSet(SYS_MODULE_INDEX gfxIndex, GFX_COLOR color)

GFX_TransparentColorDisable Function

This function disables the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_TransparentColorDisable(SYS_MODULE_INDEX gfxIndex);
```

Returns

The status of the transparent color disable action.

Description

This function disables the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.

The transparent color feature can only be enabled when the color depth used is 24 or 16 bpp.

Preconditions

Transparent color feature must be enabled at build time. This is enabled by default and can be disabled by defining the macro GFX_CONFIG_TRANSPARENT_COLOR_DISABLE in the system.

Example

```
// assume ScreenBackground and RibbonIcon are valid
// image resources
// assume BLACK is a valid GFX_COLOR value

GFX_TransparentColorEnable(GFX_INDEX_0, BLACK);
GFX_ImageDraw(GFX_INDEX_0, 0,0, (void*)&ScreenBackground);
GFX_ImageDraw(GFX_INDEX_0, 50,50, (void*)&RibbonIcon);

// disable the transparent color feature since the
// next image to render contains black pixels that
// we want to render
GFX_TransparentColorDisable(GFX_INDEX_0);
GFX_ImageDraw(GFX_INDEX_0, 50,50, (void*)&OverlayImage);
```

Function

GFX_STATUS GFX_TransparentColorDisable(SYS_MODULE_INDEX gfxIndex)

GFX_TransparentColorEnable Function

This function sets the transparent color used in GFX_ImageDraw() functions and enables the transparent color feature.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_TransparentColorEnable(SYS_MODULE_INDEX gfxIndex, GFX_COLOR color);
```

Returns

The status of the transparent color set action.

Description

This function sets the transparent color used in GFX_ImageDraw() functions and enables the transparent color feature.

When GFX_ImageDraw() or GFX_ImagePartialDraw() is called, any pixels in the image that matches the color value will not be rendered to the frame buffer.

The transparent color feature can only be enabled when the color depth used is 24 or 16 bpp.

Preconditions

Transparent color feature must be enabled at build time. This is enabled by default and can be disabled by defining the macro GFX_CONFIG_TRANSPARENT_COLOR_DISABLE in the system.

Example

```
// assume ScreenBackground and RibbonIcon are valid
// image resources
// assume BLACK is a valid GFX_COLOR value

GFX_TransparentColorEnable(GFX_INDEX_0, BLACK);
GFX_ImageDraw(GFX_INDEX_0, 0,0, (void*)&ScreenBackground);
GFX_ImageDraw(GFX_INDEX_0, 0,0, (void*)&RibbonIcon);
```

Parameters

Parameters	Description
color	the color value selected as the transparent color.

Function

GFX_STATUS GFX_TransparentColorEnable(
SYS_MODULE_INDEX gfxIndex,
GFX_COLOR color)

GFX_TransparentColorGet Function

This returns the current transparent color set for the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.

File

gfx_primitive.h

C

```
GFX_COLOR GFX_TransparentColorGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current transparent color used.

Description

This returns the current transparent color set for the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.

The transparent color feature can only be enabled when the color depth used is 24 or 16 bpp.

Preconditions

Transparent color feature must be enabled at build time. This is enabled by default and can be disabled by defining the macro GFX_CONFIG_TRANSPARENT_COLOR_DISABLE in the system.

Example

```
// assume ScreenBackground and RibbonIcon are valid
// image resources
// assume BLACK is a valid GFX_COLOR value

GFX_TransparentColorEnable(GFX_INDEX_0, BLACK);
GFX_ImageDraw(GFX_INDEX_0, 0,0, (void*)&ScreenBackground);
GFX_ImageDraw(GFX_INDEX_0, 50,50, (void*)&RibbonIcon);

// disable the transparent color feature since the
// next image to render contains black pixels that
// we want to render
if (GFX_TransparentColorGet(GFX_INDEX_0) == BLACK)
    GFX_TransparentColorDisable(GFX_INDEX_0);
GFX_ImageDraw(GFX_INDEX_0, 50,50, (void*)&OverlayImage);
```

Function

GFX_COLOR GFX_TransparentColorGet(SYS_MODULE_INDEX gfxIndex)

GFX_TransparentColorStatusGet Function

This returns the current state of the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.

File

gfx_primitive.h

C

```
GFX_FEATURE_STATUS GFX_TransparentColorStatusGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current transparent feature status (see GFX_FEATURE_STATUS for details).

Description

This returns the current transparent color set for the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.

The transparent color feature can only be enabled when the color depth used is 24 or 16 bpp.

Preconditions

Transparent color feature must be enabled at build time. This is enabled by default and can be disabled by defining the macro GFX_CONFIG_TRANSPARENT_COLOR_DISABLE in the system.

Example

```
// assume ScreenBackground and RibbonIcon are valid
// image resources
// assume BLACK is a valid GFX_COLOR value
```

```
    if (GFX_TransparentColorStatusGet(GFX_INDEX_0) == GFX_FEATURE_DISABLED)
        GFX_TransparentColorEnable(GFX_INDEX_0, BLACK);
    GFX_ImageDraw(GFX_INDEX_0, 0,0, (void*)&ScreenBackground);
    GFX_ImageDraw(GFX_INDEX_0, 50,50, (void*)&RibbonIcon);

    // disable the transparent color feature since the
    // next image to render contains black pixels that
    // we want to render
    if (GFX_TransparentColorGet(GFX_INDEX_0) == BLACK)
        GFX_TransparentColorDisable(GFX_INDEX_0);
    GFX_ImageDraw(GFX_INDEX_0, 50,50, (void*)&OverlayImage);
```

Function

GFX_FEATURE_STATUS GFX_TransparentColorStatusGet(SYS_MODULE_INDEX gfxIndex)

Background Functions

Functions

	Name	Description
	GFX_BackgroundColorGet	This function returns the color used in the current background.
	GFX_BackgroundImageGet	This function returns the image used in the current background.
	GFX_BackgroundImageLeftGet	This function returns the horizontal starting position of the current background.
	GFX_BackgroundImageTopGet	This function returns the vertical starting position of the current background.
	GFX_BackgroundSet	This function sets the background information.
	GFX_BackgroundTypeGet	This function returns the type of the current background.
	GFX_BackgroundTypeSet	This function sets the background type.

Description

Graphics Library Primitive Layer background API.

GFX_BackgroundColorGet Function

This function returns the color used in the current background.

File

gfx_primitive.h

C

```
GFX_COLOR GFX_BackgroundColorGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The color used in the current background.

Description

This function returns the color used in the current background.

Preconditions

None.

Example

None.

Function

GFX_COLOR GFX_BackgroundColorGet(SYS_MODULE_INDEX gfxIndex)

GFX_BackgroundImageGet Function

This function returns the image used in the current background.

File

gfx_primitive.h

C

```
GFX_RESOURCE_HDR * GFX_BackgroundImageGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The pointer to the image used in the current background.

Description

This function returns the pointer to the image used in the current background.

Preconditions

None.

Example

None.

Function

GFX_RESOURCE_HDR *GFX_BackgroundImageGet(SYS_MODULE_INDEX gfxIndex)

GFX_BackgroundImageLeftGet Function

This function returns the horizontal starting position of the current background.

File

gfx_primitive.h

C

```
uint16_t GFX_BackgroundImageLeftGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The horizontal starting position of the current background.

Description

This function returns the horizontal starting position of the current background. This position defines the x position of the upper left corner of the background.

Preconditions

None.

Example

None.

Function

uint16_t GFX_BackgroundImageLeftGet(SYS_MODULE_INDEX gfxIndex)

GFX_BackgroundImageTopGet Function

This function returns the vertical starting position of the current background.

File

gfx_primitive.h

C

```
uint16_t GFX_BackgroundImageTopGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The vertical starting position of the current background.

Description

This function returns the vertical starting position of the current background. This position defines the y position of the upper left corner of the background.

Preconditions

None.

Example

None.

Function

uint16_t GFX_BackgroundImageTopGet(SYS_MODULE_INDEX gfxIndex)

GFX_BackgroundSet Function

This function sets the background information.

File

gfx_primitive.h

C

```
void GFX_BackgroundSet(SYS_MODULE_INDEX gfxIndex, uint16_t left, uint16_t top, GFX_RESOURCE_HDR * pImage,
GFX_COLOR color);
```

Returns

None.

Description

This function sets the background information. Note that the width and height of the background is only needed when the background is an image. When the background is a color (image pointer is NULL), the width and height is not needed here since the purpose of the background information is to record only the color used.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
left	Horizontal starting position of the background.
top	Vertical starting position of the background.
pImage	Pointer to the background image used. Set this to NULL if not used.
color	If the background image is NULL, background is assumed to be this color.

Function

void GFX_BackgroundSet(
SYS_MODULE_INDEX gfxIndex,
uint16_t left,
uint16_t top,
GFX_RESOURCE_HDR *pImage,
GFX_COLOR color);

GFX_BackgroundTypeGet Function

This function returns the type of the current background.

File

gfx_primitive.h

C

```
GFX_BACKGROUND_TYPE GFX_BackgroundTypeGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The type of the current background set.

Description

This function returns the type of the current background.

Preconditions

None.

Example

None.

Function

GFX_BACKGROUND_TYPE GFX_BackgroundTypeGet(SYS_MODULE_INDEX gfxIndex)

GFX_BackgroundTypeSet Function

This function sets the background type.

File

gfx_primitive.h

C

```
void GFX_BackgroundTypeSet(SYS_MODULE_INDEX gfxIndex, GFX_BACKGROUND_TYPE type);
```

Returns

None.

Description

This function sets the background type.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
type	Type of background that will be used.

Function

void GFX_BackgroundTypeSet(SYS_MODULE_INDEX gfxIndex, GFX_BACKGROUND_TYPE type)

Double Buffering Functions

Functions

	Name	Description
	GFX_DoubleBufferAreaMark	This function adds the given rectangular area as an area that will be included in the list of areas for synchronization.
	GFX_DoubleBufferEnable	This function enables the double buffering feature of the graphics library.
	GFX_DoubleBufferDisable	This function disables the double buffering feature of the graphics library.
	GFX_DoubleBufferStatusGet	This function returns the current status of the double buffering feature of the graphics library.
	GFX_DoubleBufferAreaGet	This function returns a rectangular area that needs synchronization specified by the given index.
	GFX_DoubleBufferSyncAllStatusClear	This function clears the synchronize all status.
	GFX_DoubleBufferSyncAllStatusGet	This function returns the status of the synchronize all flag.
	GFX_DoubleBufferSyncAllStatusSet	This function sets the whole draw buffer to be unsynchronized.
	GFX_DoubleBufferSyncAreaCountGet	This function returns the current count of rectangular areas that needs to be synchronized.
	GFX_DoubleBufferSyncAreaCountSet	This function sets the current count of rectangular areas that needs to be synchronized.
	GFX_DoubleBufferSynchronizeRequest	This function requests synchronization of the contents of the draw and frame buffer.
	GFX_DoubleBufferSynchronize	This function synchronizes the contents of the draw and frame buffer immediately.
	GFX_DoubleBufferSynchronizeStatusGet	This function returns the status of the synchronization request of the draw and frame buffer.

	GFX_DrawBufferGet	This function returns the index of the current draw buffer.
	GFX_DrawBufferInitialize	This function initializes the address of the draw buffer specified by the given index.
	GFX_DrawBufferSet	This function sets the draw buffer with the given index number.
	GFX_FrameBufferGet	This function returns the index of the current frame buffer.
	GFX_FrameBufferSet	This function sets the frame buffer with the given index number.
	GFX_DoubleBufferPause	This function pauses the double buffering feature of the graphics library.
	GFX_DoubleBufferResume	This function resumes the double buffering feature of the graphics library.

Description

Graphics Library Primitive Layer double buffering API.

GFX_DoubleBufferAreaMark Function

This function adds the given rectangular area as an area that will be included in the list of areas for synchronization.

File

gfx_primitive.h

C

```
void GFX_DoubleBufferAreaMark(SYS_MODULE_INDEX gfxIndex, uint16_t left, uint16_t top, uint16_t right,
uint16_t bottom);
```

Returns

None.

Description

When double buffering mode is enabled, this function adds the given rectangular area into the list of rectangular areas for synchronization. When this function is called, the given rectangular area is assumed to contain new pixel information and is added into the list of areas to be synchronized.

Synchronization can be scheduled using the GFX_DoubleBufferSynchronizeRequest() or immediately performed using GFX_DoubleBufferSynchronize().

Preconditions

Double buffering feature must be enabled.

Example

None.

Parameters

Parameters	Description
left	defines the left most pixel of the rectangular area.
top	defines the top most pixel of the rectangular area.
right	defines the right most pixel of the rectangular area.
bottom	defines the bottom most pixel of the rectangular area.

Function

void GFX_DoubleBufferAreaMark(

SYS_MODULE_INDEX gfxIndex,

uint16_t left,

uint16_t top,

uint16_t right,

uint16_t bottom)

GFX_DoubleBufferEnable Function

This function enables the double buffering feature of the graphics library.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_DoubleBufferEnable(SYS_MODULE_INDEX gfxIndex);
```

Returns

Status of the double buffering feature enabling. GFX_STATUS_SUCCESS - the double buffering was successfully enabled.
GFX_STATUS_FAILURE - the double buffering was not successfully enabled.

Description

Double buffering is a feature where two buffers are utilized to perform rendering on one buffer while displaying the other buffer. The frame buffer is the buffer that is being displayed while the draw buffer is used for rendering.

When this function is called, the buffer with index number 0 is set as the draw buffer while the buffer with index number 1 is set as the frame buffer. Synchronization of the two buffers is scheduled and sets the count of unsynchronized areas to zero.

Preconditions

None.

Example

None.

Function

GFX_STATUS GFX_DoubleBufferEnable(SYS_MODULE_INDEX gfxIndex)

GFX_DoubleBufferDisable Function

This function disables the double buffering feature of the graphics library.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_DoubleBufferDisable(SYS_MODULE_INDEX gfxIndex);
```

Returns

Status of the double buffering feature disabling. GFX_STATUS_SUCCESS - the double buffering was successfully disabled.
GFX_STATUS_FAILURE - the double buffering was not successfully disabled.

Description

When double buffering is enabled, calling this function disables the double buffering feature of the graphics library.

After this function executes, all rendering will be performed on the frame buffer.

Preconditions

None.

Example

None.

Function

GFX_STATUS GFX_DoubleBufferDisable(SYS_MODULE_INDEX gfxIndex)

GFX_DoubleBufferStatusGet Function

This function returns the current status of the double buffering feature of the graphics library.

File

gfx_primitive.h

C

```
GFX_FEATURE_STATUS GFX_DoubleBufferStatusGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

Status of the double buffering feature disabling. GFX_FEATURE_ENABLED - the double buffering feature is enabled.
GFX_FEATURE_DISABLED - the double buffering feature is not enabled.

Description

If the graphics library double buffering feature is enabled, this function returns if the double buffering mode is activated or not. When activated, the function returns GFX_FEATURE_ENABLED. When deactivated, the function returns GFX_FEATURE_DISABLED.

Preconditions

None.

Example

None.

Function

GFX_FEATURE_STATUS GFX_DoubleBufferStatusGet(SYS_MODULE_INDEX gfxIndex)

GFX_DoubleBufferAreaGet Function

This function returns a rectangular area that needs synchronization specified by the given index.

File

gfx_primitive.h

C

```
GFX_RECTANGULAR_AREA * GFX_DoubleBufferAreaGet(SYS_MODULE_INDEX gfxIndex, uint16_t index);
```

Returns

The location of the rectangular area specified by the structure GFX_RECTANGULAR_AREA.

Description

Double buffering mode maintains an array of these GFX_RECTANGULAR_AREA that needs synchronization. The array serves as a list of pixel areas that needs to be synchronized.

This function returns a rectangular area that needs synchronization specified by the given index. The returned value is a pointer to the structure GFX_RECTANGULAR_AREA that describes the rectangular area of interest.

Preconditions

Double buffering feature must be enabled.

Example

None.

Parameters

Parameters	Description
index	the index of the rectangular area located in the array of areas that needs synchronization.

Function

GFX_RECTANGULAR_AREA GFX_DoubleBufferAreaGet(SYS_MODULE_INDEX gfxIndex, uint16_t index)

GFX_DoubleBufferSyncAllStatusClear Function

This function clears the synchronize all status.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_DoubleBufferSyncAllStatusClear(SYS_MODULE_INDEX gfxIndex);
```

Returns

Status of the synchronize all clear. GFX_STATUS_SUCCESS - the synchronization all clear was successful. GFX_STATUS_FAILURE - the synchronization all clear was not successful.

Description

This function clears the synchronize all status. This function will clear or cancel all synchronization requests. Calling this function while an ongoing synchronization is being performed, will not terminate the synchronization.

Preconditions

Double buffering feature must be enabled.

Example

None.

Function

GFX_STATUS GFX_DoubleBufferSyncAllStatusClear(SYS_MODULE_INDEX gfxIndex)

GFX_DoubleBufferSyncAllStatusGet Function

This function returns the status of the synchronize all flag.

File

gfx_primitive.h

C

```
GFX_FEATURE_STATUS GFX_DoubleBufferSyncAllStatusGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

Status of the synchronize all flag. GFX_FEATURE_ENABLED - the synchronization all is set. GFX_FEATURE_DISABLED - the synchronization all is not set.

Description

This function returns the status of the synchronize all flag.

Preconditions

Double buffering feature must be enabled.

Example

None.

Function

GFX_FEATURE_STATUS GFX_DoubleBufferSyncAllStatusGet(SYS_MODULE_INDEX gfxIndex)

GFX_DoubleBufferSyncAllStatusSet Function

This function sets the whole draw buffer to be unsynchronized.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_DoubleBufferSyncAllStatusSet(SYS_MODULE_INDEX gfxIndex);
```

Returns

Status of the synchronize all set. GFX_STATUS_SUCCESS - the synchronization all was successful. GFX_STATUS_FAILURE - the synchronization all was not successful.

Description

This function sets the whole draw buffer to be unsynchronized. The next synchronization will copy all pixels of the draw buffer to the frame buffer.

Preconditions

Double buffering feature must be enabled.

Example

None.

Function

GFX_STATUS GFX_DoubleBufferSyncAllStatusSet(SYS_MODULE_INDEX gfxIndex)

GFX_DoubleBufferSyncAreaCountGet Function

This function returns the current count of rectangular areas that needs to be synchronized.

File

gfx_primitive.h

C

```
uint16_t GFX_DoubleBufferSyncAreaCountGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current count of rectangular areas that needs synchronization.

Description

This function returns the current count of rectangular areas that needs to be synchronized.

Preconditions

Double buffering feature must be enabled.

Example

None.

Function

uint16_t GFX_DoubleBufferSyncAreaCountGet(SYS_MODULE_INDEX gfxIndex)

GFX_DoubleBufferSyncAreaCountSet Function

This function sets the current count of rectangular areas that needs to be synchronized.

File

gfx_primitive.h

C

```
void GFX_DoubleBufferSyncAreaCountSet(SYS_MODULE_INDEX gfxIndex, uint16_t count);
```

Returns

None.

Description

This function sets the current count of rectangular areas that needs to be synchronized.

Preconditions

Double buffering feature must be enabled.

Example

None.

Function

void GFX_DoubleBufferSyncAreaCountSet(SYS_MODULE_INDEX gfxIndex, uint16_t count)

GFX_DoubleBufferSynchronizeRequest Function

This function requests synchronization of the contents of the draw and frame buffer.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_DoubleBufferSynchronizeRequest(SYS_MODULE_INDEX gfxIndex);
```

Returns

Status of the double buffer synchronization request. GFX_STATUS_SUCCESS - the synchronization request was successful. GFX_STATUS_FAILURE - the synchronization request was not successful.

Description

This function requests synchronization of the contents of the draw and frame buffer. The contents will be synchronized on the next vertical blanking period.

Preconditions

Double buffering feature must be enabled.

Example

None.

Function

GFX_STATUS GFX_DoubleBufferSynchronizeRequest(SYS_MODULE_INDEX gfxIndex)

GFX_DoubleBufferSynchronize Function

This function synchronizes the contents of the draw and frame buffer immediately.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_DoubleBufferSynchronize(SYS_MODULE_INDEX gfxIndex);
```

Returns

Status of the double buffer synchronization. GFX_STATUS_SUCCESS - the synchronization was successful. GFX_STATUS_FAILURE - the synchronization was not successful.

Description

This function synchronizes the contents of the draw and frame buffer immediately. Contents of both frame and draw buffer will be the same after the function exits.

Preconditions

Double buffering feature must be enabled.

Example

None.

Function

GFX_STATUS GFX_DoubleBufferSynchronize(SYS_MODULE_INDEX gfxIndex)

GFX_DoubleBufferSynchronizeStatusGet Function

This function returns the status of the synchronization request of the draw and frame buffer.

File

gfx_primitive.h

C

```
GFX_FEATURE_STATUS GFX_DoubleBufferSynchronizeStatusGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

Status of the double buffer synchronization request. GFX_FEATURE_ENABLED - the synchronization request is enabled. GFX_FEATURE_DISABLED - the synchronization request is not enabled.

Description

This function returns the status of the synchronization request of the draw and frame buffer. The difference between GFX_DoubleBufferSynchronizeStatusGet() and GFX_DoubleBufferSyncAllStatusGet() is that the GFX_DoubleBufferSynchronizeStatusGet() returns the status of synchronization request. The size of the synchronization may or may not be the full screen synchronization. The GFX_DoubleBufferSyncAllStatusGet() on the other hand returns the status of a full screen synchronization.

Preconditions

Double buffering feature must be enabled.

Example

None.

Function

GFX_FEATURE_STATUS GFX_DoubleBufferSynchronizeStatusGet(SYS_MODULE_INDEX gfxIndex)

GFX_DrawBufferGet Function

This function returns the index of the current draw buffer.

File

gfx_primitive.h

C

```
uint16_t GFX_DrawBufferGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The index of the current draw buffer set.

Description

This function returns the index of the current draw buffer. Draw buffer is the buffer where rendering is performed. For systems with single buffer this function will always return 0.

Preconditions

None.

Example

None.

Function

uint16_t GFX_DrawBufferGet(SYS_MODULE_INDEX gfxIndex)

GFX_DrawBufferInitialize Function

This function initializes the address of the draw buffer specified by the given index.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_DrawBufferInitialize(SYS_MODULE_INDEX gfxIndex, uint16_t index, uint32_t address);
```

Returns

Status of the buffer set. GFX_STATUS_SUCCESS - the buffer was successfully set. GFX_STATUS_FAILURE - the buffer was not successfully set.

Description

**********f**********

For system with multiple buffers, this function is used to initialize the array of buffers. The address of the draw buffer will be associated with the specified index. Use this function to initialize or modify the array of frame buffers in the system at run time.

For systems with single buffer, frame buffer and draw buffer are the same buffer. Calls to this function will have no effect and will always return GFX_STATUS_SUCCESS. The size of the buffer is defined by the dimension of the screen and the color depth used.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
index	specifies the index value of the buffer in the array of buffers. For single buffer systems, the given index will be ignored.
address	specifies the location of the buffer in memory.

Function

GFX_STATUS GFX_DrawBufferInitialize(
SYS_MODULE_INDEX gfxIndex,
uint16_t index,
uint32_t address)

GFX_DrawBufferSet Function

This function sets the draw buffer with the given index number.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_DrawBufferSet(SYS_MODULE_INDEX gfxIndex, uint16_t index);
```

Returns

Status of the draw buffer set. GFX_STATUS_SUCCESS - the draw buffer was successfully set. GFX_STATUS_FAILURE - the draw buffer was not successfully set.

Description

This function sets the draw buffer with the given index number. For systems with single buffer, frame buffer and draw buffer are the same buffer. Calls to this function will have no effect and will always return GFX_STATUS_SUCCESS.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
index	the index of the buffer to be set as the draw buffer.

Function

GFX_STATUS GFX_DrawBufferSet(SYS_MODULE_INDEX gfxIndex, uint16_t index)

GFX_FrameBufferGet Function

This function returns the index of the current frame buffer.

File

gfx_primitive.h

C

```
uint16_t GFX_FrameBufferGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The index of the current frame buffer set.

Description

This function returns the index of the current frame buffer. Frame buffer is the buffer that is currently displayed in the screen. For systems with single buffer this function will always return 0.

Preconditions

None.

Example

None.

Function

uint16_t GFX_FrameBufferGet(void)

GFX_FrameBufferSet Function

This function sets the frame buffer with the given index number.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_FrameBufferSet(SYS_MODULE_INDEX gfxIndex, uint16_t index);
```

Returns

Status of the draw buffer set. GFX_STATUS_SUCCESS - the draw buffer was successfully set. GFX_STATUS_FAILURE - the draw buffer was not successfully set.

Description

This function sets the frame buffer with the given index number. This is the buffer that is displayed on the screen. For systems with single buffer, frame buffer and draw buffer are the same buffer. Calls to this function will have no effect and will always return GFX_STATUS_SUCCESS.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
index	the index of the buffer to be set as the frame buffer.

Function

GFX_STATUS GFX_FrameBufferSet(SYS_MODULE_INDEX gfxIndex, uint16_t index)

GFX_DoubleBufferPause Function

This function pauses the double buffering feature of the graphics library.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_DoubleBufferPause(SYS_MODULE_INDEX gfxIndex);
```

Description

Double buffering is a feature where two buffers are utilized to perform rendering on one buffer while displaying the other buffer. The frame buffer is the buffer that is being displayed while the draw buffer is used for rendering.

When this function is called, the feature is paused and no buffer swap will occur.

Function

GFX_STATUS GFX_DoubleBufferPause(void)

GFX_DoubleBufferResume Function

This function resumes the double buffering feature of the graphics library.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_DoubleBufferResume(SYS_MODULE_INDEX gfxIndex);
```

Description

Double buffering is a feature where two buffers are utilized to perform rendering on one buffer while displaying the other buffer. The frame buffer is the buffer that is being displayed while the draw buffer is used for rendering.

When this function is called, the feature is resumes the previous status of the double buffering feature.

Function

GFX_STATUS GFX_DoubleBufferResume(void)

External Resources Functions

Functions

	Name	Description
	GFX_ExternalResourceCallback	This function performs data fetch from external memory.

Description

Graphics Library Primitive Layer external resources API.

GFX_ExternalResourceCallback Function

This function performs data fetch from external memory.

File

gfx_primitive.h

C

```
GFX_STATUS GFX_ExternalResourceCallback(GFX_RESOURCE_HDR * pResource, uint32_t offset, uint16_t nCount,
void * pBuffer);
```

Returns

Status of the external resource callback. GFX_STATUS_SUCCESS when all the data was successfully retrieved. GFX_STATUS_FAILURE when partial or no data was retrieved.

Description

This function must be implemented in the application. The library will call this function each time when the external memory data will be required.

The application must copy requested byte quantity into the buffer provided. Data start address in external memory is a sum of the address in GFX_RESOURCE_HDR structure and offset.

An example of a situation where external memory will be accessed is when external fonts or images are used. External resources in the library are defined by the type in the GFX_RESOURCE_HDR (see GFX_RESOURCE for details).

Preconditions

None.

Example

None.

Parameters

Parameters	Description
pResource	Pointer to the external memory resource information.
offset	Offset of the data from the location of the resource in external memory.
nCount	Number of bytes to be transferred into the buffer.
buffer	Pointer to the buffer that will hold the retrieved data.

Function

GFX_STATUS GFX_ExternalResourceCallback(
GFX_RESOURCE_HDR *pResource,
uint32_t offset,
uint16_t nCount,
void *pBuffer)

Data Types and Constants

Enumerations

	Name	Description
	GFX_PRIMITIVE_STATES	Defines the various states that can be achieved by the PRIMITIVE HAL operation.

Macros

	Name	Description
	GFX_PRIMITIVE_HANDLE_INVALID	Constant that defines the value of an Invalid Device Handle.
	GFX_TEXT_CURSOR_HEIGHT_DEFAULT	Constant that defines the default value of text cursor height.
	GFX_TEXT_CURSOR_WIDTH_DEFAULT	Constant that defines the default value of text cursor width.

Types

	Name	Description
	GFX_PRIMITIVE_HANDLE	Data type for GFX PRIMITIVE HAL handle.

Description

Graphics Library Primitive Layer data types and constants.

GFX_PRIMITIVE_HANDLE_INVALID Macro

Constant that defines the value of an Invalid Device Handle.

File

gfx_primitive.h

C

```
#define GFX_PRIMITIVE_HANDLE_INVALID
```

Description

GFX PRIMITIVE HAL Invalid Handle

This constant is returned by the GFX_PRIMITIVE_Open() function when the function fails.

Remarks

None.

GFX_PRIMITIVE_HANDLE Type

Data type for GFX PRIMITIVE HAL handle.

File

gfx_primitive.h

C

```
typedef uintptr_t GFX_PRIMITIVE_HANDLE;
```

Description

Data type for GFX PRIMITIVE HAL handle.

The data type of the handle that is returned from GFX_PRIMITIVE_Open function.

Remarks

None.

GFX_PRIMITIVE_STATES Enumeration

Defines the various states that can be achieved by the PRIMITIVE HAL operation.

File

gfx_primitive.h

C

```
typedef enum {
  GFX_PRIMITIVE_STATE_BUSY,
  GFX_PRIMITIVE_STATE_INIT
} GFX_PRIMITIVE_STATES;
```

Members

Members	Description
GFX_PRIMITIVE_STATE_BUSY	Driver state busy
GFX_PRIMITIVE_STATE_INIT	Driver state init

Description

PRIMITIVE HAL State Machine States

This enumeration defines the various states that can be achieved by the HAL operation.

Remarks

None.

GFX_TEXT_CURSOR_HEIGHT_DEFAULT Macro

Constant that defines the default value of text cursor height.

File

gfx_primitive.h

C

```
#define GFX_TEXT_CURSOR_HEIGHT_DEFAULT 10
```

Description

GFX PRIMITIVE HAL Default Text cursor height

This constant is utilized when cursor height is not defined.

Remarks

None.

GFX_TEXT_CURSOR_WIDTH_DEFAULT Macro

Constant that defines the default value of text cursor width.

File

gfx_primitive.h

C

```
#define GFX_TEXT_CURSOR_WIDTH_DEFAULT 6
```

Description

GFX PRIMITIVE HAL Default Text cursor width

This constant is utilized when cursor width is not defined.

Remarks

GFX_TextCursorWidthGet returns this value if a valid cursor width is not available.

Color Definitions

Macros

	Name	Description
	BLACK	Basic colors definitions. The basic colors defined in this section are defined for basic demo requirements. End application can define additional colors or override existing default colors. If overriding an existing default color, define the new color value before the #include of Graphics.h to avoid the compile time warning. When using palette, a different file 'PaletteColorDefines.h' has to be used instead.
	BLUE	This is macro BLUE.
	BRIGHTBLUE	This is macro BRIGHTBLUE.
	BRIGHTCYAN	This is macro BRIGHTCYAN.
	BRIGHTGREEN	This is macro BRIGHTGREEN.
	BRIGHTMAGENTA	This is macro BRIGHTMAGENTA.
	BRIGHTRED	This is macro BRIGHTRED.
	BRIGHTYELLOW	This is macro BRIGHTYELLOW.
	BROWN	This is macro BROWN.
	BURLYWOOD	This is macro BURLYWOOD.
	CYAN	This is macro CYAN.
	DARKGRAY	This is macro DARKGRAY.
	DARKORANGE	This is macro DARKORANGE.

	GFX_W3_ALICEBLUE	This is macro GFX_W3_ALICEBLUE.
	GFX_W3_ANTIQUEWHITE	This is macro GFX_W3_ANTIQUEWHITE.
	GFX_W3_AQUA	This is macro GFX_W3_AQUA.
	GFX_W3_AQUAMARINE	This is macro GFX_W3_AQUAMARINE.
	GFX_W3_AZURE	This is macro GFX_W3_AZURE.
	GFX_W3_BEIGE	This is macro GFX_W3_BEIGE.
	GFX_W3_BISQUE	This is macro GFX_W3_BISQUE.
	GFX_W3_BLACK	This is macro GFX_W3_BLACK.
	GFX_W3_BLANCHEDALMOND	This is macro GFX_W3_BLANCHEDALMOND.
	GFX_W3_BLUE	This is macro GFX_W3_BLUE.
	GFX_W3_BLUEVIOLET	This is macro GFX_W3_BLUEVIOLET.
	GFX_W3_BROWN	This is macro GFX_W3_BROWN.
	GFX_W3_BURLYWOOD	This is macro GFX_W3_BURLYWOOD.
	GFX_W3_CADETBLUE	This is macro GFX_W3_CADETBLUE.
	GFX_W3_CHARTREUSE	This is macro GFX_W3_CHARTREUSE.
	GFX_W3_CHOCOLATE	This is macro GFX_W3_CHOCOLATE.
	GFX_W3_CORAL	This is macro GFX_W3_CORAL.
	GFX_W3_CORNFLOWERBLUE	This is macro GFX_W3_CORNFLOWERBLUE.
	GFX_W3_CORNSILK	This is macro GFX_W3_CORNSILK.
	GFX_W3_CRIMSON	This is macro GFX_W3_CRIMSON.
	GFX_W3_CYAN	This is macro GFX_W3_CYAN.
	GFX_W3_DARKBLUE	This is macro GFX_W3_DARKBLUE.
	GFX_W3_DARKCYAN	This is macro GFX_W3_DARKCYAN.
	GFX_W3_darkgoldenrod	This is macro GFX_W3_darkgoldenrod.
	GFX_W3_DARKGRAY	This is macro GFX_W3_DARKGRAY.
	GFX_W3_DARKGREEN	This is macro GFX_W3_DARKGREEN.
	GFX_W3_DARKGREY	This is macro GFX_W3_DARKGREY.
	GFX_W3_DARKHAKI	This is macro GFX_W3_DARKHAKI.
	GFX_W3_DARKMAGENTA	This is macro GFX_W3_DARKMAGENTA.
	GFX_W3_DARKOLIVEGREEN	This is macro GFX_W3_DARKOLIVEGREEN.
	GFX_W3_DARKORANGE	This is macro GFX_W3_DARKORANGE.
	GFX_W3_DARKORCHID	This is macro GFX_W3_DARKORCHID.
	GFX_W3_DARKRED	This is macro GFX_W3_DARKRED.
	GFX_W3_DARKSALMON	This is macro GFX_W3_DARKSALMON.
	GFX_W3_DARKSEAGREEN	This is macro GFX_W3_DARKSEAGREEN.
	GFX_W3_DARKSLATEBLUE	This is macro GFX_W3_DARKSLATEBLUE.
	GFX_W3_DARKSLATEGRAY	This is macro GFX_W3_DARKSLATEGRAY.
	GFX_W3_DARKSLATEGREY	This is macro GFX_W3_DARKSLATEGREY.
	GFX_W3_DARKTURQUOISE	This is macro GFX_W3_DARKTURQUOISE.
	GFX_W3_DARKVIOLET	This is macro GFX_W3_DARKVIOLET.
	GFX_W3_DEEPPINK	This is macro GFX_W3_DEEPPINK.
	GFX_W3_DEEPSKYBLUE	This is macro GFX_W3_DEEPSKYBLUE.
	GFX_W3_DIMGRAY	This is macro GFX_W3_DIMGRAY.
	GFX_W3_DIMGREY	This is macro GFX_W3_DIMGREY.
	GFX_W3_DODGERBLUE	This is macro GFX_W3_DODGERBLUE.
	GFX_W3_FIREBRICK	This is macro GFX_W3_FIREBRICK.
	GFX_W3_FLORALWHITE	This is macro GFX_W3_FLORALWHITE.
	GFX_W3_FORESTGREEN	This is macro GFX_W3_FORESTGREEN.
	GFX_W3_FUCHSIA	This is macro GFX_W3_FUCHSIA.
	GFX_W3_GAINSBORO	This is macro GFX_W3_GAINSBORO.
	GFX_W3_GHOSTWHITE	This is macro GFX_W3_GHOSTWHITE.
	GFX_W3_GOLD	This is macro GFX_W3_GOLD.
	GFX_W3_GOLDENROD	This is macro GFX_W3_GOLDENROD.
	GFX_W3_GRAY	This is macro GFX_W3_GRAY.
	GFX_W3_GREEN	This is macro GFX_W3_GREEN.

	GFX_W3_GREENYELLOW	This is macro GFX_W3_GREENYELLOW.
	GFX_W3_GREY	This is macro GFX_W3_GREY.
	GFX_W3_HONEYDEW	This is macro GFX_W3_HONEYDEW.
	GFX_W3_HOTPINK	This is macro GFX_W3_HOTPINK.
	GFX_W3_INDIANRED	This is macro GFX_W3_INDIANRED.
	GFX_W3_INDIGO	This is macro GFX_W3_INDIGO.
	GFX_W3_IVORY	This is macro GFX_W3_IVORY.
	GFX_W3_LAVENDER	This is macro GFX_W3_LAVENDER.
	GFX_W3_LAVENDERBLUSH	This is macro GFX_W3_LAVENDERBLUSH.
	GFX_W3_LAWNGREEN	This is macro GFX_W3_LAWNGREEN.
	GFX_W3_LEMONCHIFFON	This is macro GFX_W3_LEMONCHIFFON.
	GFX_W3_LIGHTBLUE	This is macro GFX_W3_LIGHTBLUE.
	GFX_W3_LIGHTCORAL	This is macro GFX_W3_LIGHTCORAL.
	GFX_W3_LIGHTCYAN	This is macro GFX_W3_LIGHTCYAN.
	GFX_W3_LIGHTGOLDENRODYELLOW	This is macro GFX_W3_LIGHTGOLDENRODYELLOW.
	GFX_W3_LIGHTGRAY	This is macro GFX_W3_LIGHTGRAY.
	GFX_W3_LIGHTGREEN	This is macro GFX_W3_LIGHTGREEN.
	GFX_W3_LIGHTGREY	This is macro GFX_W3_LIGHTGREY.
	GFX_W3_LIGHTPINK	This is macro GFX_W3_LIGHTPINK.
	GFX_W3_LIGHTSALMON	This is macro GFX_W3_LIGHTSALMON.
	GFX_W3_LIGHTSKYBLUE	This is macro GFX_W3_LIGHTSKYBLUE.
	GFX_W3_LIGHTSLATEGRAY	This is macro GFX_W3_LIGHTSLATEGRAY.
	GFX_W3_LIGHTSLATEGREY	This is macro GFX_W3_LIGHTSLATEGREY.
	GFX_W3_LIGHTSTEELBLUE	This is macro GFX_W3_LIGHTSTEELBLUE.
	GFX_W3_LIGHTYELLOW	This is macro GFX_W3_LIGHTYELLOW.
	GFX_W3_LIGTHSEAGREEN	This is macro GFX_W3_LIGTHSEAGREEN.
	GFX_W3_LIME	This is macro GFX_W3_LIME.
	GFX_W3_LIMEGREEN	This is macro GFX_W3_LIMEGREEN.
	GFX_W3_LINEN	This is macro GFX_W3_LINEN.
	GFX_W3_MAGENTA	This is macro GFX_W3_MAGENTA.
	GFX_W3_MAROON	This is macro GFX_W3_MAROON.
	GFX_W3_MEDIUMAQUAMARINE	This is macro GFX_W3_MEDIUMAQUAMARINE.
	GFX_W3_MEDIUMBLUE	This is macro GFX_W3_MEDIUMBLUE.
	GFX_W3_MEDIUMORCHID	This is macro GFX_W3_MEDIUMORCHID.
	GFX_W3_MEDIUMPURPLE	This is macro GFX_W3_MEDIUMPURPLE.
	GFX_W3_MEDIUMSEAGREEN	This is macro GFX_W3_MEDIUMSEAGREEN.
	GFX_W3_MEDIUMSLATEBLUE	This is macro GFX_W3_MEDIUMSLATEBLUE.
	GFX_W3_MEDIUMSPRINGGREEN	This is macro GFX_W3_MEDIUMSPRINGGREEN.
	GFX_W3_MEDIUMTURQUOISE	This is macro GFX_W3_MEDIUMTURQUOISE.
	GFX_W3_MEDIUMVIOLETRED	This is macro GFX_W3_MEDIUMVIOLETRED.
	GFX_W3_MIDNIGHTBLUE	This is macro GFX_W3_MIDNIGHTBLUE.
	GFX_W3_MINTCREAM	This is macro GFX_W3_MINTCREAM.
	GFX_W3_MISTYROSE	This is macro GFX_W3_MISTYROSE.
	GFX_W3_MOCCASIN	This is macro GFX_W3_MOCCASIN.
	GFX_W3_NAVAJOWHITE	This is macro GFX_W3_NAVAJOWHITE.
	GFX_W3_NAVY	This is macro GFX_W3_NAVY.
	GFX_W3_OLDLACE	This is macro GFX_W3_OLDLACE.
	GFX_W3_OLIVE	This is macro GFX_W3_OLIVE.
	GFX_W3_OLIVEDRAB	This is macro GFX_W3_OLIVEDRAB.
	GFX_W3_ORANGE	This is macro GFX_W3_ORANGE.
	GFX_W3_ORANGERED	This is macro GFX_W3_ORANGERED.
	GFX_W3_ORCHID	This is macro GFX_W3_ORCHID.
	GFX_W3_PALEGOLDENROD	This is macro GFX_W3_PALEGOLDENROD.
	GFX_W3_PALEGREEN	This is macro GFX_W3_PALEGREEN.
	GFX_W3_PALETURQUOISE	This is macro GFX_W3_PALETURQUOISE.

	GFX_W3_PALEVIOLETRED	This is macro GFX_W3_PALEVIOLETRED.
	GFX_W3_PAPAYAWHIP	This is macro GFX_W3_PAPAYAWHIP.
	GFX_W3_PEACHPUFF	This is macro GFX_W3_PEACHPUFF.
	GFX_W3_PERU	This is macro GFX_W3_PERU.
	GFX_W3_PINK	This is macro GFX_W3_PINK.
	GFX_W3_PLUM	This is macro GFX_W3_PLUM.
	GFX_W3_POWDERBLUE	This is macro GFX_W3_POWDERBLUE.
	GFX_W3_PURPLE	This is macro GFX_W3_PURPLE.
	GFX_W3_RED	This is macro GFX_W3_RED.
	GFX_W3_ROSYBROWN	This is macro GFX_W3_ROSYBROWN.
	GFX_W3_ROYALBLUE	This is macro GFX_W3_ROYALBLUE.
	GFX_W3_SADDLEBROWN	This is macro GFX_W3_SADDLEBROWN.
	GFX_W3_SALMON	This is macro GFX_W3_SALMON.
	GFX_W3_SANDYGREEN	This is macro GFX_W3_SANDYGREEN.
	GFX_W3_SEAGREEN	This is macro GFX_W3_SEAGREEN.
	GFX_W3_SEASHELL	This is macro GFX_W3_SEASHELL.
	GFX_W3_SIENNA	This is macro GFX_W3_SIENNA.
	GFX_W3_SILVER	This is macro GFX_W3_SILVER.
	GFX_W3_SKYBLUE	This is macro GFX_W3_SKYBLUE.
	GFX_W3_SLATEBLUE	This is macro GFX_W3_SLATEBLUE.
	GFX_W3_SLATEGRAY	This is macro GFX_W3_SLATEGRAY.
	GFX_W3_SLATEGREY	This is macro GFX_W3_SLATEGREY.
	GFX_W3_SNOW	This is macro GFX_W3_SNOW.
	GFX_W3_SPRINGGREEN	This is macro GFX_W3_SPRINGGREEN.
	GFX_W3_STEELBLUE	This is macro GFX_W3_STEELBLUE.
	GFX_W3_TAN	This is macro GFX_W3_TAN.
	GFX_W3_TEAL	This is macro GFX_W3_TEAL.
	GFX_W3_THISTLE	This is macro GFX_W3_THISTLE.
	GFX_W3_TOMATO	This is macro GFX_W3_TOMATO.
	GFX_W3_TURQUOISE	This is macro GFX_W3_TURQUOISE.
	GFX_W3_VIOLET	This is macro GFX_W3_VIOLET.
	GFX_W3_WHEAT	This is macro GFX_W3_WHEAT.
	GFX_W3_WHITE	This is macro GFX_W3_WHITE.
	GFX_W3_WHITESMOKE	This is macro GFX_W3_WHITESMOKE.
	GFX_W3_YELLOW	This is macro GFX_W3_YELLOW.
	GFX_W3_YELLOWGREEN	This is macro GFX_W3_YELLOWGREEN.
	GFX_X11_ALICE_BLUE	This is macro GFX_X11_ALICE_BLUE.
	GFX_X11_ANTIQUE_WHITE	This is macro GFX_X11_ANTIQUE_WHITE.
	GFX_X11_AQUA	This is macro GFX_X11_AQUA.
	GFX_X11_AQUAMARINE	This is macro GFX_X11_AQUAMARINE.
	GFX_X11_AZURE	This is macro GFX_X11_AZURE.
	GFX_X11_BEIGE	This is macro GFX_X11_BEIGE.
	GFX_X11_BISQUE	This is macro GFX_X11_BISQUE.
	GFX_X11_BLACK	This is macro GFX_X11_BLACK.
	GFX_X11_BLANCHED_ALMOND	This is macro GFX_X11_BLANCHED_ALMOND.
	GFX_X11_BLUE	This is macro GFX_X11_BLUE.
	GFX_X11_BLUE_VIOLET	This is macro GFX_X11_BLUE_VIOLET.
	GFX_X11_BROWN	This is macro GFX_X11_BROWN.
	GFX_X11_BURLY_WOOD	This is macro GFX_X11_BURLY_WOOD.
	GFX_X11_CADEL_BLUE	This is macro GFX_X11_CADEL_BLUE.
	GFX_X11_CHARTEUSE	This is macro GFX_X11_CHARTEUSE.
	GFX_X11_CHOCOLATE	This is macro GFX_X11_CHOCOLATE.
	GFX_X11_CORAL	This is macro GFX_X11_CORAL.
	GFX_X11_CORNFLOWER_BLUE	This is macro GFX_X11_CORNFLOWER_BLUE.
	GFX_X11_CORNSILK	X11: Brown Colors

	GFX_X11_CRIMSON	This is macro GFX_X11_CRIMSON.
	GFX_X11_CYAN	This is macro GFX_X11_CYAN.
	GFX_X11_DARK_BLUE	This is macro GFX_X11_DARK_BLUE.
	GFX_X11_DARK_CYAN	This is macro GFX_X11_DARK_CYAN.
	GFX_X11_DARK_GOLDENROD	This is macro GFX_X11_DARK_GOLDENROD.
	GFX_X11_DARK_GREEN	This is macro GFX_X11_DARK_GREEN.
	GFX_X11_DARK_GREY	This is macro GFX_X11_DARK_GREY.
	GFX_X11_DARK_KHAKI	This is macro GFX_X11_DARK_KHAKI.
	GFX_X11_DARK_MAGENTA	This is macro GFX_X11_DARK_MAGENTA.
	GFX_X11_DARK_OLIVE_GREEN	X11: Green Colors
	GFX_X11_DARK_ORANGE	This is macro GFX_X11_DARK_ORANGE.
	GFX_X11_DARK_ORCHID	This is macro GFX_X11_DARK_ORCHID.

	SIENNA	This is macro SIENNA.
	TAN	This is macro TAN.
	WHEAT	This is macro WHEAT.

	WHITE	This is macro WHITE.
	YELLOW	This is macro YELLOW.

Description

BLACK Macro

File

gfx_colors.h

C

```
#define BLACK GFX_RGBConvert(0, 0, 0)
```

Description

Basic colors definitions. The basic colors defined in this section are defined for basic demo requirements. End application can define additional colors or override existing default colors. If overriding an existing default color, define the new color value before the #include of Graphics.h to avoid the compile time warning. When using palette, a different file 'PaletteColorDefines.h' has to be used instead.

BLUE Macro

File

gfx_colors.h

C

```
#define BLUE GFX_RGBConvert(0, 0, 128)
```

Description

This is macro BLUE.

BRIGHTBLUE Macro

File

gfx_colors.h

C

```
#define BRIGHTBLUE GFX_RGBConvert(0, 0, 255)
```

Description

This is macro BRIGHTBLUE.

BRIGHTCYAN Macro

File

gfx_colors.h

C

```
#define BRIGHTCYAN GFX_RGBConvert(0, 255, 255)
```

Description

This is macro BRIGHTCYAN.

BRIGHTGREEN Macro

File

gfx_colors.h

C

```
#define BRIGHTGREEN GFX_RGBConvert(0, 255, 0)
```

Description

This is macro BRIGHTGREEN.

BRIGHTMAGENTA Macro

File

gfx_colors.h

C

```
#define BRIGHTMAGENTA GFX_RGBConvert(255, 0, 255)
```

Description

This is macro BRIGHTMAGENTA.

BRIGHTRED Macro

File

gfx_colors.h

C

```
#define BRIGHTRED GFX_RGBConvert(255, 0, 0)
```

Description

This is macro BRIGHTRED.

BRIGHTYELLOW Macro

File

gfx_colors.h

C

```
#define BRIGHTYELLOW GFX_RGBConvert(255, 255, 0)
```

Description

This is macro BRIGHTYELLOW.

BROWN Macro

File

gfx_colors.h

C

```
#define BROWN GFX_RGBConvert(255, 128, 0)
```

Description

This is macro BROWN.

BURLYWOOD Macro

File

gfx_colors.h

C

```
#define BURLYWOOD GFX_RGBConvert(222, 184, 135)
```

Description

This is macro BURLYWOOD.

CYAN Macro

File

gfx_colors.h

C

```
#define CYAN GFX_RGBConvert(0, 128, 128)
```

Description

This is macro CYAN.

DARKGRAY Macro

File

gfx_colors.h

C

```
#define DARKGRAY GFX_RGBConvert(64, 64, 64)
```

Description

This is macro DARKGRAY.

DARKORANGE Macro

File

gfx_colors.h

C

```
#define DARKORANGE GFX_RGBConvert(255, 140, 0)
```

Description

This is macro DARKORANGE.

GFX_W3_ALICEBLUE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_ALICEBLUE GFX_RGBConvert(240, 248, 255)
```

Description

This is macro GFX_W3_ALICEBLUE.

GFX_W3_ANTIQUEWHITE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_ANTIQUEWHITE GFX_RGBConvert(250, 235, 215)
```

Description

This is macro GFX_W3_ANTIQUEWHITE.

GFX_W3_AQUA Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_AQUA GFX_RGBConvert( 0, 255, 255)
```

Description

This is macro GFX_W3_AQUA.

GFX_W3_AQUAMARINE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_AQUAMARINE GFX_RGBConvert(127, 255, 212)
```

Description

This is macro GFX_W3_AQUAMARINE.

GFX_W3_AZURE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_AZURE GFX_RGBConvert(240, 255, 255)
```

Description

This is macro GFX_W3_AZURE.

GFX_W3_BEIGE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_BEIGE GFX_RGBConvert(245, 245, 220)
```

Description

This is macro GFX_W3_BEIGE.

GFX_W3_BISQUE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_BISQUE GFX_RGBConvert(255, 228, 196)
```

Description

This is macro GFX_W3_BISQUE.

GFX_W3_BLACK Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_BLACK GFX_RGBConvert( 0, 0, 0)
```

Description

This is macro GFX_W3_BLACK.

GFX_W3_BLANCHEDALMOND Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_BLANCHEDALMOND GFX_RGBConvert(255, 235, 205)
```

Description

This is macro GFX_W3_BLANCHEDALMOND.

GFX_W3_BLUE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_BLUE GFX_RGBConvert( 0, 0, 255)
```

Description

This is macro GFX_W3_BLUE.

GFX_W3_BLUEVIOLET Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_BLUEVIOLET GFX_RGBConvert(138, 43, 226)
```

Description

This is macro GFX_W3_BLUEVIOLET.

GFX_W3_BROWN Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_BROWN GFX_RGBConvert(165, 42, 42)
```

Description

This is macro GFX_W3_BROWN.

GFX_W3_BURLYWOOD Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_BURLYWOOD GFX_RGBConvert(222, 184, 135)
```

Description

This is macro GFX_W3_BURLYWOOD.

GFX_W3_CADETBLUE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_CADETBLUE GFX_RGBConvert( 95, 158, 160)
```

Description

This is macro GFX_W3_CADETBLUE.

GFX_W3_CHARTREUSE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_CHARTREUSE GFX_RGBConvert(127, 255, 0)
```

Description

This is macro GFX_W3_CHARTREUSE.

GFX_W3_CHOCOLATE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_CHOCOLATE GFX_RGBConvert(210, 105, 30)
```

Description

This is macro GFX_W3_CHOCOLATE.

GFX_W3_CORAL Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_CORAL GFX_RGBConvert(255, 127, 80)
```

Description

This is macro GFX_W3_CORAL.

GFX_W3_CORNFLOWERBLUE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_CORNFLOWERBLUE GFX_RGBConvert(100, 149, 237)
```

Description

This is macro GFX_W3_CORNFLOWERBLUE.

GFX_W3_CORNSILK Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_CORNSILK GFX_RGBConvert(255, 248, 220)
```

Description

This is macro GFX_W3_CORNSILK.

GFX_W3_CRIMSON Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_CRIMSON GFX_RGBConvert(220, 20, 60)
```

Description

This is macro GFX_W3_CRIMSON.

GFX_W3_CYAN Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_CYAN GFX_RGBConvert( 0, 255, 255)
```

Description

This is macro GFX_W3_CYAN.

GFX_W3_DARKBLUE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKBLUE GFX_RGBConvert( 0, 0, 139)
```

Description

This is macro GFX_W3_DARKBLUE.

GFX_W3_DARKCYAN Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKCYAN GFX_RGBConvert( 0, 139, 139)
```

Description

This is macro GFX_W3_DARKCYAN.

GFX_W3_darkgoldenrod Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_darkgoldenrod GFX_RGBConvert(184, 134, 11)
```

Description

This is macro GFX_W3_darkgoldenrod.

GFX_W3_DARKGRAY Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKGRAY GFX_RGBConvert(169, 169, 169)
```

Description

This is macro GFX_W3_DARKGRAY.

GFX_W3_DARKGREEN Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKGREEN GFX_RGBConvert( 0, 100, 0)
```

Description

This is macro GFX_W3_DARKGREEN.

GFX_W3_DARKGREY Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKGREY GFX_RGBConvert(169, 169, 169)
```

Description

This is macro GFX_W3_DARKGREY.

GFX_W3_DARKHAKI Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKHAKI GFX_RGBConvert(189, 183, 107)
```

Description

This is macro GFX_W3_DARKHAKI.

GFX_W3_DARKMAGENTA Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKMAGENTA GFX_RGBConvert(139, 0, 139)
```

Description

This is macro GFX_W3_DARKMAGENTA.

GFX_W3_DARKOLIVEGREEN Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKOLIVEGREEN GFX_RGBConvert( 85, 107, 47)
```

Description

This is macro GFX_W3_DARKOLIVEGREEN.

GFX_W3_DARKORANGE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKORANGE GFX_RGBConvert(255, 140, 0)
```

Description

This is macro GFX_W3_DARKORANGE.

GFX_W3_DARKORCHID Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKORCHID GFX_RGBConvert(153, 50, 204)
```

Description

This is macro GFX_W3_DARKORCHID.

GFX_W3_DARKRED Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKRED GFX_RGBConvert(139, 0, 0)
```

Description

This is macro GFX_W3_DARKRED.

GFX_W3_DARKSALMON Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKSALMON GFX_RGBConvert(233, 150, 122)
```

Description

This is macro GFX_W3_DARKSALMON.

GFX_W3_DARKSEAGREEN Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKSEAGREEN GFX_RGBConvert(143, 188, 143)
```

Description

This is macro GFX_W3_DARKSEAGREEN.

GFX_W3_DARKSLATEBLUE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKSLATEBLUE GFX_RGBConvert( 72, 61, 139)
```

Description

This is macro GFX_W3_DARKSLATEBLUE.

GFX_W3_DARKSLATEGRAY Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKSLATEGRAY GFX_RGBConvert( 47, 79, 79)
```

Description

This is macro GFX_W3_DARKSLATEGRAY.

GFX_W3_DARKSLATEGREY Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKSLATEGREY GFX_RGBConvert( 47, 79, 79)
```

Description

This is macro GFX_W3_DARKSLATEGREY.

GFX_W3_DARKTURQUOISE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKTURQUOISE GFX_RGBConvert( 0, 206, 209)
```

Description

This is macro GFX_W3_DARKTURQUOISE.

GFX_W3_DARKVIOLET Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DARKVIOLET GFX_RGBConvert(148, 0, 211)
```

Description

This is macro GFX_W3_DARKVIOLET.

GFX_W3_DEEPPINK Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DEEPPINK GFX_RGBConvert(255, 20, 147)
```

Description

This is macro GFX_W3_DEEPPINK.

GFX_W3_DEEPSKYBLUE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DEEPSKYBLUE GFX_RGBConvert( 0, 191, 255)
```

Description

This is macro GFX_W3_DEEPSKYBLUE.

GFX_W3_DIMGRAY Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DIMGRAY GFX_RGBConvert(105, 105, 105)
```

Description

This is macro GFX_W3_DIMGRAY.

GFX_W3_DIMGREY Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DIMGREY GFX_RGBConvert(105, 105, 105)
```

Description

This is macro GFX_W3_DIMGREY.

GFX_W3_DODGERBLUE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_DODGERBLUE GFX_RGBConvert( 30, 144, 255)
```

Description

This is macro GFX_W3_DODGERBLUE.

GFX_W3_FIREBRICK Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_FIREBRICK GFX_RGBConvert(178, 34, 34)
```

Description

This is macro GFX_W3_FIREBRICK.

GFX_W3_FLORALWHITE Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_FLORALWHITE GFX_RGBConvert(255, 250, 240)
```

Description

This is macro GFX_W3_FLORALWHITE.

GFX_W3_FORESTGREEN Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_FORESTGREEN GFX_RGBConvert( 34, 139, 34)
```

Description

This is macro GFX_W3_FORESTGREEN.

GFX_W3_FUCHSIA Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_FUCHSIA GFX_RGBConvert(255, 0, 255)
```

Description

This is macro GFX_W3_FUCHSIA.

GFX_W3_GAINSBORO Macro

File

gfx_colors_w3.h

C

```
#define GFX_W3_GAINSBORO GFX_RGBConvert(220, 220, 220)
```

Description

This is macro GFX_W3_GAINSBORO.

File

gfx_colors_x11.h

C

```
#define GFX_X11_BURLY_WOOD GFX_RGBConvert(0xDE, 0xB8, 0x87)
```

Description

This is macro GFX_X11_BURLY_WOOD.

GFX_X11_CADEL_BLUE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_CADEL_BLUE GFX_RGBConvert(0x5F, 0x9E, 0xA0)
```

Description

This is macro GFX_X11_CADEL_BLUE.

GFX_X11_CHARTEUSE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_CHARTEUSE GFX_RGBConvert(0x7F, 0xFF, 0x00)
```

Description

This is macro GFX_X11_CHARTEUSE.

GFX_X11_CHOCOLATE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_CHOCOLATE GFX_RGBConvert(0xD2, 0x69, 0x1E)
```

Description

This is macro GFX_X11_CHOCOLATE.

GFX_X11_CORAL Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_CORAL GFX_RGBConvert(0xFF, 0x7F, 0x50)
```

Description

This is macro GFX_X11_CORAL.

GFX_X11_CORNFLOWER_BLUE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_CORNFLOWER_BLUE GFX_RGBConvert(0x64, 0x95, 0xED)
```

Description

This is macro GFX_X11_CORNFLOWER_BLUE.

GFX_X11_CORNSILK Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_CORNSILK GFX_RGBConvert(0xFF, 0xF8, 0xDC)
```

Description

X11: Brown Colors

GFX_X11_CRIMSON Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_CRIMSON GFX_RGBConvert(0xDC, 0x14, 0x3C)
```

Description

This is macro GFX_X11_CRIMSON.

GFX_X11_CYAN Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_CYAN GFX_RGBConvert(0x00, 0xFF, 0xFF)
```

Description

This is macro GFX_X11_CYAN.

GFX_X11_DARK_BLUE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_BLUE GFX_RGBConvert(0x00, 0x00, 0x8B)
```

Description

This is macro GFX_X11_DARK_BLUE.

GFX_X11_DARK_CYAN Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_CYAN GFX_RGBConvert(0x00, 0x8B, 0x8B)
```

Description

This is macro GFX_X11_DARK_CYAN.

GFX_X11_DARK_GOLDENROD Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_GOLDENROD GFX_RGBConvert(0xB8, 0x86, 0x0B)
```

Description

This is macro GFX_X11_DARK_GOLDENROD.

GFX_X11_DARK_GREEN Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_GREEN GFX_RGBConvert(0x00, 0x64, 0x00)
```

Description

This is macro GFX_X11_DARK_GREEN.

GFX_X11_DARK_GREY Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_GREY GFX_RGBConvert(0xA9, 0xA9, 0xA9)
```

Description

This is macro GFX_X11_DARK_GREY.

GFX_X11_DARK_KHAKI Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_KHAKI GFX_RGBConvert(0xBD, 0xB7, 0x6B)
```

Description

This is macro GFX_X11_DARK_KHAKI.

GFX_X11_DARK_MAGENTA Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_MAGENTA GFX_RGBConvert(0x8B, 0x00, 0x8B)
```

Description

This is macro GFX_X11_DARK_MAGENTA.

GFX_X11_DARK_OLIVE_GREEN Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_OLIVE_GREEN GFX_RGBConvert(0x55, 0x6B, 0x2F)
```

Description

X11: Green Colors

GFX_X11_DARK_ORANGE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_ORANGE GFX_RGBConvert(0xFF, 0x8C, 0x00)
```

Description

This is macro GFX_X11_DARK_ORANGE.

GFX_X11_DARK_ORCHID Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_ORCHID GFX_RGBConvert(0x99, 0x32, 0xCC)
```

Description

This is macro GFX_X11_DARK_ORCHID.

GFX_X11_DARK_RED Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_RED GFX_RGBConvert(0x8B, 0x00, 0x00)
```

Description

This is macro GFX_X11_DARK_RED.

GFX_X11_DARK_SALMON Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_SALMON GFX_RGBConvert(0xEA, 0x96, 0x7A)
```

Description

This is macro GFX_X11_DARK_SALMON.

GFX_X11_DARK_SEA_GREEN Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_SEA_GREEN GFX_RGBConvert(0x8F, 0xBC, 0x8F)
```

Description

This is macro GFX_X11_DARK_SEA_GREEN.

GFX_X11_DARK_SLATE_BLUE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_SLATE_BLUE GFX_RGBConvert(0x48, 0x3D, 0x8B)
```

Description

This is macro GFX_X11_DARK_SLATE_BLUE.

GFX_X11_DARK_SLATE_GREY Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_SLATE_GREY GFX_RGBConvert(0x2F, 0x4F, 0x4F)
```

Description

This is macro GFX_X11_DARK_SLATE_GREY.

GFX_X11_DARK_TURQUOISE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_TURQUOISE GFX_RGBConvert(0x00, 0xCE, 0xD1)
```

Description

This is macro GFX_X11_DARK_TURQUOISE.

GFX_X11_DARK_VIOLET Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DARK_VIOLET GFX_RGBConvert(0x94, 0x00, 0xD3)
```

Description

This is macro GFX_X11_DARK_VIOLET.

GFX_X11_DEEP_PINK Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DEEP_PINK GFX_RGBConvert(0xFF, 0x14, 0x93)
```

Description

This is macro GFX_X11_DEEP_PINK.

GFX_X11_DEEP_SKY_BLUE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DEEP_SKY_BLUE GFX_RGBConvert(0x00, 0xBF, 0xFF)
```

Description

This is macro GFX_X11_DEEP_SKY_BLUE.

GFX_X11_DIM_GREY Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DIM_GREY GFX_RGBConvert(0x69, 0x69, 0x69)
```

Description

This is macro GFX_X11_DIM_GREY.

GFX_X11_DODGER_BLUE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_DODGER_BLUE GFX_RGBConvert(0x1E, 0x90, 0xFF)
```

Description

This is macro GFX_X11_DODGER_BLUE.

GFX_X11_FIRE_BRICK Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_FIRE_BRICK GFX_RGBConvert(0xB2, 0x22, 0x22)
```

Description

This is macro GFX_X11_FIRE_BRICK.

GFX_X11_FLORAL_WHITE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_FLORAL_WHITE GFX_RGBConvert(0xFF, 0xFA, 0xF0)
```

Description

This is macro GFX_X11_FLORAL_WHITE.

GFX_X11_FOREST_GREEN Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_FOREST_GREEN GFX_RGBConvert(0x22, 0x8B, 0x22)
```

Description

This is macro GFX_X11_FOREST_GREEN.

GFX_X11_FUCHSIA Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_FUCHSIA GFX_RGBConvert(0xFF, 0x00, 0xFF)
```

Description

This is macro GFX_X11_FUCHSIA.

GFX_X11_GAINSBORO Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_GAINSBORO GFX_RGBConvert(0xDC, 0xDC, 0xDC)
```

Description

This is macro GFX_X11_GAINSBORO.

GFX_X11_GHOST_WHITE Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_GHOST_WHITE GFX_RGBConvert(0xF8, 0xF8, 0xFF)
```

Description

This is macro GFX_X11_GHOST_WHITE.

GFX_X11_GOLD Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_GOLD GFX_RGBConvert(0xFF, 0xD7, 0x00)
```

Description

This is macro GFX_X11_GOLD.

GFX_X11_GOLDENROD Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_GOLDENROD GFX_RGBConvert(0xDA, 0xA5, 0x20)
```

Description

This is macro GFX_X11_GOLDENROD.

GFX_X11_GREEN Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_GREEN GFX_RGBConvert(0x00, 0x80, 0x00)
```

Description

This is macro GFX_X11_GREEN.

GFX_X11_GREEN_YELLOW Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_GREEN_YELLOW GFX_RGBConvert(0xAD, 0xFF, 0x2F)
```

Description

This is macro GFX_X11_GREEN_YELLOW.

GFX_X11_GREY Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_GREY GFX_RGBConvert(0x80, 0x80, 0x80)
```

Description

This is macro GFX_X11_GREY.

GFX_X11_HONEYDEW Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_HONEYDEW GFX_RGBConvert(0xF0, 0xFF, 0xF0)
```

Description

This is macro GFX_X11_HONEYDEW.

GFX_X11_HOT_PINK Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_HOT_PINK GFX_RGBConvert(0xFF, 0x69, 0xB4)
```

Description

This is macro GFX_X11_HOT_PINK.

GFX_X11_INDIAN_RED Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_INDIAN_RED GFX_RGBConvert(0xCD, 0x5C, 0x5C)
```

Description

This is macro GFX_X11_INDIAN_RED.

GFX_X11_INDIGO Macro

File

gfx_colors_x11.h

C

```
#define GFX_X11_INDIGO GFX_RGBConvert(0x4B, 0x00, 0x82)
```

Description

This is macro GFX_X11_INDIGO.

```

Description

This is macro WHEAT.

WHITE Macro

File

gfx_colors.h

C

```
#define WHITE GFX_RGBConvert(255, 255, 255)
```

Description

This is macro WHITE.

YELLOW Macro

File

gfx_colors.h

C

```
#define YELLOW GFX_RGBConvert(255, 255, 128)
```

Description

This is macro YELLOW.

Graphics Object Layer

This section describes the API and usage of the Graphics Library Object Layer.

Graphics Object Layer API

GOL Objects

Graphics Library Object Layer object API.

Button Object

Button is an object that emulates a press and release effect when operated upon.

Functions

	Name	Description
	GFX_GOL_ButtonActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_ButtonActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ButtonCreate	This function creates a GFX_GOL_BUTTON object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ButtonDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ButtonTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_ButtonTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_ButtonTextSet	This function sets the address of the current text string used by the object.

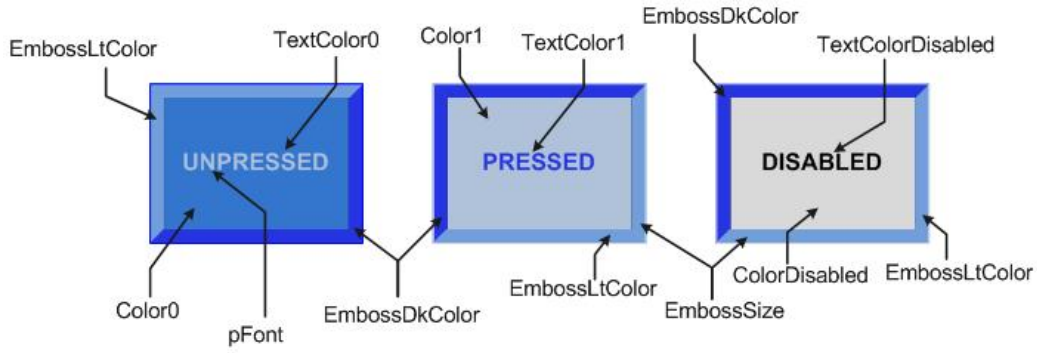
Macros

	Name	Description
	GFX_GOL_ButtonPressStateImageGet	This function gets the image used when in the pressed state.
	GFX_GOL_ButtonPressStateImageSet	This function sets the image to be used when in the pressed state.
	GFX_GOL_ButtonReleaseStateImageGet	This function gets the image used when in the released state.
	GFX_GOL_ButtonReleaseStateImageSet	This function sets the image to be used when in the released state.
	GFX_GOL_ButtonTextGet	This function returns the address of the current text string used by the object.

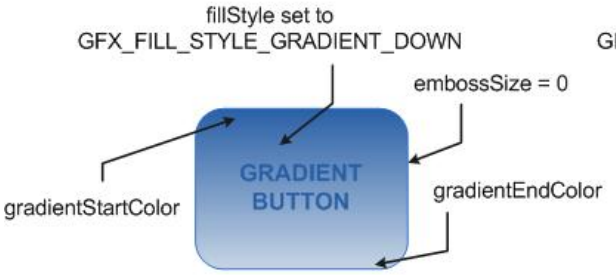
Description

Button supports Keyboard and Touchscreen inputs, replying to their events with the predefined actions (see GFX_GOL_ButtonActionGet() and GFX_GOL_ButtonActionSet() for details).

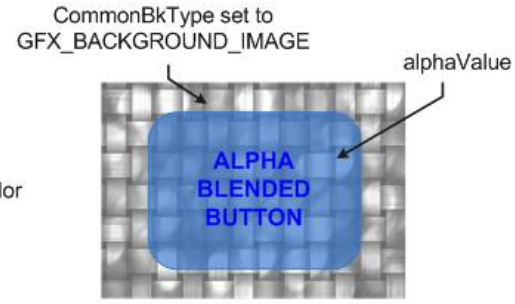
The button object is rendered using the assigned style scheme. The following figure illustrates the usage of the style schemes in the button object.



Button Style Scheme

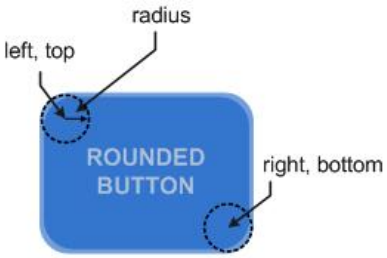


Gradient Fills in Buttons

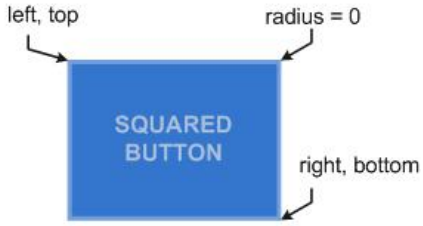


Alpha Blending in Buttons

Aside from the basic color styles, the object can also be drawn with gradient fills and alpha blended fills. Buttons can also be drawn with rectangular or rounded edges.

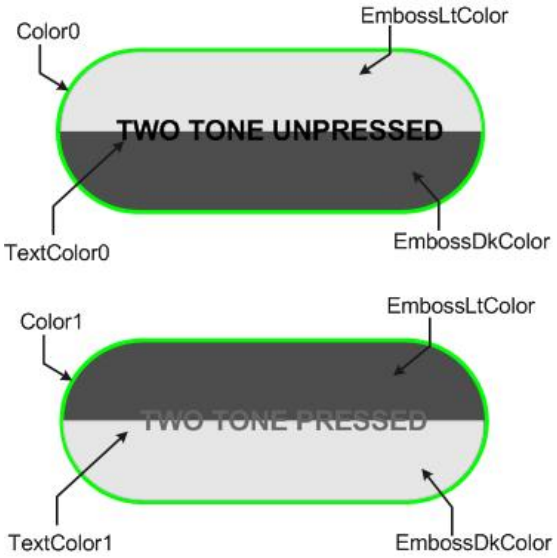


Button with Rounded Corners



Button with Squared Corners

Another variation in the rendering of button object is the two-tones mode.

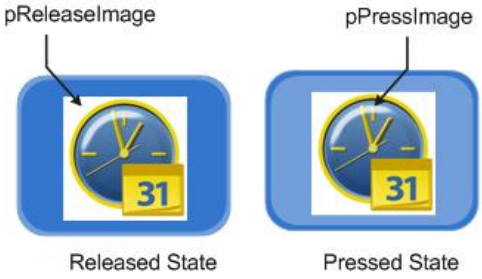


Two Tone Button

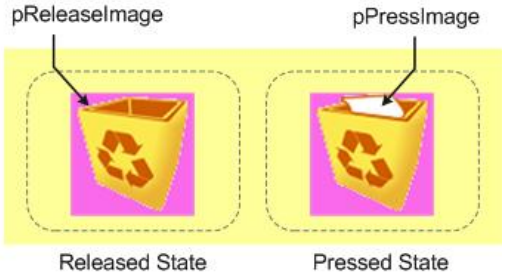
Buttons also allows alignment on the text used. The text alignment behavior of the object is the same as GFX_TextStringBoxDraw().

Instead of using text to name buttons, images or icons can also be used. Since there are two main states of the button (pressed and released state), the object allows usage of two different images. One is assigned to the pressed state and the other assigned to the released state.

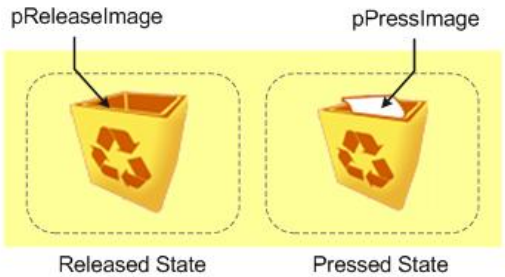
When only one image is used, both presses and released pointers should be assigned to the same image. If one state is set to NULL, then that state will not render any image.



Button with Images



Button with Images and Panel Turned Off



Button with Images, Panel Turned Off and Transparency Feature on Images Enabled

Another feature of the button object is to turn off the panel rendering of the object. This is useful when icons are used to define the buttons. Also to complete the feature set, the transparent color feature of images can also be enabled. This allows applications to use images with the flat background color ignored when rendering.

Note: Alpha blending of gradient fills is not supported by the object.

GFX_GOL_ButtonPressStateImageGet Macro

This function gets the image used when in the pressed state.

File

gfx_gol_button.h

C

```
#define GFX_GOL_ButtonPressStateImageGet(pObject, pImage) \
            (((GFX_GOL_BUTTON *)pObject)->pPressImage)
```

Returns

Pointer to the image resource.

Description

GFX GOL button press state image get.

This function gets the image used when in the pressed state.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_RESOURCE_HDR *GFX_GOL_ButtonPressStateImageGet(
GFX_GOL_BUTTON *pObject)

GFX_GOL_ButtonPressStateImageSet Macro

This function sets the image to be used when in the pressed state.

File

gfx_gol_button.h

C

```
#define GFX_GOL_ButtonPressStateImageSet(pObject, pImage) \
            (((GFX_GOL_BUTTON *)pObject)->pPressImage = pImage)
```

Returns

None.

Description

GFX GOL button press state image set.

This function sets the image to be used when in the pressed state.

Preconditions

Object must exist in memory.

Example

```
// assume ImageIcon is a valid GFX_RESOURCE_HDR

GFX_RESOURCE_HDR *pMyIcon = &ImageIcon;
GFX_GOL_BUTTON *pButton;

GFX_GOL_ButtonPressStateImageSet(pButton , pMyIcon);
```

Parameters

Parameters	Description
pObject	pointer to the object.
pImage	pointer to the image resource.

Function

void GFX_GOL_ButtonPressStateImageSet(
GFX_GOL_BUTTON *pObject,
GFX_RESOURCE_HDR *pImage)

GFX_GOL_ButtonReleaseStateImageGet Macro

This function gets the image used when in the released state.

File

gfx_gol_button.h

C

```
#define GFX_GOL_ButtonReleaseStateImageGet(pObject, pImage) \
            (((GFX_GOL_BUTTON *)pObject)->pReleaseImage)
```

Returns

Pointer to the image resource.

Description

GFX GOL button release state image get.

This function gets the image used when in the released state.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_RESOURCE_HDR *GFX_GOL_ButtonReleaseStateImageGet(
GFX_GOL_BUTTON *pObject)

GFX_GOL_ButtonReleaseStateImageSet Macro

This function sets the image to be used when in the released state.

File

gfx_gol_button.h

C

```
#define GFX_GOL_ButtonReleaseStateImageSet(pObject, pImage) \
            (((GFX_GOL_BUTTON *)pObject)->pReleaseImage = pImage)
```

Returns

None.

Description

GFX GOL button release state image set.

This function sets the image to be used when in the released state.

Preconditions

Object must exist in memory.

Example

```
// assume ImageIcon is a valid GFX_RESOURCE_HDR

GFX_RESOURCE_HDR *pMyIcon = &ImageIcon;
GFX_GOL_BUTTON *pButton;

GFX_GOL_ButtonReleaseStateImageSet(pButton , pMyIcon);
```

Parameters

Parameters	Description
pObject	pointer to the object.
pImage	pointer to the image resource.

Function

void GFX_GOL_ButtonReleaseStateImageSet(
GFX_GOL_BUTTON *pObject,
GFX_RESOURCE_HDR *pImage)

GFX_GOL_ButtonTextGet Macro

This function returns the address of the current text string used by the object.

File

gfx_gol_button.h

C

```
#define GFX_GOL_ButtonTextGet(pObject) (((GFX_GOL_BUTTON *)pObject)->pText)
```

Returns

Pointer to text string.

Description

GFX GOL button text get.

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
GFX_XCHAR *pChar;
GFX_GOL_BUTTON GFX_GOL_BUTTON[2];

pChar = GFX_GOL_ButtonTextGet(GFX_GOL_BUTTON[0]);
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_XCHAR *GFX_GOL_ButtonTextGet(
GFX_GOL_BUTTON *pObject)

GFX_GOL_ButtonActionSet Function

This function performs the state change of the object based on the translated action.

File

gfx_gol_button.h

C

```
void GFX_GOL_ButtonActionSet(GFX_GOL_TRANSLATED_ACTION translatedMsg, void * pObject, GFX_GOL_MESSAGE *
pMessage);
```

Returns

None.

Description

GFX GOL button action set.

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_BUTTON_ACTION_PRESSED	Touch Screen,	Set GFX_GOL_BUTTON_PRESSED_STATE	Button will be redrawn in the pressed state.
	Keyboard		
GFX_GOL_BUTTON_ACTION_RELEASED	Touch Screen,	Clear GFX_GOL_BUTTON_PRESSED_STATE	Button will be redrawn in the released state.
	Keyboard		
GFX_GOL_BUTTON_ACTION_CANCELPRESS	Touch Screen,	Clear GFX_GOL_BUTTON_PRESSED_STATE	Button will be redrawn in the released state.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Function

void GFX_GOL_ButtonActionSet(

GFX_GOL_TRANSLATED_ACTION translatedMsg,

void *pObject,

GFX_GOL_MESSAGE *pMessage)

GFX_GOL_ButtonActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_button.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_ButtonActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_BUTTON_ACTION_PRESSED - Object is pressed
- GFX_GOL_BUTTON_ACTION_RELEASED - Object is released
- GFX_GOL_BUTTON_ACTION_CANCELPRESS - Object will be released, user cancels press action on the GFX_GOL_BUTTON
- GFX_GOL_OBJECT_ACTION_INVALID - Object is not affected

Description

GFX GOL button action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_BUTTON_ACTION_PRESSED	Touch Screen	EVENT_PRESS, EVENT_MOVE	If events occurs and the x,y position falls in the face of the GFX_GOL_BUTTON while the GFX_GOL_BUTTON is not pressed.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_CR_PRESSED or SCAN_SPACE_PRESSED while the GFX_GOL_BUTTON is not pressed.
GFX_GOL_BUTTON_ACTION_STILLPRESSED	Touch Screen	EVENT_STILLPRESS	If event occurs and the x,y position does not change from the previous press position in the face of the GFX_GOL_BUTTON.
GFX_GOL_BUTTON_ACTION_RELEASED	Touch Screen	EVENT_RELEASE	If the event occurs and the x,y position falls in the face of the GFX_GOL_BUTTON while the GFX_GOL_BUTTON is pressed.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_CR_RELEASED or SCAN_SPACE_RELEASED while the GFX_GOL_BUTTON is pressed.
GFX_GOL_BUTTON_ACTION_CANCELPRESS	Touch Screen	EVENT_MOVE	If the event occurs outside the face of the GFX_GOL_BUTTON and the GFX_GOL_BUTTON is currently pressed.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_ButtonActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage);

GFX_GOL_ButtonCreate Function

This function creates a GFX_GOL_BUTTON object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_button.h

C

```
GFX_GOL_BUTTON * GFX_GOL_ButtonCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left, uint16_t top,
uint16_t right, uint16_t bottom, uint16_t radius, uint16_t state, GFX_RESOURCE_HDR * pPressImage,
GFX_RESOURCE_HDR * pReleaseImage, GFX_XCHAR * pText, GFX_ALIGNMENT alignment, GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL button create

This function creates a GFX_GOL_BUTTON object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The object allows setting two images. One for the pressed state and the other for the release state. If no image is to be used for the object set both pointers to NULL.

If only one image is used for both pressed and released state, set both pPressImage and pReleaseImage to the same image.

The behavior of GFX_GOL_ButtonCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- pPressImage and pReleaseImage is not pointing to a GFX_RESOURCE_HDR.
- pText is an unterminated string

Preconditions

None.

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_BUTTON *buttons[3];
GFX_GOL_BUTTON_STATE state;

// assume pScheme is initialized to a scheme in memory.
state = GFX_GOL_BUTTON_DRAW_STATE;

buttons[0] = GFX_GOL_ButtonCreate(
        gfxIndex,
        1, 20, 64, 50, 118, 0,
        state, NULL, NULL, "ON",
        GFX_ALIGN_HCENTER | GFX_ALIGN_VCENTER,
        pScheme);
// check if GFX_GOL_BUTTON 0 is created
if (buttons[0] == NULL)
   return 0;

buttons[1] = GFX_GOL_ButtonCreate(
        gfxIndex,
        2, 52, 64, 82, 118, 0,
        state, NULL, NULL, "OFF",
        GFX_ALIGN_LEFT | GFX_ALIGN_VCENTER,
        pScheme);
// check if GFX_GOL_BUTTON 1 is created
if (buttons[1] == NULL)
   return 0;

buttons[2] = GFX_GOL_ButtonCreate(
        gfxIndex,
        3, 84, 64, 114, 118, 0,
        state, NULL, NULL, "HI",
        GFX_ALIGN_RIGHT | GFX_ALIGN_VCENTER,
        pScheme);
// check if GFX_GOL_BUTTON 2 is created
if (buttons[2] == NULL)
   return 0;

return 1;
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
radius	Radius of the rounded edge. When using gradient buttons and radius != 0, emboss size <= radius. If this is not met, the the GFX_GOL_BUTTON face will not have gradient effect.
state	Sets the initial state of the object.

pPressImage	Pointer to the image used on the face of the object when it is in the pressed state.
pReleaseImage	Pointer to the image used on the face of the object when it is in the pressed state.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Function

```
GFX_GOL_BUTTON  *GFX_GOL_ButtonCreate(
                    SYS_MODULE_INDEX gfxIndex,
uint16_t        ID,
uint16_t        left,
uint16_t        top,
uint16_t        right,
uint16_t        bottom,
uint16_t        radius,
uint16_t        state,
                    GFX_RESOURCE_HDR    *pPressImage,
                    GFX_RESOURCE_HDR    *pReleaseImage,
                    GFX_XCHAR           *pText,
                    GFX_ALIGNMENT       alignment,
                    GFX_GOL_OBJ_SCHEME  *pScheme)
```

GFX_GOL_ButtonDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_button.h

C

```
GFX_STATUS GFX_GOL_ButtonDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL button draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the face of the GFX_GOL_BUTTON is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_ButtonDraw(void *pObject)

GFX_GOL_ButtonTextAlignmentGet Function

This function returns the text alignment of the text string used by the object.

File

gfx_gol_button.h

C

```
GFX_ALIGNMENT GFX_GOL_ButtonTextAlignmentGet(GFX_GOL_BUTTON * pObject);
```

Returns

The text alignment set in the object. See GFX_ALIGNMENT for more details.

Description

GFX GOL button text alignment get.

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_ALIGNMENT GFX_GOL_ButtonTextAlignmentGet(
GFX_GOL_BUTTON *pObject)

GFX_GOL_ButtonTextAlignmentSet Function

This function sets the text alignment of the text string used by the object.

File

gfx_gol_button.h

C

```
void GFX_GOL_ButtonTextAlignmentSet(GFX_GOL_BUTTON * pObject, GFX_ALIGNMENT align);
```

Returns

None.

Description

GFX GOL button text alignment set.

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Function

void GFX_GOL_ButtonTextAlignmentSet(
GFX_GOL_BUTTON *pObject,

GFX_ALIGNMENT align)

GFX_GOL_ButtonTextSet Function

This function sets the address of the current text string used by the object.

File

gfx_gol_button.h

C

```
void GFX_GOL_ButtonTextSet(GFX_GOL_BUTTON * pObject, GFX_XCHAR * pText);
```

Returns

None.

Description

GFX GOL button text set.

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
GFX_XCHAR Label0[] = â€œONâ€?;
GFX_XCHAR Label1[] = â€œOFFâ€?;
GFX_GOL_BUTTON GFX_GOL_BUTTON[2];

GFX_GOL_ButtonTextSet(GFX_GOL_BUTTON[0], Label0);
GFX_GOL_ButtonTextSet(GFX_GOL_BUTTON[1], Label1);
```

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Function

GFX_XCHAR *GFX_GOL_ButtonTextSet(
GFX_GOL_BUTTON *pObject,
GFX_XCHAR *pText)

Check Box Object

Check Box is an object that simulates a check box on paper. Usually it is used as an option setting where the checked or filled state means the option is enabled and the unfilled or unchecked state means the option is disabled.

Functions

	Name	Description
	GFX_GOL_CheckBoxActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_CheckBoxActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_CheckBoxCreate	This function creates a GFX_GOL_CHECKBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_CheckBoxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_CheckBoxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_CheckBoxTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_CheckBoxTextSet	This function sets the address of the current text string used by the object.

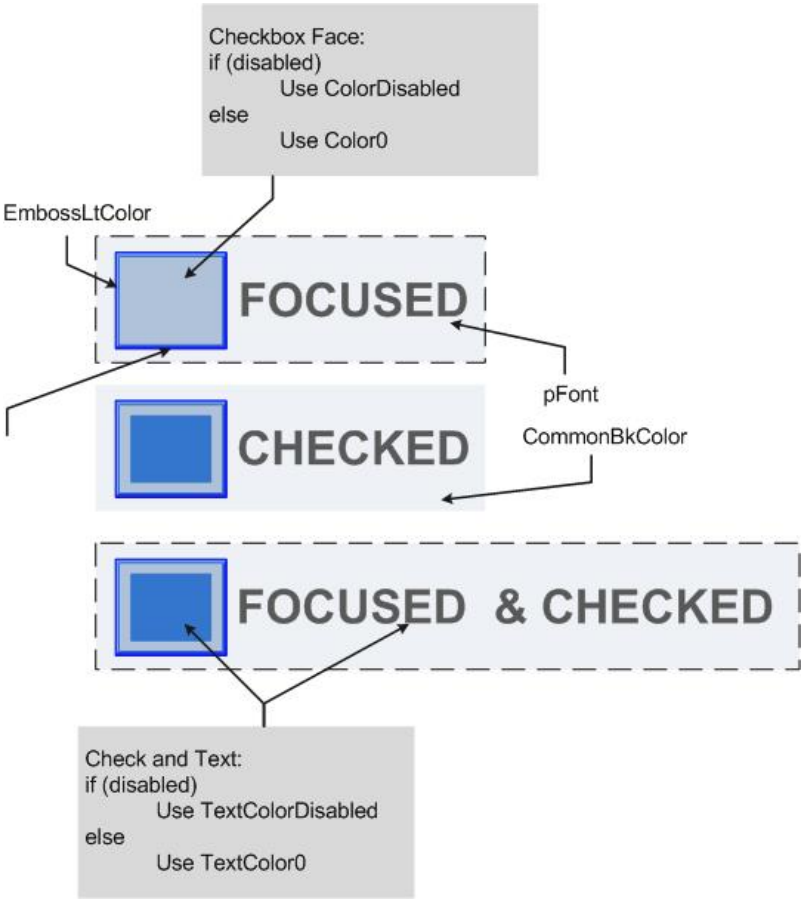
Macros

	Name	Description
	GFX_GOL_CheckBoxTextGet	This function returns the address of the current text string used by the object.

Description

Check Box supports Keyboard and Touchscreen inputs, replying to their events with the predefined actions (see GFX_GOL_CheckBoxActionGet() and GFX_GOL_CheckBoxActionSet() for details).

The Check Box object is rendered using the assigned style scheme. The following figure illustrates the color assignments.



When creating the object, the alignment of the text of the object can be formatted with the same options that GFX_TextStringBoxDraw() allows.

GFX_GOL_CheckBoxTextGet Macro

This function returns the address of the current text string used by the object.

File

gfx_gol_check_box.h

C

```
#define GFX_GOL_CheckBoxTextGet(pObject) (((GFX_GOL_CHECKBOX *)pObject)->pText)
```

Returns

Pointer to text string.

Description

GFX GOL check box text get.

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
// assume CHECK_BOX_OBJECT is a radio button that exists
GFX_XCHAR *pChar;
GFX_GOL_CHECKBOX *pObject = &CHECK_BOX_OBJECT;

pChar = GFX_GOL_CheckBoxTextGet(pObject);
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_XCHAR *GFX_GOL_CheckBoxTextGet(
GFX_GOL_CHECKBOX *pObject)

GFX_GOL_CheckBoxActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_check_box.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_CheckBoxActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_CHECKBOX_ACTION_CHECKED - Check box is checked
- GFX_GOL_CHECKBOX_ACTION_UNCHECKED - Check box is unchecked
- GFX_GOL_OBJECT_ACTION_INVALID - Object is not affected

Description

GFX GOL checkbox action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_CHECKBOX_ACTION_CHECKED	Touch Screen	EVENT_RELEASE	If events occurs and the x,y position falls in the area of the check box while the check box is unchecked.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_CR_PRESSED or SCAN_SPACE_PRESSED while the check box is unchecked.
GFX_GOL_CHECKBOX_ACTION_UNCHECKED	Touch Screen	EVENT_RELEASE	If events occurs and the x,y position falls in the area of the check box while the check box is checked.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_CR_PRESSED or SCAN_SPACE_PRESSED while the check box is checked.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_CheckBoxActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage);

GFX_GOL_CheckBoxActionSet Function

This function performs the state change of the object based on the translated action.

File

gfx_gol_check_box.h

C

```
void GFX_GOL_CheckBoxActionSet(GFX_GOL_TRANSLATED_ACTION translatedMsg, void * pObject, GFX_GOL_MESSAGE *
pMessage);
```

Returns

None.

Description

GFX GOL checkbox action set.

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_CHECKBOX_ACTION_CHECKED	Touch Screen,	Set GFX_GOL_CHECKBOX_CHECKED_STATE	Check Box will be redrawn in checked state.
	Keyboard		
GFX_GOL_CHECKBOX_ACTION_UNCHECKED	Touch Screen,	Clear GFX_GOL_CHECKBOX_CHECKED_STATE	Check Box will be redrawn in un-checked state.
	Keyboard		

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Function

void GFX_GOL_CheckBoxActionSet(
GFX_GOL_TRANSLATED_ACTION translatedMsg,
void *pObject,
GFX_GOL_MESSAGE *pMessage)

GFX_GOL_CheckBoxCreate Function

This function creates a GFX_GOL_CHECKBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_check_box.h

C

```
GFX_GOL_CHECKBOX * GFX_GOL_CheckBoxCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left, uint16_t
top, uint16_t right, uint16_t bottom, uint16_t state, GFX_XCHAR * pText, GFX_ALIGNMENT alignment,
GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL check box create.

This function creates a GFX_GOL_CHECKBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of GFX_GOL_CheckBoxCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- pText is an unterminated string

Preconditions

None.

Example

```
GFX_GOL_OBJ_SCHEME  *pScheme;
GFX_GOL_CHECKBOX    *pCb[2];

pCb[0] = GFX_GOL_CheckBoxCreate(
                    gfxIndex,
                    ID_CHECKBOX1,               // ID
                    20,135,150,175,             // dimension
                    GFX_GOL_CHECKBOX_DRAW_STATE, // Draw the object
                    "Scale",                    // text
                    GFX_ALIGN_CENTER,           // text alignment
                    pScheme);                   // use this scheme

pCb[1] = GFX_GOL_CheckBoxCreate(
                    gfxIndex,
                    ID_CHECKBOX2,               // ID
                    170,135,300,175,            // dimension
                    GFX_GOL_CHECKBOX_DRAW_STATE, // Draw the object
                    "Animate",                  // text
                    GFX_ALIGN_LEFT | GFX_ALIGN_VCENTER, // text alignment
                    pScheme);                   // use this scheme
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Function

```
GFX_GOL_CHECKBOX  *GFX_GOL_CheckBoxCreate(
                    SYS_MODULE_INDEX    gfxIndex,
uint16_t        ID,
uint16_t        left,
uint16_t        top,
uint16_t        right,
uint16_t        bottom,
```

uint16_t state,
GFX_XCHAR *pText,
GFX_ALIGNMENT alignment,
GFX_GOL_OBJ_SCHEME *pScheme)

GFX_GOL_CheckBoxDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_check_box.h

C

```
GFX_STATUS GFX_GOL_CheckBoxDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL checkbox draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the GFX_GOL_CHECKBOX is drawn with the text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_CheckBoxDraw(void *pObject)

GFX_GOL_CheckBoxTextAlignmentGet Function

This function returns the text alignment of the text string used by the object.

File

gfx_gol_check_box.h

C

```
GFX_ALIGNMENT GFX_GOL_CheckBoxTextAlignmentGet(GFX_GOL_CHECKBOX * pObject);
```

Returns

The text alignment set in the object. See GFX_ALIGNMENT for more details.

Description

GFX GOL check box text alignement get.

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_ALIGNMENT GFX_GOL_CheckBoxTextAlignmentGet(
GFX_GOL_CHECKBOX *pObject)

GFX_GOL_CheckBoxTextAlignmentSet Function

This function sets the text alignment of the text string used by the object.

File

gfx_gol_check_box.h

C

```
void GFX_GOL_CheckBoxTextAlignmentSet(GFX_GOL_CHECKBOX * pObject, GFX_ALIGNMENT align);
```

Returns

None.

Description

GFX GOL checkboc text alignment set.

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Function

void GFX_GOL_CheckBoxTextAlignmentSet(
GFX_GOL_CHECKBOX *pObject,
GFX_ALIGNMENT align)

GFX_GOL_CheckBoxTextSet Function

This function sets the address of the current text string used by the object.

File

gfx_gol_check_box.h

C

```
void GFX_GOL_CheckBoxTextSet(GFX_GOL_CHECKBOX * pObject, GFX_XCHAR * pText);
```

Returns

None.

Description

GFX OL check box text set.

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
GFX_XCHAR Label0[] = â€œEnabledâ€?;
GFX_XCHAR Label1[] = â€œDisabledâ€?;
GFX_GOL_CHECKBOX GFX_GOL_CHECKBOX[2];

GFX_GOL_CheckBoxTextSet(GFX_GOL_CHECKBOX[0], Label0);
GFX_GOL_CheckBoxTextSet(GFX_GOL_CHECKBOX[1], Label1);
```

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Function

GFX_XCHAR *GFX_GOL_CheckBoxTextSet(
GFX_GOL_CHECKBOX *pObject,
GFX_XCHAR *pText)

Custom Control Object

Functions

	Name	Description
	GFX_GOL_CustomControlActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_CustomControlActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_CustomControlCreate	This function creates a GFX_GOL_CUSTOMCONTROL object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_CustomControlDraw	This function renders the object on the screen based on the current state of the object.

Macros

	Name	Description
	GFX_GOL_CustomControlGetPos	This function returns the position of the control.
	GFX_GOL_CustomControlSetPos	This function sets the position of the control.

Description

GFX_GOL_CustomControlGetPos Macro

This function returns the position of the control.

File

gfx_gol_custom_control.h

C

```
#define GFX_GOL_CustomControlGetPos(pCc) pCc->pos
```

Returns

The position of the object.

Description

GFX GOL custom control get position

This function returns the position of the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_ALIGNMENT GFX_GOL_CustomControlGetPos(
GFX_GOL_CUSTOMCONTROL *pObject)

GFX_GOL_CustomControlSetPos Macro

This function sets the position of the control.

File

gfx_gol_custom_control.h

C

```
#define GFX_GOL_CustomControlSetPos(pCc, position) pCc->pos = position
```

Returns

none

Description

GFX GOL custom control set position.

This function sets the position of the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_CustomControlSetPos(
GFX_GOL_CUSTOMCONTROL *pObject, uint16_t pos)

GFX_GOL_CustomControlActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_custom_control.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_CustomControlActionGet(void * pObj, GFX_GOL_MESSAGE * pMsg);
```

Returns

- GFX_GOL_CUSTOMCONTROL_ACTION_SELECTED - Object is selected.
- GFX_GOL_OBJECT_ACTION_INVALID - Object is not affected

Description

GFX GOL custom control action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_CUSTOMCONTROL_ACTION_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE	If events occurs and the x,y position falls in the area of the Digital Meter.

GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_CustomControlActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage)

GFX_GOL_CustomControlActionSet Function

This function performs the state change of the object based on the translated action.

File

gfx_gol_custom_control.h

C

```
void GFX_GOL_CustomControlActionSet(GFX_GOL_TRANSLATED_ACTION translatedMsg, void * pObj, GFX_GOL_MESSAGE * pMsg);
```

Returns

None.

Description

GFX GOL custom control action set.

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source Set/Clear State Bit Description
GFX_GOL_CUSTOMCONTROL_ACTION_SELECTED	Touch Screen, Set GFX_GOL_RADIOBUTTON_DRAW_STATE, Depending on the current value of RB_CHECKED Check Box will be redrawn.
	Keyboard Set/Clear GFX_GOL_RADIOBUTTON_CHECKED_STATE

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Function

void GFX_GOL_CustomControlActionSet(
GFX_GOL_TRANSLATED_ACTION translatedMsg,
void *pObject,

GFX_GOL_MESSAGE *pMessage)

GFX_GOL_CustomControlCreate Function

This function creates a GFX_GOL_CUSTOMCONTROL object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_custom_control.h

C

```
GFX_GOL_CUSTOMCONTROL * GFX_GOL_CustomControlCreate(SYS_MODULE_INDEX clientIndex, uint16_t ID, uint16_t
left, uint16_t top, uint16_t right, uint16_t bottom, uint16_t state, GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL custom control create.

This function creates a GFX_GOL_CUSTOMCONTROL object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of GFX_GOL_CustomControlCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- pText is an unterminated string

Preconditions

None.

Example

```
GFX_GOL_OBJ_SCHEME  *pScheme;
GFX_GOL_CUSTOMCONTROL    *pCc[2];

pCc[0] = GFX_GOL_CustomControlCreate(
                    GFX_INDEX_0,
                    ID_CUSTOM1, // ID
                    30,
                    0,
                    150,
                    120, // dimension
                    // will be displayed after creation
                    GFX_GOL_CUSTOMCONTROL_DRAW_STATE,
                    pScheme
 );
```

Parameters

Parameters	Description
clientIndex	client user instance
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Function

```
GFX_GOL_CUSTOMCONTROL *GFX_GOL_CustomControlCreate(
        SYS_MODULE_INDEX clientIndex,
```

uint16_t ID,
uint16_t left,
uint16_t top,
uint16_t right,
uint16_t bottom,
uint16_t state,
GFX_GOL_OBJ_SCHEME * pScheme)

GFX_GOL_CustomControlDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_custom_control.h

C

```
GFX_STATUS GFX_GOL_CustomControlDraw(void * pObj);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL custom control draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_CustomControlDraw(void *pObject)

Digital Meter Object

Digital Meter is an object that can be used to display a value of a sampled variable. This object is ideal when fast refresh of the value is needed. The object refreshes only the digits that needs to change.

Functions

	Name	Description
	GFX_GOL_DigitalMeterActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_DigitalMeterCreate	This function creates a GFX_GOL_DIGITALMETER object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_DigitalMeterDecrement	This function decrements the meter value by the delta value set.
	GFX_GOL_DigitalMeterDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_DigitalMeterIncrement	This function increments the meter value by the delta value set.
	GFX_GOL_DigitalMeterValueSet	This function sets the value of the meter.

Macros

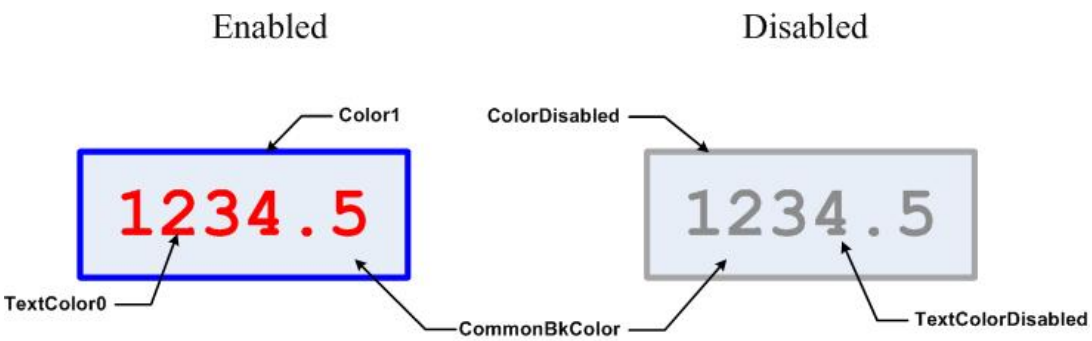
	Name	Description
	GFX_GOL_DigitalMeterTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_DigitalMeterTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_DigitalMeterValueGet	This function returns the current value of the digital meter.

Description

Digital Meter is an object that can be used to display a value of a sampled variable. This object is ideal when fast refresh of the value is needed. The object refreshes only the digits that needs to change.

Digital Meter supports only Touchscreen inputs, replying to the events with the predefined actions (see GFX_GOL_DigitalMeterActionGet() for details). There is no default action set function in this object. Application can create specific responses to the system action in the message callback function.

The DigitalMeter object is rendered using the assigned style scheme. The following figure illustrates the color assignments for the digital meter.



GFX_GOL_DigitalMeterTextAlignmentGet Macro

This function returns the text alignment of the text string used by the object.

File

gfx_gol_digital_meter.h

C

```
#define GFX_GOL_DigitalMeterTextAlignmentGet(pObject) \
                (((GFX_GOL_DIGITALMETER *)pObject)->alignment)
```

Returns

The text alignment set in the object. See GFX_ALIGNMENT for more details.

Description

GFX GOL digital meter text alignment get.

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_ALIGNMENT GFX_GOL_DigitalMeterTextAlignmentGet(
GFX_GOL_DIGITALMETER *pObject)

GFX_GOL_DigitalMeterTextAlignmentSet Macro

This function sets the text alignment of the text string used by the object.

File

gfx_gol_digital_meter.h

C

```
#define GFX_GOL_DigitalMeterTextAlignmentSet(pObject, align) \
                (((GFX_GOL_DIGITALMETER *)pObject)->alignment = align)
```

Returns

None.

Description

GFX GOL digital meter text alignment set.

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Function

void GFX_GOL_DigitalMeterTextAlignmentSet(

GFX_GOL_DIGITALMETER *pObject,

GFX_ALIGNMENT align)

GFX_GOL_DigitalMeterValueGet Macro

This function returns the current value of the digital meter.

File

gfx_gol_digital_meter.h

C

```
#define GFX_GOL_DigitalMeterValueGet(pObject) \
                                (((GFX_GOL_DIGITALMETER*)pObject)->value)
```

Returns

The current value of the object.

Description

GFX GOL digital meter value get.

This function returns the current value of the digital meter.

Preconditions

Object must exist in memory.

Example

```
#define MAXVALUE 100;

GFX_GOL_DIGITALMETER *pMeter;
uint32_t ctr = 0;

// create scroll bar here and initialize parameters
pMeter = GFX_GOL_DigitalMeterCreate(....)
GFX_GOL_ObjectStateSet(pMeter, GFX_GOL_DIGITALMETER_DRAW_STATE);

// draw the scroll bar
GFX_GOL_ObjectListDraw(gfxIndex);
```

```
// a routine that updates the position of the thumb through some
// conditions
while("some condition")
{
    GFX_GOL_DigitalMeterValueSet(pMeter, ctr);
    GFX_GOL_ObjectStateSet( pMeter,
                            GFX_GOL_DIGITALMETER_UPDATE_STATE);

    // update the screen
    GFX_GOL_ObjectListDraw(gfxIndex);

    // update ctr here
    ctr = "some source of value";
}

if (GFX_GOL_DigitalMeterValueGet(pScrollBar) > MAXVALUE)
    return 0;
else
    "do something else"
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

uint16_t GFX_GOL_DigitalMeterValueGet(
GFX_GOL_DIGITALMETER *pObject)

GFX_GOL_DigitalMeterActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_digital_meter.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_DigitalMeterActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_DIGITALMETER_ACTION_SELECTED - Object is selected.
- GFX_GOL_OBJECT_ACTION_INVALID - Object is not affected

Description

GFX GOL Digital meter action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_DIGITALMETER_ACTION_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE	If events occurs and the x,y position falls in the area of the Digital Meter.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_DigitalMeterActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage)

GFX_GOL_DigitalMeterCreate Function

This function creates a GFX_GOL_DIGITALMETER object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_digital_meter.h

C

```
GFX_GOL_DIGITALMETER * GFX_GOL_DigitalMeterCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left,
uint16_t top, uint16_t right, uint16_t bottom, uint16_t state, uint32_t value, uint8_t NoOfDigits, uint8_t
DotPos, GFX_ALIGNMENT alignment, GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL digital meter create.

This function creates a GFX_GOL_DIGITALMETER object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

Preconditions

None.

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_DIGITALMETER *pDm;

pScheme = GFX_GOL_SchemeCreate();
state = GFX_GOL_DIGITALMETER_DRAW_STATE |
        GFX_GOL_DIGITALMETER_FRAME_STATE;
GFX_GOL_DigitalMeterCreate(
        gfxIndex,
        ID_DIGITALMETER1,   // ID
        30,80,235,160,      // dimension
        state,              // has frame and center aligned
        789,4,1,            // to display 078.9
        GFX_ALIGN_CENTER,
        pScheme);           // use given scheme

// draw the objects
while(GFX_GOL_ObjectListDraw(gfxIndex) != GFX_STATUS_SUCCESS);
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
instance	Device instance
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.

bottom	Bottom most position of the object.
state	Sets the initial state of the object.
value	Sets the initial value to be displayed
NoOfDigits	Sets the number of digits to be displayed
DotPos	Sets the position of decimal point in the display
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme. Set to NULL if default style scheme is used.

Function

GFX_GOL_DIGITALMETER *GFX_GOL_DigitalMeterCreate(
SYS_MODULE_INDEX gfxIndex,
uint16_t ID,
uint16_t left,
uint16_t top,
uint16_t right,
uint16_t bottom,
uint16_t state,
uint32_t value,
uint8_t NoOfDigits,
uint8_t DotPos,
GFX_ALIGNMENT alignment
GFX_GOL_OBJ_SCHEME *pScheme)

GFX_GOL_DigitalMeterDecrement Function

This function decrements the meter value by the delta value set.

File

gfx_gol_digital_meter.h

C

```
void GFX_GOL_DigitalMeterDecrement(GFX_GOL_DIGITALMETER * pObject, uint16_t delta);
```

Returns

None.

Description

GFX GOL digital meter decrement.

This function decrements the meter value by the given delta value set. If the delta given is less than the minimum value of the meter, the value will remain to be at minimum.

Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Example

See GFX_GOL_DigitalMeterIncrement().

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_DigitalMeterDecrement(
GFX_GOL_DIGITALMETER *pObject,
uint16_t delta)

GFX_GOL_DigitalMeterDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_digital_meter.h

C

```
GFX_STATUS GFX_GOL_DigitalMeterDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL digital meter draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_DigitalMeterDraw(void *pObject)

GFX_GOL_DigitalMeterIncrement Function

This function increments the meter value by the delta value set.

File

gfx_gol_digital_meter.h

C

```
void GFX_GOL_DigitalMeterIncrement(GFX_GOL_DIGITALMETER * pObject, uint16_t delta);
```

Returns

None.

Description

GFX GOL digital meter

This function increments the scroll bar position by the given delta value set. If the delta given exceeds the maximum value of the meter, the value will remain to be at maximum.

Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Example

```
void ControlSpeed(  GFX_GOL_DIGITALMETER* pObj,
                    int setSpeed,
                    int curSpeed)
{
    // set page size to 1
    GFX_GOL_DigitalMeterValueSet(pObj, 1);

    if (setSpeed < curSpeed)
```

```
        {
            while(GFX_GOL_DigitalMeterValueGet(pObj) < SetSpeed)
            {
                // increment by 1
                GFX_GOL_DigitalMeterIncrement(pObj, 1);
            }
        }
        else if (setSpeed > curSpeed)
        {
            while(GFX_GOL_DigitalMeterValueGet(pObj) > SetSpeed)
            {
                // decrement by 1
                GFX_GOL_DigitalMeterDecrement(pObj, 1);
            }
        }
    }
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_DigitalMeterIncrement(
GFX_GOL_DIGITALMETER *pObject,
uint16_t delta)

GFX_GOL_DigitalMeterValueSet Function

This function sets the value of the meter.

File

gfx_gol_digital_meter.h

C

```
void GFX_GOL_DigitalMeterValueSet(GFX_GOL_DIGITALMETER * pObject, int16_t value);
```

Returns

None.

Description

GFX GOL digital meter value set.

This function sets the value of the meter. The value used should be within the range set for the object. The new value is checked to be in the minimum and maximum value range. If the value set is less than the minimum value, the value that will be set is the minimum value. If the value set is more than the maximum value, then the value that will be set is the maximum value.

Preconditions

Object must exist in memory.

Example

```
GFX_GOL_DIGITALMETER *pMeter;
uint16_t ctr = 0;

// create slider here and initialize parameters
GFX_GOL_ObjectStateSet(pMeter, GFX_GOL_DIGITALMETER_DRAW_STATE);
GFX_GOL_ObjectListDraw(gfxIndex);

while("some condition")
{
    GFX_GOL_DigitalMeterValueSet(pMeter, ctr);
    GFX_GOL_ObjectStateSet( pMeter,
                            GFX_GOL_DIGITALMETER_UPDATE_STATE);

    // redraw the scroll bar
    GFX_GOL_ObjectListDraw(gfxIndex);

   // update ctr here
```

```
        ctr = "some source of value";
    }
```

Parameters

Parameters	Description
pObject	pointer to the object.
value	the new value of the object.

Function

void GFX_GOL_DigitalMeterValueSet(
GFX_GOL_DIGITALMETER *pObject,
int16_t value)

Edit Box Object

Edit Box is an object that emulates a cell or a text area that can be edited dynamically.

Functions

	Name	Description
	GFX_GOL_EditBoxActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_EditBoxActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_EditBoxCharAdd	This function adds a character at the end of the text used by the object.
	GFX_GOL_EditBoxCharRemove	This function removes a character at the end of the text used by the object.
	GFX_GOL_EditBoxCreate	This function creates a GFX_GOL_EDITBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_EditBoxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_EditBoxTextSet	This function sets the text in the object.
	GFX_GOL_EditBoxCursorPositionDecrement	Decrement cursor position.
	GFX_GOL_EditBoxCursorPositionIncrement	Increment cursor position.

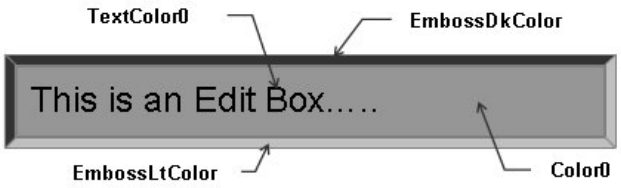
Macros

	Name	Description
	GFX_GOL_EditBoxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_EditBoxTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_EditBoxTextGet	This function returns the address of the current text string used by the object.

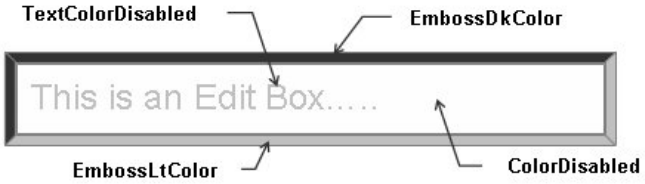
Description

Edit Box supports only keyboard inputs, replying to the events with the predefined actions (see GFX_GOL_EditBoxActionGet() and GFX_GOL_EditBoxActionSet() for details).

The Edit Box object is rendered using the assigned style scheme. The following figure illustrates the color assignments.



Edit Box in enabled state



Edit Box in disabled state

GFX_GOL_EditBoxTextAlignmentGet Macro

This function returns the text alignment of the text string used by the object.

File

gfx_gol_edit_box.h

C

```
#define GFX_GOL_EditBoxTextAlignmentGet(pObject) \
                (((GFX_GOL_EDITBOX *)pObject)->alignment)
```

Returns

The text alignment set in the object. See GFX_ALIGNMENT for more details.

Description

GFX GOL edit box text alignment get.

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_ALIGNMENT GFX_GOL_EditBoxTextAlignmentGet(
GFX_GOL_EDITBOX *pObject)

GFX_GOL_EditBoxTextAlignmentSet Macro

This function sets the text alignment of the text string used by the object.

File

gfx_gol_edit_box.h

C

```
#define GFX_GOL_EditBoxTextAlignmentSet(pObject, align) \
                (((GFX_GOL_EDITBOX *)pObject)->alignment = align)
```

Returns

None.

Description

GFX GOL edit box text alignment set.

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Function

void GFX_GOL_EditBoxTextAlignmentSet(
GFX_GOL_EDITBOX *pObject,
GFX_ALIGNMENT align)

GFX_GOL_EditBoxTextGet Macro

This function returns the address of the current text string used by the object.

File

gfx_gol_edit_box.h

C

```
#define GFX_GOL_EditBoxTextGet(pObject) (((GFX_GOL_EDITBOX *)pObject)->pText)
```

Returns

Pointer to text string.

Description

GFX GOL edit box text get.

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_XCHAR *GFX_GOL_EditBoxTextGet(
GFX_GOL_EDITBOX *pObject)

GFX_GOL_EditBoxActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_edit_box.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_EditBoxActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_EDITBOX_ACTION_ADD_CHAR - New character should be added
- GFX_GOL_EDITBOX_ACTION_DEL_CHAR - Last character should be removed.
- GFX_GOL_EDITBOX_ACTION_TOUCHSCREEN - focus will be drawn when enabled. Caret will be drawn when enabled.
- GFX_GOL_OBJECT_ACTION_INVALID - Object is not affected

Description

GFX GOL edit box action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_EDITBOX_ACTION_ADD_CHAR	Keyboard	EVENT_CHARCODE	New character should be added.
GFX_GOL_EDITBOX_ACTION_DEL_CHAR	Keyboard	EVENT_KEYPRESS	Last character should be removed.
GFX_GOL_EDITBOX_ACTION_TOUCHSCREEN	Touch Screen	GFX_GOL_EDITBOX_FOCUSED_STATE	Focus will be drawn, caret displayed when enabled.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_EditBoxActionGet(

void *pObject,

GFX_GOL_MESSAGE *pMessage);

GFX_GOL_EditBoxActionSet Function

This function performs the state change of the object based on the translated action.

File

gfx_gol_edit_box.h

C

```
void GFX_GOL_EditBoxActionSet(GFX_GOL_TRANSLATED_ACTION translatedMsg, void * pObject, GFX_GOL_MESSAGE *
pMessage);
```

Returns

None.

Description

GFX GOL edit box action set.

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the

application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_EDITBOX_ACTION_ADD_CHAR	Keyboard	Set GFX_GOL_EDITBOX_DRAW_STATE	New character is added and Edit Box will be redrawn.
GFX_GOL_EDITBOX_ACTION_DEL_CHAR	KeyBoard	Set GFX_GOL_EDITBOX_DRAW_STATE	Last character is removed and Edit Box will be redrawn.
GFX_GOL_EDITBOX_ACTION_TOUCHSCREEN	Touch Screen	Set GFX_GOL_EDITBOX_FOCUSED_STATE	When enabled, focus will be redrawn, caret will also be redrawn if enabled.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Function

void GFX_GOL_EditBoxActionSet(
GFX_GOL_TRANSLATED_ACTION translatedMsg,
void *pObject,
GFX_GOL_MESSAGE *pMessage)

GFX_GOL_EditBoxCharAdd Function

This function adds a character at the end of the text used by the object.

File

gfx_gol_edit_box.h

C

```
GFX_STATUS GFX_GOL_EditBoxCharAdd(GFX_GOL_EDITBOX * pObject, GFX_XCHAR ch);
```

Returns

The status of the addition.

- GFX_STATUS_SUCCESS - when the addition was successful.
- GFX_STATUS_FAILURE - when the addition was not successful.

Description

GFX GOL edit box char add.

This function adds a character at the end of the text used by the object. When the object contains the maximum number of characters any addition call to this function will not affect the text in the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
ch	The character to be added.

Function

GFX_STATUS GFX_GOL_EditBoxCharAdd(
GFX_GOL_EDITBOX *pObject,
GFX_XCHAR ch)

GFX_GOL_EditBoxCharRemove Function

This function removes a character at the end of the text used by the object.

File

gfx_gol_edit_box.h

C

```
GFX_STATUS GFX_GOL_EditBoxCharRemove(GFX_GOL_EDITBOX * pObject);
```

Returns

The status of the addition.

- GFX_STATUS_SUCCESS - when the removal was successful.
- GFX_STATUS_FAILURE - when the removal has no effect and the buffer is empty.

Description

GFX GOL edit box char remove.

This function removes a character at the end of the text used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_EditBoxCharRemove(
GFX_GOL_EDITBOX *pObject)

GFX_GOL_EditBoxCreate Function

This function creates a GFX_GOL_EDITBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_edit_box.h

C

```
GFX_GOL_EDITBOX * GFX_GOL_EditBoxCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left, uint16_t
top, uint16_t right, uint16_t bottom, uint16_t state, GFX_XCHAR * pText, uint16_t charMax, GFX_ALIGNMENT
alignment, GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL edit box create.

This function creates a GFX_GOL_EDITBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of GFX_GOL_ListBoxCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom

- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- pText is an unterminated string

Preconditions

None.

Example

```
// assume pScheme to be initialized with the style scheme

#define MAX_CHAR_COUNT 15

GFX_GOL_OBJ_SCHEME      *pScheme;
GFX_GOL_EDITBOX         *pEb;
GFX_GOL_EDITBOX_STATE   state;

GFX_XCHAR               TextBuffer[MAX_CHAR_COUNT + 1];

// assume pScheme is initialized to a scheme in memory.
state = GFX_GOL_EDITBOX_DRAW_STATE;

pEb = GFX_GOL_EditBoxCreate(
        1, 20, 64, 50, 118,
        state, TextBuffer, MAX_CHAR_COUNT
        GFX_ALIGN_CENTER,
        pScheme);

// check if object is not created
if (pEb == NULL)
   return 0;
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object.
charMax	Defines the maximum number of characters in the edit box.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Function

```
GFX_GOL_EDITBOX  *GFX_GOL_EditBoxCreate(
                    SYS_MODULE_INDEX    gfxIndex,
uint16_t            ID,
uint16_t            left,
uint16_t            top,
uint16_t            right,
uint16_t            bottom,
uint16_t            state,
                    GFX_XCHAR           *pText,
uint16_t            charMax,
                    GFX_ALIGNMENT       alignment,
                    GFX_GOL_OBJ_SCHEME  *pScheme)
```

GFX_GOL_EditBoxDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_edit_box.h

C

```
GFX_STATUS GFX_GOL_EditBoxDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL edit box draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_EditBoxDraw(void *pObject)

GFX_GOL_EditBoxTextSet Function

This function sets the text in the object.

File

gfx_gol_edit_box.h

C

```
void GFX_GOL_EditBoxTextSet(GFX_GOL_EDITBOX * pObject, GFX_XCHAR* pText);
```

Returns

None.

Description

GFX GOL edit box text set.

This function sets the text in the object. This function copies the text located in the address pointed to by pText to the object text buffer.

The string length must be less than or equal to the maximum characters allowed in the object. The object will truncate the string once it reaches the maximum length.

Preconditions

Object must exist in memory.

Example

```
#define MAX_EDITBOX_CHAR_LENGTH 20
GFX_XCHAR Label0[] = "This is really a long string";

// assume pEb is a pointer initialized to an edit box that
// as a buffer with 20 characters allowed.

GFX_GOL_EditBoxTextSet(pEb, Label0);
```

```
// at this point the edit box contains
// This is really a lon" - truncated to only 20 characters.
```

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be copied.

Function

GFX_XCHAR *GFX_GOL_EditBoxTextSet(
GFX_GOL_EDITBOX *pObject,
GFX_XCHAR *pText)

GFX_GOL_EditBoxCursorPositionDecrement Function

Decrement cursor position.

File

gfx_gol_edit_box.h

C

```
GFX_STATUS GFX_GOL_EditBoxCursorPositionDecrement(GFX_GOL_EDITBOX * pObject);
```

Returns

The status of the addition.

- GFX_STATUS_SUCCESS - Cursor position decrement successful.
- GFX_STATUS_FAILURE - Cursor position decrement failed.

Description

GFX GOL edit box cursor position decrement.

This function decrements cursor position.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_EditBoxCursorPositionDecrement(
GFX_GOL_EDITBOX *pObject)

GFX_GOL_EditBoxCursorPositionIncrement Function

Increment cursor position.

File

gfx_gol_edit_box.h

C

```
GFX_STATUS GFX_GOL_EditBoxCursorPositionIncrement(GFX_GOL_EDITBOX * pObject);
```

Returns

The status of the addition.

- GFX_STATUS_SUCCESS - Cursor position increment successful.
- GFX_STATUS_FAILURE - Cursor position increment failed.

Description

GFX GOL edit box cursor position increment.

This function increments cursor position.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_EditBoxCursorPostionIncrement(
GFX_GOL_EDITBOX *pObject)

Group Box Object

Group Box is an object that can be used to group objects together in the screen.

Functions

	Name	Description
	GFX_GOL_GroupboxActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_GroupboxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_GroupboxCreate	This function creates a GFX_GOL_GROUPBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_GroupboxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_GroupboxTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_GroupboxTextSet	This function sets the address of the current text string used by the object.

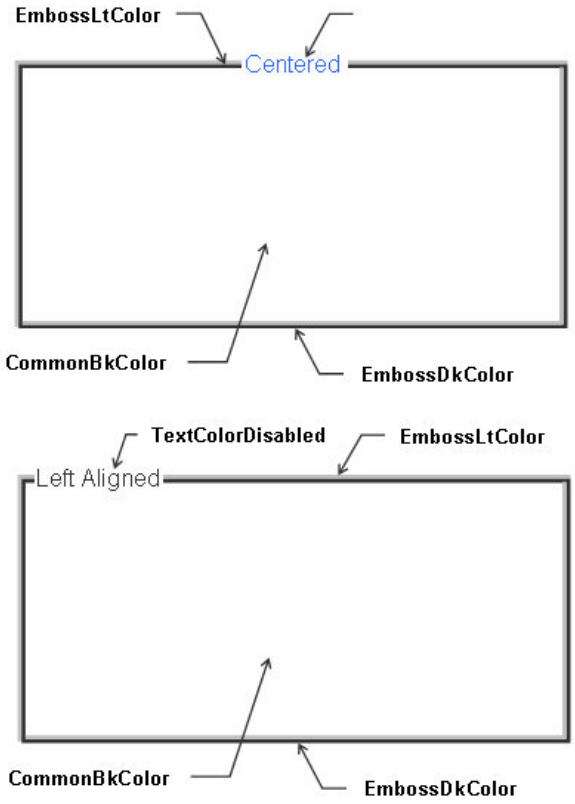
Macros

	Name	Description
	GFX_GOL_GroupboxTextGet	This function returns the address of the current text string used by the object.

Description

Group Box supports only Touchscreen inputs, replying to the events with the predefined actions (see GFX_GOL_GroupBoxActionGet() for details). There is no default action set function in this object. Application can create specific responses to the system action in the message callback function.

The Group Box object is rendered using the assigned style scheme. The following figure illustrates the color assignments.



GFX_GOL_GroupboxTextGet Macro

This function returns the address of the current text string used by the object.

File

gfx_gol_group_box.h

C

```
#define GFX_GOL_GroupboxTextGet(pObject) (((GFX_GOL_GROUPBOX *)pObject)->pText)
```

Returns

Pointer to text string.

Description

GFX GOL group box text get.

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
GFX_XCHAR *pChar;
GFX_GOL_GROUPBOX pGroupbox;

pChar = GFX_GOL_GroupboxTextGet(pGroupbox);
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_XCHAR *GFX_GOL_GroupboxTextGet(
GFX_GOL_GROUPBOX *pObject)

GFX_GOL_GroupboxActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_group_box.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_GroupboxActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_GROUPBOX_ACTION_SELECTED - Group Box area selected action ID.
- GFX_GOL_OBJECT_ACTION_INVALID â€“ Object is not affected

Description

GFX GOL group box action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Events	Description
GFX_GOL_GROUPBOX_ACTION_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE	If events occurs and the x,y position falls in the area of the group box.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_GroupboxActionGet(

void *pObject,

GFX_GOL_MESSAGE *pMessage);

GFX_GOL_GroupboxDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_group_box.h

C

```
GFX_STATUS GFX_GOL_GroupboxDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL group box draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the face of the GFX_GOL_GROUPBOX is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the

object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_GroupboxDraw(void *pObject)

GFX_GOL_GroupboxCreate Function

This function creates a GFX_GOL_GROUPBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_group_box.h

C

```
GFX_GOL_GROUPBOX * GFX_GOL_GroupboxCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left, uint16_t
top, uint16_t right, uint16_t bottom, uint16_t state, GFX_XCHAR * pText, GFX_ALIGNMENT alignment,
GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL group box create.

This function creates a GFX_GOL_GROUPBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

Preconditions

None.

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_GROUPBOX *pGroupbox;
GFX_GOL_GROUPBOX_STATE state;

// assume pScheme is initialized to a scheme in memory.
state = GFX_GOL_GROUPBOX_DRAW_STATE;

pGroupbox  = GFX_GOL_GroupboxCreate(
       gfxIndex,
       1,                              // ID
       0, 0,
       GFX_Primitive_MaxXGet(),
       GFX_Primitive_MaxYGet(),        // whole screen dimension
       state,                          // set state to draw all
       "Place Title Here.",            // text
       GFX_ALIGN_VCENTER,              // alignment of text
       NULL);                          // use default GOL scheme

if (pGroupbox == NULL)
    return 0;
```

```
    return 1;
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pImage	Pointer to the image used on the face of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Function

```
    GFX_GOL_GROUPBOX  *GFX_GOL_GroupboxCreate(
                        SYS_MODULE_INDEX    gfxIndex,
uint16_t            ID,
uint16_t            left,
uint16_t            top,
uint16_t            right,
uint16_t            bottom,
uint16_t            state,
                        GFX_RESOURCE_HDR    *pImage,
                        GFX_XCHAR           *pText,
                        GFX_ALIGNMENT       alignment,
                        GFX_GOL_OBJ_SCHEME  *pScheme)
```

GFX_GOL_GroupboxTextAlignmentGet Function

This function returns the text alignment of the text string used by the object.

File

gfx_gol_group_box.h

C

```
GFX_ALIGNMENT GFX_GOL_GroupboxTextAlignmentGet(GFX_GOL_GROUPBOX * pObject);
```

Returns

The text alignment set in the object. See GFX_ALIGNMENT for more details.

Description

GFX GOL group box text alignment get.

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

```
    GFX_ALIGNMENT GFX_GOL_GroupboxTextAlignmentGet(
```

GFX_GOL_GROUPBOX *pObject)

GFX_GOL_GroupboxTextAlignmentSet Function

This function sets the text alignment of the text string used by the object.

File

gfx_gol_group_box.h

C

```
void GFX_GOL_GroupboxTextAlignmentSet(GFX_GOL_GROUPBOX * pObject, GFX_ALIGNMENT align);
```

Returns

None.

Description

GFX GOL group box text alignment set.

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Function

void GFX_GOL_GroupboxTextAlignmentSet(
GFX_GOL_GROUPBOX *pObject,
GFX_ALIGNMENT align)

GFX_GOL_GroupboxTextSet Function

This function sets the address of the current text string used by the object.

File

gfx_gol_group_box.h

C

```
void GFX_GOL_GroupboxTextSet(GFX_GOL_GROUPBOX * pObject, GFX_XCHAR * pText);
```

Returns

None.

Description

GFX GOL group box text set.

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
GFX_XCHAR Label0[] = ?Group One?;
GFX_XCHAR Label1[] = ?Group Two?;
GFX_GOL_GROUPBOX pGroupbox;

GFX_GOL_GroupboxTextSet(pGroupbox, Label0);
GFX_GOL_GroupboxTextSet(pGroupbox, Label1);
```

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Function

```
GFX_XCHAR *GFX_GOL_GroupboxTextSet(
                GFX_GOL_GROUPBOX *pObject,
                GFX_XCHAR *pText)
```

List Box Object

List Box is an object that defines a scrollable area where items are listed. User can select a single item or multiple of items.

Functions

	Name	Description
	GFX_GOL_ListBoxActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ListBoxActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_ListBoxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ListBoxItemAdd	This function adds an item to the list box.
	GFX_GOL_ListBoxItemFocusGet	This function returns the index of the focused item in the list box.
	GFX_GOL_ListBoxItemFocusSet	This function sets the focus of the item with the index number specified by index.
	GFX_GOL_ListBoxItemListRemove	This function removes the entire items list of the list box and free the memory used.
	GFX_GOL_ListBoxItemRemove	This function removes an item from the list box and free the memory used.
	GFX_GOL_ListBoxSelectionChange	This function changes the selection status of the given item in the list box.
	GFX_GOL_ListBoxSelectionGet	This function searches for selected items from the list box.
	GFX_GOL_ListBoxVisibleItemCountGet	This function returns the count of items visible in the list box.
	GFX_GOL_ListBoxCreate	This function creates a GFX_GOL_LISTBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

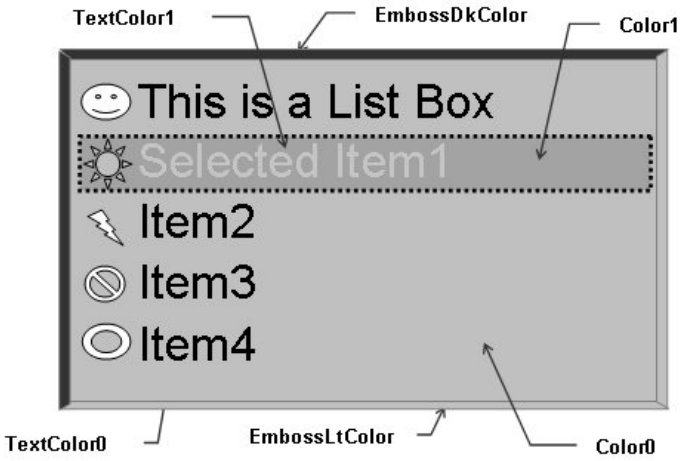
Macros

	Name	Description
	GFX_GOL_ListBoxItemCountGet	This function returns the count of items in the list box.
	GFX_GOL_ListBoxItemImageGet	This function gets the image set for a list box item.
	GFX_GOL_ListBoxItemImageSet	This function sets the image for a list box item.
	GFX_GOL_ListBoxItemListGet	This function returns the pointer to the item list of the list box.
	GFX_GOL_ListBoxItemSelectStatusClear	This function clears the selection status of the item.
	GFX_GOL_ListBoxItemSelectStatusSet	This function sets the selection status of the item to selected.
	GFX_GOL_ListBoxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_ListBoxTextAlignmentSet	This function sets the text alignment of the text string used by the object.

Description

List Box supports Keyboard and Touchscreen inputs, replying to their events with the predefined actions (see GFX_GOL_ListBoxActionGet() and GFX_GOL_ListBoxActionSet() for details).

The List Box object is rendered using the assigned style scheme. The following figure illustrates the usage of the style schemes in the object.



GFX_GOL_ListBoxItemCountGet Macro

This function returns the count of items in the list box.

File

gfx_gol_list_box.h

C

```
#define GFX_GOL_ListBoxItemCountGet(pObject) \
                (((GFX_GOL_LISTBOX *)pObject)->itemsNumber)
```

Returns

The number of items in the list box.

Description

GFX GOL list box item count get.

This function returns the count of items in the list box.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object.

Function

uint16_t GFX_GOL_ListBoxItemCountGet(
GFX_GOL_LISTBOX *pObject)

GFX_GOL_ListBoxItemImageGet Macro

This function gets the image set for a list box item.

File

gfx_gol_list_box.h

C

```
#define GFX_GOL_ListBoxItemImageGet(pItem) (((GFX_GOL_LISTITEM *)pItem)->pImage)
```

Returns

Pointer to the image used for the item.

Description

GFX GOL list box item image get.

This function gets the image set for a list box item.

Preconditions

Object must exist in memory.

Example

See GFX_GOL_ListBoxItemListGet() example.

Parameters

Parameters	Description
pItem	pointer to the list box item.

Function

GFX_RESOURCE_HDR *GFX_GOL_ListBoxItemImageGet(
GFX_GOL_LISTITEM *pItem)

GFX_GOL_ListBoxItemImageSet Macro

This function sets the image for a list box item.

File

gfx_gol_list_box.h

C

```
#define GFX_GOL_ListBoxItemImageSet(pItem, image) (((GFX_GOL_LISTITEM *)pItem)->pImage = image)
```

Returns

None.

Description

GFX GOL item image set.

This function sets the image for a list box item.

Preconditions

Object must exist in memory.

Example

See GFX_GOL_ListBoxItemAdd() and GFX_GOL_ListBoxItemListGet() example.

Parameters

Parameters	Description
pItem	pointer to the list box item.
pImage	pointer to the image resource.

Function

void GFX_GOL_ListBoxItemImageSet(
GFX_GOL_LISTITEM *pItem,
GFX_RESOURCE_HDR *pImage)

GFX_GOL_ListBoxItemListGet Macro

This function returns the pointer to the item list of the list box.

File

gfx_gol_list_box.h

C

```
#define GFX_GOL_ListBoxItemListGet(pObject) \
                ((GFX_GOL_LISTITEM *)((GFX_GOL_LISTBOX *)pObject)->pItemList)
```

Returns

The pointer to the item list of the list box.

Description

GFX GOL list box item list get.

This function returns the pointer to the item list of the list box.

Preconditions

Object must exist in memory.

Example

```
// assume:
// pLb is a initialized to a list box in memory
// myIcon is a valid image in memory

GFX_GOL_LISTITEM *pList, *pItem;
GFX_RESOURCE_HDR *pMyIcon = &myIcon;

pList = GFX_GOL_ListBoxItemListGet(pLb);
pItem = pList;

// set the image for all the items to myIcon
// set the last item image to NULL

do
{
    GFX_GOL_ListBoxImageSet(pItem, &myIcon);
}
while(pItem->pNextItem != NULL);

// get the last item's image and set to null if not null
if (GFX_GOL_ListBoxItemImageGet(pItem) != NULL)
    GFX_GOL_ListBoxImageSet(pItem, NULL);
```

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_GOL_LISTITEM *GFX_GOL_ListBoxItemListGet(
GFX_GOL_LISTBOX *pObject)

GFX_GOL_ListBoxItemSelectStatusClear Macro

This function clears the selection status of the item.

File

gfx_gol_list_box.h

C

```
#define GFX_GOL_ListBoxItemSelectStatusClear(pObject, pItem) \
                                                             \
                if(pItem->status & GFX_GOL_LISTBOX_ITEM_STATUS_SELECTED)    \
                    GFX_GOL_ListBoxSelectionChange((GFX_GOL_LISTBOX *)pObject, pItem);
```

Returns

None.

Description

GFX GOL box item select status clear.

This function clears the selection status of the item.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object.
pItem	The pointer the item that will have the selected status cleared.

Function

void GFX_GOL_ListBoxItemSelectStatusClear(
GFX_GOL_LISTBOX *pObject,
GFX_GOL_LISTITEM *pItem)

GFX_GOL_ListBoxItemSelectStatusSet Macro

This function sets the selection status of the item to selected.

File

gfx_gol_list_box.h

C

```
#define GFX_GOL_ListBoxItemSelectStatusSet(pObject, pItem) \
                                                           \
                if(!(pItem->status & GFX_GOL_LISTBOX_ITEM_STATUS_SELECTED)) \
                    GFX_GOL_ListBoxSelectionChange((GFX_GOL_LISTBOX *)pObject, pItem);
```

Returns

None.

Description

GFX GOL list box item select status set.

This function sets the selection status of the item to selected.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object.
pItem	The pointer the item that will have the selected status set to selected.

Function

void GFX_GOL_ListBoxItemSelectStatusSet(
GFX_GOL_LISTBOX *pObject,
GFX_GOL_LISTITEM *pItem)

GFX_GOL_ListBoxTextAlignmentGet Macro

This function returns the text alignment of the text string used by the object.

File

gfx_gol_list_box.h

C

```
#define GFX_GOL_ListBoxTextAlignmentGet(pObject) \
                (((GFX_GOL_LISTBOX *)pObject)->alignment)
```

Returns

The text alignment set in the object. See GFX_ALIGNMENT for more details.

Description

GFX GOL list box text alignment get.

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_ALIGNMENT GFX_GOL_ListBoxTextAlignmentGet(
GFX_GOL_LISTBOX *pObject)

GFX_GOL_ListBoxTextAlignmentSet Macro

This function sets the text alignment of the text string used by the object.

File

gfx_gol_list_box.h

C

```
#define GFX_GOL_ListBoxTextAlignmentSet(pObject, align) \
                (((GFX_GOL_LISTBOX *)pObject)->alignment = align)
```

Returns

None.

Description

GFX GOL list box text alignment set.

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Function

void GFX_GOL_ListBoxTextAlignmentSet(
GFX_GOL_LISTBOX *pObject,
GFX_ALIGNMENT align)

GFX_GOL_ListBoxActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_list_box.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_ListBoxActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_LISTBOX_ACTION_TOUCHSCREEN â€“ Item is selected using touch screen
- GFX_GOL_LISTBOX_ACTION_MOVE â€“ Focus is moved to the next item depending on the key pressed (UP or DOWN key).
- GFX_GOL_LISTBOX_ACTION_SELECTED â€“ Selection is set to the currently focused item
- GFX_GOL_OBJECT_ACTION_INVALID â€“ Object is not affected

Description

GFX GOL list box action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_LISTBOX_ACTION_TOUCHSCREEN	Touch Screen	Any	Item is selected using touch screen.
GFX_GOL_LISTBOX_ACTION_MOVE	Keyboard	EVENT_KEYSCAN	Focus is moved to the next item depending on the key pressed (UP or DOWN key).
GFX_GOL_LISTBOX_ACTION_SELECTED	Keyboard	EVENT_KEYSCAN	Selection status (GFX_GOL_LISTBOX_ITEM_STATUS_SELECTED) is set to the currently focused item.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_ListBoxActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage);

GFX_GOL_ListBoxActionSet Function

This function performs the state change of the object based on the translated action.

File

gfx_gol_list_box.h

C

```
void GFX_GOL_ListBoxActionSet(GFX_GOL_TRANSLATED_ACTION translatedMsg, void * pObject, GFX_GOL_MESSAGE *
pMessage);
```

Returns

None.

Description

GFX GOL list box action set.

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_LISTBOX_ACTION_TOUCHSCREEN	Touch Screen	Set GFX_GOL_LISTBOX_FOCUSED_STATE,	If focus is enabled, the focus state bit GFX_GOL_LISTBOX_FOCUSED_STATE will be set.
		Set GFX_GOL_LISTBOX_DRAW_FOCUS_STATE	GFX_GOL_LISTBOX_DRAW_FOCUS_STATE draw state bit will force the List Box to be redrawn with focus.
		Set GFX_GOL_LISTBOX_DRAW_ITEMS_STATE	List Box will be redrawn with selected item(s).
GFX_GOL_LISTBOX_ACTION_MOVE	KeyBoard	Set GFX_GOL_LISTBOX_DRAW_ITEMS_STATE	List Box will be redrawn with focus on one item.
GFX_GOL_LISTBOX_ACTION_SELECTED	KeyBoard	Set GFX_GOL_LISTBOX_DRAW_ITEMS_STATE	List Box will be redrawn with selection on the current item focused.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Function

void GFX_GOL_ListBoxActionSet(

GFX_GOL_TRANSLATED_ACTION translatedMsg,

void *pObject,

GFX_GOL_MESSAGE *pMessage)

GFX_GOL_ListBoxDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_list_box.h

C

```
GFX_STATUS GFX_GOL_ListBoxDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL list box draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_ListBoxDraw(void *pObject)

GFX_GOL_ListBoxItemAdd Function

This function adds an item to the list box.

File

gfx_gol_list_box.h

C

```
GFX_GOL_LISTITEM * GFX_GOL_ListBoxItemAdd(GFX_GOL_LISTBOX * pObject, GFX_GOL_LISTITEM * pPrevItem,
GFX_XCHAR * pText, GFX_RESOURCE_HDR * pImage, uint16_t status, uint16_t data);
```

Returns

The pointer to the created item.

Description

GFX GOL list box item add.

This function adds an item to the list box. This function allocates the memory needed for the GFX_GOL_LISTITEM and adds it to the list box. The newly created GFX_GOL_LISTITEM will store the location of pText, pImage and other parameters describing the added item.

Preconditions

Object must exist in memory.

Example

```
const GFX_XCHAR ItemList[] = "Line1n" "Line2n" "Line3n";

extern GFX_RESOURCE_HDR myIcon;
GFX_GOL_LISTBOX         *pLb;
GFX_GOL_LISTITEM        *pItem, *pItemList;
GFX_XCHAR               *pTemp;

// Assume that pLb is pointing to an existing list box in memory
// that is empty (no list).

// Create the list of the list box

// Initialize this to NULL to indicate that items will be added
// at the end of the list if the list exist on the list box or
// start a new list if the list box is empty.
pItem = NULL;
pTemp = ItemList;
pItem = GFX_GOL_ListBoxItemAdd(
                pLb,
                pItem,
                pTemp,
                NULL,
                LB_STS_SELECTED,
                1);
if(pItem == NULL)
    return 0;
GFX_GOL_ListBoxImageSet(pItem, &myIcon);

// Adjust pTemp to point to the next line
```

```
    while((uint16_t)*pTemp++ > (uint16_t)31);

    // add the next item
    pItem = GFX_GOL_ListBoxItemAdd(
                    pLb,
                    pItem,
                    pTemp,
                    NULL,
                    0,
                    2)
    if(pItem == NULL)
        return 0;
    GFX_GOL_ListBoxImageSet(pItem, &myIcon);

    // Adjust pTemp to point to the next line
    while((uint16_t)*pTemp++ > (uint16_t)31);

    // this time insert the next item after the first item on the list
    pItem = LbGetItemList(pLb);
    pItem = GFX_GOL_ListBoxItemAdd(
                    pLb,
                    pItem,
                    pTemp,
                    NULL,
                    0,
                    3)
    if(pItem == NULL)
        return 0;
    GFX_GOL_ListBoxImageSet(pItem, &myIcon);
```

Parameters

Parameters	Description
pObject	Pointer to the object.
pPrevItem	Pointer to the item after which a new item must be inserted, if this pointer is NULL, the item will be appended at the end of the items list.
pText	Pointer to the text that will be inserted. Text must persist in memory for as long as it is referenced by an item in the list box.
pImage	Pointer to the image for the item. Image must persist in memory for as long as it is referenced by the an item in the list box.
status	This parameter specifies if the item being added will be selected or redrawn (LB_STS_SELECTED or LB_STS_REDRAW). Refer to LISTITEM structure for details.
data	User assigned data associated with the item.

Function

```
GFX_GOL_LISTITEM *GFX_GOL_ListBoxItemAdd(
                GFX_GOL_LISTBOX     *pObject,
                GFX_GOL_LISTITEM    *pPrevItem,
                GFX_XCHAR           *pText,
                GFX_RESOURCE_HDR    *pImage,
    uint16_t        status,
    uint16_t        data)
```

GFX_GOL_ListBoxItemFocusGet Function

This function returns the index of the focused item in the list box.

File

gfx_gol_list_box.h

C

```
int16_t GFX_GOL_ListBoxItemFocusGet(GFX_GOL_LISTBOX * pObject);
```

Returns

The index of the focused item in the list box.

Description

GFX GOL list box item focus get.

This function returns the index of the focused item in the list box. First item on the list is always indexed 0. If none of the items in the list is focused, -1 is returned.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object.

Function

int16_t GFX_GOL_ListBoxItemFocusGet(
GFX_GOL_LISTBOX *pObject)

GFX_GOL_ListBoxItemFocusSet Function

This function sets the focus of the item with the index number specified by index.

File

gfx_gol_list_box.h

C

```
void GFX_GOL_ListBoxItemFocusSet(GFX_GOL_LISTBOX * pObject, uint16_t index);
```

Returns

None.

Description

GFX GOL list box item focus set.

This function sets the focus of the item with the index number specified by index. First item on the list is always indexed 0.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object.
index	The index number of the item to be focused.

Function

void GFX_GOL_ListBoxItemFocusSet(
GFX_GOL_LISTBOX *pObject,
uint16_t index)

GFX_GOL_ListBoxItemListRemove Function

This function removes the entire items list of the list box and free the memory used.

File

gfx_gol_list_box.h

C

```
void GFX_GOL_ListBoxItemListRemove(void * pObject);
```

Returns

None.

Description

GFX GOL list box item list remove.

This function removes the entire items list of the list box and free the memory used. The memory freed is the memory used for the list box. The actual text or image used for the item are not removed from memory.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_ListBoxItemListRemove(

void *pObject)

GFX_GOL_ListBoxItemRemove Function

This function removes an item from the list box and free the memory used.

File

gfx_gol_list_box.h

C

```
void GFX_GOL_ListBoxItemRemove(GFX_GOL_LISTBOX * pObject, GFX_GOL_LISTITEM * pItem);
```

Returns

None.

Description

GFX GOL list box item remove.

This function removes an item from the list box and free the memory used. The memory freed is the memory used for the list box. The actual text or image used for the item are not removed from memory.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
pItem	pointer to the list box item that will be removed.

Function

void GFX_GOL_ListBoxItemRemove(

GFX_GOL_LISTBOX *pObject

GFX_GOL_LISTITEM *pItem)

GFX_GOL_ListBoxSelectionChange Function

This function changes the selection status of the given item in the list box.

File

gfx_gol_list_box.h

C

```
void GFX_GOL_ListBoxSelectionChange(GFX_GOL_LISTBOX * pObject, GFX_GOL_LISTITEM * pItem);
```

Returns

None.

Description

GFX GOL list box selection change.

This function changes the selection status of the given item in the list box. There are two cases that this function checks Case 1: The list box is set to multiple selection.

- The item pointed to by pItem will toggle the selection status.

Case 2: The list box is set to single selection.

- If the currently selected item is not the item pointed to by pItem, the currently selected item will toggle to not selected. The item pointed to by pItem will then be set to selected.
- If the currently selected item is the same item pointed to by pItem, the selection status of that item will be set to not selected.

The change in the item's selection status should be redrawn to reflect the changes.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object.
pItem	The pointer to the item that will have the selection status changed.

Function

void GFX_GOL_ListBoxSelectionChange(
GFX_GOL_LISTBOX *pObject,
GFX_GOL_LISTITEM *pItem)

GFX_GOL_ListBoxSelectionGet Function

This function searches for selected items from the list box.

File

gfx_gol_list_box.h

C

```
GFX_GOL_LISTITEM * GFX_GOL_ListBoxSelectionGet(GFX_GOL_LISTBOX * pObject, GFX_GOL_LISTITEM * pFromItem);
```

Returns

The pointer to the first selected item found. NULL if there are no items selected.

Description

GFX GOL list box selection get.

This function searches for selected items from the list box. A starting position can optionally be given. If starting position is set to NULL, search will begin from the first item on the item list.

The function returns the pointer to the first selected item found or NULL if there are no items selected.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object.

pFromItem	The starting point of the search. If this is set to NULL, the search will start at the beginning of the item list.

Function

GFX_GOL_LISTITEM *GFX_GOL_ListBoxSelectionGet(
GFX_GOL_LISTBOX *pObject,
GFX_GOL_LISTITEM *pFromItem)

GFX_GOL_ListBoxVisibleItemCountGet Function

This function returns the count of items visible in the list box.

File

gfx_gol_list_box.h

C

```
uint16_t GFX_GOL_ListBoxVisibleItemCountGet(GFX_GOL_LISTBOX * pObject);
```

Returns

The number of visible items in the list box.

Description

GFX GOL list box visible item count get.

This function returns the count of items visible in the list box.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object.

Function

uint16_t GFX_GOL_ListBoxVisibleItemCountGet(
GFX_GOL_LISTBOX *pObject)

GFX_GOL_ListBoxCreate Function

This function creates a GFX_GOL_LISTBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_list_box.h

C

```
GFX_GOL_LISTBOX * GFX_GOL_ListBoxCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left, uint16_t
top, uint16_t right, uint16_t bottom, uint16_t state, GFX_XCHAR * pText, GFX_ALIGNMENT alignment,
GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL list box create.

This function creates a GFX_GOL_LISTBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of GFX_GOL_ListBoxCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom

- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- pText is an unterminated string

Preconditions

None.

Example

```
#define LISTBOX_ID   10
const XCHAR ItemList[] = "Line1n" "Line2n";

GFX_GOL_OBJ_SCHEME  *pScheme;
GFX_GOL_LISTBOX     *pLb;
GFX_XCHAR           *pTemp;
uint16_t            state, counter;

//assume scheme is a valid style scheme in memory
pScheme = &scheme;
state = GFX_GOL_LISTBOX_DRAW_STATE;

// create an empty list box with default style scheme
pLb = GFX_GOL_ListBoxCreate(    gfxIndex,
                                LISTBOX_ID,     // ID number
                                10,10,150,200,  // dimension
                                state,          // initial state
                                NULL,           // set items to be empty
                                GFX_ALIGN_CENTER,
                                NULL);          // use default style scheme
// check if List box was created
if (pLb == NULL)
   return 0;

// create the list of items to be placed in the list box
// Add items (each line will become one item,
// lines must be separated by 'n' character)
pTemp = ItemList;
counter = 0;

while(*pTemp)
{
    // since each item is appended NULL is assigned to
    // GFX_GOL_LISTITEM pointer.
    if(NULL == GFX_GOL_ListBoxItemAdd(
                pLb,
                NULL,
                pTemp,
                NULL,
                0,
                counter))
    {
        break;
    }

    while(*pTemp++ > (unsigned GFX_XCHAR)31);

    if(*(pTemp-1) == 0)
        break;
    counter++;
}
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.

right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object. This is used for the items of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Function

```
GFX_GOL_LISTBOX *GFX_GOL_ListBoxCreate(
                    SYS_MODULE_INDEX    gfxIndex,
uint16_t            ID,
uint16_t            left,
uint16_t            top,
uint16_t            right,
uint16_t            bottom,
uint16_t            state,
                    GFX_XCHAR           *pText,
                    GFX_ALIGNMENT       alignment,
                    GFX_GOL_OBJ_SCHEME  *pScheme)
```

Meter Object

Meter is an object that can be used to graphically display a sampled input.

Functions

	Name	Description
	GFX_GOL_MeterActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_MeterActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_MeterCreate	This function creates a GFX_GOL_METER object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_MeterDecrement	This function decrements the meter value by the delta value set.
	GFX_GOL_MeterDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_MeterIncrement	This function increments the meter value by the delta value set.
	GFX_GOL_MeterRangeSet	This function sets the range of the meter.
	GFX_GOL_MeterScaleColorsSet	This function sets the arc colors of the object.
	GFX_GOL_MeterValueSet	This function sets the value of the meter.

Macros

	Name	Description
	GFX_GOL_MeterMaximumValueGet	This function returns the maximum value set for the meter.
	GFX_GOL_MeterMinimumValueGet	This function returns the minimum value set for the meter.
	GFX_GOL_MeterTitleFontSet	This function sets the meter title font used.
	GFX_GOL_MeterTypeSet	This function sets the meter draw type.
	GFX_GOL_MeterValueFontSet	This function sets the meter's displayed value font used.
	GFX_GOL_MeterValueGet	This function returns the current value of the meter.

Description

There are three meter types that you can draw:

- MTR_WHOLE_TYPE
- MTR_HALF_TYPE
- MTR_QUARTER_TYPE

Meter supports system inputs, replying to their events with the predefined actions (see GFX_GOL_MeterActionGet() and GFX_GOL_MeterActionSet() for details).

The Meter object is rendered using the assigned style scheme, value range colors (see GFX_GOL_MeterScaleColorSet() for details) and type (see GFX_GOL_METER_DRAW_TYPE). The following figure illustrates the assignments for a half type meter.

Default Half Meter

Half Meter with Arc enabled

Note:
Normal, Critical and Danger Colors are not part of the style scheme struct. They are fields in the METER struct.

GFX_GOL_MeterMaximumValueGet Macro

This function returns the maximum value set for the meter.

File

gfx_gol_meter.h

C

```
#define GFX_GOL_MeterMaximumValueGet(pObject) \
        (((GFX_GOL_METER *)pObject)->maxValue)
```

Returns

The current maximum value set for the object.

Description

GFX GOL meter maximum value get.

This function returns the maximum value set for the meter.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_MeterMaximumValueGet(
GFX_GOL_METER *pObject)

GFX_GOL_MeterMinimumValueGet Macro

This function returns the minimum value set for the meter.

File

gfx_gol_meter.h

C

```
#define GFX_GOL_MeterMinimumValueGet(pObject) \
        (((GFX_GOL_METER *)pObject)->minValue)
```

Returns

The current minimum value set for the object.

Description

GFX GOL meter minimum value get.

This function returns the minimum value set for the meter.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_MeterMinimumValueGet(
GFX_GOL_METER *pObject)

GFX_GOL_MeterTitleFontSet Macro

This function sets the meter title font used.

File

gfx_gol_meter.h

C

```
#define GFX_GOL_MeterTitleFontSet(pObject, pNewFont) \
        (((GFX_GOL_METER *)pObject)->pTitleFont = pNewFont)
```

Returns

None.

Description

GFX GOL meter title font set.

This function sets the meter title font used. Font pointer must be initialized to a valid GFX_RESOURCE_HDR.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
pNewFont	pointer to the selected font.

Function

void GFX_GOL_MeterTitleFontSet(

GFX_GOL_METER *pObject,
GFX_RESOURCE_HDR *pNewFont)

GFX_GOL_MeterTypeSet Macro

This function sets the meter draw type.

File

gfx_gol_meter.h

C

```
#define GFX_GOL_MeterTypeSet(pObject, type) \
        (((GFX_GOL_METER *)pObject)->type = type)
```

Returns

None.

Description

GFX GOL meter type set.

This function sets the meter draw type.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
type	the draw type selected (see GFX_GOL_METER_DRAW_TYPE for more information).

Function

void GFX_GOL_MeterTypeSet(
GFX_GOL_METER *pObject,
GFX_GOL_METER_DRAW_TYPE type)

GFX_GOL_MeterValueFontSet Macro

This function sets the meter's displayed value font used.

File

gfx_gol_meter.h

C

```
#define GFX_GOL_MeterValueFontSet(pObject, pNewFont) \
        (((GFX_GOL_METER *)pObject)->pValueFont = pNewFont)
```

Returns

None.

Description

GFX GOL meter value font set.

This function sets the meter's displayed value font used. Font pointer must be initialized to a valid GFX_RESOURCE_HDR.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

pNewFont	pointer to the selected font.

Function

void GFX_GOL_MeterValueFontSet(
GFX_GOL_METER *pObject,
GFX_RESOURCE_HDR *pNewFont)

GFX_GOL_MeterValueGet Macro

This function returns the current value of the meter.

File

gfx_gol_meter.h

C

```
#define GFX_GOL_MeterValueGet(pMtr) (((GFX_GOL_METER*)pMtr)->value)
```

Returns

The current value of the object.

Description

GFX GOL meter value get.

This function returns the current value of the meter.

Preconditions

Object must exist in memory.

Example

```
#define MAXVALUE 100;

GFX_GOL_METER *pMeter;
uint32_t ctr = 0;

// create scroll bar here and initialize parameters
pMeter = GFX_GOL_MeterCreate(....)
GFX_GOL_ObjectStateSet(pMeter, GFX_GOL_METER_DRAW_STATE);

// draw the scroll bar
GFX_GOL_ObjectListDraw(gfxIndex);

// a routine that updates the position of the thumb through some
// conditions
while("some condition")
{
    GFX_GOL_MeterValueSet(pMeter, ctr);
    GFX_GOL_ObjectStateSet( pMeter,
                            GFX_GOL_METER_UPDATE_DRAW_STATE);

    // update the screen
    GFX_GOL_ObjectListDraw(gfxIndex);

    // update ctr here
    ctr = "some source of value";
}

if (GFX_GOL_MeterValueGet(pScrollBar) > MAXVALUE)
    return 0;
else
    "do something else"
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

uint16_t GFX_GOL_MeterValueGet(
GFX_GOL_METER *pObject)

GFX_GOL_MeterActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_meter.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_MeterActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_METER_ACTION_SET â€“ Meter id is given in parameter 1 for a TYPE_SYSTEM message.
- GFX_GOL_OBJECT_ACTION_INVALID â€“ Object is not affected

Description

GFX GOL meter action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_METER_ACTION_SET	System	EVENT_SET	If event set occurs and the meter id is sent in parameter 1.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_MeterActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage)

GFX_GOL_MeterActionSet Function

This function performs the state change of the object based on the translated action.

File

gfx_gol_meter.h

C

```
void GFX_GOL_MeterActionSet(GFX_GOL_TRANSLATED_ACTION translatedMsg, void * pObject, GFX_GOL_MESSAGE *
pMessage);
```

Returns

None.

Description

GFX GOL meter action set.

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_METER_ACTION_SET	System	Set GFX_GOL_METER_DRAW_STATE	Meter will be redrawn to update the needle position and value displayed. The new value is given in the pMessage parameter 2 (param2). While parameter 1 (param1) of the message holds the ID of the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Function

void GFX_GOL_MeterActionSet(

GFX_GOL_TRANSLATED_ACTION translatedMsg,

void *pObject,

GFX_GOL_MESSAGE *pMessage)

GFX_GOL_MeterCreate Function

This function creates a GFX_GOL_METER object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_meter.h

C

```
GFX_GOL_METER * GFX_GOL_MeterCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left, uint16_t top,
uint16_t right, uint16_t bottom, uint16_t state, GFX_GOL_METER_DRAW_TYPE type, int16_t value, int16_t
minValue, int16_t maxValue, GFX_RESOURCE_HDR * pTitleFont, GFX_RESOURCE_HDR * pValueFont, GFX_XCHAR *
pText, GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL meter create.

This function creates a GFX_GOL_METER object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of GFX_GOL_MeterCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- type is not one of the defined types
- pTitleFont and pValueFont is not defined to a valid font GFX_RESOURC_HDR
- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- pText is an unterminated string

Preconditions

None.

Example

```
#define ID_METER 101

extern const FONT_FLASH GOLMediumFont;      // medium font
extern const FONT_FLASH GOLSmallFont;       // small font

GFX_GOL_OBJ_SCHEME *pMeterScheme;
GFX_GOL_METER *pMtr;

// assume pMeterScheme is initialized to a scheme in memory.

// draw object after creation
state = GFX_GOL_METER_DRAW_STATE | GFX_GOL_METER_RING_STATE;

pMtr = GFX_GOL_MeterCreate(
            gfxIndex,
            ID_METER,                   // assign ID
            30, 50, 150, 180,           // set dimension
            state,
            GFX_GOL_METER_WHOLE_TYPE,   // type of meter
            0,                          // set initial value
            0, 100,                     // set min and max value
            &GOLMediumFont,             // set title font
            &GOLSmallFont,              // set value font
            "Speed",                    // Text Label
            pMeterScheme);              // style scheme

// check if meter was created
if (pMtr == NULL)
    return 0;

// Change range colors: Normal values to WHITE
//                      Critical values to BLUE
//                      Danger values to RED
// assume that WHITE, GREEN, YELLOW and RED have been defined.
GFX_GOL_MeterScaleColorSet(pMtr, WHITE, WHITE, WHITE,
                                 GREEN, YELLOW, RED);

// use GOLDraw() to draw the meter created
while(!GOLDraw());
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
type	Specifies the type of Meter to be drawn (see GFX_GOL_METER_TYPE).
value	Initial value set to the meter.
minValue	The minimum value the meter will display.
maxValue	The maximum value the meter will display.
pTitleFont	Pointer to the font used for the Title.
pValueFont	Pointer to the font used for the value.
pText	Pointer to the text label of the meter.
pScheme	Pointer to the style scheme used.

Function

```
GFX_GOL_METER *GFX_GOL_MeterCreate(
            SYS_MODULE_INDEX    gfxIndex,
```

```
uint16_t            ID,
uint16_t            left,
uint16_t            top,
uint16_t            right,
uint16_t            bottom,
uint16_t            state,
                    GFX_GOL_METER_DRAW_TYPE type,
int16_t             value,
int16_t             minValue,
int16_t             maxValue,
                    GFX_RESOURCE_HDR       *pTitleFont,
                    GFX_RESOURCE_HDR       *pValueFont,
                    GFX_XCHAR              *pText,
                    GFX_GOL_OBJ_SCHEME     *pScheme)
```

GFX_GOL_MeterDecrement Function

This function decrements the meter value by the delta value set.

File

gfx_gol_meter.h

C

```
void GFX_GOL_MeterDecrement(GFX_GOL_METER * pObject, uint16_t delta);
```

Returns

None.

Description

GFX GOL meter decrement.

This function decrements the meter value by the given delta value set. If the delta given is less than the minimum value of the meter, the value will remain to be at minimum.

Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Example

See GFX_GOL_MeterIncrement().

Parameters

Parameters	Description
pObject	pointer to the object.

Function

```
void GFX_GOL_MeterDecrement(
                    GFX_GOL_METER *pObject,
uint16_t delta)
```

GFX_GOL_MeterDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_meter.h

C

```
GFX_STATUS GFX_GOL_MeterDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished.

Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL meter draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_MeterDraw(void *pObject)

GFX_GOL_MeterIncrement Function

This function increments the meter value by the delta value set.

File

gfx_gol_meter.h

C

```
void GFX_GOL_MeterIncrement(GFX_GOL_METER * pObject, uint16_t delta);
```

Returns

None.

Description

GFX GOL meter increment

This function increments the scroll bar position by the given delta value set. If the delta given exceeds the maximum value of the meter, the value will remain to be at maximum.

Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Example

```
void ControlSpeed(  GFX_GOL_METER* pObj,
                    int setSpeed,
                    int curSpeed)
{
    // set page size to 1
    GFX_GOL_MeterValueSet(pObj, 1);

    if (setSpeed < curSpeed)
    {
        while(GFX_GOL_MeterValueGet(pObj) < SetSpeed)
            GFX_GOL_MeterIncrement(pObj, 1);  // increment by 1
    }
    else if (setSpeed > curSpeed)
    {
        while(GFX_GOL_MeterValueGet(pObj) > SetSpeed)
            GFX_GOL_MeterDecrement(pObj, 1);  // decrement by 1
    }
}
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_MeterIncrement(

GFX_GOL_METER *pObject,

uint16_t delta)

GFX_GOL_MeterRangeSet Function

This function sets the range of the meter.

File

gfx_gol_meter.h

C

```
void GFX_GOL_MeterRangeSet(GFX_GOL_METER * pObject, int16_t minValue, int16_t maxValue);
```

Returns

None.

Description

GFX GOL meter range set.

This function sets the range of the meter. When the range is modified, object must be completely redrawn to reflect the change. minValue should always be less than maxValue.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
minValue	new minimum value of the object.
maxValue	new maximum value of the object.

Function

void GFX_GOL_MeterRangeSet(

GFX_GOL_METER *pObject,

int16_t minValue,

int16_t maxValue)

GFX_GOL_MeterScaleColorsSet Function

This function sets the arc colors of the object.

File

gfx_gol_meter.h

C

```
void GFX_GOL_MeterScaleColorsSet(GFX_GOL_METER * pObject, GFX_COLOR color1, GFX_COLOR color2, GFX_COLOR
color3, GFX_COLOR color4, GFX_COLOR color5, GFX_COLOR color6);
```

Returns

None.

Description

GFX GOL meter scale colors set.

After the object is created, this function must be called to set the arc colors of the object.

Scale colors can be used to highlight values of the meter. User can set these colors to define the arc colors and scale colors. This also sets the color of the meter value when displayed. The color settings are set to the following angles:

Color Boundaries	Type Whole	Type Half	Type Quarter
Arc 6	225 to 180	not used	not used
Arc 5	179 to 135	179 to 135	not used
Arc 4	134 to 90	134 to 90	not used
Arc 3	89 to 45	89 to 45	89 to 45
Arc 2	44 to 0	44 to 0	44 to 0
Arc 1	-45 to -1	not used	not used

As the meter is drawn colors are changed depending on the angle of the scale and label being drawn.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
color1	color assigned to Arc 1 and Scale 1.
color2	color assigned to Arc 2 and Scale 2.
color3	color assigned to Arc 3 and Scale 3.
color4	color assigned to Arc 4 and Scale 4.
color5	color assigned to Arc 5 and Scale 5.
color6	color assigned to Arc 6 and Scale 6.

Function

void GFX_GOL_MeterScaleColorsSet(
GFX_GOL_METER *pObject,
GFX_COLOR color1,
GFX_COLOR color2,
GFX_COLOR color3,
GFX_COLOR color4,
GFX_COLOR color5,
GFX_COLOR color6)

GFX_GOL_MeterValueSet Function

This function sets the value of the meter.

File

gfx_gol_meter.h

C

```
void GFX_GOL_MeterValueSet(GFX_GOL_METER * pObject, int16_t value);
```

Returns

None.

Description

GFX GOL meter value set.

This function sets the value of the meter. The value used should be within the range set for the object. The new value is checked to be in the minimum and maximum value range. If the value set is less than the minimum value, the value that will be set is the minimum value. If the value set is more than the maximum value, then the value that will be set is the maximum value.

Preconditions

Object must exist in memory.

Example

```
GFX_GOL_METER *pMeter;
uint16_t ctr = 0;

// create slider here and initialize parameters
GFX_GOL_ObjectStateSet(pMeter, GFX_GOL_METER_DRAW_STATE);
GFX_GOL_ObjectListDraw(gfxIndex);

while("some condition")
{
    GFX_GOL_MeterValueSet(pMeter, ctr);
    GFX_GOL_ObjectStateSet( pMeter,
                            GFX_GOL_METER_UPDATE_DRAW_STATE);

    // redraw the scroll bar
    GFX_GOL_ObjectListDraw(gfxIndex);

   // update ctr here
   ctr = "some source of value";
}
```

Parameters

Parameters	Description
pObject	pointer to the object.
value	the new value of the object.

Function

void GFX_GOL_MeterValueSet(
GFX_GOL_METER *pObject,
int16_t value)

Panel Object

Functions

	Name	Description
	GFX_GOL_PanelAlphaParameterSet	This function sets the alpha blending value when using alpha blending in panels.
	GFX_GOL_PanelBackgroundSet	This function sets panel background information.
	GFX_GOL_PanelDraw	This function renders the panel.
	GFX_GOL_PanelGradientParameterSet	This function sets the gradient fill start and end colors of a panel.
	GFX_GOL_PanelParameterSet	This function sets the parameters to draw a panel.

Description

GFX_GOL_PanelAlphaParameterSet Function

This function sets the alpha blending value when using alpha blending in panels.

File

gfx_gol.h

C

```
void GFX_GOL_PanelAlphaParameterSet(SYS_MODULE_INDEX gfxIndex, uint16_t alphaValue);
```

Returns

None.

Description

GFX GOL panel alpha parameter set.

This function sets the alpha blending value when using alpha blending in panels. This along with the parameters set by the function GFX_GOL_PanelParameterSet() will determine how the panel will be drawn. The actual drawing of the panel is performed by GFX_GOL_PanelDraw().

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
alphaVlaue	the alpha value used to render alpha blended panels.

Function

void GFX_GOL_PanelAlphaParameterSet(SYS_MODULE_INDEX gfxIndex,
uint16_t alphaValue)

GFX_GOL_PanelBackgroundSet Function

This function sets panel background information.

File

gfx_gol.h

C

```
void GFX_GOL_PanelBackgroundSet(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pObjectHeader);
```

Returns

None.

Description

GFX GOL panel background set.

This function sets panel background information. This is an internal function and should not be called by the application.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pObjectHeader	the object header of the object that needs to draw a panel with background.

Function

void GFX_GOL_PanelBackgroundSet(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObjectHeader)

GFX_GOL_PanelDraw Function

This function renders the panel.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_PanelDraw(SYS_MODULE_INDEX gfxIndex);
```

Returns

GFX_STATUS_SUCCESS - when the panel rendering is done. GFX_STATUS_FAILURE - when the panel rendering is not yet done.

Description

GFX GOL panel draw.

This function renders the panel. Panel parameters are set by the GFX_GOL_PanelParameterSet() and GFX_GOL_PanelGradientParameterSet() or GFX_GOL_PanelAlphaParameterSet(). The function returns success (GFX_STATUS_SUCCESS) when the panel is rendered. If the function returned not success this function must be called again until success is returned.

Preconditions

Panel parameters must be set first using GFX_GOL_PanelParameterSet() and GFX_GOL_PanelGradientParameterSet() or GFX_GOL_PanelAlphaParameterSet().

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

GFX_STATUS GFX_GOL_PanelDraw(SYS_MODULE_INDEX gfxIndex)

GFX_GOL_PanelGradientParameterSet Function

This function sets the gradient fill start and end colors of a panel.

File

gfx_gol.h

C

```
void GFX_GOL_PanelGradientParameterSet(SYS_MODULE_INDEX gfxIndex, GFX_COLOR startColor, GFX_COLOR endColor);
```

Returns

None.

Description

GFX GOL panel gradient parameter set.

This function sets the gradient fill start and end colors of a panel. This along with the parameters set by the function GFX_GOL_PanelParameterSet() will determine how the panel will be drawn. The actual drawing of the panel is performed by GFX_GOL_PanelDraw().

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
startColor	the gradient fill start color.
endColor	the gradient fill end color.

Function

void GFX_GOL_PanelGradientParameterSet(SYS_MODULE_INDEX gfxIndex,

GFX_COLOR startColor,

GFX_COLOR endColor)

GFX_GOL_PanelParameterSet Function

This function sets the parameters to draw a panel.

File

gfx_gol.h

C

```
void GFX_GOL_PanelParameterSet(SYS_MODULE_INDEX gfxIndex, uint16_t left, uint16_t top, uint16_t right,
uint16_t bottom, uint16_t radius, GFX_COLOR faceClr, GFX_COLOR embossLtClr, GFX_COLOR embossDkClr,
```

```
GFX_RESOURCE_HDR * pBitmap, GFX_FILL_STYLE fillStyle, uint16_t embossSize);
```

Returns

None.

Description

GFX GOL panel parameter set.

This function sets the parameters to draw a panel. Panel is not an object. It is a routine to draw a basic component of objects. The actual drawing of the panel is performed by the GFX_GOL_PanelDraw(). After the parameters are set, call GFX_GOL_PanelDraw() to render the panel. The panel is drawn using the following:

1. Panel width is determined by right - left.
2. Panel height is determined by top - bottom.
3. Panel radius - specifies if the panel will have a rounded edge. If zero then the panel will have sharp (cornered) edge.
4. If 2*radius = height = width, the panel is circular.
5. If the panel is drawn with an image, pBitmap should point to an image resource.
6. If the panel face is drawn with the fill style specified by fillStyle. When gradient fill is used, set the gradient colors using GFX_GOL_PanelGradientParameterSet(). When alpha blending fill is used, set the alpha blending value using GFX_GOL_PanelAlphaParameterSet().

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
left	defines the left most pixel of the panel.
top	defines the top most pixel of the panel.
right	defines the right most pixel of the panel.
bottom	defines the bottom most pixel of the panel.
radius	defines the radius of the rounded corner. A zero value will result in a rectangular panel drawn.
faceClr	the color used for the face of the panel.
embossLtClr	the color used for the light emboss color for 3D effect.
embossDkClr	the color used for the dark emboss color for 3D effect.
pBitmap	pointer to the image resource of the panel.
fillStyle	fill style use for the face of the panel.
embossSize	when this is not zero, the embossLtClr and embossDkClr are used to draw the 3D effect. When this is set to zero, there will be no 3D effect.

Function

void GFX_GOL_PanelParameterSet(
SYS_MODULE_INDEX gfxIndex
uint16_t left,
uint16_t top,
uint16_t right,
uint16_t bottom,
uint16_t radius,
GFX_COLOR faceClr,
GFX_COLOR embossLtClr,
GFX_COLOR embossDkClr,
GFX_RESOURCE_HDR *pBitmap,
GFX_FILL_STYLE fillStyle,
uint16_t embossSize)

Picture Control Object

Picture Control is an object that can be used to transform an image to be an object in the screen and have control on the rendering. This object can be used to create animation using a series of bitmaps.

Functions

	Name	Description
	GFX_GOL_PictureControlActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_PictureControlCreate	This function creates a GFX_GOL_PICTURECONTROL object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_PictureControlDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_PictureControlPartialSet	This function sets the partial image parameters to be in the object.
	GFX_GOL_PictureControlScaleSet	Sets the scale factor used to render the image used in the object.

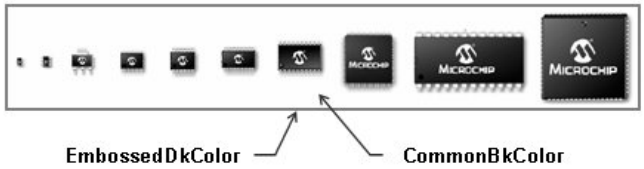
Macros

	Name	Description
	GFX_GOL_PictureControlImageGet	This function gets the image used when in the pressed state.
	GFX_GOL_PictureControlImageSet	This function sets the image to be in the object.

Description

Picture Control object supports Touchscreen inputs, replying to the events with the predefined actions (see GFX_GOL_PictureActionGet() for details).

The Picture object is rendered using the assigned style scheme. The following figure illustrates the usage of the style schemes in the object.



GFX_GOL_PictureControlImageGet Macro

This function gets the image used when in the pressed state.

File

gfx_gol_picture.h

C

```
#define GFX_GOL_PictureControlImageGet(pObject) \
                    (((GFX_GOL_PICTURECONTROL*)pObject)->pImage)
```

Returns

Pointer to the image resource.

Description

GFX GOL picture control image get.

This function gets the image used when in the pressed state.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_RESOURCE_HDR *GFX_GOL_PictureControlImageGet(
GFX_GOL_PICTURECONTROL *pObject)

GFX_GOL_PictureControlImageSet Macro

This function sets the image to be in the object.

File

gfx_gol_picture.h

C

```
#define GFX_GOL_PictureControlImageSet(pObject, image) \
                    (((GFX_GOL_PICTURECONTROL*)pObject)->pImage = (GFX_RESOURCE_HDR *)image)
```

Returns

None.

Description

GFX GOL picture control image set.

This function sets the image to be in the object.

Preconditions

Object must exist in memory.

Example

```
// assume OrigImage and NewImage are valid GFX_RESOURCE_HDR
// pointers for images

GFX_RESOURCE_HDR *pOrigIcon = &OrigImage;
GFX_RESOURCE_HDR *pNewIcon = &NewImage;
GFX_GOL_PICTURECONTROL  *pPicture;

pPicture = GFX_GOL_PictureControlCreate(
                    gfxIndex,
                    10,
                    0, 0,
                    GFX_MaxXGet(), GFX_MaxYGet(),
                    GFX_GOL_PICTURECONTROL_DRAW_STATE,
                    pOrigIcon,
                    NULL);

// change the image used
GFX_GOL_PictureControlImageSet(pPicture , pNewIcon);
```

Parameters

Parameters	Description
pObject	pointer to the object.
pImage	pointer to the image resource.

Function

void GFX_GOL_PictureControlImageSet(
GFX_GOL_PICTURECONTROL *pObject,
GFX_RESOURCE_HDR *pImage)

GFX_GOL_PictureControlActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_picture.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_PictureControlActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_PICTURECONTROL_ACTION_SELECTED â€“ Object is selected
- GFX_GOL_OBJECT_ACTION_INVALID â€“ Object is not affected

Description

GFX GOL picture control action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_PICTURECONTROL_ACTION_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE, EVENT_MOVE	If events occurs and the x,y position falls in the area of the picture.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_PictureControlActionGet(

void *pObject,

GFX_GOL_MESSAGE *pMessage);

GFX_GOL_PictureControlCreate Function

This function creates a GFX_GOL_PICTURECONTROL object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_picture.h

C

```
GFX_GOL_PICTURECONTROL * GFX_GOL_PictureControlCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t
left, uint16_t top, uint16_t right, uint16_t bottom, uint16_t state, int8_t scaleFactor, GFX_RESOURCE_HDR *
pImage, GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL picture control create.

This function creates a GFX_GOL_PICTURECONTROL object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The object allows creation with the image set to NULL. In this case, nothing will be drawn when the object is set to be drawn and the frame is not enabled (See GFX_GOL_PICTURECONTROL_FRAME_STATE). If the frame is enabled, then only the frame will be drawn.

When the assigned image's dimension is larger than the dimension of the object, partial image parameters will be set in such a way that the upper left most corner of the image that has the same dimension as the object will be used in the object. This is the default behavior.

The partial parameters can be modified by calling the GFX_GOL_PictureControlPartialSet() function with the desired partial image parameters. See GFX_ImagePartialDraw() for details on the partial image rendering.

The behavior of GFX_GOL_PictureControlCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- pImage is not pointing to a GFX_RESOURCE_HDR.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
scaleFactor	Sets the scaling factor when the image is rendered. This feature is only available in certain builds.
pImage	Pointer to the image by the object
pScheme	Pointer to the style scheme used.

Function

```
    GFX_GOL_PICTURECONTROL  *GFX_GOL_PictureControlCreate(
                SYS_MODULE_INDEX    gfxIndex,
uint16_t        ID,
uint16_t        left,
uint16_t        top,
uint16_t        right,
uint16_t        bottom,
uint16_t        state,
int8_t          scaleFactor,
                GFX_RESOURCE_HDR    *pImage,
                GFX_GOL_OBJ_SCHEME  *pScheme)
```

GFX_GOL_PictureControlDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_picture.h

C

```
GFX_STATUS GFX_GOL_PictureControlDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL picture control draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When the image size The text on the face of the GFX_GOL_PICTURECONTROL is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to

avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_PictureControlDraw(void *pObject)

GFX_GOL_PictureControlPartialSet Function

This function sets the partial image parameters to be in the object.

File

gfx_gol_picture.h

C

```
void GFX_GOL_PictureControlPartialSet(GFX_GOL_PICTURECONTROL * pObject, uint16_t xOffset, uint16_t yOffset,
uint16_t partialWidth, uint16_t partialHeight);
```

Returns

None.

Description

GFX GOL picture control partial set.

This function sets the partial image parameters to be used in the object. This function allows usage of the object to specify a rectangular area of an image to be drawn as part of the object. This is useful when an image is already included in a larger image. To save memory, a separate image is not necessary for the picture object. The location of the smaller image in the larger image can be specified to show up in the picture object.

This function will result in an undefined behavior when one of the following is true:

- xOffset - value must not be greater than the image width.
- yOffset - value must not be greater than the image height.
- partialWidth - value must not be greater than image width - xoffset + 1. Value must also be less than the actual image width.
- partialHeight - value must not be greater than image height - yoffset + 1. Value must also be less than the actual image height.

Preconditions

Object must exist in memory. The image pointer of the object must be initialized properly.

Example

```
// assume pLargeImage is a valid GFX_RESOURCE_HDR
// assume BigImage has a height and width of 100 pixels.

GFX_RESOURCE_HDR *pLargeImage = &BigImage;
GFX_GOL_PICTURECONTROL  *pPicture;
uint16_t         width, height;
uint16_t         xOffset, yOffset;
uint16_t         objectWidth, objectHeight;

objectWidth  = 60  - 50; // 10 pixels
objectHeight = 120 - 90; // 30 pixels

// -1 is needed since the object dimension is inclusive
pPicture = GFX_GOL_PictureControlCreate(
                    gfxIndex,
                    10,
                    50, 90,
                    50 + objectWidth - 1,
                    90 + objectHeight - 1,
```

```
                        GFX_GOL_PICTURECONTROL_DRAW_STATE,
                        largeImage,
                        NULL);

    // set the parameters of the partial image to be
    // shown on the image

    // get the large image dimensions
    width  = GFX_ImageWidthGet(pLargeImage);
    height = GFX_ImageHeightGet(pLargeImage);

    // get the offset so the middle of the large image with
    // the width and height matching the object will be used.
    xOffset = (width  - objectWidth)  >> 1;
    yOffset = (height - objectHeight) >> 1;

    GFX_GOL_PictureControlPartialSet(  pPicture,
                              xOffset, yOffset,
                              objectWidth, objectHeight);
```

Parameters

Parameters	Description
xOffset	x offset of the smaller portion of a large image
yOffset	y offset of the smaller portion of a large image
partialWidth	width of the selected portion of the image
partialHeight	height of the selected portion of the image

Function

void GFX_GOL_PictureControlPartialSet(

GFX_GOL_PICTURECONTROL *pObject,

uint16_t xOffset,

uint16_t yOffset,

uint16_t partialWidth,

uint16_t partialHeight)

GFX_GOL_PictureControlScaleSet Function

Sets the scale factor used to render the image used in the object.

File

gfx_gol_picture.h

C

```
void GFX_GOL_PictureControlScaleSet(GFX_GOL_PICTURECONTROL * pObject, int8_t scale);
```

Returns

None.

Description

GFX GOL picture control scale set.

This function sets the scale factor used to render the image used in the object using scale.

Remarks

None.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object
scale	Scale factor that will be used to display the image.

Function

void GFX_GOL_PictureControlScaleSet(
GFX_GOL_PICTURECONTROL pObject,
int8_t scale)

Progress Bar Object

Progress Bar is an object that can be used to display the progress of a task such as a data download or transfer.

Functions

	Name	Description
	GFX_GOL_ProgressBarActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ProgressBarCreate	This function creates a GFX_GOL_PROGRESSBAR object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ProgressBarDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ProgressBarPositionSet	This function sets the position of the progress bar.
	GFX_GOL_ProgressBarRangeSet	This function sets the range of the progress bar.

Macros

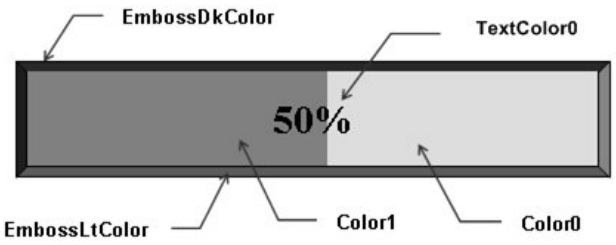
	Name	Description
	GFX_GOL_ProgressBarPositionGet	This function returns the current position of the progress bar.
	GFX_GOL_ProgressBarRangeGet	This function returns the range of the progress bar.

Description

Progress Bar is an object that can be used to display the progress of a task such as a data download or transfer.

Progress Bar supports only Touchscreen inputs, replying to the events with the predefined actions (see GFX_GOL_ProgressBarActionGet() for details).

The Progress Bar object is rendered using the assigned style scheme. The following figure illustrates the usage of the style schemes in the object.



CommonBkColor – used to hide/remove the progress bar from the screen.

GFX_GOL_ProgressBarPositionGet Macro

This function returns the current position of the progress bar.

File

gfx_gol_progress_bar.h

C

```
#define GFX_GOL_ProgressBarPositionGet(pObject) \
                                        (((GFX_GOL_PROGRESSBAR*)pObject)->pos)
```

Returns

The current position of the scroll bar thumb.

Description

GFX GOL progress bar position get.

This function returns the current position of the progress bar.

Preconditions

Object must exist in memory.

Example

See GFX_GOL_ProgressBarPositionSet() example.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

uint16_t GFX_GOL_ProgressBarPositionGet(
GFX_GOL_PROGRESSBAR *pObject)

GFX_GOL_ProgressBarRangeGet Macro

This function returns the range of the progress bar.

File

gfx_gol_progress_bar.h

C

```
#define GFX_GOL_ProgressBarRangeGet(pObject) (pObject->range)
```

Returns

The current range used by the object.

Description

GFX GOL progress bar range get.

This function returns the range of the progress bar.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_ProgressBarRangeGet(
GFX_GOL_PROGRESSBAR *pObject)

GFX_GOL_ProgressBarActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_progress_bar.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_ProgressBarActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_PROGRESSBAR_ACTION_SELECTED â€“ Object is selected
- GFX_GOL_OBJECT_ACTION_INVALID â€“ Object is not affected

Description

GFX GOL progress bar action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit Description
GFX_GOL_PROGRESSBAR_ACTION_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE, If events occurs and the x,y position falls in the area of the object. EVENT_MOVE
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_ProgressBarActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage);

GFX_GOL_ProgressBarCreate Function

This function creates a GFX_GOL_PROGRESSBAR object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_progress_bar.h

C

```
GFX_GOL_PROGRESSBAR * GFX_GOL_ProgressBarCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left,
uint16_t top, uint16_t right, uint16_t bottom, uint16_t state, uint16_t pos, uint16_t range,
GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL progress bar create.

This function creates a GFX_GOL_PROGRESSBAR object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of GFX_GOL_RadioButtonCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pos > range
- range = 0
- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- pText is an unterminated string

Preconditions

None.

Example

```
GFX_GOL_PROGRESSBAR *pPBar;
void CreateProgressBar()
{
    pPBar = GFX_GOL_ProgressBarCreate(
                    gfxIndex,
                    ID_PROGRESSBAR1,   // ID
                    50,90,270,140,      // dimension
                    PB_DRAW,            // Draw the object
                    25,                 // position
                    50,                 // set the range
                    NULL);              // use default GOL scheme

}
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pos	Defines the initial position of the progress.
range	This specifies the maximum value of the progress bar when the progress bar is at 100% position.
pScheme	Pointer to the style scheme used.

Function

```
GFX_GOL_PROGRESSBAR *GFX_GOL_ProgressBarCreate(
                SYS_MODULE_INDEX    gfxIndex,
uint16_t        ID,
uint16_t        left,
uint16_t        top,
uint16_t        right,
uint16_t        bottom,
uint16_t        state,
uint16_t        pos,
uint16_t        range,
                GFX_GOL_OBJ_SCHEME *pScheme)
```

GFX_GOL_ProgressBarDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_progress_bar.h

C

```
GFX_STATUS GFX_GOL_ProgressBarDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL progress bar draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_ProgressBarDraw(void *pObject)

GFX_GOL_ProgressBarPositionSet Function

This function sets the position of the progress bar.

File

gfx_gol_progress_bar.h

C

```
void GFX_GOL_ProgressBarPositionSet(GFX_GOL_PROGRESSBAR * pObject, uint16_t position);
```

Returns

None.

Description

GFX GOL progress bar position set.

This function sets the position of the progress bar.

The value used for the position should be within the range set for the object.

Function will have an undefined behavior if the position is outside the range.

Preconditions

Object must exist in memory.

Example

```
        GFX_GOL_PROGRESSBAR *pPb;
        uint8_t  direction = 1;

// this code increments and decrements the progress bar by 1
// assume progress bar was created and initialized before
while (1)
        {
            if(direction)
            {
                if(pPb ->pos == pPb ->range)
                    direction = 0;
                else
                    GFX_GOL_ProgressBarPositionSet(
                        pPb,
                        GFX_GOL_ProgressBarPositionGet(pPb)+1);
            }
            else
            {
                if(pPb ->pos == 0)
                    direction = 1;
                else
                    GFX_GOL_ProgressBarPositionSet(
```

```
                        pPb,
                        GFX_GOL_ProgressBarPositionGet(pPb)-1);
            }
        }
```

Parameters

Parameters	Description
pObject	pointer to the object.
position	the new position of the scroll bar thumb.

Function

void GFX_GOL_ProgressBarPositionSet(

GFX_GOL_PROGRESSBAR *pObject,

uint16_t position)

GFX_GOL_ProgressBarRangeSet Function

This function sets the range of the progress bar.

File

gfx_gol_progress_bar.h

C

```
void GFX_GOL_ProgressBarRangeSet(GFX_GOL_PROGRESSBAR * pObject, uint16_t range);
```

Returns

None.

Description

GFX GOL progress bar range set.

This function sets the range of the progress bar. When the range is modified, object must be completely redrawn to reflect the change.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
range	new range of the object.

Function

void GFX_GOL_ProgressBarRangeSet(

GFX_GOL_PROGRESSBAR *pObject,

uint16_t range)

Radio Button Object

Radio Button is an object that can be used to offer set of choices to the user. Only one of the choices is selectable. Changing selection automatically removes the selection on the previous option.

Functions

	Name	Description
	GFX_GOL_RadioButtonCheckGet	This function returns the ID of the currently checked radio button in the group.
	GFX_GOL_RadioButtonActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_RadioButtonActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_RadioButtonCheckSet	This function sets the ID of the currently checked radio button in the group.
	GFX_GOL_RadioButtonDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_RadioButtonTextAlignmentGet	This function returns the text alignment of the text string used by the object.

	GFX_GOL_RadioButtonTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_RadioButtonTextSet	This function sets the address of the current text string used by the object.
	GFX_GOL_RadioButtonCreate	This function creates a GFX_GOL_RADIOBUTTON object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_RadioButtonListCreate	This is function GFX_GOL_RadioButtonListCreate.

Macros

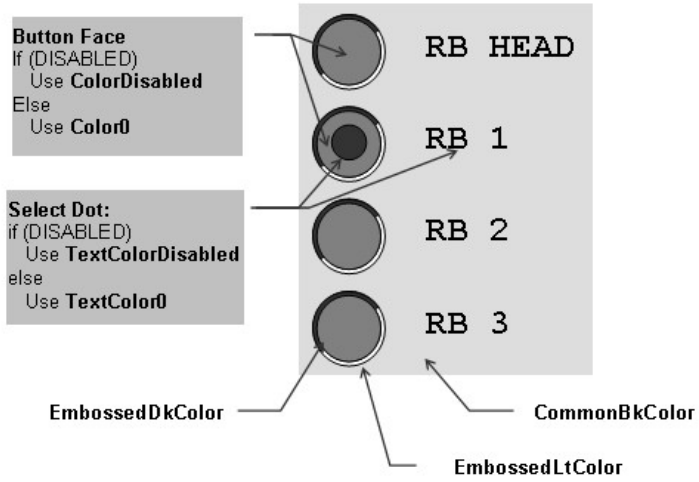
	Name	Description
	GFX_GOL_RadioButtonTextGet	This function returns the address of the current text string used by the object.

Description

Radio Button is an object that can be used to offer set of choices to the user. Only one of the choices is selectable. Changing selection automatically removes the selection on the previous option.

Radio Button supports Keyboard and Touchscreen inputs, replying to their events with the predefined actions (see GFX_GOL_RadioButtonActionGet() and GFX_GOL_RadioButtonActionSet() for details).

The Radio Button object is rendered using the assigned style scheme. The following figure illustrates the usage of the style schemes in the object.



GFX_GOL_RadioButtonTextGet Macro

This function returns the address of the current text string used by the object.

File

gfx_gol_radio_button.h

C

```
#define GFX_GOL_RadioButtonTextGet(pObject) \
                                    (((GFX_GOL_RADIOBUTTON *)pObject)->pText)
```

Returns

Pointer to text string.

Description

GFX GOL radio button text get.

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
// assume RADIO_BUTTON_OBJECT is a radio button that exists
GFX_XCHAR *pChar;
GFX_GOL_RADIOBUTTON *pRadioButton = &RADIO_BUTTON_OBJECT;
```

```
pChar = GFX_GOL_ButtonRadioTextGet(pRadioButton);
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_XCHAR *GFX_GOL_RadioButtonTextGet(
GFX_GOL_RADIOBUTTON *pObject)

GFX_GOL_RadioButtonCheckGet Function

This function returns the ID of the currently checked radio button in the group.

File

gfx_gol_radio_button.h

C

```
uint16_t GFX_GOL_RadioButtonCheckGet(GFX_GOL_RADIOBUTTON * pObject);
```

Returns

The ID of the member of the group with the check.

Description

GFX GOL radio button check get.

This function returns the ID of the currently checked radio button in the group. When there is only one member of the group, then that member will have the check.

When no member of the group is checked, then the id returned is (-1 or 0xFFFF).

Preconditions

Object must exist in memory.

Example

```
static  GFX_XCHAR   label0[] = "RB1";
static  GFX_XCHAR   label1[] = "RB2";
static  GFX_XCHAR   label2[] = "RB3";
        uint16_t    state;
        GFX_GOL_OBJ_SCHEME  *pScheme;
        RADIOBUTTON *pRb[3];
        uint16_t    ID;

pScheme = GFX_GOL_ObjectSchemeCreate();

// Object will be drawn after creation
// Object will be first button in the group
state = GFX_GOL_RADIOBUTTON_DRAW_STATE |
        GFX_GOL_RADIOBUTTON_CHECKED_STATE;

pRb[0] = GFX_GOL_RadioButtonCreate(
                  gfxIndex,
                  ID_RADIOBUTTON1,
                  255,40,310,80,
                  state,
                  label0,
                  GFX_ALIGN_CENTER,
                  pScheme);

// Object will be drawn after creation
state = GFX_GOL_RADIOBUTTON_DRAW_STATE;

pRb[1] = GFX_GOL_RadioButtonCreate(
                  gfxIndex
                  ID_RADIOBUTTON2,
                  255,85,310,125,
```

```
                    state,
                    label1,
                    GFX_ALIGN_CENTER,
                    pScheme);

    // Object will be drawn after creation
    state = GFX_GOL_RADIOBUTTON_DRAW_STATE;

    pRb[2] = GFX_GOL_RadioButtonCreate(
                    gfxIndex,
                    ID_RADIOBUTTON3,
                    255,130,310,170,
                    state,
                    label2,
                    GFX_ALIGN_CENTER,
                    pScheme);

    // draw the objects
    while(GFX_GOL_ObjectListDraw(gfxIndex) != GFX_STATUS_SUCCESS);

    // can also use pRb[1] or pRb[0] to search the checked
    // radio button of the group. ID here should be ID_RADIOBUTTON1
    ID = GFX_GOL_RadioButtonCheckGet(pRb[2]);

    if (ID == ID_RADIOBUTTON1)
    {
        // do something here then clear the check
GFX_GOL_ObjectStateClear(pRb[0], RB_CHECKED);
// Change the checked object. Pointer used is
        // any of the three. The ID used will find the
        // correct object to be checked
GFX_GOL_RadioButtonCheckSet(pRb[3], ID_RADIOBUTTON2);
    }
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

uint16_t GFX_GOL_RadioButtonCheckGet(
GFX_GOL_RADIOBUTTON *pObject)

GFX_GOL_RadioButtonActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_radio_button.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_RadioButtonActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_RADIOBUTTON_ACTION_CHECKED - Radio Button is checked
- GFX_GOL_OBJECT_ACTION_INVALID - object is not affected

Description

GFX GOL radio button action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_RADIOBUTTON_ACTION_CHECKED	Touch Screen	EVENT_PRESS	If event occurs and the x,y position falls in the area of the Radio Button while the Radio Button is not checked.

	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_CR_PRESSED or SCAN_SPACE_PRESSED while the Radio Button is not checked.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_RadioButtonActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage)

GFX_GOL_RadioButtonActionSet Function

This function performs the state change of the object based on the translated action.

File

gfx_gol_radio_button.h

C

```
void GFX_GOL_RadioButtonActionSet(GFX_GOL_TRANSLATED_ACTION translatedMsg, void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

None.

Description

GFX GOL radio button action set.

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit Description
GFX_GOL_RADIOBUTTON_ACTION_CHECKED	Touch Screen,	Set GFX_GOL_RADIOBUTTON_DRAW_STATE, Depending on the current value of RB_CHECKED Check Box will be redrawn.
	Keyboard	Set/Clear GFX_GOL_RADIOBUTTON_CHECKED_STATE

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Function

void GFX_GOL_RadioButtonActionSet(
GFX_GOL_TRANSLATED_ACTION translatedMsg,
void *pObject,
GFX_GOL_MESSAGE *pMessage)

GFX_GOL_RadioButtonCheckSet Function

This function sets the ID of the currently checked radio button in the group.

File

gfx_gol_radio_button.h

C

```
void GFX_GOL_RadioButtonCheckSet(GFX_GOL_RADIOBUTTON * pObject, uint16_t id);
```

Returns

None.

Description

GFX GOL radio button check set.

This function sets the ID of the currently checked radio button in the group. When there is only one member of the group, then that member will have the check.

When the id given does not exist in the group, the function will do nothing.

Preconditions

Object must exist in memory.

Example

See GFX_GOL_RadioButtonCheckGet() example.

Parameters

Parameters	Description
pObject	pointer to the object.
id	id of the member of the group.

Function

GFX_XCHAR GFX_GOL_RadioButtonCheckSet(
GFX_GOL_RADIOBUTTON *pObject,
uint16_t id)

GFX_GOL_RadioButtonDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_radio_button.h

C

```
GFX_STATUS GFX_GOL_RadioButtonDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL radio button draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the GFX_GOL_RADIOBUTTON is drawn with the text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_RadioButtonDraw(void *pObject)

GFX_GOL_RadioButtonTextAlignmentGet Function

This function returns the text alignment of the text string used by the object.

File

gfx_gol_radio_button.h

C

```
GFX_ALIGNMENT GFX_GOL_RadioButtonTextAlignmentGet(GFX_GOL_RADIOBUTTON * pObject);
```

Returns

The text alignment set in the object. See GFX_ALIGNMENT for more details.

Description

GFX GOL radio button text alignment get.

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_ALIGNMENT GFX_GOL_RadioButtonTextAlignmentGet(
GFX_GOL_RADIOBUTTON *pObject)

GFX_GOL_RadioButtonTextAlignmentSet Function

This function sets the text alignment of the text string used by the object.

File

gfx_gol_radio_button.h

C

```
void GFX_GOL_RadioButtonTextAlignmentSet(GFX_GOL_RADIOBUTTON * pObject, GFX_ALIGNMENT align);
```

Returns

None.

Description

GFX GOL radio button text alignment set.

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Function

void GFX_GOL_RadioButtonTextAlignmentSet(
GFX_GOL_RADIOBUTTON *pObject,
GFX_ALIGNMENT align)

GFX_GOL_RadioButtonTextSet Function

This function sets the address of the current text string used by the object.

File

gfx_gol_radio_button.h

C

```
void GFX_GOL_RadioButtonTextSet(GFX_GOL_RADIOBUTTON * pObject, GFX_XCHAR * pText);
```

Returns

None.

Description

GFX GOL radio button text set.

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
GFX_XCHAR Label0[] = â€œONâ€?;
GFX_XCHAR Label1[] = â€œOFFâ€?;
GFX_GOL_RADIOBUTTON GFX_GOL_RADIOBUTTON[2];

GFX_GOL_RadioButtonTextSet(GFX_GOL_RADIOBUTTON[0], Label0);
GFX_GOL_RadioButtonTextSet(GFX_GOL_RADIOBUTTON[1], Label1);
```

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Function

GFX_XCHAR *GFX_GOL_RadioButtonTextSet(
GFX_GOL_RADIOBUTTON *pObject,
GFX_XCHAR *pText)

GFX_GOL_RadioButtonCreate Function

This function creates a GFX_GOL_RADIOBUTTON object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_radio_button.h

C

```
GFX_GOL_RADIOBUTTON * GFX_GOL_RadioButtonCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left,
uint16_t top, uint16_t right, uint16_t bottom, uint16_t state, GFX_XCHAR * pText, GFX_ALIGNMENT alignment,
GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL Radio button create.

This function creates a GFX_GOL_RADIOBUTTON object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of GFX_GOL_RadioButtonCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- pText is an unterminated string

Preconditions

None.

Example

```
static  GFX_XCHAR   label0[] = "RB1";
static  GFX_XCHAR   label1[] = "RB2";
static  GFX_XCHAR   label2[] = "RB3";
        uint16_t    state;
        GFX_GOL_OBJ_SCHEME  *pScheme;
        RADIOBUTTON *pRb[3];

pScheme = GFX_GOL_ObjectSchemeCreate();

// Object will be drawn after creation
// Object will be first button in the group
state = GFX_GOL_RADIOBUTTON_DRAW_STATE |
        GFX_GOL_RADIOBUTTON_CHECKED_STATE;

pRb[0] = GFX_GOL_RadioButtonCreate(
                  gfxIndex,
                  ID_RADIOBUTTON1,
                  255,40,310,80,
                  state,
                  label0,
                  GFX_ALIGN_CENTER,
                  pScheme);

// Object will be drawn after creation
state = GFX_GOL_RADIOBUTTON_DRAW_STATE;

pRb[1] = GFX_GOL_RadioButtonCreate(
                  gfxIndex,
                  ID_RADIOBUTTON2,
                  255,85,310,125,
                  state,
                  label1,
                  GFX_ALIGN_CENTER,
                  pScheme);

// Object will be drawn after creation
state = GFX_GOL_RADIOBUTTON_DRAW_STATE;

pRb[2] = GFX_GOL_RadioButtonCreate(
                  gfxIndex,
                  ID_RADIOBUTTON3,
                  255,130,310,170,
```

```
                    state,
                    label2,
                    GFX_ALIGN_CENTER,
                    pScheme);

    // draw the objects
    while(GFX_GOL_ObjectListDraw(gfxIndex) != GFX_STATUS_SUCCESS);
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Function

```
GFX_GOL_RADIOBUTTON *GFX_GOL_RadioButtonCreate(
                SYS_MODULE_INDEX    gfxIndex,
uint16_t        ID,
uint16_t        left,
uint16_t        top,
uint16_t        right,
uint16_t        bottom,
uint16_t        state,
                GFX_XCHAR           *pText,
                GFX_ALIGNMENT       alignment,
                GFX_GOL_OBJ_SCHEME  *pScheme)
```

GFX_GOL_RadioButtonListCreate Function

File

gfx_gol_radio_button.h

C

```
GFX_GOL_RADIOBUTTON * GFX_GOL_RadioButtonListCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left,
uint16_t top, uint16_t right, uint16_t bottom, uint16_t state, GFX_XCHAR * pText, GFX_ALIGNMENT alignment,
GFX_GOL_OBJ_SCHEME * pScheme, uint16_t groupNo, uint16_t numOfGroups);
```

Description

This is function GFX_GOL_RadioButtonListCreate.

Description

This is function GFX_GOL_SchemeTextColorDisableSet.

GFX_GOL_SchemeTextColorSet Function

File

gfx_gol_scheme.h

C

```
inline void GFX_GOL_SchemeTextColorSet(GFX_GOL_OBJ_SCHEME * pScheme, GFX_COLOR textColor0, GFX_COLOR
textColor1, GFX_COLOR disableColor);
```

Description

This is function GFX_GOL_SchemeTextColorSet.

Scroll Bar Object

Scroll Bar is an object that can be used to display a value or scrolling location in a predefined area.

Functions

	Name	Description
	GFX_GOL_ScrollBarActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ScrollBarActionSet	This function performs the state change of the object based on the translated action.

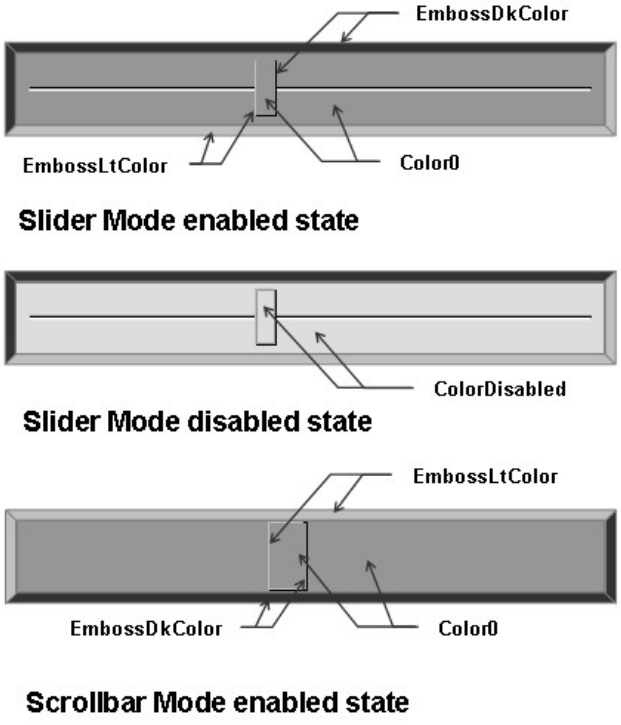
	GFX_GOL_ScrollBarCreate	This function creates a GFX_GOL_SCROLLBAR object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ScrollBarDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ScrollBarPositionDecrement	This function decrements the scroll bar position by the delta change (page) value set.
	GFX_GOL_ScrollBarPageGet	This function returns the page size of the object.
	GFX_GOL_ScrollBarPageSet	This function sets the page size of the object.
	GFX_GOL_ScrollBarPositionGet	This function returns the current position of the scroll bar thumb.
	GFX_GOL_ScrollBarPositionIncrement	This function increments the scroll bar position by the delta change (page) value set.
	GFX_GOL_ScrollBarPositionSet	This function sets the position of the scroll bar thumb.
	GFX_GOL_ScrollBarRangeGet	This function returns the range of the thumb of the scroll bar.
	GFX_GOL_ScrollBarRangeSet	This function sets the range of the thumb of the scroll bar.

Description

Scroll Bar is an object that can be used to display a value or scrolling location in a predefined area.

Scroll Bar supports Keyboard and Touchscreen inputs, replying to their events with the predefined actions (see GFX_GOL_ScrollBarActionGet() and GFX_GOL_ScrollBarActionSet() for details).

The Scroll Bar object is rendered using the assigned style scheme. The following figure illustrates the usage of the style schemes in the object.



GFX_GOL_ScrollBarActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_scroll_bar.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_ScrollBarActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_SCROLLBAR_ACTION_INC â€“ Increment scroll bar position.
- GFX_GOL_SCROLLBAR_ACTION_DEC â€“ Decrement scroll bar position.
- GFX_GOL_OBJECT_ACTION_PASSIVE â€“ Object bar is not affected
- GFX_GOL_OBJECT_ACTION_INVALID â€“ Object is not affected

Description

GFX GOL scroll bar action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_SCROLLBAR_ACTION_INC	Touch Screen	EVENT_PRESS, EVENT_MOVE	If events occurs and the x,y position falls in the area of the slider and the slider position is to the LEFT of the x,y position for a horizontal slider or BELOW the x,y position for a vertical slider.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_UP_PRESSED or SCAN_LEFT_PRESSED.
GFX_GOL_SCROLLBAR_ACTION_DEC	Touch Screen	EVENT_PRESS, EVENT_MOVE	If events occurs and the x,y position falls in the area of the slider and the slider position is to the RIGHT of the x,y position for a horizontal slider or ABOVE the x,y position for a vertical slider.
	Keyboard	EVENT_KEYSCAN	If event occurs and parameter1 passed matches the object's ID and parameter 2 passed matches SCAN_DOWN_PRESSED or SCAN_RIGHT_PRESSED.
GFX_GOL_OBJECT_ACTION_PASSIVE	Touch Screen	EVENT_RELEASE	If events occurs and the x,y position falls in the area of the slider.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_ScrollBarActionGet(

void *pObject, GFX_GOL_MESSAGE *pMessage)

GFX_GOL_ScrollBarActionSet Function

This function performs the state change of the object based on the translated action.

File

gfx_gol_scroll_bar.h

C

```
void GFX_GOL_ScrollBarActionSet(GFX_GOL_TRANSLATED_ACTION translatedMsg, void * pObject, GFX_GOL_MESSAGE *
pMessage);
```

Returns

None.

Description

GFX GOL scroll bar action set.

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_SCROLLBAR_ACTION_INC	Touch Screen,	Set GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE	Scroll Bar will be redrawn with thumb in the incremented position.
	Keyboard		
GFX_GOL_SCROLLBAR_ACTION_DEC	Touch Screen,	Set GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE	Scroll Bar will be redrawn with thumb in the decremented position.
	Keyboard		

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Function

void GFX_GOL_ScrollBarActionSet(

GFX_GOL_TRANSLATED_ACTION translatedMsg,

void *pObject,

GFX_GOL_MESSAGE *pMessage)

GFX_GOL_ScrollBarCreate Function

This function creates a GFX_GOL_SCROLLBAR object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_scroll_bar.h

C

```
GFX_GOL_SCROLLBAR * GFX_GOL_ScrollBarCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left, uint16_t top, uint16_t right, uint16_t bottom, uint16_t state, uint16_t range, uint16_t page, uint16_t pos, GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL scroll bar create.

This function creates a GFX_GOL_SCROLLBAR object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The object can be configured as a scroll bar or a slider. Use the state bit GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE to enable the usage of the object as a slider. If this state bit is not enabled, the object is set up as a scroll bar.

The object can also be configured with vertical orientation. Use the state bit GFX_GOL_SCROLLBAR_VERTICAL_STATE to set up the object with vertical orientation. If this state bit is not set, the object is used with horizontal orientation.

The behavior of GFX_GOL_ScrollBarCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- page is set to zero.
- range is set to zero.
- page > range.

Preconditions

None.

Example

```
// assume pScheme is initialized

GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_SCROLLBAR  *srollBarArray[3];
uint16_t           state;

// create a slider with
// range = [0 - 50000]
// delta = 500
// initial position = 25000

state = GFX_GOL_SCROLLBAR_DRAW_STATE;
srollBarArray[0] = GFX_GOL_ScrollBarCreate(
                        gfxIndex, 5,
                        150, 145, 285, 181,
                        state,
                        50000, 500, 25000,
                        pScheme);
if (slider[0] == NULL)
    return 0;

// create a slider with
// range = [0 - 100]
// delta = 20
// initial position = 0

state =  GFX_GOL_SCROLLBAR_DRAW_STATE |
         GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE;
srollBarArray[1] = GFX_GOL_ScrollBarCreate(
                        gfxIndex, 6,
                        150, 190, 285, 220,
                        state,
                        100, 20, 0,
                        pScheme);
if (slider[1] == NULL)
    return 0;

// create a vertical scroll bars with
// range = [0 - 30]
// delta = 2
// initial position = 20

state =  GFX_GOL_SCROLLBAR_DRAW_STATE |
         GFX_GOL_SCROLLBAR_VERTICAL_STATE;
srollBarArray[2] = GFX_GOL_ScrollBarCreate(
                        gfxIndex, 7,
                        120, 145, 140, 220,
                        state,
                        30, 2, 20,
                        pScheme);
if (slider[2] == NULL)
    return 0;

// draw the sliders
while (GFX_GOL_ObjectListDraw() == 0);

return 1;
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.

left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
range	This specifies the maximum value of the slider when the thumb is on the rightmost position for a horizontal orientation and bottom most position for the vertical orientation. Minimum value is always at zero.
page	This is the incremental change of the slider when user action requests to move the slider thumb. This value is added or subtracted to the current position of the thumb.
pos	This defines the initial position of the thumb.
pScheme	The pointer to the style scheme used for the Object. Set to NULL if default style scheme is used.

Function

```
    GFX_GOL_SCROLLBAR  *GFX_GOL_ScrollBarCreate(
                SYS_MODULE_INDEX    gfxIndex,
uint16_t        ID,
uint16_t        left,
uint16_t        top,
uint16_t        right,
uint16_t        bottom,
uint16_t        state,
uint16_t        range,
uint16_t        page,
uint16_t        pos,
                GFX_GOL_OBJ_SCHEME  *pScheme);
```

GFX_GOL_ScrollBarDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_scroll_bar.h

C

```
GFX_STATUS GFX_GOL_ScrollBarDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL scroll bar draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the face of the GFX_GOL_SCROLLBAR is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_ScrollBarDraw(void *pObject)

GFX_GOL_ScrollBarPositionDecrement Function

This function decrements the scroll bar position by the delta change (page) value set.

File

gfx_gol_scroll_bar.h

C

```
void GFX_GOL_ScrollBarPositionDecrement(GFX_GOL_SCROLLBAR * pObject);
```

Returns

None.

Description

GFX GOL scroll bar position decrement.

This function decrements the scroll bar position by the delta change (page) value set. Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Example

```
void ControlSpeed(  GFX_GOL_SCROLLBAR* pObj,
                    int setSpeed,
                    int curSpeed)
{
    // set page size to 1
    GFX_GOL_ScrollBarPageSet(pObj, 1);

    if (setSpeed < curSpeed)
    {
        while(GFX_GOL_ScrollBarPositionGet(pObj) < SetSpeed)
        {
            // increment by 1
            GFX_GOL_ScrollBarPositionIncrement(pObj);
        }

    }
    else if (setSpeed > curSpeed)
    {
        while(GFX_GOL_ScrollBarPositionGet(pObj) > SetSpeed)
        {
            // decrement by 1
            GFX_GOL_ScrollBarPositionDecrement(pObj);
        }
    }
}
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_ScrollBarPositionDecrement(
GFX_GOL_SCROLLBAR *pObject)

GFX_GOL_ScrollBarPageGet Function

This function returns the page size of the object.

File

gfx_gol_scroll_bar.h

C

```
uint16_t GFX_GOL_ScrollBarPageGet(GFX_GOL_SCROLLBAR * pObject);
```

Returns

The page size of the object.

Description

GFX GOL scroll bar page get.

This function returns the page size of the object. Page size defines the delta change of the thumb position when incremented via GFX_GOL_ScrollBarPositionIncrement() or decremented via GFX_GOL_ScrollBarPositionDecrement(). Page size minimum value is 1. Maximum value is range/2.

Preconditions

Object must exist in memory.

Example

```
uint16_t page;
GFX_GOL_SCROLLBAR *pScrollBar;

// assume pScrollBar is initialized to a scroll bar in memory
 page = GFX_GOL_ScrollBarPageGet(pScrollBar);
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

uint16_t GFX_GOL_ScrollBarPageGet(
GFX_GOL_SCROLLBAR *pObject)

GFX_GOL_ScrollBarPageSet Function

This function sets the page size of the object.

File

gfx_gol_scroll_bar.h

C

```
void GFX_GOL_ScrollBarPageSet(GFX_GOL_SCROLLBAR * pObject, uint16_t page);
```

Returns

None.

Description

GFX GOL scroll bar page set.

This function sets the page size of the object. Page size defines the delta change of the thumb position when incremented via GFX_GOL_ScrollBarPositionIncrement() or decremented via GFX_GOL_ScrollBarPositionDecrement(). Page size minimum value is 1. Maximum value is range/2.

Modifying the page size at run time may require a redraw of the object to show the visual effect of the change.

Preconditions

Object must exist in memory.

Example

See GFX_GOL_ScrollBarPositionIncrement() for code example.

Parameters

Parameters	Description
pObject	pointer to the object.
page	value of the page size of the object.

Function

void GFX_GOL_ScrollBarPageSet(
GFX_GOL_SCROLLBAR *pObject,
uint16_t page)

GFX_GOL_ScrollBarPositionGet Function

This function returns the current position of the scroll bar thumb.

File

gfx_gol_scroll_bar.h

C

```
uint16_t GFX_GOL_ScrollBarPositionGet(GFX_GOL_SCROLLBAR * pObject);
```

Returns

The current position of the scroll bar thumb.

Description

GFX GOL scroll bar position get.

This function returns the current position of the scroll bar thumb. The thumb is the rectangular area that slides left or right (for horizontal orientation) or slides up or down (for vertical orientation).

Preconditions

Object must exist in memory.

Example

```
#define MAXVALUE 100;

GFX_GOL_SCROLLBAR *pScrollBar;
uint32_t ctr = 0;

// create scroll bar here and initialize parameters
pScrollBar = GFX_GOL_ScrollBarCreate(....)
GFX_GOL_ObjectStateSet(pScrollBar, GFX_GOL_SCROLLBAR_DRAW_STATE);

// draw the scroll bar
GFX_GOL_ObjectListDraw(gfxIndex);

// a routine that updates the position of the thumb through some
// conditions
while("some condition")
{
    GFX_GOL_ScrollBarPositionSet(pScrollBar, ctr);
    GFX_GOL_ObjectStateSet( pScrollBar,
                            GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE);

    // update the screen
    GFX_GOL_ObjectListDraw(gfxIndex);

    // update ctr here
    ctr = "some source of value";
}

if (GFX_GOL_ScrollBarPositionGet(pScrollBar) > MAXVALUE)
    return 0;
else
    "do something else"
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

uint16_t GFX_GOL_ScrollBarPositionGet(
GFX_GOL_SCROLLBAR *pObject)

GFX_GOL_ScrollBarPositionIncrement Function

This function increments the scroll bar position by the delta change (page) value set.

File

gfx_gol_scroll_bar.h

C

```
void GFX_GOL_ScrollBarPositionIncrement(GFX_GOL_SCROLLBAR * pObject);
```

Returns

None.

Description

GFX GOL scroll bar position increment.

This function increments the scroll bar position by the delta change (page) value set. Object must be redrawn after this function is called to reflect the changes to the object.

Preconditions

Object must exist in memory.

Example

```
void ControlSpeed(  GFX_GOL_SCROLLBAR* pObj,
                    int setSpeed,
                    int curSpeed)
{
    // set page size to 1
    GFX_GOL_ScrollBarPageSet(pObj, 1);

    if (setSpeed < curSpeed)
    {
        while(GFX_GOL_ScrollBarPositionGet(pObj) < SetSpeed)
            GFX_GOL_ScrollBarPositionIncrement(pObj);  // increment by 1
    }
    else if (setSpeed > curSpeed)
    {
        while(GFX_GOL_ScrollBarPositionGet(pObj) > SetSpeed)
            GFX_GOL_ScrollBarPositionDecrement(pObj);  // decrement by 1
    }
}
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_ScrollBarPositionIncrement(
GFX_GOL_SCROLLBAR *pObject)

GFX_GOL_ScrollBarPositionSet Function

This function sets the position of the scroll bar thumb.

File

gfx_gol_scroll_bar.h

C

```
void GFX_GOL_ScrollBarPositionSet(GFX_GOL_SCROLLBAR * pObject, uint16_t position);
```

Returns

None.

Description

GFX GOL scroll bar position set.

This function sets the position of the scroll bar thumb. The thumb is the rectangular area that slides left or right (for horizontal orientation) or slides up or down (for vertical orientation).

The value used for the position should be within the range set for the object.

Function will have an undefined behavior if the position is outside the range.

Preconditions

Object must exist in memory.

Example

```
GFX_GOL_SCROLLBAR *pScrollBar;
uint16_t ctr = 0;

// create slider here and initialize parameters
GFX_GOL_ObjectStateSet(pScrollBar, GFX_GOL_SCROLLBAR_DRAW_STATE);
GFX_GOL_ObjectListDraw(gfxIndex);

while("some condition")
{
    GFX_GOL_ScrollBarPositionSet(pScrollBar, ctr);
    GFX_GOL_ObjectStateSet( pScrollBar,
                            GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE);

    // redraw the scroll bar
    GFX_GOL_ObjectListDraw(gfxIndex);

   // update ctr here
   ctr = "some source of value";
}
```

Parameters

Parameters	Description
pObject	pointer to the object.
position	the new position of the scroll bar thumb.

Function

void GFX_GOL_ScrollBarPositionSet(

GFX_GOL_SCROLLBAR *pObject,

uint16_t position)

GFX_GOL_ScrollBarRangeGet Function

This function returns the range of the thumb of the scroll bar.

File

gfx_gol_scroll_bar.h

C

```
uint16_t GFX_GOL_ScrollBarRangeGet(GFX_GOL_SCROLLBAR * pObject);
```

Returns

The range of the scroll bar.

Description

GFX GOL scroll bar range get.

This function returns the range of the thumb of the scroll bar.

Preconditions

Object must exist in memory.

Example

```
GFX_GOL_SCROLLBAR *pSld;
uint16_t range;

range = GFX_GOL_ScrollBarRangeGet(pSld);
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

uint16_t GFX_GOL_ScrollBarRangeGet(
GFX_GOL_SCROLLBAR *pObject)

GFX_GOL_ScrollBarRangeSet Function

This function sets the range of the thumb of the scroll bar.

File

gfx_gol_scroll_bar.h

C

```
void GFX_GOL_ScrollBarRangeSet(GFX_GOL_SCROLLBAR * pObject, uint16_t range);
```

Returns

None.

Description

GFX GOL scroll bar range set.

This function sets the range of the thumb of the scroll bar. When the range is modified, object must be completely redrawn to reflect the change.

Preconditions

Object must exist in memory.

Example

```
GFX_GOL_SCROLLBAR *pSld;

GFX_GOL_ScrollBarRangeSet(pSld, 100);

// to completely redraw the object when
// GFX_GOL_ObjectListDraw(gfxIndex) is executed.
GFX_GOL_ObjectStateSet(pSld, SLD_DRAW);
```

Parameters

Parameters	Description
pObject	pointer to the object.
range	new range of the scroll bar.

Function

void GFX_GOL_ScrollBarRangeSet(
GFX_GOL_SCROLLBAR *pObject,
uint16_t range)

Static Text Object

Static Text is an object that can be used to display a single or multi-line string of text in a defined area.

Functions

	Name	Description
	GFX_GOL_StaticTextActionGet	This function sets the text alignment of the text string used by the object.

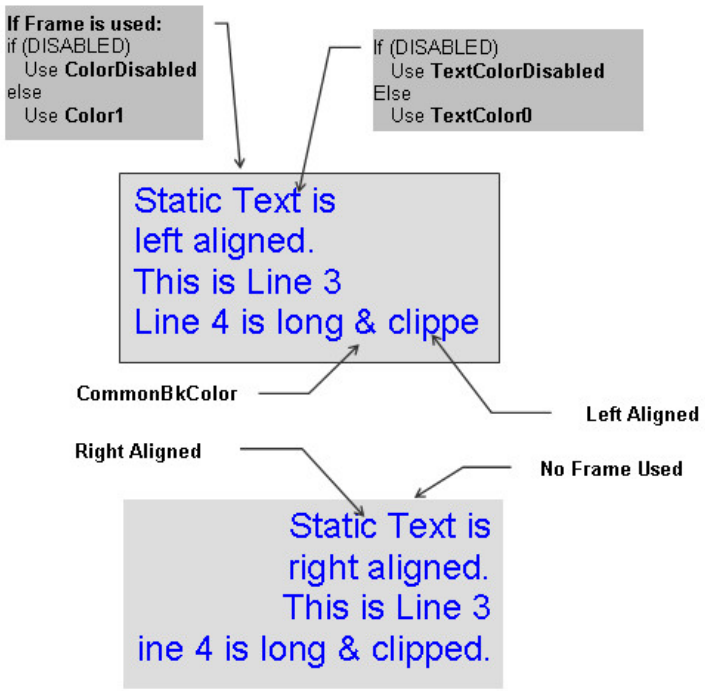
	GFX_GOL_StaticTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_StaticTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_StaticTextCreate	This function creates a GFX_GOL_STATICTEXT object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_StaticTextDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_StaticTextGet	This function returns the address of the current text string used by the object.
	GFX_GOL_StaticTextSet	This function sets the address of the current text string used by the object.

Description

Static Text is an object that can be used to display a single or multi-line string of text in a rectangular area defined by the dimension of the object. The area defined will also serve as the writable region, where any pixels that exceeds the area's dimension will be clipped.

Static Text supports Touchscreen inputs only, replying to the events with the predefined actions (see GFX_GOL_StaticTextActionGet() for details).

The Static Text object is rendered using the assigned style scheme. The following figure illustrates the usage of the style schemes in the object.



GFX_GOL_StaticTextActionGet Function

This function sets the text alignment of the text string used by the object.

File

gfx_gol_static_text.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_StaticTextActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_STATICTEXT_ACTION_SELECTED â€“ Object is selected
- GFX_GOL_OBJECT_ACTION_INVALID â€“ Object is not affected

Description

GFX GOL static text action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen inputs.

Translated Message	Input Source	Events	Description
GFX_GOL_STATICTEXT_ACTION_SELECTED	Touch Screen	EVENT_PRESS, EVENT_RELEASE	If events occurs and the x,y position falls in the area of the static text.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_StaticTextActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage);

GFX_GOL_StaticTextAlignmentGet Function

This function returns the text alignment of the text string used by the object.

File

gfx_gol_static_text.h

C

```
GFX_ALIGNMENT GFX_GOL_StaticTextAlignmentGet(GFX_GOL_STATICTEXT * pObject);
```

Returns

The text alignment set in the object. See GFX_ALIGNMENT for more details.

Description

GFX GOL static text alignment get.

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_ALIGNMENT GFX_GOL_StaticTextAlignmentGet(
GFX_GOL_STATICTEXT *pObject)

GFX_GOL_StaticTextAlignmentSet Function

This function sets the text alignment of the text string used by the object.

File

gfx_gol_static_text.h

C

```
void GFX_GOL_StaticTextAlignmentSet(GFX_GOL_STATICTEXT * pObject, GFX_ALIGNMENT align);
```

Returns

None.

Description

GFX GOL static text alignment set.

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
align	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Function

void GFX_GOL_StaticTextAlignmentSet(

GFX_GOL_STATICTEXT *pObject,

GFX_ALIGNMENT align)

GFX_GOL_StaticTextCreate Function

This function creates a GFX_GOL_STATICTEXT object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_static_text.h

C

```
GFX_GOL_STATICTEXT * GFX_GOL_StaticTextCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left,
uint16_t top, uint16_t right, uint16_t bottom, uint16_t state, GFX_XCHAR * pText, GFX_ALIGNMENT alignment,
GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL static text create.

This function creates a GFX_GOL_STATICTEXT object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The text can be configured to have text aligned. See GFX_ALIGNMENT for details. Text can also have multiple lines by inserting the new line character to the text string supplied to the object. Any string that exceeds the dimension of the object will be clipped.

When the object is used with no background, application must manage the object when text is modified and redrawn. i.e. the previous text must be removed. Use GFX_GOL_STATICTEXT_NOBACKGROUND_STATE state bit to disable the background.

The behavior of GFX_GOL_StaticTextCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- pText is an unterminated string

Preconditions

None.

Example

```
#define ID_STATICTEXT1 0x10

// assume pScheme is initialized
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_STATICTEXT *pSt;

pSt = GFX_GOL_StaticTextCreate(
    gfxIndex,
    ID_STATICTEXT1,                 // ID
    30,80,235,160,                  // dimension
    GFX_GOL_STATICTEXT_DRAW_STATE,  // draw the object
    "Static Textn Example",        // 2 lines of text
    GFX_ALIGN_CENTER,               // align text on the center
    pScheme);                       // use given scheme
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Function

```
    GFX_GOL_STATICTEXT  *GFX_GOL_StaticTextCreate(
                SYS_MODULE_INDEX    gfxIndex,
uint16_t        ID,
uint16_t        left,
uint16_t        top,
uint16_t        right,
uint16_t        bottom,
uint16_t        state,
                GFX_XCHAR           *pText,
                GFX_ALIGNMENT       alignment,
                GFX_GOL_OBJ_SCHEME  *pScheme)
```

GFX_GOL_StaticTextDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_static_text.h

C

```
GFX_STATUS GFX_GOL_StaticTextDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL static text draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_StaticTextDraw(void *pObject)

GFX_GOL_StaticTextGet Function

This function returns the address of the current text string used by the object.

File

gfx_gol_static_text.h

C

```
GFX_XCHAR * GFX_GOL_StaticTextGet(GFX_GOL_STATICTEXT * pObject);
```

Returns

Pointer to text string.

Description

GFX GOL static text get.

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
GFX_XCHAR *pChar;
GFX_GOL_STATICTEXT OBJECT_ARRAY[2];

pChar = GFX_GOL_StaticTextGet(OBJECT_ARRAY[0]);
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_XCHAR *GFX_GOL_StaticTextGet(
GFX_GOL_STATICTEXT *pObject)

GFX_GOL_StaticTextSet Function

This function sets the address of the current text string used by the object.

File

gfx_gol_static_text.h

C

```
void GFX_GOL_StaticTextSet(GFX_GOL_STATICTEXT * pObject, GFX_XCHAR * pText);
```

Returns

None.

Description

GFX GOL static text set.

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Function

GFX_XCHAR *GFX_GOL_StaticTextSet(
GFX_GOL_STATICTEXT *pObject,
GFX_XCHAR *pText)

Surface Object

Functions

	Name	Description
	GFX_GOL_SurfaceActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_SurfaceCreate	This function creates a GFX_GOL_SURFACE object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_SurfaceDraw	This function renders the object on the screen based on the current state of the object.

Description

GFX_GOL_SurfaceActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_surface.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_SurfaceActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_SURFACE_ACTION_CLIENT - Surface client area selected action ID.
- GFX_GOL_SURFACE_ACTION_TITLE - Surface title bar selected action ID.

Description

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Events	Description
GFX_GOL_SURFACE_ACTION_TITLE	Touch Screen	EVENT_PRESS, EVENT_RELEASE, EVENT_MOVE	If events occurs and the x,y position falls in the TITLE area of the surface
GFX_GOL_SURFACE_ACTION_CLIENT	Touch Screen	EVENT_PRESS, EVENT_RELEASE, EVENT_MOVE	If events occurs and the x,y position falls in the CLIENT area of the surface
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_SurfaceActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage);

GFX_GOL_SurfaceCreate Function

This function creates a GFX_GOL_SURFACE object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_surface.h

C

```
GFX_GOL_SURFACE * GFX_GOL_SurfaceCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left, uint16_t
top, uint16_t right, uint16_t bottom, uint16_t state, GFX_GOL_SURFACE_CALLBACK_FUNC callback,
GFX_RESOURCE_HDR * pImage, GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

This function creates a GFX_GOL_SURFACE object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

Preconditions

None.

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_SURFACE *pSurface;
GFX_GOL_SURFACE_STATE state;

// assume pScheme is initialized to a scheme in memory.
state = GFX_GOL_SURFACE_DRAW_STATE;

pSurface  = GFX_GOL_SurfaceCreate(
       gfxIndex,
       1,           // ID
       0,0,GFX_Primitive_MaxXGet(),GFX_Primitive_MaxYGet(), // whole screen dimension
       state,                   // set state to draw all
       (char*)myIcon,               // icon
       "Place Title Here.",                      // text
       NULL);                   // use default GOL scheme

if (pSurface == NULL)
    return 0;

return 1;
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pImage	Pointer to the image used on the face of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Function

```
    GFX_GOL_SURFACE  *GFX_GOL_SurfaceCreate(
                SYS_MODULE_INDEX    gfxIndex,
uint16_t        ID,
uint16_t        left,
uint16_t        top,
uint16_t        right,
uint16_t        bottom,
uint16_t        state,
                GFX_RESOURCE_HDR    *pImage,
                GFX_XCHAR           *pText,
                GFX_ALIGNMENT       alignment,
                GFX_GOL_OBJ_SCHEME  *pScheme)
```

GFX_GOL_SurfaceDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_surface.h

C

```
GFX_STATUS GFX_GOL_SurfaceDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the face of the GFX_GOL_SURFACE is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_SurfaceDraw(void *pObject)

Text Entry Object

Text Entry is an object that can be used to emulate a key pad entry with a display area for the entered characters.

Functions

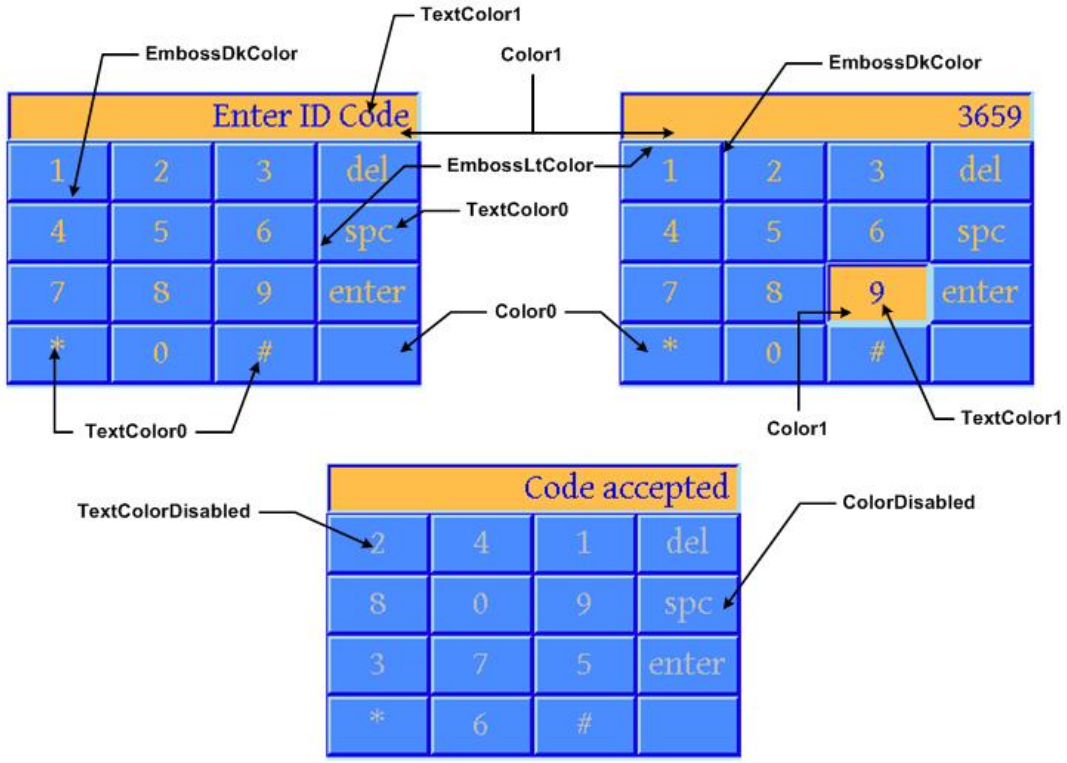
	Name	Description
	GFX_GOL_TextEntryActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_TextEntryActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_TextEntryBufferGet	This function returns the buffer used to display text.
	GFX_GOL_TextEntryBufferClear	This function will clear the data in the display.
	GFX_GOL_TextEntryBufferSet	This function sets the buffer used to display text.
	GFX_GOL_TextEntryCharAdd	This function will insert a character to the end of the buffer.
	GFX_GOL_TextEntryCreate	This function creates a GFX_GOL_TEXTENTRY object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_TextEntryDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_TextEntryKeyCommandGet	This function will return the currently assigned command to the key with the given index.
	GFX_GOL_TextEntryKeyCommandSet	This function will assign a command to a key with the given index.
	GFX_GOL_TextEntryKeyIsPressed	This function will test if a key given by its index in the object is pressed.
	GFX_GOL_TextEntryKeyListCreate	This function will create the list of key members that holds the information on each key.
	GFX_GOL_TextEntryKeyMemberListDelete	This function will delete the key member list assigned to the object.
	GFX_GOL_TextEntryKeyTextSet	This function will set the text assigned to a key with the given index.
	GFX_GOL_TextEntryLastCharDelete	This function will remove the last character of the buffer and replace it with a string terminator.
	GFX_GOL_TextEntrySpaceCharAdd	This function will insert a space character to the end of the buffer.

Description

Text Entry is an object that can be used to emulate a key pad entry with a display area for the entered characters. The object has a feature where you can define a key to reply with a translated message that signifies a command key was pressed. A command key example can be your enter or carriage return key or an escape key. Multiple keys can be assigned command keys. Application can utilize the command key to define the behavior of the program based on a command key press.

Static Text supports Touchscreen inputs only, replying to the events with the predefined actions (see GFX_GOL_TextEntryActionGet() and GFX_GOL_TextEntryActionSet() for details).

The Text Entry object is rendered using the assigned style scheme. The following figure illustrates the color assignments.



When creating the object, the alignment of the text of the object can be formatted with the same options that GFX_TextStringBoxDraw() allows.

GFX_GOL_TextEntryActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_text_entry.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_TextEntryActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_TEXTENTRY_ACTION_PRESS - A key is pressed
- GFX_GOL_TEXTENTRY_ACTION_RELEASED - A key was released (generic for keys with no commands or characters assigned)
- GFX_GOL_TEXTENTRY_ACTION_ADD_CHAR - A key was released with character assigned
- GFX_GOL_TEXTENTRY_ACTION_DELETE - A key was released with delete command assigned
- GFX_GOL_TEXTENTRY_ACTION_SPACE - A key was released with space command assigned
- GFX_GOL_TEXTENTRY_ACTION_ENTER - A key was released with enter command assigned
- GFX_GOL_OBJECT_ACTION_INVALID - Text Entry is not affected

Description

GFX GOL text entry action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Set/Clear State Bit	Description
GFX_GOL_TEXTENTRY_ACTION_PRESS	Touch Screen	EVENT_PRESS, EVENT_MOVE	If the event occurs and the x,y position falls in the face of one of the keys of the object while the key is unpressed.
GFX_GOL_TEXTENTRY_ACTION_RELEASED	Touch Screen	EVENT_MOVE	If the event occurs and the x,y position falls outside the face of one of the keys of the object while the key is pressed.
GFX_GOL_TEXTENTRY_ACTION_RELEASED	Touch Screen	EVENT_RELEASE	If the event occurs and the x,y position falls does not falls inside any of the faces of the keys of the object.

GFX_GOL_TEXTENTRY_ACTION_ADD_CHAR	Touch Screen	EVENT_RELEASE, EVENT_MOVE	If the event occurs and the x,y position falls in the face of one of the keys of the object while the key is unpressed and the key is associated with no commands.
GFX_GOL_TEXTENTRY_ACTION_DELETE	Touch Screen	EVENT_RELEASE, EVENT_MOVE	If the event occurs and the x,y position falls in the face of one of the keys of the object while the key is unpressed and the key is associated with delete command.
GFX_GOL_TEXTENTRY_ACTION_SPACE	Touch Screen	EVENT_RELEASE, EVENT_MOVE	If the event occurs and the x,y position falls in the face of one of the keys of the object while the key is unpressed and the key is associated with space command.
GFX_GOL_TEXTENTRY_ACTION_ENTER	Touch Screen	EVENT_RELEASE, EVENT_MOVE	If the event occurs and the x,y position falls in the face of one of the keys of the object while the key is unpressed and the key is associated with enter command.
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_TextEntryActionGet(
void *pObject,
GFX_GOL_MESSAGE *pMessage);

GFX_GOL_TextEntryActionSet Function

This function performs the state change of the object based on the translated action.

File

gfx_gol_text_entry.h

C

```
void GFX_GOL_TextEntryActionSet(GFX_GOL_TRANSLATED_ACTION translatedMsg, void * pObject, GFX_GOL_MESSAGE *
pMessage);
```

Returns

None.

Description

GFX GOL text entry action set.

This function performs the state change of the object based on the translated action. This change can be overridden by the application using the application defined GFX_GOL_MESSAGE_CALLBACK_FUNC. When the user message is determined to affect the object, application can perform the state change in the message callback function. The following state changes are supported:

Translated Message Input Source	Set/Clear State Bit	Description
GFX_GOL_TEXTENTRY_ACTION_ADD_CHAR Touch Screen,	Set GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE,	Add a character in the buffer and update the text displayed.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE,	Clear GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	
GFX_GOL_TEXTENTRY_ACTION_SPACE Touch Screen,	Set GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE,	Insert a space character in the buffer and update the text displayed.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE,	Clear GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	

GFX_GOL_TEXTENTRY_ACTION_DELETE Touch Screen,	Set GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE,	Delete the most recent character in the buffer and update the text displayed.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE,	Clear GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	
GFX_GOL_TEXTENTRY_ACTION_ENTER Touch Screen,	Set GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE,	User can define the use of this event in the message callback. Object will just update the key.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE,	Clear GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	
GFX_GOL_TEXTENTRY_ACTION_RELEASED Touch Screen,	Clear GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	A Key in the object will be redrawn in the unpressed state.
	Set GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE	
GFX_GOL_TEXTENTRY_ACTION_PRESSED Touch Screen,	Set GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	A Key in the object will be redrawn in the pressed state.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE		

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
translatedMsg	The action of the object based on the message.
pObject	The pointer to the object whose state will be modified.
pMessage	The pointer to the original message.

Function

void GFX_GOL_TextEntryActionSet(
GFX_GOL_TRANSLATED_ACTION translatedMsg,
void *pObject,
GFX_GOL_MESSAGE *pMessage)

GFX_GOL_TextEntryBufferGet Function

This function returns the buffer used to display text.

File

gfx_gol_text_entry.h

C

```
GFX_XCHAR * GFX_GOL_TextEntryBufferGet(GFX_GOL_TEXTENTRY * pObject);
```

Returns

The pointer to the text buffer used to display text.

Description

GFX GOL text entry buffer get.

This function returns the buffer used to display text.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_XCHAR *GFX_GOL_TextEntryBufferGet(
GFX_GOL_TEXTENTRY *pObject)

GFX_GOL_TextEntryBufferClear Function

This function will clear the data in the display.

File

gfx_gol_text_entry.h

C

```
void GFX_GOL_TextEntryBufferClear(GFX_GOL_TEXTENTRY * pObject);
```

Returns

None.

Description

GFX GOL text entry buffer clear.

This function will clear the data in the display. Object must be redrawn to reflect the change in the buffer. Use the drawing state bit GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE to update the text on the screen.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_TextEntryBufferClear(
GFX_GOL_TEXTENTRY *pObject)

GFX_GOL_TextEntryBufferSet Function

This function sets the buffer used to display text.

File

gfx_gol_text_entry.h

C

```
void GFX_GOL_TextEntryBufferSet(GFX_GOL_TEXTENTRY * pObject, GFX_XCHAR * pText, uint16_t MaxSize);
```

Returns

None.

Description

GFX GOL text entry buffer set.

This function sets the buffer used to display text. If the buffer is initialized with a string, the string must be a null terminated string. If the string length is greater than MaxSize, string will be truncated to MaxSize. pText must point to a valid memory location with size equal to MaxSize. The total number of characters that will be displayed on the object will be MaxSize - 1 since the last character will be the string terminator character.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the new text buffer to be displayed.
maxSize	maximum length of the new buffer to be used.

Function

void GFX_GOL_TextEntryBufferSet(
GFX_GOL_TEXTENTRY *pObject,
GFX_XCHAR *pText,
uint16_t MaxSize)

GFX_GOL_TextEntryCharAdd Function

This function will insert a character to the end of the buffer.

File

gfx_gol_text_entry.h

C

```
void GFX_GOL_TextEntryCharAdd(GFX_GOL_TEXTENTRY * pObject);
```

Returns

None.

Description

GFX GOL text entry char add.

This function will insert a character to the end of the buffer. Drawing states GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE or GFX_GOL_TEXTENTRY_DRAW_STATE must be set to see the effect of the addition.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_TextEntryCharAdd(
GFX_GOL_TEXTENTRY *pObject)

GFX_GOL_TextEntryCreate Function

This function creates a GFX_GOL_TEXTENTRY object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_text_entry.h

C

```
GFX_GOL_TEXTENTRY * GFX_GOL_TextEntryCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left, uint16_t
top, uint16_t right, uint16_t bottom, uint16_t state, uint16_t horizontalKeys, uint16_t verticalKeys,
GFX_XCHAR * pText[], GFX_XCHAR * pBuffer, GFX_ALIGNMENT alignment, uint16_t bufferLength, GFX_RESOURCE_HDR
* pDisplayFont, GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL text entry create.

This function creates a GFX_GOL_TEXTENTRY object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

The behavior of GFX_GOL_TextEntryCreate() will be undefined if one of the following is true:

- left >= right
- top >= bottom
- pScheme is not pointing to a GFX_GOL_OBJ_SCHEME
- horizontal key or vertical key count is 0
- pText is an unterminated string
- pBuffer is initialized to an allocated memory.

Preconditions

None.

Example

```
#define ID_TEXTENTRY 0x20
#define TEBUFFERSIZE 20    // 20 characters

GFX_XCHAR delKey[] = {'d','e','l',0};
GFX_XCHAR spaceKey[] = {'s','p','c',0};
GFX_XCHAR enterKey[] = {'e','n','t','e','r',0};
GFX_XCHAR exitKey[] = {'M','a','i','n',0};
GFX_XCHAR key1[] = {'1',0};
GFX_XCHAR key2[] = {'2',0};
GFX_XCHAR key3[] = {'3',0};
GFX_XCHAR key4[] = {'4',0};
GFX_XCHAR key5[] = {'5',0};
GFX_XCHAR key6[] = {'6',0};
GFX_XCHAR key7[] = {'7',0};
GFX_XCHAR key8[] = {'8',0};
GFX_XCHAR key9[] = {'9',0};
GFX_XCHAR key0[] = {'0',0};
GFX_XCHAR keystar[] = {'*',0};
GFX_XCHAR keypound[] = {'#',0};

GFX_XCHAR *pKeyNames[] = { key1,    key2, key3,     delKey,
                           key4,    key5, key6,     spaceKey,
                           key7,    key8, key9,     enterKey,
                           keystar, key0, keypound, exitKey
                         };

// assume pScheme is initialized
// myFont is a font in memory
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_TEXTENTRY  *pTe;
GFX_RESOURCE_HDR   *pFont = &myFont;

pTe = GFX_GOL_TextEntryCreate(
    gfxIndex,
    ID_TEXTENTRY,                   // ID
    30,80,235,160,                  // dimension
    GFX_GOL_TEXTENTRY_DRAW_STATE,   // draw the object
    4,                              // number of horizontal keys
    4,                              // number of vertical keys
    pKeyNames,                      // pointer to the array of key names
    "Enter Code",                   // initial text
    GFX_ALIGN_CENTER,               // align text on the center
    TEBUFFERSIZE,                   // size of the buffer for text
    pFont,                          // pointer to the font of the
                                    // displayed text
    pScheme);                       // use given scheme
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
radius	Radius of the rounded edge. When using gradient buttons and radius != 0, emboss size <= radius. If this is not met, the the GFX_GOL_BUTTON face will not have gradient effect.
state	Sets the initial state of the object.
horizontalKeys	Number of horizontal keys
verticalKeys	Number of vertical keys
pText	array of pointer to the custom "text" assigned by the user.
pBuffer	pointer to the buffer that holds the text to be displayed.
alignment	text alignment of the text used in the object.
bufferLength	length of the buffer assigned by the user. The choice of the length should include the string null terminator.
For example	if the bufferLength is set to 3, only two characters can be shown on the object since the last character will be the string terminator character.
pDisplayFont	pointer to the font image to be used on the edit box section of the object.
pScheme	Pointer to the style scheme used.

Function

```
    GFX_GOL_TEXTENTRY *GFX_GOL_TextEntryCreate(
                SYS_MODULE_INDEX    gfxIndex,
uint16_t        ID,
uint16_t        left,
uint16_t        top,
uint16_t        right,
uint16_t        bottom,
uint16_t        state,
uint16_t        horizontalKeys,
uint16_t        verticalKeys,
                GFX_XCHAR           *pText[],
                GFX_XCHAR           *pBuffer,
                GFX_ALIGNMENT       alignment,
uint16_t        bufferLength,
                GFX_RESOURCE_HDR    *pDisplayFont,
                GFX_GOL_OBJ_SCHEME  *pScheme);
```

GFX_GOL_TextEntryDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_text_entry.h

C

```
GFX_STATUS GFX_GOL_TextEntryDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL text entry draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right

and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_TextEntryDraw(void *pObject)

GFX_GOL_TextEntryKeyCommandGet Function

This function will return the currently assigned command to the key with the given index.

File

gfx_gol_text_entry.h

C

```
GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE GFX_GOL_TextEntryKeyCommandGet(GFX_GOL_TEXTENTRY * pObject, uint16_t
index);
```

Returns

Command assigned to the key (See GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE).

Description

GFX GOL text entry key command set.

This function will return the currently assigned command to the key with the given index. (See GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE)

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
index	index or position of the key.

Function

GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE GFX_GOL_TextEntryKeyCommandSet(
GFX_GOL_TEXTENTRY *pObject,
uint16_t index,
GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE command)

GFX_GOL_TextEntryKeyCommandSet Function

This function will assign a command to a key with the given index.

File

gfx_gol_text_entry.h

C

```
bool GFX_GOL_TextEntryKeyCommandSet(GFX_GOL_TEXTENTRY * pObject, uint16_t index,
GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE command);
```

Returns

TRUE - if the assignment was a success. FALSE - if the assignment was not successful.

Description

GFX GOL text entry key command set.

This function will assign a command to a key with the given index. (See GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE)

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
index	index or position of the key.
command	command assigned for the key.

Function

bool GFX_GOL_TextEntryKeyCommandSet(

GFX_GOL_TEXTENTRY *pObject,

uint16_t index,

GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE command)

GFX_GOL_TextEntryKeyIsPressed Function

This function will test if a key given by its index in the object is pressed.

File

gfx_gol_text_entry.h

C

```
bool GFX_GOL_TextEntryKeyIsPressed(GFX_GOL_TEXTENTRY * pObject, uint16_t index);
```

Returns

TRUE - if the key is pressed. FALSE - if the key is not pressed.

Description

GFX GOL text entry key is pressed.

This function will test if a key given by its index in the object is pressed.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
index	index or position of key that is being tested.

Function

bool GFX_GOL_TextEntryKeyIsPressed(

GFX_GOL_TEXTENTRY *pObject,

uint16_t index)

GFX_GOL_TextEntryKeyListCreate Function

This function will create the list of key members that holds the information on each key.

File

gfx_gol_text_entry.h

C

```
GFX_GOL_TEXTENTRY_KEYMEMBER * GFX_GOL_TextEntryKeyListCreate(GFX_GOL_TEXTENTRY * pObject, GFX_XCHAR *
pText[]);
```

Returns

Returns the pointer to the newly created key member list. A NULL is returned if the list is not created successfully.

Description

GFX GOL text entry key list create.

This function will create the list of key members that holds the information on each key. The number of keys is determined by the equation (keycount = verticalKeys*horizontalKeys). The object creates the information holder for each key automatically and assigns each entry in the *pText[] array with the first entry automatically assigned to the key with an index of 1.

The number of entries to *pText[] must be at least equal to keycount. The last key is assigned with an index of keycount-1.

No checking is performed on the length of *pText[] entries to match (verticalKeys*horizontalKeys).

The function behavior is undefined if the pText[] array is less than the keycount value.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text defined by the application.

Function

GFX_GOL_TEXTENTRY_KEYMEMBER *GFX_GOL_TextEntryKeyListCreate(
GFX_GOL_TEXTENTRY *pObject,
GFX_XCHAR *pText[])

GFX_GOL_TextEntryKeyMemberListDelete Function

This function will delete the key member list assigned to the object.

File

gfx_gol_text_entry.h

C

```
void GFX_GOL_TextEntryKeyMemberListDelete(void * pObject);
```

Returns

None.

Description

GFX GOL text entry key member list delete.

This function will delete the key member list assigned to the object from memory. Pointer to the key member list is then initialized to NULL. All memory resources allocated to the key member list is freed.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_TextEntryKeyMemberListDelete(
void *pObject)

GFX_GOL_TextEntryKeyTextSet Function

This function will set the text assigned to a key with the given index.

File

gfx_gol_text_entry.h

C

```
bool GFX_GOL_TextEntryKeyTextSet(GFX_GOL_TEXTENTRY * pObject, uint16_t index, GFX_XCHAR * pText);
```

Returns

TRUE - if the assignment was a success. FALSE - if the assignment was not successful.

Description

GFX GOL text entry key text set.

This function will set the text assigned to a key with the given index.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
index	index or position of the key.
pText	pointer to the text that will be assigned to the key.

Function

bool GFX_GOL_TextEntryKeyTextSet(
GFX_GOL_TEXTENTRY *pObject,
uint16_t index,
GFX_XCHAR *pText)

GFX_GOL_TextEntryLastCharDelete Function

This function will remove the last character of the buffer and replace it with a string terminator.

File

gfx_gol_text_entry.h

C

```
void GFX_GOL_TextEntryLastCharDelete(GFX_GOL_TEXTENTRY * pObject);
```

Returns

None.

Description

GFX GOL text entry last char delete.

This function will remove the last character of the buffer and replace it with a string terminator. Drawing states GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE or GFX_GOL_TEXTENTRY_DRAW_STATE must be set to see the effect of the addition.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_TextEntryLastCharDelete(
GFX_GOL_TEXTENTRY *pObject)

GFX_GOL_TextEntrySpaceCharAdd Function

This function will insert a space character to the end of the buffer.

File

gfx_gol_text_entry.h

C

```
void GFX_GOL_TextEntrySpaceCharAdd(GFX_GOL_TEXTENTRY * pObject);
```

Returns

None.

Description

GFX GOL text entry space char add.

This function will insert a space character to the end of the buffer. Drawing states GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE or GFX_GOL_TEXTENTRY_DRAW_STATE must be set to see the effect of the addition.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

void GFX_GOL_TextEntrySpaceCharAdd(
GFX_GOL_TEXTENTRY *pObject)

Window Object

Window is an object that can be used to encapsulate objects into a group.

Functions

	Name	Description
	GFX_GOL_WindowActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_WindowCreate	This function creates a GFX_GOL_WINDOW object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_WindowDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_WindowTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_WindowTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_WindowTextSet	This function sets the address of the current text string used by the object.

Macros

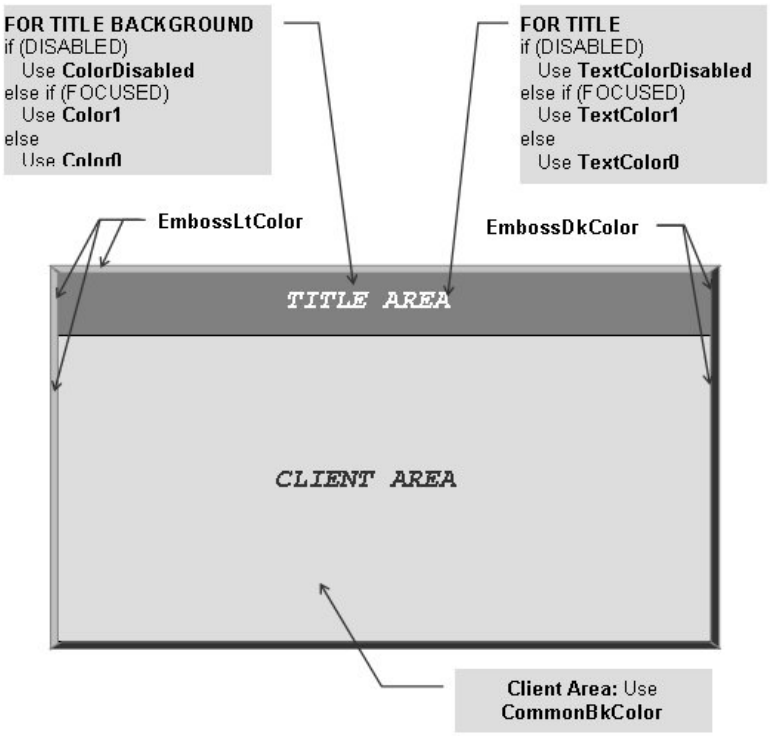
	Name	Description
	GFX_GOL_WindowImageGet	This function gets the image used.
	GFX_GOL_WindowImageSet	This function sets the image used in the object.
	GFX_GOL_WindowTextGet	This function returns the address of the current text string used by the object.

Description

Window is an object that can be used to encapsulate objects into a group. Unlike the Group Box object, the Window object has additional features such as displaying an icon or a small bitmap on its Title Bar. It also has additional controls for both Title Bar and Client Area.

Window supports Touchscreen inputs only, replying to the events with the predefined actions (see GFX_GOL_WindowActionGet() for details).

The Window object is rendered using the assigned style scheme. The following figure illustrates the color assignments.



CommonBkColor – used to hide the window from the screen.

GFX_GOL_WindowImageGet Macro

This function gets the image used.

File

gfx_gol_window.h

C

```
#define GFX_GOL_WindowImageGet(pObject) \
                                (((GFX_GOL_WINDOW *)pObject)->pImage)
```

Returns

Pointer to the image resource.

Description

GFX GOL window image get.

This function gets the image used.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_RESOURCE_HDR *GFX_GOL_WindowImageGet(
GFX_GOL_WINDOW *pObject)

GFX_GOL_WindowImageSet Macro

This function sets the image used in the object.

File

gfx_gol_window.h

C

```
#define GFX_GOL_WindowImageSet(pObject, pImg) \
                                (((GFX_GOL_WINDOW *)pObject)->pImage = pImg)
```

Returns

None.

Description

GFX GOL window image set.

This function sets the image used in the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
pImage	pointer to the image to be set.

Function

void GFX_GOL_WindowImageSet(
GFX_GOL_WINDOW *pObject,
GFX_RESOURCE_HDR *pImage)

GFX_GOL_WindowTextGet Macro

This function returns the address of the current text string used by the object.

File

gfx_gol_window.h

C

```
#define GFX_GOL_WindowTextGet(pObject) (((GFX_GOL_WINDOW *)pObject)->pText)
```

Returns

Pointer to text string.

Description

GFX GOL window text get.

This function returns the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
GFX_XCHAR *pChar;
GFX_GOL_WINDOW pWindow;

pChar = GFX_GOL_WindowTextGet(pWindow);
```

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_XCHAR *GFX_GOL_WindowTextGet(
GFX_GOL_WINDOW *pObject)

GFX_GOL_WindowActionGet Function

This function evaluates the message from a user if the message will affect the object or not.

File

gfx_gol_window.h

C

```
GFX_GOL_TRANSLATED_ACTION GFX_GOL_WindowActionGet(void * pObject, GFX_GOL_MESSAGE * pMessage);
```

Returns

- GFX_GOL_WINDOW_ACTION_CLIENT - Window client area selected action ID.
- GFX_GOL_WINDOW_ACTION_TITLE - Window title bar selected action ID.

Description

GFX GOL window action get.

This function evaluates the message from a user if the message will affect the object or not. The table below enumerates the action for each event of the touch screen and keyboard inputs.

Translated Message	Input Source	Events	Description
GFX_GOL_WINDOW_ACTION_TITLE	Touch Screen	EVENT_PRESS, EVENT_RELEASE, EVENT_MOVE	If events occurs and the x,y position falls in the TITLE area of the window
GFX_GOL_WINDOW_ACTION_CLIENT	Touch Screen	EVENT_PRESS, EVENT_RELEASE, EVENT_MOVE	If events occurs and the x,y position falls in the CLIENT area of the window
GFX_GOL_OBJECT_ACTION_INVALID	Any	Any	If the message did not affect the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	The pointer to the object where the message will be evaluated to check if the message will affect the object.
pMessage	Pointer to the the message from the user interface.

Function

GFX_GOL_TRANSLATED_ACTION GFX_GOL_WindowActionGet(

void *pObject,

GFX_GOL_MESSAGE *pMessage);

GFX_GOL_WindowCreate Function

This function creates a GFX_GOL_WINDOW object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

File

gfx_gol_window.h

C

```
GFX_GOL_WINDOW * GFX_GOL_WindowCreate(SYS_MODULE_INDEX gfxIndex, uint16_t ID, uint16_t left, uint16_t top,
uint16_t right, uint16_t bottom, uint16_t state, GFX_RESOURCE_HDR * pImage, GFX_XCHAR * pText,
GFX_ALIGNMENT alignment, GFX_GOL_OBJ_SCHEME * pScheme);
```

Returns

Pointer to the newly created object.

Description

GFX GOL window create.

This function creates a GFX_GOL_WINDOW object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.

This function returns the pointer to the newly created object. If the object is not successfully created, it returns NULL.

Preconditions

None.

Example

```
GFX_GOL_OBJ_SCHEME *pScheme;
GFX_GOL_WINDOW *pWindow;
GFX_GOL_WINDOW_STATE state;

// assume pScheme is initialized to a scheme in memory.
state = GFX_GOL_WINDOW_DRAW_STATE;

pWindow  = GFX_GOL_WindowCreate(
       gfxIndex,
       1,           // ID
       0,0,GFX_Primitive_MaxXGet(),GFX_Primitive_MaxYGet(), // whole screen dimension
       state,                   // set state to draw all
       (char*)myIcon,               // icon
       "Place Title Here.",                      // text
       NULL);                   // use default GOL scheme

if (pWindow == NULL)
    return 0;

return 1;
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
ID	Unique user defined ID for the object instance.
left	Left most position of the object.
top	Top most position of the object.
right	Right most position of the object.
bottom	Bottom most position of the object.
state	Sets the initial state of the object.
pImage	Pointer to the image used on the face of the object.
pText	Pointer to the text of the object.
alignment	text alignment of the text used in the object.
pScheme	Pointer to the style scheme used.

Function

```
    GFX_GOL_WINDOW  *GFX_GOL_WindowCreate(
                        SYS_MODULE_INDEX    gfxIndex,
    uint16_t            ID,
    uint16_t            left,
    uint16_t            top,
    uint16_t            right,
    uint16_t            bottom,
    uint16_t            state,
                        GFX_RESOURCE_HDR    *pImage,
                        GFX_XCHAR           *pText,
                        GFX_ALIGNMENT       alignment,
                        GFX_GOL_OBJ_SCHEME  *pScheme)
```

GFX_GOL_WindowDraw Function

This function renders the object on the screen based on the current state of the object.

File

gfx_gol_window.h

C

```
GFX_STATUS GFX_GOL_WindowDraw(void * pObject);
```

Returns

GFX_STATUS_SUCCESS - When the object rendering is finished. GFX_STATUS_FAILURE - When the object rendering is not yet finished. Application needs to call this rendering function again to continue the rendering.

Description

GFX GOL window draw.

This function renders the object on the screen based on the current state of the object. Location of the object is determined by the left, top, right and bottom parameters. The colors used are dependent on the state of the object. The font used is determined by the style scheme set.

The text on the face of the GFX_GOL_WINDOW is drawn on top of the bitmap. Text alignment based on the alignment parameter set on the object.

When rendering objects of the same type, each object must be rendered completely before the rendering of the next object is started. This is to avoid incomplete object rendering.

Normally, application will just call GFX_GOL_ObjectListDraw() to allow the Graphics Library to manage all object rendering. See GFX_GOL_ObjectListDraw() for more information on object rendering.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.

Function

GFX_STATUS GFX_GOL_WindowDraw(void *pObject)

GFX_GOL_WindowTextAlignmentGet Function

This function returns the text alignment of the text string used by the object.

File

gfx_gol_window.h

C

```
GFX_ALIGNMENT GFX_GOL_WindowTextAlignmentGet(GFX_GOL_WINDOW * pObject);
```

Returns

The text alignment set in the object. See GFX_ALIGNMENT for more details.

Description

GFX GOL window text alignment get.

This function returns the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_ALIGNMENT GFX_GOL_WindowTextAlignmentGet(
GFX_GOL_WINDOW *pObject)

GFX_GOL_WindowTextAlignmentSet Function

This function sets the text alignment of the text string used by the object.

File

gfx_gol_window.h

C

```
void GFX_GOL_WindowTextAlignmentSet(GFX_GOL_WINDOW * pObject, GFX_ALIGNMENT alignment);
```

Returns

None.

Description

GFX GOL window text alignment set.

This function sets the text alignment of the text string used by the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	Pointer to the object.
alignment	The alignment set for the text in the object. See GFX_ALIGNMENT for more details.

Function

void GFX_GOL_WindowTextAlignmentSet(
GFX_GOL_WINDOW *pObject,
GFX_ALIGNMENT alignment)

GFX_GOL_WindowTextSet Function

This function sets the address of the current text string used by the object.

File

gfx_gol_window.h

C

```
void GFX_GOL_WindowTextSet(GFX_GOL_WINDOW * pObject, GFX_XCHAR * pText);
```

Returns

None.

Description

GFX GOL window text set.

This function sets the address of the current text string used by the object.

Preconditions

Object must exist in memory.

Example

```
GFX_XCHAR Label0[] = ?ON?;
GFX_XCHAR Label1[] = ?OFF?;
GFX_GOL_WINDOW pWindow;

GFX_GOL_WindowTextSet(pWindow, Label0);
GFX_GOL_WindowTextSet(pWindow, Label1);
```

Parameters

Parameters	Description
pObject	pointer to the object.
pText	pointer to the text string to be used.

Function

void GFX_GOL_WindowTextSet(
GFX_GOL_WINDOW *pObject,
GFX_XCHAR *pText)

Macros

	Name	Description
	GFX_GOL_ObjectStateClear	This function clears the state bits of the given object.
	GFX_GOL_ObjectStateGet	This function retrieves the current value of the state bits of an object.
	GFX_GOL_ObjectStateSet	This function sets the state bits of the given object.

Description

Graphics Library Object Layer object state API.

GFX_GOL_ObjectStateClear Macro

This function clears the state bits of the given object.

File

gfx_gol.h

C

```
#define GFX_GOL_ObjectStateClear(pObject, stateBits) \
                ((((GFX_GOL_OBJ_HEADER*)pObject)->state) &= (~(stateBits)))
```

Returns

GFX_STATUS_SUCCESS - is returned if the clear was successful. GFX_STATUS_FAILURE - is returned if the clear was not successful.

Description

GFX GOL Object state clear.

This function clears the state bits of the given object. Object must be redrawn to display the changes. It is possible to set several state bits with this function.

Preconditions

None.

Example

See GFX_GOL_ObjectStateSet() for code example.

Parameters

Parameters	Description
pObject	Pointer to the object.
stateBits	Defines which state bits are to be cleared. Please refer to specific objects for object state bits definition for details

Function

GFX_STATUS GFX_GOL_ObjectStateClear(
GFX_GOL_OBJ_HEADER *pObject,
uint16_t stateBits);

GFX_GOL_ObjectStateGet Macro

This function retrieves the current value of the state bits of an object.

File

gfx_gol.h

C

```
#define GFX_GOL_ObjectStateGet(pObject, stateBits) \
                (((GFX_GOL_OBJ_HEADER*)pObject)->state & stateBits)
```

Returns

The current status of the specified state bits.

Description

GFX GOL object state get

This function retrieves the current value of the state bits of an object. It is possible to get several state bits.

Preconditions

None.

Example

```
#define BTN_HIDE 0x8000

GFX_GOL_BUTTON *pB;
// pB is created and initialized
// do something here to set state

// Hide the button (remove from screen)
if (GFX_GOL_ObjectStateGet(pB, GFX_GOL_BUTTON_HIDE_STATE))
{
    GFX_ColorSet(pB->pGolScheme->CommonBkColor);
    GFX_BarDraw(pB->left, pB->top,pB->right,pB->bottom);
}
```

Parameters

Parameters	Description
pObject	Pointer to the object.
stateBits	Defines which state bits are to be retrieved. Please refer to specific objects for object state bits definition for details

Function

uint16_t GFX_GOL_ObjectStateGet(
GFX_GOL_OBJ_HEADER *pObject,
uint16_t stateBits);

GFX_GOL_ObjectStateSet Macro

This function sets the state bits of the given object.

File

gfx_gol.h

C

```
#define GFX_GOL_ObjectStateSet(pObject, stateBits) \
                ((((GFX_GOL_OBJ_HEADER*)pObject)->state) |= stateBits)
```

Returns

GFX_STATUS_SUCCESS - is returned if the set was successful. GFX_STATUS_FAILURE - is returned if the set was not successful.

Description

GFX GOL object state set.

This function sets the state bits of the given object. Object must be redrawn to display the changes. It is possible to set several state bits with this function.

Preconditions

None.

Example

```
void SetMessage(uint16_t msg, GFX_GOL_BUTTON* pB)
{
    switch(msg)
    {
        case GFX_GOL_BUTTON_ACTION_PRESSED:
            // set pressed and redraw
            GFX_GOL_ObjectStateSet(pB, BTN_PRESSED|BTN_DRAW);
            break;
        case GFX_GOL_BUTTON_ACTION_RELEASED:
            // reset pressed
            GFX_GOL_ObjectStateClear(pB, BTN_PRESSED);
            // redraw
            GFX_GOL_ObjectStateSet(pB, BTN_DRAW);
            break;
        default:
            break;
    }
}
```

Parameters

Parameters	Description
pObject	Pointer to the object.
stateBits	Defines which state bits are to be cleared. Please refer to specific objects for object state bits definition for details

Function

GFX_STATUS GFX_GOL_ObjectStateSet(
GFX_GOL_OBJ_HEADER *pObject,
uint16_t stateBits);

GOL Object Management

Functions

	Name	Description
	GFX_GOL_ObjectAdd	This function adds an object to the tail of the currently active list.
	GFX_GOL_ObjectByIDDelete	This function removes an object with the given user defined ID from the currently active list.
	GFX_GOL_ObjectCanBeFocused	Checks if the object can be focused.
	GFX_GOL_ObjectDelete	This function removes an object from the currently active list.
	GFX_GOL_ObjectFind	This function returns the pointer to object in the list with the user defined ID assigned to it.

	GFX_GOL_ObjectFocusGet	This function returns the pointer to the object that is currently receiving keyboard input (or focused).
	GFX_GOL_ObjectFocusNextGet	This function returns the pointer to the next object in the active list of objects which can be focused.
	GFX_GOL_ObjectFocusPrevGet	This function returns the pointer to the previous object in the active list of objects which can be focused.
	GFX_GOL_ObjectFocusSet	This function sets the object to be focused.
	GFX_GOL_ObjectIDGet	This function returns the object ID.
	GFX_GOL_ObjectListFree	This function sets the active list to the new list.
	GFX_GOL_ObjectListGet	This function returns the current active list.
	GFX_GOL_ObjectListNew	This function removes an object with the given user defined ID from the currently active list.
	GFX_GOL_ObjectListSet	This function sets the active list to the new list.
	GFX_GOL_ObjectNextGet	This function returns the pointer to next object in the list after the specified object.
	GFX_GOL_ObjectTypeGet	This function returns the object type.

Description

Graphics Library Object Layer object management API.

GFX_GOL_ObjectAdd Function

This function adds an object to the tail of the currently active list.

File

gfx_gol.h

C

```
void GFX_GOL_ObjectAdd(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pObject);
```

Returns

None.

Description

GFX GOL object add.

This function adds an object to the tail of the currently active list. The new list tail is set to point to NULL after the new object is added.

Preconditions

None.

Example

```
void MoveObject(    GFX_GOL_OBJ_HEADER *pSrcList,
                    GFX_GOL_OBJ_HEADER *pDstList,
                    GFX_GOL_OBJ_HEADER *pObjtoMove)
{
    GFX_GOL_OBJ_HEADER *pTemp = pSrcList;

    if(pTemp != pObjtoMove)
    {
        while(pTemp->pNxtObj != pObjtoMove)
            pTemp = pTemp->pNxtObj;
    }

    pTemp->pNxtObj = pObjtoMove->pNxt;  // remove object from list
    GFX_GOL_ObjectListSet(pDstList);    // destination as active list
    GFX_GOL_ObjectAdd(gfxIndex, pObjtoMove);      // add object to active list
}
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance. Pointer to the object that will be added to the list.

Function

void GFX_GOL_ObjectAdd(SYS_MODULE_INDEX gfxIndex,

GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_ObjectByIDDelete Function

This function removes an object with the given user defined ID from the currently active list.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_ObjectByIDDelete(SYS_MODULE_INDEX gfxIndex, uint16_t id);
```

Returns

GFX_STATUS_SUCCESS - is returned if the removal was successful. GFX_STATUS_FAILURE - is returned if the removal was not successful.

Description

GFX GOL object by ID delete.

This function removes an object with the given user defined ID from the currently active list. Aside from the removal of the object from the list, the RAM resources consumed by the object is also freed.

If there is no object with the given ID, the function exits with GFX_STATUS_FAILURE.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance. Pointer to the object that will removed from the list.

Function

GFX_STATUS GFX_GOL_ObjectByIDDelete(SYS_MODULE_INDEX gfxIndex,

uint16_t id)

GFX_GOL_ObjectCanBeFocused Function

Checks if the object can be focused.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_ObjectCanBeFocused(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pObject);
```

Returns

GFX_STATUS_SUCCESS - when the object can be focused GFX_STATUS_FAILURE - when the object cannot be focused or do not support the focus feature.

Description

GFX GOL object can be focused.

This function checks if the object can be focused or not. If the object can be focused, it returns GFX_STATUS_SUCCESS. If it cannot be focused, it returns GFX_STATUS_FAILURE. Selected objects have the focus feature. Refer to the object documentation for details.

Objects that do not support focus feature will ignore any focus settings.

If the object is disabled it cannot be set to focused state.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pObject	pointer to the object.

Function

GFX_STATUS GFX_GOL_ObjectCanBeFocused(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_ObjectDelete Function

This function removes an object from the currently active list.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_ObjectDelete(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pObject);
```

Returns

GFX_STATUS_SUCCESS - is returned if the removal was successful. GFX_STATUS_FAILURE - is returned if the removal was not successful.

Description

GFX GOL object delete.

This function removes an object from the currently active list. Aside from the removal of the object from the list, the RAM resources consumed by the object is also freed.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance. Pointer to the object that will removed from the list.

Function

GFX_STATUS GFX_GOL_ObjectDelete(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_ObjectFind Function

This function returns the pointer to object in the list with the user defined ID assigned to it.

File

gfx_gol.h

C

```
GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectFind(SYS_MODULE_INDEX gfxIndex, uint16_t ID);
```

Returns

The pointer to the object in the list with the given ID.

Description

GFX GOL object find.

This function returns the pointer to object in the list with the user defined ID assigned to it.

Preconditions

None.

Example

```
void CopyObject(GFX_GOL_OBJ_HEADER *pSrcList,
                GFX_GOL_OBJ_HEADER *pDstList,
                uint16_t ID)
{
    GFX_GOL_OBJ_HEADER *pTemp;

    // find the object
    pTemp = GFX_GOL_ObjectFind(gfxIndex, ID);

    if (pTemp != NULL)
    {
        // destination as active list

        GFX_GOL_ObjectListSet(gfxIndex, pDstList);

        // add object to active list
        GFX_GOL_ObjectAdd(gfxIndex, pTemp);
    }
}
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance. User defined ID of the object of interest.

Function

GFX_GOL_OBJ_HEADER *GFX_GOL_ObjectFind(SYS_MODULE_INDEX gfxIndex, uint16_t ID)

GFX_GOL_ObjectFocusGet Function

This function returns the pointer to the object that is currently receiving keyboard input (or focused).

File

gfx_gol.h

C

```
GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectFocusGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The pointer the currently focused object. Returns NULL if there is no object currently set.

Description

GFX GOL object focus get.

This function returns the pointer to the object that is currently receiving keyboard input (or focused).

If there are no object that can accept keyboard messages, then the function will return NULL.

Objects that can be focused are those objects that can receive keyboard inputs.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

GFX_GOL_OBJ_HEADER *GFX_GOL_ObjectFocusGet(SYS_MODULE_INDEX gfxIndex)

GFX_GOL_ObjectFocusNextGet Function

This function returns the pointer to the next object in the active list of objects which can be focused.

File

gfx_gol.h

C

```
GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectFocusNextGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The pointer to the object that can be focused.

Description

GFX GOL object focus next get.

This function returns the pointer to the next object in the active list of objects which can be focused.

The reference point is the currently focused object. If there is no currently focused object, the searched starts from the beginning of the active list of objects.

Objects that can be focused are those objects that can receive keyboard inputs.

If there is no object capable of receiving keyboard inputs (i.e. none can be focused) NULL is returned.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

GFX_GOL_OBJ_HEADER *GFX_GOL_ObjectFocusNextGet(
SYS_MODULE_INDEX gfxIndex)

GFX_GOL_ObjectFocusPrevGet Function

This function returns the pointer to the previous object in the active list of objects which can be focused.

File

gfx_gol.h

C

```
GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectFocusPrevGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The pointer to the object that can be focused.

Description

GFX GOL object focus previous get.

This function returns the pointer to the previous object in the active list of objects which can be focused.

The reference point is the currently focused object. If there is no currently focused object, the searched starts from the beginning of the active list of objects.

Objects that can be focused are those objects that can receive keyboard inputs.

If there is no object capable of receiving keyboard inputs (i.e. none can be focused) NULL is returned.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

GFX_GOL_OBJ_HEADER *GFX_GOL_ObjectFocusPrevGet(
SYS_MODULE_INDEX gfxIndex)

GFX_GOL_ObjectFocusSet Function

This function sets the object to be focused.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_ObjectFocusSet(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pObject);
```

Returns

GFX_STATUS_SUCCESS - when the object can be focused GFX_STATUS_FAILURE - when the object cannot be focused or do not support the focus feature.

Description

GFX GOL object focus set.

This function sets the specified object to be focused.

If the object cannot accept keyboard messages, the object will not be set to focused state. If the object can accept keyboard messages, then the focus state will be set and will be marked to be redrawn to show the focus when the focus feature is enabled.

Objects that can be focused are those objects that can receive keyboard inputs.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pObject	pointer to the object.

Function

GFX_STATUS *GFX_GOL_ObjectFocusSet(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_ObjectIDGet Function

This function returns the object ID.

File

gfx_gol.h

C

```
uint16_t GFX_GOL_ObjectIDGet(GFX_GOL_OBJ_HEADER * pObject);
```

Returns

The user defined ID of the object.

Description

GFX GOL object ID get.

This function returns the user defined ID assigned to the object.

Preconditions

None.

Example

```
void ExampleUsageOfGettingID(GFX_GOL_OBJ_HEADER *pObject)
{
```

```
        uint16_t id;

        switch(id = GFX_GOL_ObjectIDGet(pObject))
        {
            case ID_WINDOW1:
                // do something
            case ID_WINDOW2:
                // do something else
            case ID_WINDOW3:
                // do something else
            default:
                // do something else
        }
    }
```

Function

uint16_t GFX_GOL_ObjectIDGet(GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_ObjectListFree Function

This function sets the active list to the new list.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_ObjectListFree(SYS_MODULE_INDEX gfxIndex);
```

Returns

GFX_STATUS_SUCCESS - is returned if the free was successful. GFX_STATUS_FAILURE - is returned if the free was not successful.

Description

GFX GOL Object List free.

This function frees all the memory used by objects in the active list and initializes the active list pointer to NULL to start a new empty list. This function must be called only inside the GFX_GOL_ObjectDrawCallback() function when using GFX_GOL_ObjectListDraw() and GFX_GOL_ObjectMessage() functions. This requirement assures that primitive rendering settings are not altered by the rendering state machines of the objects.

Preconditions

None.

Example

```
    void DeletePage(GFX_GOL_OBJ_HEADER *pPage)
    {
        GFX_GOL_OBJ_HEADER *pTemp;

        // assuming pPage is different from the current active list
        // save the active list
pTemp = GFX_GOL_ObjectListGet(gfxIndex);

        // set list as active list
        GFX_GOL_ObjectListSet(gfxIndex, pPage);

        // pPage objects are deleted
GFX_GOL_ObjectListFree(gfxIndex);

        // restore the active list
GFX_GOL_ObjectListSet(gfxIndex, pTemp);
    }
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

GFX_STATUS GFX_GOL_ObjectListFree(SYS_MODULE_INDEX gfxIndex)

GFX_GOL_ObjectListGet Function

This function returns the current active list.

File

gfx_gol.h

C

```
GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectListGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

Pointer (type GFX_GOL_OBJ_HEADER) to the current active list.

Description

GFX GOL object list get

This function returns the pointer to the current active.

Preconditions

None.

Example

See GFX_GOL_ObjectLlistNew() for example code.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

GFX_GOL_OBJ_HEADER *GFX_GOL_ObjectListGet(SYS_MODULE_INDEX gfxIndex)

GFX_GOL_ObjectListNew Function

This function removes an object with the given user defined ID from the currently active list.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_ObjectListNew(SYS_MODULE_INDEX gfxIndex);
```

Returns

GFX_STATUS_SUCCESS - is returned if the new list start was successful. GFX_STATUS_FAILURE - is returned if the new list start was not successful.

Description

GFX GOL object list new

This function starts a new linked list of objects and resets the keyboard focus to none. This function assigns the current active list and current focused object (receiving keyboard inputs) object pointers to NULL. Any keyboard inputs at this point will be ignored.

This function does not erase the objects in the previous list. Application must save the previous list to another pointer if to be referenced later. If not needed anymore, memory used by that list should be freed by GFX_GOL_ObjectListFree() function. In this case, freeing the list with GFX_GOL_ObjectListFree() function has the same effect as GFX_GOL_ObjectListNew() where the current active list is empty.

Preconditions

None.

Example

```
// assume pointers to objects (pButton, pWindow and pSlider
// are initialized to objects already created
// GFX_GOL_OBJ_HEADER *pButton;
// GFX_GOL_OBJ_HEADER *pWindow;
// GFX_GOL_OBJ_HEADER *pSlider;

GFX_GOL_OBJ_HEADER *pSave;
```

```
// save current list
pSave = GFX_GOL_ObjectListGet(gfxIndex);

// start the new list, after the start of the list, the
// current active list is empty.
GFX_GOL_ObjectListNew(gfxIndex);

// assume that objects are already created
// you can now add objects to the new list
GFX_GOL_ObjectAdd(gfxIndex, pButton);
GFX_GOL_ObjectAdd(gfxIndex, pWindow);
GFX_GOL_ObjectAdd(gfxIndex, pSlider);
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

GFX_STATUS GFX_GOL_ObjectListNew(SYS_MODULE_INDEX gfxIndex)

GFX_GOL_ObjectListSet Function

This function sets the active list to the new list.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_ObjectListSet(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pList);
```

Returns

GFX_STATUS_SUCCESS - is returned if the set was successful. GFX_STATUS_FAILURE - is returned if the set was not successful.

Description

GFX GOL object list set.

This function sets the active list to the new list. The previous list will still exist in memory. Application must save the previous list before the set is called if the previous list will be referenced later. If the previous list is not needed anymore, then the list must be removed from memory by GFX_GOL_ObjectListFree() function.

Setting the active list to the new list will reset the focused pointer object to NULL.

Preconditions

None.

Example

```
GFX_GOL_OBJ_HEADER *pSave;

// save current list
pSave = GFX_GOL_ObjectListSet(gfxIndex);

// start the new list
GFX_GOL_ObjectListNew(gfxIndex);

// you can now add objects to the current list
// assume that objects are already created
GFX_GOL_ObjectAdd(gfxIndex, pButton);
GFX_GOL_ObjectAdd(gfxIndex, pWindow);
GFX_GOL_ObjectAdd(gfxIndex, pSlider);

// do something here on the new list

// return the old list
GFX_GOL_ObjectListSet(gfxIndex, pSave);
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance. Pointer to the new list.

Function

GFX_STATUS *GFX_GOL_ObjectListSet(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pList)

GFX_GOL_ObjectNextGet Function

This function returns the pointer to next object in the list after the specified object.

File

gfx_gol.h

C

```
GFX_GOL_OBJ_HEADER * GFX_GOL_ObjectNextGet(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pObject);
```

Returns

The pointer to the next object in the list.

Description

GFX GOL object next get

This function returns the pointer to next object in the list after the specified object.

Preconditions

None.

Example

```
void RedrawButtons(void)
{

    GFX_GOL_OBJ_HEADER *pCurr;

    // get active list
    pCurr = GFX_GOL_ObjectListGet(gfxIndex);

    while(pCurr->pNxtObj != NULL)
    {
        // just select button objects and redraw them
        if (GFX_GOL_ObjectTypeGet(gfxIndex, pCurr) == BUTTON)
        {
            // set to be redrawn
            pCurr->state = BTN_DRAW;
        }
        pCurr = GFX_GOL_ObjectNextGet(gfxIndex, pCurr);
    }
    // redraw all buttons in the active list
    GFX_GOL_ObjectListDraw(gfxIndex);
}
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance. Pointer to the object of interest.

Function

GFX_GOL_OBJ_HEADER *GFX_GOL_ObjectNextGet(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_ObjectTypeGet Function

This function returns the object type.

File

gfx_gol.h

C

```
GFX_GOL_OBJ_TYPE GFX_GOL_ObjectTypeGet(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pObject);
```

Returns

The type of the object. The type is one of the defined enumerated types of GFX_GOL_OBJ_TYPE.

Description

GFX GOL object type get.

This function returns the object type. The object type is one of the defined enumerated types of GFX_GOL_OBJ_TYPE.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance. Pointer to the object of interest.

Function

GFX_GOL_OBJ_TYPE GFX_GOL_ObjectTypeGet(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObject)

GOL Object Rendering

Functions

	Name	Description
	GFX_GOL_DrawCallbackSet	This function sets the draw callback function that the application will use to render application specific rendering.
	GFX_GOL_ObjectDrawEnable	This function sets the object to be redraw.
	GFX_GOL_ObjectDrawDisable	This function resets the drawing state bits of the object.
	GFX_GOL_ObjectIsRedrawSet	This function checks if the object needs to be redrawn or not.
	GFX_GOL_ObjectListDraw	This function redraws all objects in the current active list that has the rendering state bits set.
	GFX_GOL_ObjectListHide	This function marks all objects in the active list to be hidden.
	GFX_GOL_ObjectRectangleRedraw	This function marks all objects in the active list intersected by the given rectangular area to be redrawn.
	GFX_GOL_ObjectHideDraw	This function performs the hiding of an object from the screen.
	GFX_GOL_TwoTonePanelDraw	This function renders the two-tone panel.
	GFX_GOL_ObjectBackGroundSet	This function sets the background information.

Description

Graphics Library Object Layer object rendering API.

GFX_GOL_DrawCallbackSet Function

This function sets the draw callback function that the application will use to render application specific rendering.

File

gfx_gol.h

C

```
void GFX_GOL_DrawCallbackSet(SYS_MODULE_INDEX gfxIndex, GFX_GOL_DRAW_CALLBACK_FUNC pFunc);
```

Returns

None.

Description

GFX GOL draw call back set.

This function sets the draw callback function that the application will use to call primitive function to implement application specific shapes.See GFX_GOL_DRAW_CALLBACK_FUNC definition for details on the draw callback function.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pFunc	pointer to the draw callback function.

Function

void GFX_GOL_DrawCallbackSet(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_DRAW_CALLBACK_FUNC pFunc)

GFX_GOL_ObjectDrawEnable Function

This function sets the object to be redraw.

File

gfx_gol.h

C

```
void GFX_GOL_ObjectDrawEnable(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pObject);
```

Returns

None.

Description

GFX GOL object draw enable.

This function sets the object to be redrawn. For the redraw to be effective, the object must be in the current active list. If not, the redraw action will not be performed until the list where the object is currently inserted will be set as the active list.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pObject	pointer to the object that will be redrawn.

Function

void GFX_GOL_ObjectDrawEnable(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_ObjectDrawDisable Function

This function resets the drawing state bits of the object.

File

gfx_gol.h

C

```
void GFX_GOL_ObjectDrawDisable(GFX_GOL_OBJ_HEADER * pObject);
```

Returns

None.

Description

GFX GOL object draw disable.

This function resets the drawing state bits of the object. This function can be called to cancel any drawing state bits that has been set or clears all the drawing state bits after the object has been redrawn.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pObject	pointer to the object.

Function

void GFX_GOL_ObjectDrawDisable(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_ObjectIsRedrawSet Function

This function checks if the object needs to be redrawn or not.

File

gfx_gol.h

C

```
bool GFX_GOL_ObjectIsRedrawSet(GFX_GOL_OBJ_HEADER * pObject);
```

Returns

true - when the object needs to be redrawn. false - when the object does not need to be redrawn.

Description

GFX GOL object is redraw set.

This function checks if the object needs to be redrawn or not. The function returns true if it is to be redrawn or false if it is not to be redrawn.

Preconditions

None.

Example

```
int DrawButtonWindowOnly()
{
    static GFX_GOL_OBJ_HEADER *pCurrentObj = NULL;
    uint16_t done = 0;

    if (pCurrentObj == NULL)
    {
        // get current list
       pCurrentObj = GFX_GOL_ObjectListGet(gfxIndex);
    }

    while(pCurrentObj != NULL)
    {
        if(GFX_GOL_ObjectIsRedrawSet(gfxIndex, pCurrentObj) == true)
        {
            done = pCurrentObj->draw(gfxIndex, pCurrentObj);

            // reset state of object if done
            if (done)
                GOLDrawComplete(pCurrentObj)
```

```
                    // Return if not done. This means that Button Draw function
                    // was not able to finish redrawing the object
                    // and must be called again to finish rendering of
                    // objects in the list that have new states.
                else
                    return 0;
            }
            // go to the next object in the list
            pCurrentObj = pCurrentObj->pNxtObj;
        }
        return 1;
    }
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pObject	pointer to the object that will be checked.

Function

bool GFX_GOL_ObjectIsRedrawSet(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_ObjectListDraw Function

This function redraws all objects in the current active list that has the rendering state bits set.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_ObjectListDraw(SYS_MODULE_INDEX gfxIndex);
```

Returns

GFX_STATUS_SUCCESS - is returned when the active list is completely parsed and redrawn. GFX_STATUS_BUSY - is returned when the active list is not completely parsed and redrawn.

Description

GFX GOL object list draw.

This function loops through the active list and redraws objects that need to be redrawn. Partial redrawing or full redraw is performed depending on the drawing states of the objects.

GFX_GOL_ObjectDrawCallback() function is called by GFX_GOL_ObjectListDraw() when drawing of objects in the active list is completed. GFX_GOL_ObjectDrawCallback() is an application implemented function that allows the application the opportunity to insert application specific rendering using Primitive Layer rendering functions.

The GFX_GOL_ObjectListDraw() function can return with GFX_STATUS_BUSY. In this case, it indicates that the currently redrawn object is not able to continue. Application needs to call GFX_GOL_ObjectListDraw() again to continue the redraw of the objects in the list.

Preconditions

None.

Example

```
    // Assume objects are created & states are set to draw objects
    while(1)
    {
        // parse active list and redraw objects
        // that needs to be redrawn
if( GFX_GOL_ObjectListDraw(gfxIndex) == GFX_STATUS_SUCCESS)
        {
            // at this point drawing is completed
            // it is safe to modify objects states and linked list

            // evaluate messages from touch screen device
            TouchGetMsg(&msg);

            // evaluate each object is affected by the message
            GFX_GOL_ObjectMessage(gfxIndex, &msg);
        }
```

```
}
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

GFX_STATUS GFX_GOL_ObjectListDraw(SYS_MODULE_INDEX gfxIndex)

GFX_GOL_ObjectListHide Function

This function marks all objects in the active list to be hidden.

File

gfx_gol.h

C

```
void GFX_GOL_ObjectListHide(SYS_MODULE_INDEX gfxIndex);
```

Returns

None.

Description

GFX GOL object list hide.

This function marks all objects in the active list to be hidden.

After calling this function, the next call to GFX_GOL_ObjectListDraw() will hide all objects.

Preconditions

The objects must be using the same background information.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

void GFX_GOL_ObjectListHide(SYS_MODULE_INDEX gfxIndex)

GFX_GOL_ObjectRectangleRedraw Function

This function marks all objects in the active list intersected by the given rectangular area to be redrawn.

File

gfx_gol.h

C

```
void GFX_GOL_ObjectRectangleRedraw(SYS_MODULE_INDEX gfxIndex, uint16_t left, uint16_t top, uint16_t right,
uint16_t bottom);
```

Returns

None.

Description

GFX GOL object rectangle redraw.

This function marks all objects in the active list intersected by the given rectangular area to be redrawn.

After calling this function, the next call to GFX_GOL_ObjectListDraw() will redraw all objects that are marked for redraw.

Preconditions

None.

Example

```
GFX_GOL_OBJ_HEADER *pTemp;
```

```
GFX_GOL_OBJ_HEADER *pAllObjects;

// assume *pAllObjects points to a list of all existing objects
// created and initialized

// mark all objects inside the rectangle to be redrawn
GFX_GOL_ObjectRectangleRedraw(gfxIndex,10,10,100,100);

// save the current active list
pTemp = pAllObjects;

// reset active list
GFX_GOL_ObjectListNew(gfxIndex);

// build the new active list with only those objects that
// are marked to be redrawn
while(pTemp->pNxtObj != NULL)
{
    if (pTemp->state&0x7C00)
        GFX_GOL_ObjectAdd(gfxIndex, pTemp);

    pTemp = pTemp->pNxtObj;
}

 // redraw active list
GFX_GOL_ObjectListDraw(gfxIndex);
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
left	Defines the left most border of the rectangle area.
top	Defines the top most border of the rectangle area.
right	Defines the right most border of the rectangle area.
bottom	Defines the bottom most border of the rectangle area.

Function

void GFX_GOL_ObjectRectangleRedraw(SYS_MODULE_INDEX gfxIndex,

uint16_t left,

uint16_t top,

uint16_t right,

uint16_t bottom)

GFX_GOL_ObjectHideDraw Function

This function performs the hiding of an object from the screen.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_ObjectHideDraw(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pObject);
```

Returns

GFX_STATUS_SUCCESS - when the hiding is done. GFX_STATUS_FAILURE - when the hiding is not yet done.

Description

GFX GOL object hide draw.

This function performs the hiding of an object from the screen. If the object's style scheme is set to have a background, the background is taken into account.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pObject	pointer to the object that will be checked.

Function

GFX_STATUS GFX_GOL_ObjectHideDraw(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_TwoTonePanelDraw Function

This function renders the two-tone panel.

File

gfx_gol.h

C

```
GFX_STATUS GFX_GOL_TwoTonePanelDraw(SYS_MODULE_INDEX gfxIndex);
```

Returns

GFX_STATUS_SUCCESS - when the panel rendering is done. GFX_STATUS_FAILURE - when the panel rendering is not yet done.

Description

GFX GOL two tone panel draw.

This function renders the two-tone panel. Panel parameters are set by the GFX_GOL_PanelParameterSet(). The function returns success (GFX_STATUS_SUCCESS) when the panel is rendered. If the function returned not success this function must be called again until success is returned.

Preconditions

Panel parameters must be set first using GFX_GOL_PanelParameterSet().

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

GFX_STATUS GFX_GOL_TwoTonePanelDraw(SYS_MODULE_INDEX gfxIndex)

GFX_GOL_ObjectBackGroundSet Function

This function sets the background information.

File

gfx_gol.h

C

```
void GFX_GOL_ObjectBackGroundSet(SYS_MODULE_INDEX gfxIndex, GFX_GOL_OBJ_HEADER * pObjectHeader);
```

Returns

None.

Description

GFX GOL object back ground set.

This function sets the background information. This is an internal function and should not be called by the application. This function is used by object's drawing functions to set the background information.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pObjectHeader	the object header of the object that needs to draw a panel with background.

Function

GFX_STATUS GFX_GOL_ObjectBackGroundSet(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_OBJ_HEADER *pObjectHeader)

GOL Object Messaging

Functions

	Name	Description
	GFX_GOL_ObjectMessage	This function process the received message from the user to determine the affected objects. Depending on the message and the affected objects, object states are modified based on the default or user-defined behavior.
	GFX_GOL_MessageCallbackSet	This function sets the message callback function that the application will use to evaluate user inputs that affects the objects and application behavior.

Description

Graphics Library Object Layer object messaging API.

GFX_GOL_ObjectMessage Function

This function process the received message from the user to determine the affected objects. Depending on the message and the affected objects, object states are modified based on the default or user-defined behavior.

File

gfx_gol.h

C

```
void GFX_GOL_ObjectMessage(SYS_MODULE_INDEX gfxIndex, GFX_GOL_MESSAGE * pMsg);
```

Returns

None.

Description

GFX GOL object message.

This function receives a GFX_GOL_MESSAGE message from user and loops through the active list of objects to check which object is affected by the message. For affected objects the message is translated and GFX_GOL_ObjectMessageCallback() is called. In the call back function, user has the ability to implement action for the message. If the call back function returns non-zero, OBJMsgDefault() is called to process message for the object by default. If zero is returned OBJMsgDefault() is not called. Please refer to GOL Messages section for details.

Preconditions

None.

Example

```
// Assume objects are created & states are set to draw objects
while (1)
{
    if(GOLDraw())
    {
        // GOL drawing is completed here
        // it is safe to change objects

        // from user interface module
```

```
            TouchGetMsg(&msg);
            // process the message
            GFX_GOL_ObjectMessage(gfxIndex, &msg);
        }
    }
```

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pMessage	Pointer to the message from user.

Function

void GFX_GOL_ObjectMessage(SYS_MODULE_INDEX gfxIndex, GFX_GOL_MESSAGE *pMessage)

GFX_GOL_MessageCallbackSet Function

This function sets the message callback function that the application will use to evaluate user inputs that affects the objects and application behavior.

File

gfx_gol.h

C

```
void GFX_GOL_MessageCallbackSet(SYS_MODULE_INDEX gfxIndex, GFX_GOL_MESSAGE_CALLBACK_FUNC pFunc);
```

Returns

None.

Description

GFX GOL message call back set.

This function sets the message callback function that the application will use to evaluate user inputs that affects the objects and application behavior. The callback function location is specified by the function pointer supplied in the call. See GFX_GOL_MESSAGE_CALLBACK_FUNC definition for details on the message callback function.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.
pFunc	pointer to the message callback function.

Function

void GFX_GOL_MessageCallbackSet(SYS_MODULE_INDEX gfxIndex,
GFX_GOL_MESSAGE_CALLBACK_FUNC pFunc)

GOL Object Style Scheme

Macros

	Name	Description
	GFX_GOL_ObjectStyleSchemeGet	This function returns the style scheme currently set for the object.
	GFX_GOL_ObjectStyleSchemeSet	This function sets the style scheme of the object.

Description

Graphics Library Object Layer object style scheme API.

GFX_GOL_ObjectStyleSchemeGet Macro

This function returns the style scheme currently set for the object.

File

gfx_gol.h

C

```
#define GFX_GOL_ObjectStyleSchemeGet(pObject) \
                (((GFX_GOL_OBJ_HEADER*)pObject)->pGolScheme)
```

Returns

The pointer to the currently set style scheme.

Description

GFX GOL object style scheme get.

This function returns the style scheme currently used by the object. The object must exist when this function is called. This function do not check if the object is valid.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_GOL_OBJ_SCHEME *GFX_GOL_ObjectStyleSchemeGet(
GFX_GOL_OBJ_HEADER *pObject)

GFX_GOL_ObjectStyleSchemeSet Macro

This function sets the style scheme of the object.

File

gfx_gol.h

C

```
#define GFX_GOL_ObjectStyleSchemeSet(pObject, pStyle) \
                ((((GFX_GOL_OBJ_HEADER*)pObject)->pGolScheme) = pStyle)
```

Returns

None.

Description

GFX GOL object style scheme set.

This function sets the style scheme of the object to the given style scheme. The object and style scheme must exist at the time of the assignment. This function do not check if the object or the style is valid.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
pStyle	pointer to the style scheme.

Function

void GFX_GOL_ObjectStyleSchemeSet(
GFX_GOL_OBJ_HEADER *pObject,

GFX_GOL_OBJ_SCHEME *pStyle)

Data Types and Constants

Enumerations

	Name	Description
	GFX_GOL_BUTTON_STATE	Specifies the different states of the Button object.
	GFX_GOL_CHECKBOX_STATE	Specifies the different states of the Check Box object.
	GFX_GOL_DIGITALMETER_STATE	Specifies the different states of the Digital Meter object.
	GFX_GOL_GROUPBOX_STATE	Specifies the different states of the Group Box object.
	GFX_GOL_LISTBOX_ITEM_STATUS	Defines the types used to indicate the status of an item.
	GFX_GOL_LISTBOX_STATE	Specifies the different states of the List Box object.
	GFX_GOL_METER_DRAW_TYPE	Specifies the different types of Meter object.
	GFX_GOL_METER_STATE	Specifies the different states of the Meter object.
	GFX_GOL_OBJ_TYPE	Specifies the different object types used in the library.
	GFX_GOL_PROGRESSBAR_STATE	Specifies the different states of the Progress Bar object.
	GFX_GOL_RADIOBUTTON_STATE	Specifies the different states of the Radio Button object.
	GFX_GOL_SCROLLBAR_STATE	Specifies the different states of the Scroll Bar object.
	GFX_GOL_STATICTEXT_STATE	Specifies the different states of the Static Text object.
	GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE	Specifies the different commands available for command keys of the Text Entry object.
	GFX_GOL_TEXTENTRY_STATE	Specifies the different states of the Text Entry object.
	GFX_GOL_TRANSLATED_ACTION	Specifies the different object actions supported in the library.
	GFX_GOL_WINDOW_STATE	Specifies the different states of the Window object.
	GFX_GOL_EDITBOX_STATE	Specifies the different states of the Edit Box object.
	GFX_GOL_PICTURECONTROLCONTROL_STATE	Specifies the different states of the Picture Control object.
	GFX_GOL_COMMON_STATE_BITS	Common Object States.
	GFX_GOL_CUSTOMCONTROL_STATE	Specifies the different states of the Custom Control object.
	GFX_GOL_CLIENT_STATUS	Enumerated data type that identifies the GFX Module Client Status.
	GFX_GOL_OBJECT_TASK	Lists the different states that GFX GOL task routine can have.
	GFX_GOL_STATES	Defines the various states that can be achieved by the GFX GOL operation.
	GFX_AT_SCAN_CODES	The following macros are the supported AT Keyboard scan codes.
	GFX_GOL_SURFACE_STATE	Specifies the different states of the Surface object.

Macros

	Name	Description
	GFX_GOL_SurfaceImageGet	This function gets the image used.
	GFX_GOL_SurfaceImageSet	This function sets the image used in the object.

Structures

	Name	Description
	GFX_GOL_BUTTON	Defines the structure used for the Button object.
	GFX_GOL_CHECKBOX	Defines the structure used for the Check Box object.
	GFX_GOL_CUSTOMCONTROL	Defines the structure used for the Custom Control object.
	GFX_GOL_DIGITALMETER	Defines the structure used for the Digital Meter object.
	GFX_GOL_EDITBOX	Defines the structure used for the Edit Box object.
	GFX_GOL_GROUPBOX	Defines the structure used for the Group Box object.
	GFX_GOL_LISTBOX	Defines the structure used for the List Box object.
	GFX_GOL_LISTITEM	The structure that defines each item in the list box.
	GFX_GOL_MESSAGE	Specifies message structure used in the library.
	GFX_GOL_METER	Defines the structure used for the Meter object.
	GFX_GOL_OBJ_HEADER	Specifies Graphics Object Layer structure used in objects.
	GFX_GOL_PROGRESSBAR	Defines the structure used for the Progress Bar object.
	GFX_GOL_RADIOBUTTON	Defines the structure used for the Radio Button object.
	GFX_GOL_SCROLLBAR	Defines the structure used for the Scroll Bar object.

	GFX_GOL_STATICTEXT	Defines the structure used for the Static Text object.
	GFX_GOL_TEXTENTRY	Defines the structure used for the Text Entry object.
	GFX_GOL_WINDOW	Defines the structure used for the Window object.
	GOL_PANEL_PARAM	Specifies panel parameters.
	GFX_GOL_PICTURECONTROL	Defines the structure used for the Picture Control object.
	GFX_GOL_TEXTENTRY_KEYMEMBER	Defines the structure used to describe a key in the Text Entry object.
	_GFX_OBJ	Defines the object required for interaction with the GFX Library.
	GFX_GOL_SURFACE	Defines the structure used for the Surface object.
	GFX_GOL_OBJ_SCHEME	This structure specifies the style scheme components of an object.

Types

	Name	Description
	GFX_GOL_DRAW_CALLBACK_FUNC	Draw callback function definition. This application defined function allows the application to perform application specific rendering.
	GFX_GOL_MESSAGE_CALLBACK_FUNC	Message callback function definition. This application defined function allows the application to perform application specific processing of user messages.
	GFX_GOL_SURFACE_CALLBACK_FUNC	Surface callback function definition. This application defined function allows the application to perform application specific rendering.

Description

Graphics Library Object Layer data types and constants.

GFX_GOL_BUTTON Structure

Defines the structure used for the Button object.

File

gfx_gol_button.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  uint16_t radius;
  uint16_t textWidth;
  uint16_t textHeight;
  GFX_XCHAR * pText;
  GFX_ALIGNMENT alignment;
  GFX_RESOURCE_HDR * pPressImage;
  GFX_RESOURCE_HDR * pReleaseImage;
} GFX_GOL_BUTTON;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
uint16_t radius;	Radius for rounded buttons.
uint16_t textWidth;	Computed text width, done at creation.
uint16_t textHeight;	Computed text height, done at creation.
GFX_XCHAR * pText;	Pointer to the text used.
GFX_ALIGNMENT alignment;	text alignment
GFX_RESOURCE_HDR * pPressImage;	Pointer to bitmap used.
GFX_RESOURCE_HDR * pReleaseImage;	Pointer to bitmap used.

Description

GFX GOL button

Typedef: GFX_GOL_BUTTON

Defines the structure used for the Button object.

1. Width is determined by right - left parameter in GFX_GOL_OBJ_HEADER.
2. Height is determined by top - bottom parameter in GFX_GOL_OBJ_HEADER.
3. radius - specifies if the GFX_GOL_BUTTON will have a rounded edge. If zero then the GFX_GOL_BUTTON will have sharp (cornered) edge.
4. If 2*radius = height = width, the GFX_GOL_BUTTON is a circular GFX_GOL_BUTTON.

Remarks

None.

GFX_GOL_BUTTON_STATE Enumeration

Specifies the different states of the Button object.

File

gfx_gol_button.h

C

```
typedef enum {
  GFX_GOL_BUTTON_FOCUSED_STATE,
  GFX_GOL_BUTTON_DISABLED_STATE,
  GFX_GOL_BUTTON_PRESSED_STATE,
  GFX_GOL_BUTTON_TOGGLE_STATE,
  GFX_GOL_BUTTON_TWOTONE_STATE,
  GFX_GOL_BUTTON_NOPANEL_STATE,
  GFX_GOL_BUTTON_DRAW_FOCUS_STATE,
  GFX_GOL_BUTTON_DRAW_STATE,
  GFX_GOL_BUTTON_HIDE_STATE
} GFX_GOL_BUTTON_STATE;
```

Members

Members	Description
GFX_GOL_BUTTON_FOCUSED_STATE	Property bit for focus state.
GFX_GOL_BUTTON_DISABLED_STATE	Property bit for disabled state.
GFX_GOL_BUTTON_PRESSED_STATE	Property bit for press state.
GFX_GOL_BUTTON_TOGGLE_STATE	Property bit to indicate object will have a toggle behavior.
GFX_GOL_BUTTON_TWOTONE_STATE	Property bit to indicate the object is a two tone type.
GFX_GOL_BUTTON_NOPANEL_STATE	Property bit to indicate the object will be drawn without a panel (for faster drawing when the object image used is larger than the object's panel).
GFX_GOL_BUTTON_DRAW_FOCUS_STATE	Draw bit to indicate focus must be redrawn.
GFX_GOL_BUTTON_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_BUTTON_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL button state.

Typedef: GFX_GOL_BUTTON_STATE

This enumeration specifies the different states of the Button object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_CHECKBOX Structure

Defines the structure used for the Check Box object.

File

gfx_gol_check_box.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  uint16_t textHeight;
  GFX_XCHAR * pText;
  GFX_ALIGNMENT alignment;
} GFX_GOL_CHECKBOX;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
uint16_t textHeight;	Pre-computed text height
GFX_XCHAR * pText;	Pointer to text
GFX_ALIGNMENT alignment;	text alignment

Description

GFX GOL checkbox

Typedef: GFX_GOL_CHECKBOX

Defines the structure used for the Check Box object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_CHECKBOX_STATE Enumeration

Specifies the different states of the Check Box object.

File

gfx_gol_check_box.h

C

```
typedef enum {
  GFX_GOL_CHECKBOX_FOCUSED_STATE,
  GFX_GOL_CHECKBOX_DISABLED_STATE,
  GFX_GOL_CHECKBOX_CHECKED_STATE,
  GFX_GOL_CHECKBOX_DRAW_CHECK_STATE,
  GFX_GOL_CHECKBOX_DRAW_FOCUS_STATE,
  GFX_GOL_CHECKBOX_DRAW_STATE,
  GFX_GOL_CHECKBOX_HIDE_STATE
} GFX_GOL_CHECKBOX_STATE;
```

Members

Members	Description
GFX_GOL_CHECKBOX_FOCUSED_STATE	Property bit for focus state.
GFX_GOL_CHECKBOX_DISABLED_STATE	Property bit to indicate object is disabled.
GFX_GOL_CHECKBOX_CHECKED_STATE	Property bit to indicate object is checked.
GFX_GOL_CHECKBOX_DRAW_CHECK_STATE	Draw bit to indicate the check must be redrawn.
GFX_GOL_CHECKBOX_DRAW_FOCUS_STATE	Draw bit to indicate focus must be redrawn.
GFX_GOL_CHECKBOX_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_CHECKBOX_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL checkbox state.

Typedef: GFX_GOL_CHECKBOX_STATE

This enumeration specifies the different states of the Check Box object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_CUSTOMCONTROL Structure

Defines the structure used for the Custom Control object.

File

gfx_gol_custom_control.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  uint8_t instance;
  uint16_t ID;
  void * pNxtObj;
  GFX_GOL_OBJ_TYPE type;
  uint16_t state;
  uint16_t left;
  uint16_t top;
  uint16_t right;
  uint16_t bottom;
  GFX_GOL_OBJ_SCHEME * pGolScheme;
  DRAW_FUNC draw;
  FREE_FUNC FreeObj;
  ACTIONGET_FUNC actionGet;
  ACTIONSET_FUNC actionSet;
  uint16_t pos;
  uint16_t prevPos;
} GFX_GOL_CUSTOMCONTROL;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_OBJ_HEADER).
uint8_t instance;	instance index
uint16_t ID;	instance unique ID
void * pNxtObj;	a pointer to the next object in the linked list
GFX_GOL_OBJ_TYPE type;	must be set to OBJ_CUSTOM
uint16_t state;	state
uint16_t left;	left border
uint16_t top;	top border
uint16_t right;	right border
uint16_t bottom;	bottom border
GFX_GOL_OBJ_SCHEME * pGolScheme;	the style scheme used
DRAW_FUNC draw;	custom control draw function
FREE_FUNC FreeObj;	function pointer to the object free function
ACTIONGET_FUNC actionGet;	function pointer to the object message function
ACTIONSET_FUNC actionSet;	function pointer to the object default message function
uint16_t pos;	current position
uint16_t prevPos;	previous position

Description

GFX GOL custom control.

Typedef: GFX_GOL_CUSTOMCONTROL

Defines the structure used for the Custom Control object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_DIGITALMETER Structure

Defines the structure used for the Digital Meter object.

File

gfx_gol_digital_meter.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
```

```
  uint16_t textHeight;
  uint32_t Cvalue;
  uint32_t Pvalue;
  uint8_t NoOfDigits;
  uint8_t DotPos;
  GFX_ALIGNMENT alignment;
} GFX_GOL_DIGITALMETER;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_OBJ_HEADER).
uint16_t textHeight;	Precomputed text height
uint32_t Cvalue;	Current value
uint32_t Pvalue;	Previous value
uint8_t NoOfDigits;	Number of digits to be displayed
uint8_t DotPos;	Position of decimal point
GFX_ALIGNMENT alignment;	text alignment

Description

GFX GOL digital meter.

Typedef: GFX_GOL_DIGITALMETER

Defines the parameters required for a Digital Meter Object. Depending on the type selected the meter is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_DIGITALMETER_STATE Enumeration

Specifies the different states of the Digital Meter object.

File

gfx_gol_digital_meter.h

C

```
typedef enum {
  GFX_GOL_DIGITALMETER_DISABLED_STATE,
  GFX_GOL_DIGITALMETER_FRAME_STATE,
  GFX_GOL_DIGITALMETER_DRAW_STATE,
  GFX_GOL_DIGITALMETER_UPDATE_STATE,
  GFX_GOL_DIGITALMETER_HIDE_STATE
} GFX_GOL_DIGITALMETER_STATE;
```

Members

Members	Description
GFX_GOL_DIGITALMETER_DISABLED_STATE	Property bit for disabled state.
GFX_GOL_DIGITALMETER_FRAME_STATE	Property bit to indicate frame is displayed.
GFX_GOL_DIGITALMETER_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_DIGITALMETER_UPDATE_STATE	Draw bit to indicate that only text must be redrawn.
GFX_GOL_DIGITALMETER_HIDE_STATE	Draw bit to indicate the object must be removed from the screen.

Description

GFX GOL digital meter state.

Typedef: GFX_GOL_DIGITALMETER_STATE

This enumeration specifies the different states of the Digital Meter object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_DRAW_CALLBACK_FUNC Type

Draw callback function definition. This application defined function allows the application to perform application specific rendering.

File

gfx_gol.h

C

```
typedef bool (* GFX_GOL_DRAW_CALLBACK_FUNC)(void);
```

Returns

true - is returned when application rendering is done. false - is returned when application rendering is not yet finished.

Description

GFX GOL draw callback function pointer

This callback function is implemented by the application. This is called inside the GFX_GOL_ObjectListDraw() function when the drawing of objects in the active list is completed.

Any application specific rendering must be performed on this callback function so no object rendering will be affected by the application calls to primitive rendering functions. Application setting the drawing color, line style, fill style, text string cursor position and current font will not affect the object rendering. This is also the safe place to modify the active list.

When the application has performed its own primitive rendering calls, this function must return true to inform the GFX_GOL_ObjectListDraw() that it is done rendering and checking for object drawing or redrawing can continue.

Preconditions

None.

Example

None.

Function

typedef bool (*GFX_GOL_DRAW_CALLBACK_FUNC) (void);

GFX_GOL_EDITBOX Structure

Defines the structure used for the Edit Box object.

File

gfx_gol_edit_box.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  uint16_t textHeight;
  GFX_XCHAR * pText;
  GFX_ALIGNMENT alignment;
  uint16_t charMax;
  uint16_t length;
  uint16_t cursorPosition;
} GFX_GOL_EDITBOX;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
uint16_t textHeight;	Precomputed text height.
GFX_XCHAR * pText;	Pointer to text buffer.
GFX_ALIGNMENT alignment;	text alignment
uint16_t charMax;	Maximum number of characters in the edit box.
uint16_t length;	Current text length.
uint16_t cursorPosition;	cursor position

Description

GFX GOL edit box.

Typedef: GFX_GOL_EDITBOX

Defines the parameters required for a Edit Box Object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_GROUPBOX Structure

Defines the structure used for the Group Box object.

File

gfx_gol_group_box.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  uint16_t textWidth;
  uint16_t textHeight;
  GFX_XCHAR * pText;
  GFX_ALIGNMENT alignment;
} GFX_GOL_GROUPBOX;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_OBJ_HEADER).
uint16_t textWidth;	Precomputed text width.
uint16_t textHeight;	Precomputed text height.
GFX_XCHAR * pText;	Text string used.
GFX_ALIGNMENT alignment;	Text alignment

Description

GFX GOL group box struct.

Typedef: GFX_GOL_GROUPBOX

Defines the parameters required for a Group Box Object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_GROUPBOX_STATE Enumeration

Specifies the different states of the Group Box object.

File

gfx_gol_group_box.h

C

```
typedef enum {
  GFX_GOL_GROUPBOX_DISABLED_STATE,
  GFX_GOL_GROUPBOX_DRAW_STATE,
  GFX_GOL_GROUPBOX_HIDE_STATE
} GFX_GOL_GROUPBOX_STATE;
```

Members

Members	Description
GFX_GOL_GROUPBOX_DISABLED_STATE	Property bit to indicate object is disabled.
GFX_GOL_GROUPBOX_DRAW_STATE	Draw bit to indicate group box must be redrawn.
GFX_GOL_GROUPBOX_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL group box state.

Typedef: GFX_GOL_GROUPBOX_STATE

This enumeration specifies the different states of the Group Box object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_LISTBOX Structure

Defines the structure used for the List Box object.

File

gfx_gol_list_box.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  GFX_GOL_LISTITEM * pItemList;
  GFX_GOL_LISTITEM * pFocusItem;
  uint16_t itemsNumber;
  int16_t scrollY;
  int16_t textHeight;
  GFX_ALIGNMENT alignment;
} GFX_GOL_LISTBOX;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
GFX_GOL_LISTITEM * pItemList;	Pointer to the list of items.
GFX_GOL_LISTITEM * pFocusItem;	Pointer to the focused item.
uint16_t itemsNumber;	Number of items in the list box.
int16_t scrollY;	Scroll displacement for the list.
int16_t textHeight;	Precomputed text height.
GFX_ALIGNMENT alignment;	items alignment.

Description

GFX GOL list box structure.

Typedef: GFX_GOL_LISTBOX

Defines the parameters required for a List Box Object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_LISTBOX_ITEM_STATUS Enumeration

Defines the types used to indicate the status of an item.

File

gfx_gol_list_box.h

C

```
typedef enum {
  GFX_GOL_LISTBOX_ITEM_STATUS_SELECTED,
  GFX_GOL_LISTBOX_ITEM_STATUS_REDRAW
} GFX_GOL_LISTBOX_ITEM_STATUS;
```

Members

Members	Description
GFX_GOL_LISTBOX_ITEM_STATUS_SELECTED	Item is selected.
GFX_GOL_LISTBOX_ITEM_STATUS_REDRAW	Item is to be redrawn.

Description

GFX GOL list box item status.

Typedef: GFX_GOL_LISTBOX_ITEM_STATUS

Defines the types used to indicate the status of an item in the List Box.

Remarks

None.

GFX_GOL_LISTBOX_STATE Enumeration

Specifies the different states of the List Box object.

File

gfx_gol_list_box.h

C

```
typedef enum {
  GFX_GOL_LISTBOX_FOCUSED_STATE,
  GFX_GOL_LISTBOX_DISABLED_STATE,
  GFX_GOL_LISTBOX_SINGLE_SELECT_STATE,
  GFX_GOL_LISTBOX_DRAW_ITEMS_STATE,
  GFX_GOL_LISTBOX_DRAW_FOCUS_STATE,
  GFX_GOL_LISTBOX_DRAW_STATE,
  GFX_GOL_LISTBOX_HIDE_STATE
} GFX_GOL_LISTBOX_STATE;
```

Members

Members	Description
GFX_GOL_LISTBOX_FOCUSED_STATE	Property bit for focus state.
GFX_GOL_LISTBOX_DISABLED_STATE	Property bit to indicate object is disabled.
GFX_GOL_LISTBOX_SINGLE_SELECT_STATE	Property bit to indicate only one item can be selected.
GFX_GOL_LISTBOX_DRAW_ITEMS_STATE	Draw bit to indicate selected items of the object must be redrawn.
GFX_GOL_LISTBOX_DRAW_FOCUS_STATE	Draw bit to indicate focus must be redrawn.
GFX_GOL_LISTBOX_DRAW_STATE	Draw Bit to indicate object must be redrawn.
GFX_GOL_LISTBOX_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL list box state.

Typedef: GFX_GOL_LISTBOX_STATE

This enumeration specifies the different states of the List Box object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_LISTITEM Structure

The structure that defines each item in the list box.

File

gfx_gol_list_box.h

C

```
typedef struct {
  void * pPrevItem;
  void * pNextItem;
  GFX_GOL_LISTBOX_ITEM_STATUS status;
  GFX_XCHAR * pText;
  GFX_RESOURCE_HDR * pImage;
  uint16_t data;
} GFX_GOL_LISTITEM;
```

Members

Members	Description
void * pPrevItem;	Pointer to the next item
void * pNextItem;	Pointer to the next item
GFX_GOL_LISTBOX_ITEM_STATUS status;	Specifies the status of the item.
GFX_XCHAR * pText;	Pointer to the text for the item
GFX_RESOURCE_HDR * pImage;	Pointer to the image used
uint16_t data;	Some data associated with the item

Description

GFX GOL list item structure.

Typedef: GFX_GOL_LISTITEM

Each item in the list box is described by this structure. The items are arranged as a linked list of this type.

Remarks

None.

GFX_GOL_MESSAGE Structure

Specifies message structure used in the library.

File

gfx_gol.h

C

```
typedef struct {
  uint8_t type;
  uint8_t uiEvent;
  int16_t param1;
  int16_t param2;
} GFX_GOL_MESSAGE;
```

Members

Members	Description
uint8_t type;	Specifies the type of input device.
uint8_t uiEvent;	An event that occurred in the input device.
int16_t param1;	Parameter 1, definition and usage is dependent on the type of input device.
int16_t param2;	Parameter 2, definition and usage is dependent on the type of input device.

Description

GFX GOL Message

Typedef: GFX_GOL_MESSAGE

Specifies message structure used in the library.

- The types must be one of the INPUT_DEVICE_TYPE:
- TYPE_UNKNOWN
- TYPE_KEYBOARD
- TYPE_TOUCHSCREEN
- TYPE_MOUSE
- uiEvent must be one of the INPUT_DEVICE_EVENT.
- for touch screen:

- EVENT_INVALID
- EVENT_MOVE
- EVENT_PRESS
- EVENT_STILLPRESS
- EVENT_RELEASE
- for keyboard:
- EVENT_KEYSCAN (param2 contains scan code)
- EVENT_KEYCODE (param2 contains character code)
- param1:
- for touch screen is the x position
- for keyboard ID of object receiving the message
- param2
- for touch screen y position
- for keyboard scan or key code

Remarks

None.

GFX_GOL_METER Structure

Defines the structure used for the Meter object.

File

gfx_gol_meter.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  GFX_XCHAR * pText;
  GFX_GOL_METER_DRAW_TYPE type;
  int16_t value;
  int16_t minValue;
  int16_t maxValue;
  int16_t xCenter;
  int16_t yCenter;
  int16_t radius;
  int16_t xPos;
  int16_t yPos;
  GFX_COLOR color1;
  GFX_COLOR color2;
  GFX_COLOR color3;
  GFX_COLOR color4;
  GFX_COLOR color5;
  GFX_COLOR color6;
  GFX_RESOURCE_HDR * pTitleFont;
  GFX_RESOURCE_HDR * pValueFont;
} GFX_GOL_METER;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see OBJ_HEADER).
GFX_XCHAR * pText;	The text label of the meter.
GFX_GOL_METER_DRAW_TYPE type;	sets the type of the meter
int16_t value;	Current value of the meter.
int16_t minValue;	minimum value the meter can display
int16_t maxValue;	maximum value the meter can display (range is maxValue - minValue)
int16_t xCenter;	The x coordinate center position. This is computed automatically.
int16_t yCenter;	The y coordinate center position. This is computed automatically.
int16_t radius;	Radius of the meter, also defines the needle length.
int16_t xPos;	The current x position of the needle. This is computed automatically.
int16_t yPos;	The current y position of the needle. This is computed automatically.
GFX_COLOR color1;	Arc1 and scale1 color parameter.
GFX_COLOR color2;	Arc2 and scale2 color parameter

GFX_COLOR color3;	Arc3 and scale3 color parameter
GFX_COLOR color4;	Arc4 and scale4 color parameter
GFX_COLOR color5;	Arc5 and scale5 color parameter
GFX_COLOR color6;	Arc6 and scale6 color parameter
GFX_RESOURCE_HDR * pTitleFont;	Pointer to the font used in the title of the meter
GFX_RESOURCE_HDR * pValueFont;	Pointer to the font used in the current reading (if displayed) of the meter

Description

GFX GOL meter structure.

Typedef: GFX_GOL_METER

Defines the parameters required for a Meter Object. Depending on the type selected the meter is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_METER_DRAW_TYPE Enumeration

Specifies the different types of Meter object.

File

gfx_gol_meter.h

C

```
typedef enum {
  GFX_GOL_METER_WHOLE_TYPE,
  GFX_GOL_METER_HALF_TYPE,
  GFX_GOL_METER_QUARTER_TYPE
} GFX_GOL_METER_DRAW_TYPE;
```

Members

Members	Description
GFX_GOL_METER_WHOLE_TYPE	draw circular meter
GFX_GOL_METER_HALF_TYPE	draw semi circle meter
GFX_GOL_METER_QUARTER_TYPE	draw quarter of a circle meter

Description

GFX GOL meter draw type.

Typedef: GFX_GOL_METER_DRAW_TYPE

This enumeration specifies the different typer of the Meter object used in the library.

- GFX_GOL_METER_WHOLE_TYPE - The meter will be drawn using all the arc colors (color1 to color6).
- GFX_GOL_METER_HALF_TYPE - The meter will be drawn using arc colors (color5, color4, color3, color2).
- GFX_GOL_METER_QUARTER_TYPE - The meter will be drawn using arc colors (color3, color2).

Remarks

None.

GFX_GOL_METER_STATE Enumeration

Specifies the different states of the Meter object.

File

gfx_gol_meter.h

C

```
typedef enum {
  GFX_GOL_METER_DISABLED_STATE,
  GFX_GOL_METER_RING_STATE,
  GFX_GOL_METER_ACCURACY_STATE,
  GFX_GOL_METER_UPDATE_DRAW_STATE,
  GFX_GOL_METER_DRAW_STATE,
  GFX_GOL_METER_HIDE_STATE
```

```
} GFX_GOL_METER_STATE;
```

Members

Members	Description
GFX_GOL_METER_DISABLED_STATE	Property bit for disabled state.
GFX_GOL_METER_RING_STATE	Property bit for ring type, scales are drawn over the ring. The default state of this state bit is disabled. Only scales are drawn.
GFX_GOL_METER_ACCURACY_STATE	Property bit when set, the values will have accuracy for 1 decimal place.
GFX_GOL_METER_UPDATE_DRAW_STATE	Draw bit to indicate update of the meter-hand only.
GFX_GOL_METER_DRAW_STATE	Draw bit to indicate the whole object must be drawn.
GFX_GOL_METER_HIDE_STATE	Draw bit to indicate the object must be removed from the screen.

Description

GFX GOL meter state.

Typedef: GFX_GOL_METER_STATE

This enumeration specifies the different states of the Meter object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_OBJ_HEADER Structure

Specifies Graphics Object Layer structure used in objects.

File

gfx_gol.h

C

```
typedef struct {
  SYS_MODULE_INDEX gfxIndex;
  uint16_t ID;
  void * pNxtObj;
  GFX_GOL_OBJ_TYPE type;
  uint16_t state;
  uint16_t left;
  uint16_t top;
  uint16_t right;
  uint16_t bottom;
  GFX_GOL_OBJ_SCHEME * pGolScheme;
  DRAW_FUNC DrawObj;
  FREE_FUNC FreeObj;
  ACTIONGET_FUNC actionGet;
  ACTIONSET_FUNC actionSet;
  uint16_t groupNo;
} GFX_GOL_OBJ_HEADER;
```

Members

Members	Description
SYS_MODULE_INDEX gfxIndex;	GFX instance index
uint16_t ID;	Unique id assigned for referencing.
void * pNxtObj;	A pointer to the next object.
GFX_GOL_OBJ_TYPE type;	Identifies the type of GOL object.
uint16_t state;	State of object.
uint16_t left;	Left position of the Object.
uint16_t top;	Top position of the Object.
uint16_t right;	Right position of the Object.
uint16_t bottom;	Bottom position of the Object.
GFX_GOL_OBJ_SCHEME * pGolScheme;	Pointer to the scheme used.

DRAW_FUNC DrawObj;	function pointer to the object's draw function.
FREE_FUNC FreeObj;	function pointer to the object's free function.
ACTIONGET_FUNC actionGet;	function pointer to the object's action get function.
ACTIONSET_FUNC actionSet;	function pointer to the object's action set function.
uint16_t groupNo;	GroupNo to keep track of group for radiobutton.

Description

GFX GOL object header

Typedef: GFX_GOL_OBJ_HEADER

This structure defines the Graphics Object Layer header used in all objects in the Graphics Library.

Remarks

None.

GFX_GOL_OBJ_TYPE Enumeration

Specifies the different object types used in the library.

File

gfx_gol.h

C

```
typedef enum {
  GFX_GOL_ANALOGCLOCK_TYPE,
  GFX_GOL_BUTTON_TYPE,
  GFX_GOL_CHART_TYPE,
  GFX_GOL_CHECKBOX_TYPE,
  GFX_GOL_DIGITALMETER_TYPE,
  GFX_GOL_EDITBOX_TYPE,
  GFX_GOL_GRID_TYPE,
  GFX_GOL_GROUPBOX_TYPE,
  GFX_GOL_LISTBOX_TYPE,
  GFX_GOL_METER_TYPE,
  GFX_GOL_PICTURECONTROL_TYPE,
  GFX_GOL_PROGRESSBAR_TYPE,
  GFX_GOL_RADIOBUTTON_TYPE,
  GFX_GOL_SCROLLBAR_TYPE,
  GFX_GOL_STATICTEXT_TYPE,
  GFX_GOL_TEXTENTRY_TYPE,
  GFX_GOL_WINDOW_TYPE,
  GFX_GOL_CUSTOM_TYPE,
  GFX_GOL_SURFACE_TYPE,
  GFX_GOL_UNKNOWN_TYPE
} GFX_GOL_OBJ_TYPE;
```

Members

Members	Description
GFX_GOL_ANALOGCLOCK_TYPE	Type defined for Analog Clock Object.
GFX_GOL_BUTTON_TYPE	Type defined for Button Object.
GFX_GOL_CHART_TYPE	Type defined for Chart Object.
GFX_GOL_CHECKBOX_TYPE	Type defined for Check Box Object.
GFX_GOL_DIGITALMETER_TYPE	Type defined for Digital Meter Object.
GFX_GOL_EDITBOX_TYPE	Type defined for Edit Box Object.
GFX_GOL_GRID_TYPE	Type defined for Grid Object.
GFX_GOL_GROUPBOX_TYPE	Type defined for Group Box Object.
GFX_GOL_LISTBOX_TYPE	Type defined for List Box Object.
GFX_GOL_METER_TYPE	Type defined for Meter Object.
GFX_GOL_PICTURECONTROL_TYPE	Type defined for Picture Control Object.
GFX_GOL_PROGRESSBAR_TYPE	Type defined for Progress Bar Object.
GFX_GOL_RADIOBUTTON_TYPE	Type defined for Radio Button Object.
GFX_GOL_SCROLLBAR_TYPE	Type defined for Slider or Scroll Bar Object.
GFX_GOL_STATICTEXT_TYPE	Type defined for Static Text Object.

GFX_GOL_TEXTENTRY_TYPE	Type defined for Text-Entry Object.
GFX_GOL_WINDOW_TYPE	Type defined for Window Object.
GFX_GOL_CUSTOM_TYPE	Type defined for Custom Object.
GFX_GOL_UNKNOWN_TYPE	Type is undefined and not supported by the library.

Description

GFX GOL object type

Typedef: GFX_GOL_OBJ_TYPE

This enumeration specifies the different object types used in the library.

Remarks

None.

GFX_GOL_PROGRESSBAR Structure

Defines the structure used for the Progress Bar object.

File

gfx_gol_progress_bar.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  uint16_t pos;
  uint16_t prevPos;
  uint16_t range;
} GFX_GOL_PROGRESSBAR;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
uint16_t pos;	Current progress position.
uint16_t prevPos;	Previous progress position.
uint16_t range;	Sets the range of the object.

Description

GFX GOL progress bar structure.

Typedef: GFX_GOL_PROGRESSBAR

Defines the parameters required for a Progress Bar object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_PROGRESSBAR_STATE Enumeration

Specifies the different states of the Progress Bar object.

File

gfx_gol_progress_bar.h

C

```
typedef enum {
  GFX_GOL_PROGRESSBAR_DISABLED_STATE,
  GFX_GOL_PROGRESSBAR_VERTICAL_STATE,
  GFX_GOL_PROGRESSBAR_NOPROGRESS_STATE,
  GFX_GOL_PROGRESSBAR_DRAW_BAR_STATE,
  GFX_GOL_PROGRESSBAR_DRAW_STATE,
  GFX_GOL_PROGRESSBAR_HIDE_STATE
} GFX_GOL_PROGRESSBAR_STATE;
```

Members

Members	Description
GFX_GOL_PROGRESSBAR_DISABLED_STATE	Property bit to indicate object is disabled.
GFX_GOL_PROGRESSBAR_VERTICAL_STATE	Property bit for vertical orientation. • When this state bit is 0 - object is rendered with horizontal orientation. • When this state bit is 1 - object is rendered with vertical orientation.
GFX_GOL_PROGRESSBAR_NOPROGRESS_STATE	Property bit that will suppress rendering of progress in text.
GFX_GOL_PROGRESSBAR_DRAW_BAR_STATE	Draw bit to indicate that the progress bar portion must be redrawn.
GFX_GOL_PROGRESSBAR_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_PROGRESSBAR_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL progress bar state.

Typedef: GFX_GOL_PROGRESSBAR_STATE

This enumeration specifies the different states of the Progress Bar object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_RADIOBUTTON Structure

Defines the structure used for the Radio Button object.

File

gfx_gol_radio_button.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  GFX_GOL_OBJ_HEADER * pHead;
  GFX_GOL_OBJ_HEADER * pNext;
  uint16_t textHeight;
  GFX_XCHAR * pText;
  GFX_ALIGNMENT alignment;
} GFX_GOL_RADIOBUTTON;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see OBJ_HEADER).
GFX_GOL_OBJ_HEADER * pHead;	Pointer to the first Radio Button in the group
GFX_GOL_OBJ_HEADER * pNext;	Pointer to the next Radio Button in the group
uint16_t textHeight;	Precomputed text height
GFX_XCHAR * pText;	Pointer to the text
GFX_ALIGNMENT alignment;	text alignment

Description

GFX GOL Radio button structure.

Typedef: GFX_GOL_RADIOBUTTON

Defines the parameters required for a Radio Button object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_RADIOBUTTON_STATE Enumeration

Specifies the different states of the Radio Button object.

File

gfx_gol_radio_button.h

C

```
typedef enum {
  GFX_GOL_RADIOBUTTON_FOCUSED_STATE,
  GFX_GOL_RADIOBUTTON_DISABLED_STATE,
  GFX_GOL_RADIOBUTTON_CHECKED_STATE,
  GFX_GOL_RADIOBUTTON_GROUP_STATE,
  GFX_GOL_RADIOBUTTON_DRAW_CHECK_STATE,
  GFX_GOL_RADIOBUTTON_DRAW_FOCUS_STATE,
  GFX_GOL_RADIOBUTTON_DRAW_STATE,
  GFX_GOL_RADIOBUTTON_HIDE_STATE
} GFX_GOL_RADIOBUTTON_STATE;
```

Members

Members	Description
GFX_GOL_RADIOBUTTON_FOCUSED_STATE	Property bit for focus state.
GFX_GOL_RADIOBUTTON_DISABLED_STATE	Property bit for disabled state.
GFX_GOL_RADIOBUTTON_CHECKED_STATE	Property bit to indicate Radio Button is checked.
GFX_GOL_RADIOBUTTON_GROUP_STATE	Bit to indicate the first Radio Button in the group. Each group MUST have this bit set for its first member even for a single member group. This means that any independent or stand alone Radio Button, the GFX_GOL_RADIOBUTTON_GROUP_STATE bit must be always set.
GFX_GOL_RADIOBUTTON_DRAW_CHECK_STATE	Draw bit to indicate check mark should be redrawn.
GFX_GOL_RADIOBUTTON_DRAW_FOCUS_STATE	Draw bit to indicate focus must be redrawn.
GFX_GOL_RADIOBUTTON_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_RADIOBUTTON_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL radio button state.

Typedef: GFX_GOL_RADIOBUTTON_STATE

This enumeration specifies the different states of the Radio Button object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_SCROLLBAR Structure

Defines the structure used for the Scroll Bar object.

File

gfx_gol_scroll_bar.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  int16_t currPos;
  uint16_t prevPos;
  uint16_t range;
  int16_t pos;
  uint16_t page;
  uint16_t thWidth;
  uint16_t thHeight;
} GFX_GOL_SCROLLBAR;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
int16_t currPos;	Position of the slider relative to minimum.
uint16_t prevPos;	Previous position of the slider relative to minimum.
uint16_t range;	User defined range of the slider. Minimum value at 0 and maximum at 0x7FFF.
int16_t pos;	Position of the slider in range domain.
uint16_t page;	User specified resolution to incrementally change the position in range domain.
uint16_t thWidth;	Thumb width. This is computed internally. User must not change this value.
uint16_t thHeight;	Thumb width. This is computed internally. User must not change this value.

Description

GFX GOL scroll bar struct.

Typedef: GFX_GOL_SCROLLBAR

Defines the parameters required for a Scroll Bar object. Object is drawn with the defined shape parameters and values set on the given fields. Depending on the GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE state bit slider or scrollbar mode is set. If GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE is set, mode is slider; if not set mode is scroll bar. For scrollbar mode, focus rectangle is not drawn.

Remarks

None.

GFX_GOL_SCROLLBAR_STATE Enumeration

Specifies the different states of the Scroll Bar object.

File

gfx_gol_scroll_bar.h

C

```
typedef enum {
  GFX_GOL_SCROLLBAR_FOCUSED_STATE,
  GFX_GOL_SCROLLBAR_DISABLED_STATE,
  GFX_GOL_SCROLLBAR_VERTICAL_STATE,
  GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE,
  GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE,
  GFX_GOL_SCROLLBAR_DRAW_FOCUS_STATE,
  GFX_GOL_SCROLLBAR_DRAW_STATE,
  GFX_GOL_SCROLLBAR_HIDE_STATE
} GFX_GOL_SCROLLBAR_STATE;
```

Members

Members	Description
GFX_GOL_SCROLLBAR_FOCUSED_STATE	Property bit for focus state.
GFX_GOL_SCROLLBAR_DISABLED_STATE	Property bit for disabled state.
GFX_GOL_SCROLLBAR_VERTICAL_STATE	Property bit to indicate the scroll bar is drawn with vertical orientation
GFX_GOL_SCROLLBAR_SLIDER_MODE_STATE	Property bit to indicate the scroll bar is in slider mode.
GFX_GOL_SCROLLBAR_DRAW_THUMB_STATE	Draw bit to indicate that only the thumb area will be redrawn.
GFX_GOL_SCROLLBAR_DRAW_FOCUS_STATE	Draw bit to indicate focus must be redrawn.
GFX_GOL_SCROLLBAR_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_SCROLLBAR_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL scroll bar state.

Typedef: GFX_GOL_SCROLLBAR_STATE

This enumeration specifies the different states of the Scroll Bar object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_STATICTEXT Structure

Defines the structure used for the Static Text object.

File

gfx_gol_static_text.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  GFX_XCHAR * pText;
  GFX_ALIGNMENT alignment;
} GFX_GOL_STATICTEXT;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see OBJ_HEADER).
GFX_XCHAR * pText;	The pointer to text used.
GFX_ALIGNMENT alignment;	text alignment

Description

GFX GOL static text structure.

Typedef: GFX_GOL_STATICTEXT

Defines the parameters required for a Static Text object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_STATICTEXT_STATE Enumeration

Specifies the different states of the Static Text object.

File

gfx_gol_static_text.h

C

```
typedef enum {
  GFX_GOL_STATICTEXT_DISABLED_STATE,
  GFX_GOL_STATICTEXT_FRAME_STATE,
  GFX_GOL_STATICTEXT_NOBACKGROUND_STATE,
  GFX_GOL_STATICTEXT_DRAW_STATE,
  GFX_GOL_STATICTEXT_HIDE_STATE
} GFX_GOL_STATICTEXT_STATE;
```

Members

Members	Description
GFX_GOL_STATICTEXT_DISABLED_STATE	Property bit for disabled state.
GFX_GOL_STATICTEXT_FRAME_STATE	Property bit to indicate frame is enabled.
GFX_GOL_STATICTEXT_NOBACKGROUND_STATE	Property bit to indicate background is enabled.
GFX_GOL_STATICTEXT_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_STATICTEXT_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL static text state.

Typedef: GFX_GOL_STATICTEXT_STATE

This enumeration specifies the different states of the Static Text object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a

complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_TEXTENTRY Structure

Defines the structure used for the Text Entry object.

File

gfx_gol_text_entry.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  uint16_t horizontalKeys;
  uint16_t verticalKeys;
  GFX_XCHAR * pTeOutput;
  GFX_ALIGNMENT alignment;
  uint16_t CurrentLength;
  uint16_t outputLenMax;
  GFX_GOL_TEXTENTRY_KEYMEMBER * pActiveKey;
  GFX_GOL_TEXTENTRY_KEYMEMBER * pHeadOfList;
  GFX_RESOURCE_HDR * pDisplayFont;
} GFX_GOL_TEXTENTRY;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all objects (see GFX_GOL_OBJ_HEADER).
uint16_t horizontalKeys;	Number of horizontal keys.
uint16_t verticalKeys;	Number of vertical keys.
GFX_XCHAR * pTeOutput;	Pointer to the buffer assigned by the user which holds the text shown in the edit box.
GFX_ALIGNMENT alignment;	Defines the text alignment.
uint16_t CurrentLength;	Current length of the string in the buffer. The maximum value of this is equal to outputLenMax. User creates and manages the buffer. Buffer can also be managed using the APIs provided to add a character, delete the last character or clear the buffer.
uint16_t outputLenMax;	Maximum expected length of output buffer. Object will update this parameter when adding, removing characters or clearing the buffer and switching buffers.
GFX_GOL_TEXTENTRY_KEYMEMBER * pActiveKey;	Pointer to the active key. This is only used by the object. User must not change the value of this parameter directly.
GFX_GOL_TEXTENTRY_KEYMEMBER * pHeadOfList;	Pointer to head of the list
GFX_RESOURCE_HDR * pDisplayFont;	Pointer to the font used in displaying the text.

Description

GFX GOL text entry structure.

Typedef: GFX_GOL_TEXTENTRY

Defines the parameters required for a Text Entry object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE Enumeration

Specifies the different commands available for command keys of the Text Entry object.

File

gfx_gol_text_entry.h

C

```
typedef enum {
  GFX_GOL_TEXTENTRY_NONE_COM,
```

```
  GFX_GOL_TEXTENTRY_DELETE_COM,
  GFX_GOL_TEXTENTRY_SPACE_COM,
  GFX_GOL_TEXTENTRY_ENTER_COM
} GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE;
```

Members

Members	Description
GFX_GOL_TEXTENTRY_NONE_COM	This type is used when the key is not assigned to any command.
GFX_GOL_TEXTENTRY_DELETE_COM	This type is used to assign a "delete" command on a key.
GFX_GOL_TEXTENTRY_SPACE_COM	This type is used to assign an insert "space" command on a key.
GFX_GOL_TEXTENTRY_ENTER_COM	This type is used to assign an "enter" carriage return) command on a key.

Description

GFX GOL text entry key command type.

Typedef: GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE

This enumeration specifies the different commands available for the command keys of the object.

The GFX_GOL_TEXTENTRY_ENTER_COM command can be used to customize application code in the message callback function. Use the returned translated GFX_GOL_TEXTENTRY_ACTION_ENTER to detect the key pressed was assigned the enter command. Refer to GFX_GOL_TextEntryActionGet() for details.

Remarks

None.

GFX_GOL_TEXTENTRY_STATE Enumeration

Specifies the different states of the Text Entry object.

File

gfx_gol_text_entry.h

C

```
typedef enum {
  GFX_GOL_TEXTENTRY_DISABLED_STATE,
  GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE,
  GFX_GOL_TEXTENTRY_ECHO_HIDE_STATE,
  GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE,
  GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE,
  GFX_GOL_TEXTENTRY_DRAW_STATE,
  GFX_GOL_TEXTENTRY_HIDE_STATE
} GFX_GOL_TEXTENTRY_STATE;
```

Members

Members	Description
GFX_GOL_TEXTENTRY_DISABLED_STATE	Property bit for disabled state.
GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE	Property bit for press state.
GFX_GOL_TEXTENTRY_ECHO_HIDE_STATE	Bit to hide the entered characters and instead echo "*" characters to the display.
GFX_GOL_TEXTENTRY_UPDATE_TEXT_STATE	Draw bit to indicate redraw of the text displayed is needed.
GFX_GOL_TEXTENTRY_UPDATE_KEY_STATE	Draw bit to indicate redraw of a key is needed.
GFX_GOL_TEXTENTRY_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_TEXTENTRY_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL text entry state.

Typedef: GFX_GOL_TEXTENTRY_STATE

This enumeration specifies the different states of the Text Entry object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_TRANSLATED_ACTION Enumeration

Specifies the different object actions supported in the library.

File

gfx_gol.h

C

```
typedef enum {
  GFX_GOL_OBJECT_ACTION_INVALID = 0x3500,
  GFX_GOL_OBJECT_ACTION_PASSIVE,
  GFX_GOL_ANALOGCLOCK_ACTION_PRESSED,
  GFX_GOL_ANALOGCLOCK_ACTION_RELEASED,
  GFX_GOL_BUTTON_ACTION_PRESSED,
  GFX_GOL_BUTTON_ACTION_STILLPRESSED,
  GFX_GOL_BUTTON_ACTION_RELEASED,
  GFX_GOL_BUTTON_ACTION_CANCELPRESS,
  GFX_GOL_CHART_ACTION_SELECTED,
  GFX_GOL_CHECKBOX_ACTION_CHECKED,
  GFX_GOL_CHECKBOX_ACTION_UNCHECKED,
  GFX_GOL_CUSTOMCONTROL_ACTION_SELECTED,
  GFX_GOL_DIGITALMETER_ACTION_SELECTED,
  GFX_GOL_EDITBOX_ACTION_ADD_CHAR,
  GFX_GOL_EDITBOX_ACTION_DEL_CHAR,
  GFX_GOL_EDITBOX_ACTION_TOUCHSCREEN,
  GFX_GOL_GRID_ACTION_TOUCHED,
  GFX_GOL_GRID_ACTION_ITEM_SELECTED,
  GFX_GOL_GRID_ACTION_UP,
  GFX_GOL_GRID_ACTION_DOWN,
  GFX_GOL_GRID_ACTION_LEFT,
  GFX_GOL_GRID_ACTION_RIGHT,
  GFX_GOL_GROUPBOX_ACTION_SELECTED,
  GFX_GOL_LISTBOX_ACTION_SELECTED,
  GFX_GOL_LISTBOX_ACTION_MOVE,
  GFX_GOL_LISTBOX_ACTION_TOUCHSCREEN,
  GFX_GOL_METER_ACTION_SET,
  GFX_GOL_PICTURECONTROL_ACTION_SELECTED,
  GFX_GOL_PROGRESSBAR_ACTION_SELECTED,
  GFX_GOL_RADIOBUTTON_ACTION_CHECKED,
  GFX_GOL_SCROLLBAR_ACTION_INC,
  GFX_GOL_SCROLLBAR_ACTION_DEC,
  GFX_GOL_STATICTEXT_ACTION_SELECTED,
  GFX_GOL_TEXTENTRY_ACTION_RELEASED,
  GFX_GOL_TEXTENTRY_ACTION_PRESSED,
  GFX_GOL_TEXTENTRY_ACTION_ADD_CHAR,
  GFX_GOL_TEXTENTRY_ACTION_DELETE,
  GFX_GOL_TEXTENTRY_ACTION_SPACE,
  GFX_GOL_TEXTENTRY_ACTION_ENTER,
  GFX_GOL_WINDOW_ACTION_CLIENT,
  GFX_GOL_WINDOW_ACTION_TITLE
} GFX_GOL_TRANSLATED_ACTION;
```

Members

Members	Description
GFX_GOL_OBJECT_ACTION_INVALID = 0x3500	Invalid message response.
GFX_GOL_OBJECT_ACTION_PASSIVE	Passive message response. No change in object needed.
GFX_GOL_ANALOGCLOCK_ACTION_PRESSED	Analog Clock Pressed Action
GFX_GOL_ANALOGCLOCK_ACTION_RELEASED	Analog Clock Released Action
GFX_GOL_BUTTON_ACTION_PRESSED	Button pressed action ID.
GFX_GOL_BUTTON_ACTION_STILLPRESSED	Button is continuously pressed ID.
GFX_GOL_BUTTON_ACTION_RELEASED	Button released action ID.
GFX_GOL_BUTTON_ACTION_CANCELPRESS	Button released action ID with button press canceled.
GFX_GOL_CHART_ACTION_SELECTED	Chart selected action ID

GFX_GOL_CHECKBOX_ACTION_CHECKED	Check Box check action ID.
GFX_GOL_CHECKBOX_ACTION_UNCHECKED	Check Box uncheck action ID.
GFX_GOL_CUSTOMCONTROL_ACTION_SELECTED	Custom Control selected action ID.
GFX_GOL_DIGITALMETER_ACTION_SELECTED	Digital Meter selected action ID.
GFX_GOL_EDITBOX_ACTION_ADD_CHAR	Edit Box insert character action ID.
GFX_GOL_EDITBOX_ACTION_DEL_CHAR	Edit Box remove character action ID.
GFX_GOL_EDITBOX_ACTION_TOUCHSCREEN	Edit Box touchscreen selected action ID.
GFX_GOL_GRID_ACTION_TOUCHED	Grid item touched action ID.
GFX_GOL_GRID_ACTION_ITEM_SELECTED	Grid item selected action ID.
GFX_GOL_GRID_ACTION_UP	Grid up action ID.
GFX_GOL_GRID_ACTION_DOWN	Grid down action ID.
GFX_GOL_GRID_ACTION_LEFT	Grid left action ID.
GFX_GOL_GRID_ACTION_RIGHT	Grid right action ID.
GFX_GOL_GROUPBOX_ACTION_SELECTED	Group Box selected action ID.
GFX_GOL_LISTBOX_ACTION_SELECTED	List Box item select action ID.
GFX_GOL_LISTBOX_ACTION_MOVE	List Box item move action ID.
GFX_GOL_LISTBOX_ACTION_TOUCHSCREEN	List Box touchscreen selected action ID.
GFX_GOL_METER_ACTION_SET	Meter set value action ID.
GFX_GOL_PICTURECONTROL_ACTION_SELECTED	Picture selected action ID.
GFX_GOL_PROGRESSBAR_ACTION_SELECTED	Progress Bar selected action ID.
GFX_GOL_RADIOBUTTON_ACTION_CHECKED	Radio Button check action ID.
GFX_GOL_SCROLLBAR_ACTION_INC	Slider or Scroll Bar increment action ID.
GFX_GOL_SCROLLBAR_ACTION_DEC	Slider or Scroll Bar decrement action ID.
GFX_GOL_STATICTEXT_ACTION_SELECTED	Static Text selected action ID.
GFX_GOL_TEXTENTRY_ACTION_RELEASED	TextEntry released action ID
GFX_GOL_TEXTENTRY_ACTION_PRESSED	TextEntry pressed action ID
GFX_GOL_TEXTENTRY_ACTION_ADD_CHAR	TextEntry add character action ID
GFX_GOL_TEXTENTRY_ACTION_DELETE	TextEntry delete character action ID
GFX_GOL_TEXTENTRY_ACTION_SPACE	TextEntry add space character action ID
GFX_GOL_TEXTENTRY_ACTION_ENTER	TextEntry enter action ID
GFX_GOL_WINDOW_ACTION_CLIENT	Window client area selected action ID.
GFX_GOL_WINDOW_ACTION_TITLE	Window title bar selected action ID.

Description

GFX GOL Translated Action

Typedef: GFX_GOL_TRANSLATED_ACTION

This enumeration specifies the different object actions supported in the library.

Remarks

None.

GFX_GOL_WINDOW Structure

Defines the structure used for the Window object.

File

gfx_gol_window.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  uint16_t textHeight;
  GFX_XCHAR * pText;
  GFX_ALIGNMENT alignment;
  GFX_RESOURCE_HDR * pImage;
} GFX_GOL_WINDOW;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all objects (see GFX_GOL_OBJ_HEADER).
uint16_t textHeight;	Precomputed text height
GFX_XCHAR * pText;	Pointer to the title text
GFX_ALIGNMENT alignment;	text alignment
GFX_RESOURCE_HDR * pImage;	Pointer to the image for the title bar

Description

GFX GOL window structure.

Typedef: GFX_GOL_WINDOW

Defines the parameters required for a Window object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_WINDOW_STATE Enumeration

Specifies the different states of the Window object.

File

gfx_gol_window.h

C

```
typedef enum {
  GFX_GOL_WINDOW_FOCUSED_STATE,
  GFX_GOL_WINDOW_DISABLED_STATE,
  GFX_GOL_WINDOW_DRAW_TITLE_STATE,
  GFX_GOL_WINDOW_DRAW_CLIENT_STATE,
  GFX_GOL_WINDOW_DRAW_STATE,
  GFX_GOL_WINDOW_HIDE_STATE
} GFX_GOL_WINDOW_STATE;
```

Members

Members	Description
GFX_GOL_WINDOW_FOCUSED_STATE	Property bit for focus state.
GFX_GOL_WINDOW_DISABLED_STATE	Property bit for disabled state.
GFX_GOL_WINDOW_DRAW_TITLE_STATE	Draw bit to indicate title area must be redrawn.
GFX_GOL_WINDOW_DRAW_CLIENT_STATE	Draw bit to indicate client area must be redrawn.
GFX_GOL_WINDOW_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_WINDOW_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL window state.

Typedef: GFX_GOL_WINDOW_STATE

This enumeration specifies the different states of the Window object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GOL_PANEL_PARAM Structure

Specifies panel parameters.

File

gfx_gol.h

C

```
typedef struct {
  int16_t panelLeft;
  int16_t panelTop;
  int16_t panelRight;
  int16_t panelBottom;
  GFX_COLOR panelFaceColor;
  GFX_COLOR panelEmbossLtColor;
  GFX_COLOR panelEmbossDkColor;
  uint16_t panelEmbossSize;
  uint16_t panelRadius;
  GFX_RESOURCE_HDR * pPanelImage;
  GFX_FILL_STYLE panelFillStyle;
  GFX_COLOR panelGradientStartColor;
  GFX_COLOR panelGradientEndColor;
  uint16_t panelAlpha;
} GOL_PANEL_PARAM;
```

Members

Members	Description
int16_t panelLeft;	Panel left coordinate.
int16_t panelTop;	Panel top coordinate.
int16_t panelRight;	Panel right coordinate.
int16_t panelBottom;	Panel Bottom coordinate.
GFX_COLOR panelFaceColor;	Panel Face color.
GFX_COLOR panelEmbossLtColor;	Panel Emboss light color.
GFX_COLOR panelEmbossDkColor;	Panel Emboss dark color.
uint16_t panelEmbossSize;	Panel Emboss size.
uint16_t panelRadius;	Panel radius.
GFX_RESOURCE_HDR * pPanelImage;	Panel image resource.
GFX_FILL_STYLE panelFillStyle;	Panel fill style.
GFX_COLOR panelGradientStartColor;	Panel gradient start color.
GFX_COLOR panelGradientEndColor;	Panel gradient end color .
uint16_t panelAlpha;	Panel alpha

Description

GOL panel parameter

Typedef: GOL_PANEL_PARAM

This structure defines the panel parameters when rendering a panel.

Remarks

None.

GFX_GOL_EDITBOX_STATE Enumeration

Specifies the different states of the Edit Box object.

File

gfx_gol_edit_box.h

C

```
typedef enum {
  GFX_GOL_EDITBOX_FOCUSED_STATE,
  GFX_GOL_EDITBOX_DISABLED_STATE,
  GFX_GOL_EDITBOX_ENABLE_CARET_STATE,
  GFX_GOL_EDITBOX_ENABLE_BAR_CARET_STATE,
  GFX_GOL_EDITBOX_ENABLE_BLOCK_CARET_STATE,
  GFX_GOL_EDITBOX_ENABLE_UNDERSCORE_CARET_STATE,
  GFX_GOL_EDITBOX_DRAW_CARET_STATE,
  GFX_GOL_EDITBOX_DRAW_FOCUS_STATE,
```

```
  GFX_GOL_EDITBOX_DRAW_STATE,
  GFX_GOL_EDITBOX_HIDE_STATE
} GFX_GOL_EDITBOX_STATE;
```

Members

Members	Description
GFX_GOL_EDITBOX_FOCUSED_STATE	Property bit for focus state. Cursor caret will be drawn when GFX_GOL_EDITBOX_ENABLE_CARET_STATE is also set.
GFX_GOL_EDITBOX_DISABLED_STATE	Property bit to indicate object is disabled.
GFX_GOL_EDITBOX_ENABLE_CARET_STATE	Property bit to indicate cursor caret will always be shown.
GFX_GOL_EDITBOX_ENABLE_BAR_CARET_STATE	property bit to indicate bar type caret
GFX_GOL_EDITBOX_ENABLE_BLOCK_CARET_STATE	property bit to indicate block type caret
GFX_GOL_EDITBOX_ENABLE_UNDERSCORE_CARET_STATE	property bit to indicate underscore type caret
GFX_GOL_EDITBOX_DRAW_CARET_STATE	Draw bit to indicate the cursor caret will be drawn if GFX_GOL_EDITBOX_FOCUSED_STATE state bit is set and erase when GFX_GOL_EDITBOX_FOCUSED_STATE state bit is not set.
GFX_GOL_EDITBOX_DRAW_FOCUS_STATE	Draw bit to indicate focus must be redrawn.
GFX_GOL_EDITBOX_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_EDITBOX_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL edit box state.

Typedef: GFX_GOL_EDITBOX_STATE

This enumeration specifies the different states of the Edit Box object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_PICTURECONTROL Structure

Defines the structure used for the Picture Control object.

File

gfx_gol_picture.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  GFX_RESOURCE_HDR * pImage;
  int8_t scaleFactor;
  uint16_t imageLeft;
  uint16_t imageTop;
  uint16_t imageRight;
  uint32_t * stream;
  uint8_t count;
  uint8_t delay;
  uint16_t imageBottom;
  GFX_PARTIAL_IMAGE_PARAM partial;
} GFX_GOL_PICTURECONTROL;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
GFX_RESOURCE_HDR * pImage;	Pointer to the image
int8_t scaleFactor;	Scale factor for the bitmap
uint16_t imageLeft;	image left position when drawn
uint16_t imageTop;	image top position when drawn
uint16_t imageRight;	image right position when drawn

uint8_t count;	Count for the number of bitmaps to be streamed
uint8_t delay;	Delay in between the streaming of bitmaps
uint16_t imageBottom;	image bottom position when drawn
GFX_PARTIAL_IMAGE_PARAM partial;	structure containing partial image data

Description

GFX GOL picture control structure.

Typedef: GFX_GOL_PICTURECONTROL

Defines the parameters required for a Picture Control object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_PICTURECONTROLCONTROL_STATE Enumeration

Specifies the different states of the Picture Control object.

File

gfx_gol_picture.h

C

```
typedef enum {
  GFX_GOL_PICTURECONTROL_DISABLED_STATE,
  GFX_GOL_PICTURECONTROL_FRAME_STATE,
  GFX_GOL_PICTURECONTROL_STREAM_STATE,
  GFX_GOL_PICTURECONTROL_DRAW_STATE,
  GFX_GOL_PICTURECONTROL_HIDE_STATE
} GFX_GOL_PICTURECONTROLCONTROL_STATE;
```

Members

Members	Description
GFX_GOL_PICTURECONTROL_DISABLED_STATE	Property bit to indicate object is disabled.
GFX_GOL_PICTURECONTROL_FRAME_STATE	Property bit to indicate that the object will have a frame.
GFX_GOL_PICTURECONTROL_STREAM_STATE	Property bit to indicate Picture is streaming. This feature is available only when the hardware can support streaming of images.
GFX_GOL_PICTURECONTROL_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_PICTURECONTROL_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL picture control, control state.

Typedef: GFX_GOL_PICTURECONTROLCONTROL_STATE

This enumeration specifies the different states of the Picture Control object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_COMMON_STATE_BITS Enumeration

Common Object States.

File

gfx_gol.h

C

```
typedef enum {
  GFX_GOL_FOCUSED,
  GFX_GOL_DISABLED,
```

```
  GFX_GOL_HIDE,
  GFX_GOL_DRAW,
  GFX_GOL_DRAW_FOCUS,
  GFX_GOL_DRAW_UPDATE
} GFX_GOL_COMMON_STATE_BITS;
```

Members

Members	Description
GFX_GOL_FOCUSED	Focus state bit
GFX_GOL_DISABLED	Disabled state bit.
GFX_GOL_HIDE	Object hide state bit. Object will be hidden from the screen by drawing over it the common background color.
GFX_GOL_DRAW	Object redraw state bits. The whole Object must be redrawn.
GFX_GOL_DRAW_FOCUS	Focus redraw state bit. The focus rectangle must be redrawn.
GFX_GOL_DRAW_UPDATE	Partial Object redraw state bits. A part or parts of the Object must be redrawn to show updated state.

Description

GFX GOL common object states

Typedef: Common Object States

The following macros defines the common Object State bits.

Remarks

None.

GFX_GOL_MESSAGE_CALLBACK_FUNC Type

Message callback function definition. This application defined function allows the application to perform application specific processing of user messages.

File

gfx_gol.h

C

```
typedef bool (* GFX_GOL_MESSAGE_CALLBACK_FUNC)(GFX_GOL_TRANSLATED_ACTION, GFX_GOL_OBJ_HEADER *,
GFX_GOL_MESSAGE *);
```

Returns

true - When true is returned, the object will set its state depending on the translated messages. false - When false is returned, the object will not process the translated message and will assume the application has performed necessary action on the message.

Description

GFX GOL message callback function pointer

This application defined function is called by the GFX_GOL_ObjectMessage() function allowing the application the opportunity to process the user messages and customize object behavior as well as application controlled functions.

GFX_GOL_ObjectMessage() calls this function when a valid message for an object in the active list is received. Application implements any action for the message in this callback function. If this callback function returns true, the message for the object will be processed using the default action of the object. If false is returned, the default action will not be performed. In this case, it is assumed that this callback function has performed the appropriate changes to the states of the objects.

Preconditions

None.

Example

None.

Parameters

Parameters	Description
GFX_GOL_TRANSLATED_ACTION	Translated message for the object
GFX_GOL_OBJ_HEADER *	Pointer to the object that processed the message.
GFX_GOL_MESSAGE *	Pointer to the message from user.

Function

typedef bool (*GFX_GOL_MESSAGE_CALLBACK_FUNC)
(
GFX_GOL_TRANSLATED_ACTION,
GFX_GOL_OBJ_HEADER *,
GFX_GOL_MESSAGE *
);

GFX_GOL_TEXTENTRY_KEYMEMBER Structure

Defines the structure used to describe a key in the Text Entry object.

File

gfx_gol_text_entry.h

C

```
typedef struct {
  uint16_t left;
  uint16_t top;
  uint16_t right;
  uint16_t bottom;
  uint16_t index;
  uint16_t state;
  bool update;
  GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE command;
  GFX_XCHAR * pKeyName;
  int16_t textWidth;
  int16_t textHeight;
  void * pNextKey;
} GFX_GOL_TEXTENTRY_KEYMEMBER;
```

Members

Members	Description
uint16_t left;	Left position of the key
uint16_t top;	Top position of the key
uint16_t right;	Right position of the key
uint16_t bottom;	Bottom position of the key
uint16_t index;	Index of the key in the list
uint16_t state;	State of the key. Either Pressed (GFX_GOL_TEXTENTRY_KEY_PRESSED_STATE) or Released (0)
bool update;	flag to indicate key is to be redrawn with the current state
GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE command;	Command of the key. Either GFX_GOL_TEXTENTRY_DELETE_COM, GFX_GOL_TEXTENTRY_SPACE_COM or GFX_GOL_TEXTENTRY_ENTER_COM.
GFX_XCHAR * pKeyName;	Pointer to the custom text assigned to the key. This is displayed over the face of the key.
int16_t textWidth;	Computed text width, done at creation. Used to predict size and position of text on the key face.
int16_t textHeight;	Computed text height, done at creation. Used to predict size and position of text on the key face.
void * pNextKey;	Pointer to the next key parameters.

Description

GFX GOL text entry key member structure.

Typedef: GFX_GOL_TEXTENTRY_KEYMEMBER

Defines the structure used to describe a key in the Text Entry object. Strings displayed on each key is assigned here as well as the commands if key is assigned a command key.

Remarks

None.

GFX_GOL_CUSTOMCONTROL_STATE Enumeration

Specifies the different states of the Custom Control object.

File

gfx_gol_custom_control.h

C

```
typedef enum {
  GFX_GOL_CUSTOMCONTROL_DISABLED_STATE,
  GFX_GOL_CUSTOMCONTROL_DRAW_BAR_STATE,
  GFX_GOL_CUSTOMCONTROL_DRAW_STATE,
  GFX_GOL_CUSTOMCONTROL_HIDE_STATE
} GFX_GOL_CUSTOMCONTROL_STATE;
```

Members

Members	Description
GFX_GOL_CUSTOMCONTROL_DISABLED_STATE	Property bit to indicate object is disabled.
GFX_GOL_CUSTOMCONTROL_DRAW_BAR_STATE	Draw bit to indicate focus must be redrawn.
GFX_GOL_CUSTOMCONTROL_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_CUSTOMCONTROL_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

GFX GOL custom control state.

Typedef: GFX_GOL_CUSTOMCONTROL_STATE

This enumeration specifies the different states of the Custom Control object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_CLIENT_STATUS Enumeration

Enumerated data type that identifies the GFX Module Client Status.

File

gfx_gol.h

C

```
typedef enum {
  GFX_GOL_CLIENT_STATUS_CLOSED,
  GFX_GOL_CLIENT_STATUS_READY
} GFX_GOL_CLIENT_STATUS;
```

Members

Members	Description
GFX_GOL_CLIENT_STATUS_CLOSED	Client is closed or the specified handle is invalid
GFX_GOL_CLIENT_STATUS_READY	Client is ready

Description

GFX GOL Client Status

This enumeration defines the possible status of the GFX Module Client.

Remarks

None.

GFX_GOL_OBJECT_TASK Enumeration

Lists the different states that GFX GOL task routine can have.

File

gfx_gol.h

C

```
typedef enum {
  GFX_GOL_TASK_STATE_OPEN_MODULE,
  GFX_GOL_TASK_STATE_RUNNING
} GFX_GOL_OBJECT_TASK;
```

Members

Members	Description
GFX_GOL_TASK_STATE_OPEN_MODULE	open module for client
GFX_GOL_TASK_STATE_RUNNING	run module for client

Description

GFX GOL task states

This enumeration lists the different states that GFX GOL task routine can have.

Remarks

None.

GFX_GOL_STATES Enumeration

Defines the various states that can be achieved by the GFX GOL operation.

File

gfx_gol.h

C

```
typedef enum {
  GFX_GOL_STATE_BUSY,
  GFX_GOL_STATE_INIT,
  GFX_GOL_STATE_INITIALIZED
} GFX_GOL_STATES;
```

Members

Members	Description
GFX_GOL_STATE_BUSY	Module state busy
GFX_GOL_STATE_INIT	Module state init
GFX_GOL_STATE_INITIALIZED	Module state initialized

Description

GFX GOL Machine States

This enumeration defines the various states that can be achieved by the GOL operation.

Remarks

None.

GFX_AT_SCAN_CODES Enumeration

The following macros are the supported AT Keyboard scan codes.

File

gfx_gol_scan_codes.h

C

```
typedef enum {
  SCAN_CR_PRESSED = 0x1C,
  SCAN_CR_RELEASED = 0x9C,
  SCAN_CRA_PRESSED = 0x2C,
  SCAN_CRA_RELEASED = 0xAC,
  SCAN_DEL_PRESSED = 0x53,
  SCAN_DEL_RELEASED = 0xD3,
  SCAN_BS_PRESSED = 0x0E,
  SCAN_BS_RELEASED = 0x8E,
  SCAN_TAB_PRESSED = 0x0F,
```

```
  SCAN_TAB_RELEASED = 0x8F,
  SCAN_HOME_PRESSED = 0x47,
  SCAN_HOME_RELEASED = 0xC7,
  SCAN_END_PRESSED = 0x4F,
  SCAN_END_RELEASED = 0xCF,
  SCAN_PGUP_PRESSED = 0x49,
  SCAN_PGUP_RELEASED = 0xC9,
  SCAN_PGDOWN_PRESSED = 0x51,
  SCAN_PGDOWN_RELEASED = 0xD1,
  SCAN_UP_PRESSED = 0x48,
  SCAN_UP_RELEASED = 0xC8,
  SCAN_DOWN_PRESSED = 0x50,
  SCAN_DOWN_RELEASED = 0xD0,
  SCAN_LEFT_PRESSED = 0x4B,
  SCAN_LEFT_RELEASED = 0xCB,
  SCAN_RIGHT_PRESSED = 0x4D,
  SCAN_RIGHT_RELEASED = 0xCD,
  SCAN_SPACE_PRESSED = 0x39,
  SCAN_SPACE_RELEASED = 0xB9
} GFX_AT_SCAN_CODES;
```

Members

Members	Description
SCAN_CR_PRESSED = 0x1C	Carriage return pressed.
SCAN_CR_RELEASED = 0x9C	Carriage return released.
SCAN_CRA_PRESSED = 0x2C	Carriage return alternate pressed.
SCAN_CRA_RELEASED = 0xAC	Carriage return alternate released.
SCAN_DEL_PRESSED = 0x53	Delete key pressed.
SCAN_DEL_RELEASED = 0xD3	Delete key released.
SCAN_BS_PRESSED = 0x0E	Back space key pressed.
SCAN_BS_RELEASED = 0x8E	Back space key released.
SCAN_TAB_PRESSED = 0x0F	Tab key pressed.
SCAN_TAB_RELEASED = 0x8F	Tab key released.
SCAN_HOME_PRESSED = 0x47	Home key pressed.
SCAN_HOME_RELEASED = 0xC7	Home key released.
SCAN_END_PRESSED = 0x4F	End key pressed.
SCAN_END_RELEASED = 0xCF	End key released.
SCAN_PGUP_PRESSED = 0x49	Page up key pressed.
SCAN_PGUP_RELEASED = 0xC9	Page up key released.
SCAN_PGDOWN_PRESSED = 0x51	Page down key pressed.
SCAN_PGDOWN_RELEASED = 0xD1	Page down key released.
SCAN_UP_PRESSED = 0x48	Up key pressed.
SCAN_UP_RELEASED = 0xC8	Up key released.
SCAN_DOWN_PRESSED = 0x50	Down key pressed.
SCAN_DOWN_RELEASED = 0xD0	Down key released.
SCAN_LEFT_PRESSED = 0x4B	Left key pressed.
SCAN_LEFT_RELEASED = 0xCB	Left key released.
SCAN_RIGHT_PRESSED = 0x4D	Right key pressed.
SCAN_RIGHT_RELEASED = 0xCD	Right key released.
SCAN_SPACE_PRESSED = 0x39	Space key pressed.
SCAN_SPACE_RELEASED = 0xB9	Space key released.

Description

GFX AT keyboard scan codes.

Typedef: GFX_AT_SCAN_CODES

The following macros are the supported AT Keyboard scan codes.

Remarks

None.

GFX_GOL_SURFACE Structure

Defines the structure used for the Surface object.

File

gfx_gol_surface.h

C

```
typedef struct {
  GFX_GOL_OBJ_HEADER hdr;
  uint16_t textHeight;
  GFX_XCHAR * pText;
  GFX_GOL_SURFACE_CALLBACK_FUNC callback;
  GFX_RESOURCE_HDR * pImage;
} GFX_GOL_SURFACE;
```

Members

Members	Description
GFX_GOL_OBJ_HEADER hdr;	Generic header for all Objects (see GFX_GOL_OBJ_HEADER).
uint16_t textHeight;	Precomputed text height
GFX_XCHAR * pText;	Pointer to the title text
GFX_GOL_SURFACE_CALLBACK_FUNC callback;	text alignment
GFX_RESOURCE_HDR * pImage;	Pointer to the image for the title bar

Description

Typedef: GFX_GOL_SURFACE

Defines the parameters required for a Surface object. Object is drawn with the defined shape parameters and values set on the given fields.

Remarks

None.

GFX_GOL_SURFACE_CALLBACK_FUNC Type

Surface callback function definition. This application defined function allows the application to perform application specific rendering.

File

gfx_gol_surface.h

C

```
typedef GFX_STATUS (* GFX_GOL_SURFACE_CALLBACK_FUNC)(void);
```

Returns

true - is returned when application rendering is done. false - is returned when application rendering is not yet finished.

Description

This callback function is implemented by the application. This is called inside the GFX_GOL_ObjectListDraw() function when the drawing of objects in the active list is completed.

Any application specific rendering must be performed on this callback function so no object rendering will be affected by the application calls to primitive rendering functions. Application setting the drawing color, line style, fill style, text string cursor position and current font will not affect the object rendering. This is also the safe place to modify the active list.

When the application has performed its own primitive rendering calls, this function must return true to inform the GFX_GOL_ObjectListDraw() that it is done rendering and checking for object drawing or redrawing can continue.

Preconditions

None.

Example

None.

Function

typedef GFX_STATUS (*GFX_GOL_SURFACE_CALLBACK_FUNC) (void);

GFX_GOL_SURFACE_STATE Enumeration

Specifies the different states of the Surface object.

File

gfx_gol_surface.h

C

```
typedef enum {
  GFX_GOL_SURFACE_FOCUSED_STATE,
  GFX_GOL_SURFACE_DISABLED_STATE,
  GFX_GOL_SURFACE_DRAW_APP_STATE,
  GFX_GOL_SURFACE_DRAW_CLIENT_STATE,
  GFX_GOL_SURFACE_DRAW_STATE,
  GFX_GOL_SURFACE_HIDE_STATE
} GFX_GOL_SURFACE_STATE;
```

Members

Members	Description
GFX_GOL_SURFACE_FOCUSED_STATE	Property bit for focus state.
GFX_GOL_SURFACE_DISABLED_STATE	Property bit for disabled state.
GFX_GOL_SURFACE_DRAW_APP_STATE	Draw bit to indicate title area must be redrawn.
GFX_GOL_SURFACE_DRAW_CLIENT_STATE	Draw bit to indicate client area must be redrawn.
GFX_GOL_SURFACE_DRAW_STATE	Draw bit to indicate object must be redrawn.
GFX_GOL_SURFACE_HIDE_STATE	Draw bit to indicate object must be removed from screen.

Description

Typedef: GFX_GOL_SURFACE_STATE

This enumeration specifies the different states of the Surface object used in the library.

For the Property State bits, more than one of these values may be OR'd together to create a complete property state.

For the Draw State bits, hide draw bit has higher priority than the draw bit. Any of these two can be combined with other draw bits to create a complete draw state.

To test a value of any of the state types, the bit of interest must be AND'ed with value and checked to see if the result is non-zero.

Remarks

None.

GFX_GOL_OBJ_SCHEME Structure

This structure specifies the style scheme components of an object.

File

gfx_gol_scheme.h

C

```
typedef struct {
  GFX_COLOR EmbossDkColor;
  GFX_COLOR EmbossLtColor;
  GFX_COLOR TextColor0;
  GFX_COLOR TextColor1;
  GFX_COLOR TextColorDisabled;
  GFX_COLOR Color0;
  GFX_COLOR Color1;
  GFX_COLOR ColorDisabled;
  GFX_RESOURCE_HDR * pFont;
  GFX_FILL_STYLE fillStyle;
  GFX_COLOR CommonBkColor;
  uint16_t CommonBkLeft;
  uint16_t CommonBkTop;
  GFX_BACKGROUND_TYPE CommonBkType;
  GFX_RESOURCE_HDR * pCommonBkImage;
  uint16_t AlphaValue;
  GFX_COLOR gradientStartColor;
  GFX_COLOR gradientEndColor;
```

```
  uint16_t EmbossSize;
} GFX_GOL_OBJ_SCHEME;
```

Members

Members	Description
GFX_COLOR EmbossDkColor;	Emboss dark color used for 3d effect.
GFX_COLOR EmbossLtColor;	Emboss light color used for 3d effect.
GFX_COLOR TextColor0;	Character color 0 used for objects that supports text.
GFX_COLOR TextColor1;	Character color 1 used for objects that supports text.
GFX_COLOR TextColorDisabled;	Character color used when object is in a disabled state.
GFX_COLOR Color0;	Color 0 usually assigned to an Object state.
GFX_COLOR Color1;	Color 1 usually assigned to an Object state.
GFX_COLOR ColorDisabled;	Color used when an Object is in a disabled state.
GFX_RESOURCE_HDR * pFont;	Font selected for the scheme.
GFX_FILL_STYLE fillStyle;	must be set to a gradient type when using gradient
GFX_COLOR CommonBkColor;	Background color used to hide Objects.
uint16_t CommonBkLeft;	Horizontal starting position of the background.
uint16_t CommonBkTop;	Vertical starting position of the background.
GFX_BACKGROUND_TYPE CommonBkType;	Specifies the type of background to use.
GFX_RESOURCE_HDR * pCommonBkImage;	Pointer to the background image used. Set this
uint16_t AlphaValue;	Alpha value used for alpha blending
GFX_COLOR gradientStartColor;	start color of the gradient fill
GFX_COLOR gradientEndColor;	end color of the gradient fill
uint16_t EmbossSize;	Emboss size of the panel for 3-D effect. Set to zero if not used.

Description

Typedef: GFX_GOL_OBJ_SCHEME

This structure specifies the style scheme components of an object. All objects will use the style scheme when rendering. Refer to specific object documentation on how the style scheme colors are utilized by the object.

The style scheme allows objects to show 3D effects as well as feedback to users. For example, in Button objects, a press and release effect on the Buttons are easily shown by manipulating the colors when the object is drawn with a pressed state and released state. The style scheme also allows effects such as gradients and alpha blending. When using alpha blending, the style scheme requires objects to be associated with background information.

A background can be a flat color background or an image. The usage of a background requires the background dimension to be larger than the object. In other words, the object should be drawn within the background dimension. Multiple objects can share a common background. As long as all the objects are drawn within the dimension of the background they can share a common background.

The supported background types are (See GFX_BACKGROUND_TYPE):

- GFX_BACKGROUND_COLOR - this type will set the common background to be a flat color. The color used is specified by CommonBkType.
- GFX_BACKGROUND_IMAGE - this type will set the common background to be an image. The image used is specified by pCommonBkImage.

When an object is associated with a background, it can be easily hidden or redrawn with some effects (for example alpha blending with the background). The background information allows the redrawing of the background with the object without the need to manually refreshing the background using primitive calls by the application.

Remarks

None.

GFX_GOL_SurfaceImageGet Macro

This function gets the image used.

File

gfx_gol_surface.h

C

```
#define GFX_GOL_SurfaceImageGet(pObject, pImage) \
                                (((GFX_GOL_SURFACE *)pObject)->pImage)
```

Returns

Pointer to the image resource.

Description

This function gets the image used.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.

Function

GFX_RESOURCE_HDR *GFX_GOL_SurfaceImageGet(
GFX_GOL_SURFACE *pObject)

GFX_GOL_SurfaceImageSet Macro

This function sets the image used in the object.

File

gfx_gol_surface.h

C

```
#define GFX_GOL_SurfaceImageSet(pObject, image) \
                                (((GFX_GOL_SURFACE *)pObject)->pImage = image)
```

Returns

None.

Description

This function sets the image used in the object.

Preconditions

Object must exist in memory.

Example

None.

Parameters

Parameters	Description
pObject	pointer to the object.
pImage	pointer to the image to be set.

Function

void GFX_GOL_SurfaceImageSet(
GFX_GOL_SURFACE *pObject,
GFX_RESOURCE_HDR *pImage)

System and Client Interfaces

Functions

	Name	Description
	GFX_Open	Opens the specified GFX library instance and returns a handle to it.
	GFX_Close	Closes a client instance of the GFX library.
	GFX_Initialize	Initialize the GFX Library.
	GFX_Deinitialize	Deinitializes the specified instance of the GFX Module.

	GFX_Status	Gets the current status of the GFX Module.
	GFX_Tasks	Maintains the GFX module state machine. It manages the GFX Module object list items and responds to GFX Module primitive events.
	GFX_GOL_Deinitialize	Deinitializes the specified instance of the GFX Module.
	GFX_GOL_Initialize	Initialize the GFX GOL Library.
	GFX_GOL_Open	opens an instance of the GFX GOL Library.
	GFX_GOL_Tasks	Maintains the GFX GOL module state machine. It manages the GFX Module object list items and responds to GFX Module primitive events.
	GFX_GOL_PreemptionLevelGet	This function returns the current preemption level.
	ImageDecoderInit	This function initializes the global variables to 0 and then initializes the driver. This must be called once before any other function of the library is called
	ImageDecodeTask	This function completes one small part of the image decode function
	ImageDecode	This function decodes and displays the image on the screen
	ImageLoopCallbackRegister	This function registers the loop callback function so that the decoder calls this function in every decoding loop. This can be used by the application program to do maintenance activities such as fetching data, updating the display, etc...
	IMG_vSetboundaries	
	ImageDecoderParceHeader	This is function ImageDecoderParceHeader.
	ImagePixelIntoArray	This is function ImagePixelIntoArray.
	ImagePixelOutput	This is function ImagePixelOutput.
	ImageRegisterFrameCompleteCallback	This is function ImageRegisterFrameCompleteCallback.
	ImageRegisterImageCompleteCallback	Function prototypes
	ImageRegisterImageFailCallback	This is function ImageRegisterImageFailCallback.

Data Types and Constants

	Name	Description
	GFX_FONT_GLYPH_ENTRY	The structure describing the glyph entry in fonts.
	GFX_FONT_GLYPH_ENTRY_EXTENDED	The structure describing the intended glyph entry in fonts.
	GFX_FONT_HEADER	The structure used to define the font header.
	GFX_MCHP_BITMAP_HEADER	The structure used to define the Microchip bitmap header.
	GFX_PARTIAL_IMAGE_PARAM	Partial Image information structure.
	GFX_RECTANGULAR_AREA	A generic rectangular area structure.
	GFX_RESOURCE	Specifies the different resource types in the library.
	GFX_RESOURCE_BINARY	Defines the structure used for the binary type resource.
	GFX_RESOURCE_FONT	Defines the structure used for the font type resource.
	GFX_RESOURCE_HDR	Defines the structure used for the resource types.
	GFX_RESOURCE_IMAGE	Defines the structure used for the image type resource.
	GFX_RESOURCE_PALETTE	Defines the structure used for the palette type resource.
	GFX_STATUS	Rendering status.
	GFX_STATUS_BIT	Additional rendering status.
	int16_gfx_image_prog	This is type int16_gfx_image_prog.
	int32_gfx_image_prog	This is type int32_gfx_image_prog.
	int8_gfx_image_prog	This is type int8_gfx_image_prog.
	uint16_gfx_image_prog	This is type uint16_gfx_image_prog.
	uint32_gfx_image_prog	This is type uint32_gfx_image_prog.
	uint8_gfx_image_prog	GFX Image data Types
	GFX_ALIGNMENT	Summary of the different text alignment supported in the library.
	GFX_BACKGROUND	Background information structure.
	GFX_BACKGROUND_TYPE	Specifies the different background fill types.
	GFX_DOUBLE_BUFFERING_MODE	Structure used for double buffering management.
	GFX_FEATURE_STATUS	States of a feature that can be enabled/disabled at run time.
	GFX_FILL_STYLE	Specifies the available fill styles.
	GFX_FONT_ANTIALIAS_TYPE	Summary of the transparency types in text anti-aliasing.
	GFX_FONT_SPACE	Font space section. The fonts can be located in psv (constant) or program space in PIC24/dsPIC MCUs. This define allows for switching of the pointer type used to access the font structure in memory See: GraphicsConfig.h for the application define.
	GFX_UXCHAR	This is macro GFX_UXCHAR.

	GFX_XCHAR	Configuration for the text character size.
	GRAPHICS_LIBRARY_VERSION	////////////////// GRAPHICS_LIBRARY_VERSION ////////////////////// MSB is version, LSB is subversion
	GFX_COMP_MASK	This is macro GFX_COMP_MASK.
	GFX_MEM_MASK	This is macro GFX_MEM_MASK.
	GFX_TYPE_MASK	This is macro GFX_TYPE_MASK.
	MCHP_BITMAP_NORMAL	no compression, palette is present for color depth = 8, 4 and 1 BPP
	MCHP_BITMAP_PALETTE_STR	palette is provided as a separate object (see PALETTE_HEADER) for color depth = 8, 4, and 1 BPP, ID to the palette is embedded in the bitmap.
	int16_prog	This is type int16_prog.
	int16_prog_pack	This is type int16_prog_pack.
	int32_prog	This is type int32_prog.
	int32_prog_pack	This is type int32_prog_pack.
	int8_prog	This is type int8_prog.
	int8_prog_pack	This is type int8_prog_pack.
	uint16_prog	This is type uint16_prog.
	uint16_prog_pack	This is type uint16_prog_pack.
	uint32_prog	This is type uint32_prog.
	uint32_prog_pack	This is type uint32_prog_pack.
	uint8_prog	General program space data types
	uint8_prog_pack	This is type uint8_prog_pack.
	GFX_CLIENT_OBJ	GFX client object structure.
	GFX_CLIENT_STATUS	Enumerated data type that identifies the GFX Module Client Status.
	GFX_OBJ	Defines the object required for interaction with the GFX Library.
	GFX_OBJECT_TASK	Lists the different states that GFX task routine can have.
	GFX_STATES	Defines the various states that can be achieved by the GFX operation.
	_IMG_FILE_FORMAT	IMG_ImageFileFormat specifies all the supported image file formats
	_IMG_FILE_SYSTEM_API	IMG_FileSystemAPI holds function pointers to the used File System APIs
	_IMG_PIXEL_XY_RGB_888	IMG_PixelRgb holds the RGB information of a pixel in BYTES
	FileFeof	This is type FileFeof.
	FileRead	Typedefs of the used File System APIs
	FileSeek	This is type FileSeek.
	FileTell	This is type FileTell.
	IMG_FILE_FORMAT	IMG_ImageFileFormat specifies all the supported image file formats
	IMG_FILE_SYSTEM_API	IMG_FileSystemAPI holds function pointers to the used File System APIs
	IMG_LOOP_CALLBACK	IMG_LoopCallback is a callback function which is called in every loop of the decoding cycle so that user application can do some maintenance activities
	IMG_PIXEL_OUTPUT	IMG_PixelOutput is a callback function which receives the color information of the output pixel
	IMG_PIXEL_XY_RGB_888	IMG_PixelRgb holds the RGB information of a pixel in BYTES
	__IMAGEDECODER_H__	This is macro __IMAGEDECODER_H__.
	_PutPixel	This is macro _PutPixel.
	ImageAbort	This function sets the Image Decoder's Abort flag so that decoding aborts in the next decoding loop.
	ImageFullScreenDecode	This function decodes and displays the image on the screen in fullscreen mode with center aligned and downscaled if required
	IMG_ALIGN_CENTER	Flags
	IMG_DECODE_ABORTED	This is macro IMG_DECODE_ABORTED.
	IMG_DOWN_SCALE	This is macro IMG_DOWN_SCALE.
	IMG_FEOF	This is macro IMG_FEOF.
	IMG_FILE	This is macro IMG_FILE.
	IMG_FREAD	This is macro IMG_FREAD.
	IMG_FSEEK	This is macro IMG_FSEEK.
	IMG_FTELL	This is macro IMG_FTELL.
	IMG_SCREEN_HEIGHT	This is macro IMG_SCREEN_HEIGHT.
	IMG_SCREEN_WIDTH	The individual image decoders use these defines instead of directly using those provided in the Display driver file

	IMG_vCheckAndAbort	This is macro IMG_vCheckAndAbort.
	IMG_vLoopCallback	This is macro IMG_vLoopCallback.
	IMG_vPutPixel	This is macro IMG_vPutPixel.
	GFX_PALETTE_ENTRY	Defines the union used for each entry in the palette table.
	GFX_TEXT_CURSOR_TYPE	Enumeration defines types of text cursor supported.
	IMG_LOOP_FRAMECOMPLETE	IMG_FrameCompleteCallback is a callback function which is called at completion decoding current frame so that user application can do some activities
	IMG_LOOP_IMAGECOMPLETE	IMG_FrameCompleteCallback is a callback function which is called at completion decoding current frame so that user application can do some activities
	IMG_LOOP_IMAGEFAIL	IMG_FrameCompleteCallback is a callback function which is called at completion decoding current frame so that user application can do some activities
	IMG_vFrameComplete	This is macro IMG_vFrameComplete.
	IMG_vImageComplete	This is macro IMG_vImageComplete.
	IMG_vImageFail	This is macro IMG_vImageFail.
	IMG_vPixelArray	This is macro IMG_vPixelArray.
	IMG_vSetColor	This is macro IMG_vSetColor.

Description

This section describes the Graphics Library System and Client API.

Functions

GFX_Open Function

Opens the specified GFX library instance and returns a handle to it.

File

gfx.h

C

```
GFX_HANDLE GFX_Open(SYS_MODULE_OBJ gfxObject);
```

Returns

If successful, the function returns a valid open instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is GFX_HANDLE_INVALID.

Description

This function opens the specified GFX library instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The handle returned is valid until the GFX_Close function is called.

Preconditions

The GFX_Initialize function must have been called before calling this function.

Example

```
GFX_HANDLE  handle;

handle = GFX_Open ( gfxObject );

if ( GFX_HANDLE_INVALID == handle )
{
    // Unable to open the library
}
```

Parameters

Parameters	Description
object	Identifier for the object instance to be opened

Function

GFX_HANDLE GFX_Open(SYS_MODULE_OBJ gfxObject)

GFX_Close Function

Closes a client instance of the GFX library.

File

gfx.h

C

```
void GFX_Close(GFX_HANDLE gfxHandle);
```

Returns

None

Description

This routine closes a client instance of the GFX library.

Preconditions

The GFX_Open routine must have been called for the specified handle.

Example

```
GFX_HANDLE handle;  // Returned from GFX_Open

GFX_Close(handle);
```

Parameters

Parameters	Description
handle	A valid handle, returned from the open routine

Function

void GFX_Close(GFX_HANDLE handle)

GFX_Initialize Function

Initialize the GFX Library.

File

gfx.h

C

```
SYS_MODULE_OBJ GFX_Initialize(const SYS_MODULE_INDEX moduleIndex, const SYS_MODULE_INIT * const moduleInit);
```

Returns

If successful, returns a valid handle to a device layer object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initialize the GFX Library primitive layer and Object Layer if enabled. The following default settings are set when this function is called.

1. font - Set to NULL. GFX_FontSet() must be called prior to any text rendering.
2. line type - Set to GFX_LINE_TYPE_THIN_SOLID (see GFX_LINE_STYLE).
3. fill type - Set to GFX_FILL_TYPE_COLOR (see GFX_FILL_STYLE).
4. text anti-alias type - Set to GFX_FONT_ANTIALIAS_OPAQUE (see GFX_FONT_ANTIALIAS_TYPE). This only affects fonts with anti-aliasing enabled.
5. Set transparent color feature in image draw functions to be disabled.
6. Set alpha blending value to 100 (or no alpha blending) if alpha blending feature is enabled.
7. Set background information to no background.

This function does not clear the screen and does not assign any color to the currently set color. Application should set the color and clear the screen.

Remarks

This routine must be called before other GFX library functions.

Preconditions

None.

Example

```
GFX_INIT gfxInit;
SYS_MODULE_OBJ gfxObj;

// GFX Module initialization
gfxObj = GFX_Initialize(GFX_INDEX_0, &gfxInit);

if (SYS_MODULE_OBJ_INVALID == gfxObj)
{
    // Handle error
}
```

Parameters

Parameters	Description
moduleIndex	client instance request.
moduleInit	initialization data for the instance.

Function

void GFX_Initialize (const SYS_MODULE_INDEX moduleIndex,
const SYS_MODULE_INIT * const moduleInit);

GFX_Deinitialize Function

Deinitializes the specified instance of the GFX Module.

File

gfx.h

C

```
void GFX_Deinitialize(SYS_MODULE_OBJ moduleObject);
```

Returns

None.

Description

Deinitializes the specified instance of the GFX Module. This function will also deinitialize the GOL, PRIMITIVE, and driver and conclude all GFX related operations. All internal data structures will be reset.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This routine will NEVER block waiting for hardware.

Preconditions

Function GFX_Deinitialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from GFX_Initialize
SYS_STATUS          status;

GFX_Deinitialize(object);

status = GFX_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
```

```
}
```

Parameters

Parameters	Description
object	GFX layer object handle, returned from the GFX_Initialize routine

Function

void GFX_Deinitialize(SYS_MODULE_OBJ object)

GFX_Status Function

Gets the current status of the GFX Module.

File

gfx.h

C

```
SYS_STATUS GFX_Status(SYS_MODULE_OBJ gfxObject);
```

Returns

SYS_STATUS_READY - Indicates that the GFX layer is ready for operations.

SYS_STATUS_DEINITIALIZED - Indicates that the driver has been deinitialized.

Description

This routine provides the current status of the GFX Module.

Remarks

None.

Preconditions

Function GFX_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_INDEX    index;     // Returned from GFX_Initialize
SYS_STATUS          status;

status = GFX_Status (object);
if (SYS_STATUS_READY == status)
{
    // This means the library can be used, using for example
    // GFX_DrawLine() function.
}
```

Parameters

Parameters	Description
object	GFX object index, returned from the GFX_Initialize routine

Function

SYS_STATUS GFX_Status (SYS_MODULE_OBJ gfxObject)

GFX_Tasks Function

Maintains the GFX module state machine. It manages the GFX Module object list items and responds to GFX Module primitive events.

File

gfx.h

C

```
void GFX_Tasks(SYS_MODULE_OBJ gfxObject);
```

Returns

None.

Description

Maintains the GFX module state machine. It manages the GFX Module object list items and responds to GFX Module primitive events. This function should be called from the SYS_Tasks() function.

Remarks

This routine is normally not called directly by an application.

Preconditions

None.

Example

```
while (true)
{
    GFX_Tasks (GFX_INDEX_0);

    // Do other tasks
}
```

Parameters

Parameters	Description
index	Object index for the specified module instance.

Function

void GFX_Tasks (SYS_MODULE_INDEX index);

GFX_GOL_Deinitialize Function

Deinitializes the specified instance of the GFX Module.

File

gfx_gol.h

C

```
void GFX_GOL_Deinitialize(SYS_MODULE_OBJ moduleObject);
```

Returns

None.

Description

Deinitializes the specified instance of the GFX Module. All internal data structures will be reset.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This routine will NEVER block waiting for hardware.

Preconditions

Function GFX_GOL_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from GFX_GOL_Initialize
SYS_STATUS          status;

GFX_GOL_Deinitialize(object);

status = GFX_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	GFX layer object handle, returned from the GFX_GOL_Initialize routine

Function

void GFX_GOL_Deinitialize(SYS_MODULE_OBJ object)

GFX_GOL_Initialize Function

Initialize the GFX GOL Library.

File

gfx_gol.h

C

```
SYS_MODULE_OBJ GFX_GOL_Initialize(const SYS_MODULE_INDEX moduleIndex, const SYS_MODULE_INIT * const moduleInit);
```

Returns

If successful, returns a valid handle to a device layer object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initialize the GFX Library GOL layer. The following default settings are set when this function is called.

1. font -

Remarks

This routine must be called before other GFX library functions.

Preconditions

None.

Example

```
GFX_INIT gfxInit;
SYS_MODULE_OBJ gfxObj;

// GFX Module initialization
gfxObj = GFX_GOL_Initialize(GFX_INDEX_0, &gfxInit);

if (SYS_MODULE_OBJ_INVALID == gfxObj)
{
    // Handle error
}
```

Parameters

Parameters	Description
moduleIndex	client instance request.
moduleInit	initialization data for the instance.

Function

void GFX_GOL_Initialize (const SYS_MODULE_INDEX moduleIndex,
const SYS_MODULE_INIT * const moduleInit);

GFX_GOL_Open Function

opens an instance of the GFX GOL Library.

File

gfx_gol.h

C

```
GFX_HANDLE GFX_GOL_Open(const SYS_MODULE_INDEX index);
```

Function

GFX_HANDLE GFX_GOL_Open(const SYS_MODULE_INDEX index)

GFX_GOL_Tasks Function

Maintains the GFX GOL module state machine. It manages the GFX Module object list items and responds to GFX Module primitive events.

File

gfx_gol.h

C

```
void GFX_GOL_Tasks(SYS_MODULE_INDEX index);
```

Returns

None.

Description

Maintains the GFX module state machine. It manages the GFX Module object list items and responds to GFX Module primitive events. This function should be called from the SYS_Tasks() function.

Remarks

This routine is normally not called directly by an application.

Preconditions

None.

Example

```
while (true)
{
    GFX_GOL_Tasks (GFX_INDEX_0);

    // Do other tasks
}
```

Parameters

Parameters	Description
index	Object index for the specified module instance.

Function

void GFX_GOL_Tasks (SYS_MODULE_INDEX index);

GFX_GOL_PreemptionLevelGet Function

This function returns the current preemption level.

File

gfx_gol.h

C

```
GFX_PREEMPTION_LEVEL GFX_GOL_PreemptionLevelGet(SYS_MODULE_INDEX gfxIndex);
```

Returns

The current preemption level.

Description

GFX GOL Preemption level get

This function returns the current preemption level.

Preconditions

None.

Parameters

Parameters	Description
gfxIndex	Object index for the specified module instance.

Function

GFX_PREEMPTION_LEVEL GFX_GOL_PreemptionLevelGet (
SYS_MODULE_INDEX gfxIndex)

ImageDecoderInit Function

File

gfx_image_decoder.h

C

```
void ImageDecoderInit();
```

Side Effects

The graphics driver will be reset

Returns

None

Description

This function initializes the global variables to 0 and then initializes the driver. This must be called once before any other function of the library is called

Example

```
  void main(void)
{
    ImageInit();
    ...
}
```

Function

void ImageDecoderInit(void)

ImageDecodeTask Function

File

gfx_image_decoder.h

C

```
uint8_t ImageDecodeTask();
```

Side Effects

None

Returns

Status code - '1' means decoding is completed

- '0' means decoding is not yet completed, call this function again

Description

This function completes one small part of the image decode function

Example

```
      IMG_bFullScreenDecode(pImageFile, IMG_JPEG, NULL, NULL);
    while(!ImageDecodeTask());
```

Function

uint8_t ImageDecodeTask(void)

ImageDecode Function

File

gfx_image_decoder.h

C

```
uint8_t ImageDecode(IMG_FILE * pImageFile, IMG_FILE_FORMAT eImgFormat, uint16_t wStartx, uint16_t wStarty,
uint16_t wWidth, uint16_t wHeight, uint16_t wFlags, IMG_FILE_SYSTEM_API * pFileAPIs, IMG_PIXEL_OUTPUT
pPixelOutput);
```

Side Effects

None

Returns

Error code -> 0 means no error

Description

This function decodes and displays the image on the screen

Example

```
void main(void)
{
   IMG_FILE pImageFile;
   IMG_vInitialize();
   pImageFile = IMG_FOPEN("Image.jpg", "r");
   if(pImageFile == NULL)
   {
         <- Error handling ->
   }
   IMG_bDecode(pImageFile, IMG_JPEG, 0, 0, 320, 240, 0, NULL, NULL);
   IMG_FCLOSE(pImageFile);
   while(1);
}
```

Function

uint8_t ImageDecode(IMG_FILE *pImageFile, IMG_FILE_FORMAT eImgFormat, uint16_t wStartx, uint16_t wStarty, uint16_t wWidth, uint16_t wHeight, uint16_t wFlags, IMG_FILE_SYSTEM_API *pFileAPIs, IMG_PIXEL_OUTPUT pPixelOutput)

ImageLoopCallbackRegister Function

File

gfx_image_decoder.h

C

```
void ImageLoopCallbackRegister(IMG_LOOP_CALLBACK pFn);
```

Side Effects

The graphics driver will be reset

Returns

None

Description

This function registers the loop callback function so that the decoder calls this function in every decoding loop. This can be used by the application program to do maintenance activities such as fetching data, updating the display, etc...

Example

```
  void Mainantance(void)
{
```

```
    ...
}

void main(void)
{
    ImageInit();
    ImageLoopCallbackRegister(Mainantance);
    ...
}
```

Function

void ImageLoopCallbackRegister(IMG_LOOP_CALLBACK pLoopCallbackFn)

IMG_vSetboundaries Function

File

gfx_image_decoder.h

C

```
void IMG_vSetboundaries();
```

Description

******* This is not for the user *******

This is used by the individual decoders

ImageDecoderParceHeader Function

File

gfx_image_decoder.h

C

```
int8_t ImageDecoderParceHeader(IMG_FILE * pImageFile, GFX_RESOURCE_HDR* header, GFX_RESOURCE source);
```

Description

This is function ImageDecoderParceHeader.

ImagePixelIntoArray Function

File

gfx_image_decoder.h

C

```
void ImagePixelIntoArray(IMG_PIXEL_XY_RGB_888 * pPix);
```

Description

This is function ImagePixelIntoArray.

ImagePixelOutput Function

File

gfx_image_decoder.h

C

```
void ImagePixelOutput(IMG_PIXEL_XY_RGB_888 * pPix);
```

Description

This is function ImagePixelOutput.

ImageRegisterFrameCompleteCallback Function

File

gfx_image_decoder.h

C

```
void ImageRegisterFrameCompleteCallback(void* callbackFn);
```

Description

This is function ImageRegisterFrameCompleteCallback.

ImageRegisterImageCompleteCallback Function

File

gfx_image_decoder.h

C

```
void ImageRegisterImageCompleteCallback(void* callbackFn);
```

Description

Function prototypes

ImageRegisterImageFailCallback Function

File

gfx_image_decoder.h

C

```
void ImageRegisterImageFailCallback(void* callbackFn);
```

Description

This is function ImageRegisterImageFailCallback.

Data Types and Constants

GFX_FONT_GLYPH_ENTRY Structure

The structure describing the glyph entry in fonts.

File

gfx_types_font.h

C

```
typedef struct {
  uint8_t width;
  uint8_t offsetLSB;
  uint16_t offsetMSB;
} GFX_FONT_GLYPH_ENTRY;
```

Members

Members	Description
uint8_t width;	The width of the glyph.
uint8_t offsetLSB;	The least Significant byte of the glyph location offset.
uint16_t offsetMSB;	The most Significant (2) bytes of the glyph location offset.

Description

Typedef: GFX_FONT_GLYPH_ENTRY

Each character's bitmap (or glyph) in a font is described by its glyph entry structure. The entry will define the width and the offset of the character

glyph from the header of the font table.

Remarks

None.

GFX_FONT_GLYPH_ENTRY_EXTENDED Structure

The structure describing the intended glyph entry in fonts.

File

gfx_types_font.h

C

```
typedef struct {
  uint32_t offset;
  uint16_t cursorAdvance;
  uint16_t glyphWidth;
  int16_t xAdjust;
  int16_t yAdjust;
} GFX_FONT_GLYPH_ENTRY_EXTENDED;
```

Members

Members	Description
uint32_t offset;	The offset of the glyph. The offset order is: LSW_LSB LSW_MSB MSW_MSB MSW_MSB.
uint16_t cursorAdvance;	The x-value by which cursor has to advance after rendering the glyph.
uint16_t glyphWidth;	The width of the glyph.
int16_t xAdjust;	The value that adjusts the x-position.
int16_t yAdjust;	The value that adjusts the y-position.

Description

Typedef: GFX_FONT_GLYPH_ENTRY_EXTENDED

Similar to the GFX_FONT_GLYPH_ENTRY, each character's glyph in a font that supports intended characters is also described by its glyph entry structure. The difference is that the extended glyph entry will contain additional information on how the characters are overlapped.

Remarks

None.

GFX_FONT_HEADER Structure

The structure used to define the font header.

File

gfx_types_font.h

C

```
typedef struct {
  uint8_t fontID;
  uint8_t extendedGlyphEntry : 1;
  uint8_t res1 : 1;
  uint8_t bpp : 2;
  uint8_t orientation : 2;
  uint8_t res2 : 2;
  uint16_t firstChar;
  uint16_t lastChar;
  uint16_t height;
} GFX_FONT_HEADER;
```

Members

Members	Description
uint8_t fontID;	User assigned value
uint8_t extendedGlyphEntry : 1;	Extended Glyph entry flag. When set font has extended glyph feature enabled.
uint8_t res1 : 1;	Reserved for future use (must be set to 0)

uint8_t bpp : 2;	Actual BPP = 2^{bpp} • 0 - 1 BPP • 1 - 2 BPP • 2 - 4 BPP • 3 - 8 BPP
uint8_t orientation : 2;	Orientation of the character glyphs (0,90,180,270 degrees) • 00 - Normal • 01 - Characters rotated 270 degrees clockwise • 10 - Characters rotated 180 degrees • 11 - Characters rotated 90 degrees clockwise
uint8_t res2 : 2;	Reserved for future use (must be set to 0).
uint16_t firstChar;	Character code of first character (e.g. 32).
uint16_t lastChar;	Character code of last character in font (e.g. 3006).
uint16_t height;	Font characters height in pixels.

Description

Typedef: GFX_FONT_HEADER

The structure used to define the font header.

Remarks

None.

GFX_MCHP_BITMAP_HEADER Structure

The structure used to define the Microchip bitmap header.

File

gfx_types_image.h

C

```
typedef struct {
  uint8_t bitmapType;
  uint8_t colorDepth;
  int16_t height;
  int16_t width;
} GFX_MCHP_BITMAP_HEADER;
```

Members

Members	Description
uint8_t bitmapType;	type of image, information on how to render the image 0 - no compression, palette is present for color depth = 8, 4 and 1 BPP 1 - palette is provided as a separate object (see PALETTE_HEADER) for color depth = 8, 4, and 1 BPP, ID to the palette is embedded in the bitmap.
uint8_t colorDepth;	Color depth used
int16_t height;	Image height
int16_t width;	Image width

Description

Typedef: GFX_MCHP_BITMAP_HEADER

The structure used to define the Microchip bitmap header.

Remarks

None.

GFX_PARTIAL_IMAGE_PARAM Structure

Partial Image information structure.

File

gfx_types_macros.h

C

```
typedef struct {
  uint16_t width;
  uint16_t height;
  uint16_t xoffset;
  uint16_t yoffset;
} GFX_PARTIAL_IMAGE_PARAM;
```

Members

Members	Description
uint16_t width;	Partial Image width.
uint16_t height;	Partial Image height.
uint16_t xoffset;	xoffset of the partial image (with respect to the image horizontal origin).
uint16_t yoffset;	yoffset of the partial image (with respect to the image vertical origin).

Description

Typedef: GFX_PARTIAL_IMAGE_PARAM

Structure describing the partial image area to be rendered.

Remarks

None.

GFX_RECTANGULAR_AREA Structure

A generic rectangular area structure.

File

gfx_types_macros.h

C

```
typedef struct {
  uint16_t left;
  uint16_t top;
  uint16_t right;
  uint16_t bottom;
} GFX_RECTANGULAR_AREA;
```

Members

Members	Description
uint16_t left;	left most pixel of the area.
uint16_t top;	top most pixel of the area.
uint16_t right;	right most pixel of the area.
uint16_t bottom;	bottom most pixel of the area.

Description

Typedef: GFX_RECTANGULAR_AREA

Structure describing a generic rectangular area defined by the left,top and right,bottom points on the frame buffer.

Remarks

None.

GFX_RESOURCE Enumeration

Specifies the different resource types in the library.

File

gfx_types_resource.h

C

```
typedef enum {
  GFX_RESOURCE_MEMORY_FLASH,
  GFX_RESOURCE_MEMORY_EXTERNAL,
```

```
  GFX_RESOURCE_MEMORY_FS,
  GFX_RESOURCE_MEMORY_RAM,
  GFX_RESOURCE_MEMORY_EDS_EPMP,
  GFX_RESOURCE_TYPE_MCHP_MBITMAP,
  GFX_RESOURCE_TYPE_JPEG,
  GFX_RESOURCE_TYPE_BINARY,
  GFX_RESOURCE_TYPE_FONT,
  GFX_RESOURCE_TYPE_PALETTE,
  GFX_RESOURCE_TYPE_BMP,
  GFX_RESOURCE_TYPE_GIF,
  GFX_RESOURCE_COMP_NONE,
  GFX_RESOURCE_COMP_RLE,
  GFX_RESOURCE_COMP_IPU,
  GFX_RESOURCE_MCHP_MBITMAP_FLASH_NONE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_FLASH |
GFX_RESOURCE_COMP_NONE),
  GFX_RESOURCE_MCHP_MBITMAP_FLASH_RLE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_FLASH |
GFX_RESOURCE_COMP_RLE),
  GFX_RESOURCE_MCHP_MBITMAP_FLASH_IPU = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_FLASH |
GFX_RESOURCE_COMP_IPU),
  GFX_RESOURCE_MCHP_MBITMAP_EXTERNAL_NONE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EXTERNAL
| GFX_RESOURCE_COMP_NONE),
  GFX_RESOURCE_MCHP_MBITMAP_EXTERNAL_RLE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EXTERNAL |
GFX_RESOURCE_COMP_RLE),
  GFX_RESOURCE_MCHP_MBITMAP_EXTERNAL_IPU = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EXTERNAL |
GFX_RESOURCE_COMP_IPU),
  GFX_RESOURCE_MCHP_MBITMAP_EDS_EPMP_NONE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EDS_EPMP
| GFX_RESOURCE_COMP_NONE),
  GFX_RESOURCE_MCHP_MBITMAP_EDS_EPMP_RLE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EDS_EPMP |
GFX_RESOURCE_COMP_RLE),
  GFX_RESOURCE_MCHP_MBITMAP_EDS_EPMP_IPU = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EDS_EPMP |
GFX_RESOURCE_COMP_IPU),
  GFX_RESOURCE_JPEG_FLASH_NONE = (GFX_RESOURCE_TYPE_JPEG | GFX_RESOURCE_MEMORY_FLASH |
GFX_RESOURCE_COMP_NONE),
  GFX_RESOURCE_JPEG_EXTERNAL_NONE = (GFX_RESOURCE_TYPE_JPEG | GFX_RESOURCE_MEMORY_EXTERNAL |
GFX_RESOURCE_COMP_NONE),

  GFX_RESOURCE_PALETTE_EXTERNAL_NONE = (GFX_RESOURCE_TYPE_PALETTE | GFX_RESOURCE_MEMORY_EXTERNAL |
GFX_RESOURCE_COMP_NONE),
```

```
  GFX_RESOURCE_PALETTE_RAM_NONE = (GFX_RESOURCE_TYPE_PALETTE | GFX_RESOURCE_MEMORY_RAM |
GFX_RESOURCE_COMP_NONE)
} GFX_RESOURCE;
```

Members

Members	Description
GFX_RESOURCE_MEMORY_FLASH	A location type: Internal flash memory.
GFX_RESOURCE_MEMORY_EXTERNAL	A location type: External memory.
GFX_RESOURCE_MEMORY_FS	A location type: External memory vis File System.
GFX_RESOURCE_MEMORY_RAM	A location type: Random Access Memory (RAM).
GFX_RESOURCE_MEMORY_EDS_EPMP	A location type: Resource is external and accessed through Enhanced Parallel Master Port (EPMP), memory size and base addresses are are set in the configuration.
GFX_RESOURCE_TYPE_MCHP_MBITMAP	A data type: Microchip bitmap type of resource.
GFX_RESOURCE_TYPE_JPEG	A data type: Image of type JPEG.
GFX_RESOURCE_TYPE_BINARY	A data type: Binary data type.
GFX_RESOURCE_TYPE_FONT	A data type: Font type of data
GFX_RESOURCE_TYPE_PALETTE	A data type: Palette type of data
GFX_RESOURCE_TYPE_BMP	A data type: Image of type BMP.
GFX_RESOURCE_COMP_NONE	A compression type: Data resource has no compression.
GFX_RESOURCE_COMP_RLE	A compression type: Data resource is compressed with RLE.
GFX_RESOURCE_COMP_IPU	A compression type: Data resource compressed with DEFLATE algorithm (for IPU).
GFX_RESOURCE_MCHP_MBITMAP_FLASH_NONE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_FLASH | GFX_RESOURCE_COMP_NONE)	These are common resource combinations used by the graphics library Microchip bitmap image type, located in flash and no compression.
GFX_RESOURCE_MCHP_MBITMAP_FLASH_RLE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_FLASH | GFX_RESOURCE_COMP_RLE)	Microchip bitmap image type, located in flash and RLE compressed.
GFX_RESOURCE_MCHP_MBITMAP_FLASH_IPU = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_FLASH | GFX_RESOURCE_COMP_IPU)	Microchip bitmap image type, located in flash and compressed for IPU
GFX_RESOURCE_MCHP_MBITMAP_EXTERNAL_NONE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_NONE)	Microchip bitmap image type, located in external memory and no compression.
GFX_RESOURCE_MCHP_MBITMAP_EXTERNAL_RLE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_RLE)	Microchip bitmap image type, located in external memory and RLE compressed.
GFX_RESOURCE_MCHP_MBITMAP_EXTERNAL_IPU = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_IPU)	Microchip bitmap image type, located in external memory and compressed for IPU.
GFX_RESOURCE_MCHP_MBITMAP_EDS_EPMP_NONE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EDS_EPMP | GFX_RESOURCE_COMP_NONE)	Microchip bitmap image type, located in EDS memory and no compression.
GFX_RESOURCE_MCHP_MBITMAP_EDS_EPMP_RLE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EDS_EPMP | GFX_RESOURCE_COMP_RLE)	Microchip bitmap image type, located in EDS memory and RLE compressed.
GFX_RESOURCE_MCHP_MBITMAP_EDS_EPMP_IPU = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EDS_EPMP | GFX_RESOURCE_COMP_IPU)	Microchip bitmap image type, located in EDS memory and compressed for IPU.
GFX_RESOURCE_JPEG_FLASH_NONE = (GFX_RESOURCE_TYPE_JPEG | GFX_RESOURCE_MEMORY_FLASH | GFX_RESOURCE_COMP_NONE)	JPEG image type, located in flash and no compression.

GFX_RESOURCE_JPEG_EXTERNAL_NONE = (GFX_RESOURCE_TYPE_JPEG | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_NONE)	JPEG image type, located in external memory no compression.
GFX_RESOURCE_JPEG_FS_NONE = (GFX_RESOURCE_TYPE_JPEG | GFX_RESOURCE_MEMORY_FS | GFX_RESOURCE_COMP_NONE)	JPEG image type, located in file system no compression.
GFX_RESOURCE_JPEG_EDS_EPMP_NONE = (GFX_RESOURCE_TYPE_JPEG | GFX_RESOURCE_MEMORY_EDS_EPMP | GFX_RESOURCE_COMP_NONE)	JPEG image type, located in EDS memory and no compression.
GFX_RESOURCE_BMP_FLASH_NONE = (GFX_RESOURCE_TYPE_BMP | GFX_RESOURCE_MEMORY_FLASH | GFX_RESOURCE_COMP_NONE)	BMP image type, located in flash and no compression.
GFX_RESOURCE_BMP_EXTERNAL_NONE = (GFX_RESOURCE_TYPE_BMP | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_NONE)	BMP image type, located in external memory no compression.
GFX_RESOURCE_BMP_FS_NONE = (GFX_RESOURCE_TYPE_BMP | GFX_RESOURCE_MEMORY_FS | GFX_RESOURCE_COMP_NONE)	BMP image type, located in file system no compression.
GFX_RESOURCE_BMP_EDS_EPMP_NONE = (GFX_RESOURCE_TYPE_BMP | GFX_RESOURCE_MEMORY_EDS_EPMP | GFX_RESOURCE_COMP_NONE)	BMP image type, located in EDS memory and no compression.
GFX_RESOURCE_GIF_FLASH_NONE = (GFX_RESOURCE_TYPE_GIF | GFX_RESOURCE_MEMORY_FLASH | GFX_RESOURCE_COMP_NONE)	GIF image type, located in flash and no compression.
GFX_RESOURCE_GIF_EXTERNAL_NONE = (GFX_RESOURCE_TYPE_GIF | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_NONE)	GIF image type, located in external memory no compression.
GFX_RESOURCE_GIF_FS_NONE = (GFX_RESOURCE_TYPE_GIF | GFX_RESOURCE_MEMORY_FS | GFX_RESOURCE_COMP_NONE)	GIF image type, located in file system no compression.
GFX_RESOURCE_GIF_EDS_EPMP_NONE = (GFX_RESOURCE_TYPE_GIF | GFX_RESOURCE_MEMORY_EDS_EPMP | GFX_RESOURCE_COMP_NONE)	GIF image type, located in EDS memory and no compression.
GFX_RESOURCE_BINARY_FLASH_NONE = (GFX_RESOURCE_TYPE_BINARY | GFX_RESOURCE_MEMORY_FLASH | GFX_RESOURCE_COMP_NONE)	Binary image type, located in flash and no compression.
GFX_RESOURCE_BINARY_FLASH_IPU = (GFX_RESOURCE_TYPE_BINARY | GFX_RESOURCE_MEMORY_FLASH | GFX_RESOURCE_COMP_IPU)	Binary image type, located in flash memory and compressed for IPU.
GFX_RESOURCE_BINARY_EXTERNAL_NONE = (GFX_RESOURCE_TYPE_BINARY | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_NONE)	Binary image type, located in external memory and no compression.
GFX_RESOURCE_BINARY_EXTERNAL_IPU = (GFX_RESOURCE_TYPE_BINARY | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_IPU)	Binary image type, located in external memory and compressed for IPU.
GFX_RESOURCE_BINARY_EDS_EPMP_NONE = (GFX_RESOURCE_TYPE_BINARY | GFX_RESOURCE_MEMORY_EDS_EPMP | GFX_RESOURCE_COMP_NONE)	Binary image type, located in EDS memory and no compression.
GFX_RESOURCE_BINARY_EDS_EPMP_IPU = (GFX_RESOURCE_TYPE_BINARY | GFX_RESOURCE_MEMORY_EDS_EPMP | GFX_RESOURCE_COMP_IPU)	Binary image type, located in EDS memory and compressed for IPU.

GFX_RESOURCE_FONT_FLASH_NONE = (GFX_RESOURCE_TYPE_FONT | GFX_RESOURCE_MEMORY_FLASH | GFX_RESOURCE_COMP_NONE)	Font type, located in flash and no compression.
GFX_RESOURCE_FONT_EXTERNAL_NONE = (GFX_RESOURCE_TYPE_FONT | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_NONE)	Font type, located in external memory and no compression.
GFX_RESOURCE_FONT_RAM_NONE = (GFX_RESOURCE_TYPE_FONT | GFX_RESOURCE_MEMORY_RAM | GFX_RESOURCE_COMP_NONE)	Font type, located in RAM and no compression.
GFX_RESOURCE_FONT_EDS_NONE = (GFX_RESOURCE_TYPE_FONT | GFX_RESOURCE_MEMORY_EDS_EPMP | GFX_RESOURCE_COMP_NONE)	Font type, located in EDS memory and no compression.
GFX_RESOURCE_PALETTE_FLASH_NONE = (GFX_RESOURCE_TYPE_PALETTE | GFX_RESOURCE_MEMORY_FLASH | GFX_RESOURCE_COMP_NONE)	Palette type, located in flash and no compression.
GFX_RESOURCE_PALETTE_EXTERNAL_NONE = (GFX_RESOURCE_TYPE_PALETTE | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_NONE)	Palette type, located in external memory and no compression.
GFX_RESOURCE_PALETTE_RAM_NONE = (GFX_RESOURCE_TYPE_PALETTE | GFX_RESOURCE_MEMORY_RAM | GFX_RESOURCE_COMP_NONE)	Palette type, located in RAM and no compression.

Description

Typedef: GFX_RESOURCE

This enumeration lists the different types of resources, how they are accessed and how the data of the resource will be interpreted when rendered.

A resource in the library has three major characteristics:

1. Location or source of the resource - The following are the recognized sources of resources
- internal flash memory type
- internal RAM type
- external memory type
- external EDS memory type
- - external via File System Service
2. Data types of the resource - The following are the supported types of resources:
- image
- font
- palette
- binary data
3. Data compression type of the resource - the following are the supported compression of data:
- RLE - Run length encoded compression. This type of compression is only available for 8 and 4 bpp bitmaps.
- IPU - Compressed data is encoded using the DEFLATE algorithm with fixed Huffman codes; dynamic Huffman codes are not supported.

The first four types indicates the location of the resource. The next five types indicates which kind of resource and the next 3 types indicates if the resource data is compressed or not.

By combining these three groups, a resource can be described fully and accessed appropriately in the library. For example: By combining the location, type and compression into one type, the library can pass the resource type parameter when rendering the resource. GFX_RESOURCE_MCHP_MBITMAP_EXTERNAL_RLE = (GFX_RESOURCE_TYPE_MCHP_MBITMAP | GFX_RESOURCE_MEMORY_EXTERNAL | GFX_RESOURCE_COMP_RLE)

Each type will determine how the library will access the resource when rendering.

Remarks

None.

GFX_RESOURCE_BINARY Structure

Defines the structure used for the binary type resource.

File

gfx_types_resource.h

C

```
typedef struct {
  union {
    uint32_t extAddress;
    uint8_gfx_image_prog * progByteAddress;
    uint16_gfx_image_prog * progWordAddress;
    const char * constAddress;
    char * ramAddress;
    __eds__ char * edsAddress;
  } location;
  uint32_t size;
  uint32_t param1;
  uint32_t param2;
} GFX_RESOURCE_BINARY;
```

Members

Members	Description
union { uint32_t extAddress; uint8_gfx_image_prog * progByteAddress; uint16_gfx_image_prog * progWordAddress; const char * constAddress; char * ramAddress; __eds__ char * edsAddress; } location;	This defines the location of the binary resource in memory. Depending on the type, the address location is interpreted accordingly.
uint32_t extAddress;	An external address.
uint8_gfx_image_prog * progByteAddress;	An 8-bit addresses in the program section.
uint16_gfx_image_prog * progWordAddress;	A 16-bit addresses in the program section.
const char * constAddress;	An addresses in constant space in flash.
char * ramAddress;	for addresses in RAM.
__eds__ char * edsAddress;	for addresses in EDS.
uint32_t size;	The size of the binary data in bytes.
uint32_t param1;	Parameters used for the GFX_RESOURCE. Depending on the GFX_RESOURCE type definition of param1 can change. For IPU and RLE compressed images, param1 indicates the compressed size of the image.
uint32_t param2;	Parameters used for the GFX_RESOURCE. Depending on the GFX_RESOURCE type

Description

Typedef: GFX_RESOURCE_BINARY

Defines the structure used for the binary type resource.

Remarks

None.

GFX_RESOURCE_FONT Structure

Defines the structure used for the font type resource.

File

gfx_types_resource.h

C

```
typedef struct {
  union {
    uint32_t extAddress;
    GFX_FONT_SPACE char * progByteAddress;
    char * ramAddress;
    __eds__ char * edsAddress;
  } location;
  GFX_FONT_HEADER header;
} GFX_RESOURCE_FONT;
```

Members

Members	Description
union { uint32_t extAddress; GFX_FONT_SPACE char * progByteAddress; char * ramAddress; __eds__ char * edsAddress; } location;	This defines the location of the font resource in memory. Depending on the type, the address location is interpreted accordingly.
uint32_t extAddress;	An external address.
GFX_FONT_SPACE char * progByteAddress;	An 8-bit addresses in the program section.
char * ramAddress;	An addresses in RAM.
__eds__ char * edsAddress;	An addresses in EDS.
GFX_FONT_HEADER header;	The header that describes the font resource.

Description

Typedef: GFX_RESOURCE_FONT

Defines the structure used for the font type resource.

Remarks

None.

GFX_RESOURCE_HDR Structure

Defines the structure used for the resource types.

File

gfx_types_resource.h

C

```
typedef struct {
  GFX_RESOURCE type;
  uint16_t ID;
  union {
    GFX_RESOURCE_IMAGE image;
    GFX_RESOURCE_FONT font;
    GFX_RESOURCE_BINARY binary;
    GFX_RESOURCE_PALETTE palette;
  } resource;
} GFX_RESOURCE_HDR;
```

Members

Members	Description
GFX_RESOURCE type;	Graphics resource type, determines the type and location of data
uint16_t ID;	memory ID, user defined value to differentiate between graphics resources of the same type When using EDS_EPMP the following ID values are reserved and used by the Microchip display driver 0 - reserved (do not use) 1 - reserved for base address of EPMP CS1 2 - reserved for base address of EPMP CS2
union { GFX_RESOURCE_IMAGE image; GFX_RESOURCE_FONT font; GFX_RESOURCE_BINARY binary; GFX_RESOURCE_PALETTE palette; } resource;	This defines the type of the resource. Depending on the type, the resource is accessed and rendered accordingly.
GFX_RESOURCE_IMAGE image;	Resource is an image.
GFX_RESOURCE_FONT font;	Resource is font.
GFX_RESOURCE_BINARY binary;	Resource is binary.
GFX_RESOURCE_PALETTE palette;	Resource is palette.

Description

Typedef: GFX_RESOURCE_HDR

Defines the common structure used for all the graphics resources.

Remarks

None.

GFX_RESOURCE_IMAGE Structure

Defines the structure used for the image type resource.

File

gfx_types_resource.h

C

```
typedef struct {
  union {
    uint32_t extAddress;
    uint8_gfx_image_prog * progByteAddress;
    uint16_gfx_image_prog * progWordAddress;
    const char * constAddress;
    char * ramAddress;
    __eds__ char * edsAddress;
  } location;
  uint16_t width;
  uint16_t height;
  union {
    uint32_t compressedSize;
    uint32_t reserved;
  } parameter1;
  union {
    uint32_t rawSize;
    uint32_t reserved;
  } parameter2;
  uint8_t colorDepth;
  uint8_t type;
  uint16_t paletteID;
} GFX_RESOURCE_IMAGE;
```

Members

Members	Description
union { uint32_t extAddress; uint8_gfx_image_prog * progByteAddress; uint16_gfx_image_prog * progWordAddress; const char * constAddress; char * ramAddress; __eds__ char * edsAddress; } location;	This defines the location of the image resource in memory. Depending on the type, the address location is interpreted accordingly.
uint32_t extAddress;	An external address.
uint8_gfx_image_prog * progByteAddress;	An 8-bit addresses in the program section.
uint16_gfx_image_prog * progWordAddress;	A 16-bit addresses in the program section.
const char * constAddress;	An addresses in constant space in flash.
char * ramAddress;	An addresses in RAM.
__eds__ char * edsAddress;	An addresses in EDS.
uint16_t width;	The width of the image.
uint16_t height;	The height of the image.
union { uint32_t compressedSize; uint32_t reserved; } parameter1;	A generic parameter 1 that changes in usage depending on the type of the resource.
uint32_t compressedSize;	Parameters used for the GFX_RESOURCE. Depending on the GFX_RESOURCE type definition of param1 can change. For IPU and RLE compressed images, param1 indicates the compressed size of the image.
union { uint32_t rawSize; uint32_t reserved; } parameter2;	A generic parameter 2 that changes in usage depending on the type of the resource.

uint32_t rawSize;	Parameters used for the GFX_RESOURCE. Depending on the GFX_RESOURCE type definition of param2 can change. For IPU and RLE compressed images, param2 indicates the uncompressed size of the image.
uint8_t colorDepth;	The color depth of the image.
uint8_t type;	The type of image, information on how to render the image 0x00 - no compression, palette is present for color depth = 8, 4 and 1 BPP 0x10 - palette is provided as a separate object (see PALETTE_HEADER) for color depth = 8, 4, and 1 BPP, ID to the palette is embedded color depth = 8, 4, and 1 BPP, in the bitmap. 0xYY - reserved
uint16_t paletteID;	The palette ID, if type == MCHP_BITMAP_PALETTE_STR (0x10), this represents the unique ID of the palette being used

Description

Typedef: GFX_RESOURCE_IMAGE

Defines the structure used for the image type resource.

Remarks

None.

GFX_RESOURCE_PALETTE Structure

Defines the structure used for the palette type resource.

File

gfx_types_resource.h

C

```
typedef struct {
  union {
    uint32_t extAddress;
    const GFX_PALETTE_ENTRY * constByteAddress;
    GFX_PALETTE_ENTRY * ramAddress;
  } location;
  uint16_t numberOfEntries;
  uint16_t paletteID;
} GFX_RESOURCE_PALETTE;
```

Members

Members	Description
union { uint32_t extAddress; const GFX_PALETTE_ENTRY * constByteAddress; GFX_PALETTE_ENTRY * ramAddress; } location;	This defines the location of the palette resource in memory. Depending on the type, the address location is interpreted accordingly.
uint32_t extAddress;	An external address.
const GFX_PALETTE_ENTRY * constByteAddress;	An addresses in constant space in flash.
GFX_PALETTE_ENTRY * ramAddress;	An addresses in RAM.
uint16_t numberOfEntries;	The number of color entries in the palette resource.
uint16_t paletteID;	Unique ID of the palette that will match the ID in the GFX_RESOURCE_HDR if the image has palette removed and supplied as a separate object.

Description

Typedef: GFX_RESOURCE_PALETTE

Defines the structure used for the palette type resource.

Remarks

None.

GFX_STATUS Enumeration

Rendering status.

File

gfx_types_macros.h

C

```
typedef enum {
  GFX_STATUS_FAILURE,
  GFX_STATUS_SUCCESS
} GFX_STATUS;
```

Members

Members	Description
GFX_STATUS_FAILURE	Rendering is not yet performed, or has started but not yet finished.
GFX_STATUS_SUCCESS	Rendering has been performed.

Description

Typedef: GFX_STATUS

When rendering into the frame buffer, it is sometimes necessary to return the status of the rendering. This is especially true when using hardware to render primitive shapes or when a FIFO is used to render primitive shapes.

Remarks

None.

GFX_STATUS_BIT Enumeration

Additional rendering status.

File

gfx_types_macros.h

C

```
typedef enum {
  GFX_STATUS_FAILURE_BIT,
  GFX_STATUS_SUCCESS_BIT,
  GFX_STATUS_ERROR_BIT,
  GFX_STATUS_BUSY_BIT,
  GFX_STATUS_READY_BIT
} GFX_STATUS_BIT;
```

Members

Members	Description
GFX_STATUS_FAILURE_BIT	Rendering failed. Depending on the driver used, hardware may or may not recover.
GFX_STATUS_SUCCESS_BIT	Rendering is successful.
GFX_STATUS_ERROR_BIT	Rendering resulted in an error and cannot recover.
GFX_STATUS_BUSY_BIT	Rendering cannot proceed due to a common resource is busy.
GFX_STATUS_READY_BIT	Rendering can proceed.

Description

Typedef: GFX_STATUS_BIT

The following rendering status types are available for a detailed description of the status of rendering.

Remarks

None.

int16_gfx_image_prog Type

File

gfx_types_image.h

C

```
typedef int16_prog_pack int16_gfx_image_prog;
```

Description

This is type int16_gfx_image_prog.

int32_gfx_image_prog Type

File

gfx_types_image.h

C

```
typedef int32_prog_pack int32_gfx_image_prog;
```

Description

This is type int32_gfx_image_prog.

int8_gfx_image_prog Type

File

gfx_types_image.h

C

```
typedef int8_prog_pack int8_gfx_image_prog;
```

Description

This is type int8_gfx_image_prog.

uint16_gfx_image_prog Type

File

gfx_types_image.h

C

```
typedef uint16_prog_pack uint16_gfx_image_prog;
```

Description

This is type uint16_gfx_image_prog.

uint32_gfx_image_prog Type

File

gfx_types_image.h

C

```
typedef uint32_prog_pack uint32_gfx_image_prog;
```

Description

This is type uint32_gfx_image_prog.

uint8_gfx_image_prog Type

File

gfx_types_image.h

C

```
typedef uint8_prog_pack uint8_gfx_image_prog;
```

Description

GFX Image data Types

GFX_ALIGNMENT Enumeration

Summary of the different text alignment supported in the library.

File

gfx_types_macros.h

C

```
typedef enum {
  GFX_ALIGN_LEFT,
  GFX_ALIGN_HCENTER,
  GFX_ALIGN_RIGHT,
  GFX_ALIGN_TOP,
  GFX_ALIGN_VCENTER,
  GFX_ALIGN_BOTTOM,
  GFX_ALIGN_CENTER
} GFX_ALIGNMENT;
```

Members

Members	Description
GFX_ALIGN_LEFT	left aligned text
GFX_ALIGN_HCENTER	horizontal center aligned text
GFX_ALIGN_RIGHT	right aligned text
GFX_ALIGN_TOP	top aligned text
GFX_ALIGN_VCENTER	vertical center aligned text
GFX_ALIGN_BOTTOM	bottom aligned text
GFX_ALIGN_CENTER	vertical & horizontal center aligned text

Description

Typedef: GFX_ALIGNMENT

This lists all the different text alignment supported in the library. The text alignment is used in GFX_TextStringBoxDraw().

Remarks

None.

GFX_BACKGROUND Structure

Background information structure.

File

gfx_types_macros.h

C

```
typedef struct {
  uint16_t left;
  uint16_t top;
  GFX_BACKGROUND_TYPE type;
  GFX_RESOURCE_HDR * pImage;
  GFX_COLOR color;
} GFX_BACKGROUND;
```

Members

Members	Description
uint16_t left;	Horizontal starting position of the background.
uint16_t top;	Horizontal starting position of the background.
GFX_BACKGROUND_TYPE type;	Specifies the type of background to use.
GFX_RESOURCE_HDR * pImage;	Pointer to the background image used. Set this to NULL if not used.
GFX_COLOR color;	If the background image is NULL, background is assumed to be this color.

Description

Typedef: GFX_BACKGROUND

Structure describing the background information. Useful in refreshing the whole screen or an area of the screen. The background information, when used, can be one of the enumerated types in GFX_BACKGROUND_TYPE.

- pBackGroundImage - pointer to a GFX_RESOURCE_HEADER with the type GFX_RESOURCE_TYPE_MCHP_MBITMAP.
- backGroundColor - value of the background color used when pBackgroundImage is NULL.

The pBackGroundImage has the high priority and will assume an image is used as a background when the pointer is initialized. If this is NULL the backgroundColor is assumed to be the background.

Remarks

None.

GFX_BACKGROUND_TYPE Enumeration

Specifies the different background fill types.

File

gfx_types_macros.h

C

```
typedef enum {
  GFX_BACKGROUND_NONE,
  GFX_BACKGROUND_COLOR,
  GFX_BACKGROUND_IMAGE,
  GFX_BACKGROUND_DISPLAY_BUFFER
} GFX_BACKGROUND_TYPE;
```

Members

Members	Description
GFX_BACKGROUND_NONE	No background information set.
GFX_BACKGROUND_COLOR	Background is set to a color.
GFX_BACKGROUND_IMAGE	Background is set to an image.
GFX_BACKGROUND_DISPLAY_BUFFER	Background is set to the current content of the display buffer. This requires support of GFX_PixelArrayGet().

Description

Typedef: GFX_FILL_STYLE

Defines the types of background information. Knowing the background information allows easier refresh of an area on the display buffer.

Remarks

None.

GFX_DOUBLE_BUFFERING_MODE Structure

Structure used for double buffering management.

File

gfx_types_macros.h

C

```
typedef struct {
  GFX_FEATURE_STATUS gfxDoubleBufferFeature;
  GFX_FEATURE_STATUS gfxDoubleBufferFeatureRecentStatus;
  GFX_FEATURE_STATUS gfxDoubleBufferRequestSync;
  GFX_FEATURE_STATUS gfxDoubleBufferFullSync;
  GFX_RECTANGULAR_AREA gfxDoubleBufferAreas[GFX_MAX_INVALIDATE_AREAS];
  uint16_t gfxUnsyncedAreaCount;
} GFX_DOUBLE_BUFFERING_MODE;
```

Members

Members	Description
GFX_FEATURE_STATUS gfxDoubleBufferFeature;	The status of the double buffering feature.
GFX_FEATURE_STATUS gfxDoubleBufferFeatureRecentStatus;	The status of the double buffering feature.

GFX_FEATURE_STATUS gfxDoubleBufferRequestSync;	The status of the request for synchronization.
GFX_FEATURE_STATUS gfxDoubleBufferFullSync;	The status of the full synchronization request.
GFX_RECTANGULAR_AREA gfxDoubleBufferAreas[GFX_MAX_INVALIDATE_AREAS];	The array of rectangular areas that needs synchronization.
uint16_t gfxUnsyncedAreaCount;	The current count of unsynchronized areas.

Description

Typedef: GFX_RECTANGULAR_AREA

Structure describing the double buffering states of the frame and draw buffer. This saves the current states of the feature for management by the graphics library. Double buffering is only available to selected configurations.

Remarks

None.

GFX_FEATURE_STATUS Enumeration

States of a feature that can be enabled/disabled at run time.

File

gfx_types_macros.h

C

```
typedef enum {
  GFX_FEATURE_PAUSED,
  GFX_FEATURE_ENABLED,
  GFX_FEATURE_DISABLED
} GFX_FEATURE_STATUS;
```

Members

Members	Description
GFX_FEATURE_PAUSED	The feature is paused.
GFX_FEATURE_ENABLED	The feature is enabled.
GFX_FEATURE_DISABLED	The feature is disabled.

Description

Typedef: GFX_FEATURE_STATUS

Defines the states of a Graphics Library feature that can be enabled/disabled at run time.

Remarks

None.

GFX_FILL_STYLE Enumeration

Specifies the available fill styles.

File

gfx_types_macros.h

C

```
typedef enum {
  GFX_FILL_STYLE_NONE,
  GFX_FILL_STYLE_COLOR,
  GFX_FILL_STYLE_ALPHA_COLOR,
  GFX_FILL_STYLE_GRADIENT_DOWN,
  GFX_FILL_STYLE_GRADIENT_UP,
  GFX_FILL_STYLE_GRADIENT_RIGHT,
  GFX_FILL_STYLE_GRADIENT_LEFT,
  GFX_FILL_STYLE_GRADIENT_DOUBLE_VER,
  GFX_FILL_STYLE_GRADIENT_DOUBLE_HOR
} GFX_FILL_STYLE;
```

Members

Members	Description
GFX_FILL_STYLE_NONE	no fill
GFX_FILL_STYLE_COLOR	color fill
GFX_FILL_STYLE_ALPHA_COLOR	color fill with alpha blending
GFX_FILL_STYLE_GRADIENT_DOWN	gradient, vertical-down direction
GFX_FILL_STYLE_GRADIENT_UP	gradient, vertical-up direction
GFX_FILL_STYLE_GRADIENT_RIGHT	gradient, horizontal-right direction
GFX_FILL_STYLE_GRADIENT_LEFT	gradient, horizontal-left direction
GFX_FILL_STYLE_GRADIENT_DOUBLE_VER	gradient, vertical-up/down direction
GFX_FILL_STYLE_GRADIENT_DOUBLE_HOR	gradient, horizontal-left/right direction

Description

Typedef: GFX_FILL_STYLE

This enumeration specifies the available fill styles used in the library.

Remarks

None.

GFX_FONT_ANTIALIAS_TYPE Enumeration

Summary of the transparency types in text anti-aliasing.

File

gfx_types_macros.h

C

```
typedef enum {
  GFX_FONT_ANTIALIAS_OPAQUE,
  GFX_FONT_ANTIALIAS_TRANSLUCENT
} GFX_FONT_ANTIALIAS_TYPE;
```

Members

Members	Description
GFX_FONT_ANTIALIAS_OPAQUE	Mid colors are calculated only once while rendering each character. This is ideal for rendering text over a constant background.
GFX_FONT_ANTIALIAS_TRANSLUCENT	Mid colors are calculated for every necessary pixel. This feature is useful when rendering text over an image or when the background is not one flat color.

Description

Typedef: GFX_FONT_ANTIALIAS_TYPE

Transparency type when rendering characters with anti-aliasing.

Remarks

None.

GFX_FONT_SPACE Macro

File

gfx_types_font.h

C

```
#define GFX_FONT_SPACE const
```

Description

Font space section. The fonts can be located in psv (constant) or program space in PIC24/dsPIC MCUs. This define allows for switching of the pointer type used to access the font structure in memory See: GraphicsConfig.h for the application define.

GFX_UXCHAR Macro

File

gfx_types_font.h

C

```
#define GFX_UXCHAR uint8_t
```

Description

This is macro GFX_UXCHAR.

GFX_XCHAR Macro

Configuration for the text character size.

File

gfx_types_font.h

C

```
#define GFX_XCHAR char
```

Description

GFX_CONFIG_FONT_CHAR_SIZE

This configuration sets the text character size used in the library.

To enable support for unicode fonts, GFX_CONFIG_FONT_CHAR_SIZE must be defined as 16 (size is 16 bits). For standard ASCII fonts, this can be defined as 8. This changes the GFX_XCHAR definition. See GFX_XCHAR for details.

Set in configuration	GFX_XCHAR	Description
#define GFX_CONFIG_FONT_CHAR_SIZE 16	#define GFX_XCHAR uint16_t	Use multi-byte characters (0-2^16 range).
#define GFX_CONFIG_FONT_CHAR_SIZE 8	#define GFX_XCHAR uint8_t	Use byte characters (0-255 range).

Remarks

None.

GRAPHICS_LIBRARY_VERSION Macro

File

gfx.h

C

```
#define GRAPHICS_LIBRARY_VERSION 0x0400
```

Description

////////////////// GRAPHICS_LIBRARY_VERSION ////////////////// MSB is version, LSB is subversion

GFX_COMP_MASK Macro

File

gfx_types_resource.h

C

```
#define GFX_COMP_MASK 0xF000
```

Description

This is macro GFX_COMP_MASK.

GFX_MEM_MASK Macro

File

gfx_types_resource.h

C

```
#define GFX_MEM_MASK 0x000F
```

Description

This is macro GFX_MEM_MASK.

GFX_TYPE_MASK Macro

File

gfx_types_resource.h

C

```
#define GFX_TYPE_MASK 0x0F00
```

Description

This is macro GFX_TYPE_MASK.

MCHP_BITMAP_NORMAL Macro

File

gfx_types_resource.h

C

```
#define MCHP_BITMAP_NORMAL 0x00                // no compression, palette is present
```

Description

no compression, palette is present for color depth = 8, 4 and 1 BPP

MCHP_BITMAP_PALETTE_STR Macro

File

gfx_types_resource.h

C

```
#define MCHP_BITMAP_PALETTE_STR 0x10                // palette is provided as a separate
```

Description

palette is provided as a separate object (see PALETTE_HEADER) for color depth = 8, 4, and 1 BPP, ID to the palette is embedded in the bitmap.

int16_prog Type

File

gfx_types_image.h

C

```
typedef __prog__ int16_t int16_prog;
```

Description

This is type int16_prog.

int16_prog_pack Type

File

gfx_types_image.h

C

```
typedef __pack_upper_byte int16_t int16_prog_pack;
```

Description

This is type int16_prog_pack.

int32_prog Type

File

gfx_types_image.h

C

```
typedef __prog__ int32_t int32_prog;
```

Description

This is type int32_prog.

int32_prog_pack Type

File

gfx_types_image.h

C

```
typedef __pack_upper_byte int32_t int32_prog_pack;
```

Description

This is type int32_prog_pack.

int8_prog Type

File

gfx_types_image.h

C

```
typedef __prog__ int8_t int8_prog;
```

Description

This is type int8_prog.

int8_prog_pack Type

File

gfx_types_image.h

C

```
typedef __pack_upper_byte int8_t int8_prog_pack;
```

Description

This is type int8_prog_pack.

uint16_prog Type

File

gfx_types_image.h

C

```
typedef __prog__ uint16_t uint16_prog;
```

Description

This is type uint16_prog.

uint16_prog_pack Type

File

gfx_types_image.h

C

```
typedef __pack_upper_byte uint16_t uint16_prog_pack;
```

Description

This is type uint16_prog_pack.

uint32_prog Type

File

gfx_types_image.h

C

```
typedef __prog__ uint32_t uint32_prog;
```

Description

This is type uint32_prog.

uint32_prog_pack Type

File

gfx_types_image.h

C

```
typedef __pack_upper_byte uint32_t uint32_prog_pack;
```

Description

This is type uint32_prog_pack.

uint8_prog Type

File

gfx_types_image.h

C

```
typedef __prog__ uint8_t uint8_prog;
```

Description

General program space data types

uint8_prog_pack Type

File

gfx_types_image.h

C

```
typedef __pack_upper_byte uint8_t uint8_prog_pack;
```

Description

This is type uint8_prog_pack.

GFX_CLIENT_OBJ Structure

GFX client object structure.

File

gfx.h

C

```
typedef struct {
  GFX_CLIENT_STATUS clientState;
  bool inUse;
  void * obj;
  SYS_MODULE_INDEX halIndex;
  GFX_HANDLE primitiveHandle;
  GFX_HANDLE golHandle;
} GFX_CLIENT_OBJ;
```

Members

Members	Description
GFX_CLIENT_STATUS clientState;	Client status
bool inUse;	Set to true if this object is in use
void * obj;	Object from which the client is derived
SYS_MODULE_INDEX halIndex;	Save the index of the driver

Description

GFX client object structure

GFX client object structure.

Remarks

None.

GFX_CLIENT_STATUS Enumeration

Enumerated data type that identifies the GFX Module Client Status.

File

gfx.h

C

```
typedef enum {
  GFX_CLIENT_STATUS_CLOSED,
  GFX_CLIENT_STATUS_READY
} GFX_CLIENT_STATUS;
```

Members

Members	Description
GFX_CLIENT_STATUS_CLOSED	Client is closed or the specified handle is invalid
GFX_CLIENT_STATUS_READY	Client is ready

Description

GFX Client Status

This enumeration defines the possible status of the GFX Module Client. It is returned by the () function.

Remarks

None.

GFX_OBJ Structure

Defines the object required for interaction with the GFX Library.

File

gfx.h

C

```
typedef struct _GFX_OBJ {
  SYS_STATUS status;
  SYS_MODULE_INDEX index;
  bool inUse;
  GFX_STATES state;
  bool IsExclusive;
  uint8_t numClients;
  GFX_OBJECT_TASK task;
  GFX_INIT * initData;
  GFX_HANDLE gfxHandle;
  SYS_MODULE_OBJ primitiveObject;
  SYS_MODULE_OBJ golObject;
} GFX_OBJ;
```

Members

Members	Description
SYS_STATUS status;	Required : The status of the module
SYS_MODULE_INDEX index;	Object Index
bool inUse;	Required : Flag to indicate in use
GFX_STATES state;	GFX machine state
bool IsExclusive;	Flag to indicate that PMP is used in exclusive access mode
uint8_t numClients;	Optional: number of clients possible with the software instance
GFX_OBJECT_TASK task;	State of the task

Description

GFX Library Instance Object

This defines the object required for interaction with the GFX Library. This object exists once per application instance of the library.

Remarks

None.

GFX_OBJECT_TASK Enumeration

Lists the different states that GFX task routine can have.

File

gfx.h

C

```
typedef enum {
  GFX_TASK_STATE_OPEN_MODULE,
  GFX_TASK_STATE_RUNNING
} GFX_OBJECT_TASK;
```

Members

Members	Description
GFX_TASK_STATE_OPEN_MODULE	open module for client

Description

GFX task states

This enumeration lists the different states that GFX task routine can have.

Remarks

None.

GFX_STATES Enumeration

Defines the various states that can be achieved by the GFX operation.

File

gfx.h

C

```
typedef enum {
  GFX_STATE_BUSY,
  GFX_STATE_INIT,
  GFX_STATE_INITIALIZED
} GFX_STATES;
```

Members

Members	Description
GFX_STATE_BUSY	Module state busy
GFX_STATE_INIT	Module state init

Description

GFX Machine States

This enumeration defines the various states that can be achieved by the HAL operation.

Remarks

None.

FileFeof Type

File

gfx_image_decoder.h

C

```
typedef bool (* FileFeof)(void *stream);
```

Description

This is type FileFeof.

FileRead Type

File

gfx_image_decoder.h

C

```
typedef size_t (* FileRead)(void *ptr, size_t size, size_t n, void *stream);
```

Description

Typedefs of the used File System APIs

FileSeek Type

File

gfx_image_decoder.h

C

```
typedef bool (* FileSeek)(void *stream, long offset, int whence);
```

Description

This is type FileSeek.

FileTell Type

File

gfx_image_decoder.h

C

```
typedef uint32_t (* FileTell)(void *fo);
```

Description

This is type FileTell.

IMG_FILE_FORMAT Enumeration

File

gfx_image_decoder.h

C

```
typedef enum _IMG_FILE_FORMAT {
  IMG_NONE = 0,
  IMG_BMP,
  IMG_JPEG,
  IMG_GIF
} IMG_FILE_FORMAT;
```

Members

Members	Description
IMG_BMP	Bitmap image
IMG_JPEG	JPEG image
IMG_GIF	GIF image

Description

IMG_ImageFileFormat specifies all the supported image file formats

IMG_FILE_SYSTEM_API Structure

File

gfx_image_decoder.h

C

```
typedef struct _IMG_FILE_SYSTEM_API {
  FileRead pFread;
  FileSeek pFseek;
  FileTell pFtell;
  FileFeof pFeof;
} IMG_FILE_SYSTEM_API;
```

Description

IMG_FileSystemAPI holds function pointers to the used File System APIs

IMG_LOOP_CALLBACK Type

File

gfx_image_decoder.h

C

```
typedef void (* IMG_LOOP_CALLBACK)(void);
```

Description

IMG_LoopCallback is a callback function which is called in every loop of the decoding cycle so that user application can do some maintenance activities

IMG_PIXEL_OUTPUT Type

File

gfx_image_decoder.h

C

```
typedef void (* IMG_PIXEL_OUTPUT)(IMG_PIXEL_XY_RGB_888 *pPix);
```

Description

IMG_PixelOutput is a callback function which receives the color information of the output pixel

IMG_PIXEL_XY_RGB_888 Structure

File

gfx_image_decoder.h

C

```
typedef struct _IMG_PIXEL_XY_RGB_888 {
  uint16_t X;
  uint16_t Y;
  uint8_t R;
  uint8_t G;
  uint8_t B;
  uint16_t POS;
} IMG_PIXEL_XY_RGB_888;
```

Description

IMG_PixelRgb holds the RGB information of a pixel in BYTES

__IMAGEDECODER_H__ Macro

File

gfx_image_decoder.h

C

```
#define __IMAGEDECODER_H__
```

Description

This is macro __IMAGEDECODER_H__.

_PutPixel Macro

File

gfx_image_decoder.h

C

```
#define _PutPixel(x, y) if(IMG_pPixelOutput != NULL) { IMG_PixelXYColor.X = x; IMG_PixelXYColor.Y = y;
IMG_pPixelOutput(&IMG_PixelXYColor); }
```

Description

This is macro _PutPixel.

ImageAbort Macro

File

gfx_image_decoder.h

C

```
#define ImageAbort IMG_blAbortImageDecoding = 1;
```

Side Effects

None

Returns

None

Description

This function sets the Image Decoder's Abort flag so that decoding aborts in the next decoding loop.

Example

```
void callback(void);
void main(void)
{
    IMG_FILE pImageFile;
    IMG_vInitialize();
    ImageLoopCallbackRegister(callback);
    pImageFile = IMG_FOPEN("Image.jpg", "r");
    if(pImageFile == NULL)
    {
              <- Error handling ->
    }
    IMG_bFullScreenDecode(pImageFile, IMG_JPEG, NULL, NULL);
    IMG_FCLOSE(pImageFile);
    while(1);
}

void callback(void)
{
    if(<- check for abort condition ->)
    {
        ImageAbort();
    }
}
```

Function

void ImageAbort(void)

ImageFullScreenDecode Macro

File

gfx_image_decoder.h

C

```
#define ImageFullScreenDecode(pImageFile, eImgFormat, pFileAPIs, pPixelOutput) \
        ImageDecode(pImageFile, eImgFormat, 0, 0, IMG_SCREEN_WIDTH, IMG_SCREEN_HEIGHT, (IMG_ALIGN_CENTER |
IMG_DOWN_SCALE), pFileAPIs, pPixelOutput)
```

Side Effects

None

Returns

Error code -> 0 means no error

Description

This function decodes and displays the image on the screen in fullscreen mode with center aligned and downscaled if required

Example

```
  void main(void)
{
    IMG_FILE pImageFile;
    IMG_vInitialize();
    pImageFile = IMG_FOPEN("Image.jpg", "r");
    if(pImageFile == NULL)
    {
              <- Error handling ->
    }
    IMG_bFullScreenDecode(pImageFile, IMG_JPEG, NULL, NULL);
    IMG_FCLOSE(pImageFile);
    while(1);
}
```

Function

uint8_t ImageFullScreenDecode(IMG_FILE *pImageFile, IMG_FILE_FORMAT eImgFormat, IMG_FILE_SYSTEM_API pFileAPIs, IMG_PIXEL_OUTPUT pPixelOutput)

IMG_ALIGN_CENTER Macro

File

gfx_image_decoder.h

C

```
#define IMG_ALIGN_CENTER 0x0001
```

Description

Flags

IMG_DECODE_ABORTED Macro

File

gfx_image_decoder.h

C

```
#define IMG_DECODE_ABORTED 0xFF
```

Description

This is macro IMG_DECODE_ABORTED.

IMG_DOWN_SCALE Macro

File

gfx_image_decoder.h

C

```
#define IMG_DOWN_SCALE 0x0002
```

Description

This is macro IMG_DOWN_SCALE.

IMG_FEOF Macro

File

gfx_image_decoder.h

C

```
#define IMG_FEOF IMG_pFileAPIs->pFeof
```

Description

This is macro IMG_FEOF.

IMG_FILE Macro

File

gfx_image_decoder.h

C

```
#define IMG_FILE void
```

Description

This is macro IMG_FILE.

IMG_FREAD Macro

File

gfx_image_decoder.h

C

```
#define IMG_FREAD IMG_pFileAPIs->pFread
```

Description

This is macro IMG_FREAD.

IMG_FSEEK Macro

File

gfx_image_decoder.h

C

```
#define IMG_FSEEK IMG_pFileAPIs->pFseek
```

Description

This is macro IMG_FSEEK.

IMG_FTELL Macro

File

gfx_image_decoder.h

C

```
#define IMG_FTELL IMG_pFileAPIs->pFtell
```

Description

This is macro IMG_FTELL.

IMG_SCREEN_HEIGHT Macro

File

gfx_image_decoder.h

C

```
#define IMG_SCREEN_HEIGHT (GetMaxY()+1)
```

Description

This is macro IMG_SCREEN_HEIGHT.

IMG_SCREEN_WIDTH Macro

File

gfx_image_decoder.h

C

```
#define IMG_SCREEN_WIDTH (GetMaxX()+1)
```

Description

The individual image decoders use these defines instead of directly using those provided in the Display driver file

IMG_vCheckAndAbort Macro

File

gfx_image_decoder.h

C

```
#define IMG_vCheckAndAbort \
        if(IMG_blAbortImageDecoding == 1)   \
        {                                   \
              IMG_blAbortImageDecoding = 0; \
              return IMG_DECODE_ABORTED;    \
        }
```

Description

This is macro IMG_vCheckAndAbort.

IMG_vLoopCallback Macro

File

gfx_image_decoder.h

C

```
#define IMG_vLoopCallback
```

Description

This is macro IMG_vLoopCallback.

IMG_vPutPixel Macro

File

gfx_image_decoder.h

C

```
#define IMG_vPutPixel(x, y) if(IMG_bDownScalingFactor <= 1)\
                                {                          \
                                    _PutPixel(IMG_wStartX + (x), IMG_wStartY + (y));\
                                }                          \
                                else if((x)%IMG_bDownScalingFactor == 0 && (y)%IMG_bDownScalingFactor ==
0)\
                                {                          \
                                    _PutPixel(IMG_wStartX + ((x)/IMG_bDownScalingFactor), IMG_wStartY +
((y)/IMG_bDownScalingFactor)); \
                                }
```

Description

This is macro IMG_vPutPixel.

GFX_PALETTE_ENTRY Union

Defines the union used for each entry in the palette table.

File

gfx_types_palette.h

C

```
typedef union {
  uint16_t value;
  struct {
    uint16_t r : 5;
    uint16_t g : 6;
    uint16_t b : 5;
  } color;
  struct {
    uint16_t reserved : 12;
    uint16_t luma : 4;
  } monochrome;
} GFX_PALETTE_ENTRY;
```

Members

Members	Description
uint16_t value;	a 16-bit value representing a color or palette entry
struct { uint16_t r : 5; uint16_t g : 6; uint16_t b : 5; } color;	color value in 5-6-5 RGB format
uint16_t r : 5;	represents the RED component
uint16_t g : 6;	represents the GREEN component
uint16_t b : 5;	represents the BLUE component
struct { uint16_t reserved : 12; uint16_t luma : 4; } monochrome;	monochrome LUMA value
uint16_t reserved : 12;	reserved, used as a filler
uint16_t luma : 4;	monochrome LUMA value

Description

Typedef: GFX_PALETTE_ENTRY

Defines the union used for each entry in the palette table specified by GFX_RESOURCE_PALETTE structure.

There are two types of palette:

- For TFT: color is defined as 5-6-5 RGB format where 5-bits for RED, 6-bits for GREEN and 5-bits for BLUE.
- For Monochrome: 4 bits are used to represent the luma.

Remarks

None.

GFX_TEXT_CURSOR_TYPE Enumeration

Enumeration defines types of text cursor supported.

File

gfx_types_macros.h

C

```
typedef enum {
  GFX_TEXT_CURSOR_TYPE_UNDERSCORE
} GFX_TEXT_CURSOR_TYPE;
```

Members

Members	Description
GFX_TEXT_CURSOR_TYPE_UNDERSCORE	Text cursor of type underscore

Description

Typedef: GFX_TEXT_CURSOR_TYPE

This enumeration defines types of cursor can be drawn.

Remarks

None.

IMG_LOOP_FRAMECOMPLETE Type

File

gfx_image_decoder.h

C

```
typedef bool (* IMG_LOOP_FRAMECOMPLETE)(uint16_t frame);
```

Description

IMG_FrameCompleteCallback is a callback function which is called at completion decoding current frame so that user application can do some activities

IMG_LOOP_IMAGECOMPLETE Type

File

gfx_image_decoder.h

C

```
typedef void (* IMG_LOOP_IMAGECOMPLETE)(void);
```

Description

IMG_FrameCompleteCallback is a callback function which is called at completion decoding current frame so that user application can do some activities

IMG_LOOP_IMAGEFAIL Type

File

gfx_image_decoder.h

C

```
typedef void (* IMG_LOOP_IMAGEFAIL)(void);
```

Description

IMG_FrameCompleteCallback is a callback function which is called at completion decoding current frame so that user application can do some activities

IMG_vFrameComplete Macro

File

gfx_image_decoder.h

C

```
#define IMG_vFrameComplete if (IMG_pFrameCompleteCallbackFn != NULL) { IMG_pImageExitRequested =
IMG_pFrameCompleteCallbackFn(++IMG_pCurrentFrame); }
```

Description

This is macro IMG_vFrameComplete.

IMG_vImageComplete Macro

File

gfx_image_decoder.h

C

```
#define IMG_vImageComplete if (IMG_pImageCompleteCallbackFn != NULL) { IMG_pImageCompleteCallbackFn(); }
```

Description

This is macro IMG_vImageComplete.

IMG_vImageFail Macro

File

gfx_image_decoder.h

C

```
#define IMG_vImageFail if (IMG_pImageFailCallbackFn != NULL) { IMG_pImageFailCallbackFn(); }
```

Description

This is macro IMG_vImageFail.

IMG_vPixelArray Macro

File

gfx_image_decoder.h

C

```
#define IMG_vPixelArray(pos) IMG_PixelXYColor.POS = pos;
```

Description

This is macro IMG_vPixelArray.

IMG_vSetColor Macro

File

gfx_image_decoder.h

C

```
#define IMG_vSetColor(r, g, b) IMG_PixelXYColor.R = r; IMG_PixelXYColor.G = g; IMG_PixelXYColor.B = b;
```

Description

This is macro IMG_vSetColor.

Files

Files

Name	Description
gfx.h	The header file joins all header files used in the graphics library and contains compile options and defaults.
gfx_colors.h	The header file contains default color definitions for each color depth.
gfx_common.h	This is file gfx_common.h.
gfx_colors_w3.h	The header file contains W3 color definitions.
gfx_colors_x11.h	The header file contains X11 color definitions.
gfx_gol.h	Graphics Object Layer of the Microchip Graphics Library.
gfx_gol_button.h	This is the header file for the button object of the GOL.
gfx_gol_check_box.h	This is the header file for the check box object of the GOL.

gfx_gol_custom_control.h	This is the header file for the custom control object of the GOL.
gfx_gol_digital_meter.h	This is the header file for the digital meter object of the GOL.

gfx_gol_group_box.h	This is the header file for the group box object of the GOL.
gfx_gol_list_box.h	This is the header file for the list box object of the GOL.
gfx_gol_meter.h	This is the header file for the meter object of the GOL.
gfx_gol_picture.h	This is the header file for the picture object of the GOL.
gfx_gol_progress_bar.h	This is the header file for the progress bar object of the GOL.
gfx_gol_radio_button.h	This is the header file for the radio button object of the GOL.
gfx_gol_scan_codes.h	This is the header file for the AT keyboard codes.
gfx_gol_scheme.h	Graphics Object Layer Scheme routines/macros of the Microchip Graphics Library.
gfx_gol_scroll_bar.h	This is the header file for the scroll bar object of the GOL.
gfx_gol_static_text.h	This is the header file for the static text object of the GOL.
gfx_gol_surface.h	This is the header file for the surface object of the GOL.
gfx_gol_text_entry.h	This is the header file for the text entry object of the GOL.
gfx_gol_window.h	This is the header file for the window object of the GOL.
gfx_image_decoder.h	This implements the image decoding of the primitive layer.
gfx_primitive.h	Primitive Layer of the Microchip Graphics Library.
gfx_types_font.h	This header file defines the types used in fonts for the Microchip Graphics Library.
gfx_types_image.h	This header file defines the types used in images for the Microchip Graphics Library.
gfx_types_macros.h	Data types used in Microchip Graphics Library.
gfx_types_palette.h	This header file defines the types used in palettes for the Microchip Graphics Library.
gfx_types_resource.h	This is the definition of the Graphics Resource Types used with the Microchip Graphics Library.
gfx_config_template.h	This header file template defines all the Graphics Library configurations available.

Description

This section lists the source and header files used by the library.

gfx.h

The header file joins all header files used in the graphics library and contains compile options and defaults.

Enumerations

	Name	Description
	GFX_CLIENT_STATUS	Enumerated data type that identifies the GFX Module Client Status.
	GFX_OBJECT_TASK	Lists the different states that GFX task routine can have.
	GFX_STATES	Defines the various states that can be achieved by the GFX operation.

Functions

	Name	Description
	GFX_Close	Closes a client instance of the GFX library.
	GFX_Deinitialize	Deinitializes the specified instance of the GFX Module.
	GFX_Initialize	Initialize the GFX Library.
	GFX_Open	Opens the specified GFX library instance and returns a handle to it.
	GFX_Status	Gets the current status of the GFX Module.
	GFX_Tasks	Maintains the GFX module state machine. It manages the GFX Module object list items and responds to GFX Module primitive events.

Macros

	Name	Description
	GRAPHICS_LIBRARY_VERSION	////////////////// GRAPHICS_LIBRARY_VERSION ////////////////////// MSB is version, LSB is subversion

Structures

	Name	Description
	_GFX_OBJ	Defines the object required for interaction with the GFX Library.

	GFX_CLIENT_OBJ	GFX client object structure.
	GFX_OBJ	Defines the object required for interaction with the GFX Library.

Description

Module for Microchip Graphics Library

This header file includes all the header files required to use the Microchip Graphics Library. Library features and options defined in the Graphics Library configurations will be included in each build.

File Name

gfx.h

Company

Microchip Technology Inc.

gfx_colors.h

The header file contains default color definitions for each color depth.

Macros

	Name	Description
	BLACK	Basic colors definitions. The basic colors defined in this section are defined for basic demo requirements. End application can define additional colors or override existing default colors. If overriding an existing default color, define the new color value before the #include of Graphics.h to avoid the compile time warning. When using palette, a different file 'PaletteColorDefines.h' has to be used instead.
	BLUE	This is macro BLUE.
	BRIGHTBLUE	This is macro BRIGHTBLUE.
	BRIGHTCYAN	This is macro BRIGHTCYAN.
	BRIGHTGREEN	This is macro BRIGHTGREEN.
	BRIGHTMAGENTA	This is macro BRIGHTMAGENTA.
	BRIGHTRED	This is macro BRIGHTRED.
	BRIGHTYELLOW	This is macro BRIGHTYELLOW.
	BROWN	This is macro BROWN.
	BURLYWOOD	This is macro BURLYWOOD.
	CYAN	This is macro CYAN.
	DARKGRAY	This is macro DARKGRAY.
	DARKORANGE	This is macro DARKORANGE.
	GOLD	This is macro GOLD.
	GRAY000	This is macro GRAY000.
	GRAY001	This is macro GRAY001.
	GRAY002	This is macro GRAY002.
	GRAY003	This is macro GRAY003.
	GRAY004	This is macro GRAY004.
	GRAY005	This is macro GRAY005.
	GRAY006	This is macro GRAY006.

	LIGHTBLUE	This is macro LIGHTBLUE.
	LIGHTCYAN	This is macro LIGHTCYAN.
	LIGHTGRAY	This is macro LIGHTGRAY.
	LIGHTGREEN	This is macro LIGHTGREEN.
	LIGHTMAGENTA	This is macro LIGHTMAGENTA.
	LIGHTORANGE	This is macro LIGHTORANGE.
	LIGHTRED	This is macro LIGHTRED.
	LIGHTYELLOW	This is macro LIGHTYELLOW.
	MAGENTA	This is macro MAGENTA.
	ORANGE	This is macro ORANGE.
	PERU	This is macro PERU.
	RED	This is macro RED.
	SADDLEBROWN	This is macro SADDLEBROWN.
	SIENNA	This is macro SIENNA.
	TAN	This is macro TAN.
	WHEAT	This is macro WHEAT.
	WHITE	This is macro WHITE.
	YELLOW	This is macro YELLOW.

Description

Module for Microchip Graphics Library

This header file provides default color definitions as well as color conversion macros. Application may or may not use this file. Application may replace this file with new color definitions that fits the application needs.

File Name

gfx_colors.h

Company

Microchip Technology Inc.

gfx_common.h

This is file gfx_common.h.

gfx_colors_w3.h

The header file contains W3 color definitions.

Macros

	Name	Description
	GFX_W3_ALICEBLUE	This is macro GFX_W3_ALICEBLUE.
	GFX_W3_ANTIQUEWHITE	This is macro GFX_W3_ANTIQUEWHITE.
	GFX_W3_AQUA	This is macro GFX_W3_AQUA.
	GFX_W3_AQUAMARINE	This is macro GFX_W3_AQUAMARINE.
	GFX_W3_AZURE	This is macro GFX_W3_AZURE.
	GFX_W3_BEIGE	This is macro GFX_W3_BEIGE.
	GFX_W3_BISQUE	This is macro GFX_W3_BISQUE.
	GFX_W3_BLACK	This is macro GFX_W3_BLACK.
	GFX_W3_BLANCHEDALMOND	This is macro GFX_W3_BLANCHEDALMOND.
	GFX_W3_BLUE	This is macro GFX_W3_BLUE.

	GFX_W3_BLUEVIOLET	This is macro GFX_W3_BLUEVIOLET.
	GFX_W3_BROWN	This is macro GFX_W3_BROWN.
	GFX_W3_BURLYWOOD	This is macro GFX_W3_BURLYWOOD.
	GFX_W3_CADETBLUE	This is macro GFX_W3_CADETBLUE.
	GFX_W3_CHARTREUSE	This is macro GFX_W3_CHARTREUSE.
	GFX_W3_CHOCOLATE	This is macro GFX_W3_CHOCOLATE.
	GFX_W3_CORAL	This is macro GFX_W3_CORAL.
	GFX_W3_CORNFLOWERBLUE	This is macro GFX_W3_CORNFLOWERBLUE.
	GFX_W3_CORNSILK	This is macro GFX_W3_CORNSILK.
	GFX_W3_CRIMSON	This is macro GFX_W3_CRIMSON.
	GFX_W3_CYAN	This is macro GFX_W3_CYAN.
	GFX_W3_DARKBLUE	This is macro GFX_W3_DARKBLUE.
	GFX_W3_DARKCYAN	This is macro GFX_W3_DARKCYAN.
	GFX_W3_darkgoldenrod	This is macro GFX_W3_darkgoldenrod.
	GFX_W3_DARKGRAY	This is macro GFX_W3_DARKGRAY.
	GFX_W3_DARKGREEN	This is macro GFX_W3_DARKGREEN.
	GFX_W3_DARKGREY	This is macro GFX_W3_DARKGREY.
	GFX_W3_DARKHAKI	This is macro GFX_W3_DARKHAKI.
	GFX_W3_DARKMAGENTA	This is macro GFX_W3_DARKMAGENTA.
	GFX_W3_DARKOLIVEGREEN	This is macro GFX_W3_DARKOLIVEGREEN.
	GFX_W3_DARKORANGE	This is macro GFX_W3_DARKORANGE.
	GFX_W3_DARKORCHID	This is macro GFX_W3_DARKORCHID.
	GFX_W3_DARKRED	This is macro GFX_W3_DARKRED.
	GFX_W3_DARKSALMON	This is macro GFX_W3_DARKSALMON.
	GFX_W3_DARKSEAGREEN	This is macro GFX_W3_DARKSEAGREEN.
	GFX_W3_DARKSLATEBLUE	This is macro GFX_W3_DARKSLATEBLUE.
	GFX_W3_DARKSLATEGRAY	This is macro GFX_W3_DARKSLATEGRAY.
	GFX_W3_DARKSLATEGREY	This is macro GFX_W3_DARKSLATEGREY.
	GFX_W3_DARKTURQUOISE	This is macro GFX_W3_DARKTURQUOISE.
	GFX_W3_DARKVIOLET	This is macro GFX_W3_DARKVIOLET.
	GFX_W3_DEEPPINK	This is macro GFX_W3_DEEPPINK.
	GFX_W3_DEEPSKYBLUE	This is macro GFX_W3_DEEPSKYBLUE.
	GFX_W3_DIMGRAY	This is macro GFX_W3_DIMGRAY.
	GFX_W3_DIMGREY	This is macro GFX_W3_DIMGREY.
	GFX_W3_DODGERBLUE	This is macro GFX_W3_DODGERBLUE.
	GFX_W3_FIREBRICK	This is macro GFX_W3_FIREBRICK.
	GFX_W3_FLORALWHITE	This is macro GFX_W3_FLORALWHITE.
	GFX_W3_FORESTGREEN	This is macro GFX_W3_FORESTGREEN.
	GFX_W3_FUCHSIA	This is macro GFX_W3_FUCHSIA.
	GFX_W3_GAINSBORO	This is macro GFX_W3_GAINSBORO.
	GFX_W3_GHOSTWHITE	This is macro GFX_W3_GHOSTWHITE.
	GFX_W3_GOLD	This is macro GFX_W3_GOLD.
	GFX_W3_GOLDENROD	This is macro GFX_W3_GOLDENROD.
	GFX_W3_GRAY	This is macro GFX_W3_GRAY.
	GFX_W3_GREEN	This is macro GFX_W3_GREEN.
	GFX_W3_GREENYELLOW	This is macro GFX_W3_GREENYELLOW.
	GFX_W3_GREY	This is macro GFX_W3_GREY.
	GFX_W3_HONEYDEW	This is macro GFX_W3_HONEYDEW.
	GFX_W3_HOTPINK	This is macro GFX_W3_HOTPINK.
	GFX_W3_INDIANRED	This is macro GFX_W3_INDIANRED.
	GFX_W3_INDIGO	This is macro GFX_W3_INDIGO.
	GFX_W3_IVORY	This is macro GFX_W3_IVORY.
	GFX_W3_LAVENDER	This is macro GFX_W3_LAVENDER.
	GFX_W3_LAVENDERBLUSH	This is macro GFX_W3_LAVENDERBLUSH.
	GFX_W3_LAWNGREEN	This is macro GFX_W3_LAWNGREEN.

	GFX_W3_LEMONCHIFFON	This is macro GFX_W3_LEMONCHIFFON.
	GFX_W3_LIGHTBLUE	This is macro GFX_W3_LIGHTBLUE.
	GFX_W3_LIGHTCORAL	This is macro GFX_W3_LIGHTCORAL.
	GFX_W3_LIGHTCYAN	This is macro GFX_W3_LIGHTCYAN.
	GFX_W3_LIGHTGOLDENRODYELLOW	This is macro GFX_W3_LIGHTGOLDENRODYELLOW.
	GFX_W3_LIGHTGRAY	This is macro GFX_W3_LIGHTGRAY.
	GFX_W3_LIGHTGREEN	This is macro GFX_W3_LIGHTGREEN.
	GFX_W3_LIGHTGREY	This is macro GFX_W3_LIGHTGREY.
	GFX_W3_LIGHTPINK	This is macro GFX_W3_LIGHTPINK.
	GFX_W3_LIGHTSALMON	This is macro GFX_W3_LIGHTSALMON.
	GFX_W3_LIGHTSKYBLUE	This is macro GFX_W3_LIGHTSKYBLUE.
	GFX_W3_LIGHTSLATEGRAY	This is macro GFX_W3_LIGHTSLATEGRAY.
	GFX_W3_LIGHTSLATEGREY	This is macro GFX_W3_LIGHTSLATEGREY.
	GFX_W3_LIGHTSTEELBLUE	This is macro GFX_W3_LIGHTSTEELBLUE.
	GFX_W3_LIGHTYELLOW	This is macro GFX_W3_LIGHTYELLOW.
	GFX_W3_LIGTHSEAGREEN	This is macro GFX_W3_LIGTHSEAGREEN.
	GFX_W3_LIME	This is macro GFX_W3_LIME.
	GFX_W3_LIMEGREEN	This is macro GFX_W3_LIMEGREEN.
	GFX_W3_LINEN	This is macro GFX_W3_LINEN.
	GFX_W3_MAGENTA	This is macro GFX_W3_MAGENTA.
	GFX_W3_MAROON	This is macro GFX_W3_MAROON.
	GFX_W3_MEDIUMAQUAMARINE	This is macro GFX_W3_MEDIUMAQUAMARINE.
	GFX_W3_MEDIUMBLUE	This is macro GFX_W3_MEDIUMBLUE.
	GFX_W3_MEDIUMORCHID	This is macro GFX_W3_MEDIUMORCHID.
	GFX_W3_MEDIUMPURPLE	This is macro GFX_W3_MEDIUMPURPLE.
	GFX_W3_MEDIUMSEAGREEN	This is macro GFX_W3_MEDIUMSEAGREEN.
	GFX_W3_MEDIUMSLATEBLUE	This is macro GFX_W3_MEDIUMSLATEBLUE.
	GFX_W3_MEDIUMSPRINGGREEN	This is macro GFX_W3_MEDIUMSPRINGGREEN.
	GFX_W3_MEDIUMTURQUOISE	This is macro GFX_W3_MEDIUMTURQUOISE.
	GFX_W3_MEDIUMVIOLETRED	This is macro GFX_W3_MEDIUMVIOLETRED.
	GFX_W3_MIDNIGHTBLUE	This is macro GFX_W3_MIDNIGHTBLUE.
	GFX_W3_MINTCREAM	This is macro GFX_W3_MINTCREAM.
	GFX_W3_MISTYROSE	This is macro GFX_W3_MISTYROSE.
	GFX_W3_MOCCASIN	This is macro GFX_W3_MOCCASIN.
	GFX_W3_NAVAJOWHITE	This is macro GFX_W3_NAVAJOWHITE.
	GFX_W3_NAVY	This is macro GFX_W3_NAVY.
	GFX_W3_OLDLACE	This is macro GFX_W3_OLDLACE.
	GFX_W3_OLIVE	This is macro GFX_W3_OLIVE.
	GFX_W3_OLIVEDRAB	This is macro GFX_W3_OLIVEDRAB.
	GFX_W3_ORANGE	This is macro GFX_W3_ORANGE.
	GFX_W3_ORANGERED	This is macro GFX_W3_ORANGERED.
	GFX_W3_ORCHID	This is macro GFX_W3_ORCHID.
	GFX_W3_PALEGOLDENROD	This is macro GFX_W3_PALEGOLDENROD.
	GFX_W3_PALEGREEN	This is macro GFX_W3_PALEGREEN.
	GFX_W3_PALETURQUOISE	This is macro GFX_W3_PALETURQUOISE.
	GFX_W3_PALEVIOLETRED	This is macro GFX_W3_PALEVIOLETRED.
	GFX_W3_PAPAYAWHIP	This is macro GFX_W3_PAPAYAWHIP.
	GFX_W3_PEACHPUFF	This is macro GFX_W3_PEACHPUFF.
	GFX_W3_PERU	This is macro GFX_W3_PERU.
	GFX_W3_PINK	This is macro GFX_W3_PINK.
	GFX_W3_PLUM	This is macro GFX_W3_PLUM.
	GFX_W3_POWDERBLUE	This is macro GFX_W3_POWDERBLUE.
	GFX_W3_PURPLE	This is macro GFX_W3_PURPLE.
	GFX_W3_RED	This is macro GFX_W3_RED.
	GFX_W3_ROSYBROWN	This is macro GFX_W3_ROSYBROWN.

	GFX_W3_ROYALBLUE	This is macro GFX_W3_ROYALBLUE.
	GFX_W3_SADDLEBROWN	This is macro GFX_W3_SADDLEBROWN.
	GFX_W3_SALMON	This is macro GFX_W3_SALMON.
	GFX_W3_SANDYGREEN	This is macro GFX_W3_SANDYGREEN.
	GFX_W3_SEAGREEN	This is macro GFX_W3_SEAGREEN.
	GFX_W3_SEASHELL	This is macro GFX_W3_SEASHELL.
	GFX_W3_SIENNA	This is macro GFX_W3_SIENNA.
	GFX_W3_SILVER	This is macro GFX_W3_SILVER.
	GFX_W3_SKYBLUE	This is macro GFX_W3_SKYBLUE.
	GFX_W3_SLATEBLUE	This is macro GFX_W3_SLATEBLUE.
	GFX_W3_SLATEGRAY	This is macro GFX_W3_SLATEGRAY.
	GFX_W3_SLATEGREY	This is macro GFX_W3_SLATEGREY.
	GFX_W3_SNOW	This is macro GFX_W3_SNOW.
	GFX_W3_SPRINGGREEN	This is macro GFX_W3_SPRINGGREEN.
	GFX_W3_STEELBLUE	This is macro GFX_W3_STEELBLUE.
	GFX_W3_TAN	This is macro GFX_W3_TAN.
	GFX_W3_TEAL	This is macro GFX_W3_TEAL.
	GFX_W3_THISTLE	This is macro GFX_W3_THISTLE.
	GFX_W3_TOMATO	This is macro GFX_W3_TOMATO.
	GFX_W3_TURQUOISE	This is macro GFX_W3_TURQUOISE.
	GFX_W3_VIOLET	This is macro GFX_W3_VIOLET.
	GFX_W3_WHEAT	This is macro GFX_W3_WHEAT.
	GFX_W3_WHITE	This is macro GFX_W3_WHITE.
	GFX_W3_WHITESMOKE	This is macro GFX_W3_WHITESMOKE.
	GFX_W3_YELLOW	This is macro GFX_W3_YELLOW.
	GFX_W3_YELLOWGREEN	This is macro GFX_W3_YELLOWGREEN.
	KHAKI	This is macro KHAKI.

Description

Module for Microchip Graphics Library

This header file provides W3 color definitions as an option of color definitions to use.

Remarks

	GFX_X11_MEDIUM_SLATE_BLUE	This is macro GFX_X11_MEDIUM_SLATE_BLUE.
	GFX_X11_MEDIUM_SPRING_GREEN	This is macro GFX_X11_MEDIUM_SPRING_GREEN.
	GFX_X11_MEDIUM_TURQUOISE	This is macro GFX_X11_MEDIUM_TURQUOISE.
	GFX_X11_MEDIUM_VIOLET_RED	This is macro GFX_X11_MEDIUM_VIOLET_RED.
	GFX_X11_MIDNIGHT_BLUE	This is macro GFX_X11_MIDNIGHT_BLUE.
	GFX_X11_MINT_CREAM	This is macro GFX_X11_MINT_CREAM.
	GFX_X11_MISTY_ROSE	This is macro GFX_X11_MISTY_ROSE.
	GFX_X11_MOCCASIN	This is macro GFX_X11_MOCCASIN.
	GFX_X11_NAVAJO_WHITE	This is macro GFX_X11_NAVAJO_WHITE.
	GFX_X11_NAVY	This is macro GFX_X11_NAVY.
	GFX_X11_OLD_LACE	This is macro GFX_X11_OLD_LACE.
	GFX_X11_OLIVE	This is macro GFX_X11_OLIVE.
	GFX_X11_OLIVE_DRAB	This is macro GFX_X11_OLIVE_DRAB.
	GFX_X11_ORANGE	This is macro GFX_X11_ORANGE.
	GFX_X11_ORANGE_RED	X11: Orange Colors
	GFX_X11_ORCHID	This is macro GFX_X11_ORCHID.
	GFX_X11_PALE_GOLDENROD	This is macro GFX_X11_PALE_GOLDENROD.
	GFX_X11_PALE_GREEN	This is macro GFX_X11_PALE_GREEN.
	GFX_X11_PALE_TURQUOISE	This is macro GFX_X11_PALE_TURQUOISE.
	GFX_X11_PALE_VIOLET_RED	This is macro GFX_X11_PALE_VIOLET_RED.
	GFX_X11_PAPAYA_WHIP	This is macro GFX_X11_PAPAYA_WHIP.
	GFX_X11_PEACH_PUFF	This is macro GFX_X11_PEACH_PUFF.
	GFX_X11_PERU	This is macro GFX_X11_PERU.
	GFX_X11_PINK	X11: Pink Colors
	GFX_X11_PLUM	This is macro GFX_X11_PLUM.
	GFX_X11_POWDER_BLUE	This is macro GFX_X11_POWDER_BLUE.
	GFX_X11_PURPLE	This is macro GFX_X11_PURPLE.
	GFX_X11_RED	This is macro GFX_X11_RED.
	GFX_X11_ROSY_BROWN	This is macro GFX_X11_ROSY_BROWN.
	GFX_X11_ROYAL_BLUE	This is macro GFX_X11_ROYAL_BLUE.
	GFX_X11_SADDLE_BROWN	This is macro GFX_X11_SADDLE_BROWN.
	GFX_X11_SALMON	This is macro GFX_X11_SALMON.
	GFX_X11_SANDY_BROWN	This is macro GFX_X11_SANDY_BROWN.
	GFX_X11_SEA_GREEN	This is macro GFX_X11_SEA_GREEN.

	GFX_X11_SEASHELL	This is macro GFX_X11_SEASHELL.
	GFX_X11_SIENNA	This is macro GFX_X11_SIENNA.
	GFX_X11_SILVER	This is macro GFX_X11_SILVER.
	GFX_X11_SKY_BLUE	This is macro GFX_X11_SKY_BLUE.
	GFX_X11_SLATE_BLUE	This is macro GFX_X11_SLATE_BLUE.
	GFX_X11_SLATE_GREY	This is macro GFX_X11_SLATE_GREY.
	GFX_X11_SNOW	This is macro GFX_X11_SNOW.
	GFX_X11_SPRING_GREEN	This is macro GFX_X11_SPRING_GREEN.
	GFX_X11_STEEL_BLUE	This is macro GFX_X11_STEEL_BLUE.
	GFX_X11_TAN	This is macro GFX_X11_TAN.
	GFX_X11_TEAL	This is macro GFX_X11_TEAL.
	GFX_X11_THISTLE	This is macro GFX_X11_THISTLE.
	GFX_X11_TOMATO	This is macro GFX_X11_TOMATO.
	GFX_X11_TURQUOISE	This is macro GFX_X11_TURQUOISE.
	GFX_X11_VIOLET	This is macro GFX_X11_VIOLET.
	GFX_X11_WHEAT	This is macro GFX_X11_WHEAT.
	GFX_X11_WHITE	X11: WHITE/GRAY/BLACK COLORS
	GFX_X11_WHITE_SMOKE	This is macro GFX_X11_WHITE_SMOKE.
	GFX_X11_YELLOW	X11: Yellow Colors
	GFX_X11_YELLOW_GREEN	This is macro GFX_X11_YELLOW_GREEN.

Enumerations

	Name	Description
	GFX_GOL_CLIENT_STATUS	Enumerated data type that identifies the GFX Module Client Status.
	GFX_GOL_COMMON_STATE_BITS	Common Object States.
	GFX_GOL_OBJ_TYPE	Specifies the different object types used in the library.
	GFX_GOL_OBJECT_TASK	Lists the different states that GFX GOL task routine can have.
	GFX_GOL_STATES	Defines the various states that can be achieved by the GFX GOL operation.
	GFX_GOL_TRANSLATED_ACTION	Specifies the different object actions supported in the library.

Functions

	Name	Description
	GFX_GOL_Deinitialize	Deinitializes the specified instance of the GFX Module.
	GFX_GOL_DrawCallbackSet	This function sets the draw callback function that the application will use to render application specific rendering.
	GFX_GOL_Initialize	Initialize the GFX GOL Library.
	GFX_GOL_MessageCallbackSet	This function sets the message callback function that the application will use to evaluate user inputs that affects the objects and application behavior.
	GFX_GOL_ObjectAdd	This function adds an object to the tail of the currently active list.
	GFX_GOL_ObjectBackGroundSet	This function sets the background information.
	GFX_GOL_ObjectByIDDelete	This function removes an object with the given user defined ID from the currently active list.
	GFX_GOL_ObjectCanBeFocused	Checks if the object can be focused.

	GFX_GOL_ObjectDelete	This function removes an object from the currently active list.
	GFX_GOL_ObjectDrawDisable	This function resets the drawing state bits of the object.
	GFX_GOL_ObjectDrawEnable	This function sets the object to be redraw.
	GFX_GOL_ObjectFind	This function returns the pointer to object in the list with the user defined ID assigned to it.
	GFX_GOL_ObjectFocusGet	This function returns the pointer to the object that is currently receiving keyboard input (or focused).
	GFX_GOL_ObjectFocusNextGet	This function returns the pointer to the next object in the active list of objects which can be focused.
	GFX_GOL_ObjectFocusPrevGet	This function returns the pointer to the previous object in the active list of objects which can be focused.
	GFX_GOL_ObjectFocusSet	This function sets the object to be focused.
	GFX_GOL_ObjectHideDraw	This function performs the hiding of an object from the screen.
	GFX_GOL_ObjectIDGet	This function returns the object ID.
	GFX_GOL_ObjectIsRedrawSet	This function checks if the object needs to be redrawn or not.
	GFX_GOL_ObjectListDraw	This function redraws all objects in the current active list that has the rendering state bits set.
	GFX_GOL_ObjectListFree	This function sets the active list to the new list.
	GFX_GOL_ObjectListGet	This function returns the current active list.
	GFX_GOL_ObjectListHide	This function marks all objects in the active list to be hidden.
	GFX_GOL_ObjectListNew	This function removes an object with the given user defined ID from the currently active list.
	GFX_GOL_ObjectListSet	This function sets the active list to the new list.
	GFX_GOL_ObjectMessage	This function process the received message from the user to determine the affected objects. Depending on the message and the affected objects, object states are modified based on the default or user-defined behavior.
	GFX_GOL_ObjectNextGet	This function returns the pointer to next object in the list after the specified object.
	GFX_GOL_ObjectRectangleRedraw	This function marks all objects in the active list intersected by the given rectangular area to be redrawn.
	GFX_GOL_ObjectTypeGet	This function returns the object type.
	GFX_GOL_Open	opens an instance of the GFX GOL Library.
	GFX_GOL_PanelAlphaParameterSet	This function sets the alpha blending value when using alpha blending in panels.
	GFX_GOL_PanelBackgroundSet	This function sets panel background information.
	GFX_GOL_PanelDraw	This function renders the panel.
	GFX_GOL_PanelGradientParameterSet	This function sets the gradient fill start and end colors of a panel.
	GFX_GOL_PanelParameterSet	This function sets the parameters to draw a panel.
	GFX_GOL_PreemptionLevelGet	This function returns the current preemption level.
	GFX_GOL_Tasks	Maintains the GFX GOL module state machine. It manages the GFX Module object list items and responds to GFX Module primitive events.
	GFX_GOL_TwoTonePanelDraw	This function renders the two-tone panel.

Macros

	Name	Description
	GFX_GOL_ObjectStateClear	This function clears the state bits of the given object.
	GFX_GOL_ObjectStateGet	This function retrieves the current value of the state bits of an object.
	GFX_GOL_ObjectStateSet	This function sets the state bits of the given object.
	GFX_GOL_ObjectStyleSchemeGet	This function returns the style scheme currently set for the object.
	GFX_GOL_ObjectStyleSchemeSet	This function sets the style scheme of the object.

Structures

	Name	Description
	GFX_GOL_MESSAGE	Specifies message structure used in the library.
	GFX_GOL_OBJ_HEADER	Specifies Graphics Object Layer structure used in objects.
	GOL_PANEL_PARAM	Specifies panel parameters.

Types

	Name	Description
	GFX_GOL_DRAW_CALLBACK_FUNC	Draw callback function definition. This application defined function allows the application to perform application specific rendering.

	GFX_GOL_MESSAGE_CALLBACK_FUNC	Message callback function definition. This application defined function allows the application to perform application specific processing of user messages.

Description

Module for Microchip Graphics Library - Graphic Object Layer

This module implements the common routines for the Graphics Object Layer of the Microchip Graphics Library. The routines are independent of the Display Driver Layer and should be compatible with any Display Driver that is compliant with the requirements of the Display Driver Layer of the Graphics Library. The module utilizes the Graphics Primitive Layer to render the objects.

File Name

gfx_gol.h

Company

Microchip Technology Inc.

gfx_gol_button.h

This is the header file for the button object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_BUTTON_STATE	Specifies the different states of the Button object.

Functions

	Name	Description
	GFX_GOL_ButtonActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ButtonActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_ButtonCreate	This function creates a GFX_GOL_BUTTON object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ButtonDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ButtonTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_ButtonTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_ButtonTextSet	This function sets the address of the current text string used by the object.

Macros

	Name	Description
	GFX_GOL_ButtonPressStateImageGet	This function gets the image used when in the pressed state.
	GFX_GOL_ButtonPressStateImageSet	This function sets the image to be used when in the pressed state.
	GFX_GOL_ButtonReleaseStateImageGet	This function gets the image used when in the released state.
	GFX_GOL_ButtonReleaseStateImageSet	This function sets the image to be used when in the released state.
	GFX_GOL_ButtonTextGet	This function returns the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_BUTTON	Defines the structure used for the Button object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the GFX_GOL_BUTTON Object.

File Name

gfx_gol_button.h

Company

Microchip Technology Inc.

gfx_gol_check_box.h

This is the header file for the check box object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_CHECKBOX_STATE	Specifies the different states of the Check Box object.

Functions

	Name	Description
	GFX_GOL_CheckBoxActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_CheckBoxActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_CheckBoxCreate	This function creates a GFX_GOL_CHECKBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_CheckBoxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_CheckBoxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_CheckBoxTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_CheckBoxTextSet	This function sets the address of the current text string used by the object.

Macros

	Name	Description
	GFX_GOL_CheckBoxTextGet	This function returns the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_CHECKBOX	Defines the structure used for the Check Box object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the CheckBox Object.

File Name

gfx_gol_check_box.h

Company

Microchip Technology Inc.

gfx_gol_custom_control.h

This is the header file for the custom control object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_CUSTOMCONTROL_STATE	Specifies the different states of the Custom Control object.

Functions

	Name	Description
	GFX_GOL_CustomControlActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_CustomControlActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_CustomControlCreate	This function creates a GFX_GOL_CUSTOMCONTROL object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_CustomControlDraw	This function renders the object on the screen based on the current state of the object.

Macros

	Name	Description
	GFX_GOL_CustomControlGetPos	This function returns the position of the control.
	GFX_GOL_CustomControlSetPos	This function sets the position of the control.

Structures

	Name	Description
	GFX_GOL_CUSTOMCONTROL	Defines the structure used for the Custom Control object.

Description

Graphics Library Implementation

Refer to Microchip Graphics Library for complete documentation of the CustomControl Object.

File Name

gfx_gol_custom_control.c

Company

Microchip Technology Inc.

gfx_gol_digital_meter.h

This is the header file for the digital meter object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_DIGITALMETER_STATE	Specifies the different states of the Digital Meter object.

Functions

	Name	Description
	GFX_GOL_DigitalMeterActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_DigitalMeterCreate	This function creates a GFX_GOL_DIGITALMETER object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_DigitalMeterDecrement	This function decrements the meter value by the delta value set.
	GFX_GOL_DigitalMeterDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_DigitalMeterIncrement	This function increments the meter value by the delta value set.
	GFX_GOL_DigitalMeterValueSet	This function sets the value of the meter.

Macros

	Name	Description
	GFX_GOL_DigitalMeterTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_DigitalMeterTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_DigitalMeterValueGet	This function returns the current value of the digital meter.

Structures

	Name	Description
	GFX_GOL_DIGITALMETER	Defines the structure used for the Digital Meter object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Digital Meter Object.

File Name

gfx_gol_digital_meter.h

Company

Microchip Technology Inc.

gfx_gol_edit_box.h

This is the header file for the edit box object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_EDITBOX_STATE	Specifies the different states of the Edit Box object.

Functions

	Name	Description
	GFX_GOL_EditBoxActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_EditBoxActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_EditBoxCharAdd	This function adds a character at the end of the text used by the object.
	GFX_GOL_EditBoxCharRemove	This function removes a character at the end of the text used by the object.
	GFX_GOL_EditBoxCreate	This function creates a GFX_GOL_EDITBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_EditBoxCursorPositionDecrement	Decrement cursor position.
	GFX_GOL_EditBoxCursorPositionIncrement	Increment cursor position.
	GFX_GOL_EditBoxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_EditBoxTextSet	This function sets the text in the object.

Macros

	Name	Description
	GFX_GOL_EditBoxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_EditBoxTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_EditBoxTextGet	This function returns the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_EDITBOX	Defines the structure used for the Edit Box object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Edit Box Object.

File Name

gfx_gol_edit_box.h

Company

Microchip Technology Inc.

gfx_gol_group_box.h

This is the header file for the group box object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_GROUPBOX_STATE	Specifies the different states of the Group Box object.

Functions

	Name	Description
	GFX_GOL_GroupboxActionGet	This function evaluates the message from a user if the message will affect the object or not.

	GFX_GOL_GroupboxCreate	This function creates a GFX_GOL_GROUPBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_GroupboxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_GroupboxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_GroupboxTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_GroupboxTextSet	This function sets the address of the current text string used by the object.

Macros

	Name	Description
	GFX_GOL_GroupboxTextGet	This function returns the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_GROUPBOX	Defines the structure used for the Group Box object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Group Box Object.

File Name

gfx_gol_group_box.h

Company

Microchip Technology Inc.

gfx_gol_list_box.h

This is the header file for the list box object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_LISTBOX_ITEM_STATUS	Defines the types used to indicate the status of an item.
	GFX_GOL_LISTBOX_STATE	Specifies the different states of the List Box object.

Functions

	Name	Description
	GFX_GOL_ListBoxActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ListBoxActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_ListBoxCreate	This function creates a GFX_GOL_LISTBOX object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ListBoxDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ListBoxItemAdd	This function adds an item to the list box.
	GFX_GOL_ListBoxItemFocusGet	This function returns the index of the focused item in the list box.
	GFX_GOL_ListBoxItemFocusSet	This function sets the focus of the item with the index number specified by index.
	GFX_GOL_ListBoxItemListRemove	This function removes the entire items list of the list box and free the memory used.
	GFX_GOL_ListBoxItemRemove	This function removes an item from the list box and free the memory used.
	GFX_GOL_ListBoxSelectionChange	This function changes the selection status of the given item in the list box.
	GFX_GOL_ListBoxSelectionGet	This function searches for selected items from the list box.
	GFX_GOL_ListBoxVisibleItemCountGet	This function returns the count of items visible in the list box.

Macros

	Name	Description
	GFX_GOL_ListBoxItemCountGet	This function returns the count of items in the list box.
	GFX_GOL_ListBoxItemImageGet	This function gets the image set for a list box item.
	GFX_GOL_ListBoxItemImageSet	This function sets the image for a list box item.

	GFX_GOL_ListBoxItemListGet	This function returns the pointer to the item list of the list box.
	GFX_GOL_ListBoxItemSelectStatusClear	This function clears the selection status of the item.
	GFX_GOL_ListBoxItemSelectStatusSet	This function sets the selection status of the item to selected.
	GFX_GOL_ListBoxTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_ListBoxTextAlignmentSet	This function sets the text alignment of the text string used by the object.

Structures

	Name	Description
	GFX_GOL_LISTBOX	Defines the structure used for the List Box object.
	GFX_GOL_LISTITEM	The structure that defines each item in the list box.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the ListBox Object.

File Name

gfx_gol_list_box.h

Company

Microchip Technology Inc.

gfx_gol_meter.h

This is the header file for the meter object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_METER_DRAW_TYPE	Specifies the different types of Meter object.
	GFX_GOL_METER_STATE	Specifies the different states of the Meter object.

Functions

	Name	Description
	GFX_GOL_MeterActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_MeterActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_MeterCreate	This function creates a GFX_GOL_METER object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_MeterDecrement	This function decrements the meter value by the delta value set.
	GFX_GOL_MeterDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_MeterIncrement	This function increments the meter value by the delta value set.
	GFX_GOL_MeterRangeSet	This function sets the range of the meter.
	GFX_GOL_MeterScaleColorsSet	This function sets the arc colors of the object.
	GFX_GOL_MeterValueSet	This function sets the value of the meter.

Macros

	Name	Description
	GFX_GOL_MeterMaximumValueGet	This function returns the maximum value set for the meter.
	GFX_GOL_MeterMinimumValueGet	This function returns the minimum value set for the meter.
	GFX_GOL_MeterTitleFontSet	This function sets the meter title font used.
	GFX_GOL_MeterTypeSet	This function sets the meter draw type.
	GFX_GOL_MeterValueFontSet	This function sets the meter's displayed value font used.
	GFX_GOL_MeterValueGet	This function returns the current value of the meter.

Structures

	Name	Description
	GFX_GOL_METER	Defines the structure used for the Meter object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Meter Object.

File Name

gfx_gol_meter.h

Company

Microchip Technology Inc.

gfx_gol_picture.h

This is the header file for the picture object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_PICTURECONTROLCONTROL_STATE	Specifies the different states of the Picture Control object.

Functions

	Name	Description
	GFX_GOL_PictureControlActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_PictureControlCreate	This function creates a GFX_GOL_PICTURECONTROL object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_PictureControlDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_PictureControlPartialSet	This function sets the partial image parameters to be in the object.
	GFX_GOL_PictureControlScaleSet	Sets the scale factor used to render the image used in the object.

Macros

	Name	Description
	GFX_GOL_PictureControlImageGet	This function gets the image used when in the pressed state.
	GFX_GOL_PictureControlImageSet	This function sets the image to be in the object.

Structures

	Name	Description
	GFX_GOL_PICTURECONTROL	Defines the structure used for the Picture Control object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Picture Object.

File Name

gfx_gol_picture.h

Company

Microchip Technology Inc.

gfx_gol_progress_bar.h

This is the header file for the progress bar object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_PROGRESSBAR_STATE	Specifies the different states of the Progress Bar object.

Functions

	Name	Description
	GFX_GOL_ProgressBarActionGet	This function evaluates the message from a user if the message will affect the object or not.

	GFX_GOL_ProgressBarCreate	This function creates a GFX_GOL_PROGRESSBAR object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ProgressBarDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ProgressBarPositionSet	This function sets the position of the progress bar.
	GFX_GOL_ProgressBarRangeSet	This function sets the range of the progress bar.

Macros

	Name	Description
	GFX_GOL_ProgressBarPositionGet	This function returns the current position of the progress bar.
	GFX_GOL_ProgressBarRangeGet	This function returns the range of the progress bar.

Structures

	Name	Description
	GFX_GOL_PROGRESSBAR	Defines the structure used for the Progress Bar object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the ProgressBar Object.

File Name

gfx_gol_progress_bar.h

Company

Microchip Technology Inc.

gfx_gol_radio_button.h

This is the header file for the radio button object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_RADIOBUTTON_STATE	Specifies the different states of the Radio Button object.

Functions

	Name	Description
	GFX_GOL_RadioButtonActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_RadioButtonActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_RadioButtonCheckGet	This function returns the ID of the currently checked radio button in the group.
	GFX_GOL_RadioButtonCheckSet	This function sets the ID of the currently checked radio button in the group.
	GFX_GOL_RadioButtonCreate	This function creates a GFX_GOL_RADIOBUTTON object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_RadioButtonDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_RadioButtonListCreate	This is function GFX_GOL_RadioButtonListCreate.
	GFX_GOL_RadioButtonTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_RadioButtonTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_RadioButtonTextSet	This function sets the address of the current text string used by the object.

Macros

	Name	Description
	GFX_GOL_RadioButtonTextGet	This function returns the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_RADIOBUTTON	Defines the structure used for the Radio Button object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the RadioButton Object.

File Name

gfx_gol_radio_button.h

Company

Microchip Technology Inc.

gfx_gol_scan_codes.h

This is the header file for the AT keyboard codes.

Enumerations

	Name	Description
	GFX_AT_SCAN_CODES	The following macros are the supported AT Keyboard scan codes.

Description

Module for Microchip Graphics Library - Graphic Object Layer

This header file contains scan codes for the standard AT keyboard that can be used to process user action in GOL messages.

File Name

gfx_gol_scan_codes.h

Company

Microchip Technology Inc.

gfx_gol_scheme.h

Graphics Object Layer Scheme routines/macros of the Microchip Graphics Library.

Functions

	Name	Description
	GFX_GOL_SchemeAlphaPrecentSet	This is function GFX_GOL_SchemeAlphaPrecentSet.
	GFX_GOL_SchemeBackgroundColorGet	This is function GFX_GOL_SchemeBackgroundColorGet.
	GFX_GOL_SchemeBackgroundColorSet	This is function GFX_GOL_SchemeBackgroundColorSet.
	GFX_GOL_SchemeBackgroundImageSet	This is function GFX_GOL_SchemeBackgroundImageSet.
	GFX_GOL_SchemeBackgroundTypeGet	This is function GFX_GOL_SchemeBackgroundTypeGet.
	GFX_GOL_SchemeBackgroundTypeSet	This is function GFX_GOL_SchemeBackgroundTypeSet.
	GFX_GOL_SchemeColor0Get	This is function GFX_GOL_SchemeColor0Get.
	GFX_GOL_SchemeColor0Set	This is function GFX_GOL_SchemeColor0Set.
	GFX_GOL_SchemeColor1Get	This is function GFX_GOL_SchemeColor1Get.
	GFX_GOL_SchemeColor1Set	This is function GFX_GOL_SchemeColor1Set.
	GFX_GOL_SchemeColorDisabledGet	This is function GFX_GOL_SchemeColorDisabledGet.
	GFX_GOL_SchemeColorDisabledSet	This is function GFX_GOL_SchemeColorDisabledSet.
	GFX_GOL_SchemeColorSet	This is function GFX_GOL_SchemeColorSet.
	GFX_GOL_SchemeEmbossDarkColorGet	This is function GFX_GOL_SchemeEmbossDarkColorGet.
	GFX_GOL_SchemeEmbossDarkColorSet	This is function GFX_GOL_SchemeEmbossDarkColorSet.
	GFX_GOL_SchemeEmbossLightColorGet	This is function GFX_GOL_SchemeEmbossLightColorGet.
	GFX_GOL_SchemeEmbossLightColorSet	This is function GFX_GOL_SchemeEmbossLightColorSet.
	GFX_GOL_SchemeEmbossSet	This is function GFX_GOL_SchemeEmbossSet.
	GFX_GOL_SchemeEmbossSizeGet	This is function GFX_GOL_SchemeEmbossSizeGet.
	GFX_GOL_SchemeEmbossSizeSet	This is function GFX_GOL_SchemeEmbossSizeSet.
	GFX_GOL_SchemeFillStyleGet	This is function GFX_GOL_SchemeFillStyleGet.
	GFX_GOL_SchemeFillStyleSet	This is function GFX_GOL_SchemeFillStyleSet.
	GFX_GOL_SchemeFontGet	This is function GFX_GOL_SchemeFontGet.

	GFX_GOL_SchemeFontSet	This is function GFX_GOL_SchemeFontSet.
	GFX_GOL_SchemeGradientColorSet	This is function GFX_GOL_SchemeGradientColorSet.
	GFX_GOL_SchemeGradientEndColorGet	This is function GFX_GOL_SchemeGradientEndColorGet.
	GFX_GOL_SchemeGradientEndColorSet	This is function GFX_GOL_SchemeGradientEndColorSet.
	GFX_GOL_SchemeGradientStartColorGet	This is function GFX_GOL_SchemeGradientStartColorGet.
	GFX_GOL_SchemeGradientStartColorSet	This is function GFX_GOL_SchemeGradientStartColorSet.
	GFX_GOL_SchemeTextColor0Get	This is function GFX_GOL_SchemeTextColor0Get.
	GFX_GOL_SchemeTextColor0Set	This is function GFX_GOL_SchemeTextColor0Set.
	GFX_GOL_SchemeTextColor1Get	This is function GFX_GOL_SchemeTextColor1Get.
	GFX_GOL_SchemeTextColor1Set	This is function GFX_GOL_SchemeTextColor1Set.
	GFX_GOL_SchemeTextColorDisableGet	This is function GFX_GOL_SchemeTextColorDisableGet.
	GFX_GOL_SchemeTextColorDisableSet	This is function GFX_GOL_SchemeTextColorDisableSet.
	GFX_GOL_SchemeTextColorSet	This is function GFX_GOL_SchemeTextColorSet.

Structures

	Name	Description
	GFX_GOL_OBJ_SCHEME	This structure specifies the style scheme components of an object.

Description

Module for Microchip Graphics Library - Graphic Object Layer Scheme

This module implements the common routines for the Graphics Object Layer of the Microchip Graphics Library. The routines are independent of the Display Driver Layer and should be compatible with any Display Driver that is compliant with the requirements of the Display Driver Layer of the Graphics Library. The module utilizes the Graphics Primitive Layer to render the objects.

File Name

gfx_gol_scheme.h

Company

Microchip Technology Inc.

gfx_gol_scroll_bar.h

This is the header file for the scroll bar object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_SCROLLBAR_STATE	Specifies the different states of the Scroll Bar object.

Functions

	Name	Description
	GFX_GOL_ScrollBarActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_ScrollBarActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_ScrollBarCreate	This function creates a GFX_GOL_SCROLLBAR object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_ScrollBarDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_ScrollBarPageGet	This function returns the page size of the object.
	GFX_GOL_ScrollBarPageSet	This function sets the page size of the object.
	GFX_GOL_ScrollBarPositionDecrement	This function decrements the scroll bar position by the delta change (page) value set.
	GFX_GOL_ScrollBarPositionGet	This function returns the current position of the scroll bar thumb.
	GFX_GOL_ScrollBarPositionIncrement	This function increments the scroll bar position by the delta change (page) value set.
	GFX_GOL_ScrollBarPositionSet	This function sets the position of the scroll bar thumb.
	GFX_GOL_ScrollBarRangeGet	This function returns the range of the thumb of the scroll bar.
	GFX_GOL_ScrollBarRangeSet	This function sets the range of the thumb of the scroll bar.

Structures

	Name	Description
	GFX_GOL_SCROLLBAR	Defines the structure used for the Scroll Bar object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Slider Object.

File Name

gfx_gol_scroll_bar.h

Company

Microchip Technology Inc.

gfx_gol_static_text.h

This is the header file for the static text object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_STATICTEXT_STATE	Specifies the different states of the Static Text object.

Functions

	Name	Description
	GFX_GOL_StaticTextActionGet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_StaticTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_StaticTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_StaticTextCreate	This function creates a GFX_GOL_STATICTEXT object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_StaticTextDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_StaticTextGet	This function returns the address of the current text string used by the object.
	GFX_GOL_StaticTextSet	This function sets the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_STATICTEXT	Defines the structure used for the Static Text object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Static Text Object.

File Name

gfx_gol_static_text.h

Company

Microchip Technology Inc.

gfx_gol_surface.h

This is the header file for the surface object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_SURFACE_STATE	Specifies the different states of the Surface object.

Functions

	Name	Description
	GFX_GOL_SurfaceActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_SurfaceCreate	This function creates a GFX_GOL_SURFACE object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_SurfaceDraw	This function renders the object on the screen based on the current state of the object.

Macros

	Name	Description
	GFX_GOL_SurfaceImageGet	This function gets the image used.
	GFX_GOL_SurfaceImageSet	This function sets the image used in the object.

Structures

	Name	Description
	GFX_GOL_SURFACE	Defines the structure used for the Surface object.

Types

	Name	Description
	GFX_GOL_SURFACE_CALLBACK_FUNC	Surface callback function definition. This application defined function allows the application to perform application specific rendering.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Surface Object.

File Name

gfx_gol_surface.h

Company

Microchip Technology Inc.

gfx_gol_text_entry.h

This is the header file for the text entry object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_TEXTENTRY_KEY_COMMAND_TYPE	Specifies the different commands available for command keys of the Text Entry object.
	GFX_GOL_TEXTENTRY_STATE	Specifies the different states of the Text Entry object.

Functions

	Name	Description
	GFX_GOL_TextEntryActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_TextEntryActionSet	This function performs the state change of the object based on the translated action.
	GFX_GOL_TextEntryBufferClear	This function will clear the data in the display.
	GFX_GOL_TextEntryBufferGet	This function returns the buffer used to display text.
	GFX_GOL_TextEntryBufferSet	This function sets the buffer used to display text.
	GFX_GOL_TextEntryCharAdd	This function will insert a character to the end of the buffer.
	GFX_GOL_TextEntryCreate	This function creates a GFX_GOL_TEXTENTRY object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_TextEntryDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_TextEntryKeyCommandGet	This function will return the currently assigned command to the key with the given index.
	GFX_GOL_TextEntryKeyCommandSet	This function will assign a command to a key with the given index.

	GFX_GOL_TextEntryKeyIsPressed	This function will test if a key given by its index in the object is pressed.
	GFX_GOL_TextEntryKeyListCreate	This function will create the list of key members that holds the information on each key.
	GFX_GOL_TextEntryKeyMemberListDelete	This function will delete the key member list assigned to the object.
	GFX_GOL_TextEntryKeyTextSet	This function will set the text assigned to a key with the given index.
	GFX_GOL_TextEntryLastCharDelete	This function will remove the last character of the buffer and replace it with a string terminator.
	GFX_GOL_TextEntrySpaceCharAdd	This function will insert a space character to the end of the buffer.

Structures

	Name	Description
	GFX_GOL_TEXTENTRY	Defines the structure used for the Text Entry object.
	GFX_GOL_TEXTENTRY_KEYMEMBER	Defines the structure used to describe a key in the Text Entry object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Text Entry Object.

File Name

gfx_gol_text_entry.h

Company

Microchip Technology Inc.

gfx_gol_window.h

This is the header file for the window object of the GOL.

Enumerations

	Name	Description
	GFX_GOL_WINDOW_STATE	Specifies the different states of the Window object.

Functions

	Name	Description
	GFX_GOL_WindowActionGet	This function evaluates the message from a user if the message will affect the object or not.
	GFX_GOL_WindowCreate	This function creates a GFX_GOL_WINDOW object with the parameters given. It automatically attaches the new object into a global linked list of objects and returns the address of the object.
	GFX_GOL_WindowDraw	This function renders the object on the screen based on the current state of the object.
	GFX_GOL_WindowTextAlignmentGet	This function returns the text alignment of the text string used by the object.
	GFX_GOL_WindowTextAlignmentSet	This function sets the text alignment of the text string used by the object.
	GFX_GOL_WindowTextSet	This function sets the address of the current text string used by the object.

Macros

	Name	Description
	GFX_GOL_WindowImageGet	This function gets the image used.
	GFX_GOL_WindowImageSet	This function sets the image used in the object.
	GFX_GOL_WindowTextGet	This function returns the address of the current text string used by the object.

Structures

	Name	Description
	GFX_GOL_WINDOW	Defines the structure used for the Window object.

Description

Module for Microchip Graphics Library - Graphic Object Layer

Refer to Microchip Graphics Library for complete documentation of the Window Object.

File Name

gfx_gol_window.h

Company

Microchip Technology Inc.

gfx_image_decoder.h

This implements the image decoding of the primitive layer.

Enumerations

	Name	Description
	_IMG_FILE_FORMAT	IMG_ImageFileFormat specifies all the supported image file formats
	IMG_FILE_FORMAT	IMG_ImageFileFormat specifies all the supported image file formats

Functions

	Name	Description
	ImageDecode	This function decodes and displays the image on the screen
	ImageDecoderInit	This function initializes the global variables to 0 and then initializes the driver. This must be called once before any other function of the library is called
	ImageDecoderParceHeader	This is function ImageDecoderParceHeader.
	ImageDecodeTask	This function completes one small part of the image decode function
	ImageLoopCallbackRegister	This function registers the loop callback function so that the decoder calls this function in every decoding loop. This can be used by the application program to do maintenance activities such as fetching data, updating the display, etc...
	ImagePixelIntoArray	This is function ImagePixelIntoArray.
	ImagePixelOutput	This is function ImagePixelOutput.
	ImageRegisterFrameCompleteCallback	This is function ImageRegisterFrameCompleteCallback.
	ImageRegisterImageCompleteCallback	Function prototypes
	ImageRegisterImageFailCallback	This is function ImageRegisterImageFailCallback.
	IMG_vSetboundaries	

Macros

	Name	Description
	__IMAGEDECODER_H__	This is macro __IMAGEDECODER_H__.
	_PutPixel	This is macro _PutPixel.
	ImageAbort	This function sets the Image Decoder's Abort flag so that decoding aborts in the next decoding loop.
	ImageFullScreenDecode	This function decodes and displays the image on the screen in fullscreen mode with center aligned and downscaled if required
	IMG_ALIGN_CENTER	Flags
	IMG_DECODE_ABORTED	This is macro IMG_DECODE_ABORTED.
	IMG_DOWN_SCALE	This is macro IMG_DOWN_SCALE.
	IMG_FEOF	This is macro IMG_FEOF.
	IMG_FILE	This is macro IMG_FILE.
	IMG_FREAD	This is macro IMG_FREAD.
	IMG_FSEEK	This is macro IMG_FSEEK.
	IMG_FTELL	This is macro IMG_FTELL.
	IMG_SCREEN_HEIGHT	This is macro IMG_SCREEN_HEIGHT.
	IMG_SCREEN_WIDTH	The individual image decoders use these defines instead of directly using those provided in the Display driver file
	IMG_vCheckAndAbort	This is macro IMG_vCheckAndAbort.
	IMG_vFrameComplete	This is macro IMG_vFrameComplete.
	IMG_vImageComplete	This is macro IMG_vImageComplete.
	IMG_vImageFail	This is macro IMG_vImageFail.
	IMG_vLoopCallback	This is macro IMG_vLoopCallback.
	IMG_vPixelArray	This is macro IMG_vPixelArray.
	IMG_vPutPixel	This is macro IMG_vPutPixel.
	IMG_vSetColor	This is macro IMG_vSetColor.

Structures

	Name	Description
	_IMG_FILE_SYSTEM_API	IMG_FileSystemAPI holds function pointers to the used File System APIs
	_IMG_PIXEL_XY_RGB_888	IMG_PixelRgb holds the RGB information of a pixel in BYTES
	IMG_FILE_SYSTEM_API	IMG_FileSystemAPI holds function pointers to the used File System APIs
	IMG_PIXEL_XY_RGB_888	IMG_PixelRgb holds the RGB information of a pixel in BYTES

Types

	Name	Description
	FileFeof	This is type FileFeof.
	FileRead	Typedefs of the used File System APIs
	FileSeek	This is type FileSeek.
	FileTell	This is type FileTell.
	IMG_LOOP_CALLBACK	IMG_LoopCallback is a callback function which is called in every loop of the decoding cycle so that user application can do some maintenance activities
	IMG_LOOP_FRAMECOMPLETE	IMG_FrameCompleteCallback is a callback function which is called at completion decoding current frame so that user application can do some activities
	IMG_LOOP_IMAGECOMPLETE	IMG_FrameCompleteCallback is a callback function which is called at completion decoding current frame so that user application can do some activities
	IMG_LOOP_IMAGEFAIL	IMG_FrameCompleteCallback is a callback function which is called at completion decoding current frame so that user application can do some activities
	IMG_PIXEL_OUTPUT	IMG_PixelOutput is a callback function which receives the color information of the output pixel

Description

Graphics Image Decoder

Refer to Microchip Graphics Library for complete documentation of the Image Decoder.

File Name

gfx_image_decoder.h

Company

Microchip Technology Inc.

gfx_primitive.h

Primitive Layer of the Microchip Graphics Library.

Enumerations

	Name	Description
	GFX_PRIMITIVE_STATES	Defines the various states that can be achieved by the PRIMITIVE HAL operation.

Functions

	Name	Description
	GFX_AlphaBlendingValueGet	This function returns the current alpha value set for alpha blending rendering.
	GFX_AlphaBlendingValueSet	This function sets the alpha value for alpha blending rendering.
	GFX_BackgroundColorGet	This function returns the color used in the current background.
	GFX_BackgroundImageGet	This function returns the image used in the current background.
	GFX_BackgroundImageLeftGet	This function returns the horizontal starting position of the current background.
	GFX_BackgroundImageTopGet	This function returns the vertical starting position of the current background.
	GFX_BackgroundSet	This function sets the background information.
	GFX_BackgroundTypeGet	This function returns the type of the current background.
	GFX_BackgroundTypeSet	This function sets the background type.
	GFX_BarDraw	This function renders a bar shape using the currently set fill style and color.
	GFX_CircleDraw	This function renders a circular shape using the currently set line style and color.
	GFX_CircleFillDraw	This function renders a filled circle shape using the currently set fill style and colors.
	GFX_ColorGet	This function returns the color currently set to render primitive shapes and text.
	GFX_ColorSet	This function sets the color to be used in rendering primitive shapes and text.

	GFX_DoubleBufferAreaGet	This function returns a rectangular area that needs synchronization specified by the given index.
	GFX_DoubleBufferAreaMark	This function adds the given rectangular area as an area that will be included in the list of areas for synchronization.
	GFX_DoubleBufferDisable	This function disables the double buffering feature of the graphics library.
	GFX_DoubleBufferEnable	This function enables the double buffering feature of the graphics library.
	GFX_DoubleBufferPause	This function pauses the double buffering feature of the graphics library.
	GFX_DoubleBufferResume	This function resumes the double buffering feature of the graphics library.
	GFX_DoubleBufferStatusGet	This function returns the current status of the double buffering feature of the graphics library.
	GFX_DoubleBufferSyncAllStatusClear	This function clears the synchronize all status.
	GFX_DoubleBufferSyncAllStatusGet	This function returns the status of the synchronize all flag.
	GFX_DoubleBufferSyncAllStatusSet	This function sets the whole draw buffer to be unsynchronized.
	GFX_DoubleBufferSyncAreaCountGet	This function returns the current count of rectangular areas that needs to be synchronized.
	GFX_DoubleBufferSyncAreaCountSet	This function sets the current count of rectangular areas that needs to be synchronized.
	GFX_DoubleBufferSynchronize	This function synchronizes the contents of the draw and frame buffer immediately.
	GFX_DoubleBufferSynchronizeRequest	This function requests synchronization of the contents of the draw and frame buffer.
	GFX_DoubleBufferSynchronizeStatusGet	This function returns the status of the synchronization request of the draw and frame buffer.
	GFX_DrawBufferGet	This function returns the index of the current draw buffer.
	GFX_DrawBufferInitialize	This function initializes the address of the draw buffer specified by the given index.
	GFX_DrawBufferSet	This function sets the draw buffer with the given index number.
	GFX_ExternalResourceCallback	This function performs data fetch from external memory.
	GFX_FillStyleGet	Return the fill style used when rendering filled shapes.
	GFX_FillStyleSet	Set the fill style to be used when rendering filled shapes.
	GFX_FontAntiAliasGet	This function returns the current font font anti-aliasing mode.
	GFX_FontAntiAliasSet	This function sets the font anti-aliasing mode.
	GFX_FontGet	This function returns the current font used when rendering strings and characters.
	GFX_FontSet	This function sets the current font used when rendering strings and characters.
	GFX_FrameBufferGet	This function returns the index of the current frame buffer.
	GFX_FrameBufferSet	This function sets the frame buffer with the given index number.
	GFX_GradientColorSet	Sets the gradient fill start and end color.
	GFX_GradientEndColorGet	Return the gradient end color when rendering gradient filled shapes.
	GFX_GradientStartColorGet	Return the gradient start color when rendering gradient filled shapes.
	GFX_ImageDraw	This function renders an image to the frame buffer.
	GFX_ImageHeaderGet	This function fills the given bitmap header with the image's header information.
	GFX_ImageHeightGet	This function returns the height of the given image.
	GFX_ImagePartialDraw	This function renders a portion of an image to the frame buffer.
	GFX_ImageWidthGet	This function returns the width of the given image.
	GFX_LineDraw	This function renders a line from x1,y1 to x2,y2 using the currently set line style (see GFX_LineStyleSet()).
	GFX_LinePositionRelativeSet	This function sets the line cursor to a new position relative to the current position.
	GFX_LinePositionSet	This function sets the line cursor to a new position.
	GFX_LinePositionXGet	This function returns the current x position of the line cursor.
	GFX_LinePositionYGet	This function returns the current y position of the line cursor.
	GFX_LineStyleGet	Return the line style used when rendering lines.
	GFX_LineStyleSet	Set the line style to be used when rendering lines.
	GFX_LineToDraw	This function renders a line from current line cursor position (x,y) to (x2,y2) using the currently set line style (see GFX_LineStyleSet()).
	GFX_LineToRelativeDraw	This function renders a line from current line cursor position (x,y) to (x+dX,y+dY) using the currently set line style (see GFX_LineStyleSet()).
	GFX_MaxXGet	This function returns the maximum horizontal pixel coordinate.
	GFX_MaxYGet	This function returns the maximum vertical pixel coordinate.
	GFX_PolygonDraw	This function renders a polygon using the currently set line style and color.
	GFX_PRIMITIVE_Close	Closes an instance of the primitive layer specified by handle.
	GFX_PRIMITIVE_Deinitialize	Deinitializes the specified instance of the GFX Module.

	GFX_PRIMITIVE_Initialize	Initialize the GFX PRIMITIVE HAL Library.
	GFX_PRIMITIVE_Open	Opens a client instance of the primitive layer specified by index.
	GFX_RectangleDraw	This function renders a rectangular shape using the currently set line style and color.
	GFX_RectangleFillDraw	This function renders a filled rectangular shape using the currently set fill style and colors.
	GFX_RectangleRoundDraw	This function renders a rounded corner rectangular shape using the currently set line style and color.
	GFX_RectangleRoundFillDraw	This function renders a filled rectangular shape with round corners using the currently set fill style and colors.
	GFX_ScreenClear	Clears the screen to the currently set color (GFX_ColorSet()).
	GFX_TextCharDraw	This function renders the given character using the currently set color using the currently set font.
	GFX_TextCursorDraw	This is function GFX_TextCursorDraw.
	GFX_TextCursorPositionSet	This function sets the text cursor to a new position.
	GFX_TextCursorPositionXGet	This function returns the current x position of the text cursor.
	GFX_TextCursorPositionYGet	This function returns the current y position of the text cursor.
	GFX_TextCursorTypeGet	This is function GFX_TextCursorTypeGet.
	GFX_TextCursorTypeSet	This is function GFX_TextCursorTypeSet.
	GFX_TextCursorWidthGet	This is function GFX_TextCursorWidthGet.
	GFX_TextStringBoxDraw	This function renders the given string using the currently set color and font into a rectangular area.
	GFX_TextStringDraw	This function renders the given string of character using the currently set color using the currently set font.
	GFX_TextStringHeightGet	This function returns the height of the given font.
	GFX_TextStringWidthGet	This function returns the width of the given string using the given font.
	GFX_TransparentColorDisable	This function disables the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.
	GFX_TransparentColorEnable	This function sets the transparent color used in GFX_ImageDraw() functions and enables the transparent color feature.
	GFX_TransparentColorGet	This returns the current transparent color set for the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.
	GFX_TransparentColorStatusGet	This returns the current state of the transparent color feature used in GFX_ImageDraw() and GFX_ImagePartialDraw() functions.

Macros

	Name	Description
	GFX_PRIMITIVE_HANDLE_INVALID	Constant that defines the value of an Invalid Device Handle.
	GFX_TEXT_CURSOR_HEIGHT_DEFAULT	Constant that defines the default value of text cursor height.
	GFX_TEXT_CURSOR_WIDTH_DEFAULT	Constant that defines the default value of text cursor width.

Types

	Name	Description
	GFX_PRIMITIVE_HANDLE	Data type for GFX PRIMITIVE HAL handle.

Description

Module for Microchip Graphics Library - Graphic Primitive Layer

This module implements the primitive rendering routines of the Microchip Graphics Library. The routines are software fallbacks for accelerated functions of the display driver and display controller. The API is compatible with any Display Driver that is compliant with the requirements of the Display Driver interface of the Graphics Library.

File Name

gfx_primitive.h

Company

Microchip Technology Inc.

gfx_types_font.h

This header file defines the types used in fonts for the Microchip Graphics Library.

Macros

	Name	Description
	GFX_FONT_SPACE	Font space section. The fonts can be located in psv (constant) or program space in PIC24/dsPIC MCUs. This define allows for switching of the pointer type used to access the font structure in memory See: GraphicsConfig.h for the application define.
	GFX_UXCHAR	This is macro GFX_UXCHAR.
	GFX_XCHAR	Configuration for the text character size.

Structures

	Name	Description
	GFX_FONT_GLYPH_ENTRY	The structure describing the glyph entry in fonts.
	GFX_FONT_GLYPH_ENTRY_EXTENDED	The structure describing the intended glyph entry in fonts.
	GFX_FONT_HEADER	The structure used to define the font header.

Description

Graphics Resource Types Header for Microchip Graphics Library

This header defines the different structures used for fonts resources in the Microchip Graphics Library.

File Name

gfx_types_font.h

Company

Microchip Technology Inc.

gfx_types_image.h

This header file defines the types used in images for the Microchip Graphics Library.

Structures

	Name	Description
	GFX_MCHP_BITMAP_HEADER	The structure used to define the Microchip bitmap header.

Types

	Name	Description
	int16_gfx_image_prog	This is type int16_gfx_image_prog.
	int16_prog	This is type int16_prog.
	int16_prog_pack	This is type int16_prog_pack.
	int32_gfx_image_prog	This is type int32_gfx_image_prog.
	int32_prog	This is type int32_prog.
	int32_prog_pack	This is type int32_prog_pack.
	int8_gfx_image_prog	This is type int8_gfx_image_prog.
	int8_prog	This is type int8_prog.
	int8_prog_pack	This is type int8_prog_pack.
	uint16_gfx_image_prog	This is type uint16_gfx_image_prog.
	uint16_prog	This is type uint16_prog.
	uint16_prog_pack	This is type uint16_prog_pack.
	uint32_gfx_image_prog	This is type uint32_gfx_image_prog.
	uint32_prog	This is type uint32_prog.
	uint32_prog_pack	This is type uint32_prog_pack.
	uint8_gfx_image_prog	GFX Image data Types
	uint8_prog	General program space data types
	uint8_prog_pack	This is type uint8_prog_pack.

Description

Graphics Resource Types Header for Microchip Graphics Library

This header defines the different structures used for images resources in the Microchip Graphics Library.

File Name

gfx_types_image.h

Company

Microchip Technology Inc.

gfx_types_macros.h

Data types used in Microchip Graphics Library.

Enumerations

	Name	Description
	GFX_ALIGNMENT	Summary of the different text alignment supported in the library.
	GFX_BACKGROUND_TYPE	Specifies the different background fill types.
	GFX_FEATURE_STATUS	States of a feature that can be enabled/disabled at run time.
	GFX_FILL_STYLE	Specifies the available fill styles.
	GFX_FONT_ANTIALIAS_TYPE	Summary of the transparency types in text anti-aliasing.
	GFX_STATUS	Rendering status.
	GFX_STATUS_BIT	Additional rendering status.
	GFX_TEXT_CURSOR_TYPE	Enumeration defines types of text cursor supported.

Structures

	Name	Description
	GFX_BACKGROUND	Background information structure.
	GFX_DOUBLE_BUFFERING_MODE	Structure used for double buffering management.
	GFX_PARTIAL_IMAGE_PARAM	Partial Image information structure.
	GFX_RECTANGULAR_AREA	A generic rectangular area structure.

Description

Module for Microchip Graphics Library

This module defines the data types used in the Microchip Graphics Library for use of Primitive and Driver Layers.

File Name

gfx_types_macros.h

Company

Microchip Technology Inc.

gfx_types_palette.h

This header file defines the types used in palettes for the Microchip Graphics Library.

Unions

	Name	Description
	GFX_PALETTE_ENTRY	Defines the union used for each entry in the palette table.

Description

Graphics Resource Types Header for Microchip Graphics Library

This header defines the different structures used for palette resources in the Microchip Graphics Library.

File Name

gfx_types_palette.h

Company

Microchip Technology Inc.

gfx_types_resource.h

This is the definition of the Graphics Resource Types used with the Microchip Graphics Library.

Enumerations

	Name	Description
	GFX_RESOURCE	Specifies the different resource types in the library.

Macros

	Name	Description
	GFX_COMP_MASK	This is macro GFX_COMP_MASK.
	GFX_MEM_MASK	This is macro GFX_MEM_MASK.
	GFX_TYPE_MASK	This is macro GFX_TYPE_MASK.
	MCHP_BITMAP_NORMAL	no compression, palette is present for color depth = 8, 4 and 1 BPP
	MCHP_BITMAP_PALETTE_STR	palette is provided as a separate object (see PALETTE_HEADER) for color depth = 8, 4, and 1 BPP, ID to the palette is embedded in the bitmap.

Structures

	Name	Description
	GFX_RESOURCE_BINARY	Defines the structure used for the binary type resource.
	GFX_RESOURCE_FONT	Defines the structure used for the font type resource.
	GFX_RESOURCE_HDR	Defines the structure used for the resource types.
	GFX_RESOURCE_IMAGE	Defines the structure used for the image type resource.
	GFX_RESOURCE_PALETTE	Defines the structure used for the palette type resource.

Description

Graphics Resource Types Header for Microchip Graphics Library

This header defines the different structures used for the Graphics Resources used in the Graphics Library. This also contains helpful macros as well as data types used.

File Name

gfx_types_resource.h

Company

Microchip Technology Inc.

gfx_config_template.h

This header file template defines all the Graphics Library configurations available.

Macros

	Name	Description
	GFX_CONFIG_ALPHABLEND_DISABLE	Macro that disables the Alpha Blending feature.
	GFX_CONFIG_COLOR_DEPTH	Macro that sets the color depth of the application.
	GFX_CONFIG_DOUBLE_BUFFERING_DISABLE	Macro disables the support for double buffering in rendering of pixels to the frame buffer.
	GFX_CONFIG_FOCUS_DISABLE	Macro that disables the focus feature in objects.
	GFX_CONFIG_FONT_ANTIALIASED_DISABLE	Macro that disables the use of anti-aliased fonts.
	GFX_CONFIG_FONT_CHAR_SIZE	Macro that sets the size of the characters used in the fonts.
	GFX_CONFIG_FONT_EXTERNAL_DISABLE	Macro that disables sourcing of font resources from external sources.
	GFX_CONFIG_FONT_FLASH_DISABLE	Macro that disables sourcing of font resources from internal flash memory.
	GFX_CONFIG_FONT_RAM_DISABLE	Macro that disables sourcing of font resources from RAM sources.
	GFX_CONFIG_GRADIENT_DISABLE	Macro that disables the gradient fill feature.
	GFX_CONFIG_IMAGE_EXTERNAL_DISABLE	Macro that disables sourcing of image resources from external sources.
	GFX_CONFIG_IMAGE_FLASH_DISABLE	Macro that disables sourcing of image resources from internal flash memory.
	GFX_CONFIG_IMAGE_PADDING_DISABLE	Macro disables the padding of bits on images converted by the Graphics Resource Converter (GRC).

	GFX_CONFIG_IMAGE_RAM_DISABLE	Macro that disables sourcing of image resources from RAM sources.
	GFX_CONFIG_IPU_DECODE_DISABLE	Macro that disables RLE compression of images.
	GFX_CONFIG_PALETTE_DISABLE	Macro that disables the palette feature.
	GFX_CONFIG_PALETTE_EXTERNAL_DISABLE	Macro that disables the palette feature that are sourced in external resources.
	GFX_CONFIG_RLE_DECODE_DISABLE	Macro that disables RLE compression of images.
	GFX_CONFIG_TRANSPARENT_COLOR_DISABLE	Macro that disables the use of anti-aliased fonts.
	GFX_CONFIG_USE_KEYBOARD_DISABLE	This macro disables the keyboard support in objects.
	GFX_CONFIG_USE_TOUCHSCREEN_DISABLE	This macro disables the resistive touchscreen support in objects.
	GFX_EXTERNAL_FONT_RASTER_BUFFER_SIZE	Macro sets the size of the external font raster buffer.
	GFX_free	Macro that defines the free function for versatility when using Operating Systems.
	GFX_INSTANCES_NUMBER	Macro to specify the number of possible client modules.
	GFX_malloc	Macro that defines the malloc function for versatility when using Operating Systems.

Math Libraries Help

This section provides descriptions of the Math libraries that are available in MPLAB Harmony.

DSP Fixed-Point Math Library

This topic describes the DSP Fixed-Point Math Library.

Introduction

The DSP Fixed-Point Library is available for the PIC32MZ family of microcontrollers. This library was created from optimized assembly routines written specifically for devices with microAptiv™ core features that utilize DSP ASE.

Description

The DSP Fixed-Point Library contains building block functions for developing digital signal processing algorithms. The library supports the Q15 and Q31 fractional data formats. The functions are implemented in efficient assembly specifically targeted at the DSP extensions in this core family. The library makes these functions available in a simple C-callable structure.

Functions included in the DSP Fixed-Point Library include complex math, vector math, matrix math, digital filters, and transforms. In many cases, these functions require specific data structures to operate, which are detailed in the header file and examples.

Using the Library

This topic describes the basic architecture of the DSP Fixed-Point Library and provides information and examples on its use.

Description

Interface Header File: `dsp.h`, `libq.h`

The interface to the DSP Fixed-Point library is defined in the `dsp.h` header file. Any C language source (`.c`) file that uses the DSP Fixed-Point library must include `dsp.h`. This file is automatically added to the project when 'use DSP library' is selected in MHC. In addition, this file name is added to the `#include` section of `system_definitions.h` after the configurations are completed through MHC.

Some functions make special use of the optimized fixed-point math library `libq.h`. For use of those functions, the `libq.h` file must also be included in a project. The `libq.h` file is also installed with MPLAB Harmony. Specific notes within each function will describe if the function is dependent on the LibQ Fixed-Point Math Library.

Library Files: `dsp_pic32mz.a`, `LIBQ_Library.X.a`, and `dsp_pic32mz_ef.a`

The DSP Fixed-Point library archive (`.a`) files are installed with MPLAB Harmony. Although there are two PIC32 DSP files, the linker will only utilize one of these depending on your device usage. If you have a device using a FPU, the `dsp_pic32mz_ef.a` file is used by the linker. Otherwise, the linker will utilize `dsp_pic32mz.a`. In a future release of the tools, the linker in the MPLAB XC32 C/C++ Compiler may be changed to do this automatically. Both of these files are added to a project when the 'use DSP library' option is selected in MHC.

This library is only available in binary form, with prototypes for each function described in the `dsp.h` file.

For functions that are supported by the LibQ Fixed-Point Math library, the `LIBQ_Library.X.a` library must also be installed. This library is also available in binary form and is installed with MPLAB Harmony. In some cases, the linker in the MPLAB XC32 C/C++ Compiler may not acknowledge the LibQ Fixed-Point Math Library file. If the library is included in the project, and the message *undefined reference* is encountered upon compilation, it may be necessary to add the specific assembly file function to your project. The source code for each function can be found in the `<install-dir>/framework/math/libq` folder of your MPLAB Harmony installation.

Library Overview

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the DSP Fixed-Point Math Library.

Library Interface Section	Description
Complex Math Functions	General mathematical operations using a complex structure with the form (a + bi)
Vector Math Functions	Mathematical operations on a array of numbers or vector
Matrix Math Functions	Mathematical operations on a matrix
Digital Filter Functions	FIR and IIR filtering functions with various architectures
Transform Functions	FFT, Windows and related transform elements
Support Functions	Quick support functions for numerical transform

The DSP Fixed-Point Library uses fixed-point fractional functions to optimize execution speed. These functions limit the accuracy of the

calculations to the bits specified for the function. Due to parallelism in some operations, the 16-bit version of the functions are more efficient than their 32-bit counterparts. In many cases both 16-bit and 32-bit functions are available to give the user the choice of balance between speed and functional resolution.

Fractional representation of a real number is given by:

Q*n.m*

where:

- *n* is the number of data bits to the left of the radix point
- *m* is the number of data bits to the right of the radix point
- a signed bit is implied, and takes one bit of resolution
- Shorthand may eliminate the leading 0, such as in Q0.15, which may be shortened to Q15, and similarly Q0.31, which is shortened to Q31

Qn.m numerical values are used by the library processing data as integers. In this format the n represents the number of integer bits, and the m represents the number of fractional bits. All values assume a sign bit in the most significant bit. Therefore, the range of the numerical value is:

$$-2^{(n-1)} \text{ to } [2^{(n-1)} - 2^{(-m)}]; \text{ with a resolution of } 2^{(-m)}.$$

A Q16 format number (Q15.16) would range from -32768.0 (0x8000 0000) to 32767.99998474 with a precision of 0.000015259 (or 2^{-16}).

For example, a numerical representation of the number 3.14159 in Q2.13 notation would be:

$$3.14159 * 2^{13} = 25735.9 \Rightarrow 0x6488$$

And converting from the Q7.8 format with the value 0x1D89 would be:

$$0x1D89 / 2^{8} = 7561 / 256 \Rightarrow 29.5316, \text{ accurate to } 0.00391$$

A majority of the DSP Fixed-Point Library uses functions with variables in Q15 or Q31 format. Representations of these numbers are given in **Data Types and Constants** in the Library Interface section, and generally are int16_t (for Q15 fractional representation) and int32_t (for Q31 fractional representation). This limits the equivalent numerical range to roughly -1.0 to 0.999999999. It is possible to represent other number ranges, but scaling before and after the function call are necessary.

All library functions will saturate the output if the value exceeds the maximum or is lower than the minimum allowable value for that resolution. Some prescaling may be necessary to prevent unwanted saturation in functions that may otherwise create calculation errors.

Table of Library Functions

Family	Function	Definition
Complex Math	Addition	DSP_ComplexAdd32
	Conjugate	DSP_ComplexConj32
	Dot Product	DSP_ComplexDotProd32
	Multiplication	DSP_ComplexMult32
	Scalar Multiplication	DSP_ComplexScalarMult32
	Subtraction	DSP_ComplexSub32
Digital Filter	FIR	DSP_FilterFIR32
	FIR Decimation	DSP_FilterFIRDecim32
	FIR Interpolation	DSP_FilterFIRInterp32
	FIR LMS	DSP_FilterLMS16
	IIR	DSP_FilterIIR16; DSP_FilterIIRSetup16
	IIR Biquad	DSP_FilterIIRBQ16; DSP_FilterIIRBQ16_fast; DSP_FilterIIRBQ32
	IIR Biquad Cascade	DSP_FilterIIRBQ16_cascade8; DSP_FilterIIRBQ16_cascade8_fast
	IIR Biquad Parallel	DSP_FilterIIRBQ16_parallel8; DSP_FilterIIRBQ16_parallel8_fast
Matrix Math	Addition	DSP_MatrixAdd32
	Equality	DSP_MatrixEqual32
	Initialization	DSP_MatrixInit32
	Multiplication	DSP_MatrixMul32
	Scale	DSP_MatrixScale32
	Subtraction	DSP_MatrixSub32
	Transpose	DSP_MatrixTranspose32
Transform	FFT	DSP_TransformFFT16; DSP_TransformFFT32
	Setup factors	DSP_TransformFFT16_setup; DSP_TransformFFT32_setup

	inverse FFT	DSP_TransformIFFT16
	Windows	DSP_TransformWindow_Bart16; DSP_TransformWindow_Bart32; DSP_TransformWindow_Black16; DSP_TransformWindow_Black32; DSP_TransformWindow_Cosine16; DSP_TransformWindow_Cosine32; DSP_TransformWindow_Hamm16; DSP_TransformWindow_Hamm32; DSP_TransformWindow_Hann16; DSP_TransformWindow_Hann32; DSP_TransformWindow_Kaiser16; DSP_TransformWindow_Kaiser32;
	Window Initialization	DSP_TransformWinInit_Bart16; DSP_TransformWinInit_Bart32; DSP_TransformWinInit_Black16; DSP_TransformWinInit_Black32; DSP_TransformWinInit_Cosine16; DSP_TransformWinInit_Cosine32; DSP_TransformWinInit_Hamm16; DSP_TransformWinInit_Hamm32; DSP_TransformWinInit_Hann16; DSP_TransformWinInit_Hann32; DSP_TransformWinInit_Kaiser16; DSP_TransformWinInit_Kaiser32
Vector Math	Absolute value	DSP_VectorAbs16; DSP_VectorAbs32
	Addition	DSP_VectorAdd16; DSP_VectorAdd32
	Addition w/ constant	DSP_VectorAddc16; DSP_VectorAddc32
	Binary exponent	DSP_VectorBexp16; DSP_VectorBexp32
	Log, Exponent, Square root	DSP_VectorExp; DSP_VectorLog10; DSP_VectorLog2; DSP_VectorLn; DSP_VectorSqrt;
	Multiplication & Division	DSP_VectorMul16; DSP_VectorMul32; DSP_VectorDotp16; DSP_VectorDotp32; DSP_VectorMulc16; DSP_VectorMulc32; DSP_VectorDivC; DSP_VectorRecip
	Subtraction	DSP_VectorSub16; DSP_VectorSub32
	Power (sum of squares)	DSP_VectorSumSquares16; DSP_VectorSumSquares32
	Equality check	DSP_VectorChkEqu32
	Maximum	DSP_VectorMax32; DSP_VectorMaxIndex32
	Minimum	DSP_VectorMin32; DSP_VectorMinIndex32
	Copy & Fill	DSP_VectorCopy; DSP_VectorFill; DSP_VectorZeroPad
	Shift	DSP_VectorShift; DSP_VectorCopyReverse32
	Negate	DSP_VectorNegate
	Statistics	DSP_VectorAutocorr16; DSP_VectorMean32; DSP_VectorRMS16; DSP_VectorStdDev16; DSP_VectorVari16; DSP_VectorVariance

Library Interface

a) Complex Math Functions

	Name	Description
	DSP_ComplexAdd32	Calculates the sum of two complex numbers.
	DSP_ComplexConj16	Calculates the complex conjugate of a complex number.
	DSP_ComplexConj32	Calculates the complex conjugate of a complex number.
	DSP_ComplexDotProd32	Calculates the dot product of two complex numbers.
	DSP_ComplexMult32	Multiplies two complex numbers.
	DSP_ComplexScalarMult32	Multiplies a complex number and a scalar number.
	DSP_ComplexSub32	Calculates the difference of two complex numbers.

b) Digital Filter Functions

	Name	Description
	DSP_FilterFIR32	Performs a Finite Infinite Response (FIR) filter on a vector.
	DSP_FilterFIRDecim32	Performs a decimating FIR filter on the input array.
	DSP_FilterFIRInterp32	Performs an interpolating FIR filter on the input array.
	DSP_FilterIIR16	Performs a single-sample cascaded biquad Infinite Impulse Response (IIR) filter.
	DSP_FilterIIRBQ16	Performs a single-pass IIR Biquad Filter.
	DSP_FilterIIRBQ16_cascade8	Performs a single-sample IIR Biquad Filter as a cascade of 8 series filters.
	DSP_FilterIIRBQ16_cascade8_fast	Performs a single-sample IIR Biquad Filter as a cascade of 8 series filters.
	DSP_FilterIIRBQ16_fast	Performs a single-pass IIR Biquad Filter.

	DSP_FilterIIRBQ16_parallel8	Performs a 8 parallel single-pass IIR Biquad Filters, and sums the result.
	DSP_FilterIIRBQ16_parallel8_fast	Performs a 8 parallel single-pass IIR Biquad Filters, and sums the result.
	DSP_FilterIIRBQ32	Performs a high resolution single-pass IIR Biquad Filter.
	DSP_FilterIIRSetup16	Converts biquad structure to coeffs array to set up IIR filter.
	DSP_FilterLMS16	Performs a single sample Least Mean Squares FIR Filter.

c) Matrix Math Functions

	Name	Description
	DSP_MatrixAdd32	Addition of two matrices C = (A + B).
	DSP_MatrixEqual32	Equality of two matrices C = (A).
	DSP_MatrixInit32	Initializes the first N elements of a Matrix to the value num.
	DSP_MatrixMul32	Multiplication of two matrices C = A x B.
	DSP_MatrixScale32	Scales each element of an input buffer (matrix) by a fixed number.
	DSP_MatrixSub32	Subtraction of two matrices C = (A - B).
	DSP_MatrixTranspose32	Transpose of a Matrix C = A (T).

d) Transform Functions

	Name	Description
	DSP_TransformFFT16	Creates an Fast Fourier Transform (FFT) from a time domain input.
	DSP_TransformFFT16_setup	Creates FFT coefficients for use in the FFT16 function.
	DSP_TransformFFT32	Creates an Fast Fourier Transform (FFT) from a time domain input.
	DSP_TransformFFT32_setup	Creates FFT coefficients for use in the FFT32 function.
	DSP_TransformIFFT16	Creates an Inverse Fast Fourier Transform (FFT) from a frequency domain input.
	DSP_TransformWindow_Bart16	Perform a Bartlett window on a vector.
	DSP_TransformWindow_Bart32	Perform a Bartlett window on a vector.
	DSP_TransformWindow_Black16	Perform a Blackman window on a vector.
	DSP_TransformWindow_Black32	Perform a Blackman window on a vector.
	DSP_TransformWindow_Cosine16	Perform a Cosine (Sine) window on a vector.
	DSP_TransformWindow_Cosine32	Perform a Cosine (Sine) window on a vector.
	DSP_TransformWindow_Hamm16	Perform a Hamming window on a vector.
	DSP_TransformWindow_Hamm32	Perform a Hamming window on a vector.
	DSP_TransformWindow_Hann16	Perform a Hanning window on a vector.
	DSP_TransformWindow_Hann32	Perform a Hanning window on a vector.
	DSP_TransformWindow_Kaiser16	Perform a Kaiser window on a vector.
	DSP_TransformWindow_Kaiser32	Perform a Kaiser window on a vector.
	DSP_TransformWinInit_Bart16	Create a Bartlett window.
	DSP_TransformWinInit_Bart32	Create a Bartlett window.
	DSP_TransformWinInit_Black16	Create a Blackman window.
	DSP_TransformWinInit_Black32	Create a Blackman window.
	DSP_TransformWinInit_Cosine16	Create a Cosine (Sine) window.
	DSP_TransformWinInit_Cosine32	Create a Cosine (Sine) window.
	DSP_TransformWinInit_Hamm16	Create a Hamming window.
	DSP_TransformWinInit_Hamm32	Create a Hamming window.
	DSP_TransformWinInit_Hann16	Create a Hanning window.
	DSP_TransformWinInit_Hann32	Create a Hanning window.
	DSP_TransformWinInit_Kaiser16	Create a Kaiser window.
	DSP_TransformWinInit_Kaiser32	Create a Kaiser window.

e) Vector Math Functions

	Name	Description
	DSP_VectorAbs16	Calculate the absolute value of a vector.
	DSP_VectorAbs32	Calculate the absolute value of a vector.
	DSP_VectorAdd16	Calculate the sum of two vectors.
	DSP_VectorAdd32	Calculate the sum of two vectors.
	DSP_VectorAddc16	Calculate the sum of a vector and a constant.

	DSP_VectorAddc32	Calculate the sum of a vector and a constant.
	DSP_VectorAutocorr16	Computes the Autocorrelation of a Vector.
	DSP_VectorBexp16	Computes the maximum binary exponent of a vector.
	DSP_VectorBexp32	Computes the maximum binary exponent of a vector.
	DSP_VectorChkEqu32	Compares two input vectors, returns an integer '1' if equal, and '0' if not equal.
	DSP_VectorCopy	Copies the elements of one vector to another.
	DSP_VectorCopyReverse32	Reverses the order of elements in one vector and copies them into another.
	DSP_VectorDivC	Divides the first N elements of inVector by a constant divisor, and stores the result in outVector.
	DSP_VectorDotp16	Computes the dot product of two vectors, and scales the output by a binary factor.
	DSP_VectorDotp32	Computes the dot product of two vectors, and scales the output by a binary factor
	DSP_VectorExp	Computes the EXP (e^x) of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorFill	Fills an input vector with scalar data.
	DSP_VectorLn	Computes the Natural Log, Ln(x), of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorLog10	Computes the Log10(x), of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorLog2	Computes the Log2(x) of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorMax32	Returns the maximum value of a vector.
	DSP_VectorMaxIndex32	Returns the index of the maximum value of a vector.
	DSP_VectorMean32	Calculates the mean average of an input vector.
	DSP_VectorMin32	Returns the minimum value of a vector.
	DSP_VectorMinIndex32	Returns the index of the minimum value of a vector.
	DSP_VectorMul16	Multiplication of a series of numbers in one vector to another vector.
	DSP_VectorMul32	Multiplication of a series of numbers in one vector to another vector.
	DSP_VectorMulc16	Multiplication of a series of numbers in one vector to a scalar value.
	DSP_VectorMulc32	Multiplication of a series of numbers in one vector to a scalar value.
	DSP_VectorNegate	Inverses the sign (negates) the elements of a vector.
	DSP_VectorRecip	Computes the reciprocal (1/x) of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorRMS16	Computes the root mean square (RMS) value of a vector.
	DSP_VectorShift	Shifts the data index of an input data vector.
	DSP_VectorSqrt	Computes the square root of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorStdDev16	Computes the Standard Deviation of a Vector.
	DSP_VectorSub16	Calculate the difference of two vectors.
	DSP_VectorSub32	Calculate the difference of two vectors.
	DSP_VectorSumSquares16	Computes the sum of squares of a vector, and scales the output by a binary factor.
	DSP_VectorSumSquares32	Computes the sum of squares of a vector, and scales the output by a binary factor.
	DSP_VectorVari16	Computes the variance of N elements of a Vector.
	DSP_VectorVariance	Computes the variance of N elements of inVector.
	DSP_VectorZeroPad	Fills an input vector with zeros.

f) Support Functions

	Name	Description
	mul16	multiply and shift integer
	mul16r	multiply and shift Q15
	mul32	multiply and shift Q31
	SAT16	saturate both positive and negative Q15
	SAT16N	saturate negative Q15
	SAT16P	saturate positive Q15

g) Data Types and Constants

	Name	Description
	biquad16	Q15 biquad
	int16c	Q15 complex number (a + bi)
	int32c	Q31 complex number (a + bi)

	matrix32	Q31 matrix
	PARM_EQUAL_FILTER	IIR BQ filter structure Q15 data, Q31 storage
	PARM_EQUAL_FILTER_16	IIR BQ filter structure Q15
	PARM_EQUAL_FILTER_32	IIR BQ filter structure Q31
	PARM_FILTER_GAIN	filter gain structure
	_PARM_EQUAL_FILTER	IIR BQ filter structure Q15 data, Q31 storage
	_PARM_EQUAL_FILTER_16	IIR BQ filter structure Q15
	_PARM_EQUAL_FILTER_32	IIR BQ filter structure Q31
	MAX16	maximum Q15
	MAX32	maximum Q31
	MIN16	minimum Q15
	MIN32	minimum Q31

Description

This section describes the Application Programming Interface (API) functions of the DSP Fixed-Point Library.

Refer to each section for a detailed description.

a) Complex Math Functions

DSP_ComplexAdd32 Function

Calculates the sum of two complex numbers.

File

dsp.h

C

```
void DSP_ComplexAdd32(int32c * indata1, int32c * indata2, int32c * Output);
```

Returns

pointer to result complex numbers (int32c)

None.

Description

Function DSP_ComplexAdd32:

void DSP_ComplexAdd32(int32c *indata1, int32c *indata2, int32c *Output);

Calculates the sum of two complex numbers, indata1 and indata2, and stores the complex result in Output. Complex numbers must be in the structural form that includes real and imaginary components. The function saturates the output values if maximum or minimum are exceeded. All values are in Q31 fractional data format. (a + bi) + (c + di) => (a + c) + (b + d)i

Remarks

None.

Preconditions

Complex numbers must be in the int32c format.

Example

```
int32c *res, result;
int32c *input1, *input2;
int32c test_complex_1 = {0x40000000,0x0CCCCCCC};
//                  (0.5 + 0.1i)
int32c test_complex_2 = {0x73333333,0xB3333334};
//                  (0.9 - 0.6i)
res=&result;
input1=&test_complex_1;
input2=&test_complex_2;

DSP_ComplexAdd32(input1, input2, res);

// result = {0x73333333, 0xC0000000} = (0.9 - 0.5i)
```

Parameters

Parameters	Description
indata1	pointer to input complex number (int32c)
indata2	pointer to input complex number (int32c)

DSP_ComplexConj16 Function

Calculates the complex conjugate of a complex number.

File

dsp.h

C

```
void DSP_ComplexConj16(int16c * indata, int16c * Output);
```

Returns

pointer to result complex numbers (int16c)

None.

Description

DSP_ComplexConj16:

void DSP_ComplexConj16(int16c *indata, int16c *Output);

CCalculates the complex conjugate of Indata, and stores the result in Outdata. Both numbers must be in the complex number data structure which includes real and imaginary components. Values are in Q15 fractional data format. The function will saturate the output if maximum or minimum values are exceeded. (a + bi) => (a - bi)

Remarks

None.

Preconditions

Complex numbers must be in the int32c format.

Example

```
int16c *res, result;
int16c *input1;
int16c test_complex_1 = {0x4000,0x0CCC};
//                  (0.5 + 0.1i)

res=&result;
input1=&test_complex_1;

DSP_ComplexConj16(input1, res);

// result = {0x4000, 0xF334} = (0.5 - 0.1i)
```

Parameters

Parameters	Description
indata	pointer to input complex number (int16c)

DSP_ComplexConj32 Function

Calculates the complex conjugate of a complex number.

File

dsp.h

C

```
void DSP_ComplexConj32(int32c * indata, int32c * Output);
```

Returns

pointer to result complex numbers (int32c)

None.

Description

Function DSP_ComplexConj32:

void DSP_ComplexConj32(int32c *indata, int32c *Output);

Calculates the complex conjugate of indata, and stores the result in Output. Both numbers must be in the complex number data structure, which includes real and imaginary components. Values are in Q31 fractional data format. The function will saturate the output if maximum or minimum values are exceeded. (a + bi) => (a - bi)

Remarks

None.

Preconditions

Complex numbers must be in the int32c format.

Example

```
int32c *res, result;
int32c *input1;
int32c test_complex_1 = {0x40000000,0x0CCCCCCC};
//                  (0.5 + 0.1i)

res=&result;
input1=&test_complex_1;

DSP_ComplexConj32(input1, res);

// result = {0x40000000, 0xF3333334} = (0.5 - 0.1i)
```

Parameters

Parameters	Description
indata1	pointer to input complex number (int32c)

DSP_ComplexDotProd32 Function

Calculates the dot product of two complex numbers.

File

dsp.h

C

```
void DSP_ComplexDotProd32(int32c * indata1, int32c * indata2, int32c * Output);
```

Returns

pointer to result complex numbers (int32c)

None.

Description

Function DSP_ComplexDotProd32:

void DSP_ComplexDotProd32(int32c *indata1, int32c *indata2, int32c *Output);

Calculates the dot product of two complex numbers, indata1 and indata2, and stores the result in Output. All numbers must be in complex structural format that includes real and imaginary components, and the numbers are in fractional Q31 format. The function will saturate the output if it exceeds maximum or minimum ratings. The formula for the dot product is as follows: Output(real) = (Input1.re * Input2.re) + (Input1.im * Input2.im); Output(img) = [(Input1.re * Input2.im) - (Input1.im * Input2.re)]i (a + bi) dot (c + di) => (a * c + b * d) + (a * d - b * c)i

Remarks

None.

Preconditions

Complex numbers must be in the int32c format.

Example

```
int32c *res, result;
int32c *input1, *input2;
int32c test_complex_1 = {0x40000000,0x0CCCCCCC};
//                  (0.5 + 0.1i)
int32c test_complex_2 = {0x73333333,0xB3333334};
//                  (0.9 - 0.6i)
res=&result;
input1=&test_complex_1;
input2=&test_complex_2;

DSP_ComplexDotProd32(input1, input2, res);

// result = {0x31EB851E, 0xCE147AE3} = (0.39 - 0.39i)
```

Parameters

Parameters	Description
indata1	pointer to input complex number (int32c)
indata2	pointer to input complex number (int32c)

DSP_ComplexMult32 Function

Multiplies two complex numbers.

File

dsp.h

C

```
void DSP_ComplexMult32(int32c * indata1, int32c * indata2, int32c * Output);
```

Returns

pointer to result complex numbers (int32c)

None.

Description

Function DSP_ComplexMult32:

void DSP_ComplexMult32(int32c *indata1, int32c *indata2, int32c *Output);

Multiplies two complex numbers, indata1 and indata2, and stores the complex result in Output. All numbers must be in the int32c complex data structure. All data is in Q31 fractional format. The function will saturate if maximum or minimum values are exceeded. Output(real) = (Input1.re * Input2.re) - (Input1.im * Input2.im); Output(img) = [(Input1.re * Input2.im) + (Input1.im * Input2.re)]i (a + bi) x (c + di) => (a * c - b * d) + (a * d + b * c)i

Remarks

None.

Preconditions

Complex numbers must be in the int32c format.

Example

```
int32c *res, result;
int32c *input1, *input2;
int32c test_complex_1 = {0x40000000,0x0CCCCCCC};
//                  (0.5 + 0.1i)
int32c test_complex_2 = {0x73333333,0xB3333334};
//                  (0.9 - 0.6i)
res=&result;
input1=&test_complex_1;
input2=&test_complex_2;

DSP_ComplexMult32(input1, input2, res);

// result = {0x4147AE14, 0xE51EB8551} = (0.51 - 0.21i)
```

Parameters

Parameters	Description
indata1	pointer to input complex number (int32c)
indata2	pointer to input complex number (int32c)

DSP_ComplexScalarMult32 Function

Multiplies a complex number and a scalar number.

File

dsp.h

C

```
void DSP_ComplexScalarMult32(int32c * indata, int32_t Scalar, int32c * Output);
```

Returns

pointer to result complex numbers (int32c)

None.

Description

Function DSP_ComplexScalarMult32:

void DSP_ComplexScalarMult32(int32c *indata, int32_t Scalar, int32c *Output);

Multiplies a complex number, indata, by a scalar number, Scalar, and stores the result in Output. indata and Output must be in int32c structure with real and imaginary components. All data must be in the fractional Q31 format. The function will saturate if maximum or minimum values are exceeded. Output(real) = (Input1.re * Scalar); Output(img) = [(Input1.im * Scalar)]i (a + bi) * C => (a * C + b * Ci)

Remarks

None.

Preconditions

Complex numbers must be in the int32c format.

Example

```
int32c *res, result;
int32c *input1;
int32_t  scalarInput = 0x20000000; // 0.25
int32c test_complex_1 = {0x40000000,0x0CCCCCCC};
//                  (0.5 + 0.1i)

res=&result;
input1=&test_complex_1;

DSP_ComplexScalarMult32(input1, scalarInput, res);

// result = {0x10000000, 0x03333333} = (0.125 + 0.025i)
```

Parameters

Parameters	Description
indata	pointer to input complex number (int32c)
Scalar	fractional scalar input value (int32_t)

DSP_ComplexSub32 Function

Calculates the difference of two complex numbers.

File

dsp.h

C

```
void DSP_ComplexSub32(int32c * indata1, int32c * indata2, int32c * Output);
```

Returns

pointer to result complex numbers (int32c)

None.

Description

Function DSP_ComplexSub32:

void DSP_ComplexSub32(int32c *indata1, int32c *indata2, int32c *Output);

Calculates the difference of two complex numbers, indata1 less indata2, and stores the complex result in Output. Both numbers must be in a complex data structure, which includes real and imaginary components. The function saturates the output values if maximum or minimum are exceeded. Real and imaginary components are in the Q31 fractional data format. (a + bi) - (c + di) => (a - c) + (b - d)i

Remarks

None.

Preconditions

Complex numbers must be in the int32c format.

Example

```
int32c *res, result;
int32c *input1, *input2;
int32c test_complex_1 = {0x40000000,0x0CCCCCCC};
//                  (0.5 + 0.1i)
int32c test_complex_2 = {0x73333333,0xB3333334};
//                  (0.9 - 0.6i)
res=&result;
input1=&test_complex_1;
input2=&test_complex_2;

DSP_ComplexSub32(input1, input2, res);

// result = {0xCCCCCCCD, 0x59999998} = (-0.4 + 0.7i)
```

Parameters

Parameters	Description
indata1	pointer to input complex number (int32c)
indata2	pointer to input complex number (int32c)

b) Digital Filter Functions

DSP_FilterFIR32 Function

Performs a Finite Infinite Response (FIR) filter on a vector.

File

dsp.h

C

```
void DSP_FilterFIR32(int32_t * outdata, int32_t * indata, int32_t * coeffs2x, int32_t * delayline, int N,
int K, int scale);
```

Returns

None.

Description

Function DSP_FilterFIR32:

void DSP_FilterFIR32(int32_t *outdata, int32_t *indata, int32_t *coeffs2x, int32_t *delayline, int N, int K, int scale);

Performs an FIR filter on the vector indata, and stores the output in the vector outdata. The number of samples processed in the array is given by N. The number of filter taps is given by K. The values are scaled upon input by the binary scaling factor (right shift), scale. The array of 2*K coefficients is contained in the array coeffs2x, where the values are in order b0, b1, b2... and repeated. Lastly the delayline is an array of K values that are initialized to zero and represent previous values. All values are in fractional Q31 data format. The function will saturate results if minimum

or maximum values are exceeded.

Remarks

Filter coefs must be repeated within the array. The array is twice as large as the number of taps, and the values are repeated in order b0, b1, b2,...bn, b0, b1, b2,... bn. The function updates the delayline array, which must be K elements long. The array should be initialized to zero prior to the first processing. It will contain values for processing cascaded filters within a loop.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four. K must be greater than 2 and a multiple of 2. delayline must have K elements, and be initialized to zero. coeffs2x must have 2*K elements.

Example

```
#define TAPS 4
#define numPOINTS 256

int filterN = numPOINTS;
int filterK = TAPS;
int filterScale = 1;  // scale output by 1/2^1 => output * 0.5
int32_t FilterCoefs[TAPS*2] = {0x40000000, 0x20000000, 0x20000000, 0x20000000,
            0x40000000, 0x20000000, 0x20000000, 0x20000000};
// note repeated filter coefs, A B C D A B C D
//             0.5, 0.25, 0.25, 0.25, 0.5, 0.25, 0.25, 0.25

int32_t outFilterData[numPOINTS]={0};
int32_t inFilterData[numPOINTS];
int filterDelayLine[TAPS]={0};

while(true)
{

//   put some data into input array, inFilterData, here //

DSP_FilterFIR32(outFilterData, inFilterData, FilterCoefs, filterDelayLine,
            filterN, filterK, filterScale);
}
```

Parameters

Parameters	Description
outdata	pointer to destination array of elements (int32_t)
indata	pointer to source array of elements (int32_t)
coeffs2x	pointer to an array of coefficients (int32_t)
delayline	pointer to an array of delay variables (int32_t)
N	number of points in the array to process (int) number of samples (int)
K	number of filter taps
scale	binary scaler divisor (1 / 2^scale) (int)

DSP_FilterFIRDecim32 Function

Performs a decimating FIR filter on the input array.

File

dsp.h

C

```
void DSP_FilterFIRDecim32(int32_t * outdata, int32_t * indata, int32_t * coeffs, int32_t * delayline, int
N, int K, int scale, int rate);
```

Returns

None.

Description

Function DSP_FilterFIRDecim32:

void DSP_FilterFIRDecim32(int32_t *outdata, int32_t *indata, int32_t *coeffs, int32_t *delayline, int N, int K, int scale, int rate);

Compute a FIR decimation filter on the input vector indata, and store the results to the vector outdata. The total number of output elements is set by N, and therefore the outdata array must be at least N in length. The decimation ratio is given by rate. The input is sampled every integer value of rate, skipping every (rate-1) input samples. The input array must therefore be (rate*N) samples long. The amount of filter taps is specified by K. Coeffs specifies the coefficients array. The delayline array holds delay inputs for calculation, and must be initialized to zero prior to calling the filter. Both coeffs and delayline must be K in length. Scale divides the input by a scaling factor by right shifting the number of bits (1/2^scale). All values of input, output, and coeffs are given in Q31 fractional data format. The function will saturate if the output value exceeds the maximum or minimum value.

Y = b0 * X0 + (b1 * X(-1)) + (b2 * X(-2)

Remarks

Coefs are loaded into the array with corresponding to the least delay first (C0, C(-1), C(-2)). K must be greater than rate. Even while decimating the input stream, every input passes through the delayline. So FIR filters of arbitrary length will give the same output as a non-decimating FIR, just with fewer responses.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. delayline must have K elements, and be initialized to zero. coeffs must have K elements. outdata must have N elements indata must have (N*rate) elements

Example

```
#define N 8         // number of output samples
#define TAPS 5
#define SKIP 3

int testFilterN = N;        // number of output elements
int testFilterK = TAPS;     // number of taps
int testFilterRate = SKIP;  // decimation rate R
int32_t outFiltDataDec[N]={0};
int32_t *inTestFilter[N*SKIP];
int filtScaleNum = 1;       // scale output (1 /2^n) => Y * 0.5

int32_t filtDelayTest[8]={0};  // always initialize to zero

// get pointer to input buffer here //
inTestFilter = &inputBuffer;

DSP_FilterFIRDecim32(outFiltDataDec, inTestFilter, inTestCoefs,
        filtDelayTest, testFilterN, testFilterK, filtScaleNum, testFilterRate);
```

Parameters

Parameters	Description
outdata	pointer to output array of elements (int32_t)
indata	pointer to input array of elements (int32_t)
coeffs	pointer to an array of coefficients (int32_t)
delayline	pointer to an array of delay variables (int32_t)
N	number of output elements to be processed (int)
K	number of filter taps and coeffs (int)
scale	binary scaler divisor (1 / 2^scale) (int)
rate	decimation ratio (int)

DSP_FilterFIRInterp32 Function

Performs an interpolating FIR filter on the input array.

File

dsp.h

C

```
void DSP_FilterFIRInterp32(int32_t * outdata, int32_t * indata, int32_t * coeffs, int32_t * delayline, int
N, int K, int scale, int rate);
```

Returns

None.

Description

Function DSP_FilterFIRInterp32:

void DSP_FilterFIRInterp32(int32_t *outdata, int32_t *indata, int32_t *coeffs, int32_t *delayline, int N, int K, int scale, int rate);

Perform an interpolating FIR filter on the first N samples of indata, and stores the result in outdata. The number of output elements is N*rate. The number of filter taps, K, must be an even multiple of N. The coefficients array, Coeffs, must be K elements long. The delay line array, delayline, must be K/R elements long, and be initialized to zero. All data elements must be in Q31 fractional data format. Scaling is performed via binary shift on the input equivalent to (1/2^shift). The function will saturate the output if it exceeds maximum or minimum values. The function creates R output values for each input value processed. The delayline of previous values is processed with R elements of the coefficient array. Numerically:

Y(1,0) = X(0)*C(0) + X(-1)*C(rate) + X(-2)*C(2*rate) ... Y(1,1) = X(0)*C(1) + X(-1)*C(rate+1) + X(-2)*C(2*rate + 1) ... Y(1,rate) = X(0)*C(N) + X(-1)*C(rate+N) + X(-2)*C(2*rate + N) ...

where output Y corresponds to (input,rate) different outputs, input X has (M/rate) sample delays and C is the coefficient array.

Remarks

The function processes each input (rate) times. With each pass, coefficients are offset so that (K/rate) multiply accumulate cycles occur.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. delayline must have (K/R) elements, and be initialized to zero. K (taps) must be an even multiple of R (rate). outdata must have R*N elements.

Example

```
// interpret evenly 1/3 spaced values
#define N 4         // number of output samples
#define TAPS 6
#define INTERP 3

int ifiltN = N;
int ifiltK = TAPS;  // k must be an even multiple of R
int ifiltR = INTERP;

int32_t ifiltOut[N*INTERP]={0};
int32_t ifiltDelay[2]={0};  // must be initialized to zero
int ifiltScale = 0;         // no scaling

int32_t ifiltCoefsThirds[TAPS]={0x2AAAAAA9, 0x55555555,0x7FFFFFFE,
                                0x55555555,0x2AAAAAA9,0x00000000};
//                  0.333333, 0.6666667, 0.99999999, 0.6666667, 0.33333333, 0

int32_t ifiltInput[N]={0x0CCCCCCD, 0x19999999, 0x26666666, 0x33333333};
//                  0.1,  0.2,  0.3,  0.4

DSP_FilterFIRInterp32(ifiltOut, ifiltInput, ifiltCoefsThirds, ifiltDelay,
                                ifiltN, ifiltK, ifiltScale, ifiltR);

// ifiltOut = {0x04444444, 0x08888889, 0x0CCCCCCD, 0x11111111, 0x15555555, 0x19999999,
//          0x1DDDDDDD, 0x22222221, 0x26666665, 0x2AAAAAAA,0x2EEEEEEE, 0x33333332}
// = 0.0333, 0.0667, 0.1, 0.1333, 0.1667, 0.2, 0.2333, 0.2667, 0.3, 0.3333, 0.3667, 0.4
```

Parameters

Parameters	Description
outdata	pointer to output array of elements (int32_t)
indata	pointer to input array of elements (int32_t)
coeffs	pointer to an array of coefficients (int32_t)
delayline	pointer to an array of delay variables (int32_t)
N	number of output elements to be processed (int)
K	number of filter taps and coeffs (int)
scale	binary scaler divisor (1 / 2^scale) (int)
rate	decimation ratio (int)

DSP_FilterIIR16 Function

Performs a single-sample cascaded biquad Infinite Impulse Response (IIR) filter.

File

dsp.h

C

```
int16_t DSP_FilterIIR16(int16_t in, int16_t * coeffs, int16_t * delayline, int B, int scale);
```

Returns

Sample output Y (int16_t)

Description

Function DSP_FilterIIR16:

int16_t DSP_FilterIIR16(int16_t in, int16_t *coeffs, int16_t *delayline, int B, int scale);

Performs a single element cascaded biquad IIR filter on the input, in. The filter contains B number of biquad sections, and cascades the output of one to the input of the next. B must be greater than 2 and a multiple of 2. The int16_t output generated by the function is the computation from the final biquad stage. Delay pipeline array delayline must contain 2*B values and be initialized to zero prior to use. The coefficient array must contain 4*B elements, and must be set up in order of biquad a1, a2, b1, b2. A binary (right shift) factor, scale, will scale the output equivalent to (1/2^scale). All numerical values must be in Q15 fractional data format. The function will saturate values if maximum or minimum values are exceeded.

Y = X0 + (b1 * X(-1)) + (b2 * X(-2) + (a1 * Y(-1)) + (a2 * Y(-2))

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. B must be greater than 2 and a multiple of 2. delayline must have 2*B elements, and be initialized to zero. coeffs must have 4*B elements.

Example

```
#define B 8         // use * biquad filters in cascade

int dataSamples = 256;
int i, j;
biquad16 bquad[B];
int16_t coefs[4*B]= {0};
int16_t delaylines[2*B]= {0};
int16_t Y, X;
int scaleBquad = 1;  // scale output (1 /2^n) => Y * 0.5

// do something to set up coefs, for instance this example //

for (j=0; jRemarks:Filter coefs must be stored within the array as a1, a2, b1, b2, a1, a2, b1, b2, in order
of biquads form input to output. A function to translate the coeffs from biquad structure to coeffs is
available in DSP_FilterIIRSetup16. The function updates the delayline array, which must be 2*B elements
long. The array should be initialized to zero prior to the first processing. It will contain values for
processing cascaded filters within a loop.
```

Parameters

Parameters	Description
in	input data element X (int16_t)
coeffs	pointer to an array of coefficients (int16_t)
delayline	pointer to an array of delay variables (int16_t)
B	number of cascaded biquad filter groups to process (int)
scale	binary scaler divisor (1 / 2^scale) (int)

DSP_FilterIIRBQ16 Function

Performs a single-pass IIR Biquad Filter.

File

dsp.h

C

```
int16_t DSP_FilterIIRBQ16(int16_t Xin, PARM_EQUAL_FILTER * pFilter);
```

Returns

Sample output Y (int16_t)

Description

Function DSP_FilterIIRBQ16:

int16_t DSP_FilterIIRBQ16(int16_t Xin, PARM_EQUAL_FILTER *pFilter);

Calculates a single pass IIR biquad filter on Xin, and delivers the result as a 16-bit output. All math is performed using 32 bit instructions, with results truncated to 16-bits for the output. The delay register is stored as a 32-bit value for subsequent functions. All values are fractional Q15 and Q31, see data structure for specifics.

Y = X(0)*b0 + (b1 * X(-1)) + (b2 * X(-2)) - (a1 * Y(-1)) - (a2 * Y(-2))

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Preconditions

Delay register values should be initialized to zero.

Example

```
PARM_EQUAL_FILTER *ptrFilterEQ;
PARM_EQUAL_FILTER FilterEQ;
uint16_t DataIn, DataOut;
ptrFilterEQ = &FilterEQ;

// 48KHz sampling; 1 KHz bandpass filter; Q=0.9
//  divide by 2 and convert to Q15
//   b0 = 0.06761171785499065
//   b1 = 0
//   b2 = -0.06761171785499065
//   a1 = -1.848823142275648
//   a2 = 0.8647765642900187

// note all coefs are half value of original design, gain handled in algorithm
ptrFiltEQ32->b[0]=0x0453;       // feed forward b0 coef
ptrFiltEQ32->b[1]=0;            // feed forward b1 coef
ptrFiltEQ32->b[2]=0xFBAD;       // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
ptrFiltEQ32->a[0]=0x89AD;       // feedback a1 coef
ptrFiltEQ32->a[1]=0x3758;       // feedback a2 coef

for (i=0;i<256;i++)
    {
    // *** get some input data here
       DataIn32 = three_hundred_hz[i];

       DataOut = DSP_FilterIIRBQ16(DataIn, ptrFilterEQ);

     // *** do something with the DataOut here
     }
```

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

DSP_FilterIIRBQ16_cascade8 Function

Performs a single-sample IIR Biquad Filter as a cascade of 8 series filters.

File

dsp.h

C

```
int16_t DSP_FilterIIRBQ16_cascade8(int16_t Xin, PARM_EQUAL_FILTER * pFilter_Array);
```

Returns

Sample output Y (int16_t)

Description

Function DSP_FilterIIRBQ16_cascade8:

int16_t DSP_FilterIIRBQ16_cascade8(int16_t Xin, PARM_EQUAL_FILTER *pFilter_Array);

Calculates a single pass IIR biquad cascade filter on Xin, and delivers the result as a 16-bit output. The cascade of filters is 8 unique biquad filters arranged in series such that the output of one is provided as the input to the next. A unique filter coefficient set is provided to each, and 32 bit delay lines are maintained for each. All math is performed using 32 bit instructions, which results truncated to 16-bits for the output. Global gain values are available on the output. Fracgain is a Q15 fractional gain value and expgain is a binary shift gain value. The combination of the two can be utilized to normalize the output as desired. All values are fractional Q15 and Q31, see data structure for specifics.

Y = Y7 <- Y6 <- Y5 <- Y4 <- Y3 <- Y2 <- Y1 <- Y0 where each Yn filter element represents a unique IIR biquad: Yn = Y(n-1)*b0 + (b1 * Y(n-2)) + (b2 * Y(n-3)) - (a1 * Yn(-1)) - (a2 * Yn(-2)) and: for Y0; Y(n-1) = Xin(0)

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Preconditions

Delay register values should be initialized to zero.

Example

```
PARM_EQUAL_FILTER filtArray[8];
uint16_t dataY, dataX;

// example to use 2 filter blocks as notch filters
// fill entire Filter Array with coefs
for (i=0;i<8;i++)
{
    filtArray[i].Z[0]=0;
    filtArray[i].Z[1]=0;

    // note all coefs are half value of original design, gain handled in algorithm
    // all pass
    filtArray[i].b[0]=0x4000;
    filtArray[i].b[1]=0;        // feed forward b1 coef
    filtArray[i].b[2]=0;  // feed forward b2 coef

    filtArray[i].a[0]=0;  // feedback a1 coef
    filtArray[i].a[1]=0;  // feedback a2 coef
}
    // Unique filters for example
    // 10KHz notch filter -- divide coefs by 2
    b0 = 0.5883783602332997
    b1 = -0.17124071441396285
    b2 = 0.5883783602332997
    a1 = -0.17124071441396285
    a2 = 0.1767567204665992

    // note all coefs are half value of original design, gain handled in algorithm
    filtArray[3].b[0]=0x25a7;           // feed forward b0 coef
    filtArray[3].b[1]=0xf508;           // feed forward b1 coef
    filtArray[3].b[2]=0x25a7;           // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArray[3].a[0]=0xf508;           // feedback a1 coef
    filtArray[3].a[1]=0x0b4f;           // feedback a2 coef
```

```
    // 1 KHz notch filter -- divide coefs by 2
    b0 = 0.9087554064944908
    b1 = -1.7990948352036205
    b2 = 0.9087554064944908
    a1 = -1.7990948352036205
    a2 = 0.8175108129889816

    // note all coefs are half value of original design, gain handled in algorithm
    filtArray[7].b[0]=0x3a29;           // feed forward b0 coef
    filtArray[7].b[1]=0x8cdc;           // feed forward b1 coef
    filtArray[7].b[2]=0x3a29;           // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArray[7].a[0]=0x8cdc;           // feedback a1 coef
    filtArray[7].a[1]=0x3452;           // feedback a2 coef

for (i=0;i<256;i++)
    {
     // *** get input data here
     dataX = compound_300_1K_hz16[i];

     dataY = DSP_FilterIIRBQ16_cascade8(dataX, filtArray);

     // *** do something with the DataY here
     }
```

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

DSP_FilterIIRBQ16_cascade8_fast Function

Performs a single-sample IIR Biquad Filter as a cascade of 8 series filters.

File

dsp.h

C

```
int16_t DSP_FilterIIRBQ16_cascade8_fast(int16_t Xin, PARM_EQUAL_FILTER_16 * pFilter_Array);
```

Returns

Sample output Y (int16_t)

Description

Function DSP_FilterIIRBQ16_cascade8_fast:

int16_t DSP_FilterIIRBQ16_cascade8_fast(int16_t Xin, PARM_EQUAL_FILTER_16 *pFilter_Array);

Calculates a single pass IIR biquad cascade filter on Xin, and delivers the result as a 16-bit output. The cascade of filters is 8 unique biquad filters arranged in series such that the output of one is provided as the input to the next. A unique filter coefficient set is provided to each, and 16 bit delay lines are maintained for each. All math is performed using 16 bit instructions, which results rounded to 16-bits for the output. All values are fractional Q15, see data structure for specifics. The function will saturate the output should it exceed maximum or minimum values.

Y = Y7 <- Y6 <- Y5 <- Y4 <- Y3 <- Y2 <- Y1 <- Y0 where each Yn filter element represents a unique IIR biquad: Yn = Y(n-1)*b0 + (b1 * Y(n-2)) + (b2 * Y(n-3)) - (a1 * Yn(-1)) - (a2 * Yn(-2)) and: for Y0; Y(n-1) = Xin(0)

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Preconditions

Delay register values should be initialized to zero.

Example

```
PARM_EQUAL_FILTER_16 filtArray[8];
uint16_t dataY, dataX;

// example to use 2 filter blocks as notch filters
// fill entire Filter Array with coefs
for (i=0;i<8;i++)
{
    filtArray[i].Z[0]=0;
    filtArray[i].Z[1]=0;

    // note all coefs are half value of original design, gain handled in algorithm
    // all pass
    filtArray[i].b[0]=0x4000;
    filtArray[i].b[1]=0;        // feed forward b1 coef
    filtArray[i].b[2]=0;  // feed forward b2 coef

    filtArray[i].a[0]=0;  // feedback a1 coef
    filtArray[i].a[1]=0;  // feedback a2 coef
}
    // Unique filters for example
    // 10KHz notch filter -- divide coefs by 2
    b0 = 0.5883783602332997
    b1 = -0.17124071441396285
    b2 = 0.5883783602332997
    a1 = -0.17124071441396285
    a2 = 0.1767567204665992

    // note all coefs are half value of original design, gain handled in algorithm
    filtArray[3].b[0]=0x25a7;           // feed forward b0 coef
    filtArray[3].b[1]=0xf508;           // feed forward b1 coef
    filtArray[3].b[2]=0x25a7;           // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArray[3].a[0]=0xf508;           // feedback a1 coef
    filtArray[3].a[1]=0x0b4f;           // feedback a2 coef

    // 1 KHz notch filter -- divide coefs by 2
    b0 = 0.9087554064944908
    b1 = -1.7990948352036205
    b2 = 0.9087554064944908
    a1 = -1.7990948352036205
    a2 = 0.8175108129889816

    // note all coefs are half value of original design, gain handled in algorithm
    filtArray[7].b[0]=0x3a29;           // feed forward b0 coef
    filtArray[7].b[1]=0x8cdc;           // feed forward b1 coef
    filtArray[7].b[2]=0x3a29;           // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArray[7].a[0]=0x8cdc;           // feedback a1 coef
    filtArray[7].a[1]=0x3452;           // feedback a2 coef

for (i=0;i<256;i++)
    {
     // *** get input data here
     dataX = compound_300_1K_hz16[i];

     dataY = DSP_FilterIIRBQ16_cascade8_fast(dataX, filtArray);

     // *** do something with the DataY here
     }
```

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

DSP_FilterIIRBQ16_fast Function

Performs a single-pass IIR Biquad Filter.

File

dsp.h

C

```
int16_t DSP_FilterIIRBQ16_fast(int16_t Xin, PARM_EQUAL_FILTER_16 * pFilter);
```

Returns

Sample output Y (int16_t)

Description

Function DSP_FilterIIRBQ16_fast:

int16_t DSP_FilterIIRBQ16_fast(int16_t Xin, PARM_EQUAL_FILTER_16 *pFilter);

Calculates a single pass IIR biquad filter on Xin, and delivers the result as a 16-bit output. All math is performed using 16 bit instructions, with results rounded to 16-bits for the output. The delay register is stored as a 16-bit value for subsequent functions. The function will saturate the results if maximum or minimum fractional values are exceeded. All values are fractional Q15 format.

Y = X(0)*b0 + (b1 * X(-1)) + (b2 * X(-2)) - (a1 * Y(-1)) - (a2 * Y(-2))

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Preconditions

Delay register values should be initialized to zero.

Example

```
PARM_EQUAL_FILTER_16 *ptrFilterEQ;
PARM_EQUAL_FILTER_16 FilterEQ;
uint16_t DataIn, DataOut;
ptrFilterEQ = &FilterEQ;

// 48KHz sampling; 1 KHz bandpass filter; Q=0.9
//  divide by 2 and convert to Q15
//   b0 = 0.06761171785499065
//   b1 = 0
//   b2 = -0.06761171785499065
//   a1 = -1.848823142275648
//   a2 = 0.8647765642900187

// note all coefs are half value of original design, gain handled in algorithm
ptrFiltEQ32->b[0]=0x0453;       // feed forward b0 coef
ptrFiltEQ32->b[1]=0;            // feed forward b1 coef
ptrFiltEQ32->b[2]=0xFBAD;       // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
ptrFiltEQ32->a[0]=0x89AD;       // feedback a1 coef
ptrFiltEQ32->a[1]=0x3758;       // feedback a2 coef

for (i=0;i<256;i++)
    {
    // *** get some input data here
       DataIn32 = three_hundred_hz[i];
```

```
    DataOut = DSP_FilterIIRBQ16_fast(DataIn, ptrFilterEQ);

  // *** do something with the DataOut here
  }
```

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

DSP_FilterIIRBQ16_parallel8 Function

Performs a 8 parallel single-pass IIR Biquad Filters, and sums the result.

File

dsp.h

C

```
int16_t DSP_FilterIIRBQ16_parallel8(int16_t Xin, PARM_EQUAL_FILTER * pFilter);
```

Returns

Sample output Y (int16_t)

Description

Function DSP_FilterIIRBQ16_parallel8:

int16_t DSP_FilterIIRBQ16_parallel8(int16_t Xin, PARM_EQUAL_FILTER *pFilter);

Calculates a 8 parallel, single pass IIR biquad filters on Xin, sums the result and delivers the result as a 16-bit output. All math is performed using 32 bit instructions, which results truncated to 16-bits for the output. The delay register is stored as a 32-bit value for subsequent functions. Output is tuned by 2 multiplier factors. First each parallel section has a fractional gain (attenuation) that enables individual scaling of that section. Second, a global binary (log2N) gain is applied to the result. The combination of gain factors enable both gain and attenuation. All values are fractional Q15 and Q31, see data structure for specifics.

Y = Y7/8 + Y6/8 + Y5/8 + Y4/8 + Y3/8 + Y2/8 + Y1/8 + Y0/8 where each Yn filter element represents a unique IIR biquad: Yn = X(0)*b0 + (b1 * X(n-1)) + (b2 * X(n-2)) - (a1 * Yn(-1)) - (a2 * Yn(-2))

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Preconditions

Delay register values should be initialized to zero. The sum of all fracgain should be <= 1

Example

```
PARM_EQUAL_FILTER filtArrayPara[8];
uint16_t dataY, dataX;

// fill entire Filter Array with coefs
for (i=0;i<8;i++)
{
    filtArrayPara[i].Z[0]=0;
    filtArrayPara[i].Z[1]=0;

    filtArrayPara[i].G.fracGain = 0x7FFF;       // gain = 1 default
    filtArrayPara[i].G.expGain = 1;             // == 2^N; gain of 2

    // note all coefs are half value of original design, gain handled in algorithm
    // none pass -- default
    filtArrayPara[i].b[0]=0;        // feed forward b0 coef
    filtArrayPara[i].b[1]=0;        // feed forward b1 coef
    filtArrayPara[i].b[2]=0;        // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArrayPara[i].a[0]=0;        // feedback a1 coef
```

```
    filtArrayPara[i].a[1]=0;        // feedback a2 coef
}

    // 1K bandpass Q=0.9
    filtArrayPara[7].G.fracGain = 0x4000;   // gain = 0.5 because using 2 outputs
    // note all coefs are half value of original design, gain handled in algorithm
    filtArrayPara[7].b[0]=0x04ad;
    filtArrayPara[7].b[1]=0;                // feed forward b1 coef
    filtArrayPara[7].b[2]=0xfb53;           // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArrayPara[7].a[0]=0x8a90;           // feedback a1 coef
    filtArrayPara[7].a[1]=0x36a4;           // feedback a2 coef

    // 300 Hz bandpass    Q=0.9
    filtArrayPara[6].G.fracGain = 0x1000;   // gain = 0.125 as an example
    // note all coefs are half value of original design, gain handled in algorithm
    filtArrayPara[6].b[0]=0x017b;           // feed forward b0 coef
    filtArrayPara[6].b[1]=0;                // feed forward b1 coef
    filtArrayPara[6].b[2]=0xfe85;           // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArrayPara[6].a[0]=0x8316;           // feedback a1 coef
    filtArrayPara[6].a[1]=0x3d08;           // feedback a2 coef

for (i=0;i<256;i++)
    {
     // *** get input data here
     dataX = compound_300_1K_hz16[i];

     dataY = DSP_FilterIIRBQ16_cascade8_fast(dataX, filtArray);

     // *** do something with the DataY here
     }
```

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

DSP_FilterIIRBQ16_parallel8_fast Function

Performs a 8 parallel single-pass IIR Biquad Filters, and sums the result.

File

dsp.h

C

```
int16_t DSP_FilterIIRBQ16_parallel8_fast(int16_t Xin, PARM_EQUAL_FILTER_16 * pFilter);
```

Returns

Sample output Y (int16_t)

Description

Function DSP_FilterIIRBQ16_parallel8_fast:

int16_t DSP_FilterIIRBQ16_parallel8_fast(int16_t Xin, PARM_EQUAL_FILTER_16 *pFilter);

Calculates a 8 parallel, single pass IIR biquad filters on Xin, sums the result and delivers the result as a 16-bit output. All math is performed using 16 bit instructions, which results rounded to 16-bits for the output. The delay register is stored as a 16-bit value for subsequent functions. Output is tuned by 2 multiplier factors. First each parallel section has a fractional gain (attenuation) that enables individual scaling of that section. Second, a global binary (log2N) gain is applied to the result. The combination of gain factors enable both gain and attenuation. All values are fractional Q15. The function will round outputs and saturate if maximum or minimum values are exceeded.

Y = Y7/8 + Y6/8 + Y5/8 + Y4/8 + Y3/8 + Y2/8 + Y1/8 + Y0/8 where each Yn filter element represents a unique IIR biquad: Yn = X(0)*b0 + (b1 * X(n-1)) + (b2 * X(n-2)) - (a1 * Yn(-1)) - (a2 * Yn(-2))

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Preconditions

Delay register values should be initialized to zero. The sum of all fracgain should be <= 1

Example

```
PARM_EQUAL_FILTER_16 filtArrayPara[8];      // note change in data structure
uint16_t dataY, dataX;

// fill entire Filter Array with coefs
for (i=0;i<8;i++)
{
    filtArrayPara[i].Z[0]=0;
    filtArrayPara[i].Z[1]=0;

    filtArrayPara[i].G.fracGain = 0x7FFF;       // gain = 1 default
    filtArrayPara[i].G.expGain = 1;             // log2N; gain of 2

    // note all coefs are half value of original design, gain handled in algorithm
    // none pass -- default
    filtArrayPara[i].b[0]=0;        // feed forward b0 coef
    filtArrayPara[i].b[1]=0;        // feed forward b1 coef
    filtArrayPara[i].b[2]=0;        // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArrayPara[i].a[0]=0;        // feedback a1 coef
    filtArrayPara[i].a[1]=0;        // feedback a2 coef
 }

    // 1K bandpass Q=0.9
    filtArrayPara[7].G.fracGain = 0x4000;   // gain = 0.5 because using 2 outputs
    // note all coefs are half value of original design, gain handled in algorithm
    filtArrayPara[7].b[0]=0x04ad;
    filtArrayPara[7].b[1]=0;                // feed forward b1 coef
    filtArrayPara[7].b[2]=0xfb53;           // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArrayPara[7].a[0]=0x8a90;           // feedback a1 coef
    filtArrayPara[7].a[1]=0x36a4;           // feedback a2 coef

    // 300 Hz bandpass    Q=0.9
    filtArrayPara[6].G.fracGain = 0x1000;   // gain = 0.125 as an example
    // note all coefs are half value of original design, gain handled in algorithm
    filtArrayPara[6].b[0]=0x017b;           // feed forward b0 coef
    filtArrayPara[6].b[1]=0;                // feed forward b1 coef
    filtArrayPara[6].b[2]=0xfe85;           // feed forward b2 coef

    // note all coefs are half value of original design, gain handled in algorithm
    // note subtract is handled in algorithm, so coefs go in at actual value
    filtArrayPara[6].a[0]=0x8316;           // feedback a1 coef
    filtArrayPara[6].a[1]=0x3d08;           // feedback a2 coef

for (i=0;i<256;i++)
    {
     // *** get input data here
     dataX = compound_300_1K_hz16[i];

     dataY = DSP_FilterIIRBQ16_cascade8_fast(dataX, filtArray);

     // *** do something with the DataY here
     }
```

Parameters

Parameters	Description
Xin	input data element X (int16_t)
pFilter	pointer to filter coef and delay structure

DSP_FilterIIRBQ32 Function

Performs a high resolution single-pass IIR Biquad Filter.

File

dsp.h

C

```
int32_t DSP_FilterIIRBQ32(int32_t Xin, PARM_EQUAL_FILTER_32 * pFilter);
```

Returns

Sample output Y (int32_t)

Description

Function DSP_FilterIIRBQ32:

int32_t DSP_FilterIIRBQ32(int32_t Xin, PARM_EQUAL_FILTER_32 *pFilter);

Calculates a single pass IIR biquad filter on Xin, and delivers the result as a 16-bit output. All math is performed using 32 bit instructions, with results truncated to 32-bits for the output. The delay register is stored as a 32-bit value for subsequent functions. All values are fractional Q31, see data structure for specifics.

Y = X(0)*b0 + (b1 * X(-1)) + (b2 * X(-2)) - (a1 * Y(-1)) - (a2 * Y(-2))

Remarks

The delay register values should be initialized to zero prior to the first call to the function, they are updated each pass. A gain of 2 has been hard coded into the function. This implies that all coefs should be input at half value. This is purposeful, since many filter designs need a div2 to have each coef between the required -1

Preconditions

Delay register values should be initialized to zero.

Example

```
PARM_EQUAL_FILTER_32 *ptrFiltEQ32;
PARM_EQUAL_FILTER_32 FilterEQ32;
int32_t DataIn32, DataOut32;

ptrFiltEQ32 = &FilterEQ32;

ptrFiltEQ32->Z[0]=0;
ptrFiltEQ32->Z[1]=0;

//  1000 Hz Q= 0.9 BP filter design, 44.1K sampling
//
//    b0 = 0.07311778239751009  forward
//    b1 = 0
//    b2 = -0.07311778239751009
//    a1 = -1.8349811166056893  back
//    a2 = 0.8537644352049799

// note all coefs are half value of original design, gain handled in algorithm
ptrFiltEQ32->b[0]=0x04ADF635;   // feed forward b0 coef
ptrFiltEQ32->b[1]=0;            // feed forward b1 coef
ptrFiltEQ32->b[2]=0xFB5209CB;   // feed forward b2 coef

// note all coefs are half value of original design, gain handled in algorithm
// note subtract is handled in algorithm, so coefs go in at actual value
ptrFiltEQ32->a[0]=0x8A8FAB5D;  // feedback a1 coef
ptrFiltEQ32->a[1]=0x36A41395;  // feedback a2 coef

for (i=0;i<256;i++)
```

```
{
 // *** get input data here
   DataIn32 = three_hundred_hz[i];

   DataOut32 = DSP_FilterIIRBQ32(DataIn32, ptrFiltEQ32);

 // *** do something with the DataOut32 here
 }
```

Parameters

Parameters	Description
Xin	input data element X (int32_t)
pFilter	pointer to high resolution filter coef and delay structure

DSP_FilterIIRSetup16 Function

Converts biquad structure to coeffs array to set up IIR filter.

File

dsp.h

C

```
void DSP_FilterIIRSetup16(int16_t * coeffs, biquad16 * bq, int B);
```

Returns

None.

Description

Function DSP_FilterIIRSetup16:

void DSP_FilterIIRSetup16(int16_t *coeffs, biquad16 *bq, int B);

Converts an array of biquad coefficients, bq, into an linear array of coefficients, coeffs. The output array must be 4*B elements long. The number of biquads in the resulting factor is given by B. All numerical values must be in Q15 fractional data format.

Remarks

None.

Preconditions

coeffs must have 4*B elements.

Example

```
see DSP_FilterIIR16 for example.
```

Parameters

Parameters	Description
coeffs	pointer to an array of coefficients (int16_t)
bq	pointer to array of biquad structure filter coefs (biquad16)
B	number of cascaded biquad filter groups to process (int)

DSP_FilterLMS16 Function

Performs a single sample Least Mean Squares FIR Filter.

File

dsp.h

C

```
int16_t DSP_FilterLMS16(int16_t in, int16_t ref, int16_t * coeffs, int16_t * delayline, int16_t * error,
int K, int16_t mu);
```

Returns

(int16_t) - FIR filter output

Description

Function DSP_FilterLMS16:

int16_t DSP_FilterLMS16(int16_t in, int16_t ref, int16_t *coeffs, int16_t *delayline, int16_t *error, int K, int16_t mu);

Computes an LMS adaptive filter on the input in. Filter output of the FIR is given as a 16 bit value. The filter target is ref, and the calculation difference between the output and the target is error. The filter adapts its coefficients, coefs, on each pass. The number of coefficients (filter taps) is given by the value K. The delayline array should be initialized to zero prior to calling the filter for the first time, and have K elements. The value mu is the rate at which the filter adapts. All values are Q15 fractional numbers. The function will saturate the output if it exceeds maximum or minimum values. The LMS will adapt its coefs to attempt to drive the output value toward the ref value. The rate of adaption on each pass depends on mu and the error from the previous calculation.

Remarks

Filter coefs may start at random or zero value, but convergence is dependent on the amount of update required.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. delayline must have (K) elements, and be initialized to zero. K (taps) must be a multiple of 4, and >= 8. mu must be positive.

Example

```
#define lmsTAPS 8

int16_t lmsOut;
int lmsTaps = lmsTAPS;

int16_t lmsCoefs[lmsTAPS]={0x5000, 0x4000,0x3000, 0x2000,0x1000, 0x0000,0xF000, 0xE000};
int16_t lmsDelay[lmsTAPS]={0};
int16_t *ptrLMSError;
int16_t lmsError = 0x0200;
int16_t inVal=0;

int16_t refVal = 0x0CCC;  // some target value = 0.1
int16_t lmsAdapt = 0x3000;

ptrLMSError = &lmsError;

for (i=0;i<200;i++)
{
// get some input value here //
 if (i < 100)
 {
     inVal = 0x4233;
 }
 else
 {
     inVal = 0xCF10;
 }

 lmsOut =  DSP_FilterLMS16(inVal, refVal, lmsCoefs, lmsDelay,
       ptrLMSError, lmsTaps, lmsAdapt);
}
```

Parameters

Parameters	Description
in	input data value (int16_t)
ref	target output value (int16_t)
coeffs	pointer to an array of coefficients (int16_t)
delayline	pointer to an array of delay variables (int16_t)
error	output minus reference (int16_t)
K	number of filter taps and coeffs (int)
mu	adaption rate (int16_t)

c) Matrix Math Functions

DSP_MatrixAdd32 Function

Addition of two matrices C = (A + B).

File

dsp.h

C

```
void DSP_MatrixAdd32(matrix32 * resMat, matrix32 * srcMat1, matrix32 * srcMat2);
```

Returns

None.

Description

Function DSP_MatrixAdd32:

void DSP_MatrixAdd32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);

Vector summation of two matrices, where both have 32-bit integer elements. The resulting output will saturate if element addition exceeds MAX32 or MIN32.

Remarks

Execution Time (cycles): 225 cycles + 23 / matrix_element. The function will saturate the output value if it exceeds maximum limits per element.

Preconditions

Both matrices must be equivalent in rows and columns. Both Matrices must be set into structure (ROWS, COLUMNS, vector_pointer).

Example

```
#define ROW 2
#define COL 2

matrix32 *resMat, *srcMat1, *srcMat2;
int32_t result[ROW*COL];

int32_t matA[ROW*COL] = {1,2,3,4};
int32_t matB[ROW*COL] = {2,4,6,8};

matrix32 mat, mat2, mat3;
resMat=&mat;
srcMat1=&mat2;
srcMat2=&mat3;

srcMat1->row=ROW;
srcMat1->col=COL;
srcMat1->pMatrix=matA;

srcMat2->col=COL;
srcMat2->row=ROW;
srcMat2->pMatrix=matB;

resMat->row=ROW;
resMat->col=COL;
resMat->pMatrix=result;

DSP_MatrixAdd32(resMat, srcMat1, srcMat2);

// result[i] = matA[i] + matB[i] = {3,6,9,0xA}
```

Parameters

Parameters	Description
resMat	pointer to new sum Matrix C (*int32_t)
srcMat1	pointer to the Matrix A structure (*int32_t)
srcMat2	pointer to the Matrix B structure (*int32_t)

DSP_MatrixEqual32 Function

Equality of two matrices C = (A).

File

dsp.h

C

```
void DSP_MatrixEqual32(matrix32 * resMat, matrix32 * srcMat);
```

Returns

None.

Description

Function DSP_MatrixEqual32:

void DSP_MatrixEqual32(matrix32 *resMat, matrix32 *srcMat);

Vector copy of all elements from one matrix to another. C is a duplicate of A.

Remarks

Execution Time (cycles): 163 cycles + 12 / matrix_element.

Preconditions

None.

Example

```
#define ROW 2
#define COL 2

matrix32 *resMat, *srcMat1, *srcMat2;
int32_t result[ROW*COL];

int32_t matA[ROW*COL] = {5,2,-3,8};

matrix32 mat, mat2;
resMat=&mat;
srcMat1=&mat2;

srcMat1->row=ROW;
srcMat1->col=COL;
srcMat1->pMatrix=matA;

resMat->row=ROW;
resMat->col=COL;
resMat->pMatrix=result;

DSP_MatrixEqual32(resMat, srcMat1, srcMat2);

// result[i] = matA[i] = {5, 2, -3, 8}
```

Parameters

Parameters	Description
resMat	pointer to completed new Matrix C (*int32_t)
srcMat	pointer to the Matrix A structure (*int32_t)

DSP_MatrixInit32 Function

Initializes the first N elements of a Matrix to the value num.

File

dsp.h

C

```
void DSP_MatrixInit32(int32_t * data_buffer, int N, int32_t num);
```

Returns

None.

Description

Function DSP_MatrixInit32:

void DSP_MatrixInit32(int32_t *data_buffer, int N, int32_t num);

Copy the value num into the first N Matrix elements of data_buffer.

Remarks

None.

Preconditions

data_buffer must be predefined to be equal to or greater than N elements. N must be a factor of four, or it will truncate to the nearest factor of four.

Example

```
#define ROW 3
#define COL 3

int32_t numElements = 4;  // multiple of 4
int valueElements = -1;

int32_t matA[ROW*COL] = {5,2,-3,8,4,2,-6,8,9};

DSP_MatrixInit32(matA, numElements, valueElements);

// matA[i] = {-1,-1,-1,-1,4,2,-6,8,9}
```

Parameters

Parameters	Description
data_buffer	pointer to the Matrix to be initialized (int32_t[M*N])
N	number of elements to be initialized (int32_t)
num	value to be initialized into the matrix (int32_t)

DSP_MatrixMul32 Function

Multiplication of two matrices C = A x B.

File

dsp.h

C

```
void DSP_MatrixMul32(matrix32 * resMat, matrix32 * srcMat1, matrix32 * srcMat2);
```

Returns

None.

Description

Function DSP_MatrixMul32:

void DSP_MatrixMul32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);

Multiplication of two matrices, with inputs and outputs being in fractional Q31 numerical format. The output elements will saturate if the dot product exceeds maximum or minimum fractional values.

Remarks

Execution Time (cycles): 319 cycles + 38 / output matrix_element. The function will saturate the output value if it exceeds maximum limits per element.

Preconditions

Matrices must be aligned such that columns of A = rows of B. resMat must have the format of rows of A, columns of B. All Matrices must be set

into structure (ROWS, COLUMNS, vector_pointer).

Example

```
#define ROW1 3
#define COL1 2
#define ROW2 2
#define COL2 2

matrix32 *resMat, *srcMat1, *srcMat2;
int32_t result[ROW1*COL2];

int32_t test_MatrixA[ROW1*COL1]=
{
    0x40000000,0x20000000,      // 0.5,  0.25
    0xD999999A,0x4CCCCCCC,      // -0.3, 0.6
    0xC0000000,0x0CCCCCCD       // -0.5  0.1
};

int32_t test_MatrixB[ROW2*COL2]=
{
    0x40000000,0x20000000,      // 0.5, 0.25
    0x0CCCCCCD,0xCCCCCCCD       // 0.1, -0.4
};

matrix32 mat, mat2, mat3;
resMat=&mat;
srcMat1=&mat2;
srcMat2=&mat3;

srcMat1->row=ROW1;
srcMat1->col=COL1;
srcMat1->pMatrix=test_MatrixA;

srcMat2->col=COL2;
srcMat2->row=ROW2;
srcMat2->pMatrix=test_MatrixB;

resMat->row=ROW1;  // note resulting matrix MUST have ROW1 & COL2 format
resMat->col=COL2;
resMat->pMatrix=result;

DSP_MatrixMul32(resMat, srcMat1, srcMat2);

// result[] = matA[] x matB[] =
//    { 0x23333333, 0x03333333   // 0.275, 0.025
//      0xF47AE147, 0xD7AE147B   // -0.9, -0.315
//      0xE147AE14, 0xEAE147AE } // -0.24, -0.165
```

Parameters

Parameters	Description
resMat	pointer to different Matrix C structure (*int32_t)
srcMat1	pointer to the Matrix A structure (*int32_t)
srcMat2	pointer to the Matrix B structure (*int32_t)

DSP_MatrixScale32 Function

Scales each element of an input buffer (matrix) by a fixed number.

File

dsp.h

C

```
void DSP_MatrixScale32(int32_t * data_buffer, int N, int32_t num);
```

Returns

None.

Description

Function DSP_MatrixScale32:

void DSP_MatrixScale32(int32_t *data_buffer, int N, int32_t num);

Multiply the first N elements of an input buffer by a fixed scalar num. The resulting value is stored back into the input buffer. N number total samples of the input buffer are processed. All values are in Q31 fractional integer format. The result of calculations is saturated to the MAX32 or MIN32 value if exceeded.

Remarks

Execution time (cycles): 190 + 9 cycles / element, typical.

Preconditions

data_buffer must be predefined to be equal to or greater than N elements. N must be a factor of four, or will truncate to the nearest factor of four.

Example

```
int32_t numScale = 0x40000000;  // 0.5
int valN = 12;
int32_t inputBufScale[12] = {0x40000000, 0x40000000, 0x20000000, 0x20000000,
            0x19999999, 0xCCCCCCCD, 0xF3333333, 0x80000000,
            0x7FFFFFFF, 0x00000000, 0x40000000, 0x70000000 };
// 0.5, 0.5, 0.25, 0.25, 0.25, 0.2, -0.4, -0.1, -1, 1, 0, 0.5, 0.875

DSP_MatrixScale32(inputBufScale,valN,numScale);

// inputBufScale[i] = {0x20000000, 0x20000000, 0x10000000, 0x10000000,
//          0x0CCCCCCC, 0xE6666666, 0xF9999999, 0xC0000000,
//          0x3FFFFFFF, 0x00000000, 0x20000000, 0x38000000}
//  0.25, 0.25, 0.125, 0.125, 0.1, -0.2, -0.05, -0.5, 0.5, 0, 0.25, 0.4375
```

Parameters

Parameters	Description
data_buffer	pointer to the Matrix to be initialized (int32_t[M*N])
N	number of elements to be initialized (int)
num	value to be initialized into the matrix (int32_t)

DSP_MatrixSub32 Function

Subtraction of two matrices C = (A - B).

File

dsp.h

C

```
void DSP_MatrixSub32(matrix32 * resMat, matrix32 * srcMat1, matrix32 * srcMat2);
```

Returns

None.

Description

Function DSP_MatrixSub32:

void DSP_MatrixSub32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);

Vector subtraction of two matrices, where both have 32-bit integer elements. The resulting output will saturate if element addition exceeds MAX32 or MIN32.

Remarks

Execution Time (cycles): 222 cycles + 21 / matrix_element. The function will saturate the output value if it exceeds maximum limits per element.

Preconditions

Both matrices must be equivalent in rows and columns. All Matrices must be set into structure (ROWS, COLUMNS, vector_pointer)

Example

```
#define ROW 2
```

```
#define COL 2

matrix32 *resMat, *srcMat1, *srcMat2;
int32_t result[ROW*COL];

int32_t matA[ROW*COL] = {5,2,-3,8};
int32_t matB[ROW*COL] = {2,2,2,2};

matrix32 mat, mat2, mat3;
resMat=&mat;
srcMat1=&mat2;
srcMat2=&mat3;

srcMat1->row=ROW;
srcMat1->col=COL;
srcMat1->pMatrix=matA;

srcMat2->col=COL;
srcMat2->row=ROW;
srcMat2->pMatrix=matB;

resMat->row=ROW;
resMat->col=COL;
resMat->pMatrix=result;

DSP_MatrixSub32(resMat, srcMat1, srcMat2);

// result[i] = matA[i] - matB[i] = {3,0,-5,6}
```

Parameters

Parameters	Description
resMat	pointer to different Matrix C structure (*int32_t)
srcMat1	pointer to the Matrix A structure (*int32_t)
srcMat2	pointer to the Matrix B structure (*int32_t)

DSP_MatrixTranspose32 Function

Transpose of a Matrix C = A (T).

File

dsp.h

C

```
void DSP_MatrixTranspose32(matrix32 * desMat, matrix32 * srcMat);
```

Returns

None.

Description

Function DSP_MatrixTranspose32:

void DSP_MatrixTranspose32(matrix32 *desMat, matrix32 *srcMat);

Transpose of rows and columns of a matrix.

Remarks

Execution Time (cycles): 210 cycles + 10 / matrix_element.

Preconditions

Matrix definitions for ROWS and COLS must be transposed prior to the function call.

Example

```
#define ROW 3
#define COL 4

matrix32 *resMat, *srcMat1;
```

```
int32_t result[ROW*COL];

int32_t matA[ROW*COL] = { 1,  2,  3,  4,
                          5,  6,  7,  8,
                         -1, -3, -5, -7};

matrix32 mat, mat2;
resMat=&mat;
srcMat1=&mat2;

srcMat1->row=ROW;
srcMat1->col=COL;
srcMat1->pMatrix=matA;

resMat->row=COL;   // note the shift in columns and rows
resMat->col=ROW;
resMat->pMatrix=result;

DSP_MatrixTranspose32(resMat, srcMat1);

// result[] = matA(T)[] = {   1,  5, -1,
//                            2,  6, -3,
//                            3,  7, -5,
//                            4,  8, -7}
```

Parameters

Parameters	Description
desMat	pointer to transposed new Matrix C (*int32_t)
srcMat	pointer to the Matrix A structure (*int32_t)

d) Transform Functions

DSP_TransformFFT16 Function

Creates an Fast Fourier Transform (FFT) from a time domain input.

File

dsp.h

C

```
void DSP_TransformFFT16(int16c * dout, int16c * din, int16c * twiddles, int16c * scratch, int log2N);
```

Returns

None.

Description

Function DSP_TransformFFT16:

void DSP_TransformFFT16(int16c *dout, int16c *din, int16c *twiddles, int16c *scratch, int log2N);

Performs an complex FFT on the input, din, and stores the complex result in dout. Performs 2^log2N point calculation, and the working buffer scratch as well as the input and output must be 2^log2N in length. Coefficient twiddle factors come from twiddles, and may be loaded with the use of DSP_TransformFFT16_setup. All values are 16 bit (Q15) fractional.

Remarks

Scratch must be declared but need not be initialized. Din may be aided with a window function prior to calling the FFT, but is not required. Din is a complex number array, but may be loaded solely with real numbers if no phase information is available.

Preconditions

din, dout, twiddles and scratch must have N elements N is calculated as 2^(log2N) log2N must be >= 3 FFT factors must be calculated in advance, use DSP_TransformFFT16_setup

Example

```
int log2N = 8;  // log2(256) = 8
int fftSamples = 256;
```

```
int16c  *fftDin;
int16c  fftDout[fftSamples];
int16c  scratch[fftSamples];
int16c  fftCoefs[fftSamples];

int16c *fftc;
fftc = &fftCoefs;

DSP_TransformFFT16_setup(fftc, log2N);  // call setup function

while (1)
{
    fftDin = &fftin_8Khz_long_window16;  // get 256 point complex data

    DSP_TransformFFT16(fftDout, fftDin, fftc, scratch, log2N);

    // do something with the output, fftDout
};
```

Parameters

Parameters	Description
dout	pointer to complex output array (int16c)
din	pointer to complex input array (int16c)
twiddles	pointer to an complex array of factors (int16c)
scratch	pointer to a complex scratch pad buffer (int16c)
log2N	binary exponent of number of samples (int)

DSP_TransformFFT16_setup Function

Creates FFT coefficients for use in the FFT16 function.

File

dsp.h

C

```
void DSP_TransformFFT16_setup(int16c * twiddles, int log2N);
```

Returns

None.

Description

Function DSP_TransformFFT16_setup:

void DSP_TransformFFT16_setup(int16c *twiddles, int log2N);

Calculates the N twiddle factors required to operate the FFT16 function. These factors are done in serial fashion, and require considerable processing power. Ideally this function would be run only once prior to an ongoing FFT, and the results held in a buffer.

Remarks

This function is of considerable length and executed in C. It is recommended it only be called once for any given FFT length in time sensitive applications.

Preconditions

twiddles must be N in length N is calculated (2^log2N)

Example

```
see DSP_TransformFFT16 for example.
```

Parameters

Parameters	Description
twiddles	pointer to a complex array of factors (int16c)
log2N	binary exponent of number of data points (int)

DSP_TransformFFT32 Function

Creates an Fast Fourier Transform (FFT) from a time domain input.

File

dsp.h

C

```
void DSP_TransformFFT32(int32c * dout, int32c * din, int32c * twiddles, int32c * scratch, int log2N);
```

Returns

None.

Description

Function DSP_TransformFFT32:

void DSP_TransformFFT32(int32c *dout, int32c *din, int32c *twiddles, int32c *scratch, int log2N);

Performs an complex FFT on the input, din, and stores the complex result in dout. Performs 2^log2N point calculation, and the working buffer scratch as well as the input and output must be 2^log2N in length. Coefficient twiddle factors come from twiddles, and may be loaded with the use of DSP_TransformFFT16_setup. All values are 16 bit (Q31) fractional.

Remarks

Scratch must be declared but need not be initialized. Din may be aided with a window function prior to calling the FFT, but is not required. Din is a complex number array, but may be loaded solely with real numbers if no phase information is available.

Preconditions

din, dout, twiddles and scratch must have N elements N is calculated as 2^(log2N) log2N must be >= 3 FFT factors must be calculated in advance, use DSP_TransformFFT32_setup

Example

```
int log2N = 8;  // log2(256) = 8
int fftSamples = 256;

int32c  *fftDin;
int32c  fftDout[fftSamples];
int32c  scratch[fftSamples];
int32c  fftCoefs[fftSamples];

int32c *fftc;
fftc = &fftCoefs;

DSP_TransformFFT32_setup(fftc, log2N);  // call setup function

while (1)
{
    fftDin = &fftin_5Khz_long_window32;  // get 256 point complex data

    DSP_TransformFFT32(fftDout, fftDin, fftc, scratch, log2N);

    // do something with the output, fftDout
};
```

Parameters

Parameters	Description
dout	pointer to complex output array (int32c)
din	pointer to complex input array (int32c)
twiddles	pointer to an complex array of FFT factors (int32c)
scratch	pointer to a complex scratch pad buffer (int32c)
log2N	binary exponent of number of samples (int)

DSP_TransformFFT32_setup Function

Creates FFT coefficients for use in the FFT32 function.

File

dsp.h

C

```
void DSP_TransformFFT32_setup(int32c * twiddles, int log2N);
```

Returns

None.

Description

Function DSP_TransformFFT32_setup:

void DSP_TransformFFT32_setup(int32c *twiddles, int log2N);

Calculates the N FFT twiddle factors required to operate the FFT32 function. These factors are done in serial fashion, and require considerable processing power. Ideally this function would be run only once prior to an ongoing FFT, and the results held in a buffer.

Remarks

This function is of considerable length and executed in C. It is recommended it only be called once for any given FFT length in time sensitive applications.

Preconditions

twiddles must be N in length N is calculated (2^log2N)

Example

```
see DSP_TransformFFT32 for example.
```

Parameters

Parameters	Description
twiddles	pointer to a complex array of coefficients (int32c)
log2N	binary exponent of number of data points (int)

DSP_TransformIFFT16 Function

Creates an Inverse Fast Fourier Transform (FFT) from a frequency domain input.

File

dsp.h

C

```
void DSP_TransformIFFT16(int16c * dout, int16c * din, int16c * twiddles, int16c * scratch, int log2N);
```

Returns

None.

Description

Function DSP_TransformIFFT16:

void DSP_TransformIFFT16(int16c *dout, int16c *din, int16c *twiddles, int16c *scratch, int log2N);

Performs an complex Inverse FFT on the input, din, and stores the complex result in dout. Performs 2^log2N point calculation, and the working buffer scratch as well as the input and output must be 2^log2N in length. Coefficient twiddle factors come from twiddles, and may be loaded with the use of DSP_TransformFFT16_setup. All values are 16 bit (Q15) fractional.

Remarks

Scratch must be declared but need not be initialized. Din may be aided with a window function prior to calling the FFT, but is not required. A very similar function to the FFT is executed for the inverse FFT. This requires twiddle factors set in advance with the same method as used in the FFT. Complex conjugate and scaling are handled within the algorithm. The output is scaled using binary shifting based on log2N. Since the algorithm reduces the output by a scale factor of log2N, the resolution is reduced proportionally to the number of data points.

Preconditions

din, dout, twiddles and scratch must have N elements N is calculated as 2^(log2N) log2N must be >= 3 FFT factors must be calculated in advance, use DSP_TransformFFT16_setup

Example

```
int ilog2N = 10;  // log2(64) = 6; log2(256) = 8; log2(1024) = 10;
int ifftSamples = pow(2,ilog2N);

int16c  *ifftDin;
int16c ifftDout[ifftSamples];
int16c  iscratch[ifftSamples];
int16c  ifftCoefs[ifftSamples];
int16c  ifftTimeOut[ifftSamples];

// set up twiddle factors, these are used for both FFT and iFFT

int16c *ifftc;
ifftc = &ifftCoefs;
DSP_TransformFFT16_setup( ifftc, ilog2N);  // call to coef setup

// in this example, we take an FFT of an original time domain (sine wave)
// the output of the FFT is used as the input of the iFFT for comparison

ifftDin = &fftin_800hz_verylong16;
DSP_TransformFFT16(ifftDout, ifftDin, ifftc, iscratch, ilog2N);

// ifftDout = frequency domain output, complex number array

DSP_TransformIFFT16(ifftTimeOut, ifftDout, ifftc, iscratch, ilog2N);

// do something with the output, fftTimeOut, time domain
```

Parameters

Parameters	Description
dout	pointer to complex output array (int16c)
din	pointer to complex input array (int16c)
twiddles	pointer to an complex array of factors (int16c)
scratch	pointer to a complex scratch pad buffer (int16c)
log2N	binary exponent of number of samples (int)

DSP_TransformWindow_Bart16 Function

Perform a Bartlett window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Bart16(int16_t * OutVector, int16_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Bart16:

void DSP_TransformWindow_Bart16(int16_t *OutVector, int16_t *InVector, int N);

Compute a Bartlett (Triangle) Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Bartlett Window follows the equation:

Window(n) = 1 - (abs(2*n - N)/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int16_t OutVector16[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector16[i]= 0x4000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Bart16(OutVector16, InVector16, WindowN);
// OutWindow = 0x0000, 0x1000, 0x2000, 0x3000, 0x4000, 0x3000, 0x2000, 0x1000
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWindow_Bart32 Function

Perform a Bartlett window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Bart32(int32_t * OutVector, int32_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Bart32:

void DSP_TransformWindow_Bart32(int32_t *OutVector, int32_t *InVector, int N);

Compute a Bartlett (Triangle) Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Bartlett Window follows the equation:

Window(n) = 1 - (abs(2*n - N)/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int32_t OutVector32[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector32[i]= 0x40000000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Bart32(OutVector32, InVector32, WindowN);
// OutWindow = 0x0, 0x10000000, 0x20000000, 0x30000000, 0x40000000,
//                      0x30000000, 0x20000000, 0x10000000
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWindow_Black16 Function

Perform a Blackman window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Black16(int16_t * OutVector, int16_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Black16:

void DSP_TransformWindow_Black16(int16_t *OutVector, int16_t *InVector, int N);

Compute a Blackman Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Blackman Window follows the equation:

Window(n) = 0.42659 - 0.49656 * COS(2*Pi*n/(N-1)) + 0.076849 * COS(4*Pi*n/(N-1)) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int16_t OutVector16[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector16[i]= 0x4000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Black16(OutVector16, InVector16, WindowN);
// OutWindow = 0x0071, 0x0665, 0x1DF1, 0x3B00, 0x3B00, 0x1DF1, 0x0665, 0x0071
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWindow_Black32 Function

Perform a Blackman window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Black32(int32_t * OutVector, int32_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Black32:

void DSP_TransformWindow_Black32(int32_t *OutVector, int32_t *InVector, int N);

Compute a Blackman Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Blackman Window follows the equation:

Window(n) = 0.42659 - 0.49656 * COS(2*Pi*n/(N-1)) + 0.076849 * COS(4*Pi*n/(N-1)) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int32_t OutVector32[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector32[i]= 0x40000000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Black32(OutVector32, InVector32, WindowN);
// OutWindow = 0x0070B490, 0x06649680, 0x1DF13240, 0x3B003D80, 0x3B003D80,
//                       0x1DF13240, 0x06649680, 0x0070B490
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWindow_Cosine16 Function

Perform a Cosine (Sine) window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Cosine16(int16_t * OutVector, int16_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Cosine16:

void DSP_TransformWindow_Cosine16(int16_t *OutVector, int16_t *InVector, int N);

Compute a Cosine Window on the first N samples of the input vector, InVector. The output is stored in OutWindow. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Cosine Window follows the equation:

Window(n) = SIN(Pi*n/(N-1)) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int16_t OutVector16[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector16[i]= 0x4000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Cosine16(OutVector16, InVector16, WindowN);
// OutWindow = 0x0000, 0x1BC5, 0x320A, 0x3E65, 0x3E65, 0x320A, 0x1BC5, 0x0071
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWindow_Cosine32 Function

Perform a Cosine (Sine) window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Cosine32(int32_t * OutVector, int32_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Cosine32:

void DSP_TransformWindow_Cosine32(int32_t *OutVector, int32_t *InVector, int N);

Compute a Cosine Window on the first N samples of the input vector, InVector. The output is stored in OutWindow. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Cosine Window follows the equation:

Window(n) = SIN(Pi*n/(N-1)) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int32_t OutVector32[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector32[i]= 0x40000000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Cosine32(OutVector32, InVector32, WindowN);
// OutWindow = 0x00000000, 0x1BC4C060, 0x32098700, 0x3E653800, 0x3E653800,
//                       0x32098700, 0x1BC4C060, 0x00000000
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWindow_Hamm16 Function

Perform a Hamming window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Hamm16(int16_t * OutVector, int16_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Hamm16:

void DSP_TransformWindow_Hamm16(int16_t *OutVector, int16_t *InVector, int N);

Compute a Hamming Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Hamming Window follows the equation:

Window(n) = 0.54 - 0.46 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int16_t OutVector16[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector16[i]= 0x4000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Hamm16(OutVector16, InVector16, WindowN);
// OutWindow = 0x051F, 0x0DBE, 0x228F, 0x3761, 0x4000, 0x3761, 0x228F, 0x0DBE
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWindow_Hamm32 Function

Perform a Hamming window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Hamm32(int32_t * OutVector, int32_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Hamm32:

void DSP_TransformWindow_Hamm32(int32_t *OutVector, int32_t *InVector, int N);

Compute a Hamming Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Hamming Window follows the equation:

Window(n) = 0.54 - 0.46 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int32_t OutVector32[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector32[i]= 0x40000000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Hamm32(OutVector32, InVector32, WindowN);
// OutWindow = 0x051EB860, 0x0DBE26C0, 0x228F5C40, 0x37609200, 0x40000000,
//                       0x37609200, 0x228F5C40, 0x0DBE26C0
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWindow_Hann16 Function

Perform a Hanning window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Hann16(int16_t * OutVector, int16_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Hann16:

void DSP_TransformWindow_Hann16(int16_t *OutVector, int16_t *InVector, int N);

Compute a Hanning Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Hanning Window follows the equation:

Window(n) = 0.5 - 0.5 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int16_t OutVector16[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector16[i]= 0x4000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Hann16(OutVector16, InVector16, WindowN);
// OutWindow = 0x0000, 0x095F, 0x2000, 0x36A1, 0x4000, 0x36A1, 0x2000, 0x095F
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWindow_Hann32 Function

Perform a Hanning window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Hann32(int32_t * OutVector, int32_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Hann32:

void DSP_TransformWindow_Hann32(int32_t *OutVector, int32_t *InVector, int N);

Compute a Hanning Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Hanning Window follows the equation:

Window(n) = 0.5 - 0.5 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int32_t OutVector32[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector32[i]= 0x40000000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Hann32(OutVector32, InVector32, WindowN);
// OutWindow = 0x00000000, 0x095F61C0, 0x20000000, 0x36A09E80, 0x40000000,
//                       0x36A09E80, 0x20000000, 0x095F61C0
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWindow_Kaiser16 Function

Perform a Kaiser window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Kaiser16(int16_t * OutVector, int16_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Kaiser16:

void DSP_TransformWindow_Kaiser16(int16_t *OutVector, int16_t *InVector, int N);

Compute a Kaiser Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q15 fractional format. The Kaiser Window follows the equation:

Window(n) = 0.402 - 0.498 * COS(2*Pi*n/N) + 0.098 * cos(4*Pi*n/N) + 0.001 * cos(6*Pi*n/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int16_t OutVector16[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector16[i]= 0x4000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Kaiser16(OutVector16, InVector16, WindowN);
// OutWindow = 0x0031, 0x0325, 0x1375, 0x304F, 0x3FCF, 0x304F, 0x1375, 0x0325
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWindow_Kaiser32 Function

Perform a Kaiser window on a vector.

File

dsp.h

C

```
void DSP_TransformWindow_Kaiser32(int32_t * OutVector, int32_t * InVector, int N);
```

Returns

None.

Description

Function DSP_TransformWindow_Kaiser32:

void DSP_TransformWindow_Kaiser32(int32_t *OutVector, int32_t *InVector, int N);

Compute a Kaiser Window on the first N samples of the input vector, InVector. The output is stored in OutVector. Operations are performed at higher resolution and rounded for the most accuracy possible. Input and output values are in Q31 fractional format. The Kaiser Window follows the equation:

Window(n) = 0.402 - 0.498 * COS(2*Pi*n/N) + 0.098 * cos(4*Pi*n/N) + 0.001 * cos(6*Pi*n/N) where n is the window sample number N is the total number of samples The functional output computes WinVector(n) = Window(n) * InVector(n)

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

```
int32_t OutVector32[8]={0};
int  WindowN = 8;

for (i=0;i<WindowN;i++)
{
   InVector32[i]= 0x40000000;  // constant 0.5 for functional testing
}

   DSP_TransformWindow_Kaiser32(OutVector32, InVector32, WindowN);
// OutWindow = 0x003126F6, 0x032555C8, 0x1374BCA0, 0x304F66C0, 0x3FCED900,
//                       0x304F66C0, 0x1374BCA0, 0x032555C8
```

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWinInit_Bart16 Function

Create a Bartlett window.

File

dsp.h

C

```
void DSP_TransformWinInit_Bart16(int16_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Bart16:

void DSP_TransformWinInit_Bart16(int16_t *OutWindow, int N);

Create a N-element Bartlett (Triangle) Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q15 fractional format. The Bartlett Window follows the equation:

Window(n) = 1 - (abs(2*n - N)/N) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWinInit_Bart32 Function

Create a Bartlett window.

File

dsp.h

C

```
void DSP_TransformWinInit_Bart32(int32_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Bart32:

void DSP_TransformWinInit_Bart32(int32_t *OutWindow, int N);

Create a N-element Bartlett (Triangle) Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values Q31 fractional format. The Bartlett Window follows the equation:

Window(n) = 1 - (abs(2*n - N)/N) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWinInit_Black16 Function

Create a Blackman window.

File

dsp.h

C

```
void DSP_TransformWinInit_Black16(int16_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Black16:

void DSP_TransformWinInit_Black16(int16_t *OutWindow, int N);

Create a N-element Blackman Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are Q16 fractional format. The Blackman Window follows the equation:

Window(n) = 0.42659 - 0.49656 * COS(2*Pi*n/(N-1)) + 0.076849 * COS(4*Pi*n/(N-1)) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWinInit_Black32 Function

Create a Blackman window.

File

dsp.h

C

```
void DSP_TransformWinInit_Black32(int32_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Black32:

void DSP_TransformWinInit_Black32(int32_t *OutWindow, int N);

Create a N-element Blackman Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are Q31 fractional format. The Blackman Window follows the equation:

Window(n) = 0.42659 - 0.49656 * COS(2*Pi*n/(N-1)) + 0.076849 * COS(4*Pi*n/(N-1)) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWinInit_Cosine16 Function

Create a Cosine (Sine) window.

File

dsp.h

C

```
void DSP_TransformWinInit_Cosine16(int16_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Cosine16:

void DSP_TransformWinInit_Cosine16(int16_t *OutWindow, int N);

Create a N-element Cosine Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q15 fractional format. The Cosine Window follows the equation:

Window(n) = SIN(Pi*n/(N-1)) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWinInit_Cosine32 Function

Create a Cosine (Sine) window.

File

dsp.h

C

```
void DSP_TransformWinInit_Cosine32(int32_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Cosine32:

void DSP_TransformWinInit_Cosine32(int32_t *OutWindow, int N);

Create a N-element Cosine Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q31 fractional format. The Cosine Window follows the equation:

Window(n) = SIN(Pi*n/(N-1)) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWinInit_Hamm16 Function

Create a Hamming window.

File

dsp.h

C

```
void DSP_TransformWinInit_Hamm16(int16_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Hamm16:

void DSP_TransformWinInit_Hamm16(int16_t *OutWindow, int N);

Create a N-element Hamming Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q15 fractional format. The Hamming Window follows the equation:

Window(n) = 0.54 - 0.46 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWinInit_Hamm32 Function

Create a Hamming window.

File

dsp.h

C

```
void DSP_TransformWinInit_Hamm32(int32_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Hamm32:

void DSP_TransformWinInit_Hamm32(int32_t *OutWindow, int N);

Create a N-element Hamming Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q31 fractional format. The Hamming Window follows the equation:

Window(n) = 0.54 - 0.46 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWinInit_Hann16 Function

Create a Hanning window.

File

dsp.h

C

```
void DSP_TransformWinInit_Hann16(int16_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Hann16:

void DSP_TransformWinInit_Hann16(int16_t *OutWindow, int N);

Create a N-element Hanning Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q15 fractional format. The Hanning Window follows the equation:

Window(n) = 0.5 - 0.5 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWinInit_Hann32 Function

Create a Hanning window.

File

dsp.h

C

```
void DSP_TransformWinInit_Hann32(int32_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Hann32:

void DSP_TransformWinInit_Hann32(int32_t *OutWindow, int N);

Create a N-element Hanning Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q31 fractional format. The Hanning Window follows the equation:

Window(n) = 0.5 - 0.5 * COS(2*Pi*n/N) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

DSP_TransformWinInit_Kaiser16 Function

Create a Kaiser window.

File

dsp.h

C

```
void DSP_TransformWinInit_Kaiser16(int16_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Kaiser16:

void DSP_TransformWinInit_Kaiser16(int16_t *OutWindow, int N);

Create a N-element Kaiser Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q15 fractional format. The Kaiser Window follows the equation:

Window(n) = 0.402 - 0.498 * COS(2*Pi*n/N) + 0.098 * cos(4*Pi*n/N) + 0.001 * cos(6*Pi*n/N) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the

window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int16_t)
N	number of samples (int)

DSP_TransformWinInit_Kaiser32 Function

Create a Kaiser window.

File

dsp.h

C

```
void DSP_TransformWinInit_Kaiser32(int32_t * OutWindow, int N);
```

Returns

None.

Description

Function DSP_TransformWinInit_Kaiser32:

void DSP_TransformWinInit_Kaiser32(int32_t *OutWindow, int N);

Create a N-element Kaiser Window, and store the output to OutWindow. Operations are performed at higher resolution floating point, and rounded for the most accuracy possible. Output values are in Q31 fractional format. The Kaiser Window follows the equation:

Window(n) = 0.402 - 0.498 * COS(2*Pi*n/N) + 0.098 * cos(4*Pi*n/N) + 0.001 * cos(6*Pi*n/N) where n is the window sample number N is the total number of samples

Remarks

This function is performed in C. The function may be optimized for the library. It is dependent on the floating point math library. The functional window is an intermediate result that needs to be multiplied by an input vector prior to FFT processing. Because of significant processing time the window need only be computed once and the multiply of the (window * input) vector done during recurring loop processing.

Preconditions

N must be a positive number. OutWindow must be declared with N elements or larger.

Example

Parameters

Parameters	Description
OutWindow	pointer to output array of elements (int32_t)
N	number of samples (int)

e) Vector Math Functions

DSP_VectorAbs16 Function

Calculate the absolute value of a vector.

File

dsp.h

C

```
void DSP_VectorAbs16(int16_t * outdata, int16_t * indata, int N);
```

Returns

None.

Description

Function DSP_VectorAbs16:

void DSP_VectorAbs16(int16_t *outdata, int16_t *indata, int N);

Computes the absolute value of each element of indata and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q15 fractional format. outdata[i] filled with the absolute value of elements of indata

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100,200,127,-127,-2};
int Num = 8;

pOutdata = &outVal;

DSP_VectorAbs16(pOutdata, inBufTest, Num);

// outVal[i] = {5,2,3,4,1,0,2,8}
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

DSP_VectorAbs32 Function

Calculate the absolute value of a vector.

File

dsp.h

C

```
void DSP_VectorAbs32(int32_t * outdata, int32_t * indata, int N);
```

Returns

None.

Description

Function DSP_VectorAbs32:

void DSP_VectorAbs32(int32_t *outdata, int32_t *indata, int N);

Computes the absolute value of each element of indata and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q31 fractional format. outdata[i] filled with N elements of abs(indata[i])

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Example

```
int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100,200,127,-127,-2};
int Num = 8;

pOutdata = &outVal;

DSP_VectorAbs32(pOutdata, inBufTest, Num);

// outVal[i] = {5,2,3,4,1,0,2,8}
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata	pointer to input array of 16-bit elements (int32_t)
N	number of samples (int)

DSP_VectorAdd16 Function

Calculate the sum of two vectors.

File

dsp.h

C

```
void DSP_VectorAdd16(int16_t * outdata, int16_t * indata1, int16_t * indata2, int N);
```

Returns

None.

Description

Function DSP_VectorAdd16:

void DSP_VectorAdd16(int16_t *outdata, int16_t *indata1, int16_t *indata2, int N);

Computes the sum value of each element of indata1 + indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in the Q15 fractional format. outdata[i] filled with N elements of indata1[i] + indata2[i]

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100, 200, 127,-127,-2};
int16_t inBuf2[16]=     { 1,2, 3,4, 5,6, 7, 8, 9, 10,-1,-100,-127,127,-7,  0};
int Num = 8;

pOutdata = &outVal;

DSP_VectorAdd16(pOutdata, inBufTest, inBuf2, Num);

// outVal[i] = inBufTest[i] + inBuf2[i] = {-4,4,0,8,4,6,5,0}
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata1	pointer to input array of 16-bit elements (int16_t)
indata2	pointer to input array of 16-bit elements (int16_t)

N	number of samples (int)

DSP_VectorAdd32 Function

Calculate the sum of two vectors.

File

dsp.h

C

```
void DSP_VectorAdd32(int32_t * outdata, int32_t * indata1, int32_t * indata2, int N);
```

Returns

None.

Description

Function DSP_VectorAdd32:

void DSP_VectorAdd32(int32_t *outdata, int32_t *indata1, int32_t *indata2, int N);

Computes the sum value of each element of indata1 + indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q31 fractional format. outdata[i] filled with N elements of indata1[i] + indata2[i]

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100, 200, 127,-127,-2};
int32_t inBuf2[16]=     { 1,2, 3,4, 5,6, 7, 8, 9, 10,-1,-100,-127,127,-7,  0};
int Num = 8;

pOutdata = &outVal;

DSP_VectorAdd32(pOutdata, inBufTest, inBuf2, Num);

// outVal[i] = inBufTest[i] + inBuf2[i] = {-4,4,0,8,4,6,5,0}
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata1	pointer to input array of 16-bit elements (int32_t)
indata2	pointer to input array of 16-bit elements (int32_t)
N	number of samples

DSP_VectorAddc16 Function

Calculate the sum of a vector and a constant.

File

dsp.h

C

```
void DSP_VectorAddc16(int16_t * outdata, int16_t * indata, int16_t c, int N);
```

Returns

None.

Description

Function DSP_VectorAddc16:

void DSP_VectorAddc16(int16_t *outdata, int16_t *indata, int16_t c, int N);

Computes the sum value of each element of (indata + c) and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q15 fractional format. outdata[i] filled with N elements of indata[i] + c

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100, 200, 127,-127,-2};
int16_t constValue =  3;
int Num = 8;

pOutdata = &outVal;

DSP_VectorAddc16(pOutdata, inBufTest, constValue, Num);

// outVal[i] = inBufTest[i] + constValue = {-2,5,0,7,2,3,1,-5}
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata	pointer to input array of 16-bit elements (int16_t)
c	constant value added to all indata1 elements (int16_t)
N	number of samples (int)

DSP_VectorAddc32 Function

Calculate the sum of a vector and a constant.

File

dsp.h

C

```
void DSP_VectorAddc32(int32_t * outdata, int32_t * indata, int32_t c, int N);
```

Returns

None.

Description

Function DSP_VectorAddc32:

void DSP_VectorAddc32(int32_t *outdata, int32_t *indata, int32_t c, int N);

Computes the sum value of each element of (indata + c) and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q31 fractional format. outdata[i] filled with N elements of indata1[i] + c

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100, 200, 127,-127,-2};
```

```
int32_t constValue =  3;
int Num = 8;

pOutdata = &outVal;

DSP_VectorAddc32(pOutdata, inBufTest, constValue, Num);

// outVal[i] = inBufTest[i] + constValue = {-2,5,0,7,2,3,1,-5}
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata	pointer to input array of 16-bit elements (int32_t)
c	constant value added to all indata1 elements (int32_t)
N	number of samples (int)

DSP_VectorAutocorr16 Function

Computes the Autocorrelation of a Vector.

File

dsp.h

C

```
void DSP_VectorAutocorr16(int16_t * outCorr, int16_t * inVector, int N, int K);
```

Returns

None.

Description

Function DSP_VectorAutocorr16:

void DSP_VectorAutocorr16(int16_t *outCorr, int16_t *inVector, int N, int K);

Calculates the autocorrelation, with a lag of 1 to K, on the first N elements of inVector and returns the 16-bit scalar result in outCorr. The autocorrelation is calculated from other statistical equations including mean and variance. While in some cases these equations exist inside the DSP library, the functions are executed in a serial fashion within this code to provide enhanced performance. The unbiased function has the form -

mean (M) = sum[0..N-1](x(n) / N) variance (V) = sum[0..N-1]((x(n) - M)^2) / (N-1) autocovariance (ACV)[k] = sum[0..(N-k)]((x(n) - M) * (x(n+k) - M) / (N-k)) autocorrelation (AC)[k] = CV[k] / V where N is the number of vector elements, n is the index of those elements x(n) is a single element in the input vector M is the mean of the N elements of the vector k is the lag or series index

The output of the function will return K elements, and the outCorr array should be sized to accept those 16-bit results. The outputs correspond to k=1, k=2, .., k=K delay states. The function returns a 16-bit value in rounded, saturated Q15 format.

Input values of the vector and output scalar value is Q15 fractional format. This format has data that ranges from -1 to 1, and has internal saturation limits of those same values. Some care has been taken to reduce the impact of saturation by adding processing steps to effectively complete the processing in blocks. However, in some extreme cases of data variance it is still possible to reach the saturation limits.

Remarks

This function is optimized with microMIPS and M14KCe ASE DSP instructions. This function is dependent on the LibQ library, and the _LIBQ_Q16Div specifically.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. outCorr must be an array with at least K values. N must be greater than or equal to four and a multiple of four.

Example

```
int  autocvN = 16;                    // N value, number of samples in array
int  autocvLag = 4;                   // Lag value, output shifts to observe
int16_t outAC[16]={0};
int16_t CVIn16[16] = {0x1999, 0xD99A, 0x1000, 0x6000, 0x1999, 0x1999, 0x2666,
     0x3333, 0x1000, 0x6000, 0x1999, 0x1999, 0x2666, 0x3333, 0x1999, 0x0CCC};
//  = { .2, -.3, .125, .75, .2, .2, .3, .4, .125, .75, .2, .2, .3, .4, .2, .1};

DSP_VectorAutocorr16(outAC, CVIn16, autocvN, autocvLag);

// outAC = {0xF406, D46C, 0x098F, 0x191A}
```

```
//    = -0.093567, -0.34045, 0.07468, 0.19611
```

Parameters

Parameters	Description
outCorr	pointer to output array (int16_t)
inVector	pointer to source array of elements (int16_t)
N	number of samples (int)
K	lag value, number of output elements (int)

DSP_VectorBexp16 Function

Computes the maximum binary exponent of a vector.

File

dsp.h

C

```
int DSP_VectorBexp16(int16_t * DataIn, int N);
```

Returns

Binary exponent [log2 multiplier] (int)

Description

Function DSP_VectorBexp16:

int DSP_VectorBexp16(int16_t *DataIn, int N);

Calculates the maximum binary exponent on the first N elements of the input vector DataIn, and stores the integer result. The returned value represents the potential binary scaling of the vector, and may be used with other functions that auto scale their output without saturation. Inputs are given in Q15 fractional data format.

Remarks

None.

Preconditions

N must be a multiple of 2 and greater or equal to 2.

Example

```
int valN = 4;
int16_t  dummy16[valN]={0x3004, 0x00CC, 0xFC04, 0xFFF0};
//                          0.375, 0.0062, -0.0311, -0.00049
int answer;

answer =   DSP_VectorBexp16(dummy16, valN);

// answer = 1, maximum binary gain is 2.
```

Parameters

Parameters	Description
DataIn	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

DSP_VectorBexp32 Function

Computes the maximum binary exponent of a vector.

File

dsp.h

C

```
int DSP_VectorBexp32(int32_t * DataIn, int N);
```

Returns

Binary exponent [log2 multiplier] (int)

Description

Function DSP_VectorBexp32:

int DSP_VectorBexp32(int32_t *DataIn, int N);

Calculates the maximum binary exponent on the first N elements of the input vector DataIn, and stores the integer result. The returned value represents the potential binary scaling of the vector, and may be used with other functions that auto scale their output without saturation. Inputs are given in Q31 fractional data format.

Remarks

None.

Preconditions

None.

Example

```
int valN=4;
int32_t  datInput32[4]={0xFF000000, 0x07000000,0x000CCCCC, 0x08000000};
//                          -0.007183, 0.054688, 0.0003906, 0.0625
int answer32;

answer32 =   DSP_VectorBexp32(datInput32, valN);

// answer = 3, maximum binary gain is 8.
```

Parameters

Parameters	Description
DataIn	pointer to input array of 16-bit elements (int32_t)
N	number of samples (int)

DSP_VectorChkEqu32 Function

Compares two input vectors, returns an integer '1' if equal, and '0' if not equal.

File

dsp.h

C

```
int DSP_VectorChkEqu32(int32_t * indata1, int32_t * indata2, int N);
```

Returns

(int) - '1' if vectors are equal, '0' if vectors are not equal

Description

Function DSP_VectorChkEqu32:

int DSP_VectorChkEqu32(int32_t *indata1, int32_t *indata2, int N);

Compares the first N values of indata1 to the same elements of indata2. The comparison requires that all numbers be in Q31 fractional data format. Returns the integer value '1' if all numbers are equal, and '0' if they are not equal. N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Remarks

None.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int     outCheck;
int     Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
```

```
                            0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  1,      -1,       0.9,    0.8,    0.2,    0.5,    1,      -0.6
int32_t inBufTestB[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                            0x80000000, 0x40000000, 0x7FFFFFFF, 0x20000000};
//                  1,      -1,       0.9,    0.8,    -1,    0.5,    1,      0.25

outCheck = DSP_VectorChkEqu32(inBufTestA, inBufTestB, Num);

// outCheck = 1  // true for first 4 numbers of series
```

Parameters

Parameters	Description
indata1	pointer to input array 1 of elements (int32_t)
indata2	pointer to input array 2 of elements (int32_t)
N	number of samples (int)

DSP_VectorCopy Function

Copies the elements of one vector to another.

File

dsp.h

C

```
void DSP_VectorCopy(int32_t * outdata, int32_t * indata, int N);
```

Returns

None.

Description

Function DSP_VectorCopy:

void DSP_VectorCopy(int32_t *outdata, int32_t *indata, int N);

Fills the first N values of an input vector outdata with the elements from indata. N must be a multiple of four and greater than or equal to four or it will be truncated to the nearest multiple of four. The vector result and the scalar value to fill are both Q31 fractional format.

Remarks

None.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int     Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                            0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  1,      -1,       0.9,    0.8,    0.2,    0.5,    1,      -0.6
int32_t inBufTestB[8]={0x00000000, 0x7FFFFFFF, 0x40000000, 0x0CCCCCCC,
                            0x40000000, 0x60000000, 0x80000000, 0x20000000};
//                  0,      1,       0.5,    0.1,    0.75,    0.5,    -1,      0.25

DSP_VectorCopy(inBufTestA, inBufTestB, Num);

// inBufTestA =  {0x00000000, 0x7FFFFFFF, 0x40000000, 0x0CCCCCCC,
//           0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334} // first 4 values copied
```

Parameters

Parameters	Description
outdata	pointer to destination array of values (int32_t)
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

DSP_VectorCopyReverse32 Function

Reverses the order of elements in one vector and copies them into another.

File

dsp.h

C

```
void DSP_VectorCopyReverse32(int32_t * outdata, int32_t * indata, int N);
```

Returns

None.

Description

Function DSP_VectorCopyReverse32:

void DSP_VectorCopyReverse32(int32_t *outdata, int32_t *indata, int N);

Fills the first N values of an input vector Outdata with the reverse elements from INDATA. N must be a multiple of 4 and greater than 4 or will be truncated to the nearest multiple of 4. The vectors are both Q31 fractional format.

Remarks

None.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int     Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  1,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6
int32_t inBufTestB[8]={0x00000000, 0x7FFFFFFF, 0x40000000, 0x0CCCCCCC,
                       0x40000000, 0x60000000, 0x80000000, 0x20000000};
//                  0,     1,      0.5,    0.1,    0.75,   0.5,    -1,     0.25

DSP_VectorCopyReverse32(inBufTestA, inBufTestB, Num);

// inBufTestA =  {0x0CCCCCCC, 0x40000000, 0x7FFFFFFF, 0x00000000,
//           0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334}
//   first 4 values copied reverse order
```

Parameters

Parameters	Description
outdata	pointer to destination array of values (int32_t)
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

DSP_VectorDivC Function

Divides the first N elements of inVector by a constant divisor, and stores the result in outVector.

File

dsp.h

C

```
void DSP_VectorDivC(_Q16 * outVector, _Q16 * inVector, _Q16 divisor, int N);
```

Returns

None.

Description

Function DSP_VectorDivC:

void DSP_VectorDivC(_Q16 *outVector, _Q16 *inVector, _Q16 divisor, int N);

Divides each element of the first N elements of inVector by a constant, divisor. The output is stored to outVector. Both vectors and the scalar are _Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. If values exceed maximum or minimum they will saturate to the maximum or minimum respectively.

Remarks

This function uses the Microchip PIC32MZ LibQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Div function see the LibQ documentation for _LIBQ_Q16Div.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Div function from the LibQ library. That library must be compiled as part of the project.

Example

```
int divNum = 4;
_Q16 divScalar = 0x00020000;  // 2.0
_Q16 inDivVec[8] = {0x08000000, 0xfffc0000,0x00024000,0x00100000,0x00038000,
       0x00400000,0xfffe0000,0x00058000};
//     2048, -4, 2.25, 16, 3.5, 64, -2, 5.5
_Q16 outDivVec[8] = {0};

DSP_VectorDivC(outDivVec, inDivVec,  divScalar, divNum);

// outDivVec =  0x04000000, 0xFFFFE0000, 0x00012000, 0x00080000, 0, 0, 0, 0
//                  1024.0,        -2.0,      1.125,       16.0, 0, 0, 0, 0
```

Parameters

Parameters	Description
outdata	pointer to destination array of elements (_Q16)
indata	pointer to source array of elements (_Q16)
divisor	scalar divisor for the input vector (_Q16)
N	number of samples (int)

DSP_VectorDotp16 Function

Computes the dot product of two vectors, and scales the output by a binary factor.

File

dsp.h

C

```
int16_t DSP_VectorDotp16(int16_t * indata1, int16_t * indata2, int N, int scale);
```

Returns

int16_t - scaled output of calculation, Q15 format

Description

Function DSP_VectorDotp16:

int16_t DSP_VectorDotp16(int16_t *indata1, int16_t *indata2, int N, int scale);

Calculates the dot product of two input vectors, and scales the output. Function will saturate if it exceeds maximum or minimum values. Scaling is done by binary shifting, after accumulation in a 32 bit register. All calculations are done in Q15 fractional format. return = 1/(2^scale) * sum(indata1[i] * indata2[i])

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Example

```
int16_t inBufMultA[8]={0x7FFF, 0x8000, 0x7333, 0x6666, 0x1999, 0x4000, 0x7FFF, 0xB334};
//                      1,     -1,      0.9,    0.8,    0.2,    0.5,    1,      -0.6
int16_t inBufMultB[8]={0x0CCD, 0x0CCD, 0x4000, 0xC000, 0xE667, 0x4000, 0x0000, 0x0CCD};
```

```
//                          0.1,    0.1,    0.5,   -0.5,   -0.2,   0.5,    0,      0.1
int Num = 8;
int scaleVal = 2;
int16_t outScalar;

int Num = 8;

outScalar = DSP_VectorDotp16(inBufMultA, inBufMultB, Num, scaleVal);

// outScalar = 1/(2^scaleVal)*(inBufMultA[] dot inBufMultB[]) =
//   (1/4) * (0.1 + -0.1 + 0.45 + -0.4 + -0.04 + 0.25 + 0 + -0.06) = 0.25 * 0.20 = 0.05
//      = (int16_t)0x0666
```

Parameters

Parameters	Description
indata1	pointer to input array of 16-bit elements (int16_t)
indata2	pointer to input array of 16-bit elements (int16_t)
scale	number of bits to shift return right (int)
N	number of samples (int)

DSP_VectorDotp32 Function

Computes the dot product of two vectors, and scales the output by a binary factor

File

dsp.h

C

```
int32_t DSP_VectorDotp32(int32_t * indata1, int32_t * indata2, int N, int scale);
```

Returns

int16_t - scaled output of calculation, Q31 format

Description

Function DSP_VectorDotp32:

int32_t DSP_VectorDotp32(int32_t *indata1, int32_t *indata2, int N, int scale);

Calculates the dot product of two input vectors, and scales the output. Function will saturate if it exceeds maximum or minimum values. Scaling is done by binary shifting, after calculation of the result. All calculations are done in Q31 fractional format. return = 1/(2^scale) * sum(indata1[i] * indata2[i])

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int32_t inBufMultA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                 1,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6
int32_t inBufMultB[8]={0x0CCCCCCD, 0x0CCCCCCD, 0x40000000, 0xC0000000,
                       0xE6666667, 0x40000000, 0x00000000, 0x0CCCCCCD};
//                 0.1,    0.1,    0.5,   -0.5,   -0.2,   0.5,    0,      0.1
int Num = 8;
int scaleVal = 2;
int32_t outScalar;

int Num = 8;

outScalar = DSP_VectorDotp32(inBufMultA, inBufMultB, Num, scaleVal);

// outScalar = 1/(2^scaleVal)*(inBufMultA[] dot inBufMultB[]) =
//   (1/4) * (0.1 + -0.1 + 0.45 + -0.4 + -0.04 + 0.25 + 0 + -0.06) = 0.25 * 0.20 = 0.05
//      = (int32_t)0x06666666
```

Parameters

Parameters	Description
indata1	pointer to input array of 16-bit elements (int32_t)
indata2	pointer to input array of 16-bit elements (int32_t)
scale	number of bits to shift return right (int)
N	number of samples (int)

DSP_VectorExp Function

Computes the EXP (e^x) of the first N elements of inVector, and stores the result in outVector.

File

dsp.h

C

```
void DSP_VectorExp(_Q16 * outVector, _Q16 * inVector, int N);
```

Returns

None.

Description

Function DSP_VectorExp:

void DSP_VectorExp(_Q16 *outVector, _Q16 *inVector, int N);

Computes the Exp value, e to the power of X, on the first N elements of inVector. The output is stored to outVector. Both vectors are _Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. If values exceed maximum or minimum they will saturate to the maximum or zero respectively.

Remarks

Inclusion of the LibQ header file and library is mandatory to use this function.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Exp and Div functions from the LibQ library. That library must be compiled as part of the project.

Example

```
int expNum = 4;
_Q16 inExpVec[8] = {0x00010000, 0xffff0000,0x00020000,0x00030000,0x00038000,
            0x00040000,0xfffe0000,0x00058000};
//          1.0,   -1.0,   2.0,   3.0,    3.5,    4.0,   -2.0,   5.5
_Q16 outExpVec[8] = {0};

DSP_VectorExp(outExpVec, inExpVec, expNum);

// outExpVec = 0x0002B7E1, 0x00005E2D, 0x00076399, 0x001415E6, 0, 0, 0, 0
//                2.71828,    0.26787,     7.3891,    20.0855, 0, 0, 0, 0
```

Parameters

Parameters	Description
outdata	pointer to destination array of elements (_Q16)
indata	pointer to source array of elements (_Q16)
N	number of samples (int)

DSP_VectorFill Function

Fills an input vector with scalar data.

File

dsp.h

C

```
void DSP_VectorFill(int32_t * indata, int32_t data, int N);
```

Returns

None.

Description

Function DSP_VectorFill:

void DSP_VectorFill(int32_t *indata, int32_t data, int N);

Fills the first N values of an input vector indata with the value data. N must be a multiple of four and greater than or equal to four or it will be truncated to the nearest multiple of four. The vector result and the scalar value to fill are both Q31 fractional format.

Remarks

None.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int32_t fillValue = 0x3FFFFFFF;
int     Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  1,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6

DSP_VectorFill(inBufTestA, fillValue, Num);

// inBufTestA =  {0x3FFFFFFF, 0x3FFFFFFF, 0x3FFFFFFF, 0x3FFFFFFF,
//           0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334} // first 4 values filled
```

Parameters

Parameters	Description
indata	pointer to source array of elements (int32_t)
data	scalar value to fill the array (int32_t)
N	number of samples (int)

DSP_VectorLn Function

Computes the Natural Log, Ln(x), of the first N elements of inVector, and stores the result in outVector.

File

dsp.h

C

```
void DSP_VectorLn(_Q4_11 * outVector, _Q16 * inVector, int N);
```

Returns

None.

Description

Function DSP_VectorLn:

void DSP_VectorLn(_Q4_11 *outVector, _Q16 *inVector, int N);

Computes the Ln(x) value, on the first N elements of inVector. The output is stored to outVector. Input vector is _Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. The output vector is reduced resolution Q4.11 format, which is a 16-bit integer format with 11 bits representing the fractional resolution. If values exceed maximum or minimum they will saturate to the maximum or zero respectively.

Remarks

This function uses the Microchip PIC32MZ LibQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Ln function see the LibQ documentation for _LIBQ_Q4_11_ln_Q16. A negative number input will return a saturated negative value (0x8000).

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Ln function from the LibQ library. That library must be compiled as part of the project.

Example

```
int lnNum = 4;
_Q16 inLnVal[8] = {0x40000000, 0xffff0000,0x00020000,0x00100000,0x00038000,
       0x00400000,0xfffe0000,0x00058000};
//          16384.0,  -1.0,  2.0,  16.0,   3.5,   64.0,  -2.0,  5.5
_Q4_11 outLnVal[8] = {0};

DSP_VectorLn(outLnVal, inLnVal,  lnNum);

// outLnVal =     0x4DA2,        0x8000,   0x058C,   0x162E, 0, 0, 0, 0
//                 9.704,  sat negative,   0.6934,    2.772, 0, 0, 0, 0
```

Parameters

Parameters	Description
outdata	pointer to destination array of elements (_Q16)
indata	pointer to source array of elements (_Q4_11)
N	number of samples (int)

DSP_VectorLog10 Function

Computes the Log10(x), of the first N elements of inVector, and stores the result in outVector.

File

dsp.h

C

```
void DSP_VectorLog10(_Q3_12 * outVector, _Q16 * inVector, int N);
```

Returns

None.

Description

Function DSP_VectorLog10:

void DSP_VectorLog10(_Q3_12 *outVector, _Q16 *inVector, int N);

Computes the Log10(x) value, on the first N elements of inVector. The output is stored to outVector. Input vector is _Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. The output vector is reduced resolution Q3.12 format, which is a 16-bit integer format with 12 bits representing the fractional resolution. If values exceed maximum or minimum they will saturate to the maximum or zero respectively.

Remarks

This function uses the Microchip PIC32MZ LibQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Log10 function see the LibQ documentation for _LIBQ_Q3_12_log10_Q16. A negative number input will return a saturated negative value (0x8000).

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Log10 function from the LibQ library. That library must be compiled as part of the project.

Example

```
int logNum = 4;
_Q16 inLogVal[8] = {0x40000000, 0xffff0000,0x00020000,0x00100000,0x00038000,
                    0x00400000,0xfffe0000,0x00058000};
//          16384.0,  -1.0,  2.0,  16.0,   3.5,   64.0,  -2.0,  5.5
_Q3_12 outLogVal[8] = {0};

DSP_VectorLog10(outLogVal, inLogVal,  logNum);

// outLogVal =    0x436E,        0x8000,    0x04D1,   0x1344, 0, 0, 0, 0
```

```
//                4.2144,  sat negative,   0.3010,   1.2041, 0, 0, 0, 0
```

Parameters

Parameters	Description
outdata	pointer to destination array of elements (_Q16)
indata	pointer to source array of elements (_Q3_12)
N	number of samples (int)

DSP_VectorLog2 Function

Computes the Log2(x) of the first N elements of inVector, and stores the result in outVector.

File

dsp.h

C

```
void DSP_VectorLog2(_Q5_10 * outVector, _Q16 * inVector, int N);
```

Returns

None.

Description

Function DSP_VectorLog2:

void DSP_VectorLog2(_Q5_10 *outVector, _Q16 *inVector, int N);

Computes the Log2 value, where log2(x) = ln(x) * log2(e), on the first N elements of inVector. The output is stored to outVector. Input vector is _Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. The output vector is reduced resolution Q5.10 format, which is a 16-bit integer format with 10 bits representing the fractional resolution. If values exceed maximum or minimum they will saturate to the maximum or zero respectively.

Remarks

This function uses the Microchip PIC32MZ LibQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Log2 function see the LibQ documentation for _LIBQ_Q5_10_log2_Q16. A negative number input will return a saturated negative value (0x8000).

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Log2 function from the LibQ library. That library must be compiled as part of the project.

Example

```
int log2Num = 4;
_Q16 inLog2Val[8] = {0x40000000, 0xffff0000,0x00020000,0x00030000,0x00038000,
           0x00040000,0xfffe0000,0x00058000};
//          16384.0,  -1.0,  2.0,  3.0,   3.5,   4.0,  -2.0,  5.5
_Q5_10 outLog2Val[8] = {0};

DSP_VectorLog2(outLog2Val, inLog2Val,  log2Num);

// outLog2Val =    0x3800,        0x8000,   0x0400,   0x0657, 0, 0, 0, 0
//                  14.0,  sat negative,      1.0,    1.585, 0, 0, 0, 0
```

Parameters

Parameters	Description
outdata	pointer to destination array of elements (_Q16)
indata	pointer to source array of elements (_Q5_10)
N	number of samples (int)

DSP_VectorMax32 Function

Returns the maximum value of a vector.

File

dsp.h

C

```
int32_t DSP_VectorMax32(int32_t * indata, int N);
```

Returns

(int32_t) - maximum value within the vector, Q31 format

Description

Function DSP_VectorMax32:

int32_t DSP_VectorMax32(int32_t *indata, int N);

Returns the highest value of the first N elements of the vector indata. The comparison requires that all numbers be in Q31 fractional data format. N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Remarks

None.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and multiple of four.

Example

```
int32_t   outCheck;
int     Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  1,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6

outCheck = DSP_VectorMax32(inBufTestA, Num);

// outCheck = 0x7FFFFFFF  // first 4 values
```

Parameters

Parameters	Description
indata	pointer to input array of elements (int32_t)
N	number of samples (int)

DSP_VectorMaxIndex32 Function

Returns the index of the maximum value of a vector.

File

dsp.h

C

```
int DSP_VectorMaxIndex32(int32_t * indata, int N);
```

Returns

int - index of the position of the maximum array element

Description

Function DSP_VectorMaxIndex32:

int DSP_VectorMaxIndex32(int32_t *indata, int N);

Returns the index of the highest value of the first N elements of the vector indata. The comparison requires that all numbers be in Q31 fractional data format. N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Remarks

Index values range from 0 .. (n-1).

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int     indexValue;
int     Num = 8;
int32_t inBufTestA[8]={0x3FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  0.5,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6

indexValue = DSP_VectorMaxIndex32(inBufTestA, Num);

// returnValue =  6 (position corresponding to 0x7FFFFFFF)
```

Parameters

Parameters	Description
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

DSP_VectorMean32 Function

Calculates the mean average of an input vector.

File

dsp.h

C

```
int32_t DSP_VectorMean32(int32_t * indata1, int N);
```

Returns

int32_t - mean average value of the vector

Description

Function DSP_VectorMean32:

int32_t DSP_VectorMean32(int32_t *indata, int N);

Calculates the mean average of the first N elements of the vector indata. The values of indata1 are in Q31 fractional format. The value N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Remarks

None.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int32_t   returnValue;
int     Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  1,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6

returnValue = DSP_VectorMean32(inBufTestA, Num);

// returnValue =  0x36666666 = (1-1+0.9+0.8)/4 = 0.425
```

Parameters

Parameters	Description
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

DSP_VectorMin32 Function

Returns the minimum value of a vector.

File

dsp.h

C

```
int32_t DSP_VectorMin32(int32_t * input, int N);
```

Returns

(int32_t) - minimum value within the vector, Q31 format

Description

Function DSP_VectorMin32:

int32_t DSP_VectorMin32(int32_t *indata, int N);

Returns the lowest value of the first N elements of the vector indata. The comparison requires that all numbers be in Q31 fractional data format. N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Remarks

None.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and multiple of four.

Example

```
int32_t   outCheck;
int     Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  1,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6

outCheck = DSP_VectorMin32(inBufTestA, Num);

// outCheck = 0x80000000  // first 4 values
```

Parameters

Parameters	Description
indata	pointer to input array of elements (int32_t)
N	number of samples (int)

DSP_VectorMinIndex32 Function

Returns the index of the minimum value of a vector.

File

dsp.h

C

```
int DSP_VectorMinIndex32(int32_t * indata, int N);
```

Returns

int32_t - mean average value of the vector

Description

Function DSP_VectorMinIndex32:

int DSP_VectorMinIndex32(int32_t *indata, int N);

Returns the relative position index of the lowest value of the first N elements of the vector indata. The comparison requires that all numbers be in Q31 fractional data format. N must be greater than or equal to four and a multiple of four, or it will be truncated to the nearest multiple of four.

Remarks

Index values range from 0 .. (n-1).

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int     indexValue;
int     Num = 8;
int32_t inBufTestA[8]={0x3FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  0.5,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6

indexValue = DSP_VectorMinIndex32(inBufTestA, Num);

// returnValue =  1 (position corresponding to 0x80000000)
```

Parameters

Parameters	Description
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

DSP_VectorMul16 Function

Multiplication of a series of numbers in one vector to another vector.

File

dsp.h

C

```
void DSP_VectorMul16(int16_t * outdata, int16_t * indata1, int16_t * indata2, int N);
```

Returns

None.

Description

Function DSP_VectorMul16:

void DSP_VectorMul16(int16_t *outdata, int16_t *indata1, int16_t *indata2, int N);

Multiples the value of each element of indata1 * indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in the Q15 fractional format. outdata[i] filled with N elements of indata1[i] * indata2[i]

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufMultA[8]={0x7FFF, 0x8000, 0x7333, 0x6666, 0x1999, 0x4000, 0x7FFF, 0xB334};
//                        1,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6
int16_t inBufMultB[8]={0x0CCD, 0x0CCD, 0x4000, 0xC000, 0xE667, 0x4000, 0x0000, 0x0CCD};
//                        0.1,    0.1,    0.5,   -0.5,   -0.2,   0.5,    0,      0.1
int Num = 8;

pOutdata = &outVal;

DSP_VectorMul16(pOutdata, inBufMultA, inBufMultB, Num);

// outVal[i] = inBufTest[i] * inBuf2[i] =
//    {0x0CCD, 0xF333, 0x399A, 0xCCCD, 0xFAE2, 0x2000, 0x0000, 0xF852}
//      0.1,   -0.1,   0.45,  -0.4,   -0.04,   0.25,    0,     -0.06
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata1	pointer to input array of 16-bit elements (int16_t)

indata2	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

DSP_VectorMul32 Function

Multiplication of a series of numbers in one vector to another vector.

File

dsp.h

C

```
void DSP_VectorMul32(int32_t * outdata, int32_t * indata1, int32_t * indata2, int N);
```

Returns

None.

Description

Function DSP_VectorMul32:

void DSP_VectorMul32(int32_t *outdata, int32_t *indata1, int32_t *indata2, int N);

Multiples the value of each element of indata1 * indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in the Q31 fractional format. outdata[i] filled with N elements of indata1[i] * indata2[i]

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufMultA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  1,      -1,       0.9,     0.8,     0.2,    0.5,     1,      -0.6
int32_t inBufMultB[8]={0x0CCCCCCD, 0x0CCCCCCD, 0x40000000, 0xC0000000,
                       0xE6666667, 0x40000000, 0x00000000, 0x0CCCCCCD};
//                  0.1,     0.1,     0.5,    -0.5,    -0.2,    0.5,     0,       0.1
int Num = 8;

pOutdata = &outVal;

DSP_VectorMul32(pOutdata, inBufMultA, inBufMultB, Num);

// outVal[i] = inBufTest[i] * inBuf2[i] =
//    {0x0CCCCCCD, 0xF3333333, 0x3999999A, 0xCCCCCCCD, 0xFAE147AE,
//                                         0x20000000, 0x00000000, 0xF851EB86}
//      0.1,    -0.1,    0.45,   -0.4,    -0.04,    0.25,     0,      -0.06
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata1	pointer to input array of 16-bit elements (int32_t)
indata2	pointer to input array of 16-bit elements (int32_t)
N	number of samples (int)

DSP_VectorMulc16 Function

Multiplication of a series of numbers in one vector to a scalar value.

File

dsp.h

C

```
void DSP_VectorMulc16(int16_t * outdata, int16_t * indata, int16_t c, int N);
```

Returns

None.

Description

Function DSP_VectorMulc16:

void DSP_VectorMulc16(int16_t *outdata, int16_t *indata, int16_t c, int N);

Multiples the value of each element of indata1 * c and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q15 fractional format. outdata[i] filled with N elements of indata[i] * c

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufMultA[8]={0x7FFF, 0x8000, 0x7333, 0x6666, 0x1999, 0x4000, 0x0000, 0xB334};
//                      1,     -1,      0.9,    0.8,    0.2,   0.5,    0,     -0.6
int16_t constValue = 0x4000;
int Num = 8;

pOutdata = &outVal;

DSP_VectorMulc16(pOutdata, inBufMultA, constValue, Num);

// outVal[i] = inBufTest[i] * constValue =
//    {0x4000, 0xC000, 0x399A, 0x3333, 0x1999, 0x2000, 0x0000, 0xD99A}
//      0.5,   -0.5,   0.45,    0.4,    0.1,   0.25,    0,     -0.3
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata	pointer to input array of 16-bit elements (int16_t)
c	scalar multiplicand (int16_t)
N	number of samples (int)

DSP_VectorMulc32 Function

Multiplication of a series of numbers in one vector to a scalar value.

File

dsp.h

C

```
void DSP_VectorMulc32(int32_t * outdata, int32_t * indata, int32_t c, int N);
```

Returns

None.

Description

Function DSP_VectorMulc32:

void DSP_VectorMulc32(int32_t *outdata, int32_t *indata, int32_t c, int N);

Multiples the value of each element of indata * c and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q31 fractional format. outdata[i] filled with N elements of indata[i] * c

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufMultA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x00000000, 0xB3333334};
//                    1,    -1,    0.9,    0.8,    0.2,    0.5,    1,    -0.6
int32_t constValue = 0x4000;
int Num = 8;

pOutdata = &outVal;

DSP_VectorMulc32(pOutdata, inBufMultA, constValue, Num);

// outVal[i] = inBufTest[i] * constValue =
//    {0x40000000, 0xC0000000, 0x3999999A, 0x33333333, 0x19999999,
//                                         0x20000000, 0x00000000, 0xD999999A}
//      0.5,   -0.5,   0.45,    0.4,    0.1,   0.25,    0,     -0.3
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata	pointer to input array of 16-bit elements (int32_t)
c	scalar multiplicand (int32_t)
N	number of samples (int)

DSP_VectorNegate Function

Inverses the sign (negates) the elements of a vector.

File

dsp.h

C

```
void DSP_VectorNegate(int32_t * outdata, int32_t * indata, int N);
```

Returns

None.

Description

Function DSP_VectorNegate:

void DSP_VectorNegate(int32_t *outdata, int32_t *indata, int N);

Sign inversion of the first N values of an indata are assigned to outdata. N must be a multiple of four and greater than or equal to four or it will be truncated to the nearest multiple of four. The vector result and the scalar value to fill are both Q31 fractional format.

Remarks

None.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int     Num = 4;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  1,     -1,      0.9,    0.8,    0.2,    0.5,    1,     -0.6
int32_t outBufTest[8]={0x0CCCCCCD, 0x0CCCCCCD, 0x40000000, 0xC0000000,
```

```
                            0xE6666667, 0x40000000, 0x00000000, 0x0CCCCCCD};
//                  0.1,    0.1,    0.5,    -0.5,    -0.2,    0.5,    0,      0.1;

DSP_VectorNegate(outBufTest, inBufTestA, Num);

// inBufTestA =  {0x80000000, 0x7FFFFFFF, 0x8CCCCCCD, 0x9999999A,
//            0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334} // first 4 values neg
//               -1,   1,   -0.9,   -0.8,   -0.2,   0.5,   0,   0.1
```

Parameters

Parameters	Description
outdata	pointer to destination array of elements (int32_t)
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

DSP_VectorRecip Function

Computes the reciprocal (1/x) of the first N elements of inVector, and stores the result in outVector.

File

dsp.h

C

```
void DSP_VectorRecip(_Q16 * outVector, _Q16 * inVector, int N);
```

Returns

None.

Description

Function DSP_VectorRecip:

void DSP_VectorRecip(_Q16 *outVector, _Q16 *inVector, int N);

Computes the reciprocal (1/x) on the first N elements of inVector. The output is stored to outVector. Both vectors are _Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. If values exceed maximum or minimum they will saturate to the maximum or minimum respectively.

Remarks

This function uses the Microchip PIC32MZ LibQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Div function see the LibQ documentation for _LIBQ_Q16Div. A value of zero in the array will not cause an error, but will return 0.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Div function from the LibQ library. That library must be compiled as part of the project.

Example

```
int recNum = 4;
_Q16 inRecVec[8] = {0x08000000, 0xfffc0000,0x00020000,0x00100000,0x00038000,
                0x00400000,0xfffe0000,0x00058000};
//            2048.0, -4.0, 2.0, 16.0, 3.5, 64.0, -2.0, 5.5
_Q16 outRecVec[8] = {0};

DSP_VectorRecip(outRecVec, inRecVec,  recNum);

// outRecVec =  0x00000020, 0xFFFFC0000, 0x00008000, 0x00001000, 0, 0, 0, 0
//                0.000488,        -0.25,         0.5,      0.0625, 0, 0, 0, 0
```

Parameters

Parameters	Description
outdata	pointer to destination array of elements (_Q16)
indata	pointer to source array of elements (_Q16)
N	number of samples (int)

DSP_VectorRMS16 Function

Computes the root mean square (RMS) value of a vector.

File

dsp.h

C

```
int16_t DSP_VectorRMS16(int16_t * inVector, int N);
```

Returns

int16_t - RMS function output, Q15 format

Description

Function DSP_VectorRMS16:

int16_t DSP_VectorRMS16(int16_t *inVector, int N);

Computes the root mean square value of the first N values of inVector. Both input and output are Q15 fractional values. The function will saturate if maximum or minimum values are exceeded.

Remarks

This function is optimized with microMIPS and M14KCe ASE DSP instructions. This function is dependent on the LibQ library, and uses the _LIBQ_Q16Sqrt external function call.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and multiple of four.

Example

```
int16_t vecRMSIn[32]={0x1999, 0xD99A, 0x4000, 0x2666,0x1999,0x1999,0x2666, 0x3333};
// 0.2, -0.3, 0.5, 0.3, 0.2, 0.2, 0.3, 0.4
int16_t RMSOut=0;
int Nrms = 8;

RMSOut = DSP_VectorRMS16(vecRMSIn, Nrms);

// RMSOut = 0x287C (= 0.31628)
```

Parameters

Parameters	Description
indata	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

DSP_VectorShift Function

Shifts the data index of an input data vector.

File

dsp.h

C

```
void DSP_VectorShift(int32_t * outdata, int32_t * indata, int N, int shift);
```

Returns

None.

Description

Function DSP_VectorShift:

void DSP_VectorShift(int32_t *outdata, int32_t *indata, int N, int shift);

Shifts N data elements of indata to outdata, with an index change of shift. The amount of data shifted includes zero padding for the first (shift) elements if shift is positive. The vector size of indata and outdata need not be the same, however, N must not exceed either array size.

Remarks

Destination array values shift to left (relative to the input vector) when shift is positive (back filled with zeros) and shift to the right when shift is negative. The total amount of values copied to the destination array is the length of N less the shift amount.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must not exceed the amount of elements in the source array. shift must not exceed the number of elements in the destination array.

Example

```
int shiftValue = 3;
int     Num = 8;
int32_t inBufTestA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                  1,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6
int32_t inBufTestB[8]={0x80000000, 0x7FFFFFFF, 0x40000000, 0x0CCCCCCC,
                       0x40000000, 0x60000000, 0x80000000, 0x20000000};
//                  -1,     1,      0.5,    0.1,    0.75,   0.5,    -1,     0.25

DSP_VectorShift(inBufTestA, inBufTestB, Num, shiftValue);

// inBufTestA =  {0x00000000, 0x00000000, 0x00000000, 0x80000000,
//           0x7FFFFFFF, 0x40000000, 0x0CCCCCCC, 0x40000000} // shifted 3 positive
```

Parameters

Parameters	Description
outdata	pointer to destination array of elements (int32_t)
indata	pointer to source array of elements (int32_t)
N	number of samples (int)
shift	number of indexes to shift (int)

DSP_VectorSqrt Function

Computes the square root of the first N elements of inVector, and stores the result in outVector.

File

dsp.h

C

```
void DSP_VectorSqrt(_Q16 * outVector, _Q16 * inVector, int N);
```

Returns

None.

Description

Function DSP_VectorSqrt:

void DSP_VectorSqrt(_Q16 *outVector, _Q16 *inVector, int N);

Computes the Sqrt(x) on the first N elements of inVector. The output is stored to outVector. Both vectors are _Q16 format, which is 32-bit data with 15 bits for the integer and 16 bits for the fractional portion. If values exceed maximum or minimum they will saturate to the maximum or zero respectively.

Remarks

This function uses the Microchip PIC32MZ LibQ library to function. The user must include that library and header file into the design in order to operate this function. For more information on the Sqrt function see the LibQ documentation for _LIBQ_Q16Sqrt. A negative number input will return a saturated value (0x00FFFFxx).

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. This function uses the Sqrt function from the LibQ library. That library must be compiled as part of the project.

Example

```
int sqrtNum = 4;
_Q16 inSqrtVec[8] = {0x40000000, 0xffff0000,0x00020000,0x00100000,0x00038000,
```

```
            0x00400000,0xfffe0000,0x00058000};
//          16384.0,  -1.0,  2.0,  16.0,   3.5,   64.0,  -2.0,  5.5
_Q16 outSqrtVec[8] = {0};

DSP_VectorSqrt(outSqrtVec, inSqrtVec,  sqrtNum);

// outSqrtVec =  0x00800000, 0x00FFFF80, 0x00016A0A, 0x00040000, 0, 0, 0, 0
//                 128.0,  sat negative,   1.41422,      4.0,    0, 0, 0, 0
```

Parameters

Parameters	Description
outdata	pointer to destination array of elements (_Q16)
indata	pointer to source array of elements (_Q16)
N	number of samples (int)

DSP_VectorStdDev16 Function

Computes the Standard Deviation of a Vector.

File

dsp.h

C

```
int16_t DSP_VectorStdDev16(int16_t * inVector, int N);
```

Returns

int16_t - Standard Deviation of N selected elements

Description

Function DSP_VectorStdDev16:

int16_t DSP_VectorStdDev16(int16_t *inVector, int N);

Calculates the standard deviation on the first N elements of inVector and returns the 16-bit scalar result. The standard deviation is the square root of the variance, which is a measure of the delta from mean values. The mean value of the vector is computed in the process. The function has the form -

StdDev = SQRT(sum[0..N]((x(i) - M(N))^2) / (N-1)) where N is the number of vector elements x(i) is a single element in the vector M(N) is the mean of the N elements of the vector

Input values of the vector and output scalar value is Q15 fractional format. This format has data that ranges from -1 to 1, and has internal saturation limits of those same values. Some care has been taken to reduce the impact of saturation by adding processing steps to effectively complete the processing in blocks. However, in some extreme cases of data variance it is still possible to reach the saturation limits.

Remarks

The input vector elements number, N, must be at least 4 and a multiple of 4. This function is optimized with microMIPS and M14KCe ASE DSP instructions. This function is dependent on the LibQ library, and the _LIBQ_Q16Sqrt specifically.

Preconditions

The pointers inVector must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four. Dependent on use of the LibQ library.

Example

```
int16_t vecStdDevIn[32]={0x4000, 0xD99A, 0x1000, 0x6000,0x1999,0x1999,0x2666, 0x3333};
        // .2, -.3, .125, .75, .2, .2, .3, .4
int16_t StDevOut, Var16Out;
int Nstdev = 4;

StDevOut = DSP_VectorStdDev16(vecStdDevIn, Nstdev);
        // StDevOut = 0x3A9E (= 0.45797)
```

Parameters

Parameters	Description
inVector	pointer to source array of elements (int16_t)
N	number of samples (int)

DSP_VectorSub16 Function

Calculate the difference of two vectors.

File

dsp.h

C

```
void DSP_VectorSub16(int16_t * outdata, int16_t * indata1, int16_t * indata2, int N);
```

Returns

None.

Description

Function DSP_VectorSub16:

void DSP_VectorSub16(int16_t *outdata, int16_t *indata1, int16_t *indata2, int N);

Computes the difference value of each element of indata1 - indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q15 fractional format. outdata[i] filled with N elements of indata1[i] - indata2[i]

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Example

```
int16_t *pOutdata;
int16_t outVal[8];
int16_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100, 200, 127,-127,-2};
int16_t inBuf2[16]=     { 1,2, 3,4, 5,6, 7, 8, 9, 10,-1,-100,-127,127,-7,  0};
int Num = 8;

pOutdata = &outVal;

DSP_VectorSub16(pOutdata, inBufTest, inBuf2, Num);

// outVal[i] = inBufTest[i] - inBuf2[i] = {-6,0,-6,0,-6,-6,-9,-16}
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int16_t)
indata1	pointer to input array of 16-bit elements (int16_t)
indata2	pointer to input array of 16-bit elements (int16_t)
N	number of samples (int)

DSP_VectorSub32 Function

Calculate the difference of two vectors.

File

dsp.h

C

```
void DSP_VectorSub32(int32_t * outdata, int32_t * indata1, int32_t * indata2, int N);
```

Returns

None.

Description

Function DSP_VectorSub32:

void DSP_VectorSub32(int32_t *outdata, int32_t *indata1, int32_t *indata2, int N);

Computes the difference value of each element of indata1 - indata2 and stores it to outdata. The number of samples to process is given by the parameter N. Data is in a Q31 fractional format. outdata[i] filled with N elements of indata1[i] - indata2[i]

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int16_t *pOutdata;
int32_t outVal[8];
int32_t inBufTest[16] = {-5,2,-3,4,-1,0,-2,-8,-21,21,10,100, 200, 127,-127,-2};
int32_t inBuf2[16]=     { 1,2, 3,4, 5,6, 7, 8, 9, 10,-1,-100,-127,127,-7,  0};
int Num = 8;

pOutdata = &outVal;

DSP_VectorSub32(pOutdata, inBufTest, inBuf2, Num);

// outVal[i] = inBufTest[i] - inBuf2[i] = {-6,0,-6,0,-6,-6,-9,-16}
```

Parameters

Parameters	Description
outdata	pointer to output array of 16-bit elements (int32_t)
indata1	pointer to input array of 16-bit elements (int32_t)
indata2	pointer to input array of 16-bit elements (int32_t)
N	number of samples (int)

DSP_VectorSumSquares16 Function

Computes the sum of squares of a vector, and scales the output by a binary factor.

File

dsp.h

C

```
int16_t DSP_VectorSumSquares16(int16_t * indata, int N, int scale);
```

Returns

int16_t - scaled output of calculation, Q15 format

Description

Function DSP_VectorSumSquares16:

int16_t DSP_VectorSumSquares16(int16_t *indata, int N, int scale);

Calculates the sum of the squares of each element of an input vector, and scales the output. Function will saturate if it exceeds maximum or minimum values. Scaling is done by binary shifting, after accumulation in a 32 bit register. All calculations are done in Q15 fractional format. return = 1/(2^scale) * sum(indata[i]^2)

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to eight and a multiple of eight.

Example

```
int16_t inBufMultA[8]={0x7FFF, 0x8000, 0x7333, 0x6666, 0x1999, 0x4000, 0x7FFF, 0xB334};
//                        1,     -1,      0.9,    0.8,    0.2,   0.5,    1,     -0.6
int Num = 8;
int scaleVal = 3;
int16_t outScalar;

outScalar = DSP_VectorSumSquares16(inBufMultA, Num, scaleVal);
```

```
// outScalar = 1/(2^scaleVal)* sum(inBufMultA[i]^2) =
//   (1/8) * (1 + 1 + 0.81 + 0.64 + 0.04 + 0.25 + 1 + 0.36) = 0.125 * 5.1 = 0.6375
//      = (int16_t)0x5199
```

Parameters

Parameters	Description
indata	pointer to input array of 16-bit elements (int16_t)
scale	number of bits to shift return right (int)
N	number of samples (int)

DSP_VectorSumSquares32 Function

Computes the sum of squares of a vector, and scales the output by a binary factor.

File

dsp.h

C

```
int32_t DSP_VectorSumSquares32(int32_t * indata, int N, int scale);
```

Returns

int32_t - scaled output of calculation, Q15 format

Description

Function DSP_VectorSumSquares32:

int32_t DSP_VectorSumSquares32(int32_t *indata, int N, int scale);

Calculates the sum of the squares of each element of an input vector, and scales the output. The function will saturate if it exceeds maximum or minimum values. Scaling is done by binary shifting, after calculation of the results. All calculations are done in Q31 fractional format. return = 1/(2^scale) * sum(indata[i]^2)

Remarks

This must be assembled with .set microMIPS.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and multiple of four.

Example

```
int32_t inBufMultA[8]={0x7FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x00000000, 0xB3333334};
//                   1,    -1,    0.9,    0.8,    0.2,   0.5,    1,    -0.6
int Num = 8;
int scaleVal = 3;
int32_t outScalar;

outScalar = DSP_VectorSumSquares32(inBufMultA, Num, scaleVal);

// outScalar = 1/(2^scaleVal)* sum(inBufMultA[i]^2) =
//   (1/8) * (1 + 1 + 0.81 + 0.64 + 0.04 + 0.25 + 1 + 0.36) = 0.125 * 5.1 = 0.6375
//      = (int32_t)0x51999999
```

Parameters

Parameters	Description
indata	pointer to input array of 16-bit elements (int32_t)
scale	number of bits to shift return right (int)
N	number of samples (int)

DSP_VectorVari16 Function

Computes the variance of N elements of a Vector.

File

dsp.h

C

```
int16_t DSP_VectorVari16(int16_t * inVector, int N);
```

Returns

int16_t - Variance of N selected elements

Description

Function DSP_VectorVari16:

int16_t DSP_VectorVari16(int16_t *inVector, int N);

Calculates the variance on the first N elements of inVector and returns the 16-bit scalar result. The variance is a measure of the delta from mean values, and the mean value of the vector is computed in the process. The function has the form -

var = sum[0..N]((x(i) - M(N))^2) / (N-1) where N is the number of vector elements x(i) is a single element in the vector M(N) is the mean of the N elements of the vector

Input values of the vector and output scalar value is Q15 fractional format. This format has data that ranges from -1 to 1, and has internal saturation limits of those same values. Some care has been taken to reduce the impact of saturation by adding processing steps to effectively complete the processing in blocks. However, in some extreme cases of data variance it is still possible to reach the saturation limits.

Remarks

The input vector elements number, N, must be at least 4 and a multiple of 4. This function is optimized with microMIPS and M14KCe ASE DSP instructions.

Preconditions

The pointers inVector must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int16_t vecStDevIn[32]={0x4000, 0xD99A, 0x1000, 0x6000,0x1999,0x1999,0x2666, 0x3333};
        // .2, -.3, .125, .75, .2, .2, .3, .4
int16_t Var16Out;
int Nvar = 4;

Var16Out= DSP_VectorVari16(vecStDevIn, Nvar);  // 16-bit variance function
        // Var16Out = 0x1AD8 (= 0.20974)
```

Parameters

Parameters	Description
inVector	pointer to source array of elements (int16_t)
N	number of samples (int)

DSP_VectorVariance Function

Computes the variance of N elements of inVector.

File

dsp.h

C

```
int32_t DSP_VectorVariance(int32_t * inVector, int N);
```

Returns

int32_t - Variance of N selected elements

Description

Function DSP_VectorVariance:

int32_t DSP_VectorVariance(int32_t *inVector, int N);

Calculates the variance on the first N elements of inVector and returns the 32-bit scalar result. The variance is a measure of the delta from mean values, and the mean value of the vector is computed in the process. The function has the form -

var = sum[0..N]((x(i) - M(N))^2) / (N-1) where N is the number of vector elements x(i) is a single element in the vector M(N) is the mean of the N elements of the vector

Input values of the vector and output scalar value is Q31 fractional format. This format has data that ranges from -1 to 1, and has internal saturation limits of those same values. Some care has been taken to reduce the impact of saturation by adding processing steps to effectively complete the processing in blocks. However, in some extreme cases of data variance it is still possible to reach the saturation limits.

Remarks

The input vector elements number, N, must be at least 4 and a multiple of 4. This function is optimized with microMIPS and M14KCe ASE DSP instructions.

Preconditions

The pointers inVector must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int varN = 8;

int32_t inVarVec[8] = {0xE6666667, 0x40000000,0x40000000,0x0CCCCCCC,
          0x00000000,0x59999999,0x20000000,0xC0000000};
//     -0.2, 0.5, 0.5, 0.1, 0, 0.7, 0.25, -0.5
int32_t outVar = 0;

outVar = DSP_VectorVariance(inVarVec, varN);

// outVar == 0x1490D2A6, = 0.1606696
```

Parameters

Parameters	Description
inVector	pointer to source array of elements (int32_t)
N	number of samples (int)

DSP_VectorZeroPad Function

Fills an input vector with zeros.

File

dsp.h

C

```
void DSP_VectorZeroPad(int32_t * indata, int N);
```

Returns

None.

Description

Function DSP_VectorZeroPad:

void DSP_VectorZeroPad(int32_t *indata, int N);

Fills the first N values of an input vector indata with the value zero. N must be a multiple of four and greater than or equal to four or it will be truncated to the nearest multiple of four. The vector result is in Q31 fractional format.

Remarks

None.

Preconditions

The pointers outdata and indata must be aligned on 4-byte boundaries. N must be greater than or equal to four and a multiple of four.

Example

```
int     Num = 4;
int32_t inBufTestA[8]={0x3FFFFFFF, 0x80000000, 0x73333333, 0x66666666,
                       0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
//                 0.5,     -1,      0.9,    0.8,    0.2,   0.5,    1,    -0.6

DSP_VectorZeroPad(inBufTestA, Num);

// inBufTestA =  {0x00000000, 0x00000000, 0x00000000, 0x00000000,
//                            0x19999999, 0x40000000, 0x7FFFFFFF, 0xB3333334};
```

```
// 0, 0, 0, 0, 0.2, 0.5, 1, -0.6
```

Parameters

Parameters	Description
indata	pointer to source array of elements (int32_t)
N	number of samples (int)

Description

This section lists the source and header files used by the DSP Fixed-Point Math Library.

dsp.h

DSP functions for the PIC32MZ device family.

Functions

	Name	Description
	DSP_ComplexAdd32	Calculates the sum of two complex numbers.
	DSP_ComplexConj16	Calculates the complex conjugate of a complex number.
	DSP_ComplexConj32	Calculates the complex conjugate of a complex number.
	DSP_ComplexDotProd32	Calculates the dot product of two complex numbers.
	DSP_ComplexMult32	Multiplies two complex numbers.
	DSP_ComplexScalarMult32	Multiplies a complex number and a scalar number.
	DSP_ComplexSub32	Calculates the difference of two complex numbers.
	DSP_FilterFIR32	Performs a Finite Infinite Response (FIR) filter on a vector.
	DSP_FilterFIRDecim32	Performs a decimating FIR filter on the input array.
	DSP_FilterFIRInterp32	Performs an interpolating FIR filter on the input array.
	DSP_FilterIIR16	Performs a single-sample cascaded biquad Infinite Impulse Response (IIR) filter.
	DSP_FilterIIRBQ16	Performs a single-pass IIR Biquad Filter.
	DSP_FilterIIRBQ16_cascade8	Performs a single-sample IIR Biquad Filter as a cascade of 8 series filters.
	DSP_FilterIIRBQ16_cascade8_fast	Performs a single-sample IIR Biquad Filter as a cascade of 8 series filters.
	DSP_FilterIIRBQ16_fast	Performs a single-pass IIR Biquad Filter.
	DSP_FilterIIRBQ16_parallel8	Performs a 8 parallel single-pass IIR Biquad Filters, and sums the result.
	DSP_FilterIIRBQ16_parallel8_fast	Performs a 8 parallel single-pass IIR Biquad Filters, and sums the result.
	DSP_FilterIIRBQ32	Performs a high resolution single-pass IIR Biquad Filter.
	DSP_FilterIIRSetup16	Converts biquad structure to coeffs array to set up IIR filter.
	DSP_FilterLMS16	Performs a single sample Least Mean Squares FIR Filter.
	DSP_MatrixAdd32	Addition of two matrices C = (A + B).
	DSP_MatrixEqual32	Equality of two matrices C = (A).
	DSP_MatrixInit32	Initializes the first N elements of a Matrix to the value num.
	DSP_MatrixMul32	Multiplication of two matrices C = A x B.
	DSP_MatrixScale32	Scales each element of an input buffer (matrix) by a fixed number.
	DSP_MatrixSub32	Subtraction of two matrices C = (A - B).
	DSP_MatrixTranspose32	Transpose of a Matrix C = A (T).
	DSP_TransformFFT16	Creates an Fast Fourier Transform (FFT) from a time domain input.
	DSP_TransformFFT16_setup	Creates FFT coefficients for use in the FFT16 function.
	DSP_TransformFFT32	Creates an Fast Fourier Transform (FFT) from a time domain input.
	DSP_TransformFFT32_setup	Creates FFT coefficients for use in the FFT32 function.
	DSP_TransformIFFT16	Creates an Inverse Fast Fourier Transform (FFT) from a frequency domain input.
	DSP_TransformWindow_Bart16	Perform a Bartlett window on a vector.
	DSP_TransformWindow_Bart32	Perform a Bartlett window on a vector.

	DSP_TransformWindow_Black16	Perform a Blackman window on a vector.
	DSP_TransformWindow_Black32	Perform a Blackman window on a vector.
	DSP_TransformWindow_Cosine16	Perform a Cosine (Sine) window on a vector.
	DSP_TransformWindow_Cosine32	Perform a Cosine (Sine) window on a vector.
	DSP_TransformWindow_Hamm16	Perform a Hamming window on a vector.
	DSP_TransformWindow_Hamm32	Perform a Hamming window on a vector.
	DSP_TransformWindow_Hann16	Perform a Hanning window on a vector.
	DSP_TransformWindow_Hann32	Perform a Hanning window on a vector.
	DSP_TransformWindow_Kaiser16	Perform a Kaiser window on a vector.
	DSP_TransformWindow_Kaiser32	Perform a Kaiser window on a vector.
	DSP_TransformWinInit_Bart16	Create a Bartlett window.
	DSP_TransformWinInit_Bart32	Create a Bartlett window.
	DSP_TransformWinInit_Black16	Create a Blackman window.
	DSP_TransformWinInit_Black32	Create a Blackman window.
	DSP_TransformWinInit_Cosine16	Create a Cosine (Sine) window.
	DSP_TransformWinInit_Cosine32	Create a Cosine (Sine) window.
	DSP_TransformWinInit_Hamm16	Create a Hamming window.
	DSP_TransformWinInit_Hamm32	Create a Hamming window.
	DSP_TransformWinInit_Hann16	Create a Hanning window.
	DSP_TransformWinInit_Hann32	Create a Hanning window.
	DSP_TransformWinInit_Kaiser16	Create a Kaiser window.
	DSP_TransformWinInit_Kaiser32	Create a Kaiser window.
	DSP_VectorAbs16	Calculate the absolute value of a vector.
	DSP_VectorAbs32	Calculate the absolute value of a vector.
	DSP_VectorAdd16	Calculate the sum of two vectors.
	DSP_VectorAdd32	Calculate the sum of two vectors.
	DSP_VectorAddc16	Calculate the sum of a vector and a constant.
	DSP_VectorAddc32	Calculate the sum of a vector and a constant.
	DSP_VectorAutocorr16	Computes the Autocorrelation of a Vector.
	DSP_VectorBexp16	Computes the maximum binary exponent of a vector.
	DSP_VectorBexp32	Computes the maximum binary exponent of a vector.
	DSP_VectorChkEqu32	Compares two input vectors, returns an integer '1' if equal, and '0' if not equal.
	DSP_VectorCopy	Copies the elements of one vector to another.
	DSP_VectorCopyReverse32	Reverses the order of elements in one vector and copies them into another.
	DSP_VectorDivC	Divides the first N elements of inVector by a constant divisor, and stores the result in outVector.
	DSP_VectorDotp16	Computes the dot product of two vectors, and scales the output by a binary factor.
	DSP_VectorDotp32	Computes the dot product of two vectors, and scales the output by a binary factor
	DSP_VectorExp	Computes the EXP (e^x) of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorFill	Fills an input vector with scalar data.
	DSP_VectorLn	Computes the Natural Log, Ln(x), of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorLog10	Computes the Log10(x), of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorLog2	Computes the Log2(x) of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorMax32	Returns the maximum value of a vector.
	DSP_VectorMaxIndex32	Returns the index of the maximum value of a vector.
	DSP_VectorMean32	Calculates the mean average of an input vector.
	DSP_VectorMin32	Returns the minimum value of a vector.
	DSP_VectorMinIndex32	Returns the index of the minimum value of a vector.
	DSP_VectorMul16	Multiplication of a series of numbers in one vector to another vector.
	DSP_VectorMul32	Multiplication of a series of numbers in one vector to another vector.
	DSP_VectorMulc16	Multiplication of a series of numbers in one vector to a scalar value.
	DSP_VectorMulc32	Multiplication of a series of numbers in one vector to a scalar value.
	DSP_VectorNegate	Inverses the sign (negates) the elements of a vector.
	DSP_VectorRecip	Computes the reciprocal (1/x) of the first N elements of inVector, and stores the result in outVector.

	DSP_VectorRMS16	Computes the root mean square (RMS) value of a vector.
	DSP_VectorShift	Shifts the data index of an input data vector.
	DSP_VectorSqrt	Computes the square root of the first N elements of inVector, and stores the result in outVector.
	DSP_VectorStdDev16	Computes the Standard Deviation of a Vector.
	DSP_VectorSub16	Calculate the difference of two vectors.
	DSP_VectorSub32	Calculate the difference of two vectors.
	DSP_VectorSumSquares16	Computes the sum of squares of a vector, and scales the output by a binary factor.
	DSP_VectorSumSquares32	Computes the sum of squares of a vector, and scales the output by a binary factor.
	DSP_VectorVari16	Computes the variance of N elements of a Vector.
	DSP_VectorVariance	Computes the variance of N elements of inVector.
	DSP_VectorZeroPad	Fills an input vector with zeros.
	mul16	multiply and shift integer
	mul16r	multiply and shift Q15
	mul32	multiply and shift Q31
	SAT16	saturate both positive and negative Q15
	SAT16N	saturate negative Q15
	SAT16P	saturate positive Q15

Macros

	Name	Description
	MAX16	maximum Q15
	MAX32	maximum Q31
	MIN16	minimum Q15
	MIN32	minimum Q31

Structures

	Name	Description
	_PARM_EQUAL_FILTER	IIR BQ filter structure Q15 data, Q31 storage
	_PARM_EQUAL_FILTER_16	IIR BQ filter structure Q15
	_PARM_EQUAL_FILTER_32	IIR BQ filter structure Q31
	biquad16	Q15 biquad
	int16c	Q15 complex number (a + bi)
	int32c	Q31 complex number (a + bi)
	matrix32	Q31 matrix
	PARM_EQUAL_FILTER	IIR BQ filter structure Q15 data, Q31 storage
	PARM_EQUAL_FILTER_16	IIR BQ filter structure Q15
	PARM_EQUAL_FILTER_32	IIR BQ filter structure Q31
	PARM_FILTER_GAIN	filter gain structure

Description

Digital Signal Processing (DSP) Library

The DSP Library provides functions that are optimized for performance on the PIC32MZ families of devices that have microAptiv core features and utilize DSP ASE. The library provides advanced mathematical operations for complex numbers, vector and matrix mathematics, digital filtering and transforms.

All functions are implemented in efficient assembly with C-callable prototypes. In some cases both 16-bit and 32-bit functions are supplied to enable the user with a choice of resolution and performance.

For most functions, input and output data is represented by 16-bit fractional numbers in Q15 format, which is the most commonly used data format for signal processing. Some functions use other data formats internally for increased precision of intermediate results.

The Q15 data type used by the DSP functions is specified as int16_t in the C header file that is supplied with the library. Note that within C code, care must be taken to avoid confusing fixed-point values with integers. To the C compiler, objects declared with int16_t type are integers, not fixed-point, and all arithmetic operations performed on those objects in C will be done as integers. Fixed-point values have been declared as int16_t only because the standard C language does not include intrinsic support for fixed-point data types.

Some functions also have versions operating on 32-bit fractional data in Q31 format. These functions operate similarly to their 16-bit counterparts. However, it should be noted that the 32-bit functions do not benefit much from the SIMD capabilities offered by DSP ASE. Thus, the performance of the 32-bit functions is generally reduced compared to the performance of the corresponding 16-bit functions.

Signed fixed point types are defined as follows:

Qn.m where:

- n is the number of data bits to the left of the radix point
- m is the number of data bits to the right of the radix point
- a signed bit is implied

Unique variable types for fractional representation are also defined:

Exact Name # Bits Required Type Q0.15 (Q15) 16 int16_t Q0.31 (Q31) 32 int32_t

Table of DSP Library functions:

Complex Math:

void DSP_ComplexAdd32(int32c *indata1, int32c *indata2, int32c *Output);

void DSP_ComplexConj16(int16c *indata, int16c *Output);

void DSP_ComplexConj32(int32c *indata, int32c *Output);

void DSP_ComplexDotProd32(int32c *indata1, int32c *indata2, int32c *Output);

void DSP_ComplexMult32(int32c *indata1, int32c *indata2, int32c *Output);

void DSP_ComplexScalarMult32(int32c *indata, int32_t Scalar, int32c *Output);

void DSP_ComplexSub32(int32c *indata1, int32c *indata2, int32c *Output);

Filter Functions:

void DSP_FilterFIR32(int32_t *outdata, int32_t *indata, int32_t *coeffs2x, int32_t *delayline, int N, int K, int scale);

void DSP_FilterFIRDecim32(int32_t *outdata, int32_t *indata, int32_t *coeffs, int32_t *delayline, int N, int K, int scale, int rate);

int16_t DSP_FilterIIR16(int16_t in, int16_t *coeffs, int16_t *delayline, int B, int scale);

void DSP_FilterIIRSetup16(int16_t *coeffs, biquad16 *bq, int B);

void DSP_FilterFIRInterp32(int32_t *outdata, int32_t *indata, int32_t *coeffs, int32_t *delayline, int N, int K, int scale, int rate);

int16_t DSP_FilterLMS16(int16_t in, int16_t ref, int16_t *coeffs, int16_t *delayline, int16_t *error, int K, int16_t mu);

int16_t DSP_FilterIIRBQ16_fast(int16_t Xin, PARM_EQUAL_FILTER_16 *pFilter);

int16_t DSP_FilterIIRBQ16(int16_t Xin, PARM_EQUAL_FILTER *pFilter);

int32_t DSP_FilterIIRBQ32(int32_t Xin, PARM_EQUAL_FILTER_32 *pFilter);

int16_t DSP_FilterIIRBQ16_cascade8(int16_t Xin, PARM_EQUAL_FILTER *pFilter_Array);

int16_t DSP_FilterIIRBQ16_cascade8_fast(int16_t Xin, PARM_EQUAL_FILTER_16 *pFilter_Array);

int16_t DSP_FilterIIRBQ16_parallel8(int16_t Xin, PARM_EQUAL_FILTER *pFilter);

int16_t DSP_FilterIIRBQ16_parallel8_fast(int16_t Xin, PARM_EQUAL_FILTER_16 *pFilter);

Matrix Functions:

void DSP_MatrixAdd32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);

void DSP_MatrixEqual32(matrix32 *resMat, matrix32 *srcMat);

void DSP_MatrixInit32(int32_t *data_buffer, int32_t N, int32_t num);

void DSP_MatrixMul32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);

void DSP_MatrixScale32(int32_t *data_buffer, int32_t N, int32_t num);

void DSP_MatrixSub32(matrix32 *resMat, matrix32 *srcMat1, matrix32 *srcMat2);

void DSP_MatrixTranspose32(matrix32 *desMat, matrix32 *srcMat);

Transforms:

void DSP_TransformFFT16(int16c *dout, int16c *din, int16c *twiddles, int16c *scratch, int log2N);

void DSP_TransformIFFT16(int16c *dout, int16c *din, int16c *twiddles, int16c *scratch, int log2N);

void DSP_TransformFFT16_setup(int16c *twiddles, int log2N);

void DSP_TransformFFT32(int32c *dout, int32c *din, int32c *twiddles, int32c *scratch, int log2N);

void DSP_TransformFFT32_setup(int32c *twiddles, int log2N);

void DSP_TransformWindow_Bart16(int16_t *OutVector, int16_t *InVector, int N);

void DSP_TransformWindow_Bart32(int32_t *OutVector, int32_t *InVector, int N);

void DSP_TransformWindow_Black16(int16_t *OutVector, int16_t *InVector, int N);

LibQ Fixed-Point 'C' Math Library

This topic describes the LibQ Fixed-Point 'C' Math Library.

Introduction

The LibQ Fixed-Point 'C' Math Library is available for the PIC32 family of microcontrollers.

Description

The LibQ Fixed-Point 'C' Math Library provides fixed-point math functions written in C for portability between core processors.

The library utilizes signed fixed point types (fractional Q types specified by Qn.m) as follows:

Qndm where:

- n is the number of data bits to the left of the radix point
- m is the number of data bits to the right of the radix point
- a signed bit is implied (unless stated otherwise)

Whereas, the implied fractional scaling of the integer value is given by 2^(-m), i.e. arithmetic left-shift of m bit positions of the fractional part into the value. This necessarily reduces the maximum magnitude of that can be stored in the n+m bit value, since only n bit remain and 1 of those bits is usually the sign..

For convenience, short names are also defined for arbitrary scaled fractional types:

- q15 is signed fractional 16 bit value
- q31 is signed fractional 32 bit value

In addition, A pseudo floating point 32 bit format (FxQFloat32) is defined that consists of 16 bit mantissa and a 16 bit exponent (base 2).

Functions in the library are prefixed with the type of the return value and followed by the argument types, as follows:

libq_: libq_q15_sin_Q2d13

For example, libq_q1d15_Sin_q10d6 returns a Q1.15 value equal to the to the sine of an angle specified as a Q10.6 value (in degrees between 0 and 360). Argument types separated by an underscore.

For arbitrary scaled types (q15 and q31), the scaling of the result will depend on the function and the scaling of the arguments. For instance, libq_q15_Add_q15_q15(a,b) will return a scaled value type that is the same as the two input types (which also must have equivalent Q format).

The library supports the original ETSI family of basic operations as described in:

"ETSI G.729 recommendation Coding of speech at 8 kbit/s using conjugate-structure algebraic-code excited linear prediction (CS-ACELP)".

This includes:

- Saturated arithmetic operations, such as L_add, L_sub, sub, add.
- Multiplication operations, such as mult, mult_r and L_mult.
- Arithmetic shift operations, such as shl and shr.
- Data conversion operations, such as extract_l, extract_h, and round.
- Normalization to maximize resolution, such as norm_l
- Loading of 15 bit values into 32 bit values, such as L_deposit_h
- Signed negation, such as L_negate
- Multiply accumulate, such as L_mac, L_macNs, mac_r
- Multiply subtract, such as L_msu, L_msuNs msu_r
- Divide, such as div_s
- Saturate value, such as L_sat
- Rounding, such as round.
- Left Shift, such as L_shl and shl
- Right Shift, such as L_shr, L_shr_r and shr
- Extraction of 16 bit values, such as extract_l
- Absolute value, such as L_abs

The 'C' Code implementation provides portability of the library, yet the functions easily translate to specific processor assembly code (intrinsic operations) when needed.

Note: The LibQ Fixed-Point 'C' Math Library functions do not correspond to the LibQ Fixed-Point Math Library, which is optimized for the microAptiv core processor and is written in Assembly language.

Using the Library

This topic describes the basic architecture of the LibQ Fixed-Point 'C' Math Library and provides information and examples on its use.

Description

Interface Header File: `libq_C.h`

The interface to the LibQ Fixed-Point 'C' Math Library is defined in the `libq_C.h` header file. Any C language source (`.c`) file that uses the LibQ Fixed-Point Library should include `libq_C.h`.

Library File:

The LibQ Fixed-Point 'C' Math Library archive (`.a`) file is installed with MPLAB Harmony.

Library Interface

Functions

	Name	Description
	libq_q15_Abs_q15	Saturated Absolute value.
	libq_q15_Add_q15_q15	Add two 16-bit 2s-complement fractional values.
	libq_q15_DivisionWithSaturation_q15_q15	Fractional division with saturation.
	libq_q15_ExtractH_q31	Extracts upper 16 bits of input 32-bit fractional value.
	libq_q15_ExtractL_q31	Extracts lower 16-bits of input 32-bit fractional value. Descriptionf Extracts lower 16-bits of input 32-bit fractional value and returns them as 16-bit fractional value. This is a bit-for-bit extraction of the bottom 16-bits of the 32-bit input. This function relates to the ETSI extract_l function.
	libq_q15_Negate_q15	Negate 16-bit 2s-complement fractional value with saturation.
	libq_q15_RoundL_q31	Rounds the lower 16-bits of the 32-bit fractional input.
	libq_q15_ShiftLeft_q15_q15	'Arithmetic' Shift of the 16-bit input argument.
	libq_q15_ShiftRight_q15_q15	'Arithmetic' RIGHT Shift on a 16-bit value.
	libq_q15_ShiftRightRound_q15_q15	Performs an 'Arithmetic' RIGHT Shift on a 16-bit input.
	libq_q1d15_Sin_q10d6	Approximates the sine of an angle.
	libq_q31_Abs_q31	Saturated Absolute value.
	libq_q31_Add_q31_q31	Add two 32-bit 2s-complement fractional values.
	libq_q31_DepositH_q15	Place 16 bits in the upper half of 32 bit word.
	libq_q31_DepositL_q15	Place 16 bits in the lower half of 32 bit word.
	libq_q31_Mult2_q15	fractional multiplication of two 16-bit fractional values.
	libq_q31_Multi_q15_q31	Implement 16 bit by 32 bit multiply.
	libq_q31_Negate_q31	Negate 32-bit 2s-complement fractional value with saturation.
	libq_q31_ShiftRight_q31_q15	'Arithmetic' RIGHT Shift on a 32-bit value.
	libq_q31_ShiftRightRound_q31_q15	'Arithmetic' RIGHT Shift on a 32-bit value
	libq_q20d12_Sin_q20d12	3rd order Polynomial apprx. of a sine function
	libq_q15_ExpAvg_q15_q15_q1d15	Exponential averaging
	libq_q15_Sub_q15_q15	Subtract two 16-bit 2s-complement fractional values
	libq_q1d15_MacR_q1d31_q1d15_q1d15	Multiply accumulate with rounding.
	libq_q1d15_MsuR_q1d31_q1d15_q1d15	Multiply-Subtraction with rounding
	libq_q1d15_MultipyR2_q1d15_q1d15	fractional multiplication of two 16-bit fractional values giving a 16 bit rounded result.
	libq_q1d31_Mac_q1d31_q1d15_q1d15	Multiply-Accumulate function WITH saturation
	libq_q1d31_Msu_q1d31_q1d15_q1d15	L_msu(a,b,c)
	libq_q31_ShiftLeft_q31_i16	'Arithmetic' Shift of the 32-bit value.
	Fx16Norm	Normalize the 16-bit fractional value.
	Fx32Norm	Normalize the 32-bit number.

Data Types and Constants

	Name	Description
	q15	q15 n.n (signed)
	q31	q31 n.n (signed)
	q63	Q63 n.n (signed)
	_LIBQ_C_H_	This is macro _LIBQ_C_H_.
	BITMASKFRACT16	Bit Mask for 16
	BITMASKFRACT32	Bit Mask for 32
	Fl2Fract16	Converts floating point constant value to fractional 16-bit value

	Fl2Fract32	Converts floating point constant value to fractional 32-bit value
	Fl2FxPnt	Converts floating point constant value to fixed/fractional value
	Fl2FxPnt16	Converts floating point constant value to fixed point 16-bit value
	Fl2FxPnt32	Converts floating point constant value to fixed point 32-bit value
	Fl2Int16	Converts floating point constant expression to 16-bit integer value
	Fl2Int32	Converts floating point constant expression to 32-bit integer value
	FrMax	find the maximum of two numbers
	FrMin	find the minimum of two numbers
	LOG102Q5D11	log10(2) scaled to Q5.11 format
	MAXFRACT16	0.999969
	MAXFRACT32	0.9999999995
	MAXINT16	Maximum and minimum values for 16-bit data types.
	MAXINT32	This is macro MAXINT32.
	MAXPFLOAT32	minimum and maximum definitions for FX floating point data types
	MINFRACT16	1.000000
	MINFRACT32	1.0000000000
	MININT16	This is macro MININT16.
	MININT32	This is macro MININT32.
	MINPFLOAT32	This is macro MINPFLOAT32.
	MSBBITFRACT16	16-bit Sign Bit
	MSBBITFRACT32	32-bit Sign Bit
	NINETYQ10D22	Ninety degrees scaled to Q10d22
	NINETYQ10D6	Ninety degrees scaled to Q10d6
	NORMNEGFRACT16	Max -val for 16
	NORMNEGFRACT32	Max -val for 32
	NORMPOSFRACT16	Min +val for 16
	NORMPOSFRACT32	Min +val for 32
	NUMBITSFRACT16	Num of bits 16
	NUMBITSFRACT32	Num of bits 32
	ONEEIGHTYQ10D22	180 degrees scaled to Q10d22
	ONEEIGHTYQ10D6	180 degrees scaled to Q10d6
	ROUNDFRACT32	Rounding value
	THREESIXTYQ10D22	360 degrees scaled to Q10d22
	THREESIXTYQ10D6	360 degrees scaled to Q10d6
	TWOSEVENTYQ10D22	270 degrees scaled to Q10d22
	TWOSEVENTYQ10D6	270 degrees scaled to Q10d6
	UNITYFLOAT	This is macro UNITYFLOAT.
	FxQFloat32	FxQFloat32 pseudo floating point type (limited floating point)
	Exponent16ToQFloat32	Converts a power of 2 16-bit integer to 32-bit floating point value.
	Fl2QFloat32	Converts a decimal floating-point constant expression to pseudo float
	i16	Q16d0

Description

This section describes the Application Programming Interface (API) functions, macros, and types of the LibQ Fixed Point 'C' Math Library. Refer to each section for a detailed description.

Functions

libq_q15_Abs_q15 Function

Saturated Absolute value.

File

libq_C.h

C

```
q15 libq_q15_Abs_q15(q15);
```

Returns

q15 result - abs(input) <= MAXFRACT16

Description

Function libq_q15_Abs_q15:

Creates a saturated Absolute value. It takes the absolute value of the 16-bit 2s-complement fractional input with saturation. The saturation is for handling the case where taking the absolute value of MINFRACT16 is greater than MAXFRACT16, or the allowable range of 16-bit values. This function relates to the ETSI abs function.

Parameters

Parameters	Description
q15 a	input argument

libq_q15_Add_q15_q15 Function

Add two 16-bit 2s-complement fractional values.

File

libq_C.h

C

```
q15 libq_q15_Add_q15_q15(q15, q15);
```

Returns

q15 - a+b on Range: MINFRACT16 <= result <= MAXFRACT16

Description

Function libq_q15_Add_q15_q15: f

Add two 16-bit 2s-complement fractional (op1 + op2) to produce a 16-bit 2s-complement fractional result with saturation. The saturation is for handling the overflow/underflow cases, where the result is set to MAX16 when an overflow occurs and the result is set to MIN16 when an underflow occurs. This function does not produce any status flag to indicate when an overflow or underflow has occured. It is assumed that the binary point is in exactly the same bit position for both 16-bit inputs and the resulting 16-bit output.

libq_q15_DivisionWithSaturation_q15_q15 Function

Fractional division with saturation.

File

libq_C.h

C

```
q15 libq_q15_DivisionWithSaturation_q15_q15(q15, q15);
```

Returns

q15 result - ratio a/b in 16-bit fractional format

Description

Function libq_q15_DivisionWithSaturation_q15_q15():

Performs fractional division with saturation. There are three restrictions that the calling code must satisfy.

1. Both the numerator and denominator must be positive.
2. In order to obtain a non-saturated result, the numerator must be LESS than or equal to the denominator.
3. The denominator must not equal zero.

If 'num' equals 'den', then the result equals MAXINT16.

This function relates to the ETSI div_s function.

Parameters

Parameters	Description
q15 num	16-bit fractional numerator
q15 den	16-bit fractional denumerator

libq_q15_ExtractH_q31 Function

Extracts upper 16 bits of input 32-bit fractional value.

File

libq_C.h

C

```
q15 libq_q15_ExtractH_q31(q31);
```

Returns

q15 result - Upper 16 bits of 32-bit argument a

Description

Function libq_q15_ExtractH_q31:

Extracts upper 16 bits of input 32-bit fractional value and returns them as 16-bit fractional value. This is a bit-for-bit extraction of the top 16-bits of the 32-bit input. This function relates to the ETSI extract_h function.

libq_q15_ExtractL_q31 Function

Extracts lower 16-bits of input 32-bit fractional value.

Descriptionf Extracts lower 16-bits of input 32-bit fractional value and returns them as 16-bit fractional value. This is a bit-for-bit extraction of the bottom 16-bits of the 32-bit input. This function relates to the ETSI extract_l function.

File

libq_C.h

C

```
q15 libq_q15_ExtractL_q31(q31);
```

Returns

q15 - Lower 16 bits of 32-bit argument a

Description

Function libq_q15_ExtractL_q31:

libq_q15_Negate_q15 Function

Negate 16-bit 2s-complement fractional value with saturation.

File

libq_C.h

C

```
q15 libq_q15_Negate_q15(q15);
```

Returns

q15 result on range: MINFRACT16 <= result <= MAXFRACT16

Description

Function libq_q15_Negate_q15:

Negate 16-bit 2s-complement fractional value with saturation. The saturation is for handling the case where negating a MINFRACT16 is greater than MAXFRACT16, or the allowable range of values. This function relates to the ETSI negate function.

libq_q15_RoundL_q31 Function

Rounds the lower 16-bits of the 32-bit fractional input.

File

libq_C.h

C

```
q15 libq_q15_RoundL_q31(q31);
```

Returns

q15 result

Description

Function libq_q15_RoundL_q31:

Rounds the lower 16-bits of the 32-bit fractional input into a 16-bit fractional value with saturation. This converts the 32-bit fractional value to 16-bit fractional value with rounding. This function calls the 'Add' function to perform the 32-bit rounding of the input value and 'ExtractH' function to extract to top 16-bits. This has the effect of rounding positive fractional values up and more positive, and has the effect of rounding negative fractional values up and more positive. This function relates to the ETSI round function.

libq_q15_ShiftLeft_q15_q15 Function

'Arithmetic' Shift of the 16-bit input argument.

File

libq_C.h

C

```
q15 libq_q15_ShiftLeft_q15_q15(q15, int16_t);
```

Returns

q15 result - arithmetically shifted 16-bit signed integer output

Description

Function libq_q15_ShiftLeft_q15_i16:

Performs an 'Arithmetic' Shift of the 16-bit input argument 'a' left by the input argument 'b' bit positions. If 'b' is a positive number, a 16-bit left shift is performed with 'zeros' inserted to the right of the shifted bits. If 'b' is a negative number, a right shift by abs(b) positions with 'sign extention' Saturation is applied if shifting causes an overflow or an underflow.

positive value: # of bits to left shift (zeros inserted at LSB's) {To not always saturate: if 'a=0', then max b=15, else max b=14} negative value: # of bits to right shift (sign extend)

This function relates to the ETSI shl function.

Parameters

Parameters	Description
q15 a	16-bit signed integer value to be shifted.
i16 b	16-bit signed integer shift value

libq_q15_ShiftRight_q15_q15 Function

'Arithmetic' RIGHT Shift on a 16-bit value.

File

libq_C.h

C

```
q15 libq_q15_ShiftRight_q15_q15(q15, int16_t);
```

Returns

q15 result - 16-bit signed shifted output

Description

Function libq_q15_ShiftRight_q15_q15:

Performs an 'Arithmetic' RIGHT Shift on a 16-bit input by 'b' bit positions. For positive shift directions (b>0), 'b' Lsb-bits are shifted out to the right and 'b' sign-extended Msb-bits fill in From the left. For negative shift directions (b<0), 'b' Lsb's are shifted to the LEFT with 0's filling in the empty lsb position. The left shifting causes 'b' Msb-bits to fall off to the left, saturation is applied to any shift left value that overflows. This function calls the left-shift function to perform any 16-bit left shifts. This function does not provide any status-type information to indicate when overflows occur.

positive value: # of bits to right shift (sign extend) { To get all sign bits, b>=15 } negative value: # of bits to left shift (zeros inserted at LSB's)

This function relates to the ETSI shr function.

Parameters

Parameters	Description
q15 a	16-bit signed input value to shift
i16 b	16-bit signed integer shift index

libq_q15_ShiftRightRound_q15_q15 Function

Performs an 'Arithmetic' RIGHT Shift on a 16-bit input.

File

libq_C.h

C

```
q15 libq_q15_ShiftRightRound_q15_q15(q15, int16_t);
```

Returns

q15 result - Arithmetically shifted 16-bit signed integer output

Description

Function libq_q15_ShiftRightRound_q15_q15:

Performs an 'Arithmetic' RIGHT Shift on a 16-bit input by 'b' bits with Rounding applied. The rounding occurs by adding a bit weight of "1/2 Lsb", where the "Lsb" is the Ending (shifted) Lsb. For example: The initial Bit#(b) is after the right shift Bit#(0), so the rounding bit weight is Bit#(b-1). Rounding does not occur on either left shifts or on no shift needed cases. For positive shift directions (b>0), 'b' Lsb-bits are shifted out to the right and 'b' sign-extended Msb-bits fill in From the left. For negative shift directions (b<0), 'b' Lsb's are shifted to the LEFT with 0's filling in the empty lsb position. The left shifting causes 'b' Msb-bits to fall off to the left, saturation is applied to any shift left value that overflows. This function calls the left-shift function to perform the actual 16-bit left shift. This function does not provide any status-type information to indicate when overflows occur.

positive value: # of bits to right shift (sign extend) {b > 15, results in all sign bits} negative value: # of bits to left shift (zeros inserted at LSB's)

This function relates to the ETSI shr_r function.

Parameters

Parameters	Description
q15 a	16-bit signed integer value to be shifted
i16 b	16-bit signed integer shift index

libq_q1d15_Sin_q10d6 Function

Approximates the sine of an angle.

File

libq_C.h

C

```
q15 libq_q1d15_Sin_q10d6(q15 angleQ10d6);
```

Returns

q15 sine(angle) value in Q1.15

Description

Function libq_q1d15_Sin_q10d6:

This function approximates the sine of an angle using the following algorithm: sin(x) = 3.140625x + 0.02026367x^2 - 5.325196x^3 + 0.5446778x^4 + 1.800293x^5. The approximation is accurate for any value of x from 0 degrees to 90 degrees. Because sin(-x) = - sin(x) and sin(x) = sin(180 - x), the sine of any angle can be inferred from an angle in the first quadrant. Therefore, any angle > 90 is converted to an angle between 0 & 90. The coefficients of the algorithm have been scaled by 1/8 to fit a Q1d15 format. So the result is scaled up by 8 to obtain the proper magnitudes. The algorithm expects the angle to be in degrees and represented in Q10.6 format. The computed sine value is returned in Q1.15 format.

Preconditions

none.

Parameters

Parameters	Description
q15 angle	The angle in degrees for which the sine is computed in Q10.6

libq_q31_Abs_q31 Function

Saturated Absolute value.

File

libq_C.h

C

```
q31 libq_q31_Abs_q31(q31);
```

Returns

q31 result - abs(a) <= MAXFRACT32

Description

Function libq_q31_Abs_q31:

Creates a saturated Absolute value. It takes the absolute value of the 32-bit 2s-complement fractional input with saturation. The saturation is for handling the case where taking the absolute value of MINFRACT32 is greater than MAXFRACT32, or the allowable range of 32-bit values.

This function relates to the ETSI L_abs function.

libq_q31_Add_q31_q31 Function

Add two 32-bit 2s-complement fractional values.

File

libq_C.h

C

```
q31 libq_q31_Add_q31_q31(q31, q31);
```

Returns

q31 result a+b on range: MINFRACT32 <= result <= MAXFRACT32

Description

Function libq_q31_Add_q31_q31:

Add two 32-bit 2s-complement fractional (op1 + op2) to produce a 32-bit 2s-complement fractional result with saturation. The saturation is for handling the overflow/underflow cases, where the result is set to MAX32 when an overflow occurs and the result is set to MIN32 when an underflow occurs. This function does not produce any status flag to indicate when an overflow or underflow has occured. It is assumed that the binary point is in exactly the same bit position for both 32-bit inputs and the resulting 32-bit output. This function relates to the ETSI L_add function.

libq_q31_DepositH_q15 Function

Place 16 bits in the upper half of 32 bit word.

File

libq_C.h

C

```
q31 libq_q31_DepositH_q15(q15);
```

Returns

q31 result 16-bits of a in upper MSB's and zeros in the lower LSB's

Description

Function libq_q31_DepositH_q15:

Composes a 32-bit fractional value by placing the input 16-bit fractional value in the composite MSB's and zeros the composite 16-bit LSB's This is a bit-for-bit placement of input 16-bits into the upper part of 32-bit result.

This function relates to the ETSI L_deposit_H function.

libq_q31_DepositL_q15 Function

Place 16 bits in the lower half of 32 bit word.

File

libq_C.h

C

```
q31 libq_q31_DepositL_q15(q15);
```

Returns

q31 result - SignExtended 16-bit MSB's and a Value in lower 16-bit LSB's

Description

Function libq_q31_DepositL_q15:

Composes a 32-bit fractional value by placing the 16-bit Fraction input value into the lower 16-bits of the 32-bit composite value. The 16-bit MSB's of the composite output are sign extended. This is a bit-for-bit placement of input 16-bits into the bottom portion of the composite 32-bit result with sign extention. This function relates to the ETSI L_deposit_l function.

libq_q31_Mult2_q15 Function

fractional multiplication of two 16-bit fractional values.

File

libq_C.h

C

```
q31 libq_q31_Mult2_q15(q15, q15);
```

Returns

q31, a*b

Description

Function libq_q31_Mult2_q15:

Performs fractional multiplication of two 16-bit fractional values and returns the 32-bit fractional scaled result. The function performs the Q15xQ15->Q30 fractional bit multiply. It then shifts the result left by '1', to give a Q31 type result, (the lsb is zero-filled). This automatic shift left is done to get rid of the extra sign bit that occurs in the interpretation of the fractional multiply result. Saturation is applied to any results that overflow, and then the function returns the 32-bit fractional q31 result. This function is for fractional 'Q' data only and it therefore will not give correct results for true integers (because left shift by '1'). For the special case where both inputs equal the MINFRACT16, the function returns a value equal to MAXFACT32, i.e. 0x7fffffff = libq_q15_mult_q15_q31(0x8000,0x8000).

This function relates to the ETSI L_mult function.

Parameters

Parameters	Description
q15 a	multiplicand a
q15 b	multiplicand b

libq_q31_Multi_q15_q31 Function

Implement 16 bit by 32 bit multiply.

File

libq_C.h

C

```
q31 libq_q31_Multi_q15_q31(q15 argAQ1d15, q31 argBQ1d31);
```

Returns

q31 result - a*b rounded

Description

Function libq_q31_Multi_q15_q31():

Implement 16 bit by 32 bit multiply as shown below The 's' and 'u' notation shows the processing of signed and unsigned numbers.

-B1- -B0- s u 2nd argument is 32 bits -A0- s 1st argument is 16 bits

----

A0B0 A0B0 s=s*u 1st 32-bit product is A0*B0 A0B1 A0B1 s=s*s 2nd 32-bit product is A0*B1

-S2- -S1- -S0- s=s+s 48-bit result is the sum of products -P1- -P0- 32-bit return is the most significant bits of sum

The algorithm is implemented entirely with the fractional arithmetic library. The unsigned by signed multiply is implemented by shifting bits 15:1 to bits 14:0 of a 16-bit positive fractional number, which throws away bit 0 of the 32-bit number. Since that affects result bits that are used for rounding, rounding processing is included. Saturation processing is handled implicitly in the fractional arithmetic library, except for the case of maximum negative numbers.

libq_q31_Negate_q31 Function

Negate 32-bit 2s-complement fractional value with saturation.

File

libq_C.h

C

```
q31 libq_q31_Negate_q31(q31);
```

Returns

q31 result on range: MINFRACT32 <= result <= MAXFRACT32

Description

Function libq_q31_Negate_q31:

Negate 32-bit 2s-complement fractional value with saturation. The saturation is for handling the case where negating a MINFRACT32 is greater than MAXFRACT32, or the allowable range of values. This function relates to the ETSI L_negate function.

libq_q31_ShiftRight_q31_q15 Function

'Arithmetic' RIGHT Shift on a 32-bit value.

File

libq_C.h

C

```
q31 libq_q31_ShiftRight_q31_q15(q31, int16_t);
```

Returns

q31 result - Arithmetically shifted 32-bit signed integer output

Description

Function libq_q31_ShiftRight_q31_q15:

Performs an 'Arithmetic' RIGHT Shift on a 32-bit input by 'b' bit positions. For positive shift directions (b>0), 'b' Lsb-bits are shifted out to the right and 'b' sign-extended Msb-bits fill in From the left. For negative shift directions (b<0), 'b' Lsb's are shifted to the LEFT with 0's filling in the empty lsb position. The left shifting causes 'b' Msb-bits to fall off to the left, saturation is applied to any shift left value that overflows. This function calls the left-shift function to perform any 32-bit left shifts. This function does not provide any status-type information to indicate when overflows occur.

positive value: # of bits to right shift (sign extend) negative value: # of bits to left shift (zeros inserted at LSB's)

This function relates to the ETSI L_shr function.

Parameters

Parameters	Description
q31 a	32-bit signed integer value to be shifted
i16 b	16-bit signed integer shift index

libq_q31_ShiftRightRound_q31_q15 Function

'Arithmetic' RIGHT Shift on a 32-bit value

File

libq_C.h

C

```
q31 libq_q31_ShiftRightRound_q31_q15(q31, int16_t);
```

Returns

q31 result - Arithmetically shifted 32-bit signed integer output

Description

Function libq_q31_ShiftRightRound_q31_q15:

Performs an 'Arithmetic' RIGHT Shift on a 32-bit input by 'b' bits with Rounding applied. The rounding occurs before any shift by adding a bit weight of "1/2 Lsb", where the "Lsb" is the Ending (shifted) Lsb. For example: The initial Bit#(i+b) is after the right shift Bit#(i), so the rounding bit weight is Bit#(i+b-1). Rounding does not occur on left shifts, when b is negative. After rounding, this function calls the right-shift function to perform the actual 32-bit right shift. For positive shift directions (b>0), 'b' Lsb-bits are shifted out to the right and 'b' sign-extended Msb-bits fill in From the left. For negative shift directions (b<0), 'b' Lsb's are shifted to the LEFT with 0's filling in the empty lsb position. The left shifting causes 'b' Msb-bits to fall off to the left, saturation is applied to any shift left value that overflows. This function calls the left-shift function to perform the actual 32-bit left shift. This function does not provide any status-type flag to indicate occurence of overflow.

positive value: # of bits to right shift (sign extend) negative value: # of bits to left shift (zeros inserted at LSB's)

This function relates to the ETSI L_shr_r function.

Parameters

Parameters	Description
q31 a	32-bit signed integer value to be shifted
i16 b	16-bit signed integer shift index

libq_q20d12_Sin_q20d12 Function

3rd order Polynomial apprx. of a sine function

File

libq_C.h

C

```
q31 libq_q20d12_Sin_q20d12(q31 angQ20d12);
```

Returns

q31 Sine(angle) value in Q20.12

Description

Function libq_q20d12_Sin_q20d12:

3rd order Polynomial apprx. of a sine function

Preconditions

none.

Parameters

Parameters	Description
q31 angle	The angle in radians for which the sine is computed in Q20.12

libq_q15_ExpAvg_q15_q15_q1d15 Function

Exponential averaging

File

libq_C.h

C

```
q15 libq_q15_ExpAvg_q15_q15_q1d15(q15 prevAvgQ15, q15 newMeasQ15, q15 lamdaQ1d15);
```

Returns

q15 result - S(k+1) = S(k)*L + X(k)*(1-L)

Description

Function libq_q15_ExpAvg_q15_q15_q1d15()

Exponential averaging implements a smoothing function based on the form: avg[i+1] = avg[i] * lamda + new * (1-lamda) In this implementation, is has been optimized as follows. avg[i+1] = (avg[i] - new) * lamda + new

The optimization precludes accurate processing of new numbers that differ from the current average by more than unity. If the difference is greater than unity or less than negative unity, the difference is saturated.

The effect is akin to a smaller lambda, e.g., the new value will have a greater weight than expected. If the smoothing is of data that is entirely positive or entirely negative, then the saturation will not be an issue.

Parameters

Parameters	Description
q15 S(k)	Previous exponential average
q15 X(k)	New value to be averaged in
q15 L	exponential averaging constant in Q1.15

libq_q15_Sub_q15_q15 Function

Subtract two 16-bit 2s-complement fractional values

File

libq_C.h

C

```
q15 libq_q15_Sub_q15_q15(q15, i16);
```

Returns

q15 result a+b on range: MINFRACT16 <= result <= MAXFRACT16

Description

Function libq_q15_Sub_q15_q15:

Subtract two 16-bit 2s-complement fractional (op1 - op2) to produce a 16-bit 2s-complement fractional difference result with saturation. The saturation is for handling the overflow/underflow cases, where the result is set to MAX16 when an overflow occurs and the result is set to MIN16 when an underflow occurs. This function does not produce any status flag to indicate when an overflow or underflow has occured. It is assumed that the binary point is in exactly the same bit position for both 16-bit inputs and the resulting 16-bit output. This function relates to the ETSI sub function.

libq_q1d15_MacR_q1d31_q1d15_q1d15 Function

Multiply accumulate with rounding.

File

libq_C.h

C

```
q15 libq_q1d15_MacR_q1d31_q1d15_q1d15(q31, q15, q15);
```

Returns

q15 result - a+b*c rounded

Description

Function libq_q15_MacR_q31_q15_q15:

This function is multiply-accumulate WITH Rounding applied to the accumulator result before it is saturated and the top 16-bits taken. This function first multiplies the two 16-bit input values 'b x c' which results in a 32-bit value. This result is left shifted by one to account for the extra sign bit inherent in the fractional-type multiply. So, the shifted number now has a '0' in the Lsb. The shifted multiplier output is then added to the 32-bit fractional input 'a'. Then the 32-bits of the accumulator output are rounded by adding '2^15'. This value is then saturated to be within the q15 range. It is assumed that the binary point of the 32-bit input value a is in the same bit position as the shifted multiplier output. This function is for fractional Qtype format data only and it therefore will not give the correct results for true integers. This function relates to the ETSI L_mac_r function.

Parameters

Parameters	Description
q31 a	32-bit accumulator operand
q15 b	16-bit multiplication operand
q15 c	16-bit multiplication operand

libq_q1d15_MsuR_q1d31_q1d15_q1d15 Function

Multiply-Subtraction with rounding

File

libq_C.h

C

```
q15 libq_q1d15_MsuR_q1d31_q1d15_q1d15(q31, q15, q15);
```

Returns

q15 result - a-b*c rounded to Q1.15

Description

Function libq_q15_MsuR_q31_q15_q15:

This function is like Multiply-Subtract but WITH Rounding applied to the subtractor result before it is saturated and the top 16-bits taken. This function first multiplies the two 16-bit input values 'b x c' which results in a 32-bit value. This result is left shifted by one to account for the extra sign bit inherent in the fractional-type multiply. So, the shifted number now has a '0' in the Lsb. The shifted multiplier output is then SUBTRACTED From the 32-bit fractional input 'a'. Then the 32-bits output From this subtraction are rounded by adding '2^15'. This value is then saturated to be within the q15 range. It is assumed that the binary point of the 32-bit input value a is in the same bit position as the shifted multiplier output.

This function is for fractional Qtype format data only and it therefore will not give the correct results for true integers.

This function relates to the ETSI msu_r function.

Parameters

Parameters	Description
q31 a	Value which is subtracted from
q15 b	multiplication operand 1
q15 c	multiplication operand 2

libq_q1d15_MultipyR2_q1d15_q1d15 Function

fractional multiplication of two 16-bit fractional values giving a 16 bit rounded result.

File

libq_C.h

C

```
q15 libq_q1d15_MultipyR2_q1d15_q1d15(q15, q15);
```

Returns

q15 result - a*b rounded 16-bit signed integer (Q1.15) output value

Description

Function libq_q1d15_MultipyR2_q1d15:

Performs fractional multiplication of two 16-bit fractional values and returns a ROUNDED 16-bit fractional result. The function performs a Q15xQ15->Q30 bit multiply with a left shift by '1' to give a Q31 result. This automatic shift left is done to get rid of the extra sign bit that occurs in the interpretation of the fractional multiply result. Saturation is applied to any 32-bit result that overflows. Rounding is applied to the 32-bit SHIFTED result by adding in a weight factor of 2^15, again any overflows are saturated. The TOP 16-bits are extracted and returned. This function is for fractional 'Qtype' data only and it therefore will not give the correct results for true integers (because left shift by '1'). This function assumes that the binary point in the 32-bit shifted multiplier output is between bit_16 and bit_15 when the rounding factor is added. For the special case where both inputs equal the MINFACT16, the function returns a value equal to MAXFACT16, i.e. 0x7fff = FrsssMult(0x8000,0x8000). This function internally calls the libq_q15_mult_q15_q31() routine to perform the actual multiplication and the rounding routine to perform the actual rounding.

This function relates to the ETSI mult_r function.

Parameters

Parameters	Description
q15 a	value in Q1.15
q15 b	value in Q1.15

libq_q1d31_Mac_q1d31_q1d15_q1d15 Function

Multiply-Accumulate function WITH saturation

File

libq_C.h

C

```
q31 libq_q1d31_Mac_q1d31_q1d15_q1d15(q31, q15, q15);
```

Returns

q31 result, a+b*c saturated

Description

Function libq_q31_Mac_q31_q15_q15():

Performs a Multiply-Accumulate function WITH saturation. This routine returns the fully fractional 32-bit result From the accumulator output 'SAT(addOut_Q1d31)=outQ1d15' where 'multOut_Q1d31 + a_Q1d31 = addOut_Q1d31', and 'b_Q1d15 x c_Q1d15 = multOut_Q1d31'. The multiply is performed on the two 16-bit fully fully fractional input values 'b x c' which results in a 32-bit value. This result is left shifted by one to account for the extra sign bit inherent in the fully fully fractional-type multiply. The shifted number represents a Q1d31 number with the lsb set to '0'. This Q1d31 number is added with the 32-bit fully fully fractional input argument 'a'. Saturation is applied on the output of the accumulator to keep the value within the 32-bit fully fractional range and then this value is returned. This function is for fully fractional Qtype format data only and it therefore will not give the correct results for true integers.

This function relates to the ETSI L_mac function.

Parameters

Parameters	Description
q31 a	32-bit accumulator operand 1 in Q1d31
q15 b	16-bit multiplication operand 1 in Q1d15
q15 c	16-bit multiplication operand 2 in Q1d15

libq_q1d31_Msu_q1d31_q1d15_q1d15 Function

File

libq_C.h

C

```
q31 libq_q1d31_Msu_q1d31_q1d15_q1d15(q31, q15, q15);
```

Description

L_msu(a,b,c)

libq_q31_ShiftLeft_q31_i16 Function

'Arithmetic' Shift of the 32-bit value.

File

libq_C.h

C

```
q31 libq_q31_ShiftLeft_q31_i16(q31, i16);
```

Returns

q31 result - arithmetically shifted 32-bit signed integer output

Description

Function libq_q31_ShiftLeft_q31_i16:

Performs an 'Arithmetic' Shift of the 32-bit input argument 'a' left by the input argument 'b' bit positions. If 'b' is a positive number, a 32-bit left shift is performed with 'zeros' inserted to the right of the shifted bits. If 'b' is a negative number, a 32-bit right shift by b bit positions with 'sign extention':

positive value: # of bits to left shift (zeros inserted at LSB's) negative value: # of bits to right shift (sign extend)

Saturation is applied if shifting causes an overflow or an underflow.

This function relates to the ETSI L_shl function.

Parameters

Parameters	Description
q31 a	32-bit signed integer value to be shifted
i16	16-bit signed integer shift index

Fx16Norm Function

Normalize the 16-bit fractional value.

File

libq_C.h

C

```
int16_t Fx16Norm(q15);
```

Returns

i16 result - The number of left shifts required to normalize

Description

Function Fx16Norm:

Produces then number of left shifts needed to Normalize the 16-bit fully fractional input. If the input 'a' is a positive number, it will produce the number of left shifts required to normalized it to the range of a minimum of [(MAXFRACT16+1)/2] to a maximum of [MAXFRACT16]. If the input 'a' is a negative number, it will produce the number of left shifts required to normalized it to the range of a minimum of [MINFRACT16] to a maximum of [MINFRACT16/2]. This function does not actually normalize the input, it just produces the number of left shifts required. To actually normalize the value the left shift function should be used with the value returned From this function.

the 16-bit input on range: 0 => result < 16 (i.e. NUMBITSFRACT16) If a>0: 0x4000 > Normalized Value <= 0x7fff i.e. (MAXFRACT16+1)/2 > aNorm <= MAXFRACT16 If a<0: 0x8000 >= Normalilzed Value < 0xC000 i.e. MINFRACT16>= aNorm < MINFRACT16/2

This function relates to the ETSI norm_s function.

Parameters

Parameters	Description
q15	a in Q1.15

Fx32Norm Function

Normalize the 32-bit number.

File

libq_C.h

C

```
int16_t Fx32Norm(q31);
```

Returns

int16_t result - The number of left shifts required to normalize the

Description

Function Fx32Norm:

Produces then number of left shifts needed to Normalize the 32-bit fractional input. If the input 'a' is a positive number, it will produce the number of left shifts required to normalized it to the range of a minimum of [(MAXFRACT32+1)/2] to a maximum of [MAXFRACT32]. If the input 'a' is a negative number, it will produce the number of left shifts required to normalized it to the range of a minimum of [MINFRACT32] to a maximum of [MINFRACT32/2]. This function does not actually normalize the input, it just produces the number of left shifts required. To actually normalize the value the left-shift function should be used with the value returned From this function.

32-bit input on range: 0 => result < 32 (i.e. NUMBITSFRACT32) If a>0: 0x40000000 > Normalized Value <= 0x7fffffff i.e. (MAXFRACT32+1)/2 > aNorm <= MAXFRACT32 If a<0: 0x80000000 >= Normalized Value < 0xC0000000 i.e. MINFRACT32>= aNorm < MINFRACT32/2

This function relates to the ETSI norm_l function.

Parameters

Parameters	Description
q31 a	32-bit Q1.d31 to be normalized

Data Types and Constants

q15 Type

File

libq_C.h

C

```
typedef int16_t q15;
```

Description

q15 n.n (signed)

q31 Type

File

libq_C.h

C

```
typedef int32_t q31;
```

Description

q31 n.n (signed)

q63 Type

File

libq_C.h

C

```
typedef int64_t q63;
```

Description

Q63 n.n (signed)

_LIBQ_C_H_ Macro

File

libq_C.h

C

```
#define _LIBQ_C_H_
```

Description

This is macro _LIBQ_C_H_.

BITMASKFRACT16 Macro

File

libq_C.h

C

```
#define BITMASKFRACT16 (~((uint16_t)0x0))      /* Bit Mask for 16 */
```

Description

Bit Mask for 16

BITMASKFRACT32 Macro

File

libq_C.h

C

```
#define BITMASKFRACT32 (~((uint32_t)0x0L))     /* Bit Mask for 32 */
```

Description

Bit Mask for 32

Fl2Fract16 Macro

Converts floating point constant value to fractional 16-bit value

File

libq_C.h

C

```
#define Fl2Fract16(value) \
( \
  (q15)Fl2FxPnt((value), 15) \
)
```

Returns

q15 - Equivalent fractional value

Description

Function Fl2Fract16:

Converts floating point constant value to fractional 16-bit value with rounding.

Parameters

Parameters	Description
value	Floating point value constant expression to convert.

Fl2Fract32 Macro

Converts floating point constant value to fractional 32-bit value

File

libq_C.h

C

```
#define Fl2Fract32(value) \
( \
  (q31)Fl2FxPnt((value), 31) \
)
```

Returns

Equivalent fractional value as AtiFract32.

Description

Function Fl2Fract32:

Converts floating point constant value to fractional 32-bit value with rounding.

Parameters

Parameters	Description
value	Floating point value constant expression to convert.

Fl2FxPnt Macro

Converts floating point constant value to fixed/fractional value

File

libq_C.h

C

```
#define Fl2FxPnt(value, bits) \
( \
  ((double)(value)*(double)(1UL<<(bits))) + \
    (((double)((double)(value) >= 0.0)) - ((double)0.5)) \
)
```

Returns

double - Equivalent floating point value

Description

Function Fl2FxPnt:

Converts floating point constant value to fixed/fractional value of specified precision with rounding.

Parameters

Parameters	Description
value	Floating point value constant expression to convert.
int_t bits	Number of fractional bits.

Fl2FxPnt16 Macro

Converts floating point constant value to fixed point 16-bit value

File

libq_C.h

C

```
#define Fl2FxPnt16(value, bits) \
( \
  (q15)Fl2FxPnt((value), (bits)) \
)
```

Returns

q15 - Equivalent fixed point value

Description

Function Fl2FxPnt16:

Converts floating point constant value to fixed point 16-bit value with rounding.

Parameters

Parameters	Description
value	Floating point value constant expression to convert. int_t bits -- Number of fractional bits.

Fl2FxPnt32 Macro

Converts floating point constant value to fixed point 32-bit value

File

libq_C.h

C

```
#define Fl2FxPnt32(value, bits) \
( \
  (q31)Fl2FxPnt((value), (bits)) \
)
```

Returns

q31 - Equivalent fixed point value

Description

Function Fl2FxPnt32:

Converts floating point constant value to fixed point 32-bit value with rounding.

Parameters

Parameters	Description
value	Floating point value constant expression to convert.
int_t bits	Number of fractional bits.

Fl2Int16 Macro

Converts floating point constant expression to 16-bit integer value

File

libq_C.h

C

```
#define Fl2Int16(value) ((int16_t)((double)(value)))
```

Returns

int_t - Calculated value.

Description

Function Fl2Int16:

Converts floating point constant expression to 16-bit integer value Conversion is safe for compilers which assign fractional data type to constants with decimal point

Parameters

Parameters	Description
value	Floating point value constant expression to convert.

Fl2Int32 Macro

Converts floating point constant expression to 32-bit integer value

File

libq_C.h

C

```
#define Fl2Int32(value) ((int32_t)((double)(value)))
```

Returns

int_t - Calculated integer value.

Description

Function Fl2Int32:

Converts floating point constant expression to 32-bit integer value Conversion is safe for compilers which assign fractional data type to constants with decimal point

Parameters

Parameters	Description
value	Floating point value constant expression to convert.

FrMax Macro

File

libq_C.h

C

```
#define FrMax(a,b) ((a)>(b)?(a):(b))
```

Description

find the maximum of two numbers

FrMin Macro

File

libq_C.h

C

```
#define FrMin(a,b) ((a)<(b)?(a):(b))
```

Description

find the minimum of two numbers

LOG102Q5D11 Macro

File

libq_C.h

C

```
#define LOG102Q5D11 Fl2FxPnt16(0.301029996,11)
```

Description

log10(2) scaled to Q5.11 format

MAXFRACT16 Macro

File

libq_C.h

C

```
#define MAXFRACT16 MAXINT16       /* +0.999969 */
```

Description

0.999969

MAXFRACT32 Macro

File

libq_C.h

C

```
#define MAXFRACT32 MAXINT32       /* +0.9999999995 */
```

Description

0.9999999995

MAXINT16 Macro

File

libq_C.h

C

```
#define MAXINT16 ((int16_t) 0x7fff)
```

Description

Maximum and minimum values for 16-bit data types.

MAXINT32 Macro

File

libq_C.h

C

```
#define MAXINT32 ((int32_t)0x7fffffffL)
```

Description

This is macro MAXINT32.

MAXPFLOAT32 Macro

File

libq_C.h

C

```
#define MAXPFLOAT32 {MAXFRACT16, MAXINT16}
```

Description

minimum and maximum definitions for FX floating point data types

MINFRACT16 Macro

File

libq_C.h

C

```
#define MINFRACT16 MININT16       /* -1.000000 */
```

Description

1.000000

MINFRACT32 Macro

File

libq_C.h

C

```
#define MINFRACT32 MININT32       /* -1.0000000000 */
```

Description

1.0000000000

MININT16 Macro

File

libq_C.h

C

```
#define MININT16 ((int16_t) (-MAXINT16 - 1))
```

Description

This is macro MININT16.

MININT32 Macro

File

libq_C.h

C

```
#define MININT32 ((int32_t)(-MAXINT32 - 1))
```

Description

This is macro MININT32.

MINPFLOAT32 Macro

File

libq_C.h

C

```
#define MINPFLOAT32 {MINFRACT16, MAXINT16}
```

Description

This is macro MINPFLOAT32.

MSBBITFRACT16 Macro

File

libq_C.h

C

```
#define MSBBITFRACT16 MININT16                /* 16-bit Sign Bit */
```

Description

16-bit Sign Bit

MSBBITFRACT32 Macro

File

libq_C.h

C

```
#define MSBBITFRACT32 MININT32                /* 32-bit Sign Bit */
```

Description

32-bit Sign Bit

NINETYQ10D22 Macro

File

libq_C.h

C

```
#define NINETYQ10D22 Fl2FxPnt32(90,22)  /* Ninety degrees scaled to Q10d22*/
```

Description

Ninety degrees scaled to Q10d22

NINETYQ10D6 Macro

File

libq_C.h

C

```
#define NINETYQ10D6 Fl2FxPnt16(90,6)   /* Ninety degrees scaled to Q10d6 */
```

Description

Ninety degrees scaled to Q10d6

NORMNEGFRACT16 Macro

File

libq_C.h

C

```
#define NORMNEGFRACT16 ((q15)0xc000)           /* Max -val for 16 */
```

Description

Max -val for 16

NORMNEGFRACT32 Macro

File

libq_C.h

C

```
#define NORMNEGFRACT32 ((q31)0xc0000000L)      /* Max -val for 32 */

Description

Max -val for 32

NORMPOSFRACT16 Macro

File

libq_C.h

C

```
#define NORMPOSFRACT16 ((q15)0x4000)           /* Min +val for 16 */
```

Description

Min +val for 16

NORMPOSFRACT32 Macro

File

libq_C.h

C

```
#define NORMPOSFRACT32 ((q31)0x40000000L)      /* Min +val for 32 */
```

Description

Min +val for 32

NUMBITSFRACT16 Macro

File

libq_C.h

C

```
#define NUMBITSFRACT16 ((int16_t)0x010)        /* Num of bits 16  */
```

Description

Num of bits 16

NUMBITSFRACT32 Macro

File

libq_C.h

C

```
#define NUMBITSFRACT32 ((int16_t)0x020)        /* Num of bits 32  */
```

Description

Num of bits 32

ONEEIGHTYQ10D22 Macro

File

libq_C.h

C

```
#define ONEEIGHTYQ10D22 Fl2FxPnt32(180,22) /* 180 degrees scaled to Q10d22   */
```

Description

180 degrees scaled to Q10d22

ONEEIGHTYQ10D6 Macro

File

libq_C.h

C

```
#define ONEEIGHTYQ10D6 Fl2FxPnt16(180,6)  /* 180 degrees scaled to Q10d6    */
```

Description

180 degrees scaled to Q10d6

ROUNDFRACT32 Macro

File

libq_C.h

C

```
#define ROUNDFRACT32 ((q31)0x00008000L)      /* Rounding value  */
```

Description

Rounding value

THREESIXTYQ10D22 Macro

File

libq_C.h

C

```
#define THREESIXTYQ10D22 Fl2FxPnt32(360,22) /* 360 degrees scaled to Q10d22   */
```

Description

360 degrees scaled to Q10d22

THREESIXTYQ10D6 Macro

File

libq_C.h

C

```
#define THREESIXTYQ10D6 Fl2FxPnt16(360,6)  /* 360 degrees scaled to Q10d6    */
```

Description

360 degrees scaled to Q10d6

TWOSEVENTYQ10D22 Macro

File

libq_C.h

C

```
#define TWOSEVENTYQ10D22 Fl2FxPnt32(270,22) /* 270 degrees scaled to Q10d22   */
```

Description

270 degrees scaled to Q10d22

TWOSEVENTYQ10D6 Macro

File

libq_C.h

C

```
#define TWOSEVENTYQ10D6 Fl2FxPnt16(270,6)  /* 270 degrees scaled to Q10d6    */
```

Description

270 degrees scaled to Q10d6

UNITYFLOAT Macro

File

libq_C.h

C

```
#define UNITYFLOAT 1.0
```

Description

This is macro UNITYFLOAT.

FxQFloat32 Variable

File

libq_C.h

C

```
struct {
  q15 man;
  i16 exp;
} FxQFloat32;
```

Description

FxQFloat32 pseudo floating point type (limited floating point)

Remarks

Extended FxQflExt32 used with f2Qfloat32)

Exponent16ToQFloat32 Macro

Converts a power of 2 16-bit integer to 32-bit floating point value.

File

libq_C.h

C

```
#define Exponent16ToQFloat32(value) \
```

```
( \
  (((value) < 0) ? ((float)1.0/(float)(1UL<<(-(value)))): \
   ((float)(1UL<<(value)))) \
)
```

Returns

32-bit floating point value of 2^n.

Description

Function Exponent16ToQFloat32

Converts a power of 2 16-bit integer to 32-bit floating point value.

Parameters

Parameters	Description
int16_t	16-bit integer number for power (expected to be a variable).

Fl2QFloat32 Macro

Converts a decimal floating-point constant expression to pseudo float

File

libq_C.h

C

```
#define Fl2QFloat32(mantissa, exponent) \
  { \
    Fl2Fract16(mantissa), \
    Fl2Int16(exponent) \
  }
```

Returns

Calculated integer value.

Description

Function Fl2QFloat32:

Converts a decimal floating-point constant expression to pseudo float

Parameters

Parameters	Description
mantissa	Floating-point value constant expression to convert to the mantissa portion of the floating-point number.
exponent	Integer value constant expression to convert to the exponent portion of the floating-point number.

i16 Type

File

libq_C.h

C

```
typedef int16_t i16;
```

Description

Q16d0

Files

Files

Description

This section lists the source and header files used by the LibQ Fixed-Point 'C' Math Library.

libq_C.h

C-code fixed point math functions.

Functions

	Name	Description
	Fx16Norm	Normalize the 16-bit fractional value.
	Fx32Norm	Normalize the 32-bit number.
	libq_q15_Abs_q15	Saturated Absolute value.
	libq_q15_Add_q15_q15	Add two 16-bit 2s-complement fractional values.
	libq_q15_DivisionWithSaturation_q15_q15	Fractional division with saturation.
	libq_q15_ExpAvg_q15_q15_q1d15	Exponential averaging
	libq_q15_ExtractH_q31	Extracts upper 16 bits of input 32-bit fractional value.
	libq_q15_ExtractL_q31	Extracts lower 16-bits of input 32-bit fractional value. Descriptionf Extracts lower 16-bits of input 32-bit fractional value and returns them as 16-bit fractional value. This is a bit-for-bit extraction of the bottom 16-bits of the 32-bit input. This function relates to the ETSI extract_l function.
	libq_q15_Negate_q15	Negate 16-bit 2s-complement fractional value with saturation.
	libq_q15_RoundL_q31	Rounds the lower 16-bits of the 32-bit fractional input.
	libq_q15_ShiftLeft_q15_q15	'Arithmetic' Shift of the 16-bit input argument.
	libq_q15_ShiftRight_q15_q15	'Arithmetic' RIGHT Shift on a 16-bit value.
	libq_q15_ShiftRightRound_q15_q15	Performs an 'Arithmetic' RIGHT Shift on a 16-bit input.
	libq_q15_Sub_q15_q15	Subtract two 16-bit 2s-complement fractional values
	libq_q1d15_MacR_q1d31_q1d15_q1d15	Multiply accumulate with rounding.
	libq_q1d15_MsuR_q1d31_q1d15_q1d15	Multiply-Subtraction with rounding
	libq_q1d15_MultipyR2_q1d15_q1d15	fractional multiplication of two 16-bit fractional values giving a 16 bit rounded result.
	libq_q1d15_Sin_q10d6	Approximates the sine of an angle.
	libq_q1d31_Mac_q1d31_q1d15_q1d15	Multiply-Accumulate function WITH saturation
	libq_q1d31_Msu_q1d31_q1d15_q1d15	L_msu(a,b,c)
	libq_q20d12_Sin_q20d12	3rd order Polynomial apprx. of a sine function
	libq_q31_Abs_q31	Saturated Absolute value.
	libq_q31_Add_q31_q31	Add two 32-bit 2s-complement fractional values.
	libq_q31_DepositH_q15	Place 16 bits in the upper half of 32 bit word.
	libq_q31_DepositL_q15	Place 16 bits in the lower half of 32 bit word.
	libq_q31_Mult2_q15	fractional multiplication of two 16-bit fractional values.
	libq_q31_Multi_q15_q31	Implement 16 bit by 32 bit multiply.
	libq_q31_Negate_q31	Negate 32-bit 2s-complement fractional value with saturation.
	libq_q31_ShiftLeft_q31_i16	'Arithmetic' Shift of the 32-bit value.
	libq_q31_ShiftRight_q31_q15	'Arithmetic' RIGHT Shift on a 32-bit value.
	libq_q31_ShiftRightRound_q31_q15	'Arithmetic' RIGHT Shift on a 32-bit value

Macros

	Name	Description
	_LIBQ_C_H_	This is macro _LIBQ_C_H_.
	BITMASKFRACT16	Bit Mask for 16
	BITMASKFRACT32	Bit Mask for 32
	Exponent16ToQFloat32	Converts a power of 2 16-bit integer to 32-bit floating point value.
	Fl2Fract16	Converts floating point constant value to fractional 16-bit value
	Fl2Fract32	Converts floating point constant value to fractional 32-bit value
	Fl2FxPnt	Converts floating point constant value to fixed/fractional value
	Fl2FxPnt16	Converts floating point constant value to fixed point 16-bit value
	Fl2FxPnt32	Converts floating point constant value to fixed point 32-bit value
	Fl2Int16	Converts floating point constant expression to 16-bit integer value

	Fl2Int32	Converts floating point constant expression to 32-bit integer value
	Fl2QFloat32	Converts a decimal floating-point constant expression to pseudo float
	FrMax	find the maximum of two numbers
	FrMin	find the minimum of two numbers
	LOG102Q5D11	log10(2) scaled to Q5.11 format
	MAXFRACT16	0.999969
	MAXFRACT32	0.9999999995
	MAXINT16	Maximum and minimum values for 16-bit data types.
	MAXINT32	This is macro MAXINT32.
	MAXPFLOAT32	minimum and maximum definitions for FX floating point data types
	MINFRACT16	1.000000
	MINFRACT32	1.0000000000
	MININT16	This is macro MININT16.
	MININT32	This is macro MININT32.
	MINPFLOAT32	This is macro MINPFLOAT32.
	MSBBITFRACT16	16-bit Sign Bit
	MSBBITFRACT32	32-bit Sign Bit
	NINETYQ10D22	Ninety degrees scaled to Q10d22
	NINETYQ10D6	Ninety degrees scaled to Q10d6
	NORMNEGFRACT16	Max -val for 16
	NORMNEGFRACT32	Max -val for 32
	NORMPOSFRACT16	Min +val for 16
	NORMPOSFRACT32	Min +val for 32
	NUMBITSFRACT16	Num of bits 16
	NUMBITSFRACT32	Num of bits 32
	ONEEIGHTYQ10D22	180 degrees scaled to Q10d22
	ONEEIGHTYQ10D6	180 degrees scaled to Q10d6
	ROUNDFRACT32	Rounding value
	THREESIXTYQ10D22	360 degrees scaled to Q10d22
	THREESIXTYQ10D6	360 degrees scaled to Q10d6
	TWOSEVENTYQ10D22	270 degrees scaled to Q10d22
	TWOSEVENTYQ10D6	270 degrees scaled to Q10d6
	UNITYFLOAT	This is macro UNITYFLOAT.

Types

	Name	Description
	i16	Q16d0
	q15	q15 n.n (signed)
	q31	q31 n.n (signed)
	q63	Q63 n.n (signed)

Variables

	Name	Description
	FxQFloat32	FxQFloat32 pseudo floating point type (limited floating point)

Description

The libq_c Fixed-Point Math Library provides fixed-point math functions written in C for portability between core processors.

Signed fixed point types (fractional Q types specified by Qn.m) are named as follows in the library names:

Qndm where:

- n is the number of data bits to the left of the radix point
- m is the number of data bits to the right of the radix point
- a signed bit is implied (unless stated otherwise)

For convenience, short names are also defined for arbitrary scaled fractional types:

q15 is signed fractional 16 bit value q31 is signed fractional 32 bit value i16 is signed integer, i.e. Q16d0

In addition, A pseudo floating point 32 bit format (FxQFloat32) is defined that consists of 16 mantissa and a 16 bit exponant (base 2).

Functions in the library are prefixed with the type of the return value and followed by argument types (in order):

libq___: libq_q15_sin_Q2d13

For example, libq_q1d15_Sin_q10d6 returns a Q1.15 value equal to the to the sine of an angle specified as a Q10.6 value (in degrees between 0 and 360)

Argument types do not always match the return type. Refer to the function prototype for a specification of its arguments.

In some cases, both the return type and the argument type are specified within the function name. For example,

For arbitrary scaled types (q15, q16, q31, and q32) the scaling of the result will depend on the function and the scaling of the arguments. For instance, libq_q15_Add_q15_q15(a,b) will return a scaled value type that is the two input types (which must have equivalent scaled value type).

Remarks

The libq_c functions do not correspond to the libq fixed-point library optimized for the microaptive core processor and written in asm.

Table of LIBQ_C math functions:

Sine: libq_q1d15_Sin_q10d6 libq_q20d12_Sin_q20d12

Abs: libq_q15_Abs_q15 libq_q31_Abs_q31

Negate: libq_q15_Negate_q15 libq_q31_Negate_q31

Round: libq_q15_RoundL_q31

Deposit: libq_q31_DepositH_q15 libq_q31_DepositL_q15

Extract: libq_q15_ExtractH_q31 libq_q15_ExtractL_q31

Add: libq_q15_Add_q15_q15 libq_q31_Add_q31_q31

Subtract: libq_q15_Sub_q15_q15

Shift(Scale): libq_q15_ShiftLeft_q15_q15 libq_q31_ShiftLeft_q31_q15 libq_q15_ShiftRight_q15_q15 libq_q31_ShiftRight_q31_q15 libq_q15_ShiftRightRound_q15_q15 libq_q31_ShiftRightRound_q31_q15

Multiply: libq_q15_Mult_q15_q15) libq_q15_MultipyR2_q15 libq_q31_Multi_q15_q31

Divide: libq_q15_DivisionWithSaturation_q15_q15

Multiply-Accumulate: libq_q31_Mac_q31_q15_q15 libq_q15_MacR_q31_q15_q15

Multiply-Subtract: libq_q31_Msu_q31_q15_q15 libq_q15_MsuR_q31_q15_q15

Exponential-Averaging: libq_q15_ExpAvg_q15_q15_q1d15

Table of LIBQ_C conversion functions:

Normalize Q value: Fx16Norm Fx32Norm

Float-to-Q value: Fl2Fract16 Fl2Fract32 Fl2FxPnt16 Fl2FxPnt32 Fl2FxPnt

Float-To-Integer: Fl2Int16 Fl2Int32

Float-To-FxQFloat32: Fl2QFloat32

Exponent-To-Float: Exponent16ToFloat32

LibQ Fixed-Point Math Library

This topic describes the LibQ Fixed-Point Math Library.

Introduction

The LibQ Fixed-Point Math Library is available for the PIC32MZ family of microcontrollers. This library was created from optimized assembly routines written specifically for devices with microAptiv™ core features.

Description

The LibQ Fixed-Point Math Library simplifies writing fixed point algorithms, supporting Q15, Q31 and other 16-bit and 32-bit data formats. Using the simple, C callable functions contained in the library, fast fixed point mathematical operations can be easily executed. Fixed-point mathematical calculations may replace some functions implemented in the floating point library (`math.h`), depending on performance and resolution requirements.

Functions included in the LibQ library include capabilities for trigonometric, power and logarithms, and data conversion. In many cases the functions are identical other than the precision of their operands and the corresponding value that they return.

These functions are implemented in efficient assembly, and generally tuned to optimize performance over code size. In some cases the library breaks out functions that enable one to be optimized for accuracy, while another version is optimized for speed. These functions such as _LIBQ_Q2_29_acos_Q31 and _LIBQ_Q2_29_acos_Q31_Fast are otherwise identical and can be used interchangeably. Each of these functions are typically used in computationally intensive real-time applications where execution time is a critical parameter.

Using the Library

This topic describes the basic architecture of the LibQ Fixed-Point Math Library and provides information and examples on its use.

Description

Interface Header File: `libq.h`

The interface to the LibQ Fixed-Point Math Library is defined in the `libq.h` header file. Any C language source (`.c`) file that uses the LibQ Fixed-Point Library should include `libq.h`.

Library File:

The LibQ Fixed-Point Math Library archive (`.a`) file is installed with MPLAB Harmony.

Library Overview

The LibQ Fixed-Point Math Library contains functions for manipulating Q15, Q31 and other intermediate integer representations of real numbers. The Library Interface section details the operation of the data formats and explains each function in detail.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the DSP Fixed-Point Math Library.

Library Interface Section	Description
Divide Functions	_Q16 fixed point divide function.
Square Root Functions	Square root of a positive _Q16 fixed point value function.
Log Functions	Log calculation functions.
Power Functions	Power calculation functions.
Exponential Functions	Exponential calculation functions.
Sine Functions	Sine calculation functions.
Cosine Functions	Cosine calculation functions.
Target Functions	Target calculation functions.
Arcsin Functions	Arcsin calculation functions.
Arccos Functions	Arccos calculation functions.
Arctan2 Functions	Arctan2 calculation functions.
Random Number Functions	_Q15 and _Q31 pseudo-random value functions.
Float Functions	Float conversion functions.
String Functions	ASCII to _Q15 conversions.

Signed fixed-point types are defined as follows:

Q*n*_*m* where:

- *n* is the number of data bits to the left of the radix point
- *m* is the number of data bits to the right of the radix point
- a signed bit is implied

For convenience, short names are also defined:

Exact Name	Number of Bits Required	Short Name
_Q0_15	16	_Q15
_Q15_16	32	_Q16
_Q0_31	32	_Q31

Qn_m numerical values are used by the library processing data as integers. In this format the n represents the number of integer bits, and the m represents the number of fractional bits. All values assume a sign bit in the most significant bit. The range of the numerical value therefore is:

$$-2^{(n-1)} \text{ to } [2^{(n-1)} - 2^{(-m)}]; \text{ with a resolution of } 2^{(-m)}.$$

A _Q16 format number (_Q15_16) would range from -32768.0 (0x8000 0000) to 32767.99998474 with a precision of 0.000015259 (or 2^{-16}).

For example, a numerical representation of the number 3.14159 in _Q2_13 notation would be:

$$3.14159 * 2^{13} = 25735.9 \Rightarrow 0x6488$$

And converting from the _Q7_8 format with the value 0x1D89 would be:

$$0x1D89 / 2^{8} = 7561 / 256 \Rightarrow 29.5316, \text{ accurate to } 0.00391$$

Functions in the library are prefixed with the type of the return value. For example, _LIBQ_Q16Sqrt returns a _Q16 value equal to the square root of its argument. Argument types do not always match the return type. Refer to the function prototype for a specification of its arguments.

In cases where the return value is not a fixed-point type, the argument type is appended to the function name. For example, _LIBQ_ToFloatQ31 accepts a type _Q31 argument.

In some cases, both the return type and the argument type are specified within the function name. For example:

Function Name	Return Type	Argument Type
_LIBQ_Q15_sin_Q2_13	_Q15	_Q2_13
_LIBQ_Q31_sin_Q2_29	_Q31	_Q2_29

Table of Library Functions

Math Function	Function Definition
Divide	_Q16 _LIBQ_Q16Div (_Q16 dividend, _Q16 divisor);
Square Root	_Q16 _LIBQ_Q16Sqrt (_Q16 x);
Exponential	_Q16 _LIBQ_Q16Exp (_Q16 x);
Log	_Q4_11 _LIBQ_Q4_11_ln_Q16 (_Q16 x); _Q3_12 _LIBQ_Q3_12_log10_Q16 (_Q16 x); _Q5_10 _LIBQ_Q5_10_log2_Q16 (_Q16 x);
Power	_Q16 _LIBQ_Q16Power (_Q16 x, _Q16 y);
Sine	_Q15 _LIBQ_Q15_sin_Q2_13 (_Q2_13 x); _Q31 _LIBQ_Q31_sin_Q2_29 (_Q2_29 x);
Cosine	_Q15 _LIBQ_Q15_cos_Q2_13 (_Q2_13 x); _Q31 _LIBQ_Q31_cos_Q2_29 (_Q2_29 x);
Tangent	_Q7_8 _LIBQ_Q7_8_tan_Q2_13 (_Q2_13 x); _Q16 _LIBQ_Q16_tan_Q2_29 (_Q2_29 x);
Arcsin	_Q2_13 _LIBQ_Q2_13_asin_Q15 (_Q15 x); _Q2_29 _LIBQ_Q2_29_asin_Q31 (_Q31 x); _Q2_29 _LIBQ_Q2_29_asin_Q31_Fast (_Q31 x);
Arccos	_Q2_13 _LIBQ_Q2_13_acos_Q15 (_Q15 x); _Q2_29 _LIBQ_Q2_29_acos_Q31 (_Q31 x); _Q2_29 _LIBQ_Q2_29_acos_Q31_Fast (_Q31 x);
Arctan	_Q2_13 _LIBQ_Q2_13_atan_Q7_8 (_Q7_8 x); _Q2_29 _LIBQ_Q2_29_atan_Q16 (_Q16 x);
Arctan2	_Q2_13 _LIBQ_Q2_13_atan2_Q7_8 (_Q7_8 y, _Q7_8 x); _Q2_29 _LIBQ_Q2_29_atan2_Q16 (_Q16 y, _Q16 x);
Random Number	_Q15 _LIBQ_Q15Rand (int64_t *pSeed); _Q31 _LIBQ_Q31Rand (int64_t *pSeed);
Float	float _LIBQ_ToFloatQ31 (_Q31 x); float _LIBQ_ToFloatQ15 (_Q15 x); _Q31 _LIBQ_Q31FromFloat (float x); _Q15 _LIBQ_Q15FromFloat (float x);
String	void _LIBQ_ToStringQ15 (_Q15 x, char *s); _Q15 _LIBQ_Q15FromString (char *s);

Library Interface

a) Divide Functions

	Name	Description
	_LIBQ_Q16Div	_Q16 fixed point divide.

b) Square Root Functions

	Name	Description
	_LIBQ_Q16Sqrt	Square root of a positive _Q16 fixed point value.

c) Log Functions

	Name	Description
	_LIBQ_Q3_12_log10_Q16	Calculates the value of Log10(x).
	_LIBQ_Q4_11_ln_Q16	Calculates the natural logarithm ln(x).
	_LIBQ_Q5_10_log2_Q16	Calculates the value of log2(x).

d) Power Functions

	Name	Description
	_LIBQ_Q16Power	Calculates the value of x raised to the y power (x^y).

e) Exponential Functions

	Name	Description
	_LIBQ_Q16Exp	Calculates the exponential function e^x.

f) Sine Functions

	Name	Description
	_LIBQ_Q15_sin_Q2_13	Calculates the value of sine(x).
	_LIBQ_Q31_sin_Q2_29	Calculates the value of sine(x).

g) Cosine Functions

	Name	Description
	_LIBQ_Q15_cos_Q2_13	Calculates the value of cosine(x).
	_LIBQ_Q31_cos_Q2_29	Calculates the value of cosine(x).

h) Target Functions

	Name	Description
	_LIBQ_Q16_tan_Q2_29	Calculates the value of tan(x).
	_LIBQ_Q7_8_tan_Q2_13	Calculates the value of tan(x).

i) Arcsin Functions

	Name	Description
	_LIBQ_Q2_13_asin_Q15	Calculates the asin value of asin(x).
	_LIBQ_Q2_29_asin_Q31	Calculates the value of asin(x).
	_LIBQ_Q2_29_asin_Q31_Fast	Calculates the value of asin(x). This function executes faster than the _LIBQ_Q2_29_asin_Q31 function, but is less precise.

j) Arccos Functions

	Name	Description
	_LIBQ_Q2_13_acos_Q15	Calculates the value of acos(x).
	_LIBQ_Q2_29_acos_Q31	Calculates the value of acos(x).
	_LIBQ_Q2_29_acos_Q31_Fast	Calculates the value of acos(x). This function executes faster than _LIBQ_Q2_29_acos_Q31 but is less precise.

k) Arctan Functions

	Name	Description
	_LIBQ_Q2_13_atan_Q7_8	Calculates the value of atan(x).
	_LIBQ_Q2_29_atan_Q16	Calculates the value of atan(x).

l) Arctan2 Functions

	Name	Description
	_LIBQ_Q2_13_atan2_Q7_8	Calculates the value of atan2(y, x).
	_LIBQ_Q2_29_atan2_Q16	Calculates the value of atan2(y, x).

m) Random Number Functions

	Name	Description
	_LIBQ_Q15Rand	Generate a _Q15 random number.
	_LIBQ_Q31Rand	Generate a _Q31 random number.

n) Float Functions

	Name	Description
	_LIBQ_Q15FromFloat	Converts a float to a _Q15 value.
	_LIBQ_Q31FromFloat	Converts a float to a _Q31 value.
	_LIBQ_ToFloatQ15	Converts a _Q15 value to a float.
	_LIBQ_ToFloatQ31	Converts a _Q31 value to a float.

o) String Functions

	Name	Description
	_LIBQ_Q15FromString	ASCII to _Q15 conversion.
	_LIBQ_ToStringQ15	_Q15 to ASCII conversion.

p) Data Types and Constants

	Name	Description
	_Q15_MAX	Maximum value of _Q15 (~1.0)
	_Q15_MIN	Minimum value of _Q15 (-1.0)
	_Q16_MAX	Maximum value of _Q16 (~32768.0)
	_Q16_MIN	Minimum value of _Q16 (-32768.0)
	_Q2_13_MAX	Maximum value of _Q2_13 (~4.0)
	_Q2_13_MIN	Minimum value of _Q2_13 (-4.0)
	_Q2_29_MAX	Maximum value of _Q2_29 (~4.0)
	_Q2_29_MIN	Minimum value of _Q2_29 (-4.0)
	_Q3_12_MAX	Maximum value of _Q3_12 (~8.0)
	_Q3_12_MIN	Minimum value of _Q3_12 (-8.0)
	_Q31_MAX	Maximum value of _Q31 (~1.0)
	_Q31_MIN	Minimum value of _Q31 (-1.0)
	_Q4_11_MAX	Maximum value of _Q4_11 (~16.0)
	_Q4_11_MIN	Minimum value of _Q4_11 (-16.0)
	_Q5_10_MAX	Maximum value of _Q5_10 (~32.0)
	_Q5_10_MIN	Minimum value of _Q5_10 (-32.0)
	_Q7_8_MAX	Maximum value of _Q7_8 (~128.0)
	_Q7_8_MIN	Minimum value of _Q7_8 (-128.0)
	_Q0_15	1 sign bit, 15 bits right of radix
	_Q0_31	1 sign bit, 31 bits right of radix
	_Q15	Short name for _Q0_15
	_Q15_16	1 sign bit, 15 bits left of radix, 16 bits right of radix
	_Q16	Short name for _Q15_16
	_Q2_13	1 sign bit, 2 bits left of radix, 13 bits right of radix
	_Q2_29	1 sign bit, 2 bits left of radix, 29 bits right of radix
	_Q3_12	1 sign bit, 3 bits left of radix, 12 bits right of radix
	_Q31	Short name for _Q_0_31
	_Q4_11	1 sign bit, 4 bits left of radix, 11 bits right of radix
	_Q5_10	1 sign bit, 5 bits left of radix, 10 bits right of radix
	_Q7_8	1 sign bit, 7 bits left of radix, 8 bits right of radix
	_LIBQ_H	Guards against multiple inclusion

Description

This section describes the Application Programming Interface (API) functions, macros, and types of the LibQ Fixed Point Math Library.

Refer to each section for a detailed description.

a) Divide Functions

_LIBQ_Q16Div Function

_Q16 fixed point divide.

File

libq.h

C

```
_Q16 _LIBQ_Q16Div(_Q16 dividend, _Q16 divisor);
```

Returns

_Q16 quotient of the divide operation

Description

Function _LIBQ_Q16Div:

_Q16 _LIBQ_Q16Div (_Q16 dividend, _Q16 divisor);

Quotient (_Q16) = Dividend (_Q16) / Divisor (_Q16).

Remarks

The _LIBQ_Q16Div operation saturates its result.

Execution Time (cycles): 143 typical (80 to 244) Program Memory 204 bytes

Error <= 0.000015258789 (accurate to least significant _Q16 bit within the non-saturated range)

Preconditions

Divisor must not equal 0.

Example

```
_Q16  quotient, dividend, divisor;

dividend = (_Q16)0x00010000;  // 1
divisor  = (_Q16)0x00008000;  // 0.5

quotient = _LIBQ_Q16Div (dividend, divisor);

// quotient now equals 2;  i.e.,  (_Q16)0x00020000;
```

Parameters

Parameters	Description
dividend	The divide operation dividend (_Q16)
divisor	The divide operation divisor (_Q16)

b) Square Root Functions

_LIBQ_Q16Sqrt Function

Square root of a positive _Q16 fixed point value.

File

libq.h

C

```
_Q16 _LIBQ_Q16Sqrt(_Q16 x);
```

Returns

_LIBQ_Q16Sqrt returns the _Q16 fixed point value which is the square root of the input parameter.

Description

Function _LIBQ_Q16Sqrt:

_Q16 _LIBQ_Q16Sqrt(_Q16 x);

Calculate the square root of a positive _Q16 fixed point value, and return the _Q16 result.

Remarks

Execution Time (cycles): 240 typical (104 to 258) Program Memory 152 bytes

Error <= 0.000015258789 (accurate to least significant _Q16 bit)

Preconditions

The input value must be positive.

Example

```
_Q16 squareRoot;

squareRoot = _LIBQ_Q16Sqrt((_Q16)0x01000000);  // The square root of 256.0 is 16.0 (0x00100000)

squareRoot = _LIBQ_Q16Sqrt((_Q16)0x00004000);  // The square root of 0.25 is 0.5 (0x00008000)

squareRoot = _LIBQ_Q16Sqrt((_Q16)0x5851f42d);  // The square root of 22609.953125 is 150.366074 (0x00965db7)
```

Parameters

Parameters	Description
x	The _Q16 fixed point value input from which to find the square root.

c) Log Functions

_LIBQ_Q3_12_log10_Q16 Function

Calculates the value of Log10(x).

File

libq.h

C

```
_Q3_12 _LIBQ_Q3_12_log10_Q16(_Q16 x);
```

Returns

_LIBQ_Q3_12_log10_Q16 returns the _Q3_12 fixed point result from the calculation log10(x).

Description

Function _LIBQ_Q3_12_log10_Q16:

_Q3_12 _LIBQ_Q3_12_log10_Q16 (_Q16 x);

Calculates the log10(x), where log10(x) = ln(x) * log10(e). x is of type _Q16 and must be positive. The resulting value is of type _Q3_12.

Remarks

Execution Time (cycles): 301 typical (14 to 346) Program Memory 176 bytes

Error <= 0.000244140625 (accurate to least significant _Q3_12 bit)

Preconditions

The input x must be positive.

Example

```
_Q3_12 resultLog10;

resultLog10 = _LIBQ_Q3_12_log10_Q16 ((_Q16)0x12ed7d91);  // _LIBQ_Q3_12_log10_Q16(4845.490494) = 3.685303
(0x3af7)
```

Parameters

Parameters	Description
x	The input value from which to calculate log10(x).

_LIBQ_Q4_11_ln_Q16 Function

Calculates the natural logarithm ln(x).

File

libq.h

C

```
_Q4_11 _LIBQ_Q4_11_ln_Q16(_Q16 x);
```

Returns

_LIBQ_Q4_11_ln_Q16 returns the _Q4_11 fixed point result from the calculation ln(x).

Description

Function _LIBQ_Q4_11_ln_Q16:

_Q4_11 _LIBQ_Q4_11_ln_Q16 (_Q16 x);

Calculates the natural logarithm ln(x). x is of type _Q16 and must be positive. The resulting value is of type _Q4_11.

Remarks

Execution Time (cycles): 301 typical (14 to 346) Program Memory 176 bytes

Error <= 0.00048828 (accurate to least significant _Q4_11 bit)

Preconditions

The input x must be positive.

Example

```
_Q4_11 resultLN;

resultLN = _LIBQ_Q4_11_ln_Q16 ((_Q16)0x00004000);  // _LIBQ_Q4_11_LN_Q16(0.250000) = -1.386230 (0xf4e9)
```

Parameters

Parameters	Description
x	The input value from which to calculate ln(x).

_LIBQ_Q5_10_log2_Q16 Function

Calculates the value of log2(x).

File

libq.h

C

```
_Q5_10 _LIBQ_Q5_10_log2_Q16(_Q16 x);
```

Returns

_LIBQ_Q5_10_log2_Q16 returns the _Q5_10 fixed point result from the calculation log2(x).

Description

Function _LIBQ_Q5_10_log2_Q16:

_Q5_10 _LIBQ_Q5_10_log2_Q16 (_Q16 x);

Calculates the log2(x), where log2(x) = ln(x) * log2(e). x is of type _Q16 and must be positive. The resulting value is of type _Q5_10.

Remarks

Execution Time (cycles): 227 typical (14 to 268) Program Memory 164 bytes

Error <= 0.0009765625 (accurate to least significant _Q5_10 bit)

Preconditions

The input x must be positive.

Example

```
_Q5_10 resultLog2;

resultLog2 = _LIBQ_Q5_10_log2_Q16 ((_Q16)0x40000000);  // _LIBQ_Q5_10_log2_Q16(16384.000000) = 14.000000
(0x3800)
```

Parameters

Parameters	Description
x	The input value from which to calculate log2(x).

d) Power Functions

_LIBQ_Q16Power Function

Calculates the value of x raised to the y power (x^y).

File

libq.h

C

```
_Q16 _LIBQ_Q16Power(_Q16 x, _Q16 y);
```

Returns

_LIBQ_Q16Power returns the _Q16 fixed point result from the calculation x raised to the y.

Description

Function _LIBQ_Q16Power:

_Q16 _LIBQ_Q16Power (_Q16 x, _Q16 y);

Calculates the x raised to the y power. Both x and y are of type _Q16. x must be positive. The calculation will saturate if the resulting value is outside the range of the _Q16 representation.

Remarks

Execution Time (cycles): 882 typical (586 to 1042) Program Memory 1038 bytes

Error <= 0.000015258789 (accurate to least significant _Q16 bit within the non-saturated range)

Preconditions

x must be positive.

Example

```
_Q16 resultPower;

resultPower = _LIBQ_Q16Power ((_Q16)0x00020000, (_Q16)0xffff0000);  // _LIBQ_Q16Power(2.000000, -1.000000)
= 0.500000 (0x00008000)
```

Parameters

Parameters	Description
x	The _Q16 input value x from which to calculate x raised to the y.
y	The _Q16 input value y from which to calculate x raised to the y.

e) Exponential Functions

_LIBQ_Q16Exp Function

Calculates the exponential function e^x.

File

libq.h

C

```
_Q16 _LIBQ_Q16Exp(_Q16 x);
```

Returns

_LIBQ_Q16Exp returns the _Q16 fixed point result from the calculation e^x.

Description

Function _LIBQ_Q16Exp:

_Q16 _LIBQ_Q16Exp(_Q16 x);

Calculates the exponential function e^x. The calculation will saturate if the resulting value is outside the range of the _Q16 representation. For x > 10.3972015380859375, the resulting value will be saturated to 0x7fffffff. For x < -10.3972015380859375 the resulting value will be saturated to 0.

Remarks

The function _LIBQ_Q16Div is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 170 typical (18 to 292) Program Memory 446 bytes

Error <= 0.000015258789 (accurate to least significant _Q16 bit within the non-saturated range)

Preconditions

None.

Example

```
_Q16 expResult;

expResult = _LIBQ_Q16Exp((_Q16)0x00010000);   // _LIBQ_Q16Exp(1.000000) = 2.718277 (0x0002b7e1)
```

Parameters

Parameters	Description
x	The exponent value

f) Sine Functions

_LIBQ_Q15_sin_Q2_13 Function

Calculates the value of sine(x).

File

libq.h

C

```
_Q15 _LIBQ_Q15_sin_Q2_13(_Q2_13 x);
```

Returns

_LIBQ_Q15_sin_Q2_13 returns the _Q15 fixed point result from the calculation sine(x).

Description

Function _LIBQ_Q15_sin_Q2_13:

_Q15 _LIBQ_Q15_sin_Q2_13 (_Q2_13 x);

Calculates the sine(x), where x is of type _Q2_13 radians and the resulting value is of type _Q15.

Remarks

Execution Time (cycles): 100 typical (100 to 102) Program Memory 220 bytes

Error <= 0.00003052 (accurate to least significant _Q15 bit)

Preconditions

None.

Example

```
_Q15 resultSin;

resultSin = _LIBQ_Q15_sin_Q2_13 ((_Q2_13)0x4093);  // _LIBQ_Q15_sin_Q2_13(2.017944) = 0.901672 (0x736a)
```

Parameters

Parameters	Description
x	The _Q2_13 input value from which to calculate sine(x).

_LIBQ_Q31_sin_Q2_29 Function

Calculates the value of sine(x).

File

libq.h

C

```
_Q31 _LIBQ_Q31_sin_Q2_29(_Q2_29 x);
```

Returns

_LIBQ_Q31_sin_Q2_29 returns the _Q31 fixed point result from the calculation sine(x).

Description

Function _LIBQ_Q31_sin_Q2_29:

_Q31 _LIBQ_Q31_sin_Q2_29 (_Q2_29 x);

Calculates the sine(x), where x is of type _Q2_29 radians and the resulting value is of type _Q31.

Remarks

Execution Time (cycles): 246 typical (244 to 266) Program Memory 598 bytes

Error <= 0.00000000047 (accurate to least significant _Q31 bit)

Preconditions

None.

Example

```
_Q31 resultSin;

resultSin = _LIBQ_Q31_sin_Q2_29 ((_Q2_29)0x5a637cfe);  // _LIBQ_Q31_sin_Q2_29( 2.824644562) =  0.311668121
(0x27e4bdb1)
```

Parameters

Parameters	Description
x	The _Q2_29 input value from which to calculate sine(x).

g) Cosine Functions

_LIBQ_Q15_cos_Q2_13 Function

Calculates the value of cosine(x).

File

libq.h

C

```
_Q15 _LIBQ_Q15_cos_Q2_13(_Q2_13 x);
```

Returns

_LIBQ_Q15_cos_Q2_13 returns the _Q15 fixed point result from the calculation cosine(x).

Description

Function _LIBQ_Q15_cos_Q2_13:

_Q15 _LIBQ_Q15_cos_Q2_13 (_Q2_13 x);

Calculates the cosine(x), where x is of type _Q2_13 radians and the resulting value is of type _Q15.

Remarks

Execution Time (cycles): 102 cycles Program Memory 224 bytes

Error <= 0.00003052 (accurate to least significant _Q15 bit)

Preconditions

None

Example

```
_Q15 resultCos;

resultCos = _LIBQ_Q15_cos_Q2_13 ((_Q2_13)0x2171);  // _LIBQ_Q15_cos_Q2_13(1.045044) = 0.501862 (0x403d)
```

Parameters

Parameters	Description
x	The _Q2_13 input value from which to calculate cosine(x).

_LIBQ_Q31_cos_Q2_29 Function

Calculates the value of cosine(x).

File

libq.h

C

```
_Q31 _LIBQ_Q31_cos_Q2_29(_Q2_29 x);
```

Returns

_LIBQ_Q31_cos_Q2_29 returns the _Q31 fixed point result from the calculation sine(x).

Description

Function _LIBQ_Q31_cos_Q2_29:

_Q31 _LIBQ_Q31_cos_Q2_29 (_Q2_29 x);

Calculates the cosine(x), where x is of type _Q2_29 radians and the resulting value is of type _Q31.

Remarks

Execution Time (cycles): 265 typical (22 to 288) Program Memory 746 bytes

Error <= 0.00000000047 (accurate to least significant _Q31 bit)

Preconditions

None.

Example

```
_Q31 resultCos;

resultCos = _LIBQ_Q31_cos_Q2_29 ((_Q2_29)0x07e2e1c2);  // _LIBQ_Q31_cos_Q2_29( 0.246445540) =  0.969785686
(0x7c21eff7)
```

Parameters

Parameters	Description
x	The _Q2_29 input value from which to calculate cosine(x).

h) Target Functions

_LIBQ_Q16_tan_Q2_29 Function

Calculates the value of tan(x).

File

libq.h

C

```
_Q16 _LIBQ_Q16_tan_Q2_29(_Q2_29 x);
```

Returns

_LIBQ_Q16_tan_Q2_29 returns the _Q16 fixed point result from the calculation tan(x). The resulting value is saturated.

Description

Function _LIBQ_Q16_tan_Q2_29:

_Q16 _LIBQ_Q16_tan_Q2_29 (_Q2_29 x);

Calculates the tan(x), where x is of type _Q2_29 radians and the resulting value is of type _Q16.

Remarks

The functions _LIBQ_Q31_sin_Q2_29, _LIBQ_Q31_cos_Q2_29, and _LIBQ_Q16Div are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 703 typical (22 to 796) Program Memory 88 bytes

Error <= 0.000015259 (accurate to least significant _Q16 bit for the input range -1.568 .. 1.568) Error rises from 0.0 to 0.065 for the input range -1.568 .. -1.570765808 and 1.568 .. 1.570765808)

Preconditions

None

Example

```
_Q16 resultTan;

resultTan = _LIBQ_Q16_tan_Q2_29 ((_Q2_29)0x16720c36);  // _LIBQ_Q16_tan_Q2_29( 0.701421838) =  0.844726562 (0x0000d840)
```

Parameters

Parameters	Description
x	The _Q2_29 input value from which to calculate tan(x).

_LIBQ_Q7_8_tan_Q2_13 Function

Calculates the value of tan(x).

File

libq.h

C

```
_Q7_8 _LIBQ_Q7_8_tan_Q2_13(_Q2_13 x);
```

Returns

_LIBQ_Q7_8_tan_Q2_13 returns the _Q7_8 fixed point result from the calculation tan(x).

Description

Function _LIBQ_Q7_8_tan_Q2_13:

_Q7_8 _LIBQ_Q7_8_tan_Q2_13 (_Q2_13 x);

Calculates the tan(x), where x is of type _Q2_13 radians and the resulting value is of type _Q7_8.

Remarks

Execution Time (cycles): 288 typical (18 to 346) Program Memory 980 bytes

Error <= 0.00390625 (accurate to least significant _Q7_8 bit)

Preconditions

None

Example

```
_Q7_8 resultTan;

resultTan = _LIBQ_Q7_8_tan_Q2_13 ((_Q2_13)0x2e20);  // _LIBQ_Q7_8_tan_Q2_13(1.441406) = 7.683594 (0x07af)
```

Parameters

Parameters	Description
x	The _Q2_13 input value from which to calculate tan(x).

i) Arcsin Functions

_LIBQ_Q2_13_asin_Q15 Function

Calculates the asin value of asin(x).

File

libq.h

C

```
_Q2_13 _LIBQ_Q2_13_asin_Q15(_Q15 x);
```

Returns

_LIBQ_Q2_13_asin_Q15 returns the _Q2_13 fixed point result from the calculation asin(x).

Description

Function _LIBQ_Q2_13_asin_Q15:

_Q2_13 _LIBQ_Q2_13_asin_Q15 (_Q15 x);

Calculates asin(x), where x is of type _Q15 and the resulting value is of type _Q2_13. The output value will be radians in the range pi >= result >= -pi.

Remarks

The functions _LIBQ_Q16Sqrt and _LIBQ_Q16Div are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 578 typical (22 to 656) Program Memory 336 bytes

Error <= 0.00012207 (accurate to least significant _Q2_13 bit)

A higher resolution version of this function exists with equivalent performance, see _LIBQ_Q2_29_asin_Q31_Fast

Preconditions

None.

Example

```
_Q2_13 resultAsin;

resultAsin = _LIBQ_Q2_13_asin_Q15 ((_Q15)0x3231);  // _LIBQ_Q2_13_asin_Q15(0.392120) = 0.402954 (0x0ce5)
```

Parameters

Parameters	Description
x	The _Q15 input value from which to calculate asin(x).

_LIBQ_Q2_29_asin_Q31 Function

Calculates the value of asin(x).

File

libq.h

C

```
_Q2_29 _LIBQ_Q2_29_asin_Q31(_Q31 x);
```

Returns

_LIBQ_Q2_29_asin_Q31 returns the _Q2_29 fixed point result from the calculation asin(x).

Description

Function _LIBQ_Q2_29_asin_Q31:

_Q2_29 _LIBQ_Q2_29_asin_Q31 (_Q31 x);

Calculates the asin(x), where x is of type _Q31 and the resulting value is of type _Q2_29. The output value will be in radians the range pi >= result >= -pi.

Remarks

The functions _LIBQ_Q2_29_asin_Q31_Fast and_LIBQ_Q31_sin_Q2_29 are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 2525 typical (286 to 4330) Program Memory 138 bytes

Error <= 0.0000000019 (accurate to least significant _Q2_29 bit for the range -0.9993..0.9993) Error <= 0.0000000346 (accurate to 5th least significant _Q2_29 bit for the range -1.0 .. -0.9993 and 0.9993 .. 1.0)

A faster version of this function exists with modestly reduced accuracy, see _LIBQ_Q2_29_asin_Q31_Fast

Preconditions

None.

Example

```
_Q2_29 resultAsin;

resultAsin = _LIBQ_Q2_29_asin_Q31 ((_Q31)0x7fe50658);  // _LIBQ_Q2_29_asin_Q31( 0.9991767816) =
1.5302172359 (0x30f78a23)
```

Parameters

Parameters	Description
x	The _Q31 input value from which to calculate asin(x).

_LIBQ_Q2_29_asin_Q31_Fast Function

Calculates the value of asin(x). This function executes faster than the _LIBQ_Q2_29_asin_Q31 function, but is less precise.

File

libq.h

C

```
_Q2_29 _LIBQ_Q2_29_asin_Q31_Fast(_Q31 x);
```

Returns

_LIBQ_Q2_29_asin_Q31_Fast returns the _Q2_29 fixed point result from the calculation asin(x).

Description

Function _LIBQ_Q2_29_asin_Q31_Fast:

_Q2_29 _LIBQ_Q2_29_asin_Q31_Fast (_Q31 x);

Calculates the asin(x), where x is of type _Q31 and the resulting value is of type _Q2_29. The output value will be in radians the range pi >= result >= -pi.

Remarks

Execution Time (cycles): 507 typical (22 to 1300) Program Memory 638 bytes

Error <= 0.000000911 (accurate to 9 least significant _Q2_29 bits)

A higher resolution version of this function exists with reduced performance, see _LIBQ_Q2_29_asin_Q31

Preconditions

None.

Example

```
_Q2_29 resultAsin;

resultAsin = _LIBQ_Q2_29_asin_Q31_Fast ((_Q31)0x7fe50658);  // _LIBQ_Q2_29_asin_Q31_Fast( 0.9991767816) =
1.5302172359 (0x30f78a23)
```

Parameters

Parameters	Description
x	The _Q31 input value from which to calculate asin(x).

j) Arccos Functions

_LIBQ_Q2_13_acos_Q15 Function

Calculates the value of acos(x).

File

libq.h

C

```
_Q2_13 _LIBQ_Q2_13_acos_Q15(_Q15 x);
```

Returns

_LIBQ_Q2_13_acos_Q15 returns the _Q2_13 fixed point result from the calculation acos(x).

Description

Function _LIBQ_Q2_13_acos_Q15:

_Q2_13 _LIBQ_Q2_13_acos_Q15 (_Q15 x);

Calculates the acos(x), where x is of type _Q15 and the resulting value is of type _Q2_13. The output value will be radians in the range pi >= result >= -pi.

Remarks

The function _LIBQ_Q2_13_asin_Q15 is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 588 typical (32 to 666) Program Memory 24 bytes

Error <= 0.00012207 (accurate to least significant _Q2_13 bit)

A higher precision function with equivalent performance exists, see _LIBQ_Q2_29_acos_Q31_Fast

Preconditions

None.

Example

```
_Q2_13 resultAcos;

resultAcos = _LIBQ_Q2_13_acos_Q15((_Q15)0x2993); // _LIBQ_Q2_13_acos_Q15(0.324799) = 1.239990 (0x27ae)
```

Parameters

Parameters	Description
x	The _Q15 input value from which to calculate acos(x).

_LIBQ_Q2_29_acos_Q31 Function

Calculates the value of acos(x).

File

libq.h

C

```
_Q2_29 _LIBQ_Q2_29_acos_Q31(_Q31 x);
```

Returns

_LIBQ_Q2_29_acos_Q31 returns the _Q2_29 fixed point result from the calculation acos(x).

Description

Function _LIBQ_Q2_29_acos_Q31:

_Q2_29 _LIBQ_Q2_29_acos_Q31 (_Q31 x);

Calculates the acos(x), where x is of type _Q31 and the resulting value is of type _Q2_29. The output value will be radians in the range pi >= result >= -pi.

Remarks

The functions _LIBQ_Q2_29_asin_Q31_Fast and _LIBQ_Q31_cos_Q2_29 are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 3370 typical (70 to 4824) Program Memory 142 bytes

Error <= 0.0000000019 (accurate to least significant _Q2_29 bit for the range -0.9993..0.9993) Error <= 0.0000000355 (accurate to 5th least significant _Q2_29 bit for the range -1.0 .. -0.9993 and 0.9993 .. 1.0)

A similar function with higher performance and reduced precision exists, see _LIBQ_Q2_29_acos_Q31_Fast

Preconditions

None.

Example

```
_Q2_29 resultAcos;

resultAcos = _LIBQ_Q2_29_acos_Q31 ((_Q31)0xee63708c);  // _LIBQ_Q2_29_acos_Q31(-0.1375903431) =
1.7088244837 (0x36aeb0af)
```

Parameters

Parameters	Description
x	The _Q31 input value from which to calculate acos(x).

_LIBQ_Q2_29_acos_Q31_Fast Function

Calculates the value of acos(x). This function executes faster than _LIBQ_Q2_29_acos_Q31 but is less precise.

File

libq.h

C

```
_Q2_29 _LIBQ_Q2_29_acos_Q31_Fast(_Q31 x);
```

Returns

_LIBQ_Q2_29_acos_Q31_Fast returns the _Q2_29 fixed point result from the calculation acos(x).

Description

Function _LIBQ_Q2_29_acos_Q31_Fast:

_Q2_29 _LIBQ_Q2_29_acos_Q31_Fast (_Q31 x);

Calculates the acos(x), where x is of type _Q31 and the resulting value is of type _Q2_29. The output value will be radians in the range pi >= result >= -pi.

Remarks

The function _LIBQ_Q2_29_asin_Q31_Fast is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 517 typical (32 to 1310) Program Memory 28 bytes

Error <= 0.000000911 (accurate to 9 least significant _Q2_29 bits)

A higher precision function with reduced performance exists, see _LIBQ_Q2_29_acos_Q31

Preconditions

None.

Example

```
_Q2_29 resultAcos;
```

```
resultAcos = _LIBQ_Q2_29_acos_Q31_Fast ((_Q31)0xee63708c);  // _LIBQ_Q2_29_acos_Q31_Fast(-0.1375903431) =
1.7088244837 (0x36aeb0af)
```

Parameters

Parameters	Description
x	The _Q31 input value from which to calculate acos(x).

k) Arctan Functions

_LIBQ_Q2_13_atan_Q7_8 Function

Calculates the value of atan(x).

File

libq.h

C

```
_Q2_13 _LIBQ_Q2_13_atan_Q7_8(_Q7_8 x);
```

Returns

_LIBQ_Q2_13_atan_Q7_8 returns the _Q2_13 fixed point result from the calculation atan(x).

Description

Function _LIBQ_Q2_13_atan_Q7_8:

_Q2_13 _LIBQ_Q2_13_atan_Q7_8 (_Q7_8 x);

Calculates the atan(x), where x is of type _Q7_8 and the resulting value is of type _Q2_13. The output value will be radians in the range pi >= result >= -pi.

Remarks

The function _LIBQ_Q2_13_atan2_Q7_8 is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 240 typical (202 to 256) Program Memory 16 bytes

Error <= 0.00012207 (accurate to least significant _Q2_13 bit)

Preconditions

None.

Example

```
_Q2_13 resultAtan;

resultAtan = _LIBQ_Q2_13_atan_Q7_8 ((_Q7_8)0x0097);  // _LIBQ_Q2_13_atan_Q7_8(0.589844) = 0.532959 (0x110e)
```

Parameters

Parameters	Description
x	The _Q7_8 input value from which to calculate atan(x).

_LIBQ_Q2_29_atan_Q16 Function

Calculates the value of atan(x).

File

libq.h

C

```
_Q2_29 _LIBQ_Q2_29_atan_Q16(_Q16 x);
```

Returns

_LIBQ_Q2_29_atan_Q16 returns the _Q2_29 fixed point result from the calculation atan(x).

Description

Function _LIBQ_Q2_29_atan_Q16:

_Q2_29 _LIBQ_Q2_29_atan_Q16 (_Q16 x);

Calculates the atan(x), where x is of type _Q16 and the resulting value is of type _Q2_29. The output value will be radians in the range pi >= result >= -pi.

Remarks

The function _LIBQ_Q2_29_atan2_Q16 is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 354 typical (178 to 360) Program Memory 16 bytes

Error <= 0.000000003 (accurate within one least significant _Q2_29 bit)

Preconditions

None.

Example

```
_Q2_29 resultAtan;

resultAtan = _LIBQ_Q2_29_atan_Q16 ((_Q16)0x00098b31);  // _LIBQ_Q2_29_atan_Q16(9.543716) = 1.466396
(0x2eecb7ee)
```

Parameters

Parameters	Description
x	The _Q16 input value from which to calculate atan(x).

l) Arctan2 Functions

_LIBQ_Q2_13_atan2_Q7_8 Function

Calculates the value of atan2(y, x).

File

libq.h

C

```
_Q2_13 _LIBQ_Q2_13_atan2_Q7_8(_Q7_8 y, _Q7_8 x);
```

Returns

_LIBQ_Q2_13_atan2_Q7_8 returns the _Q2_13 fixed point result from the calculation atan2(y, x).

Description

Function _LIBQ_Q2_13_atan2_Q7_8:

_Q2_13 _LIBQ_Q2_13_atan2_Q7_8 (_Q7_8 y, _Q7_8 x);

Calculates the atan2(y, x), where y and x are of type _Q7_8 and the resulting value is of type _Q2_13. The output value will be radians in the range pi >= result >= -pi.

Remarks

The function _LIBQ_Q16Div is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 220 typical (22 to 250) Program Memory 288 bytes

Error <= 0.00012207 (accurate to least significant _Q2_13 bit)

Preconditions

None.

Example

```
_Q2_13 resultAtan2;

resultAtan2 = _LIBQ_Q2_13_atan2_Q7_8 ((_Q7_8)0x589d, (_Q7_8)0xf878); // _LIBQ_Q2_13_atan2_Q7_8(88.613281,
-7.531250) = 1.655518 (0x34fa)
```

Parameters

Parameters	Description
y	The _Q7_8 input value from which to calculate atan2(y, x).
x	The _Q7_8 input value from which to calculate atan2(y, x).

_LIBQ_Q2_29_atan2_Q16 Function

Calculates the value of atan2(y, x).

File

libq.h

C

```
_Q2_29 _LIBQ_Q2_29_atan2_Q16(_Q16 y, _Q16 x);
```

Returns

_LIBQ_Q2_29_atan2_Q16 returns the _Q2_29 fixed point result from the calculation atan2(y, x).

Description

Function _LIBQ_Q2_29_atan2_Q16:

_Q2_29 _LIBQ_Q2_29_atan2_Q16 (_Q16 y, _Q16 x);

Calculates the atan(y, x), where y and x are of type _Q16 and the resulting value is of type _Q2_29. The output value will be radians in the range pi >= result >= -pi.

Remarks

The C function __divdi3 is called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 348 typical (20 to 376) Program Memory 464 bytes

Error <= 0.000000003 (accurate within one least significant _Q2_29 bit)

Preconditions

None.

Example

```
_Q2_29 resultAtan2;

resultAtan2 = _LIBQ_Q2_29_atan2_Q16 ((_Q16)0xf6276270, x(_Q16)0x34b4b4c0);  //
_LIBQ_Q2_29_atan2_Q16(-2520.615479, 13492.706055) = -0.184684 (0xfa1710c7)
```

Parameters

Parameters	Description
y	The _Q16 input value from which to calculate atan2(y, x).
x	The _Q16 input value from which to calculate atan2(y, x).

m) Random Number Functions

_LIBQ_Q15Rand Function

Generate a _Q15 random number.

File

libq.h

C

```
_Q15 _LIBQ_Q15Rand(int64_t * pSeed);
```

Returns

_LIBQ_Q15Rand returns a random _Q15 value. _LIBQ_Q15Rand also updates the int64_t *pSeed value.

Description

Function _LIBQ_Q15Rand:

_Q15 _LIBQ_Q15Rand (int64_t *pSeed);

Generates a _Q15 pseudo-random value based on the seed supplied as a parameter. The first time this function is called, the seed value must be supplied by the user; this initial seed value can either be constant or random, depending on whether the user wants to generate a repeatable or a non-repeatable pseudo-random sequence.

The function updates the *pSeed value each time it is called. The updated *pSeed value must be passed back to the function with each subsequent call.

Warning: The pseudo-random sequence generated by this function may be insufficient for cryptographic use.

Remarks

Execution Time (cycles): 32 Program Memory 92 bytes

Preconditions

None.

Example

```
// Initialize seed to a constant or random value
static int64_t  randomSeed = 0xA71078BE72D4C1F1;

_Q15           randomValue;

randomValue = _LIBQ_Q15Rand(&randomSeed);
...
randomValue = _LIBQ_Q15Rand(&randomSeed);
```

Parameters

Parameters	Description
pSeed	A pointer to the seed value used by the function to generate a pseudo-random sequence.

_LIBQ_Q31Rand Function

Generate a _Q31 random number.

File

libq.h

C

```
_Q31 _LIBQ_Q31Rand(int64_t * pSeed);
```

Returns

_LIBQ_Q31Rand returns a pseudo-random _Q31 value. _LIBQ_Q31Rand also updates the int64_t *pSeed value.

Description

Function _LIBQ_Q31Rand:

_Q31 _LIBQ_Q31Rand (int64_t *pSeed);

Generates a _Q31 pseudo-random value based on the seed supplied as a parameter. The first time this function is called, the seed value must be supplied by the user; this initial seed value can either be constant or random, depending on whether the user wants to generate a repeatable or a non-repeatable pseudo-random sequence.

The function updates the *pSeed value each time it is called. The updated *pSeed value must be passed back to the function with each subsequent call.

Warning: The pseudo-random sequence generated by this function may be insufficient for cryptographic use.

Remarks

Execution Time (cycles): 32 Program Memory 88 bytes

Preconditions

None.

Example

```
// Initialize seed to a constant or random value
```

```
static int64_t  randomSeed = 0x7F18BA710E72D4C1;

_Q31  randomValue;

randomValue = _LIBQ_Q31Rand(&randomSeed);
...
randomValue = _LIBQ_Q31Rand(&randomSeed);
```

Parameters

Parameters	Description
pSeed	A pointer to the seed value used by the function to generate a pseudo-random sequence.

n) Float Functions

_LIBQ_Q15FromFloat Function

Converts a float to a _Q15 value.

File

libq.h

C

```
_Q15 _LIBQ_Q15FromFloat(float x);
```

Returns

_LIBQ_Q15FromFloat returns the _Q15 fixed point value corresponding to the floating point (float) input value.

Description

Function _LIBQ_Q15FromFloat:

_Q15 _LIBQ_Q15FromFloat(float x);

Converts a floating point value to a _Q15 fixed point representation. The _Q15 fixed point value is returned by the function. The conversion will saturate if the value is outside the range of the _Q15 representation.

Remarks

The C library functions __gesf2, __lesf2, __addsf3, __mulsf3, and __fixsfsi are called by this routine and thus must be linked into the executable image.

Execution Time (cycles): 213 typical (158 to 224) Program Memory 96 bytes

Preconditions

None.

Example

```
_Q15 q15;

q15 = _LIBQ_Q15FromFloat((float)0.5);  // q15 now equals (_Q15)0x4000

q15 = _LIBQ_Q15FromFloat((float)-1.0);  // q15 now equals (_Q15)0x8000

q15 = _LIBQ_Q15FromFloat((float)-0.233828);  // q15 now equals (_Q15)0xe212
```

Parameters

Parameters	Description
x	The float point value to convert to _Q15 fixed point

_LIBQ_Q31FromFloat Function

Converts a float to a _Q31 value.

File

libq.h

C

```
_Q31 _LIBQ_Q31FromFloat(float x);
```

Returns

_LIBQ_Q31FromFloat returns the _Q31 fixed point value corresponding to the floating point (float) input value.

Description

Function _LIBQ_Q31FromFloat:

_Q31 _LIBQ_Q31FromFloat(float x);

Converts a floating point value to a _Q31 fixed point representation. The _Q31 fixed point value is returned by the function. The conversion will saturate if the value is outside the range of the _Q31 representation.

Remarks
