If successful, the DRV_SST25VF020B_Open function will return a handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_SST25VF020B_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in other (error) cases as well.

The following code shows an example of the driver being opened in different modes.

```
DRV_HANDLE sstHandle1, sstHandle2;

/* Client 1 opens the SST driver in non blocking mode */
sstHandle1 = DRV_SST25VF020B_Open(DRV_SST25VF020B_INDEX_0, DRV_IO_INTENT_NONBLOCKING);

/* Check if the handle is valid */
if(DRV_HANDLE_INVALID == sstHandle1)
{
    /* The driver was not opened successfully. The client
     * can try opening it again */
}

/* Client 2 opens the SST driver in Exclusive Write only mode */
sstHandle2 = DRV_SST25VF020B_Open(DRV_SST25VF020B_INDEX_0, DRV_IO_INTENT_WRITE | DRV_IO_INTENT_EXCLUSIVE);

/* Check if the handle is valid */
if(DRV_HANDLE_INVALID == sstHandle2)
{
    /* The driver was not opened successfully. The client
     * can try opening it again */
}
```

Block Operations

Provides information on block operations.

Description

This driver provides simple client interfaces to Erase, Write, and Read the SST flash in blocks. A block is the unit to represent minimum amount of data that can be erased, written, or read. Block size may differ for Erase, Write, and Read operations. Using the SST25VF020B as an example, the DRV_SST25VF020B_GeometryGet function can be used to determine the different block sizes for the driver.

The DRV_SST25VF020B_BlockErase, DRV_SST25VF020B_BlockWrite, and DRV_SST25VF020B_BlockRead functions are used to erase, write, and read the data to/from SST SPI Flash. These functions are always non-blocking. All of these functions follow a standard queue model to read, write, and erase. When any of these functions are called (i.e., a block request is made), the request is queued. The size of the queue is determined by the queueSize member of the DRV_SST25VF020B_INIT data structure. All of the requests in the queue are executed by the DRV_SST25VF020B_Tasks function one-by-one.

When the driver adds a request to the queue, it returns a buffer handle. This handle allows the client to track the request as it progresses through the queue. The buffer handle expires when the event associated with the buffer completes. The driver provides driver events (DRV_SST25VF020B_BLOCK_EVENT) that indicate termination of the buffer requests.

The following steps can be performed for a simple Block Data Operation:

1. The system should have completed necessary initialization of the SPI Driver and the SST Flash Driver, and the DRV_SST25VF020B_Tasks function should be running in a polled environment.
2. The DRV_SPI_Tasks function should be running in either a polled environment or an interrupt environment.
3. Open the driver using DRV_SST25VF020B_Open with the necessary intent.
4. Set an event handler callback using the function DRV_SST25VF020B_BlockEventHandlerSet.
5. Request for block operations using the functions, DRV_SST25VF020B_BlockErase, DRV_SST25VF020B_BlockWrite, and DRV_SST25VF020B_BlockRead, with the appropriate parameters.
6. Wait for event handler callback to occur and check the status of the block operation using the callback function parameter of type DRV_SST25VF020B_BLOCK_EVENT.
7. The client will be able to close the driver using the function, DRV_SST25VF020B_Close, when required.

Example:

```
/* This code example shows usage of the block operations
```

```
 * on the SPI Flash SST25VF020B device */

DRV_HANDLE sstHandle1;
uint8_t myData1[10], myData2[10];
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE  blockHandle1, blockHandle2, blockHandle3;

/* The driver is opened for read-write in Exclusive mode */
sstHandle1 = DRV_SST25VF020B_Open(DRV_SST25VF020B_INDEX_0,
                                  DRV_IO_INTENT_READWRITE | DRV_IO_INTENT_EXCLUSIVE);

/* Check if the driver was opened successfully */
if(DRV_HANDLE_INVALID == sstHandle1)
{
    /* The driver could not be opened successfully */
}

/* Register a Buffer Event Handler with SST25VF020B  driver.
 * This event handler function will be called whenever
 * there is a buffer event.  An application defined
 * context can also be specified. This is returned when
 * the event handler is called.
 * */
DRV_SST25VF020B_BlockEventHandlerSet(sstHandle1,
        APP_SSTBufferEventHandler, NULL);

/* Request for all the three block operations one by one */

/* first block API to erase 1 block of the flash starting from address 0x0, each block is of 4kbyte */
DRV_SST25VF020B_BlockErase(sstHandle1, &blockHandle1, 0x0, 1);
/* 2nd block API to write myData1 in the first 10 locations of the flash */
DRV_SST25VF020B_BlockWrite(sstHandle1, &blockHandle2, &myData1[0], 0x0, 10);
/* 3rd block API to read the first 10 locations of the flash into myData2 */
DRV_SST25VF020B_BlockRead(sstHandle1, &blockHandle3, &myData2[0], 0x0, 10);

/* This is the Driver Event Handler */

void APP_SSTBufferEventHandler(DRV_SST25VF020B_BLOCK_EVENT event,
        DRV_SST25VF020B_BLOCK_COMMAND_HANDLE blockHandle, uintptr_t contextHandle)
{
    switch(event)
    {
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE:
    if ( blockHandle == blockHandle3)
    {
            /* This means the data was read */
    /* Do data verification/processing */
    }
            break;
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR:
            /* Error handling here. */
            break;
        default:
            break;
    }
}
```

Configuring the Library

SST25VF016B Configuration

	Name	Description
	DRV_SST25VF016B_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_SST25VF016B_HARDWARE_HOLD_ENABLE	Specifies if the hardware hold feature is enabled or not.
	DRV_SST25VF016B_HARDWARE_WRITE_PROTECTION_ENABLE	Specifies if the hardware write protect feature is enabled or not.

	DRV_SST25VF016B_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_SST25VF016B_MODE	Determines whether the driver is implemented as static or dynamic
	DRV_SST25VF016B_QUEUE_DEPTH_COMBINED	Number of entries of queues in all instances of the driver.

SST25VF020B Configuration

	Name	Description
	DRV_SST25VF020B_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_SST25VF020B_HARDWARE_HOLD_ENABLE	Specifies if the hardware hold feature is enabled or not.
	DRV_SST25VF020B_HARDWARE_WRITE_PROTECTION_ENABLE	Specifies if the hardware write protect feature is enabled or not.
	DRV_SST25VF020B_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_SST25VF020B_MODE	Determines whether the driver is implemented as static or dynamic.
	DRV_SST25VF020B_QUEUE_DEPTH_COMBINED	Number of entries of queues in all instances of the driver.

SST25VF064C Configuration

	Name	Description
	DRV_SST25VF064C_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_SST25VF064C_HARDWARE_HOLD_ENABLE	Specifies whether or not the hardware hold feature is enabled.
	DRV_SST25VF064C_HARDWARE_WRITE_PROTECTION_ENABLE	Specifies whether or not the hardware write protect feature is enabled.
	DRV_SST25VF064C_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_SST25VF064C_MODE	Determines whether the driver is implemented as static or dynamic.
	DRV_SST25VF064C_QUEUE_DEPTH_COMBINED	Number of entries of queues in all instances of the driver.

Description

The SST Flash Driver requires the specification of compile-time configuration macros. These macros define resource usage, feature availability, and dynamic behavior of the driver. These configuration macros should be defined in the `system_config.h` file.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

SST25VF016B Configuration

DRV_SST25VF016B_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_CLIENTS_NUMBER 4
```

Description

SST25VF016B Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance. This value represents the total number of clients to be supported across all hardware instances. So if SST25VF016B-1 will be accessed by 2 clients and SST25VF016B-2 will accessed by 3 clients, then this number should be 5. It is recommended that this be set exactly equal to the number of expected clients. Client support consumes RAM memory space. If this macro is not defined and the DRV_SST25VF016B_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - single client operation. If this macro is defined and the DRV_SST25VF016B_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - multi client operation.

Remarks

None.

DRV_SST25VF016B_HARDWARE_HOLD_ENABLE Macro

Specifies if the hardware hold feature is enabled or not.

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_HARDWARE_HOLD_ENABLE false
```

Description

SST25VF016B Hardware HOLD Support

This macro defines if the hardware hold feature is enabled or not. If hardware hold is enabled, then user must provide a port pin corresponding to HOLD pin on the flash

Remarks

None

DRV_SST25VF016B_HARDWARE_WRITE_PROTECTION_ENABLE Macro

Specifies if the hardware write protect feature is enabled or not.

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_HARDWARE_WRITE_PROTECTION_ENABLE false
```

Description

SST25VF016B Hardware Write Protect Support

This macro defines if the hardware Write Protect feature is enabled or not. If hardware write protection is enabled, then user must provide a port pin corresponding to WP pin on the flash

Remarks

None.

DRV_SST25VF016B_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_INSTANCES_NUMBER 2
```

Description

SST25VF016B driver objects configuration

Sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of SST25VF016B modules that are needed by the application. Hardware Instance support consumes RAM memory space. If this macro is not defined, then the driver will be built statically.

Remarks

None.

DRV_SST25VF016B_MODE Macro

Determines whether the driver is implemented as static or dynamic

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_MODE DYNAMIC
```

Description

SST25VF016B mode

Determines whether the driver is implemented as static or dynamic. Static drivers control the peripheral directly with peripheral library routines.

Remarks

None.

DRV_SST25VF016B_QUEUE_DEPTH_COMBINED Macro

Number of entries of queues in all instances of the driver.

File

drv_sst25vf016b_config_template.h

C

```
#define DRV_SST25VF016B_QUEUE_DEPTH_COMBINED 7
```

Description

SST25VF016B Driver Instance combined queue depth.

This macro defines the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for all the read/write/erase operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build).

A buffer queue will contain buffer queue entries, each related to a BufferAdd request. This configuration macro defines total number of buffer entries that will be available for use between all SST25VF016B driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking erase/write/read requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. More the number of buffer entries, greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its buffer queue size.

SST25VF020B Configuration

DRV_SST25VF020B_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_CLIENTS_NUMBER 4
```

Description

SST25VF020B Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance. This value represents the total number of clients to be supported across all hardware instances. So if SST25VF020B-1 will be accessed by 2 clients and SST25VF020B-2 will accessed by 3 clients, then this number should be 5. It is recommended that this be set exactly equal to the number of expected clients. Client support consumes RAM memory space. If this macro is not defined and the DRV_SST25VF020B_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - single client operation. If this macro is defined and the DRV_SST25VF020B_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - multi client operation.

Remarks

None.

DRV_SST25VF020B_HARDWARE_HOLD_ENABLE Macro

Specifies if the hardware hold feature is enabled or not.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_HARDWARE_HOLD_ENABLE false
```

Description

SST25VF020B Hardware HOLD Support

This macro defines if the hardware hold feature is enabled or not. If hardware hold is enabled, then user must provide a port pin corresponding to HOLD pin on the flash

Remarks

None.

DRV_SST25VF020B_HARDWARE_WRITE_PROTECTION_ENABLE Macro

Specifies if the hardware write protect feature is enabled or not.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_HARDWARE_WRITE_PROTECTION_ENABLE false
```

Description

SST25VF020B Hardware Write Protect Support

This macro defines if the hardware Write Protect feature is enabled or not. If hardware write protection is enabled, then user must provide a port pin corresponding to WP pin on the flash

Remarks

None.

DRV_SST25VF020B_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_INSTANCES_NUMBER 2
```

Description

SST25VF020B driver objects configuration

Sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of SST25VF020B modules that are needed by the application. Hardware Instance support consumes RAM memory space. If this macro is not defined, then the driver will be built statically.

Remarks

None.

DRV_SST25VF020B_MODE Macro

Determines whether the driver is implemented as static or dynamic.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_MODE DYNAMIC
```

Description

SST25VF020B mode

Determines whether the driver is implemented as static or dynamic. Static drivers control the peripheral directly with peripheral library routines.

Remarks

None.

DRV_SST25VF020B_QUEUE_DEPTH_COMBINED Macro

Number of entries of queues in all instances of the driver.

File

drv_sst25vf020b_config_template.h

C

```
#define DRV_SST25VF020B_QUEUE_DEPTH_COMBINED 7
```

Description

SST25VF020B Driver Instance combined queue depth.

This macro defines the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for all the read/write/erase operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build).

A buffer queue will contain buffer queue entries, each related to a BufferAdd request. This configuration macro defines total number of buffer entries that will be available for use between all SST25VF020B driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking erase/write/read requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. More the number of buffer entries, greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its buffer queue size.

SST25VF064C Configuration

DRV_SST25VF064C_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_sst25vf064c_config_template.h

C

```
#define DRV_SST25VF064C_CLIENTS_NUMBER 4
```

Description

SST25VF064C Client Count Configuration

Sets up the maximum number of clients that can be connected to any hardware instance. This value represents the total number of clients to be supported across all hardware instances. So if SST25VF064C-1 will be accessed by 2 clients and SST25VF064C-2 will accessed by 3 clients, then this number should be 5. It is recommended that this be set exactly equal to the number of expected clients. Client support consumes RAM memory space. If this macro is not defined and the DRV_SST25VF064C_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - single client operation. If this macro is defined and the DRV_SST25VF064C_INSTANCES_NUMBER macro is not defined, then the driver will be built for static - multi client operation.

Remarks

None.

DRV_SST25VF064C_MODE Macro

Determines whether the driver is implemented as static or dynamic.

File

drv_sst25vf064c_config_template.h

C

```
#define DRV_SST25VF064C_MODE DYNAMIC
```

Description

SST25VF064C mode

Determines whether the driver is implemented as static or dynamic. Static drivers control the peripheral directly with peripheral library routines.

Remarks

None.

DRV_SST25VF064C_QUEUE_DEPTH_COMBINED Macro

Number of entries of queues in all instances of the driver.

File

drv_sst25vf064c_config_template.h

C

```
#define DRV_SST25VF064C_QUEUE_DEPTH_COMBINED 7
```

Description

SST25VF064C Driver Instance combined queue depth.

This macro defines the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for all the read/write/erase operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build).

A buffer queue will contain buffer queue entries, each related to a BufferAdd request. This configuration macro defines total number of buffer entries that will be available for use between all SST25VF064C driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking erase/write/read requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. More the number of buffer entries, greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its buffer queue size.

Building the Library

This section lists the files that are available in the SPI Flash Driver Library.

Description

This section list the files that are available in the `/src` folder of the SPI Flash Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/spi_flash`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`sst25vf016b/drv_sst25vf016b.h`	Header file that exports the SST25VF016B driver API.
`sst25vf020b/drv_sst25vf020b.h`	Header file that exports the SST25VF020B driver API.
`sst25vf064c/drv_sst25vf064c.h`	Header file that exports the SST25VF064C driver API.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`sst25vf016b/src/dynamic/drv_sst25vf016b.c`	Basic SPI Flash Driver SST25VF016B implementation file.

sst25vf020b/src/dynamic/drv_sst25vf020b.c	Basic SPI Flash Driver SST25VF020B implementation file.
sst25vf064c/src/dynamic/drv_sst25vf064c.c	Basic SPI Flash Driver SST25VF064C implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
sst25vf020b/src/dynamic/drv_sst25vf020b_erasewrite.c	This file implements an optional BlockEraseWrite feature for the SST25VF020B driver.

Module Dependencies

The SPI Flash Driver Library depends on the following modules:

- SPI Driver Library
- Ports System Service Library

Library Interface

This section describes the API functions of the SPI Flash Driver Library.

Refer to each section for a detailed description.

SST25FV016B API

a) System Functions

	Name	Description
	DRV_SST25VF016B_Initialize	Initializes the SST25VF016B SPI Flash Driver instance for the specified driver index. **Implementation:** Dynamic
	DRV_SST25VF016B_Deinitialize	Deinitializes the specified instance of the SPI Flash driver module. **Implementation:** Dynamic
	DRV_SST25VF016B_Status	Gets the current status of the SPI Flash Driver module. **Implementation:** Dynamic
	DRV_SST25VF016B_Tasks	Maintains the driver's read, erase, and write state machine and implements its ISR. **Implementation:** Dynamic

b) Core Client Functions

	Name	Description
	DRV_SST25VF016B_Close	Closes an opened-instance of the SPI Flash driver. **Implementation:** Dynamic
	DRV_SST25VF016B_Open	Opens the specified SPI Flash driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_SST25VF016B_ClientStatus	Gets current client-specific status of the SPI Flash driver. **Implementation:** Dynamic

c) Block Operation Functions

	Name	Description
	DRV_SST25VF016B_BlockErase	Erase the specified number of blocks in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF016B_BlockEventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed. **Implementation:** Dynamic
	DRV_SST25VF016B_BlockRead	Reads blocks of data starting from the specified address in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF016B_BlockWrite	Write blocks of data starting from a specified address in Flash memory. **Implementation:** Dynamic

d) Media Interface Functions

	Name	Description
	DRV_SST25VF016B_GeometryGet	Returns the geometry of the device. **Implementation:** Dynamic
	DRV_SST25VF016B_MediaIsAttached	Returns the status of the media. **Implementation:** Dynamic

e) Data Types and Constants

	Name	Description
	DRV_SST25VF016B_BLOCK_COMMAND_HANDLE	Handle identifying block commands of the driver.
	DRV_SST25VF016B_BLOCK_EVENT	Identifies the possible events that can result from a request.
	DRV_SST25VF016B_CLIENT_STATUS	Defines the client status. **Implementation:** Dynamic
	DRV_SST25VF016B_EVENT_HANDLER	Pointer to a SST25VF016B SPI Flash Driver Event handler function. **Implementation:** Dynamic
	DRV_SST25VF016B_INIT	Contains all the data necessary to initialize the SPI Flash device. **Implementation:** Dynamic
	DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID	This value defines the SPI Flash Driver Block Command Invalid handle.
	DRV_SST25VF016B_INDEX_0	SPI Flash driver index definitions
	DRV_SST25VF016B_INDEX_1	This is macro DRV_SST25VF016B_INDEX_1.

Description

This section contains the SST25V016B Flash device API.

a) System Functions

DRV_SST25VF016B_Initialize Function

Initializes the SST25VF016B SPI Flash Driver instance for the specified driver index.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
SYS_MODULE_OBJ DRV_SST25VF016B_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the SPI Flash driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This function must be called before any other SPI Flash function is called.

This function should only be called once during system initialization unless DRV_SST25VF016B_Deinitialize is called to deinitialize the driver instance.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

None.

Example

```
// This code snippet shows an example of initializing the SST25VF016B SPI
// Flash Driver. SPI driver index 0 is used for the purpose. Pin numbers 1, 2
// and 3 of port channel B are configured for hold pin, write protection pin
```

```
// and chip select pin respectively. Maximum buffer queue size is set 5.

DRV_SST25VF016B_INIT   SST25VF016BInitData;
SYS_MODULE_OBJ      objectHandle;

SST25VF016BInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
SST25VF016BInitData.spiDriverModuleIndex  = DRV_SPI_INDEX_0;
SST25VF016BInitData.holdPortChannel       = PORT_CHANNEL_B;
SST25VF016BInitData.holdBitPosition       = PORTS_BIT_POS_1;
SST25VF016BInitData.writeProtectPortChannel = PORT_CHANNEL_B;
SST25VF016BInitData.writeProtectBitPosition = PORTS_BIT_POS_2;
SST25VF016BInitData.chipSelectPortChannel = PORT_CHANNEL_F;
SST25VF016BInitData.chipSelectBitPosition = PORTS_BIT_POS_2;
SST25VF016BInitData.queueSize = 5;

objectHandle = DRV_SST25VF016B_Initialize(DRV_SST25VF016B_INDEX_0,
                                (SYS_MODULE_INIT*)SST25VF016BInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_SST25VF016B_Initialize

(

const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init

);

DRV_SST25VF016B_Deinitialize Function

Deinitializes the specified instance of the SPI Flash driver module.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SPI Flash Driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF016B_Initialize should have been called before calling this function.

Example

```
// This code snippet shows an example of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_SST25VF016B_Initialize
SYS_STATUS          status;
```

```
DRV_SST25VF016B_Deinitialize(object);

status = DRV_SST25VF016B_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF016B_Initialize

Function

void DRV_SST25VF016B_Deinitialize(SYS_MODULE_OBJ object)

DRV_SST25VF016B_Status Function

Gets the current status of the SPI Flash Driver module.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
SYS_STATUS DRV_SST25VF016B_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and accept requests for new operations

SYS_STATUS_UNINITIALIZED - Indicates that the driver is not initialized

Description

This function provides the current status of the SPI Flash Driver module.

Remarks

A driver can only be opened when its status is SYS_STATUS_READY.

Preconditions

Function DRV_SST25VF016B_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF016B_Initialize
SYS_STATUS          SST25VF016BStatus;

SST25VF016BStatus = DRV_SST25VF016B_Status(object);
else if (SYS_STATUS_ERROR >= SST25VF016BStatus)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF016B_Initialize

Function

SYS_STATUS DRV_SST25VF016B_Status(SYS_MODULE_OBJ object)

DRV_SST25VF016B_Tasks Function

Maintains the driver's read, erase, and write state machine and implements its ISR.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal state machine and should be called from the system's Tasks function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function (SYS_Tasks).

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI Flash driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF016B_Initialize

while (true)
{
    DRV_SST25VF016B_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SST25VF016B_Initialize)

Function

void DRV_SST25VF016B_Tasks (SYS_MODULE_OBJ object);

b) Core Client Functions

DRV_SST25VF016B_Close Function

Closes an opened-instance of the SPI Flash driver.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the SPI Flash driver, invalidating the handle.

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SST25VF016B_Open before the caller may use the driver again.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SST25VF016B_Open

DRV_SST25VF016B_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

void DRV_SST25VF016B_Close(DRV_Handle handle);

DRV_SST25VF016B_Open Function

Opens the specified SPI Flash driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
DRV_HANDLE DRV_SST25VF016B_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_SST25VF016B_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.
- if the driver status is not ready.

The driver status becomes ready inside "DRV_SST25VF016B_Tasks" function. To make the SST Driver status ready and hence successfully "Open" the driver, "Task" routine need to be called periodically.

Description

This function opens the specified SPI Flash driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The driver will always work in Non-Blocking mode even if IO-intent is selected as blocking.

The handle returned is valid until the DRV_SST25VF016B_Close function is called.

This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF016B_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_SST25VF016B_Open(DRV_SST25VF016B_INDEX_0,
                                                DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
```

```
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_SST25VF016B_Open
(
const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT ioIntent
);

DRV_SST25VF016B_ClientStatus Function

Gets current client-specific status of the SPI Flash driver.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
DRV_SST25VF016B_CLIENT_STATUS DRV_SST25VF016B_ClientStatus(const DRV_HANDLE handle);
```

Returns

A DRV_SST25VF016B_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the SPI Flash driver associated with the given handle.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      handle;         // Returned from DRV_SST25VF016B_Open
DRV_SST25VF016B_CLIENT_STATUS     clientStatus;

clientStatus = DRV_SST25VF016B_ClientStatus(handle);
if(DRV_SST25VF016B_CLIENT_STATUS_READY == clientStatus)
{
    // do the tasks
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's open

Function

DRV_SST25VF016B_CLIENT_STATUS DRV_SST25VF016B_ClientStatus(DRV_HANDLE handle);

c) Block Operation Functions

DRV_SST25VF016B_BlockErase Function

Erase the specified number of blocks in Flash memory.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_BlockErase(const DRV_HANDLE handle, DRV_SST25VF016B_BLOCK_COMMAND_HANDLE *
commandHandle, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It Will be DRV_BUFFER_HANDLE_INVALID if the request was not queued.

Description

This function schedules a non-blocking erase operation in flash memory. The function returns with a valid erase handle in the commandHandle argument if the erase request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the client opened the driver for read only
- if nBlock is 0
- if the queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SST25VF016B_EVENT_ERASE_COMPLETE event if the erase operation was successful or DRV_SST25VF016B_EVENT_ERASE_ERROR event if the erase operation was not successful.

Remarks

Write Protection will be disabled for the complete flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF016B_Open call.

Example

```
// Destination address should be block aligned.
uint32_t blockStart;
uint32_t nBlock;
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF016BHandle is the handle returned
// by the DRV_SST25VF016B_Open function.

// Client registers an event handler with driver

DRV_SST25VF016B_BlockEventHandlerSet(mySST25VF016BHandle,
                APP_SST25VF016BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF016B_BlockErase( mySST25VF016BHandle, commandHandle,
                                                    blockStart, nBlock );

if(DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer queue is processed.

void APP_SST25VF016BEventHandler(DRV_SST25VF016B_BLOCK_EVENT event,
        DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
```

```
        // contextHandle points to myAppObj.

        switch(event)
        {
            case DRV_SST25VF016B_EVENT_ERASE_COMPLETE:

                // This means the data was transferred.
                break;

            case DRV_SST25VF016B_EVENT_ERASE_ERROR:

                // Error handling here.

                break;

            default:
                break;
        }
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
blockStart	Start block address in SST25VF016B memory from where the erase should begin. LSBs (A0-A11) of block start address will be ignored to align it with Erase block size boundary.
nBlock	Total number of blocks to be erased. Each Erase block is of size 4 KByte.

Function

void DRV_SST25VF016B_BlockErase

(

const DRV_HANDLE handle,

DRV_SST25VF016B_BLOCK_COMMAND_HANDLE * commandHandle,

uint32_t blockStart,

uint32_t nBlock

);

DRV_SST25VF016B_BlockEventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_BlockEventHandlerSet(const DRV_HANDLE handle, const DRV_SST25VF016B_EVENT_HANDLER
eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client calls any read, write or erase function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any read/write/erase operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI FLash driver instance.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle;

// mySST25VF016BHandle is the handle returned
// by the DRV_SST25VF016B_Open function.

// Client registers an event handler with driver. This is done once.

DRV_SST25VF016B_BlockEventHandlerSet( mySST25VF016BHandle,
                APP_SST25VF016BEventHandler, (uintptr_t)&myAppObj );

DRV_SST25VF016B_BlockRead( mySST25VF016BHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_SST25VF016BEventHandler(DRV_SST25VF016B_BLOCK_EVENT event,
        DRV_SST25VF016B_BLOCK_COMMAND_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_SST25VF016B_BlockEventHandlerSet

```
(
const      DRV_HANDLE handle,
const      DRV_SST25VF016B_EVENT_HANDLER eventHandler,
const uintptr_t context
);
```

DRV_SST25VF016B_BlockRead Function

Reads blocks of data starting from the specified address in Flash memory.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_BlockRead(const DRV_HANDLE handle, DRV_SST25VF016B_BLOCK_COMMAND_HANDLE *
commandHandle, uint8_t * targetBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation for reading blocks of data from flash memory. The function returns with a valid handle in the commandHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the target buffer pointer is NULL
- if the client opened the driver for write only
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully of
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

The maximum read speed is 33 MHz.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF016B_Open call.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF016B_BASE_ADDRESS_TO_READ_FROM;
uint32_t    nBlock = 2;
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF016BHandle is the handle returned
// by the DRV_SST25VF016B_Open function.

// Client registers an event handler with driver

DRV_SST25VF016B_BlockEventHandlerSet(mySST25VF016BHandle,
                APP_SST25VF016BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF016B_BlockRead( mySST25VF016BHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );
```

```
if(DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when the buffer is processed.

void APP_SST25VF016BEventHandler(DRV_SST25VF016B_BLOCK_EVENT event,
        DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
*targetBuffer	Buffer into which the data read from the SPI Flash instance will be placed
blockStart	Start block address in SST25VF016B memory from where the read should begin. It can be any address of the flash.
nBlock	Total number of blocks to be read. Each Read block is of 1 byte.

Function

void DRV_SST25VF016B_BlockRead
(
const DRV_HANDLE handle,
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *targetBuffer,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST25VF016B_BlockWrite Function

Write blocks of data starting from a specified address in Flash memory.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
void DRV_SST25VF016B_BlockWrite(DRV_HANDLE handle, DRV_SST25VF016B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t * sourceBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking write operation for writing blocks of data into flash memory. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only
- if the buffer size is 0
- if the write queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully or
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

In the case of multi bytes write operation, byte by byte writing will happen instead of Address auto Increment writing.

Write Protection will be disabled for the complete flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF016B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF016B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF016B_Open call.

The flash address location which has to be written, must be erased before using the API DRV_SST25VF016B_BlockErase().

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF016B_BASE_ADDRESS_TO_WRITE_TO;
uint32_t    nBlock = 2;
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF016BHandle is the handle returned
// by the DRV_SST25VF016B_Open function.

// Client registers an event handler with driver

DRV_SST25VF016B_BlockEventHandlerSet(mySST25VF016BHandle,
                APP_SST25VF016BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF016B_BlockWrite( mySST25VF016BHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_SST25VF016BEventHandler(DRV_SST25VF016B_BLOCK_EVENT event,
        DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE:
```

```
            // This means the data was transferred.
            break;

        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function commandHandle -Pointer to an argument that will contain the return buffer handle
sourceBuffer	The source buffer containing data to be programmed into SPI Flash
blockStart	Start block address of SST25VF016B Flash where the write should begin. It can be any address of the flash.
nBlock	Total number of blocks to be written. Each write block is of 1 byte.

Function

void DRV_SST25VF016B_BlockWrite
(
DRV_HANDLE handle,
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *sourceBuffer,
uint32_t blockStart,
uint32_t nBlock
);

d) Media Interface Functions

DRV_SST25VF016B_GeometryGet Function

Returns the geometry of the device.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_SST25VF016B_GeometryGet(DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Structure which holds the media geometry information.

Description

This API gives the following geometrical details of the SST25VF016B Flash:

- Media Property
- Number of Read/Write/Erase regions in the flash device
- Number of Blocks and their size in each region of the device

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
SYS_FS_MEDIA_GEOMETRY * sstFlashGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalFlashSize;

sstFlashGeometry = DRV_SST25VF016B_GeometryGet(sstOpenHandle1);

// read block size should be 1 byte
readBlockSize  = sstFlashGeometry->geometryTable->blockSize;
nReadBlocks = sstFlashGeometry->geometryTable->numBlocks;
nReadRegions = sstFlashGeometry->numReadRegions;

// write block size should be 1 byte
writeBlockSize  = (sstFlashGeometry->geometryTable +1)->blockSize;
// erase block size should be 4k byte
eraseBlockSize  = (sstFlashGeometry->geometryTable +2)->blockSize;

// total flash size should be 256k byte
totalFlashSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY DRV_SST25VF016B_GeometryGet(DRV_HANDLE handle);

DRV_SST25VF016B_MediaIsAttached Function

Returns the status of the media.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
bool DRV_SST25VF016B_MediaIsAttached(DRV_HANDLE handle);
```

Returns

- True - Media is attached
- False - Media is not attached

Description

This API tells if the media is attached or not.

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
if (DRV_SST25VF016B_MediaIsAttached(handle))
{
// Do Something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SST25VF016B_MediaIsAttached(DRV_HANDLE handle);

e) Data Types and Constants

DRV_SST25VF016B_BLOCK_COMMAND_HANDLE Type

Handle identifying block commands of the driver.

File

drv_sst25vf016b.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_SST25VF016B_BLOCK_COMMAND_HANDLE;
```

Description

SPI Flash Driver Block Command Handle

A block command handle is returned by a call to the Read, Write, or Erase functions. This handle allows the application to track the completion of the operation. The handle is returned back to the client by the "event handler callback" function registered with the driver.

The handle assigned to a client request expires when the client has been notified of the completion of the operation (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SST25VF016B_BLOCK_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_sst25vf016b.h

C

```
typedef enum {
  DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR
} DRV_SST25VF016B_BLOCK_EVENT;
```

Members

Members	Description
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE	Block operation has been completed successfully. Read/Write/Erase Complete
DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR	There was an error during the block operation Read/Write/Erase Error

Description

SST25VF016B SPI Flash Driver Events

This enumeration identifies the possible events that can result from a Read, Write, or Erase request caused by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SST25VF016B_BlockEventHandlerSet function when a block request is completed.

DRV_SST25VF016B_CLIENT_STATUS Enumeration

Defines the client status.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
typedef enum {
  DRV_SST25VF016B_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0,
  DRV_SST25VF016B_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY,
  DRV_SST25VF016B_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED,
  DRV_SST25VF016B_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR
} DRV_SST25VF016B_CLIENT_STATUS;
```

Members

Members	Description
DRV_SST25VF016B_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0	Up and running, ready to start new operations
DRV_SST25VF016B_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY	Operation in progress, unable to start a new one
DRV_SST25VF016B_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED	Client is closed
DRV_SST25VF016B_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR	Client Error

Description

SPI Flash Client Status

Defines the various client status codes.

Remarks

None.

DRV_SST25VF016B_EVENT_HANDLER Type

Pointer to a SST25VF016B SPI Flash Driver Event handler function.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
typedef void (* DRV_SST25VF016B_EVENT_HANDLER)(DRV_SST25VF016B_BLOCK_EVENT event,
DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t context);
```

Returns

None.

Description

SST25VF016B SPI Flash Driver Event Handler Function Pointer

This data type defines the required function signature for the SST25VF016B SPI Flash driver event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event calls back from the driver.

The parameters and return values and return value are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE, it means that the data was transferred successfully.

If the event is DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR, it means that the data was not transferred successfully.

The context parameter contains the a handle to the client context, provided at the time the event handling function was registered using the DRV_SST25VF016B_BlockEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write/erase request.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

The Read, Write, and Erase functions can be called in the event handler to add a buffer to the driver queue. These functions can only be called to add buffers to the driver whose event handler is running.

Example

```
void APP_MyBufferEventHandler
(
    DRV_SST25VF016B_BLOCK_EVENT event,
    DRV_SST25VF016B_BLOCK_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_SST25VF016B_EVENT_BLOCK_COMMAND_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle returned from the Read/Write/Erase requests
context	Value identifying the context of the application that registered the event handling function

DRV_SST25VF016B_INIT Structure

Contains all the data necessary to initialize the SPI Flash device.

Implementation: Dynamic

File

drv_sst25vf016b.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX spiDriverModuleIndex;
  PORTS_CHANNEL holdPortChannel;
  PORTS_BIT_POS holdBitPosition;
  PORTS_CHANNEL writeProtectPortChannel;
  PORTS_BIT_POS writeProtectBitPosition;
  PORTS_CHANNEL chipSelectPortChannel;
  PORTS_BIT_POS chipSelectBitPosition;
  uint32_t queueSize;
} DRV_SST25VF016B_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX spiDriverModuleIndex;	Identifies the SPI driver to be used
PORTS_CHANNEL holdPortChannel;	HOLD pin port channel
PORTS_BIT_POS holdBitPosition;	HOLD pin port position
PORTS_CHANNEL writeProtectPortChannel;	Write protect pin port channel
PORTS_BIT_POS writeProtectBitPosition;	Write Protect Bit pin position
PORTS_CHANNEL chipSelectPortChannel;	Chip select pin port channel
PORTS_BIT_POS chipSelectBitPosition;	Chip Select Bit pin position

uint32_t queueSize;	This is the buffer queue size. This is the maximum number of requests that this instance of the driver will queue. For a static build of the driver, this is overridden by the DRV_SST25VF016B_QUEUE_SIZE macro in system_config.h

Description

SST SPI Flash Driver Initialization Data

This structure contains all of the data necessary to initialize the SPI Flash device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the DRV_SST25VF016B_Initialize function.

DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID Macro

This value defines the SPI Flash Driver Block Command Invalid handle.

File

drv_sst25vf016b.h

C

```
#define DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID
```

Description

SPI Flash Driver Block Event Invalid Handle

This value defines the SPI Flash Driver Block Command Invalid handle. It is returned by read/write/erase routines when the request could not be taken.

Remarks

None.

DRV_SST25VF016B_INDEX_0 Macro

SPI Flash driver index definitions

File

drv_sst25vf016b.h

C

```
#define DRV_SST25VF016B_INDEX_0 0
```

Description

Driver SPI Flash Module Index reference

These constants provide SST25VF016B SPI Flash driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_SST25VF016B_Initialize and DRV_SST25VF016B_Open routines to identify the driver instance in use.

DRV_SST25VF016B_INDEX_1 Macro

File

drv_sst25vf016b.h

C

```
#define DRV_SST25VF016B_INDEX_1 1
```

Description

This is macro DRV_SST25VF016B_INDEX_1.

SST25VF020B API

a) System Functions

	Name	Description
	DRV_SST25VF020B_Initialize	Initializes the SST25VF020B SPI Flash Driver instance for the specified driver index. **Implementation:** Dynamic
	DRV_SST25VF020B_Deinitialize	Deinitializes the specified instance of the SPI Flash driver module. **Implementation:** Dynamic
	DRV_SST25VF020B_Status	Gets the current status of the SPI Flash Driver module. **Implementation:** Dynamic
	DRV_SST25VF020B_Tasks	Maintains the driver's read, erase, and write state machine and implements its ISR. **Implementation:** Dynamic

b) Core Client Functions

	Name	Description
	DRV_SST25VF020B_ClientStatus	Gets current client-specific status of the SPI Flash driver. **Implementation:** Dynamic
	DRV_SST25VF020B_CommandStatus	Gets the current status of the command.
	DRV_SST25VF020B_Close	Closes an opened-instance of the SPI Flash driver. **Implementation:** Dynamic
	DRV_SST25VF020B_Open	Opens the specified SPI Flash driver instance and returns a handle to it. **Implementation:** Dynamic

c) Block Operation Functions

	Name	Description
	DRV_SST25VF020B_BlockErase	Erase the specified number of blocks in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF020B_BlockEventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed. **Implementation:** Dynamic
	DRV_SST25VF020B_BlockRead	Reads blocks of data starting from the specified address in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF020B_BlockWrite	Write blocks of data starting from a specified address in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF020B_BlockEraseWrite	Erase and Write blocks of data starting from a specified address in SST flash memory.

d) Media Interface Functions

	Name	Description
	DRV_SST25VF020B_GeometryGet	Returns the geometry of the device. **Implementation:** Dynamic
	DRV_SST25VF020B_MediaIsAttached	Returns the status of the media. **Implementation:** Dynamic

e) Data Types and Constants

	Name	Description
	DRV_SST25VF020B_BLOCK_COMMAND_HANDLE	Handle identifying block commands of the driver.
	DRV_SST25VF020B_BLOCK_EVENT	Identifies the possible events that can result from a request.
	DRV_SST25VF020B_CLIENT_STATUS	Defines the client status.
	DRV_SST25VF020B_EVENT_HANDLER	Pointer to a SST25VF020B SPI Flash Driver Event handler function.
	DRV_SST25VF020B_INIT	Contains all the data necessary to initialize the SPI Flash device.
	DRV_SST25VF020B_COMMAND_STATUS	Specifies the status of the command for the read, write and erase operations.
	DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID	This value defines the SPI Flash Driver Block Command Invalid handle.
	DRV_SST25VF020B_INDEX_0	SPI Flash driver index definitions.

	DRV_SST25VF020B_INDEX_1	This is macro DRV_SST25VF020B_INDEX_1.

Description

This section contains the SST25V020B Flash device API.

a) System Functions

DRV_SST25VF020B_Initialize Function

Initializes the SST25VF020B SPI Flash Driver instance for the specified driver index.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
SYS_MODULE_OBJ DRV_SST25VF020B_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the SPI Flash driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This function must be called before any other SPI Flash function is called.

This function should only be called once during system initialization unless DRV_SST25VF020B_Deinitialize is called to deinitialize the driver instance.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

None.

Example

```
// This code snippet shows an example of initializing the SST25VF020B SPI
// Flash Driver. SPI driver index 0 is used for the purpose. Pin numbers 1, 2
// and 3 of port channel B are configured for hold pin, write protection pin
// and chip select pin respectively. Maximum buffer queue size is set 5.

DRV_SST25VF020B_INIT   SST25VF020BInitData;
SYS_MODULE_OBJ      objectHandle;

SST25VF020BInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
SST25VF020BInitData.spiDriverModuleIndex  = DRV_SPI_INDEX_0;
SST25VF020BInitData.holdPortChannel       = PORT_CHANNEL_B;
SST25VF020BInitData.holdBitPosition       = PORTS_BIT_POS_1;
SST25VF020BInitData.writeProtectPortChannel = PORT_CHANNEL_B;
SST25VF020BInitData.writeProtectBitPosition = PORTS_BIT_POS_2;
SST25VF020BInitData.chipSelectPortChannel = PORT_CHANNEL_F;
SST25VF020BInitData.chipSelectBitPosition = PORTS_BIT_POS_2;
SST25VF020BInitData.queueSize = 5;

objectHandle = DRV_SST25VF020B_Initialize(DRV_SST25VF020B_INDEX_0,
                                (SYS_MODULE_INIT*)SST25VF020BInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_SST25VF020B_Initialize
(
const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init
);

DRV_SST25VF020B_Deinitialize Function

Deinitializes the specified instance of the SPI Flash driver module.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SPI Flash Driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF020B_Initialize should have been called before calling this function.

Example

```
// This code snippet shows an example of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_SST25VF020B_Initialize
SYS_STATUS          status;

DRV_SST25VF020B_Deinitialize(object);

status = DRV_SST25VF020B_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF020B_Initialize

Function

void DRV_SST25VF020B_Deinitialize(SYS_MODULE_OBJ object)

DRV_SST25VF020B_Status Function

Gets the current status of the SPI Flash Driver module.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
SYS_STATUS DRV_SST25VF020B_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and accept requests for new operations

SYS_STATUS_UNINITIALIZED - Indicates that the driver is not initialized

Description

This function provides the current status of the SPI Flash Driver module.

Remarks

A driver can only be opened when its status is SYS_STATUS_READY.

Preconditions

Function DRV_SST25VF020B_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF020B_Initialize
SYS_STATUS          SST25VF020BStatus;

SST25VF020BStatus = DRV_SST25VF020B_Status(object);
else if (SYS_STATUS_ERROR >= SST25VF020BStatus)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF020B_Initialize

Function

SYS_STATUS DRV_SST25VF020B_Status(SYS_MODULE_OBJ object)

DRV_SST25VF020B_Tasks Function

Maintains the driver's read, erase, and write state machine and implements its ISR.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal state machine and should be called from the system's Tasks function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function (SYS_Tasks).

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI Flash driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF020B_Initialize

while (true)
{
    DRV_SST25VF020B_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SST25VF020B_Initialize)

Function

void DRV_SST25VF020B_Tasks (SYS_MODULE_OBJ object);

b) Core Client Functions

DRV_SST25VF020B_ClientStatus Function

Gets current client-specific status of the SPI Flash driver.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
DRV_SST25VF020B_CLIENT_STATUS DRV_SST25VF020B_ClientStatus(const DRV_HANDLE handle);
```

Returns

A DRV_SST25VF020B_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the SPI Flash driver associated with the given handle.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      handle;         // Returned from DRV_SST25VF020B_Open
DRV_SST25VF020B_CLIENT_STATUS     clientStatus;

clientStatus = DRV_SST25VF020B_ClientStatus(handle);
if(DRV_SST25VF020B_CLIENT_STATUS_READY == clientStatus)
{
    // do the tasks
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's open

Function

DRV_SST25VF020B_CLIENT_STATUS DRV_SST25VF020B_ClientStatus(DRV_HANDLE handle);

DRV_SST25VF020B_CommandStatus Function

Gets the current status of the command.

File

drv_sst25vf020b.h

C

```
DRV_SST25VF020B_COMMAND_STATUS DRV_SST25VF020B_CommandStatus(const DRV_HANDLE handle, const
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle);
```

Returns

A DRV_SST25VF020B_COMMAND_STATUS value describing the current status of the buffer. Returns DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID if the client handle or the command handle is not valid.

Description

This routine gets the current status of the buffer. The application must use this routine where the status of a scheduled buffer needs to polled on. The function may return DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID in a case where the buffer handle has expired. A buffer handle expires when the internal buffer object is re-assigned to another erase, read or write request. It is recommended that this function be called regularly in order to track the buffer status correctly.

The application can alternatively register an event handler to receive write, read or erase operation completion events.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

Block command request must have been made using Erase, Read or Write APIs to get a valid command handle.

Example

```
DRV_HANDLE      sstOpenHandle;   // Returned from DRV_SST25VF020B_Open
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE  commandHandle;
DRV_SST25VF020B_BlockErase
                        (
                            sstOpenHandle,
                            &commandHandle,
                            0,
                            1
                        );

if(DRV_SST25VF020B_CommandStatus(sstOpenHandle, commandHandle) == DRV_SST25VF020B_COMMAND_COMPLETED );
{
    // do something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
commandHandle	A valid command handle, returned from Read/Write/Erase APIs.

Function

DRV_SST25VF020B_COMMAND_STATUS DRV_SST25VF020B_CommandStatus

(

const DRV_HANDLE handle,
const DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle
);

DRV_SST25VF020B_Close Function

Closes an opened-instance of the SPI Flash driver.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the SPI Flash driver, invalidating the handle.

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SST25VF020B_Open before the caller may use the driver again.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SST25VF020B_Open

DRV_SST25VF020B_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

void DRV_SST25VF020B_Close(DRV_Handle handle);

DRV_SST25VF020B_Open Function

Opens the specified SPI Flash driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
DRV_HANDLE DRV_SST25VF020B_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_SST25VF020B_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.
- if the driver status is not ready.

The driver status becomes ready inside "DRV_SST25VF020B_Tasks" function. To make the SST Driver status ready and hence successfully "Open" the driver, "Task" routine need to be called periodically.

Description

This function opens the specified SPI Flash driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The driver will always work in Non-Blocking mode even if IO-intent is selected as blocking.

The handle returned is valid until the DRV_SST25VF020B_Close function is called.

This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF020B_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_SST25VF020B_Open(DRV_SST25VF020B_INDEX_0,
                                                DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_SST25VF020B_Open

(

const SYS_MODULE_INDEX drvIndex,

const DRV_IO_INTENT ioIntent

);

c) Block Operation Functions

DRV_SST25VF020B_BlockErase Function

Erase the specified number of blocks in Flash memory.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_BlockErase(const DRV_HANDLE handle, DRV_SST25VF020B_BLOCK_COMMAND_HANDLE *
commandHandle, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It Will be DRV_BUFFER_HANDLE_INVALID if the request was not queued.

Description

This function schedules a non-blocking erase operation in flash memory. The function returns with a valid erase handle in the commandHandle argument if the erase request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the client opened the driver for read only
- if nBlock is 0
- if the queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SST25VF020B_EVENT_ERASE_COMPLETE event if the erase operation was successful or DRV_SST25VF020B_EVENT_ERASE_ERROR event if the erase operation was not successful.

Remarks

Write Protection will be disabled for the complete flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF020B_Open call.

Example

```
// Destination address should be block aligned.
uint32_t blockStart;
uint32_t nBlock;
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF020BHandle is the handle returned
// by the DRV_SST25VF020B_Open function.

// Client registers an event handler with driver

DRV_SST25VF020B_BlockEventHandlerSet(mySST25VF020BHandle,
                APP_SST25VF020BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF020B_BlockErase( mySST25VF020BHandle, commandHandle,
                                                    blockStart, nBlock );

if(DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer queue is processed.

void APP_SST25VF020BEventHandler(DRV_SST25VF020B_BLOCK_EVENT event,
        DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF020B_EVENT_ERASE_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF020B_EVENT_ERASE_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
blockStart	Start block address in SST25VF020B memory from where the erase should begin. LSBs (A0-A11) of block start address will be ignored to align it with Erase block size boundary.
nBlock	Total number of blocks to be erased. Each Erase block is of size 4 KByte.

Function

void DRV_SST25VF020B_BlockErase
(
const DRV_HANDLE handle,
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE * commandHandle,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST25VF020B_BlockEventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_BlockEventHandlerSet(const DRV_HANDLE handle, const DRV_SST25VF020B_EVENT_HANDLER
eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client calls any read, write or erase function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any read/write/erase operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI FLash driver instance.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle;

// mySST25VF020BHandle is the handle returned
// by the DRV_SST25VF020B_Open function.

// Client registers an event handler with driver. This is done once.

DRV_SST25VF020B_BlockEventHandlerSet( mySST25VF020BHandle,
```

```
                APP_SST25VF020BEventHandler, (uintptr_t)&myAppObj );

DRV_SST25VF020B_BlockRead( mySST25VF020BHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_SST25VF020BEventHandler(DRV_SST25VF020B_BLOCK_EVENT event,
        DRV_SST25VF020B_BLOCK_COMMAND_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_SST25VF020B_BlockEventHandlerSet

(

const DRV_HANDLE handle,

const DRV_SST25VF020B_EVENT_HANDLER eventHandler,

const uintptr_t context

);

DRV_SST25VF020B_BlockRead Function

Reads blocks of data starting from the specified address in Flash memory.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_BlockRead(const DRV_HANDLE handle, DRV_SST25VF020B_BLOCK_COMMAND_HANDLE *
commandHandle, uint8_t * targetBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation for reading blocks of data from flash memory. The function returns with a valid handle in the commandHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the target buffer pointer is NULL
- if the client opened the driver for write only
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully of
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

The maximum read speed is 33 MHz.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF020B_Open call.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF020B_BASE_ADDRESS_TO_READ_FROM;
uint32_t    nBlock = 2;
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF020BHandle is the handle returned
// by the DRV_SST25VF020B_Open function.

// Client registers an event handler with driver

DRV_SST25VF020B_BlockEventHandlerSet(mySST25VF020BHandle,
                APP_SST25VF020BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF020B_BlockRead( mySST25VF020BHandle, commandHandle,
                                      &myBuffer, blockStart, nBlock );

if(DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when the buffer is processed.

void APP_SST25VF020BEventHandler(DRV_SST25VF020B_BLOCK_EVENT event,
        DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;
```

```
            case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR:

                // Error handling here.

                break;

            default:
                break;
        }
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
*targetBuffer	Buffer into which the data read from the SPI Flash instance will be placed
blockStart	Start block address in SST25VF020B memory from where the read should begin. It can be any address of the flash.
nBlock	Total number of blocks to be read. Each Read block is of 1 byte.

Function

void DRV_SST25VF020B_BlockRead
(
const DRV_HANDLE handle,
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *targetBuffer,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST25VF020B_BlockWrite Function

Write blocks of data starting from a specified address in Flash memory.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_BlockWrite(DRV_HANDLE handle, DRV_SST25VF020B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t * sourceBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking write operation for writing blocks of data into flash memory. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only
- if the buffer size is 0
- if the write queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully or
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

In the case of multi bytes write operation, byte by byte writing will happen instead of Address auto Increment writing.

Write Protection will be disabled for the complete flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF020B_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF020B_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF020B_Open call.

The flash address location which has to be written, must be erased before using the API DRV_SST25VF020B_BlockErase().

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF020B_BASE_ADDRESS_TO_WRITE_TO;
uint32_t    nBlock = 2;
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF020BHandle is the handle returned
// by the DRV_SST25VF020B_Open function.

// Client registers an event handler with driver

DRV_SST25VF020B_BlockEventHandlerSet(mySST25VF020BHandle,
                APP_SST25VF020BEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF020B_BlockWrite( mySST25VF020BHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_SST25VF020BEventHandler(DRV_SST25VF020B_BLOCK_EVENT event,
        DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function commandHandle -Pointer to an argument that will contain the return buffer handle

sourceBuffer	The source buffer containing data to be programmed into SPI Flash
blockStart	Start block address of SST25VF020B Flash where the write should begin. It can be any address of the flash.
nBlock	Total number of blocks to be written. Each write block is of 1 byte.

Function

void DRV_SST25VF020B_BlockWrite
(
DRV_HANDLE handle,
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *sourceBuffer,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST25VF020B_BlockEraseWrite Function

Erase and Write blocks of data starting from a specified address in SST flash memory.

File

drv_sst25vf020b.h

C

```
void DRV_SST25VF020B_BlockEraseWrite(DRV_HANDLE hClient, DRV_SST25VF020B_BLOCK_COMMAND_HANDLE *
commandHandle, uint8_t * sourceBuffer, uint32_t blockStart, uint32_t nBlock);
```

Description

This function combines the step of erasing blocks of SST Flash and then writing the data. The application can use this function if it wants to avoid having to explicitly delete a block in order to update the bytes contained in the block.

This function schedules a non-blocking operation to erase and write blocks of data into SST flash. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only
- if the buffer size is 0
- if the queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully or
DRV_SST25VF020B_EVENT_ERASE_ERROR event if the buffer was not processed successfully.

Remarks

Refer to drv_sst25vf020b.h for usage information.

Function

void DRV_SST25VF020B_BlockEraseWrite
(
const DRV_HANDLE handle,
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE * commandHandle,
void * sourceBuffer,
uint32_t writeBlockStart,
uint32_t nWriteBlock
)

d) Media Interface Functions

DRV_SST25VF020B_GeometryGet Function

Returns the geometry of the device.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_SST25VF020B_GeometryGet(DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Structure which holds the media geometry information.

Description

This API gives the following geometrical details of the SST25VF020B Flash:

- Media Property
- Number of Read/Write/Erase regions in the flash device
- Number of Blocks and their size in each region of the device

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
SYS_FS_MEDIA_GEOMETRY * sstFlashGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalFlashSize;

sstFlashGeometry = DRV_SST25VF020B_GeometryGet(sstOpenHandle1);

// read block size should be 1 byte
readBlockSize  = sstFlashGeometry->geometryTable->blockSize;
nReadBlocks = sstFlashGeometry->geometryTable->numBlocks;
nReadRegions = sstFlashGeometry->numReadRegions;

// write block size should be 1 byte
writeBlockSize  = (sstFlashGeometry->geometryTable +1)->blockSize;
// erase block size should be 4k byte
eraseBlockSize  = (sstFlashGeometry->geometryTable +2)->blockSize;

// total flash size should be 256k byte
totalFlashSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY DRV_SST25VF020B_GeometryGet(DRV_HANDLE handle);

DRV_SST25VF020B_MediaIsAttached Function

Returns the status of the media.

Implementation: Dynamic

File

drv_sst25vf020b.h

C

```
bool DRV_SST25VF020B_MediaIsAttached(DRV_HANDLE handle);
```

Returns

- True - Media is attached
- False - Media is not attached

Description

This function determines whether or not the media is attached.

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
if (DRV_SST25VF020B_MediaIsAttached(handle))
{
// Do Something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SST25VF020B_MediaIsAttached(DRV_HANDLE handle);

e) Data Types and Constants

DRV_SST25VF020B_BLOCK_COMMAND_HANDLE Type

Handle identifying block commands of the driver.

File

drv_sst25vf020b.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_SST25VF020B_BLOCK_COMMAND_HANDLE;
```

Description

SPI Flash Driver Block Command Handle

A block command handle is returned by a call to the Read, Write, or Erase functions. This handle allows the application to track the completion of the operation. The handle is returned back to the client by the "event handler callback" function registered with the driver.

The handle assigned to a client request expires when the client has been notified of the completion of the operation (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SST25VF020B_BLOCK_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_sst25vf020b.h

C

```
typedef enum {
```

```
  DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR
} DRV_SST25VF020B_BLOCK_EVENT;
```

Members

Members	Description
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE	Block operation has been completed successfully. Read/Write/Erase Complete
DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR	There was an error during the block operation Read/Write/Erase Error

Description

SST25VF020B SPI Flash Driver Events

This enumeration identifies the possible events that can result from a Read, Write, or Erase request caused by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SST25VF020B_BlockEventHandlerSet function when a block request is completed.

DRV_SST25VF020B_CLIENT_STATUS Enumeration

Defines the client status.

File

drv_sst25vf020b.h

Description

SPI Flash Client Status

Defines the various client status codes.

Remarks

None.

DRV_SST25VF020B_EVENT_HANDLER Type

Pointer to a SST25VF020B SPI Flash Driver Event handler function.

File

drv_sst25vf020b.h

C

```
typedef void (* DRV_SST25VF020B_EVENT_HANDLER)(DRV_SST25VF020B_BLOCK_EVENT event,
DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t context);
```

Returns

None.

Description

SST25VF020B SPI Flash Driver Event Handler Function Pointer

This data type defines the required function signature for the SST25VF020B SPI Flash driver event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event calls back from the driver.

The parameters and return values and return value are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE, it means that the data was transferred successfully.

If the event is DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR, it means that the data was not transferred successfully.

The context parameter contains the a handle to the client context, provided at the time the event handling function was registered using the DRV_SST25VF020B_BlockEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write/erase request.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

The Read, Write, and Erase functions can be called in the event handler to add a buffer to the driver queue. These functions can only be called to add buffers to the driver whose event handler is running.

Example

```
void APP_MyBufferEventHandler
(
    DRV_SST25VF020B_BLOCK_EVENT event,
    DRV_SST25VF020B_BLOCK_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_SST25VF020B_EVENT_BLOCK_COMMAND_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle returned from the Read/Write/Erase requests
context	Value identifying the context of the application that registered the event handling function

DRV_SST25VF020B_INIT Structure

Contains all the data necessary to initialize the SPI Flash device.

File

drv_sst25vf020b.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX spiDriverModuleIndex;
  PORTS_CHANNEL holdPortChannel;
  PORTS_BIT_POS holdBitPosition;
```

```
  PORTS_CHANNEL writeProtectPortChannel;
  PORTS_BIT_POS writeProtectBitPosition;
  PORTS_CHANNEL chipSelectPortChannel;
  PORTS_BIT_POS chipSelectBitPosition;
  uint32_t queueSize;
} DRV_SST25VF020B_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX spiDriverModuleIndex;	Identifies the SPI driver to be used
PORTS_CHANNEL holdPortChannel;	HOLD pin port channel
PORTS_BIT_POS holdBitPosition;	HOLD pin port position
PORTS_CHANNEL writeProtectPortChannel;	Write protect pin port channel
PORTS_BIT_POS writeProtectBitPosition;	Write Protect Bit pin position
PORTS_CHANNEL chipSelectPortChannel;	Chip select pin port channel
PORTS_BIT_POS chipSelectBitPosition;	Chip Select Bit pin position
uint32_t queueSize;	This is the buffer queue size. This is the maximum number of requests that this instance of the driver will queue. For a static build of the driver, this is overridden by the DRV_SST25VF020B_QUEUE_SIZE macro in system_config.h

Description

SST SPI Flash Driver Initialization Data

This structure contains all of the data necessary to initialize the SPI Flash device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the DRV_SST25VF020B_Initialize function.

DRV_SST25VF020B_COMMAND_STATUS Enumeration

Specifies the status of the command for the read, write and erase operations.

File

drv_sst25vf020b.h

C

```
typedef enum {
  DRV_SST25VF020B_COMMAND_COMPLETED,
  DRV_SST25VF020B_COMMAND_QUEUED,
  DRV_SST25VF020B_COMMAND_IN_PROGRESS,
  DRV_SST25VF020B_COMMAND_ERROR_UNKNOWN
} DRV_SST25VF020B_COMMAND_STATUS;
```

Members

Members	Description
DRV_SST25VF020B_COMMAND_COMPLETED	Requested operation is completed
DRV_SST25VF020B_COMMAND_QUEUED	Scheduled but not started
DRV_SST25VF020B_COMMAND_IN_PROGRESS	Currently being in transfer
DRV_SST25VF020B_COMMAND_ERROR_UNKNOWN	Unknown Command

Description

SST Flash Driver Command Status

SST Flash Driver command Status

This type specifies the status of the command for the read, write and erase operations.

Remarks

None.

DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID Macro

This value defines the SPI Flash Driver Block Command Invalid handle.

File

drv_sst25vf020b.h

C

```
#define DRV_SST25VF020B_BLOCK_COMMAND_HANDLE_INVALID
```

Description

SPI Flash Driver Block Event Invalid Handle

This value defines the SPI Flash Driver Block Command Invalid handle. It is returned by read/write/erase routines when the request could not be taken.

Remarks

None.

DRV_SST25VF020B_INDEX_0 Macro

SPI Flash driver index definitions.

File

drv_sst25vf020b.h

C

```
#define DRV_SST25VF020B_INDEX_0 0
```

Description

Driver SPI Flash Module Index reference

These constants provide SST25VF020B SPI Flash driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_SST25VF020B_Initialize and DRV_SST25VF020B_Open routines to identify the driver instance in use.

DRV_SST25VF020B_INDEX_1 Macro

File

drv_sst25vf020b.h

C

```
#define DRV_SST25VF020B_INDEX_1 1
```

Description

This is macro DRV_SST25VF020B_INDEX_1.

SST25VF064C API

a) System Functions

	Name	Description
	DRV_SST25VF064C_Initialize	Initializes the SST25VF064C SPI Flash Driver instance for the specified driver index.
	DRV_SST25VF064C_Deinitialize	Deinitializes the specified instance of the SPI Flash driver module.
	DRV_SST25VF064C_Status	Gets the current status of the SPI Flash Driver module.
	DRV_SST25VF064C_Tasks	Maintains the driver's read, erase, and write state machine and implements its ISR.

b) Core Client Functions

	Name	Description
	DRV_SST25VF064C_ClientStatus	Gets current client-specific status of the SPI Flash driver.
	DRV_SST25VF064C_Close	Closes an opened-instance of the SPI Flash driver.
	DRV_SST25VF064C_CommandStatus	Gets the current status of the command.

	DRV_SST25VF064C_Open	Opens the specified SPI Flash driver instance and returns a handle to it.

c) Block Operation Functions

	Name	Description
	DRV_SST25VF064C_BlockErase	Erase the specified number of blocks in Flash memory.
	DRV_SST25VF064C_BlockEventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed.
	DRV_SST25VF064C_BlockRead	Reads blocks of data starting from the specified address in Flash memory.
	DRV_SST25VF064C_BlockWrite	Write blocks of data starting from a specified address in Flash memory.

d) Media Interface Functions

	Name	Description
	DRV_SST25VF064C_GeometryGet	Returns the geometry of the device.
	DRV_SST25VF064C_MediaIsAttached	Returns the status of the media.

e) Data Types and Constants

	Name	Description
	DRV_SST25VF064C_BLOCK_COMMAND_HANDLE	Handle identifying block commands of the driver.
	DRV_SST25VF064C_BLOCK_EVENT	Identifies the possible events that can result from a request.
	DRV_SST25VF064C_CLIENT_STATUS	Defines the client status.
	DRV_SST25VF064C_COMMAND_STATUS	Specifies the status of the command for the read, write and erase operations.
	DRV_SST25VF064C_EVENT_HANDLER	Pointer to a SST25VF064C SPI Flash Driver Event handler function.
	DRV_SST25VF064C_INIT	Contains all the data necessary to initialize the SPI Flash device.
	DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID	This value defines the SPI Flash Driver Block Command Invalid handle.
	DRV_SST25VF064C_INDEX_0	SPI Flash driver index definitions.
	DRV_SST25VF064C_INDEX_1	This is macro DRV_SST25VF064C_INDEX_1.

Description

a) System Functions

DRV_SST25VF064C_Initialize Function

Initializes the SST25VF064C SPI Flash Driver instance for the specified driver index.

File

drv_sst25vf064c.h

C

```
SYS_MODULE_OBJ DRV_SST25VF064C_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the SPI Flash driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This function must be called before any other SPI Flash function is called.

This function should only be called once during system initialization unless DRV_SST25VF064C_Deinitialize is called to deinitialize the driver instance.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

None.

Example

```
// This code snippet shows an example of initializing the SST25VF064C SPI
// Flash Driver. SPI driver index 0 is used for the purpose. Pin numbers 1, 2
// and 3 of port channel B are configured for hold pin, write protection pin
// and chip select pin respectively. Maximum buffer queue size is set 5.

DRV_SST25VF064C_INIT   SST25VF064CInitData;
SYS_MODULE_OBJ      objectHandle;

SST25VF064CInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
SST25VF064CInitData.spiDriverModuleIndex  = DRV_SPI_INDEX_0;
SST25VF064CInitData.holdPortChannel       = PORT_CHANNEL_B;
SST25VF064CInitData.holdBitPosition       = PORTS_BIT_POS_1;
SST25VF064CInitData.writeProtectPortChannel = PORT_CHANNEL_B;
SST25VF064CInitData.writeProtectBitPosition = PORTS_BIT_POS_2;
SST25VF064CInitData.chipSelectPortChannel = PORT_CHANNEL_F;
SST25VF064CInitData.chipSelectBitPosition = PORTS_BIT_POS_2;
SST25VF064CInitData.queueSize = 5;

objectHandle = DRV_SST25VF064C_Initialize(DRV_SST25VF064C_INDEX_0,
                                (SYS_MODULE_INIT*)SST25VF064CInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_SST25VF064C_Initialize

(

const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init

);

DRV_SST25VF064C_Deinitialize Function

Deinitializes the specified instance of the SPI Flash driver module.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SPI Flash Driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF064C_Initialize should have been called before calling this function.

Example

```
// This code snippet shows an example of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_SST25VF064C_Initialize
SYS_STATUS          status;

DRV_SST25VF064C_Deinitialize(object);

status = DRV_SST25VF064C_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF064C_Initialize

Function

void DRV_SST25VF064C_Deinitialize(SYS_MODULE_OBJ object)

DRV_SST25VF064C_Status Function

Gets the current status of the SPI Flash Driver module.

File

drv_sst25vf064c.h

C

```
SYS_STATUS DRV_SST25VF064C_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and accept requests for new operations

SYS_STATUS_UNINITIALIZED - Indicates that the driver is not initialized

Description

This function provides the current status of the SPI Flash Driver module.

Remarks

A driver can only be opened when its status is SYS_STATUS_READY.

Preconditions

Function DRV_SST25VF064C_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF064C_Initialize
SYS_STATUS          SST25VF064CStatus;

SST25VF064CStatus = DRV_SST25VF064C_Status(object);
else if (SYS_STATUS_ERROR >= SST25VF064CStatus)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST25VF064C_Initialize

Function

SYS_STATUS DRV_SST25VF064C_Status(SYS_MODULE_OBJ object)

DRV_SST25VF064C_Tasks Function

Maintains the driver's read, erase, and write state machine and implements its ISR.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal state machine and should be called from the system's Tasks function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function (SYS_Tasks).

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI Flash driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST25VF064C_Initialize

while (true)
{
    DRV_SST25VF064C_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SST25VF064C_Initialize)

Function

void DRV_SST25VF064C_Tasks (SYS_MODULE_OBJ object);

b) Core Client Functions

DRV_SST25VF064C_ClientStatus Function

Gets current client-specific status of the SPI Flash driver.

File

drv_sst25vf064c.h

C

```
DRV_SST25VF064C_CLIENT_STATUS DRV_SST25VF064C_ClientStatus(const DRV_HANDLE handle);
```

Returns

A DRV_SST25VF064C_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the SPI Flash driver associated with the given handle.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      handle;         // Returned from DRV_SST25VF064C_Open
DRV_SST25VF064C_CLIENT_STATUS     clientStatus;

clientStatus = DRV_SST25VF064C_ClientStatus(handle);
if(DRV_SST25VF064C_CLIENT_STATUS_READY == clientStatus)
{
    // do the tasks
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's open

Function

DRV_SST25VF064C_CLIENT_STATUS DRV_SST25VF064C_ClientStatus(DRV_HANDLE handle);

DRV_SST25VF064C_Close Function

Closes an opened-instance of the SPI Flash driver.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the SPI Flash driver, invalidating the handle.

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SST25VF064C_Open before the caller may use the driver again.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SST25VF064C_Open

DRV_SST25VF064C_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

void DRV_SST25VF064C_Close(DRV_Handle handle);

DRV_SST25VF064C_CommandStatus Function

Gets the current status of the command.

File

drv_sst25vf064c.h

C

```
DRV_SST25VF064C_COMMAND_STATUS DRV_SST25VF064C_CommandStatus(const DRV_HANDLE handle, const
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle);
```

Returns

A DRV_SST25VF064C_COMMAND_STATUS value describing the current status of the buffer. Returns DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID if the client handle or the command handle is not valid.

Description

This routine gets the current status of the buffer. The application must use this routine where the status of a scheduled buffer needs to polled on. The function may return DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID in a case where the buffer handle has expired. A buffer handle expires when the internal buffer object is re-assigned to another erase, read or write request. It is recommended that this function be called regularly in order to track the buffer status correctly.

The application can alternatively register an event handler to receive write, read or erase operation completion events.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

Block command request must have been made using Erase, Read or Write APIs to get a valid command handle.

Example

```
DRV_HANDLE      sstOpenHandle;   // Returned from DRV_SST25VF064C_Open
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE  commandHandle;
DRV_SST25VF064C_BlockErase
                        (
                            sstOpenHandle,
                            &commandHandle,
                            0,
                            1
                        );

if(DRV_SST25VF064C_CommandStatus(sstOpenHandle, commandHandle) == DRV_SST25VF064C_COMMAND_COMPLETED );
{
    // do something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
commandHandle	A valid command handle, returned from Read/Write/Erase APIs.

Function

DRV_SST25VF064C_COMMAND_STATUS DRV_SST25VF064C_CommandStatus

(

const DRV_HANDLE handle,

const DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle

);

DRV_SST25VF064C_Open Function

Opens the specified SPI Flash driver instance and returns a handle to it.

File

drv_sst25vf064c.h

C

```
DRV_HANDLE DRV_SST25VF064C_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_SST25VF064C_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.

Description

This function opens the specified SPI Flash driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The driver will always work in Non-Blocking mode even if IO-intent is selected as blocking.

The handle returned is valid until the DRV_SST25VF064C_Close function is called.

This function will NEVER block waiting for hardware.

Preconditions

Function DRV_SST25VF064C_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_SST25VF064C_Open(DRV_SST25VF064C_INDEX_0,
                                                DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_SST25VF064C_Open

(

const SYS_MODULE_INDEX drvIndex,

const DRV_IO_INTENT ioIntent

);

c) Block Operation Functions

DRV_SST25VF064C_BlockErase Function

Erase the specified number of blocks in Flash memory.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_BlockErase(const DRV_HANDLE handle, DRV_SST25VF064C_BLOCK_COMMAND_HANDLE *
commandHandle, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It Will be DRV_BUFFER_HANDLE_INVALID if the request was not queued.

Description

This function schedules a non-blocking erase operation in Flash memory. The function returns with a valid erase handle in the commandHandle argument if the erase request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the client opened the driver for read only
- if nBlock is 0
- if the queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SST25VF064C_EVENT_ERASE_COMPLETE event if the erase operation was successful or DRV_SST25VF064C_EVENT_ERASE_ERROR event if the erase operation was not successful.

Remarks

Write Protection will be disabled for the complete Flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF064C_Open call.

Example

```
// Destination address should be block aligned.
uint32_t blockStart;
uint32_t nBlock;
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF064CHandle is the handle returned
// by the DRV_SST25VF064C_Open function.

// Client registers an event handler with driver

DRV_SST25VF064C_BlockEventHandlerSet(mySST25VF064CHandle,
                APP_SST25VF064CEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF064C_BlockErase( mySST25VF064CHandle, commandHandle,
                                                    blockStart, nBlock );

if(DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer queue is processed.

void APP_SST25VF064CEventHandler(DRV_SST25VF064C_BLOCK_EVENT event,
        DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF064C_EVENT_ERASE_COMPLETE:
```

```
            // This means the data was transferred.
            break;

        case DRV_SST25VF064C_EVENT_ERASE_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
blockStart	Start block address in SST25VF064C memory from where the erase should begin. LSBs (A0-A11) of block start address will be ignored to align it with Erase block size boundary.
nBlock	Total number of blocks to be erased. Each Erase block is of size 4 KByte.

Function

void DRV_SST25VF064C_BlockErase
(
const DRV_HANDLE handle,
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE * commandHandle,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST25VF064C_BlockEventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_BlockEventHandlerSet(const DRV_HANDLE handle, const DRV_SST25VF064C_EVENT_HANDLER
eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client calls any read, write or erase function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any read/write/erase operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI FLash driver instance.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;
```

```
uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle;

// mySST25VF064CHandle is the handle returned
// by the DRV_SST25VF064C_Open function.

// Client registers an event handler with driver. This is done once.

DRV_SST25VF064C_BlockEventHandlerSet( mySST25VF064CHandle,
                APP_SST25VF064CEventHandler, (uintptr_t)&myAppObj );

DRV_SST25VF064C_BlockRead( mySST25VF064CHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_SST25VF064CEventHandler(DRV_SST25VF064C_BLOCK_EVENT event,
        DRV_SST25VF064C_BLOCK_COMMAND_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_SST25VF064C_BlockEventHandlerSet

(

const DRV_HANDLE handle,

const DRV_SST25VF064C_EVENT_HANDLER eventHandler,

const uintptr_t context

);

DRV_SST25VF064C_BlockRead Function

Reads blocks of data starting from the specified address in Flash memory.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_BlockRead(const DRV_HANDLE handle, DRV_SST25VF064C_BLOCK_COMMAND_HANDLE *
commandHandle, uint8_t * targetBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation for reading blocks of data from Flash memory. The function returns with a valid handle in the commandHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the target buffer pointer is NULL
- if the client opened the driver for write only
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully of
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

The maximum read speed is 33 MHz.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF064C_Open call.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF064C_BASE_ADDRESS_TO_READ_FROM;
uint32_t    nBlock = 2;
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF064CHandle is the handle returned
// by the DRV_SST25VF064C_Open function.

// Client registers an event handler with driver

DRV_SST25VF064C_BlockEventHandlerSet(mySST25VF064CHandle,
                APP_SST25VF064CEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF064C_BlockRead( mySST25VF064CHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when the buffer is processed.
```

```
void APP_SST25VF064CEventHandler(DRV_SST25VF064C_BLOCK_EVENT event,
        DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
*targetBuffer	Buffer into which the data read from the SPI Flash instance will be placed
blockStart	Start block address in SST25VF064C memory from where the read should begin. It can be any address of the Flash.
nBlock	Total number of blocks to be read. Each Read block is of 1 byte.

Function

void DRV_SST25VF064C_BlockRead

(

const DRV_HANDLE handle,

DRV_SST25VF064C_BLOCK_COMMAND_HANDLE * commandHandle,

uint8_t *targetBuffer,

uint32_t blockStart,

uint32_t nBlock

);

DRV_SST25VF064C_BlockWrite Function

Write blocks of data starting from a specified address in Flash memory.

File

drv_sst25vf064c.h

C

```
void DRV_SST25VF064C_BlockWrite(DRV_HANDLE handle, DRV_SST25VF064C_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t * sourceBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking write operation for writing blocks of data into Flash memory. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL

- if the client opened the driver for read only
- if the buffer size is 0
- if the write queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully or
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

In the case of multi bytes write operation, byte by byte writing will happen instead of Address auto Increment writing.

Write Protection will be disabled for the complete Flash memory region in the beginning by default.

Preconditions

The DRV_SST25VF064C_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_SST25VF064C_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_SST25VF064C_Open call.

The Flash address location which has to be written, must be erased before using the API DRV_SST25VF064C_BlockErase().

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = SST25VF064C_BASE_ADDRESS_TO_WRITE_TO;
uint32_t    nBlock = 2;
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST25VF064CHandle is the handle returned
// by the DRV_SST25VF064C_Open function.

// Client registers an event handler with driver

DRV_SST25VF064C_BlockEventHandlerSet(mySST25VF064CHandle,
                APP_SST25VF064CEventHandler, (uintptr_t)&myAppObj);

DRV_SST25VF064C_BlockWrite( mySST25VF064CHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_SST25VF064CEventHandler(DRV_SST25VF064C_BLOCK_EVENT event,
        DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
```

```
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function commandHandle -Pointer to an argument that will contain the return buffer handle
sourceBuffer	The source buffer containing data to be programmed into SPI Flash
blockStart	Start block address of SST25VF064C Flash where the write should begin. It can be any address of the Flash.
nBlock	Total number of blocks to be written. Each write block is of 1 byte.

Function

```
void DRV_SST25VF064C_BlockWrite
(
    DRV_HANDLE handle,
    DRV_SST25VF064C_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *sourceBuffer,
uint32_t blockStart,
uint32_t nBlock
);
```

d) Media Interface Functions

DRV_SST25VF064C_GeometryGet Function

Returns the geometry of the device.

File

drv_sst25vf064c.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_SST25VF064C_GeometryGet(DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Structure which holds the media geometry information.

Description

This API gives the following geometrical details of the SST25VF064C Flash:

- Media Property
- Number of Read/Write/Erase regions in the Flash device
- Number of Blocks and their size in each region of the device

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
SYS_FS_MEDIA_GEOMETRY * sstFlashGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalFlashSize;

sstFlashGeometry = DRV_SST25VF064C_GeometryGet(sstOpenHandle1);

// read block size should be 1 byte
readBlockSize  = sstFlashGeometry->geometryTable->blockSize;
nReadBlocks = sstFlashGeometry->geometryTable->numBlocks;
nReadRegions = sstFlashGeometry->numReadRegions;
```

```
// write block size should be 1 byte
writeBlockSize  = (sstFlashGeometry->geometryTable +1)->blockSize;
// erase block size should be 4k byte
eraseBlockSize  = (sstFlashGeometry->geometryTable +2)->blockSize;

// total Flash size should be 8 MB
totalFlashSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY DRV_SST25VF064C_GeometryGet(DRV_HANDLE handle);

DRV_SST25VF064C_MediaIsAttached Function

Returns the status of the media.

File

drv_sst25vf064c.h

C

```
bool DRV_SST25VF064C_MediaIsAttached(DRV_HANDLE handle);
```

Returns

- True - Media is attached
- False - Media is not attached

Description

This function determines whether or not the media is attached.

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
if (DRV_SST25VF064C_MediaIsAttached(handle))
{
// Do Something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SST25VF064C_MediaIsAttached(DRV_HANDLE handle);

e) Data Types and Constants

DRV_SST25VF064C_BLOCK_COMMAND_HANDLE Type

Handle identifying block commands of the driver.

File

drv_sst25vf064c.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_SST25VF064C_BLOCK_COMMAND_HANDLE;
```

Description

SPI Flash Driver Block Command Handle

A block command handle is returned by a call to the Read, Write, or Erase functions. This handle allows the application to track the completion of the operation. The handle is returned back to the client by the "event handler callback" function registered with the driver.

The handle assigned to a client request expires when the client has been notified of the completion of the operation (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SST25VF064C_BLOCK_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_sst25vf064c.h

C

```
typedef enum {
  DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR
} DRV_SST25VF064C_BLOCK_EVENT;
```

Members

Members	Description
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE	Block operation has been completed successfully. Read/Write/Erase Complete
DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR	There was an error during the block operation Read/Write/Erase Error

Description

SST25VF064C SPI Flash Driver Events

This enumeration identifies the possible events that can result from a Read, Write, or Erase request caused by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SST25VF064C_BlockEventHandlerSet function when a block request is completed.

DRV_SST25VF064C_CLIENT_STATUS Enumeration

Defines the client status.

File

drv_sst25vf064c.h

C

```
typedef enum {
  DRV_SST25VF064C_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0,
  DRV_SST25VF064C_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY,
  DRV_SST25VF064C_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED,
  DRV_SST25VF064C_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR
} DRV_SST25VF064C_CLIENT_STATUS;
```

Members

Members	Description
DRV_SST25VF064C_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0	Up and running, ready to start new operations
DRV_SST25VF064C_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY	Operation in progress, unable to start a new one
DRV_SST25VF064C_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED	Client is closed

DRV_SST25VF064C_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR	Client Error

Description

SPI Flash Client Status

Defines the various client status codes.

Remarks

None.

DRV_SST25VF064C_COMMAND_STATUS Enumeration

Specifies the status of the command for the read, write and erase operations.

File

drv_sst25vf064c.h

C

```
typedef enum {
  DRV_SST25VF064C_COMMAND_COMPLETED,
  DRV_SST25VF064C_COMMAND_QUEUED,
  DRV_SST25VF064C_COMMAND_IN_PROGRESS,
  DRV_SST25VF064C_COMMAND_ERROR_UNKNOWN
} DRV_SST25VF064C_COMMAND_STATUS;
```

Members

Members	Description
DRV_SST25VF064C_COMMAND_COMPLETED	Requested operation is completed
DRV_SST25VF064C_COMMAND_QUEUED	Scheduled but not started
DRV_SST25VF064C_COMMAND_IN_PROGRESS	Currently being in transfer
DRV_SST25VF064C_COMMAND_ERROR_UNKNOWN	Unknown Command

Description

SST Flash Driver Command Status

SST Flash Driver command Status. This type specifies the status of the command for the read, write and erase operations.

Remarks

None.

DRV_SST25VF064C_EVENT_HANDLER Type

Pointer to a SST25VF064C SPI Flash Driver Event handler function.

File

drv_sst25vf064c.h

C

```
typedef void (* DRV_SST25VF064C_EVENT_HANDLER)(DRV_SST25VF064C_BLOCK_EVENT event,
DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t context);
```

Returns

None.

Description

SST25VF064C SPI Flash Driver Event Handler Function Pointer

This data type defines the required function signature for the SST25VF064C SPI Flash driver event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event calls back from the driver.

The parameters and return values and return value are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE, it means that the data was transferred successfully.

If the event is DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR, it means that the data was not transferred successfully.

The context parameter contains the a handle to the client context, provided at the time the event handling function was registered using the DRV_SST25VF064C_BlockEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write/erase request.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

The Read, Write, and Erase functions can be called in the event handler to add a buffer to the driver queue. These functions can only be called to add buffers to the driver whose event handler is running.

Example

```
void APP_MyBufferEventHandler
(
    DRV_SST25VF064C_BLOCK_EVENT event,
    DRV_SST25VF064C_BLOCK_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_SST25VF064C_EVENT_BLOCK_COMMAND_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle returned from the Read/Write/Erase requests
context	Value identifying the context of the application that registered the event handling function

DRV_SST25VF064C_INIT Structure

Contains all the data necessary to initialize the SPI Flash device.

File

drv_sst25vf064c.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX spiDriverModuleIndex;
  PORTS_CHANNEL holdPortChannel;
  PORTS_BIT_POS holdBitPosition;
  PORTS_CHANNEL writeProtectPortChannel;
  PORTS_BIT_POS writeProtectBitPosition;
  PORTS_CHANNEL chipSelectPortChannel;
  PORTS_BIT_POS chipSelectBitPosition;
  uint32_t queueSize;
} DRV_SST25VF064C_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX spiDriverModuleIndex;	Identifies the SPI driver to be used

PORTS_CHANNEL holdPortChannel;	HOLD pin port channel
PORTS_BIT_POS holdBitPosition;	HOLD pin port position
PORTS_CHANNEL writeProtectPortChannel;	Write protect pin port channel
PORTS_BIT_POS writeProtectBitPosition;	Write Protect Bit pin position
PORTS_CHANNEL chipSelectPortChannel;	Chip select pin port channel
PORTS_BIT_POS chipSelectBitPosition;	Chip Select Bit pin position
uint32_t queueSize;	This is the buffer queue size. This is the maximum number of requests that this instance of the driver will queue. For a static build of the driver, this is overridden by the DRV_SST25VF064C_QUEUE_SIZE macro in system_config.h

Description

SST SPI Flash Driver Initialization Data

This structure contains all of the data necessary to initialize the SPI Flash device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the DRV_SST25VF064C_Initialize function.

DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID Macro

This value defines the SPI Flash Driver Block Command Invalid handle.

File

drv_sst25vf064c.h

C

```
#define DRV_SST25VF064C_BLOCK_COMMAND_HANDLE_INVALID
```

Description

SPI Flash Driver Block Event Invalid Handle

This value defines the SPI Flash Driver Block Command Invalid handle. It is returned by read/write/erase routines when the request could not be taken.

Remarks

None.

DRV_SST25VF064C_INDEX_0 Macro

SPI Flash driver index definitions.

File

drv_sst25vf064c.h

C

```
#define DRV_SST25VF064C_INDEX_0 0
```

Description

Driver SPI Flash Module Index reference

These constants provide SST25VF064C SPI Flash driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_SST25VF064C_Initialize and DRV_SST25VF064C_Open routines to identify the driver instance in use.

DRV_SST25VF064C_INDEX_1 Macro

File

drv_sst25vf064c.h

C

```
#define DRV_SST25VF064C_INDEX_1 1
```

Description

This is macro DRV_SST25VF064C_INDEX_1.

Description

This section lists the source and header files used by the SPI Flash Driver Library.

drv_sst25vf016b.h

SPI Flash Driver Interface Definition

Enumerations

	Name	Description
	DRV_SST25VF016B_BLOCK_EVENT	Identifies the possible events that can result from a request.
	DRV_SST25VF016B_CLIENT_STATUS	Defines the client status. **Implementation:** Dynamic

Functions

	Name	Description
	DRV_SST25VF016B_BlockErase	Erase the specified number of blocks in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF016B_BlockEventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed. **Implementation:** Dynamic
	DRV_SST25VF016B_BlockRead	Reads blocks of data starting from the specified address in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF016B_BlockWrite	Write blocks of data starting from a specified address in Flash memory. **Implementation:** Dynamic
	DRV_SST25VF016B_ClientStatus	Gets current client-specific status of the SPI Flash driver. **Implementation:** Dynamic
	DRV_SST25VF016B_Close	Closes an opened-instance of the SPI Flash driver. **Implementation:** Dynamic
	DRV_SST25VF016B_Deinitialize	Deinitializes the specified instance of the SPI Flash driver module. **Implementation:** Dynamic
	DRV_SST25VF016B_GeometryGet	Returns the geometry of the device. **Implementation:** Dynamic
	DRV_SST25VF016B_Initialize	Initializes the SST25VF016B SPI Flash Driver instance for the specified driver index. **Implementation:** Dynamic
	DRV_SST25VF016B_MediaIsAttached	Returns the status of the media. **Implementation:** Dynamic
	DRV_SST25VF016B_Open	Opens the specified SPI Flash driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_SST25VF016B_Status	Gets the current status of the SPI Flash Driver module. **Implementation:** Dynamic

	DRV_SST25VF016B_Tasks	Maintains the driver's read, erase, and write state machine and implements its ISR. **Implementation:** Dynamic

Macros

	Name	Description
	DRV_SST25VF016B_BLOCK_COMMAND_HANDLE_INVALID	This value defines the SPI Flash Driver Block Command Invalid handle.
	DRV_SST25VF016B_INDEX_0	SPI Flash driver index definitions
	DRV_SST25VF016B_INDEX_1	This is macro DRV_SST25VF016B_INDEX_1.

Structures

	Name	Description
	DRV_SST25VF016B_INIT	Contains all the data necessary to initialize the SPI Flash device. **Implementation:** Dynamic

Types

	Name	Description
	DRV_SST25VF016B_BLOCK_COMMAND_HANDLE	Handle identifying block commands of the driver.
	DRV_SST25VF016B_EVENT_HANDLER	Pointer to a SST25VF016B SPI Flash Driver Event handler function. **Implementation:** Dynamic

SPI PIC32WK IPF Flash Driver Library

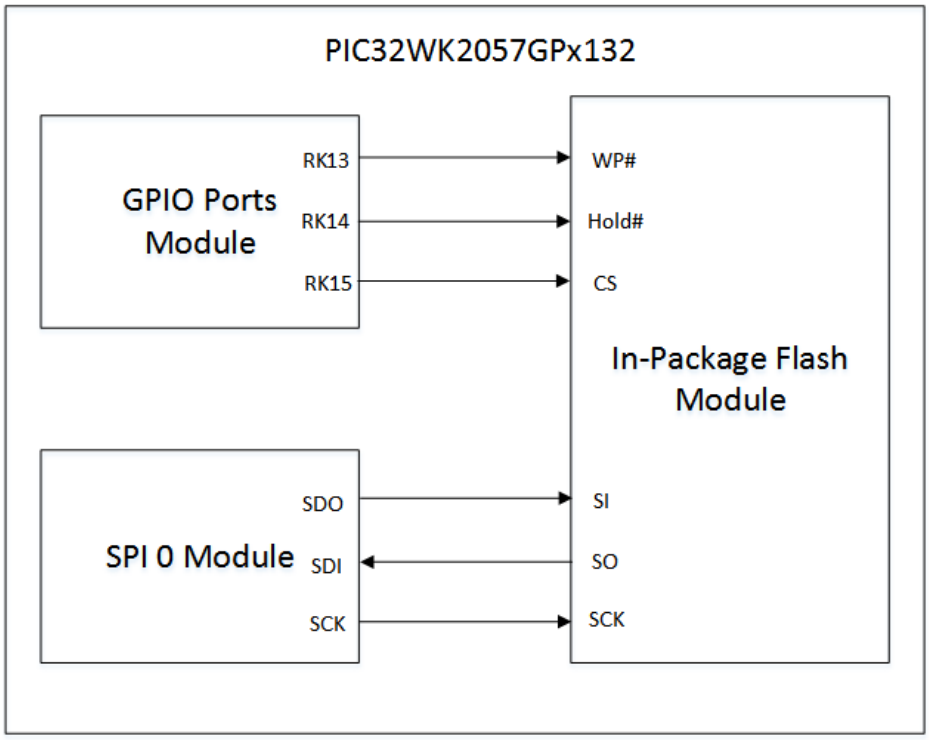
This section describes the Serial Peripheral Interface (SPI) Flash driver library for the PIC32WK IPF (in-package flash) module.

Introduction

This library provides an interface to manage the PIC32WK IPF module in different modes of operation.

Description

PIC32WK consists of an in-package flash (IPF) that is interfaced to the core using SPI, specifically the SPI0 instance. For more information, refer to the PIC32WK Silicon Data Sheet. The SPI module of the controller operates as a master device and the IPF module operates as a slave.



The PIC32WK IPF driver is dynamic in nature, therefore a single instance of it can support multiple clients that want to use the same flash. Multiple instances of the driver can be used when multiple flash devices are required to be part of the system. The SPI driver, which is used by the PIC32WK IPF driver, can be configured for use in either Polled or Interrupt mode.

Using the Library

This topic describes the basic architecture of the SPI PIC32WK IPF Flash Driver Library and provides information and examples about how to use it.

Description

Interface Header File: `drv_ipf.h`

The interface to the SPI PIC32WK IPF Flash Driver Library is defined in the `drv_ipf.h` header file. Any C language source (.c) file that uses the SPI PIC32WK IPF Flash Driver Library should include this header file.

Refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Library Source Files

The SPI PIC32WK IPF Flash Driver Library source files are provided in the `<install-dir>/framework/driver/spi_flash/pic32wk_ipf/src` folder. This folder may contain optional files and alternate

implementations. Refer to Configuring the Library for instructions about how to select optional features, and Building the Library for instructions about how to build the library.

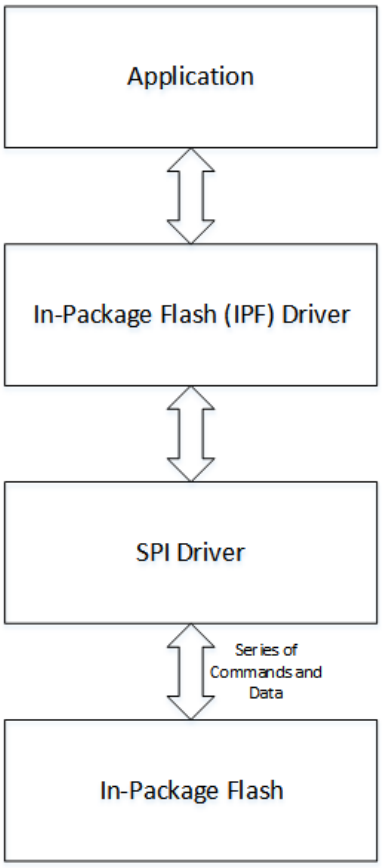
Abstraction Model

This section provides a low-level abstraction of the SPI PIC32WK IPF Flash Driver Library with a convenient C language interface. This topic describes how that abstraction is modeled in software.

Description

To perform a particular operation, the SPI PIC32WK IPF Flash Driver Library needs a specific set of commands to be given on its SPI interface along with the required address and data. The driver abstracts these requirements and provides simple APIs that can be used to perform Erase, Write, Read and memory protect operations. The SPI Driver is used for this purpose. The following layered diagram depicts the communication between different modules.

SPI PIC32WK IPF Flash Driver Library Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

Description

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the SPI PIC32WK IPF Flash Driver Library.

Library Interface Section	Description
System Functions	Accessed by the MPLAB Harmony system module and allow the driver to be initialized, de-initialized, and maintained.
Core Client Functions	Allow the application client to open and close the driver.
Block Operation Functions	Enable the Flash module to be erased, written, and read (to/from).
Media Interface Functions	Provide media status and the Flash geometry.
Memory Protection Functions	Functions protect or unprotect the required block of memory.

Pin Control Functions	Functions provide a means of controlling WP and Hold Pins.

How the Library Works

This topic describes the basic architecture of the SPI PIC32WK IPF Flash Driver Library and provides information and examples about its use.

Description

The library provides interfaces to support:

- System Initialization/Deinitialization
- Opening the Driver
- Block Operations

System Initialization/Deinitialization

This section provides information about initializing the system.

Description

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization, the SPI PIC32WK IPF Flash Driver is initialized with the following configuration settings (either passed dynamically at runtime by using DRV_IPF_INIT or by using Initialization Overrides) that are supported or used by the IPF:

- Device-requested power state: one of the System Module Power States. For specific details please refer to "Data Types and Constants" in the Library Interface section.
- The SPI Driver Module Index, which is intended to be used to communicate with the IPF (for example, DRV_SPI_INDEX_0)
- Port Pins of the microcontroller to be used for Chip Select, Write Protection, and Hold operations on the IPF.
- Maximum Buffer Queue Size for that instance of the IPF.

The DRV_IPF_Initialize function returns an object handle of the type SYS_MODULE_OBJ. After this, the object handle returned by the Initialize interface is used by the other system interfaces such as DRV_IPF_Deinitialize, DRV_ IPF _Status, and DRV_ IPF _Tasks.

Notes:

1. The system initialization and deinitialization settings affect only the instance of the peripheral that is being initialized or deinitialized.
2. As Hold, WP, and Chip select pins are internally routed, these are not configurable. Refer to the PIC32WK Silicon Data Sheet for more information.

Example:

```
// This code example shows the initialization of the In-Package Flash
// Driver. SPI driver index 0 is used for the purpose. Pin numbers 1, 2,
// and 3 of PORTB are configured for the Hold pin, Write Protection pin, and
// the Chip Select pin, respectively. The maximum buffer queue size is set to 5.
DRV_IPF_INIT IPFInitData;
SYS_MODULE_OBJ objectHandle;
IPFInitData.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
IPFInitData.spiDriverModuleIndex = DRV_SPI_INDEX_0;
IPFInitData.holdPortChannel = PORT_CHANNEL_K;
IPFInitData.holdBitPosition = PORTS_BIT_POS_14;
IPFInitData.writeProtectPortChannel = PORT_CHANNEL_K;
IPFInitData.writeProtectBitPosition = PORTS_BIT_POS_13;
IPFInitData.chipSelectPortChannel = PORT_CHANNEL_K;
IPFInitData.chipSelectBitPosition = PORTS_BIT_POS_15;
IPFInitData.queueSize = 5;

objectHandle = DRV_IPF_Initialize(DRV_IPF_INDEX_0,(SYS_MODULE_INIT*)IPFInitData);

if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
// Handle error
}
```

Tasks Routine

The system will call DRV_IPF_Tasks, from SYS_Tasks. .

Opening the Driver

This section provides information about opening the driver.

Description

To use the SST Flash driver, the application must open the driver. Using the SST25VF020B as an example, this is done by calling the DRV_IPF_Open function. Calling this function with DRV_IO_INTENT_NONBLOCKING will cause the driver to be opened in non blocking mode. Then DRV_IPF_BlockErase, DRV_IPF_BlockWrite and DRV_IPF_BlockRead functions when called by this client will be non-blocking.

The client can also open the driver in Read-only mode (DRV_IO_INTENT_READ), Write-only mode (DRV_IO_INTENT_WRITE), and Exclusive mode (DRV_IO_INTENT_EXCLUSIVE). If the driver has been opened exclusively by a client, it cannot be opened again by another client. If successful, the DRV_IPF_Open function will return a handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_IPF_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return and invalid handle in other (error) cases as well.

The following code shows an example of the driver being opened in different modes.

```
DRV_HANDLE ipfHandle1, ipfHandle2;
/* Client 1 opens the IPF driver in non blocking mode */
ipfHandle1 = DRV_IPF_Open(DRV_IPF_INDEX_0, DRV_IO_INTENT_NONBLOCKING);
/* Check if the handle is valid */
if(DRV_HANDLE_INVALID == ipfHandle1)
{
/* The driver was not opened successfully. The client
* can try opening it again */
}
/* Client 2 opens the IPF driver in Exclusive Write only mode */
ipfHandle2 = DRV_IPF_Open(DRV_IPF_INDEX_0, DRV_IO_INTENT_WRITE | DRV_IO_INTENT_EXCLUSIVE);
/* Check if the handle is valid */
if(DRV_HANDLE_INVALID == ipfHandle2)
{
/* The driver was not opened successfully. The client
* can try opening it again */
}
```

Block Operations

This section provides information about block operations.

Description

This driver provides simple client interfaces to Erase, Write, and Read the IPF in blocks. A block is the unit to represent minimum amount of data that can be erased, written, or read. Block size may differ for Erase, Write, and Read operations. The DRV_IPF_GeometryGet function can be used to determine the different block sizes for the driver.

The DRV_IPF_BlockErase, DRV_IPF_BlockWrite, and DRV_IPF_BlockRead functions are used to erase, write, and read the data to/from IPF. These functions are always non-blocking. All of these functions follow a standard queue model to read, write, and erase. When any of these functions are called (i.e., a block request is made), the request is queued. The size of the queue is determined by the queueSize member of the DRV_IPF_INIT data structure. All of the requests in the queue are executed by the DRV_IPF_Tasks function one-by-one.

When the driver adds a request to the queue, it returns a buffer handle. This handle allows the client to track the request as it progresses through the queue. The buffer handle expires when the event associated with the buffer completes. The driver provides driver events (DRV_IPF_BLOCK_EVENT) that indicate termination of the buffer requests.

For a simple Block Data Operation, perform the following steps :

1. The system should have completed necessary initialization of the SPI Driver and the IPF Driver, and the DRV_IPF_Tasks function should be running in a polled environment.
2. The DRV_SPI_Tasks function should be running in either a polled environment or an interrupt environment.
3. Open the driver using DRV_IPF_Open with the necessary intent.
4. Set an event handler callback using the function DRV_IPF_BlockEventHandlerSet.
5. Request for block operations using the functions, DRV_IPF_BlockErase, DRV_IPF_BlockWrite, and DRV_IPF_BlockRead, with the appropriate parameters.
6. Wait for event handler callback to occur and check the status of the block operation using the callback function parameter of type DRV_IPF_BLOCK_EVENT.
7. The client will be able to close the driver using the function, DRV_IPF_Close, when required.

Example:

```
/* This code example shows usage of the block operations
* on the PIC32WK IPF */
DRV_HANDLE ipfHandle1;
uint8_t myData1[10], myData2[10];
DRV_IPF_BLOCK_COMMAND_HANDLE blockHandle1, blockHandle2, blockHandle3;

/* The driver is opened for read-write in Exclusive mode */
```

```
ipfHandle1 = DRV_IPF_Open(DRV_IPF_INDEX_0,
DRV_IO_INTENT_READWRITE | DRV_IO_INTENT_EXCLUSIVE);

/* Check if the driver was opened successfully */
if(DRV_HANDLE_INVALID == ipfHandle1)
{
 /* The driver could not be opened successfully */
}

/* Register a Buffer Event Handler with IPF driver.
* This event handler function will be called whenever
* there is a buffer event. An application defined
* context can also be specified. This is returned when
* the event handler is called.
* */
DRV_IPF_BlockEventHandlerSet(sstHandle1,APP_IPFBufferEventHandler, NULL);

/* Request for all the three block operations one by one */
/* first block API to erase 1 block of the flash starting from address 0x0, each block is of 4kbyte */
DRV_IPF_BlockErase(ipfHandle1, &blockHandle1, 0x0, 1);

/* 2nd block API to write myData1 in the first 10 locations of the flash */
DRV_SST25VF020B_BlockWrite(ipfHandle1, &blockHandle2, &myData1[0], 0x0, 10);

/* 3rd block API to read the first 10 locations of the flash into myData2 */
DRV_SST25VF020B_BlockRead(ipfHandle1, &blockHandle3, &myData2[0], 0x0, 10);

/* This is the Driver Event Handler */
void APP_IPFBufferEventHandler(DRV_SST25VF020B_BLOCK_EVENT event, DRV_SST25VF020B_BLOCK_COMMAND_HANDLE
blockHandle, uintptr_t contextHandle)
{
 switch(event)
 {
 case DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE:
 if ( blockHandle == blockHandle3)
 {
 /* This means the data was read */
 /* Do data verification/processing */
 }
 break;
 case DRV_IPF_EVENT_BLOCK_COMMAND_ERROR:
 /* Error handling here. */
 break;
 default:
 break;
 }
```

Configuring the Library

Use this section for the drivers and system services and middleware. This section will contain any related configuration macros imported into the project from the companion `<library>_config_template.h` file into this topic, if applicable.

Description

The SPI PIC32WK IPF Flash Driver Library requires the specification of compile-time configuration macros. These macros define resource usage, feature availability, and dynamic behavior of the driver. These configuration macros should be defined in the `system_config.h` file.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. For more details, refer to Applications Help.

Building the Library

This section lists the files that are available in the SPI PIC32WK IPF Flash Driver Library.

Description

This section list the files that are available in the `\src` folder of the SPI PIC32WK IPF Flash Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (.h) and source (.c) files that implement this library. The parent folder for these files is

`<install-dir>/framework/driver/spi_flash/pic32wk_ipf`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_ipf.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_ipf.c`	Basic SPI PIC32WK IPF Flash Driver implementation file.
`/src/dynamic/drv_ipf_fs.c`	File system functions used by the driver API.
`/src/drv_ipf_prot.c`	Protocol implementation used by the driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library

Module Dependencies

The SPI PIC32WK IPF Flash Driver Library depends on the following modules:

- Clock System Service Library

Optional Dependencies

- DMA System Service Library (used when operating in DMA mode)
- Interrupt System Service Library (used when task is running in Interrupt mode)

Library Interface

a) System Initialization Functions

	Name	Description
	DRV_IPF_Deinitialize	Deinitializes the specified instance of the SPI Flash driver module. **Implementation:** Dynamic
	DRV_IPF_Initialize	Initializes the IPF SPI Flash Driver instance for the specified driver index. **Implementation:** Dynamic
	DRV_IPF_Status	Gets the current status of the SPI Flash Driver module. **Implementation:** Dynamic
	DRV_IPF_Tasks	Maintains the driver's read, erase, and write state machine and implements its ISR. **Implementation:** Dynamic

b) Client Setup Functions

	Name	Description
	DRV_IPF_ClientStatus	Gets current client-specific status of the SPI Flash driver. **Implementation:** Dynamic
	DRV_IPF_Close	Closes an opened-instance of the SPI Flash driver. **Implementation:** Dynamic
	DRV_IPF_Open	Opens the specified SPI Flash driver instance and returns a handle to it. **Implementation:** Dynamic

c) Other Functions

	Name	Description
	DRV_IPF_BlockErase	Erase the specified number of blocks in Flash memory. **Implementation:** Dynamic

	DRV_IPF_BlockEventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed. **Implementation:** Dynamic
	DRV_IPF_BlockRead	Reads blocks of data starting from the specified address in Flash memory. **Implementation:** Dynamic
	DRV_IPF_BlockWrite	Write blocks of data starting from a specified address in Flash memory. **Implementation:** Dynamic
	DRV_IPF_GeometryGet	Returns the geometry of the device. **Implementation:** Dynamic
	DRV_IPF_HoldAssert	Asserts the Hold pin for flash. **Implementation:** Dynamic
	DRV_IPF_HoldDeAssert	Deasserts the Hold pin for flash. **Implementation:** Dynamic
	DRV_IPF_MediaIsAttached	Returns the status of the media. **Implementation:** Dynamic
	DRV_IPF_ProtectMemoryVolatile	Protects the memory block to which the given memory address belongs **Implementation:** Dynamic
	DRV_IPF_ReadBlockProtectionStatus	Reads the content of Block Protection Register which belongs to In-Package flash. **Implementation:** Dynamic
	DRV_IPF_UnProtectMemoryVolatile	Un-protects the memory block to which the given memory address belongs **Implementation:** Dynamic
	DRV_IPF_WPAssert	Asserts the WP pin for flash. **Implementation:** Dynamic
	DRV_IPF_WPDeAssert	Deasserts the WP pin for flash. **Implementation:** Dynamic

d) Data Types and Constants

	Name	Description
	DRV_IPF_BLOCK_COMMAND_HANDLE	Handle identifying block commands of the driver.
	DRV_IPF_BLOCK_EVENT	Identifies the possible events that can result from a request.
	DRV_IPF_BLOCK_OPERATION	Lists the different operations that IPF driver can do.
	DRV_IPF_CLIENT_STATUS	Defines the client status. **Implementation:** Dynamic
	DRV_IPF_COMMAND_STATUS	Specifies the status of the command for the read, write and erase operations.
	DRV_IPF_EVENT_HANDLER	Pointer to a IPF SPI Flash Driver Event handler function. **Implementation:** Dynamic
	DRV_IPF_INIT	Contains all the data necessary to initialize the SPI Flash device. **Implementation:** Dynamic
	DRV_IPF_PROT_MODE	Lists the different memory protection modes.
	_DRV_IPF_H	This is macro _DRV_IPF_H.
	DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID	This value defines the SPI Flash Driver Block Command Invalid handle.
	DRV_IPF_INDEX_0	SPI Flash driver index definitions
	_DRV_IPF_CONFIG_TEMPLATE_H	This is macro _DRV_IPF_CONFIG_TEMPLATE_H.
	DRV_IPF_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to the hardware instance.
	DRV_IPF_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_IPF_MODE	Determines whether the driver is implemented as static or dynamic

Description

This section describes the API functions of the SPI PIC32WK IPF Flash Driver library.

Refer to each section for a detailed description.

a) System Initialization Functions

DRV_IPF_Deinitialize Function

Deinitializes the specified instance of the SPI Flash driver module.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SPI Flash Driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This function will NEVER block waiting for hardware.

Preconditions

Function DRV_IPF_Initialize should have been called before calling this function.

Example

```
// This code snippet shows an example of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_IPF_Initialize
SYS_STATUS          status;

DRV_IPF_Deinitialize(object);

status = DRV_IPF_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_IPF_Initialize

Function

void DRV_IPF_Deinitialize(SYS_MODULE_OBJ object)

DRV_IPF_Initialize Function

Initializes the IPF SPI Flash Driver instance for the specified driver index.

Implementation: Dynamic

File

drv_ipf.h

C

```
SYS_MODULE_OBJ DRV_IPF_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, it returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the SPI Flash driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This function must be called before any other SPI Flash function is called.

This function should only be called once during system initialization unless DRV_IPF_Deinitialize is called to deinitialize the driver instance.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

None.

Example

```
// This code snippet shows an example of initializing the IPF SPI
// Flash Driver. SPI driver index 0 is used for the purpose. Pin numbers 1, 2
// and 3 of port channel B are configured for hold pin, write protection pin
// and chip select pin respectively. Maximum buffer queue size is set 5.

DRV_IPF_INIT   IPFInitData;
SYS_MODULE_OBJ      objectHandle;

IPFInitData.moduleInit.value      = SYS_MODULE_POWER_RUN_FULL;
IPFInitData.spiDriverModuleIndex  = DRV_SPI_INDEX_0;
IPFInitData.holdPortChannel       = PORT_CHANNEL_B;
IPFInitData.holdBitPosition       = PORTS_BIT_POS_1;
IPFInitData.writeProtectPortChannel = PORT_CHANNEL_B;
IPFInitData.writeProtectBitPosition = PORTS_BIT_POS_2;
IPFInitData.chipSelectPortChannel = PORT_CHANNEL_F;
IPFInitData.chipSelectBitPosition = PORTS_BIT_POS_2;
IPFInitData.queueSize = 5;

objectHandle = DRV_IPF_Initialize(DRV_IPF_INDEX_0,
                                  (SYS_MODULE_INIT*)IPFInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_IPF_Initialize

(

const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init

);

DRV_IPF_Status Function

Gets the current status of the SPI Flash Driver module.

Implementation: Dynamic

File

drv_ipf.h

C

```
SYS_STATUS DRV_IPF_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and accept requests for new operations

SYS_STATUS_UNINITIALIZED - Indicates that the driver is not initialized

Description

This function provides the current status of the SPI Flash Driver module.

Remarks

A driver can only be opened when its status is SYS_STATUS_READY.

Preconditions

Function DRV_IPF_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_IPF_Initialize
SYS_STATUS          IPFStatus;

IPFStatus = DRV_IPF_Status(object);
else if (SYS_STATUS_ERROR >= IPFStatus)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_IPF_Initialize

Function

SYS_STATUS DRV_IPF_Status(SYS_MODULE_OBJ object)

DRV_IPF_Tasks Function

Maintains the driver's read, erase, and write state machine and implements its ISR.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal state machine and should be called from the system's Tasks function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function (SYS_Tasks).

Preconditions

The DRV_IPF_Initialize function must have been called for the specified SPI Flash driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_IPF_Initialize

while (true)
{
    DRV_IPF_Tasks (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_IPF_Initialize)

Function

void DRV_IPF_Tasks (SYS_MODULE_OBJ object);

b) Client Setup Functions

DRV_IPF_ClientStatus Function

Gets current client-specific status of the SPI Flash driver.

Implementation: Dynamic

File

drv_ipf.h

C

```
DRV_IPF_CLIENT_STATUS DRV_IPF_ClientStatus(const DRV_HANDLE handle);
```

Returns

A DRV_IPF_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the SPI Flash driver associated with the given handle.

Remarks

This function will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_IPF_Initialize function must have been called.

DRV_IPF_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      handle;         // Returned from DRV_IPF_Open
DRV_IPF_CLIENT_STATUS     clientStatus;

clientStatus = DRV_IPF_ClientStatus(handle);
if(DRV_IPF_CLIENT_STATUS_READY == clientStatus)
{
    // do the tasks
}
```

Parameters

Parameters	Description
handle	A valid open instance handle, returned from the driver's open

Function

DRV_IPF_CLIENT_STATUS DRV_IPF_ClientStatus(DRV_HANDLE handle);

DRV_IPF_Close Function

Closes an opened-instance of the SPI Flash driver.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the SPI Flash driver, invalidating the handle.

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_IPF_Open before the caller may use the driver again.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_IPF_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_IPF_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_IPF_Open

DRV_IPF_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

void DRV_IPF_Close(DRV_Handle handle);

DRV_IPF_Open Function

Opens the specified SPI Flash driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_ipf.h

C

```
DRV_HANDLE DRV_IPF_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the function returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_IPF_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.
- if the driver status is not ready.

The driver status becomes ready inside "DRV_IPF_Tasks" function. To make the SST Driver status ready and hence successfully "Open" the driver, "Task" routine need to be called periodically.

Description

This function opens the specified SPI Flash driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The driver will always work in Non-Blocking mode even if IO-intent is selected as blocking.

The handle returned is valid until the DRV_IPF_Close function is called.

This function will NEVER block waiting for hardware.

Preconditions

Function DRV_IPF_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_IPF_Open(DRV_IPF_INDEX_0,
                                                DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Identifier for the object instance to be opened
ioIntent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_IPF_Open
(
const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT ioIntent
);

c) Other Functions

DRV_IPF_BlockErase Function

Erase the specified number of blocks in Flash memory.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_BlockErase(const DRV_HANDLE handle, DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle, uint32_t
blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It Will be DRV_BUFFER_HANDLE_INVALID if the request was not queued.

Description

This function schedules a non-blocking erase operation in flash memory. The function returns with a valid erase handle in the commandHandle argument if the erase request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the client opened the driver for read only
- if nBlock is 0
- if the queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_IPF_EVENT_ERASE_COMPLETE event if the erase operation was successful or DRV_IPF_EVENT_ERASE_ERROR event if the erase operation was not successful.

Remarks

Write Protection will be disabled for the complete flash memory region in the beginning by default.

Preconditions

The DRV_IPF_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_IPF_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_IPF_Open call.

Example

```
// Destination address should be block aligned.
uint32_t blockStart;
uint32_t nBlock;
DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// myIPFHandle is the handle returned
// by the DRV_IPF_Open function.

// Client registers an event handler with driver

DRV_IPF_BlockEventHandlerSet(myIPFHandle,
                APP_IPFEventHandler, (uintptr_t)&myAppObj);

DRV_IPF_BlockErase( myIPFHandle, commandHandle,
                                                    blockStart, nBlock );

if(DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer queue is processed.

void APP_IPFEventHandler(DRV_IPF_BLOCK_EVENT event,
        DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_IPF_EVENT_ERASE_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_IPF_EVENT_ERASE_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
blockStart	Start block address in IPF memory from where the erase should begin. LSBs (A0-A11) of block start address will be ignored to align it with Erase block size boundary.
nBlock	Total number of blocks to be erased. Each Erase block is of size 4 KByte.

Function

void DRV_IPF_BlockErase

(

const DRV_HANDLE handle,

DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle,

uint32_t blockStart,
uint32_t nBlock
);

DRV_IPF_BlockEventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_BlockEventHandlerSet(const DRV_HANDLE handle, const DRV_IPF_EVENT_HANDLER eventHandler, const
uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client calls any read, write or erase function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any read/write/erase operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_IPF_Initialize function must have been called for the specified SPI FLash driver instance.

DRV_IPF_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle;

// myIPFHandle is the handle returned
// by the DRV_IPF_Open function.

// Client registers an event handler with driver. This is done once.

DRV_IPF_BlockEventHandlerSet( myIPFHandle,
                APP_IPFEventHandler, (uintptr_t)&myAppObj );

DRV_IPF_BlockRead( myIPFHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_IPFEventHandler(DRV_IPF_BLOCK_EVENT event,
        DRV_IPF_BLOCK_COMMAND_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;
```

```
    switch(event)
    {
        case DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_IPF_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_IPF_BlockEventHandlerSet

(

const DRV_HANDLE handle,

const DRV_IPF_EVENT_HANDLER eventHandler,

const uintptr_t context

);

DRV_IPF_BlockRead Function

Reads blocks of data starting from the specified address in Flash memory.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_BlockRead(const DRV_HANDLE handle, DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle, uint8_t *
targetBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation for reading blocks of data from flash memory. The function returns with a valid handle in the commandHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the target buffer pointer is NULL
- if the client opened the driver for write only
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE

event if the buffer was processed successfully of DRV_IPF_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

The maximum read speed is 33 MHz.

Preconditions

The DRV_IPF_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_IPF_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_IPF_Open call.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = IPF_BASE_ADDRESS_TO_READ_FROM;
uint32_t    nBlock = 2;
DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// myIPFHandle is the handle returned
// by the DRV_IPF_Open function.

// Client registers an event handler with driver

DRV_IPF_BlockEventHandlerSet(myIPFHandle,
                APP_IPFEventHandler, (uintptr_t)&myAppObj);

DRV_IPF_BlockRead( myIPFHandle, commandHandle,
                                      &myBuffer, blockStart, nBlock );

if(DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when the buffer is processed.

void APP_IPFEventHandler(DRV_IPF_BLOCK_EVENT event,
        DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_IPF_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
*targetBuffer	Buffer into which the data read from the SPI Flash instance will be placed

blockStart	Start block address in IPF memory from where the read should begin. It can be any address of the flash.
nBlock	Total number of blocks to be read. Each Read block is of 1 byte.

Function

void DRV_IPF_BlockRead
(
const DRV_HANDLE handle,
DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t *targetBuffer,
uint32_t blockStart,
uint32_t nBlock
);

DRV_IPF_BlockWrite Function

Write blocks of data starting from a specified address in Flash memory.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_BlockWrite(DRV_HANDLE handle, DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle, uint8_t *
sourceBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking write operation for writing blocks of data into flash memory. The function returns with a valid buffer handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only
- if the buffer size is 0
- if the write queue size is full or queue depth is insufficient
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE event if the buffer was processed successfully or DRV_IPF_EVENT_BLOCK_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

In the case of multi bytes write operation, byte by byte writing will happen instead of Address auto Increment writing.

Write Protection will be disabled for the complete flash memory region in the beginning by default.

Preconditions

The DRV_IPF_Initialize function must have been called for the specified SPI Flash driver instance.

DRV_IPF_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_IPF_Open call.

The flash address location which has to be written, must be erased before using the API DRV_IPF_BlockErase().

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// address should be block aligned.
uint32_t blockStart = IPF_BASE_ADDRESS_TO_WRITE_TO;
uint32_t    nBlock = 2;
DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle;
```

```
MY_APP_OBJ myAppObj;

// myIPFHandle is the handle returned
// by the DRV_IPF_Open function.

// Client registers an event handler with driver

DRV_IPF_BlockEventHandlerSet(myIPFHandle,
                APP_IPFEventHandler, (uintptr_t)&myAppObj);

DRV_IPF_BlockWrite( myIPFHandle, commandHandle,
                                        &myBuffer, blockStart, nBlock );

if(DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_IPFEventHandler(DRV_IPF_BLOCK_EVENT event,
        DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_IPF_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function commandHandle -Pointer to an argument that will contain the return buffer handle
sourceBuffer	The source buffer containing data to be programmed into SPI Flash
blockStart	Start block address of IPF Flash where the write should begin. It can be any address of the flash.
nBlock	Total number of blocks to be written. Each write block is of 1 byte.

Function

void DRV_IPF_BlockWrite

(

DRV_HANDLE handle,

DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle,

uint8_t *sourceBuffer,

uint32_t blockStart,

uint32_t nBlock

);

DRV_IPF_GeometryGet Function

Returns the geometry of the device.

Implementation: Dynamic

File

drv_ipf.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_IPF_GeometryGet(DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Structure which holds the media geometry information.

Description

This API gives the following geometrical details of the IPF Flash:

- Media Property
- Number of Read/Write/Erase regions in the flash device
- Number of Blocks and their size in each region of the device

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
SYS_FS_MEDIA_GEOMETRY * sstFlashGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalFlashSize;

sstFlashGeometry = DRV_IPF_GeometryGet(sstOpenHandle1);

// read block size should be 1 byte
readBlockSize  = sstFlashGeometry->geometryTable->blockSize;
nReadBlocks = sstFlashGeometry->geometryTable->numBlocks;
nReadRegions = sstFlashGeometry->numReadRegions;

// write block size should be 1 byte
writeBlockSize  = (sstFlashGeometry->geometryTable +1)->blockSize;
// erase block size should be 4k byte
eraseBlockSize  = (sstFlashGeometry->geometryTable +2)->blockSize;

// total flash size should be 256k byte
totalFlashSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY DRV_IPF_GeometryGet(DRV_HANDLE handle);

DRV_IPF_HoldAssert Function

Asserts the Hold pin for flash.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_HoldAssert();
```

Returns

None.

Description

This API is used to assert the Hold pin of the in-package flash.

Remarks

The Hold GPIO is fixed in case of PIC32WK devices.

Preconditions

None.

Example

```
DRV_IPF_HoldAssert();
```

Function

void DRV_IPF_HoldAssert();

DRV_IPF_HoldDeAssert Function

Deasserts the Hold pin for flash.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_HoldDeAssert();
```

Returns

None.

Description

This API is used to deassert the Hold pin of the in-package flash.

Remarks

The Hold GPIO is fixed in case of PIC32WK devices.

Preconditions

None.

Example

```
DRV_IPF_HoldDeAssert();
```

Function

void DRV_IPF_HoldDeAssert();

DRV_IPF_MediaIsAttached Function

Returns the status of the media.

Implementation: Dynamic

File

drv_ipf.h

C

```
bool DRV_IPF_MediaIsAttached(DRV_HANDLE handle);
```

Returns

- True - Media is attached
- False - Media is not attached

Description

This API tells if the media is attached or not.

Remarks

This function is typically used by File System Media Manager.

Preconditions

None.

Example

```
if (DRV_IPF_MediaIsAttached(handle))
{
// Do Something
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_IPF_MediaIsAttached(DRV_HANDLE handle);

DRV_IPF_ProtectMemoryVolatile Function

Protects the memory block to which the given memory address belongs

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_ProtectMemoryVolatile(DRV_HANDLE clientHandle, DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle,
uintptr_t memAddress, DRV_IPF_PROT_MODE protMode);
```

Returns

None.

Description

This API is used to protect the memory block to which a given memory address belongs. Both read and write protection mode is supported. The memory will be protected until the next power cycle.

Remarks

Only the selected blocks can be read protected, which is as per the in-package flash specification.

Preconditions

In-package flash driver open function must be called and a valid client handle must be available.

Example

```
uintptr_t memAddr = IPF_ADDRESS_PROTECT;
DRV_IPF_PROT_MODE    protMode = DRV_IPF_WRITE_PROTECT;
DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// myIPFHandle is the handle returned
// by the DRV_IPF_Open function.

// Client registers an event handler with driver
```

```
DRV_IPF_BlockEventHandlerSet(myIPFHandle,
                APP_IPFEventHandler, (uintptr_t)&myAppObj);

DRV_IPF_ProtectMemoryVolatile( myIPFHandle, commandHandle,
                                        memAddr, protMode );

if(DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_IPFEventHandler(DRV_IPF_BLOCK_EVENT event,
        DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the memory protection is complete.
            break;

        case DRV_IPF_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
clientHandle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
memAddress	Memory address which belongs to the memory block which needs to be protected
protMode	Read or write protect mode. If a block needs to be protected for both read and write, then both enum values can be ORed and passed to the function.

Function

void DRV_IPF_ProtectMemoryVolatile
(
    DRV_HANDLE clientHandle,
    DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle,
uintptr_t memAddress,
    DRV_IPF_PROT_MODE protMode
);

DRV_IPF_ReadBlockProtectionStatus Function

Reads the content of Block Protection Register which belongs to In-Package flash.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_ReadBlockProtectionStatus(DRV_HANDLE clientHandle, DRV_IPF_BLOCK_COMMAND_HANDLE *
```

```
commandHandle, uint8_t * buffer);
```

Returns

None.

Description

This API is read the current contents of the block protection register in in-package flash and fills the buffer passed by the client.

Remarks

The block protection word is 6-bytes wide.

Preconditions

In-package flash driver open function must be called and a valid client handle must be available.

Example

```
uint8_t buf[6] = {0,};
DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// myIPFHandle is the handle returned
// by the DRV_IPF_Open function.

// Client registers an event handler with driver

DRV_IPF_BlockEventHandlerSet(myIPFHandle,
                APP_IPFEventHandler, (uintptr_t)&myAppObj);

DRV_IPF_ReadBlockProtectionStatus( myIPFHandle, commandHandle,
                                        buf );

if(DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_IPFEventHandler(DRV_IPF_BLOCK_EVENT event,
        DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE:

            // This means the BPR read is complete.
            break;

        case DRV_IPF_EVENT_BLOCK_COMMAND_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
clientHandle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
buffer	pointer to a buffer to which the block protection status has to be updated

Function

void DRV_IPF_ReadBlockProtectionStatus
(
DRV_HANDLE clientHandle,
DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle,
uint8_t * buffer
);

DRV_IPF_UnProtectMemoryVolatile Function

Un-protects the memory block to which the given memory address belongs

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_UnProtectMemoryVolatile(DRV_HANDLE clientHandle, DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle,
uintptr_t memAddress, DRV_IPF_PROT_MODE protMode);
```

Returns

None.

Description

This API is used to un-protect the memory block to which a given memory address belongs. Both read and write protection mode is supported. The memory will be protected until the next power cycle.

Remarks

If the memory block a client is trying to unprotect, is protected by some other client, then memory unprotection will not executed. The function will return without unprotecting.

Preconditions

In-package flash driver open function must be called and a valid client handle must be available.

Example

```
uintptr_t memAddr = IPF_ADDRESS_UNPROTECT;
DRV_IPF_PROT_MODE    protMode = DRV_IPF_WRITE_PROTECT;
DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// myIPFHandle is the handle returned
// by the DRV_IPF_Open function.

// Client registers an event handler with driver

DRV_IPF_BlockEventHandlerSet(myIPFHandle,
                APP_IPFEventHandler, (uintptr_t)&myAppObj);

DRV_IPF_UnProtectMemoryVolatile( myIPFHandle, commandHandle,
                                        memAddr, protMode );

if(DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_IPFEventHandler(DRV_IPF_BLOCK_EVENT event,
        DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.
```

```
        switch(event)
        {
            case DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE:

                // This means the memory unprotection is complete.
                break;

            case DRV_IPF_EVENT_BLOCK_COMMAND_ERROR:

                // Error handling here.

                break;

            default:
                break;
        }
    }
```

Parameters

Parameters	Description
clientHandle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
memAddress	Memory address which belongs to the memory block which needs to be un-protected
protMode	Read or write protect mode. If a block needs to be un-protected for both read and write, then both enum values can be ORed and passed to the function.

Function

```
void DRV_IPF_UnProtectMemoryVolatile
(
    DRV_HANDLE clientHandle,
    DRV_IPF_BLOCK_COMMAND_HANDLE * commandHandle,
uintptr_t memAddress,
    DRV_IPF_PROT_MODE protMode
);
```

DRV_IPF_WPAssert Function

Asserts the WP pin for flash.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_WPAssert();
```

Returns

None.

Description

This API is used to assert the Write Protect (WP) pin of the in-package flash.

Remarks

The Write Protection GPIO is fixed in case of PIC32WK devices.

Preconditions

None.

Example

```
DRV_IPF_WPAssert();
```

Function

void DRV_IPF_WPAssert();

DRV_IPF_WPDeAssert Function

Deasserts the WP pin for flash.

Implementation: Dynamic

File

drv_ipf.h

C

```
void DRV_IPF_WPDeAssert();
```

Returns

None.

Description

This API is used to deassert the Write Protect (WP) pin of the in-package flash.

Remarks

The Write Protection GPIO is fixed in case of PIC32WK devices.

Preconditions

None.

Example

```
DRV_IPF_WPDeAssert();
```

Function

void DRV_IPF_WPAssert();

d) Data Types and Constants

DRV_IPF_BLOCK_COMMAND_HANDLE Type

Handle identifying block commands of the driver.

File

drv_ipf.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_IPF_BLOCK_COMMAND_HANDLE;
```

Description

SPI Flash Driver Block Command Handle

A block command handle is returned by a call to the Read, Write, or Erase functions. This handle allows the application to track the completion of the operation. The handle is returned back to the client by the "event handler callback" function registered with the driver.

The handle assigned to a client request expires when the client has been notified of the completion of the operation (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_IPF_BLOCK_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_ipf.h

C

```
typedef enum {
  DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_IPF_EVENT_BLOCK_COMMAND_ERROR
} DRV_IPF_BLOCK_EVENT;
```

Members

Members	Description
DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE	Block operation has been completed successfully. Read/Write/Erase Complete
DRV_IPF_EVENT_BLOCK_COMMAND_ERROR	There was an error during the block operation Read/Write/Erase Error

Description

IPF SPI Flash Driver Events

This enumeration identifies the possible events that can result from a Read, Write, or Erase request caused by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_IPF_BlockEventHandlerSet function when a block request is completed.

DRV_IPF_BLOCK_OPERATION Enumeration

Lists the different operations that IPF driver can do.

File

drv_ipf.h

C

```
typedef enum {
  DRV_IPF_BLOCK_READ,
  DRV_IPF_BLOCK_WRITE,
  DRV_IPF_BLOCK_ERASE,
  DRV_IPF_HW_BLOCK_PROT,
  DRV_IPF_HW_BLOCK_UNPROT,
  DRV_IPF_READ_HW_BLOCK_PROT
} DRV_IPF_BLOCK_OPERATION;
```

Members

Members	Description
DRV_IPF_BLOCK_READ	Block Read
DRV_IPF_BLOCK_WRITE	Block Write
DRV_IPF_BLOCK_ERASE	Block Erase
DRV_IPF_HW_BLOCK_PROT	Hardware Block Protection
DRV_IPF_HW_BLOCK_UNPROT	Hardware Block Un-Protection
DRV_IPF_READ_HW_BLOCK_PROT	Read HW Block Protection Status

Description

IPF Driver Operations

This enumeration lists the different operations that IPF driver can do.

Remarks

None.

DRV_IPF_CLIENT_STATUS Enumeration

Defines the client status.

Implementation: Dynamic

File

drv_ipf.h

C

```
typedef enum {
  DRV_IPF_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0,
  DRV_IPF_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY,
  DRV_IPF_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED,
  DRV_IPF_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR
} DRV_IPF_CLIENT_STATUS;
```

Members

Members	Description
DRV_IPF_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY+0	Up and running, ready to start new operations
DRV_IPF_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY	Operation in progress, unable to start a new one
DRV_IPF_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED	Client is closed
DRV_IPF_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR	Client Error

Description

SPI Flash Client Status

Defines the various client status codes.

Remarks

None.

DRV_IPF_COMMAND_STATUS Enumeration

Specifies the status of the command for the read, write and erase operations.

File

drv_ipf.h

C

```
typedef enum {
  DRV_IPF_COMMAND_COMPLETED = SYS_FS_MEDIA_COMMAND_COMPLETED,
  DRV_IPF_COMMAND_QUEUED = SYS_FS_MEDIA_COMMAND_QUEUED,
  DRV_IPF_COMMAND_IN_PROGRESS = SYS_FS_MEDIA_COMMAND_IN_PROGRESS,
  DRV_IPF_COMMAND_ERROR_UNKNOWN = SYS_FS_MEDIA_COMMAND_UNKNOWN
} DRV_IPF_COMMAND_STATUS;
```

Members

Members	Description
DRV_IPF_COMMAND_COMPLETED = SYS_FS_MEDIA_COMMAND_COMPLETED	Done OK and ready
DRV_IPF_COMMAND_QUEUED = SYS_FS_MEDIA_COMMAND_QUEUED	Scheduled but not started
DRV_IPF_COMMAND_IN_PROGRESS = SYS_FS_MEDIA_COMMAND_IN_PROGRESS	Currently being in transfer
DRV_IPF_COMMAND_ERROR_UNKNOWN = SYS_FS_MEDIA_COMMAND_UNKNOWN	Unknown Command

Description

IPF Driver Command Status

IPF Driver command Status

This type specifies the status of the command for the read, write and erase operations.

Remarks

None.

DRV_IPF_EVENT_HANDLER Type

Pointer to a IPF SPI Flash Driver Event handler function.

Implementation: Dynamic

File

drv_ipf.h

C

```
typedef void (* DRV_IPF_EVENT_HANDLER)(DRV_IPF_BLOCK_EVENT event, DRV_IPF_BLOCK_COMMAND_HANDLE
commandHandle, uintptr_t context);
```

Returns

None.

Description

IPF SPI Flash Driver Event Handler Function Pointer

This data type defines the required function signature for the IPF SPI Flash driver event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event calls back from the driver.

The parameters and return values and return value are described here and a partial example implementation is provided.

Remarks

If the event is DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE, it means that the data was transferred successfully.

If the event is DRV_IPF_EVENT_BLOCK_COMMAND_ERROR, it means that the data was not transferred successfully.

The context parameter contains the a handle to the client context, provided at the time the event handling function was registered using the DRV_IPF_BlockEventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write/erase request.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations with in this function.

The Read, Write, and Erase functions can be called in the event handler to add a buffer to the driver queue. These functions can only be called to add buffers to the driver whose event handler is running.

Example

```
void APP_MyBufferEventHandler
(
    DRV_IPF_BLOCK_EVENT event,
    DRV_IPF_BLOCK_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_IPF_EVENT_BLOCK_COMMAND_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_IPF_EVENT_BLOCK_COMMAND_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event

commandHandle	Handle returned from the Read/Write/Erase requests
context	Value identifying the context of the application that registered the event handling function

DRV_IPF_INIT Structure

Contains all the data necessary to initialize the SPI Flash device.

Implementation: Dynamic

File

drv_ipf.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  SYS_MODULE_INDEX spiDriverModuleIndex;
  PORTS_CHANNEL holdPortChannel;
  PORTS_BIT_POS holdBitPosition;
  PORTS_CHANNEL writeProtectPortChannel;
  PORTS_BIT_POS writeProtectBitPosition;
  PORTS_CHANNEL chipSelectPortChannel;
  PORTS_BIT_POS chipSelectBitPosition;
  uint32_t queueSize;
} DRV_IPF_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
SYS_MODULE_INDEX spiDriverModuleIndex;	Identifies the SPI driver to be used
PORTS_CHANNEL holdPortChannel;	HOLD pin port channel
PORTS_BIT_POS holdBitPosition;	HOLD pin port position
PORTS_CHANNEL writeProtectPortChannel;	Write protect pin port channel
PORTS_BIT_POS writeProtectBitPosition;	Write Protect Bit pin position
PORTS_CHANNEL chipSelectPortChannel;	Chip select pin port channel
PORTS_BIT_POS chipSelectBitPosition;	Chip Select Bit pin position
uint32_t queueSize;	This is the buffer queue size. This is the maximum number of requests that this instance of the driver will queue. For a static build of the driver, this is overridden by the DRV_IPF_QUEUE_SIZE macro in system_config.h

Description

SST SPI Flash Driver Initialization Data

This structure contains all of the data necessary to initialize the SPI Flash device.

Remarks

A pointer to a structure of this format containing the desired initialization data must be passed into the DRV_IPF_Initialize function.

DRV_IPF_PROT_MODE Enumeration

Lists the different memory protection modes.

File

drv_ipf.h

C

```
typedef enum {
  DRV_IPF_WRITE_PROTECT = 1,
  DRV_IPF_READ_PROTECT
} DRV_IPF_PROT_MODE;
```

Members

Members	Description
DRV_IPF_WRITE_PROTECT = 1	Write Protect
DRV_IPF_READ_PROTECT	Read Protect

Description

IPF Driver memory protection modes

This enumeration lists the different memory protection modes.

Remarks

None.

_DRV_IPF_H Macro

File

drv_ipf.h

C

```
#define _DRV_IPF_H
```

Description

This is macro _DRV_IPF_H.

DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID Macro

This value defines the SPI Flash Driver Block Command Invalid handle.

File

drv_ipf.h

C

```
#define DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID
```

Description

SPI Flash Driver Block Event Invalid Handle

This value defines the SPI Flash Driver Block Command Invalid handle. It is returned by read/write/erase routines when the request could not be taken.

Remarks

None.

DRV_IPF_INDEX_0 Macro

SPI Flash driver index definitions

File

drv_ipf.h

C

```
#define DRV_IPF_INDEX_0 0
```

Description

Driver SPI Flash Module Index reference

These constants provide IPF SPI Flash driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_IPF_Initialize and DRV_IPF_Open routines to identify the driver instance in use.

_DRV_IPF_CONFIG_TEMPLATE_H Macro

File

drv_ipf_config_template.h

C

```
#define _DRV_IPF_CONFIG_TEMPLATE_H
```

Description

This is macro _DRV_IPF_CONFIG_TEMPLATE_H.

DRV_IPF_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to the hardware instance.

File

drv_ipf_config_template.h

C

```
#define DRV_IPF_CLIENTS_NUMBER 4
```

Description

IPF Client Count Configuration

Sets up the maximum number of clients that can be connected to the hardware instance. So if IPF will be accessed by 2 clients then this number should be 2. It is recommended that this be set exactly equal to the number of expected clients. Client support consumes RAM memory space.

Remarks

None.

DRV_IPF_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported

File

drv_ipf_config_template.h

C

```
#define DRV_IPF_INSTANCES_NUMBER 1
```

Description

IPF driver objects configuration

Sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of IPF modules that are needed by the application. Hardware Instance support consumes RAM memory space.

Remarks

As PIC32WK has only 1 instance of IPF, this macro is always set to 1.

DRV_IPF_MODE Macro

Determines whether the driver is implemented as static or dynamic

File

drv_ipf_config_template.h

C

```
#define DRV_IPF_MODE DYNAMIC
```

Description

IPF mode

Determines whether the driver is implemented as static or dynamic. Static drivers control the peripheral directly with peripheral library routines.

Remarks

None.

Files

SPI Flash Driver Interface Definition

Enumerations

	Name	Description
	DRV_IPF_BLOCK_EVENT	Identifies the possible events that can result from a request.
	DRV_IPF_BLOCK_OPERATION	Lists the different operations that IPF driver can do.
	DRV_IPF_CLIENT_STATUS	Defines the client status. **Implementation:** Dynamic
	DRV_IPF_COMMAND_STATUS	Specifies the status of the command for the read, write and erase operations.
	DRV_IPF_PROT_MODE	Lists the different memory protection modes.

Functions

	Name	Description
	DRV_IPF_BlockErase	Erase the specified number of blocks in Flash memory. **Implementation:** Dynamic
	DRV_IPF_BlockEventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed. **Implementation:** Dynamic
	DRV_IPF_BlockRead	Reads blocks of data starting from the specified address in Flash memory. **Implementation:** Dynamic
	DRV_IPF_BlockWrite	Write blocks of data starting from a specified address in Flash memory. **Implementation:** Dynamic
	DRV_IPF_ClientStatus	Gets current client-specific status of the SPI Flash driver. **Implementation:** Dynamic
	DRV_IPF_Close	Closes an opened-instance of the SPI Flash driver. **Implementation:** Dynamic
	DRV_IPF_Deinitialize	Deinitializes the specified instance of the SPI Flash driver module. **Implementation:** Dynamic
	DRV_IPF_GeometryGet	Returns the geometry of the device. **Implementation:** Dynamic
	DRV_IPF_HoldAssert	Asserts the Hold pin for flash. **Implementation:** Dynamic
	DRV_IPF_HoldDeAssert	Deasserts the Hold pin for flash. **Implementation:** Dynamic
	DRV_IPF_Initialize	Initializes the IPF SPI Flash Driver instance for the specified driver index. **Implementation:** Dynamic
	DRV_IPF_MediaIsAttached	Returns the status of the media. **Implementation:** Dynamic
	DRV_IPF_Open	Opens the specified SPI Flash driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_IPF_ProtectMemoryVolatile	Protects the memory block to which the given memory address belongs **Implementation:** Dynamic
	DRV_IPF_ReadBlockProtectionStatus	Reads the content of Block Protection Register which belongs to In-Package flash. **Implementation:** Dynamic

	DRV_IPF_Status	Gets the current status of the SPI Flash Driver module. **Implementation:** Dynamic
	DRV_IPF_Tasks	Maintains the driver's read, erase, and write state machine and implements its ISR. **Implementation:** Dynamic
	DRV_IPF_UnProtectMemoryVolatile	Un-protects the memory block to which the given memory address belongs **Implementation:** Dynamic
	DRV_IPF_WPAssert	Asserts the WP pin for flash. **Implementation:** Dynamic
	DRV_IPF_WPDeAssert	Deasserts the WP pin for flash. **Implementation:** Dynamic

Macros

	Name	Description
	_DRV_IPF_H	This is macro _DRV_IPF_H.
	DRV_IPF_BLOCK_COMMAND_HANDLE_INVALID	This value defines the SPI Flash Driver Block Command Invalid handle.
	DRV_IPF_INDEX_0	SPI Flash driver index definitions

Structures

	Name	Description
	DRV_IPF_INIT	Contains all the data necessary to initialize the SPI Flash device. **Implementation:** Dynamic

Types

	Name	Description
	DRV_IPF_BLOCK_COMMAND_HANDLE	Handle identifying block commands of the driver.
	DRV_IPF_EVENT_HANDLER	Pointer to a IPF SPI Flash Driver Event handler function. **Implementation:** Dynamic

Description

SPI Flash Driver Interface Definition

The SPI Flash device driver provides a simple interface to manage the SPI Flash modules which are external to Microchip Controllers. This file defines the interface definition for the SPI Flash Driver.

File Name

drv_IPF.h

Company

Microchip Technology Inc.

drv_ipf_config_template.h

IPF Driver Configuration Template.

Macros

	Name	Description
	_DRV_IPF_CONFIG_TEMPLATE_H	This is macro _DRV_IPF_CONFIG_TEMPLATE_H.
	DRV_IPF_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to the hardware instance.
	DRV_IPF_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported
	DRV_IPF_MODE	Determines whether the driver is implemented as static or dynamic

Description

IPF Driver Configuration Template

These file provides the list of all the configurations that can be used with the driver. This file should not be included in the driver.

File Name

drv_ipf_config_template.h

Company

Microchip Technology Inc.

SQI Driver Library

Introduction

This library provides an interface to manage the Serial Quad Interface (SQI) module on the Microchip family of microcontrollers in different modes of operation.

Description

The MPLAB Harmony Serial Quad Interface (SQI) Driver provides a high-level interface to the SQI peripherals on Microchip's PIC32 microcontrollers. The SQI Driver includes the following features:

- Provides application ready routines to read and write data to an SQI peripheral
- Supports Single, Dual, and Quad Lane modes
- Supports Single Data Rate (SDR)
- Supports Interrupt mode operation only
- Supports multi-client operation
- Provides data transfer events
- Supports non-blocking mode operation only
- Features thread-safe functions for use in RTOS applications
- Uses the SQI module's internal DMA Controller for transfers

Using the Library

This topic describes the basic architecture of the SQI Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_sqi.h`

The interface to the SQI Driver Library is defined in the `drv_sqi.h` header file. Any C language source (`.c`) file that uses the SQI Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the Driver interacts with the framework.

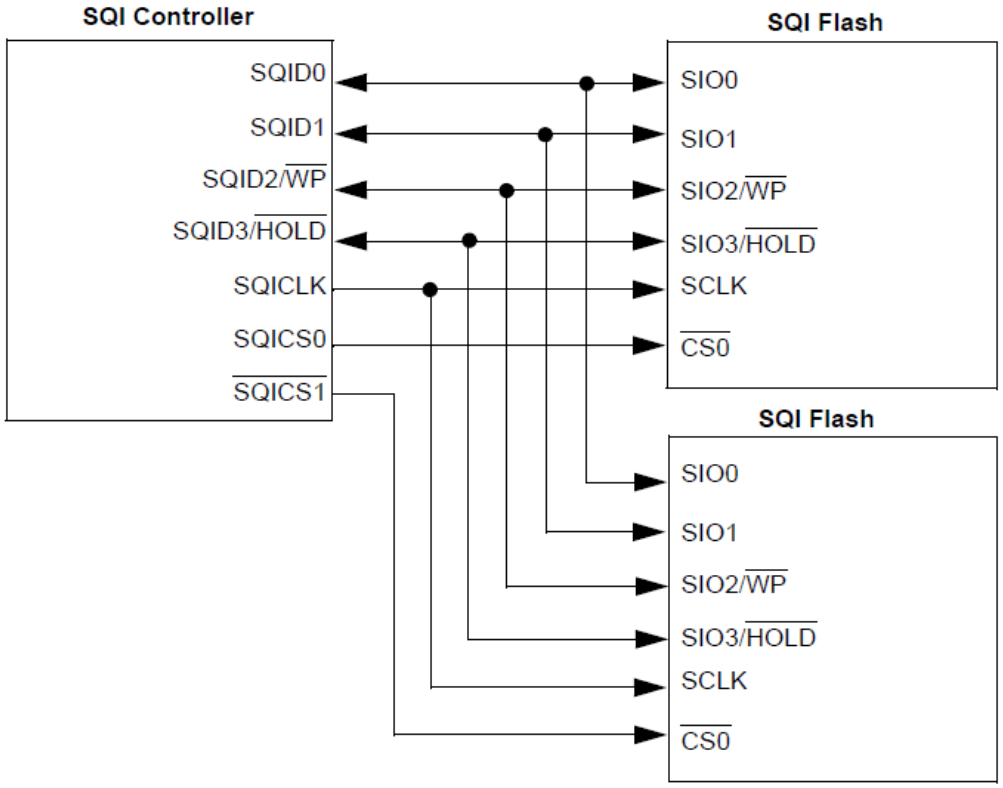
Abstraction Model

This library provides a low-level abstraction of the SQI Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The SQI Driver Library supports up to two Chip Select lines. The following diagram shows the high SQI Driver and the SQI Flash sub-system

SQI Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the SQI module.

Library Interface Section	Description
System Interaction Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks and status functions.
Client Setup Functions	Provides open, close, status and other setup functions.
Data Transfer Functions	Provides data transfer functions available in the configuration.

How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality

Note: Not all modes are available on all devices, please refer to the specific device data sheet to determine the modes that are supported for your device.

System Functions

Provides information on the system functions provided in the SQI Driver Library.

Description

SQI Driver Initialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization, each instance of the SQI would be initialized with the following configuration settings (either passed dynamically at run time using DRV_SQI_INIT or by using initialization overrides) that are supported by the specific SQI Controller hardware:

- SQI Peripheral ID - Identifies the SQI Peripheral ID to be used
- Interrupt Source - The interrupt source associated with the SQI Controller
- Enabled Devices - Number of devices to enable
- Device Configuration - This configuration is per enabled device. A maximum of two devices are supported. The following configurations are allowed per device:
- Clock Divider Value - Clock divider value to be used
- SPI Mode of Operation - SPI mode of operation to be used for this device
- LSB First - Send or receive least significant bit of a byte first

The DRV_SQI_Initialize function configures and initializes the SQI controller using the configuration information provided. It returns an object handle of the type SYS_MODULE_OBJ. This object handle would be used by other system interfaces such as DRV_SQI_Status, DRV_SQI_Tasks and DRV_SQI_Deinitialize.

Example:

```
/* SQI Driver Initialization Data */
const DRV_SQI_INIT drvSqiInit =
{
    .sqiId = SQI_ID_0,
    .interruptSource = INT_SOURCE_SQI1,
    .enabledDevices = DRV_SQI_ENABLE_DEVICE_1,
    .clockDivider = DRV_SQI_CLK_DIV_1,
    .devCfg[0].spiMode = DRV_SQI_SPI_MODE_0,
    .devCfg[0].lsbFirst = false,
};

/* Initialize the SQI Driver */
sysObj.drvSqi = DRV_SQI_Initialize(DRV_SQI_INDEX_0, (SYS_MODULE_INIT *)&drvSqiInit);
```

SQI Driver Task Routine

The SQI driver data transfers are interrupt driven. The data transfer request from the client results in the SQI driver kick starting the transfer if there is no transfer in progress otherwise the request is added to the driver queue. The SQI interrupt handler is responsible for invoking the DRV_SQI_Tasks, which maintains the driver state machine. The task routine checks if the current request is complete and if there is another data transfer request queued, then it kick starts the processing of the request.

SQI Driver Status

DRV_SQI_Status returns the current status of the SQI driver module and is called by the Harmony System. The application may not find the need to call this function directly.

Example:

```
SYS_MODULE_OBJ object;
// Returned from DRV_SQI_Initialize
SYS_STATUS sqiStatus;

sqiStatus = DRV_SQI_Status(object);
if (SYS_STATUS_ERROR >= sqiStatus)
{
    // Handle error
}
```

Client Core Functions

Provides information on the client core functions provided in the SQI Driver Library

Description

Opening the Driver

For the application to start using an instance of the module, it must call the DRV_SQI_Open function repeatedly until a valid handle is returned by the driver. This provides the configuration required to open the SQI instance for operation.

For the various options available for I/O INTENT please refer to "Data Types and Constants" in the Library Interface section.

Example:

```
sqiHandle = DRV_SQI_Open (0, DRV_IO_INTENT_READWRITE);
if (sqiHandle != DRV_HANDLE_INVALID)
{
    /* Do further processing. */
}
else
{
```

```
    /* Call until the function returns a valid handle. */
}
```

Closing the Driver

Closes an opened-instance of the SQI driver

Example:

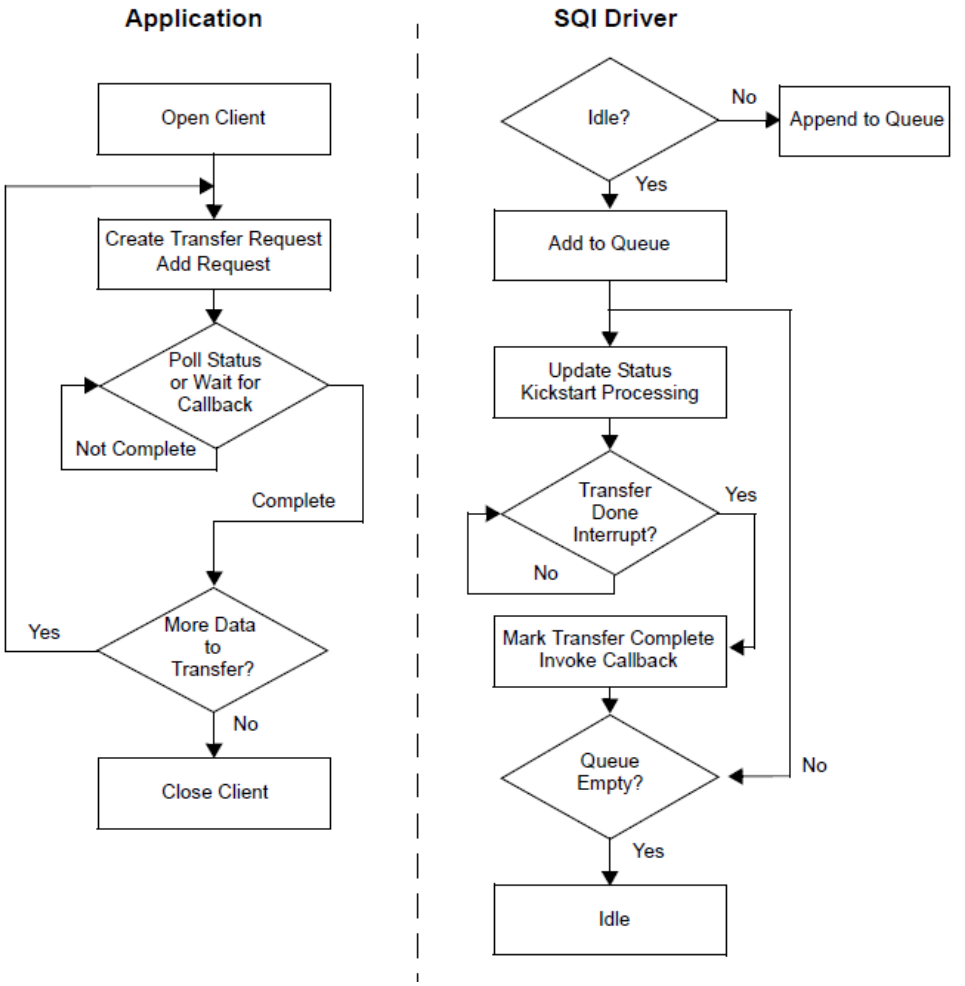
```
DRV_HANDLE handle; // Returned from DRV_SQI_Open
DRV_SQI_Close(handle);
```

Client Data Transfer Functions

Provides information on the client data transfer functions provided in the SQI Driver Library.

Description

Client data transfer functionality provides API interfaces for the data transfer operation. The following diagram illustrates the data transfer model.



Applications need to perform the following steps to transfer data using the SQI Driver:

1. The system should have completed necessary initialization and the DRV_SQI_Tasks should be running in an interrupt environment.
2. Open_the driver using DRV_SQI_Open with the necessary intent. The application should wait call the DRV_SQI_Open until the function returns a valid open handle.
3. Register callback function using the DRV_SQI_EventHandlerSet.
4. Add a transfer request using the buffer using the DRV_SQI_TransferData function. The reads or writes of blocks of data generally involves sending down the read or a write command, the address on the device from/to which data is to be read/written. The client also has to specify the source or destination buffer and the number of bytes to be read or written. The client builds an array of transfer elements containing this information and passes the array and the number of elements of the array as part of this transfer request.
5. Check for the current transfer status using DRV_SQI_CommandStatus until the transfer progress is DRV_SQI_COMMAND_COMPLETED, or wait for the callback to be called.
6. When the client has no more data to be transferred, the client can close the driver using DRV_SQI_Close.

Example:

```
#define READ_BUF_SIZE 512

uint8_t readBuffer[READ_BUF_SIZE] __attribute__((coherent, aligned(16)));
uint8_t command [5] __attribute__((coherent, aligned(16)) = {0x0B, 0x00, 0x00, 0x00, 0x0FF};
uint8_t numElements = 0;
DRV_SQI_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;
DRV_SQI_TRANSFER_ELEMENT xferData[2];

// mySQIHandle is the handle returned by the DRV_SQI_Open function.
// Setup the transfer elements.

xferData[0].data = &command[0];
xferData[0].length = sizeof(command);
xferData[0].flag = (DRV_SQI_FLAG_MODE_SINGLE_LANE);

xferData[1].data = readBuffer;
xferData[1].length = READ_BUF_SIZE;
xferData[1].flag = (DRV_SQI_FLAG_MODE_QUAD_LANE | DRV_SQI_FLAG_DIR_READ | DRV_SQI_FLAG_DEASSERT_CS);

DRV_SQI_TransferData(mySQIHandle, &commandHandle, 0, xferData, 2);

if(DRV_SQI_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}
else
{
    // Transfer operation queued successfully. Wait for the
    // completion event.
}

// Transfer completion can be tracked either by polling on the commandHandle or waiting
// for the event using the event callback function.
status = DRV_SQI_CommandStatus(mySQIHandle, commandHandle);
if(status == DRV_SQI_COMMAND_COMPLETED)
{
    // Operation Done
}

// Event handler.
void APP_SQIEventHandler
(
    DRV_SQI_EVENT event,
    DRV_SQI_COMMAND_HANDLE handle,
    uintptr_t context
)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event
    // handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SQI_EVENT_COMMAND_COMPLETE:
            // This means the operation was completed
            // successfully.
            break;

        case DRV_SQI_EVENT_COMMAND_ERROR:
            // Operation failed. Handle the error.
            break;

        default:
            break;
    }
}
```

Configuring the Library

Macros

	Name	Description
	DRV_SQI_BUFFER_OBJECT_NUMBER	Selects the maximum number of buffer objects
	DRV_SQI_CLIENTS_NUMBER	Selects the maximum number of clients
	DRV_SQI_DMA_BUFFER_DESCRIPTORS_NUMBER	Selects the maximum number of DMA Buffer descriptors to be used by the driver.
	DRV_SQI_INSTANCES_NUMBER	Selects the maximum number of Driver instances that can be supported by the dynamic driver.
	DRV_SQI_INTERRUPT_MODE	Macro specifies operation of the driver to be in the interrupt mode or polled mode

Description

The configuration of the SQI driver is based on the file `system_config.h`.

This header file contains the configuration selection for the SQI driver. Based on the selections made, the SQI driver may support the selected features. These configuration settings will apply to all instances of the SQI driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_SQI_BUFFER_OBJECT_NUMBER Macro

Selects the maximum number of buffer objects

File

drv_sqi_config_template.h

C

```
#define DRV_SQI_BUFFER_OBJECT_NUMBER 5
```

Description

SQI Driver maximum number of buffer objects

This definition selects the maximum number of buffer objects. This indirectly also specifies the queue depth. The SQI Driver can queue up DRV_SQI_BUFFER_OBJECT_NUMBER of read/write/erase requests before return a DRV_SQI_BUFFER_HANDLE_INVALID due to the queue being full. Buffer objects are shared by all instances of the driver. Increasing this number increases the RAM requirement of the driver.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_SQI_CLIENTS_NUMBER Macro

Selects the maximum number of clients

File

drv_sqi_config_template.h

C

```
#define DRV_SQI_CLIENTS_NUMBER 1
```

Description

SQI maximum number of clients

This definition selects the maximum number of clients that the SQI driver can supported at run time. This constant defines the total number of SQI driver clients that will be available to all instances of the SQI driver.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_SQI_DMA_BUFFER_DESCRIPTORS_NUMBER Macro

Selects the maximum number of DMA Buffer descriptors to be used by the driver.

File

drv_sqi_config_template.h

C

```
#define DRV_SQI_DMA_BUFFER_DESCRIPTORS_NUMBER 4
```

Description

SQI Driver maximum number DMA Buffer Descriptors

This definition selects the maximum number of DMA buffer descriptor objects. The SQI Driver can queue up to DRV_SQI_DMA_BUFFER_DESCRIPTORS_NUMBER of transactions to be processed by the hardware. DMA buffer desired are shared by all instances of the driver. Increasing this number increases the RAM requirement of the driver.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_SQI_INSTANCES_NUMBER Macro

Selects the maximum number of Driver instances that can be supported by the dynamic driver.

File

drv_sqi_config_template.h

C

```
#define DRV_SQI_INSTANCES_NUMBER 1
```

Description

SQI Driver instance configuration

This definition selects the maximum number of Driver instances that can be supported by the dynamic driver. In case of this driver, multiple instances of the driver could use the same hardware instance.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_SQI_INTERRUPT_MODE Macro

Macro specifies operation of the driver to be in the interrupt mode or polled mode

File

drv_sqi_config_template.h

C

```
#define DRV_SQI_INTERRUPT_MODE true
```

Description

SQI interrupt and polled mode operation control

This macro specifies operation of the driver to be in the interrupt mode or polled mode

- true - Select if interrupt mode of SQI operation is desired
- false - Select if polling mode of SQI operation is desired

Not defining this option to true or false will result in build error.

Remarks

This macro is mandatory when building the driver for dynamic operation.

Building the Library

This section lists the files that are available in the SQI Driver Library.

Description

This section list the files that are available in the \src folder of the SQI Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (.h) and source (.c) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/sqi`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_sqi.h	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/dynamic/drv_sqi.c	This file contains the source code for the dynamic implementation of the SQI driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library

Module Dependencies

The SQI Driver Library depends on the following modules:

- Clock System Service Library

Optional Dependencies

- Interrupt System Service Library (used when task is running in Interrupt mode)

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_SQI_Initialize	Initializes the SQI instance for the specified driver index
	DRV_SQI_Deinitialize	Deinitializes the specified instance of the SQI driver module
	DRV_SQI_Status	Gets the current status of the SQI driver module.
	DRV_SQI_Tasks	Maintains the driver's task state machine.

b) Client Setup Functions

	Name	Description
	DRV_SQI_Open	Opens the specified SQI driver instance and returns a handle to it.
	DRV_SQI_Close	Closes an opened-instance of the SQI driver
	DRV_SQI_CommandStatus	Gets the current status of the transfer request.
	DRV_SQI_EventHandlerSet	Allows a client to register an event handling function, which the driver can invoke when the queued transfer request has completed.

c) Data Transfer Functions

	Name	Description
	DRV_SQI_TransferData	Queue a data transfer operation on the specified SQI device.
	DRV_SQI_TransferFrames	Queue a transfer request operation on the SQI device.

d) Data Types and Constants

	Name	Description
	DRV_SQI_COMMAND_HANDLE	Handle to identify the transfer request queued at the SQI driver.
	DRV_SQI_COMMAND_STATUS	Specifies the status of the transfer request.
	DRV_SQI_EVENT	Identifies the possible events that can result from a transfer request.
	DRV_SQI_EVENT_HANDLER	Pointer to a SQI Driver Event handler function
	DRV_SQI_SPI_OPERATION_MODE	Enumeration of the SPI mode of operation supported by the SQI Controller.
	DRV_SQI_TRANSFER_FLAGS	Enumeration of the configuration options associated with a single transfer element.
	DRV_SQI_TransferElement	Defines the data transfer element of the SQI driver.
	DRV_SQI_COMMAND_HANDLE_INVALID	Identifies an invalid command handle.
	DRV_SQI_INDEX_0	SQI driver index definitions.
	DRV_SQI_FLAG_32_BIT_ADDR_ENABLE	This is macro DRV_SQI_FLAG_32_BIT_ADDR_ENABLE.
	DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_MASK	This is macro DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_MASK.
	DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_POS	Enables 32-bit addressing instead of 24-bit addressing.
	DRV_SQI_FLAG_ADDR_ENABLE	This is macro DRV_SQI_FLAG_ADDR_ENABLE.
	DRV_SQI_FLAG_ADDR_ENABLE_MASK	This is macro DRV_SQI_FLAG_ADDR_ENABLE_MASK.
	DRV_SQI_FLAG_ADDR_ENABLE_POS	Address Enable Macro.
	DRV_SQI_FLAG_CRM_ENABLE	This is macro DRV_SQI_FLAG_CRM_ENABLE.
	DRV_SQI_FLAG_CRM_ENABLE_MASK	This is macro DRV_SQI_FLAG_CRM_ENABLE_MASK.
	DRV_SQI_FLAG_CRM_ENABLE_POS	Continuous Read Mode Enable Macro.
	DRV_SQI_FLAG_DATA_DIRECTION_MASK	This is macro DRV_SQI_FLAG_DATA_DIRECTION_MASK.
	DRV_SQI_FLAG_DATA_DIRECTION_POS	Macros to select the direction of the transfers.
	DRV_SQI_FLAG_DATA_DIRECTION_READ	This is macro DRV_SQI_FLAG_DATA_DIRECTION_READ.
	DRV_SQI_FLAG_DATA_DIRECTION_WRITE	This is macro DRV_SQI_FLAG_DATA_DIRECTION_WRITE.
	DRV_SQI_FLAG_DATA_ENABLE	This is macro DRV_SQI_FLAG_DATA_ENABLE.
	DRV_SQI_FLAG_DATA_ENABLE_MASK	This is macro DRV_SQI_FLAG_DATA_ENABLE_MASK.
	DRV_SQI_FLAG_DATA_ENABLE_POS	Data Enable Macro.
	DRV_SQI_FLAG_DATA_TARGET_MASK	This is macro DRV_SQI_FLAG_DATA_TARGET_MASK.
	DRV_SQI_FLAG_DATA_TARGET_MEMORY	This is macro DRV_SQI_FLAG_DATA_TARGET_MEMORY.
	DRV_SQI_FLAG_DATA_TARGET_POS	Macros to select the source and destination of a transfer.
	DRV_SQI_FLAG_DATA_TARGET_REGISTER	This is macro DRV_SQI_FLAG_DATA_TARGET_REGISTER.
	DRV_SQI_FLAG_DDR_ENABLE	This is macro DRV_SQI_FLAG_DDR_ENABLE.
	DRV_SQI_FLAG_DDR_ENABLE_MASK	This is macro DRV_SQI_FLAG_DDR_ENABLE_MASK.
	DRV_SQI_FLAG_DDR_ENABLE_POS	DDR Enable Macro.
	DRV_SQI_FLAG_INSTR_ENABLE	This is macro DRV_SQI_FLAG_INSTR_ENABLE.
	DRV_SQI_FLAG_INSTR_ENABLE_MASK	This is macro DRV_SQI_FLAG_INSTR_ENABLE_MASK.
	DRV_SQI_FLAG_INSTR_ENABLE_POS	Macros listing the bitmap values for the flags member of the DRV_SQI_TransferFrame structure. Instruction Enable Macro.
	DRV_SQI_FLAG_OPT_ENABLE	This is macro DRV_SQI_FLAG_OPT_ENABLE.
	DRV_SQI_FLAG_OPT_ENABLE_MASK	This is macro DRV_SQI_FLAG_OPT_ENABLE_MASK.
	DRV_SQI_FLAG_OPT_ENABLE_POS	Option Enable Macro.
	DRV_SQI_FLAG_OPT_LENGTH	This is macro DRV_SQI_FLAG_OPT_LENGTH.
	DRV_SQI_FLAG_OPT_LENGTH_1BIT	This is macro DRV_SQI_FLAG_OPT_LENGTH_1BIT.
	DRV_SQI_FLAG_OPT_LENGTH_2BIT	This is macro DRV_SQI_FLAG_OPT_LENGTH_2BIT.
	DRV_SQI_FLAG_OPT_LENGTH_4BIT	This is macro DRV_SQI_FLAG_OPT_LENGTH_4BIT.
	DRV_SQI_FLAG_OPT_LENGTH_8BIT	This is macro DRV_SQI_FLAG_OPT_LENGTH_8BIT.
	DRV_SQI_FLAG_OPT_LENGTH_MASK	This is macro DRV_SQI_FLAG_OPT_LENGTH_MASK.
	DRV_SQI_FLAG_OPT_LENGTH_POS	Macros to enable and specify the option length.
	DRV_SQI_FLAG_SQI_CS_NUMBER	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER.
	DRV_SQI_FLAG_SQI_CS_NUMBER_0	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_0.
	DRV_SQI_FLAG_SQI_CS_NUMBER_1	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_1.
	DRV_SQI_FLAG_SQI_CS_NUMBER_2	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_2.
	DRV_SQI_FLAG_SQI_CS_NUMBER_3	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_3.
	DRV_SQI_FLAG_SQI_CS_NUMBER_MASK	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_MASK.

	DRV_SQI_FLAG_SQI_CS_NUMBER_POS	Macros to select the SQI CS Line Number to be used for the current transfer • frame.
	DRV_SQI_LANE_CONFIG	Defines the SQI lane configuration options.
	DRV_SQI_TransferFrame	Defines the transfer frame of the SQI driver.

Description

This section describes the API functions of the SQI Driver Library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_SQI_Initialize Function

Initializes the SQI instance for the specified driver index

File

drv_sqi.h

C

```
SYS_MODULE_OBJ DRV_SQI_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT *const init);
```

Returns

Returns a valid handle to a driver instance object on success. Otherwise returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the SQI driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This routine must be called before any other SQI routines are called.

This routine should only be called once during system initialization unless DRV_SQI_Deinitialize is called to deinitialize the driver instance.

This routine will NEVER block for hardware access. If the operation requires time to allow the hardware to initialize, it will be reported by the DRV_SQI_Status operation. The system must use DRV_SQI_Status to find out when the driver is in the ready state.

Preconditions

None.

Example

```
// This code snippet shows an example of initializing the SQI Driver.

SYS_MODULE_OBJ  objectHandle;
TODO:Replace with appropriate init snippet.
    // SQI Driver Initialization Data
    const DRV_SQI_INIT drvSqiInit =
    {
        .sqiId = SQI_ID_0,
        .interruptSource = INT_SOURCE_SQI1,
        .enabledDevices = DRV_SQI_ENABLE_BOTH_DEVICES,
        .clockDivider = DRV_SQI_CLK_DIV_1,
        .devCfg[0].spiMode = DRV_SQI_SPI_MODE_0,
        .devCfg[0].lsbFirst = true,
        .devCfg[1].spiMode = DRV_SQI_SPI_MODE_3,
        .devCfg[1].lsbFirst = false,
    };

    objectHandle = DRV_SQI_Initialize(DRV_SQI_INDEX_0, (SYS_MODULE_INIT*)&drvSqiInit);
    if (SYS_MODULE_OBJ_INVALID == objectHandle)
    {
        // Handle error
    }
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized.
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_SQI_Initialize
(
const SYS_MODULE_INDEX index,
const SYS_MODULE_INIT * const init
);

DRV_SQI_Deinitialize Function

Deinitializes the specified instance of the SQI driver module

File

drv_sqi.h

C

```
void DRV_SQI_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SQI driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

Preconditions

Function DRV_SQI_Initialize should have been called before calling this function.

Parameter: object - Driver object handle, returned from the DRV_SQI_Initialize routine

Example

```
// This code snippet shows an example of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_SQI_Initialize
SYS_STATUS          status;

DRV_SQI_Deinitialize(object);

status = DRV_SQI_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later to know if the driver is deinitialized.
}
```

Function

void DRV_SQI_Deinitialize
(
SYS_MODULE_OBJ object
);

DRV_SQI_Status Function

Gets the current status of the SQI driver module.

File

drv_sqi.h

C

```
SYS_STATUS DRV_SQI_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and can accept transfer requests.

SYS_STATUS_UNINITIALIZED - Indicates the driver is not initialized.

Description

This routine provides the current status of the SQI driver module.

Remarks

This routine will NEVER block waiting for hardware.

Preconditions

Function DRV_SQI_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SQI_Initialize
SYS_STATUS          sqiStatus;

sqiStatus = DRV_SQI_Status(object);
else if (SYS_STATUS_ERROR >= sqiStatus)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SQI_Initialize routine

Function

SYS_STATUS DRV_SQI_Status

(

SYS_MODULE_OBJ object

);

DRV_SQI_Tasks Function

Maintains the driver's task state machine.

File

drv_sqi.h

C

```
void DRV_SQI_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal task state machine.

Remarks

This routine may either be called by the system's task routine(SYS_Tasks) or the from the interrupt service routine of the peripheral.

Preconditions

The DRV_SQI_Initialize routine must have been called for the specified SQI driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SQI_Initialize

while (true)
{
    DRV_SQI_Tasks (object);
    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SQI_Initialize)

Function

void DRV_SQI_Tasks

(

SYS_MODULE_OBJ object

);

b) Client Setup Functions

DRV_SQI_Open Function

Opens the specified SQI driver instance and returns a handle to it.

File

drv_sqi.h

C

```
DRV_HANDLE DRV_SQI_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, DRV_HANDLE_INVALID is returned. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_SQI_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.
- if the driver hardware instance being opened is not initialized or is invalid

Description

This routine opens the specified SQI driver instance and provides a handle identifying the SQI driver instance. This handle must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The handle returned is valid until the DRV_SQI_Close routine is called. This routine will NEVER block waiting for hardware. If the driver has has already been opened, it cannot be opened exclusively.

Preconditions

Function DRV_SQI_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_SQI_Open(DRV_SQI_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened.
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver.

Function

```
  DRV_HANDLE DRV_SQI_Open
(
const SYS_MODULE_INDEX index,
const    DRV_IO_INTENT ioIntent
);
```

DRV_SQI_Close Function

Closes an opened-instance of the SQI driver

File

drv_sqi.h

C

```
void DRV_SQI_Close(const DRV_HANDLE handle);
```

Returns

None

Description

This routine closes an opened-instance of the SQI driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SQI_Open before the caller may use the driver again. Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SQI_Initialize routine must have been called for the specified SQI driver instance.

DRV_SQI_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SQI_Open

DRV_SQI_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

```
void DRV_SQI_Close
(
const    DRV_HANDLE handle
);
```

DRV_SQI_CommandStatus Function

Gets the current status of the transfer request.

File

drv_sqi.h

C

```
DRV_SQI_COMMAND_STATUS DRV_SQI_CommandStatus(const DRV_HANDLE handle, const DRV_SQI_COMMAND_HANDLE
commandHandle);
```

Returns

A DRV_SQI_COMMAND_STATUS value describing the current status of the transfer request. Returns DRV_SQI_COMMAND_ERROR_UNKNOWN if the client handle or the handle is not valid.

Description

This routine gets the current status of the tranfer request. The application must use this routine where the status of a scheduled transfer request needs to polled on. The function may return DRV_SQI_COMMAND_COMPLETED in a case where the handle has expired. A handle expires when the internal buffer object is re-assigned to another transfer request. It is recommended that this function be called regularly in order to track the status of the transfer request correctly.

The application can alternatively register an event handler to receive the transfer completion events.

Remarks

This routine will not block for hardware access and will immediately return the current status of the transfer request.

Preconditions

The DRV_SQI_Initialize() routine must have been called.

The DRV_SQI_Open() must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE                  handle;         // Returned from DRV_SQI_Open
DRV_SQI_COMMAND_HANDLE      commandHandle;
DRV_SQI_COMMAND_STATUS      status;

status = DRV_SQI_CommandStatus(handle, commandHandle);
if(status == DRV_SQI_COMMAND_COMPLETED)
{
    // Operation Done
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_SQI_COMMAND_STATUS DRV_SQI_CommandStatus

(

const DRV_HANDLE handle,

const DRV_SQI_COMMAND_HANDLE commandHandle

);

DRV_SQI_EventHandlerSet Function

Allows a client to register an event handling function, which the driver can invoke when the queued transfer request has completed.

File

drv_sqi.h

C

```
void DRV_SQI_EventHandlerSet(const DRV_HANDLE handle, const void * eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client queues a transfer request with the driver, it is provided with a handle identifying the transfer request that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any transfer operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_SQI_Initialize() routine must have been called for the specified SQI driver instance.

The DRV_SQI_Open() routine must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

DRV_SQI_TransferFrame xferFrame;
DRV_SQI_COMMAND_HANDLE commandHandle;

// drvSQIHandle is the handle returned by the DRV_SQI_Open function.
// Client registers an event handler with driver. This is done once.
DRV_SQI_EventHandlerSet(drvSQIHandle, APP_SQIEventHandler, (uintptr_t)&myAppObj);

DRV_SQI_Read(drvSQIHandle, &commandHandle, &xferFrame, 1);

if(DRV_SQI_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event handler.
void APP_SQIEventHandler
(
    DRV_SQI_EVENT event,
    DRV_SQI_COMMAND_HANDLE handle,
    uintptr_t context
)
{
    // The context handle was set to an application specific object. It is
    // now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SQI_EVENT_COMMAND_COMPLETE:
            // This means the operation was completed successfully.
            break;

        case DRV_SQI_EVENT_COMMAND_ERROR:
            // Operation failed. Handle the error.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user

context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_SQI_EventHandlerSet
(
const DRV_HANDLE handle,
const void *eventHandler,
const uintptr_t context
);

c) Data Transfer Functions

DRV_SQI_TransferData Function

Queue a data transfer operation on the specified SQI device.

File

drv_sqi.h

C

```
void DRV_SQI_TransferData(DRV_HANDLE handle, DRV_SQI_COMMAND_HANDLE * commandHandle, uint8_t sqiDevice,
DRV_SQI_TransferElement * xferData, uint8_t numElements);
```

Returns

The handle to the command request is returned in the commandHandle argument. It will be DRV_SQI_COMMAND_HANDLE_INVALID if the request was not successful.

Description

This routine queues a data transfer operation on the specified SQI device. The reads or writes of blocks of data generally involves sending down the read or a write command, the address on the device from/to which data is to be read/written. The client also has to specify the source or destination buffer and the number of bytes to be read or written. The client builds an array of transfer elements containing these information and passes the array and the number of elements of the array as part of this transfer operation. If an event handler is registered with the driver the event handler would be invoked with the status of the operation once the operation has been completed. The function returns DRV_SQI_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the driver handle is invalid
- if the transfer element is NULL or number of transfer elements is zero
- if a buffer object could not be allocated to the request

Remarks

None.

Preconditions

The DRV_SQI_Initialize routine must have been called for the specified SQI driver instance.

DRV_SQI_Open must have been called with DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE as the ioIntent to obtain a valid opened device handle.

Example

```
#define READ_BUF_SIZE 512

uint8_t readBuffer[READ_BUF_SIZE] __attribute__((coherent, aligned(16)));
uint8_t command [5] __attribute__((coherent, aligned(16)) = {0x0B, 0x00, 0x00, 0x00, 0x0FF};
uint8_t numElements = 0;
DRV_SQI_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;
DRV_SQI_TransferElement xferData[2];

// mySQIHandle is the handle returned by the DRV_SQI_Open function.
// Setup the transfer elements.
```

```
xferData[0].data = &command[0];
xferData[0].length = sizeof(command);
xferData[0].flag = (DRV_SQI_FLAG_MODE_SINGLE_LANE);

xferData[1].data = readBuffer;
xferData[1].length = READ_BUF_SIZE;
xferData[1].flag = (DRV_SQI_FLAG_MODE_QUAD_LANE | DRV_SQI_FLAG_DIR_READ | DRV_SQI_FLAG_DEASSERT_CS);

DRV_SQI_TransferData(mySQIHandle, &commandHandle, 0, xferData, 2);

if(DRV_SQI_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}
else
{
    // Transfer operation queued successfully. Wait for the completion event.
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
sqiDevice	The SQI device index on which the operation is to be performed.
xferData	Pointer to the transfer elements array.
numElements	Number of elements in the transfer elements array.

Function

void DRV_SQI_TransferData
(
    DRV_HANDLE handle,
    DRV_SQI_COMMAND_HANDLE *commandHandle,
uint8_t sqiDevice,
    DRV_SQI_TransferElement *xferData,
uint8_t numElements
);

DRV_SQI_TransferFrames Function

Queue a transfer request operation on the SQI device.

File

drv_sqi.h

C

```
void DRV_SQI_TransferFrames(DRV_HANDLE handle, DRV_SQI_COMMAND_HANDLE * commandHandle,
DRV_SQI_TransferFrame * frame, uint8_t numFrames);
```

Returns

The handle to the transfer request is returned in the commandHandle argument. It will be DRV_SQI_COMMAND_HANDLE_INVALID if the request was not successful.

Description

This routine queues a transfer request operation on the SQI device. In order to perform any operation on the sqi flash device, a one byte instruction specifying the operation to be performed needs to be sent out. This is followed by optional address from/to which data is to be read/written, option, dummy and data bytes.

If an event handler is registered with the driver the event handler would be invoked with the status of the operation once the operation has been completed. The function returns DRV_SQI_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the driver handle is invalid
- if the transfer element is NULL or number of transfer elements is zero
- if a buffer object could not be allocated to the request

Remarks

None.

Preconditions

The DRV_SQI_Initialize routine must have been called for the specified SQI driver instance.

DRV_SQI_Open must have been called with DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE as the ioIntent to obtain a valid opened device handle.

Example

```
#define READ_BUF_SIZE 512

uint8_t readBuffer[READ_BUF_SIZE];
uint8_t numElements = 0;
DRV_SQI_COMMAND_HANDLE cmdHandle;
DRV_SQI_TransferFrame xferFrame;

DRV_SQI_TransferFrame *frame = &xferFrame;
frame->instruction = 0x6B;
frame->address = 0x00;
frame->data = readBuffer;
frame->length = READ_BUF_SIZE;
frame->laneCfg = DRV_SQI_LANE_QUAD_DATA;
frame->numDummyBytes = 8;
frame->flags = (DRV_SQI_FLAG_INSTR_ENABLE_MASK | DRV_SQI_FLAG_DATA_ENABLE_MASK |
    DRV_SQI_FLAG_ADDR_ENABLE_MASK | DRV_SQI_FLAG_DATA_TARGET_MEMORY |
    DRV_SQI_FLAG_DATA_DIRECTION_READ);
DRV_SQI_TransferFrames (sqiHandle, &cmdHandle, frame, 1);
if (cmdHandle == DRV_SQI_COMMAND_HANDLE_INVALID)
{
    // handle the failure.
}
else
{
    // continue with the rest of the operation.
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the handle to the track the status of the transfer request.
frame	Pointer to the transfer frame array.
numFrames	Number of elements in the transfer frame array.

Function

void DRV_SQI_TransferFrames

(

DRV_HANDLE handle,

DRV_SQI_COMMAND_HANDLE *commandHandle,

DRV_SQI_TransferFrame *frame,

uint8_t numFrames

);

d) Data Types and Constants

DRV_SQI_COMMAND_HANDLE Type

Handle to identify the transfer request queued at the SQI driver.

File

drv_sqi.h

C

```
typedef uintptr_t DRV_SQI_COMMAND_HANDLE;
```

Description

SQI Driver Command Handle

A command handle is returned by a call to the DRV_SQI_TransferFrames () function. This handle allows the application to track the completion of the request. This command handle is also returned to the client along with the event that has occurred with respect to the request. This allows the application to connect the event to a specific transfer request in case where multiple requests are queued.

The command handle associated with the transfer request expires when the client has been notified of the completion of the request (after event handler function that notifies the client returns) or after the request has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SQI_COMMAND_STATUS Enumeration

Specifies the status of the transfer request.

File

drv_sqi.h

C

```
typedef enum {
  DRV_SQI_COMMAND_COMPLETED,
  DRV_SQI_COMMAND_QUEUED,
  DRV_SQI_COMMAND_IN_PROGRESS,
  DRV_SQI_COMMAND_ERROR_UNKNOWN
} DRV_SQI_COMMAND_STATUS;
```

Members

Members	Description
DRV_SQI_COMMAND_COMPLETED	Command completed.
DRV_SQI_COMMAND_QUEUED	Command is pending.
DRV_SQI_COMMAND_IN_PROGRESS	Command is being processed
DRV_SQI_COMMAND_ERROR_UNKNOWN	There was an error while processing the command.

Description

SQI Driver Command Status

This enumeration identifies the possible status values associated with a transfer request. The client can retrieve the status by calling the DRV_SQI_CommandStatus () function and passing the command handle associated with the request.

Remarks

None.

DRV_SQI_EVENT Enumeration

Identifies the possible events that can result from a transfer request.

File

drv_sqi.h

C

```
typedef enum {
  DRV_SQI_EVENT_COMMAND_COMPLETE = 0,
  DRV_SQI_EVENT_COMMAND_ERROR
} DRV_SQI_EVENT;
```

Members

Members	Description
DRV_SQI_EVENT_COMMAND_COMPLETE = 0	Operation has been completed successfully.
DRV_SQI_EVENT_COMMAND_ERROR	There was an error during the operation

Description

SQI Driver Events

This enumeration identifies the possible events that can result from a transfer request issued by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SQI_EventHandlerSet function when a request is completed.

DRV_SQI_EVENT_HANDLER Type

Pointer to a SQI Driver Event handler function

File

drv_sqi.h

C

```
typedef void (* DRV_SQI_EVENT_HANDLER)(DRV_SQI_EVENT event, DRV_SQI_COMMAND_HANDLE commandHandle, void
*context);
```

Returns

None.

Description

SQI Driver Event Handler Function Pointer data type.

This data type defines the required function signature for the SQI driver event handling callback function. A client must register a pointer to a event handling function the signature(parameter and return value types) of which should match the types specified by this function pointer in order to receive transfer request related event call backs from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SQI_EVENT_COMMAND_COMPLETE, that the operation associated with the transfer request was completed successfully. If the event is DRV_SQI_EVENT_COMMAND_ERROR, there was an error while executing the transfer request.

The context parameter contains context details provided by the client as part of registering the event handler function. This context value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) of the client that made the request.

Example

```
void MyAppCommandEventHandler
(
    DRV_SQI_EVENT event,
    DRV_SQI_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT)context;

    switch(event)
    {
        case DRV_SQI_EVENT_COMMAND_COMPLETE:
            // Handle the completed transfer request.
            break;

        case DRV_SQI_EVENT_COMMAND_ERROR:
        default:
            // Handle the failed transfer request.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle identifying the transfer request to which this event relates

context	Value identifying the context of the application that registered the event handling function.

DRV_SQI_SPI_OPERATION_MODE Enumeration

Enumeration of the SPI mode of operation supported by the SQI Controller.

File

drv_sqi.h

C

```
typedef enum {
  DRV_SQI_SPI_MODE_0 = 0,
  DRV_SQI_SPI_MODE_3 = 3
} DRV_SQI_SPI_OPERATION_MODE;
```

Members

Members	Description
DRV_SQI_SPI_MODE_0 = 0	CPOL = 0 and CPHA = 0. SCK Idle state = LOW
DRV_SQI_SPI_MODE_3 = 3	CPOL = 1 and CPHA = 1. SCK Idle state = HIGH

Description

SQI SPI Mode of operation

This enumeration lists the SPI mode of operation supported by the SQI controller. In MODE 0 of operation: CPOL = 0 and CPHA = 0. SCK Idle state = LOW

In MODE 3 of operation: CPOL = 1 and CPHA = 1. SCK Idle state = HIGH

In both MODE 0 and MODE 3 of operation the: SQI Data Input is sampled on the rising edge of the SQI Clock SQI Data is Output on the falling edge of the SQI Clock

Remarks

None

DRV_SQI_TRANSFER_FLAGS Enumeration

Enumeration of the configuration options associated with a single transfer element.

File

drv_sqi.h

C

```
typedef enum {
  DRV_SQI_FLAG_MODE_SINGLE_LANE = 0x00,
  DRV_SQI_FLAG_MODE_DUAL_LANE = 0x01,
  DRV_SQI_FLAG_MODE_QUAD_LANE = 0x02,
  DRV_SQI_FLAG_DDR_MODE = 0x04,
  DRV_SQI_FLAG_DEASSERT_CS = 0x08,
  DRV_SQI_FLAG_DIR_READ = 0x80
} DRV_SQI_TRANSFER_FLAGS;
```

Members

Members	Description
DRV_SQI_FLAG_MODE_SINGLE_LANE = 0x00	Bits 0-1: Indicates the Lane configuration to be used.
DRV_SQI_FLAG_DDR_MODE = 0x04	Bit 2: This bit indicates if DDR or SDR mode of operation is to be used.
DRV_SQI_FLAG_DEASSERT_CS = 0x08	Bit 3: This bit indicates if CS is to be de-asserted at the end of this • transaction.
DRV_SQI_FLAG_DIR_READ = 0x80	Bit 7: This bit indicates if the operation is a read or a write.

Description

Flags associated with the SQI Driver Transfer element.

This enumeration lists the various configuration options associated with a single transfer element(Refer to the data structure DRV_SQI_TransferElement). The client can specify one or more of these as configuration parameters of a single transfer element.

Remarks

None

DRV_SQI_TransferElement Structure

Defines the data transfer element of the SQI driver.

File

drv_sqi.h

C

```
typedef struct {
  uint8_t * data;
  uint32_t length;
  uint8_t flag;
} DRV_SQI_TransferElement;
```

Members

Members	Description
uint8_t * data;	Pointer to the source or destination buffer
uint32_t length;	Length of the buffer in bytes.
uint8_t flag;	This is a bitmap used to indicate the configuration options to be used • for this transfer element. One or more values of the enumeration • DRV_SQI_TRANSFER_FLAGS can be passed as part of this flag.

Description

SQI Driver data transfer element.

This data type defines the composition of a single transfer element. A single element will consist of the pointer to the source of destination buffer, length of the data to be transferred or received and the various configuration options to be used for the element. The configuration options also indicate if data is transferred to/from the device. A client builds an array of such transfer elements and passes the array and the number of elements of the array as part of the read or write operation.

Remarks

None.

DRV_SQI_COMMAND_HANDLE_INVALID Macro

Identifies an invalid command handle.

File

drv_sqi.h

C

```
#define DRV_SQI_COMMAND_HANDLE_INVALID ((DRV_SQI_COMMAND_HANDLE)(-1))
```

Description

SQI Driver Invalid Command Handle

This is the definition of an invalid command handle. An invalid command handle is returned by DRV_SQI_TransferFrames() function if the transfer request was not queued.

Remarks

None.

DRV_SQI_INDEX_0 Macro

SQI driver index definitions.

File

drv_sqi.h

C

```
#define DRV_SQI_INDEX_0 0
```

Description

SQI Driver Module Index Numbers

This constant provides the SQI driver index definition.

Remarks

This constant should be used in place of hard-coded numeric literal.

This value should be passed into the DRV_SQI_Initialize and DRV_SQI_Open functions to identify the driver instance in use.

DRV_SQI_FLAG_32_BIT_ADDR_ENABLE Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_32_BIT_ADDR_ENABLE(value) (DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_MASK & ((value) <<
DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_POS))
```

Description

This is macro DRV_SQI_FLAG_32_BIT_ADDR_ENABLE.

DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_MASK (0x1U << DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_POS)
```

Description

This is macro DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_MASK.

DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_POS (6)
```

Description

Enables 32-bit addressing instead of 24-bit addressing.

DRV_SQI_FLAG_ADDR_ENABLE Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_ADDR_ENABLE(value) (DRV_SQI_FLAG_ADDR_ENABLE_MASK & ((value) <<
DRV_SQI_FLAG_ADDR_ENABLE_POS))
```

Description

This is macro DRV_SQI_FLAG_ADDR_ENABLE.

DRV_SQI_FLAG_ADDR_ENABLE_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_ADDR_ENABLE_MASK (0x1U << DRV_SQI_FLAG_ADDR_ENABLE_POS)
```

Description

This is macro DRV_SQI_FLAG_ADDR_ENABLE_MASK.

DRV_SQI_FLAG_ADDR_ENABLE_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_ADDR_ENABLE_POS (1)
```

Description

Address Enable Macro.

DRV_SQI_FLAG_CRM_ENABLE Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_CRM_ENABLE(value) (DRV_SQI_FLAG_CRM_ENABLE_MASK & ((value) <<
DRV_SQI_FLAG_CRM_ENABLE_POS))
```

Description

This is macro DRV_SQI_FLAG_CRM_ENABLE.

DRV_SQI_FLAG_CRM_ENABLE_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_CRM_ENABLE_MASK (0x1U << DRV_SQI_FLAG_CRM_ENABLE_POS)
```

Description

This is macro DRV_SQI_FLAG_CRM_ENABLE_MASK.

DRV_SQI_FLAG_CRM_ENABLE_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_CRM_ENABLE_POS (5)
```

Description

Continuous Read Mode Enable Macro.

DRV_SQI_FLAG_DATA_DIRECTION_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_DIRECTION_MASK (0x1U << DRV_SQI_FLAG_DATA_DIRECTION_POS)
```

Description

This is macro DRV_SQI_FLAG_DATA_DIRECTION_MASK.

DRV_SQI_FLAG_DATA_DIRECTION_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_DIRECTION_POS (11)
```

Description

Macros to select the direction of the transfers.

DRV_SQI_FLAG_DATA_DIRECTION_READ Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_DIRECTION_READ (DRV_SQI_FLAG_DATA_DIRECTION_MASK & ((0x1U) <<
DRV_SQI_FLAG_DATA_DIRECTION_POS))
```

Description

This is macro DRV_SQI_FLAG_DATA_DIRECTION_READ.

DRV_SQI_FLAG_DATA_DIRECTION_WRITE Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_DIRECTION_WRITE (DRV_SQI_FLAG_DATA_DIRECTION_MASK & ((0x0U) <<
DRV_SQI_FLAG_DATA_DIRECTION_POS))
```

Description

This is macro DRV_SQI_FLAG_DATA_DIRECTION_WRITE.

DRV_SQI_FLAG_DATA_ENABLE Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_ENABLE(value) (DRV_SQI_FLAG_DATA_ENABLE_MASK & ((value) <<
DRV_SQI_FLAG_DATA_ENABLE_POS))
```

Description

This is macro DRV_SQI_FLAG_DATA_ENABLE.

DRV_SQI_FLAG_DATA_ENABLE_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_ENABLE_MASK (0x1U << DRV_SQI_FLAG_DATA_ENABLE_POS)
```

Description

This is macro DRV_SQI_FLAG_DATA_ENABLE_MASK.

DRV_SQI_FLAG_DATA_ENABLE_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_ENABLE_POS (3)
```

Description

Data Enable Macro.

DRV_SQI_FLAG_DATA_TARGET_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_TARGET_MASK (0x1U << DRV_SQI_FLAG_DATA_TARGET_POS)
```

Description

This is macro DRV_SQI_FLAG_DATA_TARGET_MASK.

DRV_SQI_FLAG_DATA_TARGET_MEMORY Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_TARGET_MEMORY (DRV_SQI_FLAG_DATA_TARGET_MASK & ((0x1U) <<
DRV_SQI_FLAG_DATA_TARGET_POS))
```

Description

This is macro DRV_SQI_FLAG_DATA_TARGET_MEMORY.

DRV_SQI_FLAG_DATA_TARGET_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_TARGET_POS (10)
```

Description

Macros to select the source and destination of a transfer.

DRV_SQI_FLAG_DATA_TARGET_REGISTER Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DATA_TARGET_REGISTER (DRV_SQI_FLAG_DATA_TARGET_MASK & ((0x0U) <<
DRV_SQI_FLAG_DATA_TARGET_POS))
```

Description

This is macro DRV_SQI_FLAG_DATA_TARGET_REGISTER.

DRV_SQI_FLAG_DDR_ENABLE Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DDR_ENABLE(value) (DRV_SQI_FLAG_DDR_ENABLE_MASK & ((value) <<
DRV_SQI_FLAG_DDR_ENABLE_POS))
```

Description

This is macro DRV_SQI_FLAG_DDR_ENABLE.

DRV_SQI_FLAG_DDR_ENABLE_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DDR_ENABLE_MASK (0x1U << DRV_SQI_FLAG_DDR_ENABLE_POS)
```

Description

This is macro DRV_SQI_FLAG_DDR_ENABLE_MASK.

DRV_SQI_FLAG_DDR_ENABLE_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_DDR_ENABLE_POS (4)
```

Description

DDR Enable Macro.

DRV_SQI_FLAG_INSTR_ENABLE Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_INSTR_ENABLE(value) (DRV_SQI_FLAG_INSTR_ENABLE_MASK & ((value) <<
DRV_SQI_FLAG_INSTR_ENABLE_POS))
```

Description

This is macro DRV_SQI_FLAG_INSTR_ENABLE.

DRV_SQI_FLAG_INSTR_ENABLE_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_INSTR_ENABLE_MASK (0x1U << DRV_SQI_FLAG_INSTR_ENABLE_POS)
```

Description

This is macro DRV_SQI_FLAG_INSTR_ENABLE_MASK.

DRV_SQI_FLAG_INSTR_ENABLE_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_INSTR_ENABLE_POS (0)
```

Description

Macros listing the bitmap values for the flags member of the DRV_SQI_TransferFrame structure. Instruction Enable Macro.

DRV_SQI_FLAG_OPT_ENABLE Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_OPT_ENABLE(value) (DRV_SQI_FLAG_OPT_ENABLE_MASK & ((value) <<
DRV_SQI_FLAG_OPT_ENABLE_POS))
```

Description

This is macro DRV_SQI_FLAG_OPT_ENABLE.

DRV_SQI_FLAG_OPT_ENABLE_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_OPT_ENABLE_MASK (0x1U << DRV_SQI_FLAG_OPT_ENABLE_POS)
```

Description

This is macro DRV_SQI_FLAG_OPT_ENABLE_MASK.

DRV_SQI_FLAG_OPT_ENABLE_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_OPT_ENABLE_POS (2)
```

Description

Option Enable Macro.

DRV_SQI_FLAG_OPT_LENGTH Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_OPT_LENGTH(value) (DRV_SQI_FLAG_OPT_LENGTH_MASK & ((value) <<
DRV_SQI_FLAG_OPT_LENGTH_POS))
```

Description

This is macro DRV_SQI_FLAG_OPT_LENGTH.

DRV_SQI_FLAG_OPT_LENGTH_1BIT Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_OPT_LENGTH_1BIT (0x0U)
```

Description

This is macro DRV_SQI_FLAG_OPT_LENGTH_1BIT.

DRV_SQI_FLAG_OPT_LENGTH_2BIT Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_OPT_LENGTH_2BIT (0x1U)
```

Description

This is macro DRV_SQI_FLAG_OPT_LENGTH_2BIT.

DRV_SQI_FLAG_OPT_LENGTH_4BIT Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_OPT_LENGTH_4BIT (0x2U)
```

Description

This is macro DRV_SQI_FLAG_OPT_LENGTH_4BIT.

DRV_SQI_FLAG_OPT_LENGTH_8BIT Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_OPT_LENGTH_8BIT (0x3U)
```

Description

This is macro DRV_SQI_FLAG_OPT_LENGTH_8BIT.

DRV_SQI_FLAG_OPT_LENGTH_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_OPT_LENGTH_MASK (0x3U << DRV_SQI_FLAG_OPT_LENGTH_POS)
```

Description

This is macro DRV_SQI_FLAG_OPT_LENGTH_MASK.

DRV_SQI_FLAG_OPT_LENGTH_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_OPT_LENGTH_POS (8)
```

Description

Macros to enable and specify the option length.

DRV_SQI_FLAG_SQI_CS_NUMBER Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_SQI_CS_NUMBER(value) (DRV_SQI_FLAG_SQI_CS_NUMBER_MASK & ((value) <<
DRV_SQI_FLAG_SQI_CS_NUMBER_POS))
```

Description

This is macro DRV_SQI_FLAG_SQI_CS_NUMBER.

DRV_SQI_FLAG_SQI_CS_NUMBER_0 Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_SQI_CS_NUMBER_0 (0x0U)
```

Description

This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_0.

DRV_SQI_FLAG_SQI_CS_NUMBER_1 Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_SQI_CS_NUMBER_1 (0x1U)
```

Description

This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_1.

DRV_SQI_FLAG_SQI_CS_NUMBER_2 Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_SQI_CS_NUMBER_2 (0x2U)
```

Description

This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_2.

DRV_SQI_FLAG_SQI_CS_NUMBER_3 Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_SQI_CS_NUMBER_3 (0x3U)
```

Description

This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_3.

DRV_SQI_FLAG_SQI_CS_NUMBER_MASK Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_SQI_CS_NUMBER_MASK (0x3U << DRV_SQI_FLAG_SQI_CS_NUMBER_POS)
```

Description

This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_MASK.

DRV_SQI_FLAG_SQI_CS_NUMBER_POS Macro

File

drv_sqi.h

C

```
#define DRV_SQI_FLAG_SQI_CS_NUMBER_POS (16)
```

Description

Macros to select the SQI CS Line Number to be used for the current transfer

- frame.

DRV_SQI_LANE_CONFIG Enumeration

Defines the SQI lane configuration options.

File

drv_sqi.h

C

```
typedef enum {
  DRV_SQI_LANE_SINGLE = 0,
  DRV_SQI_LANE_DUAL_DATA,
  DRV_SQI_LANE_QUAD_DATA,
  DRV_SQI_LANE_DUAL_ADDR_DATA,
  DRV_SQI_LANE_QUAD_ADDR_DATA,
```

```
  DRV_SQI_LANE_DUAL_ALL,
  DRV_SQI_LANE_QUAD_ALL
} DRV_SQI_LANE_CONFIG;
```

Members

Members	Description
DRV_SQI_LANE_SINGLE = 0	Instruction opcode, Address and Data are all sent in single lane
DRV_SQI_LANE_DUAL_DATA	Instruction opcode and Address are sent in single lane, while data is • sent using dual lane.
DRV_SQI_LANE_QUAD_DATA	Instruction opcode and Address are sent in single lane, while data is • sent using quad lane.
DRV_SQI_LANE_DUAL_ADDR_DATA	Instruction opcode is sent in single lane, Address and Data are sent • using dual lane.
DRV_SQI_LANE_QUAD_ADDR_DATA	Instruction opcode is sent in single lane, Address and Data are sent • using quad lane.
DRV_SQI_LANE_DUAL_ALL	Instruction opcode, Address and Data are sent using dual lanes.
DRV_SQI_LANE_QUAD_ALL	Instruction opcode, Address and Data are sent using quad lanes.

Description

SQI lane configuration options.

This enumeration lists the various lane configuration options provided by the driver.

Remarks

None.

DRV_SQI_TransferFrame Structure

Defines the transfer frame of the SQI driver.

File

drv_sqi.h

C

```
typedef struct {
  uint8_t instruction;
  uint32_t address;
  uint8_t * data;
  uint32_t length;
  DRV_SQI_LANE_CONFIG laneCfg;
  uint8_t option;
  uint8_t numDummyBytes;
  uint32_t flags;
} DRV_SQI_TransferFrame;
```

Members

Members	Description
uint8_t instruction;	8-bit instruction opcode.
uint32_t address;	24/32-bit address.
uint8_t * data;	Pointer to the source or destination buffer
uint32_t length;	Length of the buffer in bytes.
DRV_SQI_LANE_CONFIG laneCfg;	Lane Configuration.
uint8_t option;	Option code associated with the current command.
uint8_t numDummyBytes;	Optional number of dummy bytes associated with the current command.
uint32_t flags;	This is bit-map field providing various configuration options for the • current frame.

Description

SQI Driver transfer frame.

This data type defines the composition of a single transfer frame. In order to perform any operation on the SQI flash device, a one byte instruction specifying the operation to be performed needs to be sent out. This is followed by optional address from/to which data is to be read/written, option, dummy and data bytes.

The configuration options also indicate if data is transferred to/from the device.

Remarks

None.

Description

This section lists the source and header files used by the SQI Driver Library.

drv_sqi.h

SQI Driver Interface Definition

Enumerations

	Name	Description
	DRV_SQI_COMMAND_STATUS	Specifies the status of the transfer request.
	DRV_SQI_EVENT	Identifies the possible events that can result from a transfer request.
	DRV_SQI_LANE_CONFIG	Defines the SQI lane configuration options.
	DRV_SQI_SPI_OPERATION_MODE	Enumeration of the SPI mode of operation supported by the SQI Controller.
	DRV_SQI_TRANSFER_FLAGS	Enumeration of the configuration options associated with a single transfer element.

Functions

	Name	Description
	DRV_SQI_Close	Closes an opened-instance of the SQI driver
	DRV_SQI_CommandStatus	Gets the current status of the transfer request.
	DRV_SQI_Deinitialize	Deinitializes the specified instance of the SQI driver module
	DRV_SQI_EventHandlerSet	Allows a client to register an event handling function, which the driver can invoke when the queued transfer request has completed.
	DRV_SQI_Initialize	Initializes the SQI instance for the specified driver index
	DRV_SQI_Open	Opens the specified SQI driver instance and returns a handle to it.
	DRV_SQI_Status	Gets the current status of the SQI driver module.
	DRV_SQI_Tasks	Maintains the driver's task state machine.
	DRV_SQI_TransferData	Queue a data transfer operation on the specified SQI device.
	DRV_SQI_TransferFrames	Queue a transfer request operation on the SQI device.

Macros

	Name	Description
	DRV_SQI_COMMAND_HANDLE_INVALID	Identifies an invalid command handle.
	DRV_SQI_FLAG_32_BIT_ADDR_ENABLE	This is macro DRV_SQI_FLAG_32_BIT_ADDR_ENABLE.
	DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_MASK	This is macro DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_MASK.
	DRV_SQI_FLAG_32_BIT_ADDR_ENABLE_POS	Enables 32-bit addressing instead of 24-bit addressing.
	DRV_SQI_FLAG_ADDR_ENABLE	This is macro DRV_SQI_FLAG_ADDR_ENABLE.
	DRV_SQI_FLAG_ADDR_ENABLE_MASK	This is macro DRV_SQI_FLAG_ADDR_ENABLE_MASK.
	DRV_SQI_FLAG_ADDR_ENABLE_POS	Address Enable Macro.
	DRV_SQI_FLAG_CRM_ENABLE	This is macro DRV_SQI_FLAG_CRM_ENABLE.
	DRV_SQI_FLAG_CRM_ENABLE_MASK	This is macro DRV_SQI_FLAG_CRM_ENABLE_MASK.
	DRV_SQI_FLAG_CRM_ENABLE_POS	Continuous Read Mode Enable Macro.
	DRV_SQI_FLAG_DATA_DIRECTION_MASK	This is macro DRV_SQI_FLAG_DATA_DIRECTION_MASK.
	DRV_SQI_FLAG_DATA_DIRECTION_POS	Macros to select the direction of the transfers.
	DRV_SQI_FLAG_DATA_DIRECTION_READ	This is macro DRV_SQI_FLAG_DATA_DIRECTION_READ.

	DRV_SQI_FLAG_DATA_DIRECTION_WRITE	This is macro DRV_SQI_FLAG_DATA_DIRECTION_WRITE.
	DRV_SQI_FLAG_DATA_ENABLE	This is macro DRV_SQI_FLAG_DATA_ENABLE.
	DRV_SQI_FLAG_DATA_ENABLE_MASK	This is macro DRV_SQI_FLAG_DATA_ENABLE_MASK.
	DRV_SQI_FLAG_DATA_ENABLE_POS	Data Enable Macro.
	DRV_SQI_FLAG_DATA_TARGET_MASK	This is macro DRV_SQI_FLAG_DATA_TARGET_MASK.
	DRV_SQI_FLAG_DATA_TARGET_MEMORY	This is macro DRV_SQI_FLAG_DATA_TARGET_MEMORY.
	DRV_SQI_FLAG_DATA_TARGET_POS	Macros to select the source and destination of a transfer.
	DRV_SQI_FLAG_DATA_TARGET_REGISTER	This is macro DRV_SQI_FLAG_DATA_TARGET_REGISTER.
	DRV_SQI_FLAG_DDR_ENABLE	This is macro DRV_SQI_FLAG_DDR_ENABLE.
	DRV_SQI_FLAG_DDR_ENABLE_MASK	This is macro DRV_SQI_FLAG_DDR_ENABLE_MASK.
	DRV_SQI_FLAG_DDR_ENABLE_POS	DDR Enable Macro.
	DRV_SQI_FLAG_INSTR_ENABLE	This is macro DRV_SQI_FLAG_INSTR_ENABLE.
	DRV_SQI_FLAG_INSTR_ENABLE_MASK	This is macro DRV_SQI_FLAG_INSTR_ENABLE_MASK.
	DRV_SQI_FLAG_INSTR_ENABLE_POS	Macros listing the bitmap values for the flags member of the DRV_SQI_TransferFrame structure. Instruction Enable Macro.
	DRV_SQI_FLAG_OPT_ENABLE	This is macro DRV_SQI_FLAG_OPT_ENABLE.
	DRV_SQI_FLAG_OPT_ENABLE_MASK	This is macro DRV_SQI_FLAG_OPT_ENABLE_MASK.
	DRV_SQI_FLAG_OPT_ENABLE_POS	Option Enable Macro.
	DRV_SQI_FLAG_OPT_LENGTH	This is macro DRV_SQI_FLAG_OPT_LENGTH.
	DRV_SQI_FLAG_OPT_LENGTH_1BIT	This is macro DRV_SQI_FLAG_OPT_LENGTH_1BIT.
	DRV_SQI_FLAG_OPT_LENGTH_2BIT	This is macro DRV_SQI_FLAG_OPT_LENGTH_2BIT.
	DRV_SQI_FLAG_OPT_LENGTH_4BIT	This is macro DRV_SQI_FLAG_OPT_LENGTH_4BIT.
	DRV_SQI_FLAG_OPT_LENGTH_8BIT	This is macro DRV_SQI_FLAG_OPT_LENGTH_8BIT.
	DRV_SQI_FLAG_OPT_LENGTH_MASK	This is macro DRV_SQI_FLAG_OPT_LENGTH_MASK.
	DRV_SQI_FLAG_OPT_LENGTH_POS	Macros to enable and specify the option length.
	DRV_SQI_FLAG_SQI_CS_NUMBER	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER.
	DRV_SQI_FLAG_SQI_CS_NUMBER_0	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_0.
	DRV_SQI_FLAG_SQI_CS_NUMBER_1	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_1.
	DRV_SQI_FLAG_SQI_CS_NUMBER_2	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_2.
	DRV_SQI_FLAG_SQI_CS_NUMBER_3	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_3.
	DRV_SQI_FLAG_SQI_CS_NUMBER_MASK	This is macro DRV_SQI_FLAG_SQI_CS_NUMBER_MASK.
	DRV_SQI_FLAG_SQI_CS_NUMBER_POS	Macros to select the SQI CS Line Number to be used for the current transfer • frame.
	DRV_SQI_INDEX_0	SQI driver index definitions.

Structures

	Name	Description
	DRV_SQI_TransferElement	Defines the data transfer element of the SQI driver.
	DRV_SQI_TransferFrame	Defines the transfer frame of the SQI driver.

Types

	Name	Description
	DRV_SQI_COMMAND_HANDLE	Handle to identify the transfer request queued at the SQI driver.
	DRV_SQI_EVENT_HANDLER	Pointer to a SQI Driver Event handler function

Description

SQI Driver Interface Definition

The SQI driver provides data structures and interfaces to manage the SQI controller. This file contains the data structures and interface definitions of the SQI driver.

File Name

drv_sqi.h

Company

Microchip Technology Inc.

drv_sqi_config_template.h

SQI driver configuration definitions.

Macros

	Name	Description
	DRV_SQI_BUFFER_OBJECT_NUMBER	Selects the maximum number of buffer objects
	DRV_SQI_CLIENTS_NUMBER	Selects the maximum number of clients
	DRV_SQI_DMA_BUFFER_DESCRIPTORS_NUMBER	Selects the maximum number of DMA Buffer descriptors to be used by the driver.
	DRV_SQI_INSTANCES_NUMBER	Selects the maximum number of Driver instances that can be supported by the dynamic driver.
	DRV_SQI_INTERRUPT_MODE	Macro specifies operation of the driver to be in the interrupt mode or polled mode

Description

SQI Driver Configuration Template Header file.

This template file describes all the mandatory and optional configuration macros that are needed for building the SQI driver. Do not include this file in source code.

File Name

SQI Flash Driver Library

This section describes the Serial Quad Interface (SQI) Flash Driver Library.

Introduction

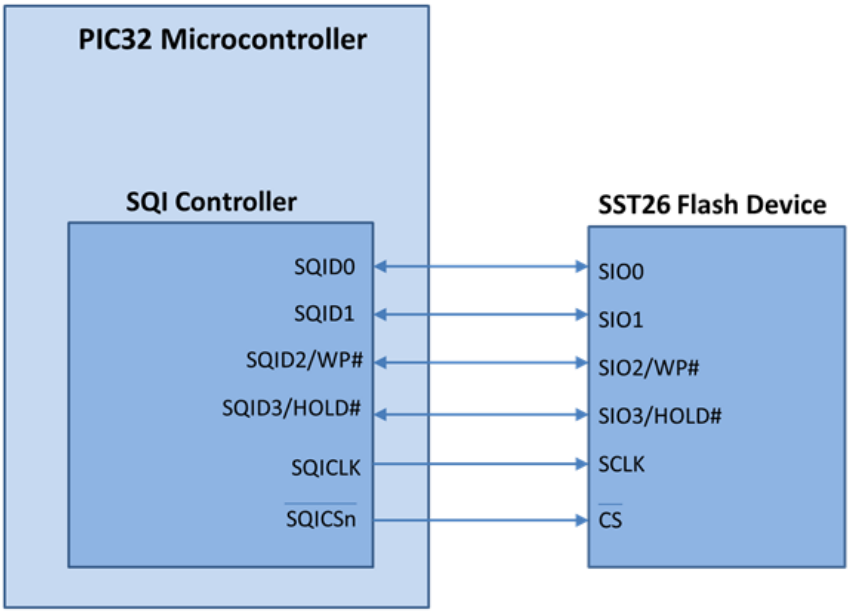
This library provides an interface to manage the SST26VF family of SQI Flash devices in different modes of operation.

Description

The MPLAB Harmony SST26 SQI Flash Driver provides a high-level interface to manage the SST26VF family of Flash devices over the SQI interface. The driver includes the following features:

- Provides application ready routines to perform block operations on the SQI Flash devices
- Supports Single, Dual, and Quad Lane modes
- Supports multi-client operation
- Provides data transfer events
- Supports non-blocking mode of operation only
- Thread-safe functions for use in RTOS applications

The SST26 Flash Driver uses the SQI module to establish the communication between SST26 Flash devices and Microchip microcontrollers. The following diagram shows the pin connections that are required to make the driver operational:



The SST26 Flash driver supports multi-client operation. This feature allows multiple application clients to access the same Flash device. Multiple instances of the driver can be used when multiple Flash devices are required to be part of the system.

Using the Library

This topic describes the basic architecture of the SQI Flash Driver Library and provides information and examples on its use.

Description

Interface Header Files: `drv_sst26.h`

The interface to the SQI Flash Driver Library is defined in the header file. Any C language source (`.c`) file that uses the SQI Flash Driver library should include this header.

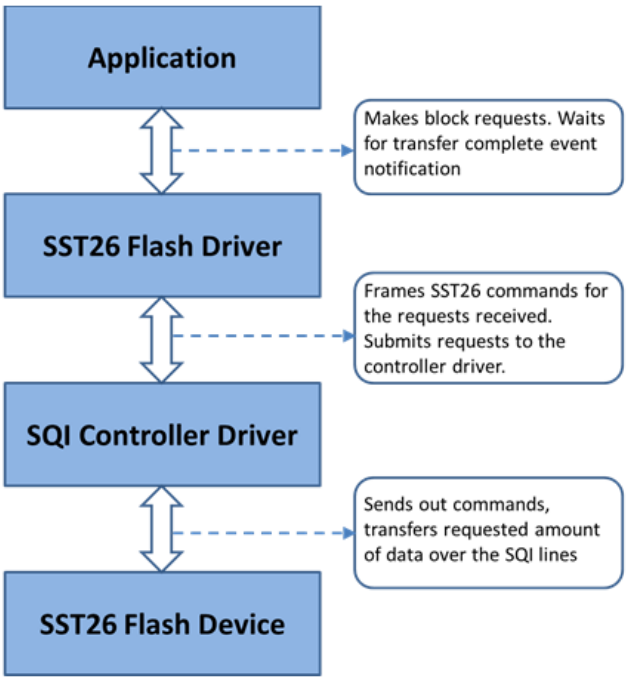
Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the SQI Flash Driver Library with a convenient C language interface. This topic describes how that abstraction is modeled in software.

Description

The SST26 SQI Flash needs a specific set of commands to be given on its SQI interface along with the required address and data to do different operations. This driver abstracts these requirements and provide simple APIs that can be used to perform Erase, Write, and Read operations. The SQI Driver is used for this purpose. The following layered diagram depicts the communication between different modules.



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the SQI Flash Driver module.

Library Interface Section	Description
System Functions	These functions are accessed by the MPLAB Harmony System module and allow the driver to be initialized, deinitialized, and maintained.
Core Client Functions	These functions allow the application client to open and close the driver.
Block Operation Functions	These functions enable the Flash module to be erased, written, and read (to/from).
Media Interface Functions	These functions provide media status and the Flash geometry.

How the Library Works

This topic provides information on how the SQI Flash Driver Library works.

Description

System Functions

SST26 Driver Initialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization each instance of the SST26 Flash driver would be initialized with the following configuration settings passed dynamically at run time using DRV_SST26_INIT, that are supported by the specific SST26 Flash driver:

- sqiDevice: The SQI controller supports a maximum of two slave devices. This identifies the SQI device index on which the flash device is located.

The DRV_SST26_Initialize function configures and initializes the SST26 Flash driver using the configuration information provided. It returns an object handle of the type SYS_MODULE_OBJ. This object handle would be used by other system interfaces such as DRV_SST26_Status, DRV_SST26_Tasks and DRV_SST26_Deinitialize.

Example:

```
/*** SST26 FLASH Driver Initialization Data ***/
const DRV_SST26_INIT drvSst26InitData0 =
{
    .sqiDevice = 1,
};
```

```
/* Initialize the SST26 Driver */
sysObj.drvSst26Obj0 = DRV_SST26_Initialize(DRV_SST26_INDEX_0,
                                           (SYS_MODULE_INIT *)&drvSst26InitData0);
```

SST26 Flash Driver Task Routine

The SST26 Driver task routine DRV_SST26_Tasks, will be called from the system task routine, SYS_Tasks. The driver task routine is responsible maintaining the driver state machine. The block operation requests from the application or from other modules are added to the driver queue. The task routine processes these queued requests by invoking the SQI driver routines for handling the transfer to the flash media.

SST26 Flash Driver Status

DRV_SST26_Status returns the current status of the SST26 Flash driver and is called by MPLAB Harmony. The application may not find the need to call this function directly.

Example:

```
SYS_MODULE_OBJ object;
// Returned from DRV_SST26_Initialize
SYS_STATUS sst26Status;

sst26Status = DRV_SST26_Status(object);
if (SYS_STATUS_ERROR >= sst26Status)
{
    // Handle error
}
```

Client Core Functions

Opening the Driver

For the application to start using an instance of the module, it must call the DRV_SST26_Open function repeatedly until a valid handle is returned by the driver. The application client uses this driver handle to access the driver functions.

For the various options available for I/O INTENT please refer to Data Types and Constants in the Library Interface section.

Example:

```
handle = DRV_SST26_Open(DRV_SST26_INDEX_0,
         DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    /* Call until the function returns a valid handle. */
}
else
{
    /* Do further processing. */
}
```

Closing the Driver

DRV_SST26_Close closes an opened-instance of the SST26 Flash driver, which also invalidates the driver handle. The application must open the driver again to obtain a valid handle.

Example:

```
DRV_HANDLE handle; // Returned from DRV_SST26_Open
DRV_SST26_Close(handle);
```

Client Block Operation Functions

The driver provides client interfaces to perform operations in terms of blocks. A block is a unit that represents the minimum amount of data that can be erased, written, or read. The block sizes may differ for Erase, Write, and Read operations. The DRV_SST26_GeometryGet function can be used to read out the geometry of the flash device. The geometry indicates the number of read, write and erase regions, blocks per region and the size of each block.

The DRV_SST26_Erase, DRV_SST26_Write, and DRV_SST26_Read functions are used to erase, write, and read the data to/from SST26 Flash devices. In addition to these functions, the driver also provides the DRV_SST26_EraseWrite function that combines the step of erasing a sector and then writing a page. The application can use this function if it wants to avoid having to explicitly delete a sector in order to update the pages contained in the sector.

These functions are non-blocking in nature and queue the operation request into the driver queue. All of the requests in the queue are executed by the DRV_SST26_Tasks function one-by-one. A command handle associated with the operation request is returned to the application client when the operation request is queued at the driver. This handle allows the application client to track the request as it progresses through the queue. The handle expires when the request processing is complete. The driver provides events (DRV_SST26_EVENT) that indicate the completion of the requests.

The following steps can be used for a simple Block Data Operation:

1. The system should have completed necessary initialization of the SQI Driver and the SST26 Flash Driver, and the DRV_SST26_Tasks function should be running in a polled environment.
2. Open the driver using DRV_SST26_Open with the necessary intent.
3. Set an event handler callback using the function DRV_SST26_EventHandlerSet.
4. Request for block operations using the functions, DRV_SST26_Erase, DRV_SST26_Write, DRV_SST26_Read and DRV_SST26_EraseWrite with the appropriate parameters.
5. Wait for event handler callback to occur and check the status of the block operation using the callback function parameter of type DRV_SST26_ EVENT.
6. After performing the required block operations, the client can close the driver using the function , DRV_SST25VF020B_Close .

Example:

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_SST26_COMMAND_HANDLE commandHandle;

// drvSST26Handle is the handle returned by the DRV_SST26_Open
// function. Client registers an event handler with driver. This is done once.

DRV_SST26_EventHandlerSet(drvSST26Handle, APP_SST26EventHandler, (uintptr_t)&myAppObj);

DRV_SST26_Read(drvSST26Handle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_SST26_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_SST26EventHandler
(
    DRV_SST26_EVENT event,
    DRV_SST26_COMMAND_HANDLE commandHandle,
    uintptr_t contextHandle
)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event
    // handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SST26_EVENT_COMMAND_COMPLETE:
            // Operation completed successfully.
            break;

        case DRV_SST26_EVENT_COMMAND_ERROR:
            // Error handling here.
            break;

        default:
            break;
    }
}
```

Media Interface Functions

Reading the Device Geometry

The application can call the DRV_SST26_GeometryGet function to obtain the geometry of the flash device. The geometry indicates the number of read, write and erase regions, number of blocks per region and the size of each block.

Example:

```
SYS_FS_MEDIA_GEOMETRY * sst26FlashGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
```

```
uint32_t nReadBlocks, nReadRegions, totalFlashSize;

sst26FlashGeometry = DRV_SST26_GeometryGet(sst26OpenHandle1);

readBlockSize  = sst26FlashGeometry->geometryTable->blockSize;
nReadBlocks = sst26FlashGeometry->geometryTable->numBlocks;
nReadRegions = sst26FlashGeometry->numReadRegions;

writeBlockSize  = (sst26FlashGeometry->geometryTable +1)->blockSize;
eraseBlockSize  = (sst26FlashGeometry->geometryTable +2)->blockSize;

//The below expression provides the flash memory size.
totalFlashSize = readBlockSize * nReadBlocks * nReadRegions;
```

Configuring the Library

Macros

	Name	Description
	DRV_SST26_BUFFER_OBJECT_NUMBER	Selects the maximum number of buffer objects
	DRV_SST26_CLIENTS_NUMBER	Selects the maximum number of clients
	DRV_SST26_INSTANCES_NUMBER	Selects the maximum number of Driver instances that can be supported by the dynamic driver.
	DRV_SST26_SYS_FS_REGISTER	Register to use with the File system

Description

The SQI Flash Driver requires the specification of compile-time configuration macros. These macros define resource usage, feature availability, and dynamic behavior of the driver. These configuration macros should be defined in the `system_config.h` file.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_SST26_BUFFER_OBJECT_NUMBER Macro

Selects the maximum number of buffer objects

File

drv_sst26_config_template.h

C

```
#define DRV_SST26_BUFFER_OBJECT_NUMBER 5
```

Description

SST26 Driver maximum number of buffer objects

This definition selects the maximum number of buffer objects. This indirectly also specifies the queue depth. The SST26 Driver can queue up DRV_SST26_BUFFER_OBJECT_NUMBER of read/write/erase requests before return a DRV_SST26_BUFFER_HANDLE_INVALID due to the queue being full. Buffer objects are shared by all instances of the driver. Increasing this number increases the RAM requirement of the driver.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_SST26_CLIENTS_NUMBER Macro

Selects the maximum number of clients

File

drv_sst26_config_template.h

C

```
#define DRV_SST26_CLIENTS_NUMBER 1
```

Description

SST26 maximum number of clients

This definition selects the maximum number of clients that the SST26 driver can supported at run time. This constant defines the total number of

SST26 driver clients that will be available to all instances of the SST26 driver.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_SST26_INSTANCES_NUMBER Macro

Selects the maximum number of Driver instances that can be supported by the dynamic driver.

File

drv_sst26_config_template.h

C

```
#define DRV_SST26_INSTANCES_NUMBER 1
```

Description

SST26 Driver instance configuration

This definition selects the maximum number of Driver instances that can be supported by the dynamic driver. In case of this driver, multiple instances of the driver could use the same hardware instance.

Remarks

This macro is mandatory when building the driver for dynamic operation.

DRV_SST26_SYS_FS_REGISTER Macro

Register to use with the File system

File

drv_sst26_config_template.h

C

```
#define DRV_SST26_SYS_FS_REGISTER
```

Description

SST26 Driver Register with File System

Specifying this macro enables the SST26 driver to register its services with the SYS FS.

Remarks

This macro is optional and should be specified only if the SST26 driver is to be used with the File System.

Building the Library

This section lists the files that are available in the SQI Flash Driver Library.

Description

This section list the files that are available in the `/src` folder of the SQI Flash Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/sqi_flash`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`sst26/drv_sst26.h`	Header file that exports the SST26VF driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
sst26/src/dynamic/drv_sst26.c	Basic SQI Flash Driver SST26VF implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library

Module Dependencies

The SQI Flash Driver Library depends on the following modules:

- SQI Driver Library
- Ports System Service Library

Library Interface

a) System Functions

	Name	Description
	DRV_SST26_Initialize	Initializes the SST26 instance for the specified driver index
	DRV_SST26_Deinitialize	Deinitializes the specified instance of the SST26 driver module
	DRV_SST26_Status	Gets the current status of the SST26 driver module.
	DRV_SST26_Tasks	Maintains the SST26 driver's internal state machine.

b) Core Client Functions

	Name	Description
	DRV_SST26_Open	Opens the specified SST26 driver instance and returns a handle to it
	DRV_SST26_Close	Closes an opened-instance of the SST26 driver

c) Block Operation Functions

	Name	Description
	DRV_SST26_Erase	Erase the specified number of flash blocks from the specified block start address.
	DRV_SST26_EraseWrite	Erase and Write blocks of data starting from a specified block start address.
	DRV_SST26_Read	Reads blocks of data from the specified block start address.
	DRV_SST26_Write	Writes blocks of data starting at the specified block start address.
	DRV_SST26_CommandStatus	Gets the current status of the command.
	DRV_SST26_EventHandlerSet	Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

d) Media Interface Functions

	Name	Description
	DRV_SST26_AddressGet	Returns the SST26 media start address
	DRV_SST26_GeometryGet	Returns the geometry of the device.
	DRV_SST26_IsAttached	Returns the physical attach status of the SST26.
	DRV_SST26_IsWriteProtected	Returns the write protect status of the SST26.

e) Data Types and Constants

	Name	Description
	DRV_SST26_COMMAND_HANDLE	Handle identifying commands queued in the driver.
	DRV_SST26_COMMAND_STATUS	SST26 Driver command Status
	DRV_SST26_EVENT	Identifies the possible events that can result from a request.
	DRV_SST26_EVENT_HANDLER	Pointer to a SST26 Driver Event handler function
	DRV_SST26_INIT	Defines the data required to initialize or reinitialize the SST26 driver
	DRV_SST26_COMMAND_HANDLE_INVALID	This value defines the SST26 Driver's Invalid Command Handle.
	DRV_SST26_INDEX_0	SST26 driver index definitions
	DRV_SST26_INDEX_1	This is macro DRV_SST26_INDEX_1.

Description

This section describes the API functions of the SQI Flash Driver Library.

Refer to each section for a detailed description.

a) System Functions

DRV_SST26_Initialize Function

Initializes the SST26 instance for the specified driver index

File

drv_sst26.h

C

```
SYS_MODULE_OBJ DRV_SST26_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise it returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the SST26 driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This routine must be called before any other SST26 routine is called.

This routine should only be called once during system initialization unless DRV_SST26_Deinitialize is called to deinitialize the driver instance.

This routine will NEVER block for hardware access. If the operation requires time to allow the hardware to initialize, it will be reported by the DRV_SST26_Status operation. The system must use DRV_SST26_Status to find out when the driver is in the ready state.

Preconditions

None.

Example

```
// This code snippet shows an example of initializing the SST26 Driver.

SYS_MODULE_OBJ  objectHandle;

const DRV_SST26_INIT drvSst26InitData0 =
{
    .sqiDevice = 1,
};

//usage of DRV_SST26_INDEX_0 indicates usage of Flash-related APIs
objectHandle = DRV_SST26_Initialize(DRV_SST26_INDEX_0, (SYS_MODULE_INIT*)&drvSst26InitData0);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_SST26_Initialize

(

const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init

);

DRV_SST26_Deinitialize Function

Deinitializes the specified instance of the SST26 driver module

File

drv_sst26.h

C

```
void DRV_SST26_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SST26 driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

Preconditions

Function DRV_SST26_Initialize should have been called before calling this function.

Parameter: object - Driver object handle, returned from the DRV_SST26_Initialize routine

Example

```
// This code snippet shows an example of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_SST26_Initialize
SYS_STATUS          status;

DRV_SST26_Deinitialize(object);

status = DRV_SST26_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know when the driver is
    // deinitialized.
}
```

Function

void DRV_SST26_Deinitialize

(

SYS_MODULE_OBJ object

);

DRV_SST26_Status Function

Gets the current status of the SST26 driver module.

File

drv_sst26.h

C

```
SYS_STATUS DRV_SST26_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and accept requests for new operations.

SYS_STATUS_UNINITIALIZED - Indicates the driver is not initialized.

Description

This routine provides the current status of the SST26 driver module.

Remarks

This routine will NEVER block waiting for hardware.

Preconditions

Function DRV_SST26_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST26_Initialize
SYS_STATUS          SST26Status;

SST26Status = DRV_SST26_Status(object);
else if (SYS_STATUS_ERROR >= SST26Status)
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SST26_Initialize routine

Function

SYS_STATUS DRV_SST26_Status

(

SYS_MODULE_OBJ object

);

DRV_SST26_Tasks Function

Maintains the SST26 driver's internal state machine.

File

drv_sst26.h

C

```
void DRV_SST26_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine maintains the driver's internal state machine. Part of the driver initialization is done in this routine. This routine is responsible for processing the read, write, erase or erasewrite requests queued for the SST26 driver.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks).

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_SST26_Initialize routine must have been called for the specified SST26 driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SST26_Initialize

while (true)
{
    DRV_SST26_Tasks (object);
    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_SST26_Initialize)

Function

void DRV_SST26_Tasks
(
SYS_MODULE_OBJ object
);

b) Core Client Functions

DRV_SST26_Open Function

Opens the specified SST26 driver instance and returns a handle to it

File

drv_sst26.h

C

```
DRV_HANDLE DRV_SST26_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, DRV_HANDLE_INVALID is returned. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_SST26_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.
- if the driver hardware instance being opened is not initialized or is invalid

Description

This routine opens the specified SST26 driver instance and provides a handle. This handle must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The handle returned is valid until the DRV_SST26_Close routine is called. This routine will NEVER block waiting for hardware. If the driver has has already been opened, it cannot be opened exclusively.

Preconditions

Function DRV_SST26_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_SST26_Open(DRV_SST26_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_SST26_Open

(
const SYS_MODULE_INDEX index,
const DRV_IO_INTENT ioIntent
);

DRV_SST26_Close Function

Closes an opened-instance of the SST26 driver

File

drv_sst26.h

C

```
void DRV_SST26_Close(const DRV_HANDLE handle);
```

Returns

None

Description

This routine closes an opened-instance of the SST26 driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SST26_Open before the caller may use the driver again. Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SST26_Initialize routine must have been called for the specified SST26 driver instance.

DRV_SST26_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SST26_Open

DRV_SST26_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_SST26_Close
(
const DRV_HANDLE handle
);

c) Block Operation Functions

DRV_SST26_Erase Function

Erase the specified number of flash blocks from the specified block start address.

File

drv_sst26.h

C

```
void DRV_SST26_Erase(const DRV_HANDLE handle, DRV_SST26_COMMAND_HANDLE * commandHandle, uint32_t
blockStart, uint32_t nBlock);
```

Returns

The command handle is returned in the commandHandle argument. It Will be DRV_SST26_COMMAND_HANDLE_INVALID if the request was not queued.

Description

This function schedules a non-blocking erase operation of flash memory. The function returns with a valid erase handle in the commandHandle argument if the erase request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_SST26_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer object could not be allocated to the request
- if the client opened the driver for read only
- if the number of blocks to be erased is either zero or more than the number of blocks actually available
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SST26_EVENT_COMMAND_COMPLETE event if the erase operation was successful or DRV_SST26_EVENT_COMMAND_ERROR event if the erase operation was not successful.

Remarks

None.

Preconditions

The DRV_SST26_Initialize() routine must have been called for the specified SST26 driver instance.

The DRV_SST26_Open() routine must have been called with DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE to obtain a valid opened device handle.

Example

```
// Use DRV_SST26_GeometryGet () to find the read region geometry.
// Find the erase block start address from where the number of blocks
// should be erased.
uint32_t blockStart = 0;
uint32_t nBlock = 4;
DRV_SST26_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST26Handle is the handle returned by the DRV_SST26_Open function.

// Client registers an event handler with driver
DRV_SST26_EventHandlerSet(mySST26Handle, APP_SST26EventHandler, (uintptr_t)&myAppObj);

DRV_SST26_Erase( mySST26Handle, &commandHandle, blockStart, nBlock );

if(DRV_SST26_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when the buffer queue is processed.

void APP_SST26EventHandler
(
    DRV_SST26_EVENT event,
    DRV_SST26_COMMAND_HANDLE commandHandle,
    uintptr_t contextHandle
)
{
    // contextHandle points to myAppObj.
    switch(event)
    {
        case DRV_SST26_EVENT_COMMAND_COMPLETE:
            // Erase operation completled successfully.
            break;

        case DRV_SST26_EVENT_COMMAND_ERROR:
            // Error handling here.
            break;
```

```
            default:
                break;
        }
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
blockStart	Erase block start address from where the blocks should be erased.
nBlock	Total number of blocks to be erased.

Function

void DRV_SST26_Erase

(

const DRV_HANDLE handle,

DRV_SST26_COMMAND_HANDLE * commandHandle,

uint32_t blockStart,

uint32_t nBlock

);

DRV_SST26_EraseWrite Function

Erase and Write blocks of data starting from a specified block start address.

File

drv_sst26.h

C

```
void DRV_SST26_EraseWrite(const DRV_HANDLE handle, DRV_SST26_COMMAND_HANDLE * commandHandle, void *
sourceBuffer, uint32_t writeBlockStart, uint32_t nWriteBlock);
```

Returns

The command handle is returned in the commandHandle argument. It Will be DRV_SST26_COMMAND_HANDLE_INVALID if the request was not queued.

Description

This function combines the step of erasing a sector and then writing the page. The application can use this function if it wants to avoid having to explicitly delete a sector in order to update the pages contained in the sector.

This function schedules a non-blocking operation to erase and write blocks of data into flash memory. The function returns with a valid command handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST26_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read only
- if the number of blocks to be written is either zero or more than the number of blocks actually available
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SST26_EVENT_COMMAND_COMPLETE event if the buffer was processed successfully or DRV_SST26_EVENT_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

None.

Preconditions

The DRV_SST26_Initialize() routine must have been called for the specified SST26 driver instance.

The DRV_SST26_Open() must have been called with DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE as a parameter to obtain a valid opened device handle.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// Use DRV_SST26_GeometryGet () to find the write region geometry.
// Find the block address to which data is to be written.
uint32_t blockStart = SST26_BLOCK_ADDRESS_TO_WRITE_TO;
uint32_t nBlock = 2;
DRV_SST26_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST26Handle is the handle returned by the DRV_SST26_Open function.
// Client registers an event handler with driver

DRV_SST26_EventHandlerSet(mySST26Handle, APP_SST26EventHandler, (uintptr_t)&myAppObj);

DRV_SST26_EraseWrite(mySST26Handle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_SST26_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when the buffer is processed.

void APP_SST26EventHandler
(
    DRV_SST26_EVENT event,
    DRV_SST26_COMMAND_HANDLE commandHandle,
    uintptr_t contextHandle
)
{
    // contextHandle points to myAppObj.
    switch(event)
    {
        case DRV_SST26_EVENT_COMMAND_COMPLETE:
            // Operation completled successfully.
            break;

        case DRV_SST26_EVENT_COMMAND_ERROR:
            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return command handle. If NULL, then command handle is not returned.
sourceBuffer	The source buffer containing data to be programmed into SST26 Flash
writeBlockStart	Write block start address where the write should begin.
nWriteBlock	Total number of blocks to be written.

Function

void DRV_SST26_EraseWrite

(

const DRV_HANDLE handle,

DRV_SST26_COMMAND_HANDLE * commandHandle,

void * sourceBuffer,

uint32_t writeBlockStart,

uint32_t nWriteBlock

);

DRV_SST26_Read Function

Reads blocks of data from the specified block start address.

File

drv_sst26.h

C

```
void DRV_SST26_Read(const DRV_HANDLE handle, DRV_SST26_COMMAND_HANDLE * commandHandle, void * targetBuffer,
uint32_t blockStart, uint32_t nBlock);
```

Returns

The command handle is returned in the commandHandle argument. It will be DRV_SST26_COMMAND_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation for reading blocks of data from the flash memory. The function returns with a valid command handle in the commandHandle argument if the request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST26_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer object could not be allocated to the request
- if the target buffer pointer is NULL
- if the client opened the driver for write only
- if the number of blocks to be read is either zero or more than the number of blocks actually available
- if the driver handle is invalid

Remarks

None.

Preconditions

The DRV_SST26_Initialize routine must have been called for the specified SST26 driver instance.

DRV_SST26_Open must have been called with DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE as the ioIntent to obtain a valid opened device handle.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// Use DRV_SST26_GeometryGet () to find the read region geometry.
// Find the block address from which to read data.
uint32_t blockStart = SST26_BLOCK_ADDRESS_TO_READ_FROM;
uint32_t nBlock = 2;
DRV_SST26_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST26Handle is the handle returned by the DRV_SST26_Open function.
// Client registers an event handler with driver

DRV_SST26_EventHandlerSet(mySST26Handle, APP_SST26EventHandler, (uintptr_t)&myAppObj);

DRV_SST26_Read(mySST26Handle, &commandHandle, &myBuffer, blockStart, nBlock);
if(DRV_SST26_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}
else
{
    // Read queued successfully.
}

// Event is received when the command request is processed.

void APP_SST26EventHandler
(
```

```
    DRV_SST26_EVENT event,
    DRV_SST26_COMMAND_HANDLE commandHandle,
    uintptr_t contextHandle
)
{
    // contextHandle points to myAppObj.
    switch(event)
    {
        case DRV_SST26_EVENT_COMMAND_COMPLETE:
            // This means the data was transferred.
            break;

        case DRV_SST26_EVENT_COMMAND_ERROR:
            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the command handle
targetBuffer	Buffer into which the data read from the SST26 Flash memory will be placed
blockStart	Read block start address from where the data should be read.
nBlock	Total number of blocks to be read.

Function

void DRV_SST26_Read
(
const DRV_HANDLE handle,
DRV_SST26_COMMAND_HANDLE * commandHandle,
void * targetBuffer,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST26_Write Function

Writes blocks of data starting at the specified block start address.

File

drv_sst26.h

C

```
void DRV_SST26_Write(const DRV_HANDLE handle, DRV_SST26_COMMAND_HANDLE * commandHandle, void *
sourceBuffer, uint32_t blockStart, uint32_t nBlock);
```

Returns

The command handle is returned in the commandHandle argument. It will be DRV_SST26_COMMAND_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking write operation for writing blocks of data into flash memory. The function returns with a valid command handle in the commandHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_SST26_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if a buffer object could not be allocated to the request
- if the source buffer pointer is NULL
- if the client opened the driver for read only

- if the number of blocks to be written is either zero or more than the number of blocks actually available
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_SST26_EVENT_COMMAND_COMPLETE event if the buffer was processed successfully or DRV_SST26_EVENT_COMMAND_ERROR event if the buffer was not processed successfully.

Remarks

None.

Preconditions

The DRV_SST26_Initialize() routine must have been called for the specified SST26 driver instance.

DRV_SST26_Open() routine must have been called to obtain a valid opened device handle. DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified as a parameter to this routine.

The flash address location which has to be written, must have be erased before using the DRV_SST26_Erase() routine.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];

// Use DRV_SST26_GeometryGet () to find the write region geometry.
// Find the block address to which data is to be written.
uint32_t blockStart = SST26_BLOCK_ADDRESS_TO_WRITE_TO;
uint32_t nBlock = 2;
DRV_SST26_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySST26Handle is the handle returned by the DRV_SST26_Open function.
// Client registers an event handler with driver

DRV_SST26_EventHandlerSet(mySST26Handle, APP_SST26EventHandler, (uintptr_t)&myAppObj);

DRV_SST26_Write(mySST26Handle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_SST26_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event is received when the buffer is processed.

void APP_SST26EventHandler
(
    DRV_SST26_EVENT event,
    DRV_SST26_COMMAND_HANDLE commandHandle,
    uintptr_t contextHandle
)
{
    // contextHandle points to myAppObj.
    switch(event)
    {
        case DRV_SST26_EVENT_COMMAND_COMPLETE:
            // This means the data was transferred.
            break;

        case DRV_SST26_EVENT_COMMAND_ERROR:
            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
sourceBuffer	The source buffer containing data to be programmed into SST26 Flash

blockStart	Write block start address from where the data should be written to.
nBlock	Total number of blocks to be written.

Function

void DRV_SST26_Write
(
const DRV_HANDLE handle,
DRV_SST26_COMMAND_HANDLE * commandHandle,
void * sourceBuffer,
uint32_t blockStart,
uint32_t nBlock
);

DRV_SST26_CommandStatus Function

Gets the current status of the command.

File

drv_sst26.h

C

```
DRV_SST26_COMMAND_STATUS DRV_SST26_CommandStatus(const DRV_HANDLE handle, const DRV_SST26_COMMAND_HANDLE commandHandle);
```

Returns

A DRV_SST26_COMMAND_STATUS value describing the current status of the command. Returns DRV_SST26_COMMAND_HANDLE_INVALID if the client handle or the command handle is not valid.

Description

This routine gets the current status of the command. The application must use this routine where the status of a scheduled command needs to be polled on. The function may return DRV_SST26_COMMAND_COMPLETED in a case where the command handle has expired. A command handle expires when the internal buffer object is re-assigned to another request. It is recommended that this function be called regularly in order to track the command status correctly.

The application can alternatively register an event handler to receive the command completion events.

Remarks

This routine will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_SST26_Initialize() routine must have been called.

The DRV_SST26_Open() must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE                  handle;         // Returned from DRV_SST26_Open
DRV_SST26_COMMAND_HANDLE      commandHandle;
DRV_SST26_COMMAND_STATUS      status;

status = DRV_SST26_CommandStatus(handle, commandHandle);
if(status == DRV_SST26_COMMAND_COMPLETED)
{
    // Operation Done
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_SST26_COMMAND_STATUS DRV_SST26_CommandStatus
(
const DRV_HANDLE handle,

```
    const       DRV_SST26_COMMAND_HANDLE commandHandle
    );
```

DRV_SST26_EventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when queued operation has completed.

File

drv_sst26.h

C

```
void DRV_SST26_EventHandlerSet(const DRV_HANDLE handle, const void * eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when queued operation has completed. When a client calls a read, write, erase or a erasewrite function, it is provided with a handle identifying the command that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the queued operation has completed.

The event handler should be set before the client performs any operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_SST26_Initialize() routine must have been called for the specified SST26 driver instance.

The DRV_SST26_Open() routine must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_SST26_COMMAND_HANDLE commandHandle;

// drvSST26Handle is the handle returned by the DRV_SST26_Open function.
// Client registers an event handler with driver. This is done once.

DRV_SST26_EventHandlerSet(drvSST26Handle, APP_SST26EventHandler, (uintptr_t)&myAppObj);

DRV_SST26_Read(drvSST26Handle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_SST26_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.

void APP_SST26EventHandler
(
    DRV_SST26_EVENT event,
    DRV_SST26_COMMAND_HANDLE commandHandle,
    uintptr_t contextHandle
)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
```

```
            case DRV_SST26_EVENT_COMMAND_COMPLETE:
                // Operation completled successfully.
                break;

            case DRV_SST26_EVENT_COMMAND_ERROR:
                // Error handling here.
                break;

            default:
                break;
        }
    }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_SST26_EventHandlerSet
(
const DRV_HANDLE handle,
const void * eventHandler,
const uintptr_t context
);

d) Media Interface Functions

DRV_SST26_AddressGet Function

Returns the SST26 media start address

File

drv_sst26.h

C

```
uintptr_t DRV_SST26_AddressGet(const DRV_HANDLE handle);
```

Returns

Start address of the SST26 Media if the handle is valid otherwise NULL.

Description

This function returns the SST26 Media start address.

Remarks

None.

Preconditions

The DRV_SST26_Initialize() routine must have been called for the specified SST26 driver instance.

The DRV_SST26_Open() routine must have been called to obtain a valid opened device handle.

Example

```
uintptr_t startAddress;
startAddress = DRV_SST26_AddressGet(drvSST26Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

uintptr_t DRV_SST26_AddressGet
(
const DRV_HANDLE handle
);

DRV_SST26_GeometryGet Function

Returns the geometry of the device.

File

drv_sst26.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_SST26_GeometryGet(const DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Pointer to structure which holds the media geometry information.

Description

This API gives the following geometrical details of the SST26 Flash:

- Media Property
- Number of Read/Write/Erase regions in the flash device
- Number of Blocks and their size in each region of the device

Remarks

None.

Preconditions

The DRV_SST26_Initialize() routine must have been called for the specified SST26 driver instance.

The DRV_SST26_Open() routine must have been called to obtain a valid opened device handle.

Example

```
SYS_FS_MEDIA_GEOMETRY * sst26FlashGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalFlashSize;

sst26FlashGeometry = DRV_SST26_GeometryGet(sst26OpenHandle1);

readBlockSize  = sst26FlashGeometry->geometryTable->blockSize;
nReadBlocks = sst26FlashGeometry->geometryTable->numBlocks;
nReadRegions = sst26FlashGeometry->numReadRegions;

writeBlockSize  = (sst26FlashGeometry->geometryTable +1)->blockSize;
eraseBlockSize  = (sst26FlashGeometry->geometryTable +2)->blockSize;

totalFlashSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY * DRV_SST26_GeometryGet
(
const DRV_HANDLE handle

);

DRV_SST26_IsAttached Function

Returns the physical attach status of the SST26.

File

drv_sst26.h

C

```
bool DRV_SST26_IsAttached(const DRV_HANDLE handle);
```

Returns

Returns false if the handle is invalid otherwise returns true.

Description

This function returns the physical attach status of the SST26.

Remarks

None.

Preconditions

The DRV_SST26_Initialize() routine must have been called for the specified SST26 driver instance.

The DRV_SST26_Open() routine must have been called to obtain a valid opened device handle.

Example

```
bool isSST26Attached;
isSST26Attached = DRV_SST26_isAttached(drvSST26Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SST26_IsAttached

(

const DRV_HANDLE handle

);

DRV_SST26_IsWriteProtected Function

Returns the write protect status of the SST26.

File

drv_sst26.h

C

```
bool DRV_SST26_IsWriteProtected(const DRV_HANDLE handle);
```

Returns

True - If the flash is write protected. False - If the flash is not write protected.

Description

This function returns the write protect status of the SST26.

Remarks

None.

Preconditions

The DRV_SST26_Initialize() routine must have been called for the specified SST26 driver instance.

The DRV_SST26_Open() routine must have been called to obtain a valid opened device handle.

Example

```
bool isWriteProtected;
isWriteProtected = DRV_SST26_IsWriteProtected(drvSST26Handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SST26_IsWriteProtected

(

const DRV_HANDLE handle

);

e) Data Types and Constants

DRV_SST26_COMMAND_HANDLE Type

Handle identifying commands queued in the driver.

File

drv_sst26.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_SST26_COMMAND_HANDLE;
```

Description

SST26 Driver command handle.

A command handle is returned by a call to the Read, Write, Erase or EraseWrite functions. This handle allows the application to track the completion of the operation. This command handle is also returned to the client along with the event that has occurred with respect to the command. This allows the application to connect the event to a specific command in case where multiple commands are queued.

The command handle associated with the command request expires when the client has been notified of the completion of the command (after event handler function that notifies the client returns) or after the command has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SST26_COMMAND_STATUS Enumeration

SST26 Driver command Status

File

drv_sst26.h

C

```
typedef enum {
  DRV_SST26_COMMAND_COMPLETED = SYS_FS_MEDIA_COMMAND_COMPLETED,
  DRV_SST26_COMMAND_QUEUED = SYS_FS_MEDIA_COMMAND_QUEUED,
  DRV_SST26_COMMAND_IN_PROGRESS = SYS_FS_MEDIA_COMMAND_IN_PROGRESS,
  DRV_SST26_COMMAND_ERROR_UNKNOWN = SYS_FS_MEDIA_COMMAND_UNKNOWN
} DRV_SST26_COMMAND_STATUS;
```

Members

Members	Description
DRV_SST26_COMMAND_COMPLETED = SYS_FS_MEDIA_COMMAND_COMPLETED	Done OK and ready
DRV_SST26_COMMAND_QUEUED = SYS_FS_MEDIA_COMMAND_QUEUED	Scheduled but not started
DRV_SST26_COMMAND_IN_PROGRESS = SYS_FS_MEDIA_COMMAND_IN_PROGRESS	Currently being in transfer

DRV_SST26_COMMAND_ERROR_UNKNOWN = SYS_FS_MEDIA_COMMAND_UNKNOWN	Unknown Command

Description

SST26 Driver Command Status

Specifies the status of the command for the read, write, erase and erasewrite operations.

Remarks

None.

DRV_SST26_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_sst26.h

C

```
typedef enum {
  DRV_SST26_EVENT_COMMAND_COMPLETE = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_SST26_EVENT_COMMAND_ERROR = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_ERROR
} DRV_SST26_EVENT;
```

Members

Members	Description
DRV_SST26_EVENT_COMMAND_COMPLETE = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_COMPLETE	Operation has been completed successfully.
DRV_SST26_EVENT_COMMAND_ERROR = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_ERROR	There was an error during the operation

Description

SST26 Driver Events

This enumeration identifies the possible events that can result from a read, write, erase or erasewrite request caused by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SST26_EventHandlerSet function when a request is completed.

DRV_SST26_EVENT_HANDLER Type

Pointer to a SST26 Driver Event handler function

File

drv_sst26.h

C

```
typedef SYS_FS_MEDIA_EVENT_HANDLER DRV_SST26_EVENT_HANDLER;
```

Returns

None.

Description

SST26 Driver Event Handler Function Pointer

This data type defines the required function signature for the SST26 event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event calls back from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SST26_EVENT_COMMAND_COMPLETE, it means that the requested operation was completed successfully.

If the event is DRV_SST26_EVENT_COMMAND_ERROR, it means that the scheduled operation was not completed successfully.

The context parameter contains the handle to the client context, provided at the time the event handling function was registered using the DRV_SST26_EventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write/erase request.

The event handler function executes in the driver peripheral's interrupt context when the driver is configured for interrupt mode operation. It is recommended of the application to not perform process intensive or blocking operations within this function.

Example

```
void APP_MySst26EventHandler
(
    DRV_SST26_EVENT event,
    DRV_SST26_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_SST26_EVENT_COMMAND_COMPLETE:
            // Handle the completed buffer.
            break;

        case DRV_SST26_EVENT_COMMAND_ERROR:
        default:
            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle returned from the Read/Write/Erase/EraseWrite requests
context	Value identifying the context of the application that registered the event handling function

DRV_SST26_INIT Structure

Defines the data required to initialize or reinitialize the SST26 driver

File

drv_sst26.h

C

```
typedef struct {
  uint8_t sqiDevice;
} DRV_SST26_INIT;
```

Members

Members	Description
uint8_t sqiDevice;	SQI Device Index.

Description

SST26 Driver Initialization Data

This data type defines the data required to initialize or reinitialize the SST26 driver.

Remarks

Not all initialization features are available for all devices. Please refer to the specific device data sheet to determine availability.

DRV_SST26_COMMAND_HANDLE_INVALID Macro

This value defines the SST26 Driver's Invalid Command Handle.

File

drv_sst26.h

C

```
#define DRV_SST26_COMMAND_HANDLE_INVALID SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE_INVALID
```

Description

SST26 Driver Invalid Command Handle.

This value defines the SST26 Driver's Invalid Command Handle. This value is returned by read/write/erase/erasewrite routines when the command request was not accepted.

Remarks

None.

DRV_SST26_INDEX_0 Macro

SST26 driver index definitions

File

drv_sst26.h

C

```
#define DRV_SST26_INDEX_0 0
```

Description

Driver SST26 Module Index reference

These constants provide SST26 driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_SST26_Initialize and DRV_SST26_Open routines to identify the driver instance in use.

DRV_SST26_INDEX_1 Macro

File

drv_sst26.h

C

```
#define DRV_SST26_INDEX_1 1
```

Description

This is macro DRV_SST26_INDEX_1.

SRAM Driver Library

This section describes the Static Random Access (SRAM) driver library.

Introduction

The SRAM Media Driver library provides a high-level interface to manage the onboard SRAM as a media

Description

The SRAM Media driver features the following:

- Provides application ready routines to perform block operations on the SRAM media
- Supports multi-client operation
- Provides data transfer events
- Supports blocking mode of operation only

Using the Library

This topic describes the basic architecture of the SRAM Media Driver Library and provides information and examples about how to use it.

Description

Interface Header Files: `drv_sram.h`

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Topics

Name	Description
Abstraction Model	This library provides a low-level abstraction of the SRAM media with a convenient C language interface. This topic describes how that abstraction is modeled in software.
Library Overview	This library provides information about how the driver operates in a system. The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the SRAM Media driver module.
How the Library Works	This section describes how the SRAM Media Driver Library operates

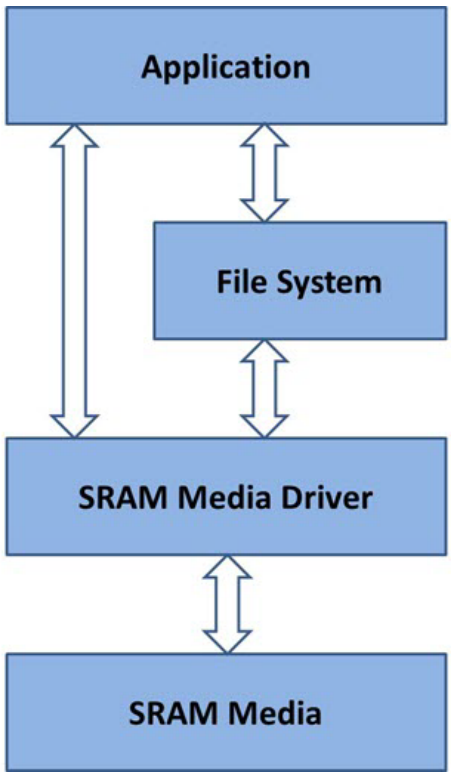
Abstraction Model

This library provides a low-level abstraction of the SRAM media with a convenient C language interface. This section describes how that abstraction is modeled in software.

Description

The SRAM Media driver facilitates the block access to the SRAM media by providing APIs that can be used to perform read/write operations. The end applications can either access the media directly through the driver or through MPLAB Harmony. The following diagram shows the communication between different modules.

SRAM Media Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information about how the SRAM driver operates within a system.

Description

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the SRAM module.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, de-initialization and status functions.
Data Types and Constants	Provides data types and macros.

How the Library Works

The library provides interfaces to support:

- System Functionality
- Client Functionality
- Media Functionality

System Initialization/Status Functions

The SRAM driver provides the following system functions:

- SRAM driver initialization
- SRAM driver status.

Description

SRAM driver initialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized. During system initialization each instance of the SRAM Media driver would be initialized with the following configuration settings passed dynamically at run time using DRV_SRAM_INIT:

- registerWithFs: This controls the registration of the driver with the Harmony File System.
- mediaStartAddress: This indicates the start address of the SRAM media on which driver is to operate.
- sramMediaGeometry: This provides the SRAM media geometry information that the driver will use while performing the read/write operations on the media.

The DRV_SRAM_Initialize function configures and initializes the SRAM Media driver by using the configuration information provided. The function returns an object handle of the type SYS_MODULE_OBJ. This object handle is used by other system interfaces such as DRV_SRAM_Status and DRV_SRAM_Deinitialize.

Example:

```
/*** SRAM Driver Initialization Data ***/
SYS_FS_MEDIA_REGION_GEOMETRY sramMedia0GeometryTable[3] =
{
{
.blockSize = 1,
.numBlocks = (32 * (1024/1)),
},
{
.blockSize = 1,
.numBlocks = (32 * (1024/1)),
},
{
.blockSize = 1,
.numBlocks = (32 * (1024/1)),
}
};

const SYS_FS_MEDIA_GEOMETRY sramMedia0Geometry =
{
.mediaProperty = SYS_FS_MEDIA_WRITE_IS_BLOCKING | SYS_FS_MEDIA_READ_IS_BLOCKING,
.numReadRegions = 1,
.numWriteRegions = 1,
.numEraseRegions = 1,
.geometryTable = (SYS_FS_MEDIA_REGION_GEOMETRY *)&sramMedia0GeometryTable
};

extern uint8_t SRAM_MEDIA_0_DATA[];
const DRV_SRAM_INIT drvSram0Init =
{
.registerWithFs = true,
.mediaStartAddress = (uint8_t *)SRAM_MEDIA_0_DATA,
.sramMediaGeometry = (SYS_FS_MEDIA_GEOMETRY
*)&sramMedia0Geometry
};

/* Initialize the SRAM Driver Instance 0 */
sysObj.drvSramObj0 = DRV_SRAM_Initialize(DRV_SRAM_INDEX_0, (SYS_MODULE_INIT *)&drvSram0Init);
```

SRAM driver status

DRV_SRAM_Status() returns the current status of the SRAM Media driver and is called by the Harmony System. The application may not find the need to call this function directly.

Example:

```
SYS_MODULE_OBJ object;
// Returned from DRV_SRAM_Initialize
SYS_STATUS sramStatus;

sramStatus = DRV_SRAM_Status(object);
if (SYS_STATUS_ERROR >= sramStatus)
```

```
{
// Handle error
}
```

Client Core Functions

The SRAM driver provides the following client core functions:

- Opening the driver
- Closing the driver

Description

Opening the driver

For the application to start using an instance of the module, it must call the function DRV_SRAM_Open and obtain a valid driver handle. The application client uses this driver handle to access the driver functions.

For the various options available for I/O INTENT, please refer to Data Types and Constants in the Library Interface section.

Example:

```
handle = DRV_SRAM_Open(DRV_SRAM_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
/* Call until the function returns a valid handle. */
}
else
{
/* Do further processing. */
}
```

Closing the driver

This function closes an opened-instance of the SRAM Media driver. This invalidates the driver handle. The application must open the driver again to obtain a valid handle.

Example:

```
DRV_HANDLE handle; // Returned from DRV_SRAM_Open
DRV_SRAM_Close(handle);
```

Client Block Operation Functions

The SRAM driver provides client interfaces to perform operations in terms of blocks.

Description

A block is a unit that represents the minimum amount of data that can be written or read. The block sizes may differ for write and read operations. The DRV_SRAM_GeometryGet function can be used to read out the geometry of the SRAM Media. The geometry indicates the number of read, write, and erase regions; blocks per region; and the size of each block.

The DRV_SRAM_Write and DRV_SRAM_Read functions are used to write and read the data to/from SRAM media. These functions block operations until the requested amount of data is transferred. If an event handler has been registered to receive the driver events, then the event handler will be invoked from within these functions. The driver provides events (DRV_SRAM_EVENT) that indicate the completion of the requests.

The following steps can be performed for a simple block data transfer operation:

1. Make sure the system has completed the necessary initialization of the SRAM driver.
2. Open the driver using DRV_SRAM_Open with the necessary intent.
3. Register an event handler callback by using the function DRV_SRAM_EventHandlerSet.
4. Request for block operation by using the functions DRV_SRAM_Write and DRV_SRAM_Read with the appropriate parameters.
5. Wait for the event handler callback to occur and check the status of the block operation by using the callback function parameter of type DRV_SRAM_ EVENT.
6. After performing the required block operations, the client can close the driver by using the function DRV_SRAM_Close.

Example:

```
uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart = 0;
uint32_t nBlock = 2;
DRV_SRAM_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySRAMHandle is the handle returned by the DRV_SRAM_Open
```

```
// function.

DRV_SRAM_EventHandlerSet(
mySRAMHandle,
APP_SRAMEventHandler,
(uintptr_t)&myAppObj);

DRV_SRAM_Read(
mySRAMHandle,
&commandHandle,
&myBuffer,
blockStart,
nBlock);
if(DRV_SRAM_COMMAND_HANDLE_INVALID == commandHandle)
{
// Error handling here
}
else
{
// Read operation completed successfully.
}

// Event is invoked from within the DRV_SRAM_Read function when
// the read operation processing is complete.

void APP_SRAMEventHandler
(
 DRV_SRAM_EVENT event,
 DRV_SRAM_COMMAND_HANDLE commandHandle,
uintptr_t contextHandle
)
{
// contextHandle points to myAppObj.
switch(event)
{
case DRV_SRAM_EVENT_COMMAND_COMPLETE:
// This means the data was transferred.
break;

case DRV_SRAM_EVENT_COMMAND_ERROR:
// Error handling here.
break;

default:
break;
}
}
```

Media Interface Functions

The SRAM driver provides the following media interface function:

- Reading the device geometry

Description

The application can call the DRV_SRAM_GeometryGet function to obtain the geometry of the media device.

Reading the device geometry

The geometry indicates the number of read, write, and erase regions; the number of blocks per region; and the size of each block.

Example:

```
SYS_FS_MEDIA_GEOMETRY * sramGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
```

```
uint32_t nReadBlocks, nReadRegions, totalSize;

sramGeometry = DRV_SRAM_GeometryGet(sramOpenHandle1);

readBlockSize = sramGeometry->geometryTable->blockSize;
nReadBlocks = sramGeometry->geometryTable->numBlocks;
nReadRegions = sramGeometry->numReadRegions;

writeBlockSize = (sramGeometry->geometryTable +1)->blockSize;
eraseBlockSize = (sramGeometry->geometryTable +2)->blockSize;
totalSize = readBlockSize * nReadBlocks * nReadRegions;
```

Configuring the Library

This section contains related configuration macros.

Description

The configuration of the SRAM driver is based on the file `system_config.h`.

This header file contains the configuration selection for the SRAM driver. Based on the selections made, the SRAM driver may support the selected features. These configuration settings apply to all instances of the SRAM driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Building the Library

This section lists the files that are available in the SRAM library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/sram/`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_sram.h`	This is the SRAM library's interface header file.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_sram.c`	This file contains the source code for the dynamic implementation of the SRAM driver.
`/config/drv_sram_config_template.h`	This file contains configuration macros for the SRAM driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Library Interface

This section describes the Application Programming Interface (API) functions of the SRAM driver library.

Refer to each section for a detailed description.

a) System Functions

	Name	Description
	DRV_SRAM_AddressGet	Returns the SRAM media start address
	DRV_SRAM_Close	Closes an opened-instance of the SRAM driver
	DRV_SRAM_CommandStatus	Gets the current status of the command.
	DRV_SRAM_Deinitialize	Deinitializes the specified instance of the SRAM driver module
	DRV_SRAM_EventHandlerSet	Allows a client to identify an event handling function for the driver to call back when an operation has completed.
	DRV_SRAM_GeometryGet	Returns the geometry of the device.
	DRV_SRAM_Initialize	Initializes the SRAM instance for the specified driver index.
	DRV_SRAM_IsAttached	Returns the physical attach status of the SRAM.
	DRV_SRAM_IsWriteProtected	Returns the write protect status of the SRAM.
	DRV_SRAM_Open	Opens the specified SRAM driver instance and returns a handle to it
	DRV_SRAM_Read	Reads blocks of data from the specified block start address.
	DRV_SRAM_Status	Gets the current status of the SRAM driver module.
	DRV_SRAM_Write	Writes blocks of data starting from the specified block start address of the SRAM media.

c) Data Types and Constants

	Name	Description
	DRV_SRAM_COMMAND_HANDLE	Handle identifying commands queued in the driver.
	DRV_SRAM_COMMAND_STATUS	Specifies the status of the command for the read and write operations.
	DRV_SRAM_EVENT	Identifies the possible events that can result from a request.
	DRV_SRAM_EVENT_HANDLER	Pointer to a SRAM Driver Event handler function
	DRV_SRAM_INIT	Defines the data required to initialize the SRAM driver
	_DRV_SRAM_H	This is macro _DRV_SRAM_H.
	DRV_SRAM_COMMAND_HANDLE_INVALID	This value defines the SRAM Driver's Invalid Command Handle.
	DRV_SRAM_INDEX_0	SRAM driver index definitions
	DRV_SRAM_INDEX_1	This is macro DRV_SRAM_INDEX_1.

a) System Functions

DRV_SRAM_AddressGet Function

Returns the SRAM media start address

File

drv_sram.h

C

```
uintptr_t DRV_SRAM_AddressGet(const DRV_HANDLE handle);
```

Returns

Start address of the SRAM Media if the handle is valid otherwise NULL.

Description

This function returns the SRAM Media start address.

Remarks

None.

Preconditions

The DRV_SRAM_Initialize() routine must have been called for the specified SRAM driver instance.

The DRV_SRAM_Open() routine must have been called to obtain a valid opened device handle.

Example

```
uintptr_t startAddress;
```

```
startAddress = DRV_SRAM_AddressGet(drvSRAMHandle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open

Function

uintptr_t DRV_SRAM_AddressGet
(
const DRV_HANDLE handle
);

DRV_SRAM_Close Function

Closes an opened-instance of the SRAM driver

File

drv_sram.h

C

```
void DRV_SRAM_Close(const DRV_HANDLE handle);
```

Returns

None

Description

This routine closes an opened-instance of the SRAM driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_SRAM_Open before the caller may use the driver again. Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_SRAM_Initialize routine must have been called for the specified SRAM driver instance.

DRV_SRAM_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_SRAM_Open

DRV_SRAM_Close(handle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_SRAM_Close
(
const DRV_HANDLE handle
);

DRV_SRAM_CommandStatus Function

Gets the current status of the command.

File

drv_sram.h

C

```
DRV_SRAM_COMMAND_STATUS DRV_SRAM_CommandStatus(const DRV_HANDLE handle, const DRV_SRAM_COMMAND_HANDLE
```

```
commandHandle);
```

Returns

A DRV_SRAM_COMMAND_STATUS value describing the current status of the command. Returns DRV_SRAM_COMMAND_COMPLETED if the client handle or the command handle is not valid.

Description

This routine gets the current status of the command. The application must use this routine where the status of a scheduled command needs to be polled on. The function may return DRV_SRAM_COMMAND_COMPLETED in a case where the command handle has expired. A command handle expires when the internal buffer object is re-assigned to another read or write request. It is recommended that this function be called regularly in order to track the command status correctly.

The application can alternatively register an event handler to receive read or write operation completion events.

Remarks

This routine will not block for hardware access and will immediately return the current status.

Preconditions

The DRV_SRAM_Initialize() routine must have been called.

The DRV_SRAM_Open() must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE                  handle;         // Returned from DRV_SRAM_Open
DRV_SRAM_COMMAND_HANDLE     commandHandle;
DRV_SRAM_COMMAND_STATUS     status;

status = DRV_SRAM_CommandStatus(handle, commandHandle);
if(status == DRV_SRAM_COMMAND_COMPLETED)
{
    // Operation Done
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_SRAM_COMMAND_STATUS DRV_SRAM_CommandStatus

(

const DRV_HANDLE handle,

const DRV_SRAM_COMMAND_HANDLE commandHandle

);

DRV_SRAM_Deinitialize Function

Deinitializes the specified instance of the SRAM driver module

File

drv_sram.h

C

```
void DRV_SRAM_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the SRAM driver module, disabling its operation. Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

Preconditions

Function DRV_SRAM_Initialize should have been called before calling this function.

Parameter: object - Driver object handle, returned from the DRV_SRAM_Initialize routine

Example

```
// This code snippet shows an example of deinitializing the driver.

SYS_MODULE_OBJ      object;     //  Returned from DRV_SRAM_Initialize
SYS_STATUS          status;

DRV_SRAM_Deinitialize(object);

status = DRV_SRAM_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know when the driver is
    // deinitialized.
}
```

Function

void DRV_SRAM_Deinitialize

(

SYS_MODULE_OBJ object

);

DRV_SRAM_EventHandlerSet Function

Allows a client to identify an event handling function for the driver to call back when an operation has completed.

File

drv_sram.h

C

```
void DRV_SRAM_EventHandlerSet(const DRV_HANDLE handle, const void * eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify an event handling function for the driver to call back when an operation has completed. When a client calls a read or a write function, it is provided with a handle identifying the read/write request. The driver will pass this handle back to the client by calling "eventHandler" function when the operation has completed.

The event handler should be set before the client performs any read or write operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued operation has completed, it does not need to register a callback.

Preconditions

The DRV_SRAM_Initialize() routine must have been called for the specified SRAM driver instance.

The DRV_SRAM_Open() routine must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart, nBlock;
DRV_SRAM_COMMAND_HANDLE commandHandle;

// drvSRAMHandle is the handle returned by the DRV_SRAM_Open function.
```

```
// Client registers an event handler with driver. This is done once.

DRV_SRAM_EventHandlerSet(drvSRAMHandle, APP_SRAMEventHandler, (uintptr_t)&myAppObj);

DRV_SRAM_Read(drvSRAMHandle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_SRAM_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when operation is done.
void APP_SRAMEventHandler
(
    DRV_SRAM_EVENT event,
    DRV_SRAM_COMMAND_HANDLE handle,
    uintptr_t context
)
{
    // The context handle was set to an application specific object. It is
    // now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_SRAM_EVENT_COMMAND_COMPLETE:
            // This means the data was transferred.
            break;

        case DRV_SRAM_EVENT_COMMAND_ERROR:
            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
eventHandler	Pointer to the event handler function implemented by the user
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_SRAM_EventHandlerSet
(
const DRV_HANDLE handle,
const void * eventHandler,
const uintptr_t context
);

DRV_SRAM_GeometryGet Function

Returns the geometry of the device.

File

drv_sram.h

C

```
SYS_FS_MEDIA_GEOMETRY * DRV_SRAM_GeometryGet(const DRV_HANDLE handle);
```

Returns

SYS_FS_MEDIA_GEOMETRY - Pointer to structure which holds the media geometry information.

Description

This API gives the following geometrical details of the SRAM memory:

- Media Property
- Number of Read/Write/Erase regions
- Number of Blocks and their size in each region of the device

Remarks

None.

Preconditions

The DRV_SRAM_Initialize() routine must have been called for the specified SRAM driver instance.

The DRV_SRAM_Open() routine must have been called to obtain a valid opened device handle.

Example

```
SYS_FS_MEDIA_GEOMETRY * sramGeometry;
uint32_t readBlockSize, writeBlockSize, eraseBlockSize;
uint32_t nReadBlocks, nReadRegions, totalSize;

sramGeometry = DRV_SRAM_GeometryGet(sramOpenHandle1);

readBlockSize  = sramGeometry->geometryTable->blockSize;
nReadBlocks = sramGeometry->geometryTable->numBlocks;
nReadRegions = sramGeometry->numReadRegions;

writeBlockSize  = (sramGeometry->geometryTable +1)->blockSize;
eraseBlockSize  = (sramGeometry->geometryTable +2)->blockSize;

totalSize = readBlockSize * nReadBlocks * nReadRegions;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

SYS_FS_MEDIA_GEOMETRY * DRV_SRAM_GeometryGet

(

const DRV_HANDLE handle

);

DRV_SRAM_Initialize Function

Initializes the SRAM instance for the specified driver index.

File

drv_sram.h

C

```
SYS_MODULE_OBJ DRV_SRAM_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise it returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the SRAM driver instance for the specified driver index, making it ready for clients to open and use it.

Remarks

This routine must be called before any other SRAM routine is called.

This routine should only be called once during system initialization unless DRV_SRAM_Deinitialize is called to deinitialize the driver instance.

This routine will NEVER block for hardware access. The system must use DRV_SRAM_Status to find out when the driver is in the ready state.

Preconditions

None.

Example

```
// This code snippet shows an example of initializing the SRAM Driver.

SYS_MODULE_OBJ  objectHandle;

SYS_FS_MEDIA_REGION_GEOMETRY gSramGeometryTable[3] =
{
    {
        // Read Region Geometry
        .blockSize = 512,
        .numBlocks = (DRV_SRAM_MEDIA_SIZE * (1024/512)),
    },
    {
        // Write Region Geometry
        .blockSize = 512,
        .numBlocks = ((DRV_SRAM_MEDIA_SIZE * (1024/512))
    },
    {
        // Erase Region Geometry
        .blockSize = 512,
        .numBlocks = ((DRV_SRAM_MEDIA_SIZE * (1024/512))
    }
};

const SYS_FS_MEDIA_GEOMETRY gSramGeometry =
{
    .mediaProperty = SYS_FS_MEDIA_WRITE_IS_BLOCKING,

    // Number of read, write and erase entries in the table
    .numReadRegions = 1,
    .numWriteRegions = 1,
    .numEraseRegions = 1,
    .geometryTable = &gSramGeometryTable
};

// SRAM Driver Initialization Data
const DRV_SRAM_INIT drvSramInit =
{
    .mediaStartAddress = DRV_SRAM_MEDIA_START_ADDRESS,
    .sramMediaGeometry = &gSramGeometry
};

objectHandle = DRV_SRAM_Initialize(DRV_SRAM_INDEX_0, (SYS_MODULE_INIT*)&drvSRAMInit);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized.
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_SRAM_Initialize

(

const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init

);

DRV_SRAM_IsAttached Function

Returns the physical attach status of the SRAM.

File

drv_sram.h

C

```
bool DRV_SRAM_IsAttached(const DRV_HANDLE handle);
```

Returns

Returns false if the handle is invalid otherwise returns true.

Description

This function returns the physical attach status of the SRAM.

Remarks

None.

Preconditions

The DRV_SRAM_Initialize() routine must have been called for the specified SRAM driver instance.

The DRV_SRAM_Open() routine must have been called to obtain a valid opened device handle.

Example

```
// The SRAM media is always attached and so the below always returns true.
bool isSRAMAttached;
isSRAMAttached = DRV_SRAM_isAttached(drvSRAMHandle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open

Function

bool DRV_SRAM_IsAttached

(

const DRV_HANDLE handle

);

DRV_SRAM_IsWriteProtected Function

Returns the write protect status of the SRAM.

File

drv_sram.h

C

```
bool DRV_SRAM_IsWriteProtected(const DRV_HANDLE handle);
```

Returns

Always returns false.

Description

This function returns the physical attach status of the SRAM. This function always returns false.

Remarks

None.

Preconditions

The DRV_SRAM_Initialize() routine must have been called for the specified SRAM driver instance.

The DRV_SRAM_Open() routine must have been called to obtain a valid opened device handle.

Example

```
// The SRAM media is treated as always writeable.
bool isWriteProtected;
isWriteProtected = DRV_SRAM_IsWriteProtected(drvSRAMHandle);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function

Function

bool DRV_SRAM_IsWriteProtected

(

const DRV_HANDLE handle

);

DRV_SRAM_Open Function

Opens the specified SRAM driver instance and returns a handle to it

File

drv_sram.h

C

```
DRV_HANDLE DRV_SRAM_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, DRV_HANDLE_INVALID is returned. Errors can occur under the following circumstances:

- if the number of client objects allocated via DRV_SRAM_CLIENTS_NUMBER

is insufficient

- if the client is trying to open the driver but driver has been opened

exclusively by another client

- if the client is trying to open the driver exclusively, but has

already been opened in a non exclusive mode by another client.

- if the driver hardware instance being opened is invalid

Description

This routine opens the specified SRAM driver instance and provides a handle. This handle must be provided to all other client-level operations to identify the caller and the instance of the driver.

Remarks

The handle returned is valid until the DRV_SRAM_Close routine is called. This routine will NEVER block waiting for hardware. If the driver has has already been opened, it cannot be opened exclusively.

Preconditions

DRV_SRAM_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_SRAM_Open(DRV_SRAM_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened

intent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_SRAM_Open
(
const SYS_MODULE_INDEX index,
const DRV_IO_INTENT ioIntent
);

DRV_SRAM_Read Function

Reads blocks of data from the specified block start address.

File

drv_sram.h

C

```
void DRV_SRAM_Read(const DRV_HANDLE handle, DRV_SRAM_COMMAND_HANDLE * commandHandle, void * targetBuffer,
uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_SRAM_COMMAND_HANDLE_INVALID if the request was not successful.

Description

This routine reads blocks of data from the specified block start address. This operation is blocking and returns with the required data in the target buffer. If a event handler has been registered to receive the driver events then the event handler will be called from within this function. The function returns DRV_SRAM_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the driver handle is invalid
- if the driver state is not ready
- if the target buffer pointer is NULL
- if the number of blocks to be read is zero or more than the actual number

of blocks available

- if the client opened the driver in write only mode

Remarks

None.

Preconditions

The DRV_SRAM_Initialize routine must have been called for the specified SRAM driver instance.

DRV_SRAM_Open must have been called with DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE as the ioIntent to obtain a valid opened device handle.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart = 0;
uint32_t nBlock = 2;
DRV_SRAM_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySRAMHandle is the handle returned by the DRV_SRAM_Open function.

DRV_SRAM_EventHandlerSet(mySRAMHandle, APP_SRAMEventHandler, (uintptr_t)&myAppObj);
DRV_SRAM_Read(mySRAMHandle, &commandHandle, &myBuffer, blockStart, nBlock);
if(DRV_SRAM_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}
else
{
    // Read operation completed successfully.
```

```
}

// Event is invoked from within the DRV_SRAM_Read function when the read
// operation processing is complete.

void APP_SRAMEventHandler
(
    DRV_SRAM_EVENT event,
    DRV_SRAM_COMMAND_HANDLE commandHandle,
    uintptr_t contextHandle
)
{
    // contextHandle points to myAppObj.
    switch(event)
    {
        case DRV_SRAM_EVENT_COMMAND_COMPLETE:
            // This means the data was transferred.
            break;

        case DRV_SRAM_EVENT_COMMAND_ERROR:
            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
targetBuffer	Buffer into which the data read from the SRAM memory will be placed
blockStart	SRAM media's start block address from where the read should begin.
nBlock	Total number of blocks to be read.

Function

```
void DRV_SRAM_Read
(
const       DRV_HANDLE handle,
    DRV_SRAM_COMMAND_HANDLE * commandHandle,
void * targetBuffer,
uint32_t blockStart,
uint32_t nBlock
);
```

DRV_SRAM_Status Function

Gets the current status of the SRAM driver module.

File

drv_sram.h

C

```
SYS_STATUS DRV_SRAM_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is ready and accept requests for new operations.
SYS_STATUS_UNINITIALIZED - Indicates the driver is not initialized.

Description

This routine provides the current status of the SRAM driver module.

Remarks

None.

Preconditions

Function DRV_SRAM_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_SRAM_Initialize
SYS_STATUS          SRAMStatus;

SRAMStatus = DRV_SRAM_Status(object);
if (SRAMStatus == SYS_STATUS_READY)
{
    // Driver is ready to process read/write operations.
}
else
{
    // Driver is not ready.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_SRAM_Initialize routine

Function

SYS_STATUS DRV_SRAM_Status

(

SYS_MODULE_OBJ object

);

DRV_SRAM_Write Function

Writes blocks of data starting from the specified block start address of the SRAM media.

File

drv_sram.h

C

```
void DRV_SRAM_Write(const DRV_HANDLE handle, DRV_SRAM_COMMAND_HANDLE * commandHandle, void * sourceBuffer,
uint32_t blockStart, uint32_t nBlock);
```

Returns

The buffer handle is returned in the commandHandle argument. It will be DRV_SRAM_COMMAND_HANDLE_INVALID if the request was not successful.

Description

This routine writes blocks of data starting at the specified block start address. This operation is blocking and returns after having written the data. If a event handler has been registered to receive the driver events then the event handler will be called from within this function. The function returns DRV_SRAM_COMMAND_HANDLE_INVALID in the commandHandle argument under the following circumstances:

- if the driver handle is invalid
- if the driver state is not ready
- if the source buffer pointer is NULL
- if the number of blocks to be written is zero or more than the actual

number of blocks available

- if the client opened the driver in read only mode

Remarks

None

Preconditions

The DRV_SRAM_Initialize() routine must have been called for the specified SRAM driver instance.

DRV_SRAM_Open() routine must have been called to obtain a valid opened device handle. DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified as a parameter to this routine.

Example

```
uint8_t myBuffer[MY_BUFFER_SIZE];
uint32_t blockStart = 2;
uint32_t nBlock = 2;
DRV_SRAM_COMMAND_HANDLE commandHandle;
MY_APP_OBJ myAppObj;

// mySRAMHandle is the handle returned by the DRV_SRAM_Open function.
// Client registers an event handler with driver

DRV_SRAM_EventHandlerSet(mySRAMHandle, APP_SRAMEventHandler, (uintptr_t)&myAppObj);
DRV_SRAM_Write(mySRAMHandle, &commandHandle, &myBuffer, blockStart, nBlock);

if(DRV_SRAM_COMMAND_HANDLE_INVALID == commandHandle)
{
    // Error handling here
}
else
{
    // Write completed successfully.
}

// Event is received from within the DRV_SRAM_Write function when the
// buffer is processed.

void APP_SRAMEventHandler
(
    DRV_SRAM_EVENT event,
    DRV_SRAM_COMMAND_HANDLE commandHandle,
    uintptr_t contextHandle
)
{
    // contextHandle points to myAppObj.
    switch(event)
    {
        case DRV_SRAM_EVENT_COMMAND_COMPLETE:
            // This means the data was transferred.
            break;

        case DRV_SRAM_EVENT_COMMAND_ERROR:
            // Error handling here.
            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open function
commandHandle	Pointer to an argument that will contain the return buffer handle
sourceBuffer	The source buffer containing data to be programmed into SRAM memory
blockStart	Start block address of SRAM media from where the write should begin.
nBlock	Total number of blocks to be written.

Function

void DRV_SRAM_Write

(

```
const       DRV_HANDLE handle,
    DRV_SRAM_COMMAND_HANDLE * commandHandle,
void * sourceBuffer,
uint32_t blockStart,
uint32_t nBlock
);
```

c) Data Types and Constants

DRV_SRAM_COMMAND_HANDLE Type

Handle identifying commands queued in the driver.

File

drv_sram.h

C

```
typedef SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE DRV_SRAM_COMMAND_HANDLE;
```

Description

SRAM Driver command handle.

A command handle is returned by a call to the Read or Write functions. This handle allows the application to track the completion of the operation. This command handle is also returned to the client along with the event that has occurred with respect to the command. This allows the application to connect the event to a specific command in case where multiple commands are queued.

The command handle associated with the command request expires when the client has been notified of the completion of the command (after event handler function that notifies the client returns) or after the command has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_SRAM_COMMAND_STATUS Enumeration

Specifies the status of the command for the read and write operations.

File

drv_sram.h

C

```
typedef enum {
  DRV_SRAM_COMMAND_COMPLETED = SYS_FS_MEDIA_COMMAND_COMPLETED,
  DRV_SRAM_COMMAND_QUEUED = SYS_FS_MEDIA_COMMAND_QUEUED,
  DRV_SRAM_COMMAND_IN_PROGRESS = SYS_FS_MEDIA_COMMAND_IN_PROGRESS,
  DRV_SRAM_COMMAND_ERROR_UNKNOWN = SYS_FS_MEDIA_COMMAND_UNKNOWN
} DRV_SRAM_COMMAND_STATUS;
```

Members

Members	Description
DRV_SRAM_COMMAND_COMPLETED = SYS_FS_MEDIA_COMMAND_COMPLETED	Done OK and ready
DRV_SRAM_COMMAND_QUEUED = SYS_FS_MEDIA_COMMAND_QUEUED	Scheduled but not started
DRV_SRAM_COMMAND_IN_PROGRESS = SYS_FS_MEDIA_COMMAND_IN_PROGRESS	Currently being in transfer
DRV_SRAM_COMMAND_ERROR_UNKNOWN = SYS_FS_MEDIA_COMMAND_UNKNOWN	Unknown Command

Description

SRAM Driver Command Status

SRAM Driver command Status

This type specifies the status of the command for the read and write operations.

Remarks

None.

DRV_SRAM_EVENT Enumeration

Identifies the possible events that can result from a request.

File

drv_sram.h

C

```
typedef enum {
  DRV_SRAM_EVENT_COMMAND_COMPLETE = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_COMPLETE,
  DRV_SRAM_EVENT_COMMAND_ERROR = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_ERROR
} DRV_SRAM_EVENT;
```

Members

Members	Description
DRV_SRAM_EVENT_COMMAND_COMPLETE = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_COMPLETE	Operation has been completed successfully.
DRV_SRAM_EVENT_COMMAND_ERROR = SYS_FS_MEDIA_EVENT_BLOCK_COMMAND_ERROR	There was an error during the operation

Description

SRAM Driver Events

This enumeration identifies the possible events that can result from a read or a write request caused by the client.

Remarks

One of these values is passed in the "event" parameter of the event handling callback function that client registered with the driver by calling the DRV_SRAM_EventHandlerSet function when a request is completed.

DRV_SRAM_EVENT_HANDLER Type

Pointer to a SRAM Driver Event handler function

File

drv_sram.h

C

```
typedef SYS_FS_MEDIA_EVENT_HANDLER DRV_SRAM_EVENT_HANDLER;
```

Returns

None.

Description

SRAM Driver Event Handler Function Pointer

This data type defines the required function signature for the SRAM event handling callback function. A client must register a pointer to an event handling function whose function signature (parameter and return value types) match the types specified by this function pointer in order to receive event callbacks from the driver.

The parameters and return values are described here and a partial example implementation is provided.

Remarks

If the event is DRV_SRAM_EVENT_COMMAND_COMPLETE, it means that the read or write operation was completed successfully.

If the event is DRV_SRAM_EVENT_COMMAND_ERROR, it means that the scheduled operation was not completed successfully.

The context parameter contains the handle to the client context, provided at the time the event handling function was registered using the DRV_SRAM_EventHandlerSet function. This context handle value is passed back to the client as the "context" parameter. It can be any value necessary to identify the client context or instance (such as a pointer to the client's data) instance of the client that made the read/write request.

The event handler function executes in the driver's context. It is recommended of the application to not perform process intensive or blocking operations within this function.

Example

```
void APP_MySramEventHandler
(
    DRV_SRAM_EVENT event,
    DRV_SRAM_COMMAND_HANDLE commandHandle,
    uintptr_t context
)
{
    MY_APP_DATA_STRUCT pAppData = (MY_APP_DATA_STRUCT) context;

    switch(event)
    {
        case DRV_SRAM_EVENT_COMMAND_COMPLETE:

            // Handle the completed buffer.
            break;

        case DRV_SRAM_EVENT_COMMAND_ERROR:
        default:

            // Handle error.
            break;
    }
}
```

Parameters

Parameters	Description
event	Identifies the type of event
commandHandle	Handle returned from the Read/Write requests
context	Value identifying the context of the application that registered the event handling function

DRV_SRAM_INIT Structure

Defines the data required to initialize the SRAM driver

File

drv_sram.h

C

```
typedef struct {
  bool registerWithFs;
  uint8_t* mediaStartAddress;
  const SYS_FS_MEDIA_GEOMETRY * sramMediaGeometry;
} DRV_SRAM_INIT;
```

Members

Members	Description
bool registerWithFs;	Flag to indicate if the driver is to be registered with the file system.
uint8_t* mediaStartAddress;	SRAM Media start address. The driver treats this address as block 0 • address for read and write operations.
const SYS_FS_MEDIA_GEOMETRY * sramMediaGeometry;	SRAM Media geometry object.

Description

SRAM Driver Initialization Data

This data type defines the data required to initialize the SRAM driver.

Remarks

None.

_DRV_SRAM_H Macro

File

drv_sram.h

C

```
#define _DRV_SRAM_H
```

Description

This is macro _DRV_SRAM_H.

DRV_SRAM_COMMAND_HANDLE_INVALID Macro

This value defines the SRAM Driver's Invalid Command Handle.

File

drv_sram.h

C

```
#define DRV_SRAM_COMMAND_HANDLE_INVALID SYS_FS_MEDIA_BLOCK_COMMAND_HANDLE_INVALID
```

Description

SRAM Driver Invalid Command Handle.

This value defines the SRAM Driver Invalid Command Handle. This value is returned by read/write routines when the command request is not accepted.

Remarks

None.

DRV_SRAM_INDEX_0 Macro

SRAM driver index definitions

File

drv_sram.h

C

```
#define DRV_SRAM_INDEX_0 0
```

Description

Driver SRAM Module Index reference

These constants provide SRAM driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_SRAM_Initialize and DRV_SRAM_Open routines to identify the driver instance in use.

DRV_SRAM_INDEX_1 Macro

File

drv_sram.h

C

```
#define DRV_SRAM_INDEX_1 1
```

Description

This is macro DRV_SRAM_INDEX_1.

SRAM Driver Interface Definition

Enumerations

	Name	Description
	DRV_SRAM_COMMAND_STATUS	Specifies the status of the command for the read and write operations.
	DRV_SRAM_EVENT	Identifies the possible events that can result from a request.

Functions

	Name	Description
	DRV_SRAM_AddressGet	Returns the SRAM media start address
	DRV_SRAM_Close	Closes an opened-instance of the SRAM driver
	DRV_SRAM_CommandStatus	Gets the current status of the command.
	DRV_SRAM_Deinitialize	Deinitializes the specified instance of the SRAM driver module
	DRV_SRAM_EventHandlerSet	Allows a client to identify an event handling function for the driver to call back when an operation has completed.
	DRV_SRAM_GeometryGet	Returns the geometry of the device.
	DRV_SRAM_Initialize	Initializes the SRAM instance for the specified driver index.
	DRV_SRAM_IsAttached	Returns the physical attach status of the SRAM.
	DRV_SRAM_IsWriteProtected	Returns the write protect status of the SRAM.
	DRV_SRAM_Open	Opens the specified SRAM driver instance and returns a handle to it
	DRV_SRAM_Read	Reads blocks of data from the specified block start address.
	DRV_SRAM_Status	Gets the current status of the SRAM driver module.
	DRV_SRAM_Write	Writes blocks of data starting from the specified block start address of the SRAM media.

Macros

	Name	Description
	_DRV_SRAM_H	This is macro _DRV_SRAM_H.
	DRV_SRAM_COMMAND_HANDLE_INVALID	This value defines the SRAM Driver's Invalid Command Handle.
	DRV_SRAM_INDEX_0	SRAM driver index definitions
	DRV_SRAM_INDEX_1	This is macro DRV_SRAM_INDEX_1.

Structures

	Name	Description
	DRV_SRAM_INIT	Defines the data required to initialize the SRAM driver

Types

	Name	Description
	DRV_SRAM_COMMAND_HANDLE	Handle identifying commands queued in the driver.
	DRV_SRAM_EVENT_HANDLER	Pointer to a SRAM Driver Event handler function

Description

SRAM Driver Interface Definition

The SRAM driver provides a simple interface to manage the SRAM Memory on Microchip microcontrollers. This file defines the interface definition for the SRAM driver.

File Name

drv_sram.h

Company

Microchip Technology Inc.

Timer Driver Library

This section describes the Timer Driver Library.

Introduction

This library provides an interface to manage the Timer module on the Microchip family of microcontrollers during different modes of operation.

Description

Timers are useful for generating accurate time based periodic interrupts for software application or real time operating systems. Other uses include counting external pulses or accurate timing measurement of external events using the timer's gate functions and accurate hardware delays.

Note: Not all features are available on all devices. Please refer to the specific device data sheet to determine availability.

Using the Library

This topic describes the basic architecture of the Timer Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_tmr.h`

The interface to the Timer Driver Library is defined in the `drv_tmr.h` header file.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

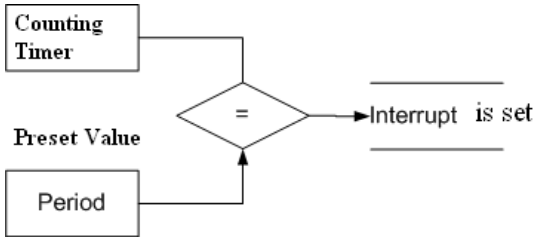
Abstraction Model

The Timer Driver abstracts the hardware by providing the capability to register callback functions to the application.

Description

Abstraction Model

The abstraction model of the Timer Driver is explained in the following diagram:



The core functionality of the Timer allows access to both the counter and the period values.

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Timer Driver Library.

Library Interface Section	Description
Configuration	Provides macros for configuring the system. It is required that the system configures the driver to build correctly by choosing appropriate configuration options as listed in this section. These macros enable different features or modes of the timer peripheral.
System Interaction Functions	Provides interfaces to system layer to initialize, deinitialize and reinitialize the module. This section also describes functions to query the status of the module.
Core Functions	Provides interfaces for core functionality of the driver.
Alarm Functions	Provides interfaces to handle alarm features, if alarm functionality is enabled.
Period Functions	Provides interfaces to control the periodicity of the timers.
Counter Control Functions	Provides interfaces to update the counter values.
Miscellaneous Functions	Provides interfaces to get the version information, timer tick and operating frequencies.

How the Library Works

The library provides interfaces to support:

- System Interaction
- Sync Mode Setup
- Period Modification
- Counter Modification
- Client Core Functionality
- Client Alarm Functionality (optional function, enabled using configuration options)
- Other Optional Functionality (enabled using configuration options)

Note: Any code segment pertaining to the driver interfaces will work for both the static or dynamic configurations. It is not necessary to modify the code to move from one configuration to the other (i.e., from static or dynamic or static-multi).

System Interaction

This section describes Timer initialization and reinitialization.

Description

Initialization and Reinitialization

The system performs the initialization of the device driver with settings that affect only the instance of the device that is being initialized.

The DRV_TMR_Initialize function returns an object handle of the type SYS_MODULE_OBJ. After this, the object handle returned by the Initialize interface would be used by the other system interfaces such as DRV_TMR_Deinitialize and DRV_TMR_Status, DRV_TMR_Tasks.

Example: Timer Initialization

```
DRV_TMR_INIT     init;
SYS_MODULE_OBJ   object;
SYS_STATUS       tmrStatus;

// populate the TMR init configuration structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId            = TMR_ID_2;
init.clockSource      = TMR_CLOCK_SOURCE_PERIPHERAL_CLOCK;
init.prescale         = TMR_PRESCALE_VALUE_256;
init.interruptSource  = INT_SOURCE_TIMER_2;
init.mode             = DRV_TMR_OPERATION_MODE_16_BIT;
init.asyncWriteEnable = false;

object = DRV_TMR_Initialize (DRV_TMR_INDEX_0, (SYS_MODULE_INIT *)&init);

if (object == SYS_MODULE_OBJ_INVALID)
{
    // Handle error
}
```

Deinitialization

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This routine may block if the driver is running in an OS environment that supports blocking operations and the driver requires system resources access. However, the routine will never block for hardware Timer access.

Status

Timer status is available to query the module state after initialization and reinitialization.

Tasks Routine

The interface DRV_TMR_Tasks needs to be called by the system task service in a polled environment and in an interrupt-based system.

Example: Polling

```
int main( void )
{
    SYS_MODULE_OBJ object;
    object = DRV_TMR_Initialize( DRV_TMR_INDEX_0, (SYS_MODULE_INIT *) &initConf );

    if( SYS_STATUS_READY != DRV_TMR_Status( object ) )
        return 0;

    while (1)
    {
        DRV_TMR_Tasks (object);
    }
}
```

Example: Interrupt

```
int main( void )
{
    SYS_MODULE_OBJ object;
    object = DRV_TMR_Initialize( DRV_TMR_INDEX_0, (SYS_MODULE_INIT *) &initConf );

    if( SYS_STATUS_READY != DRV_TMR_Status( object ) )
        return 0;

    while (1);
}

/* Sample interrupt routine not specific to any device family */
void ISR T1Interrupt(void)
{
    //Call the Timer Tasks routine
    DRV_TMR_Tasks(object);
}
```

Client Interaction

This section describes general client operation.

Description

General Client Operation

For the application to begin using an instance of the Timer module, it must call the DRV_TMR_Open function. This provides the configuration required to open the Timer instance for operation.

The Timer Driver supports only the 'DRV_IO_INTENT_EXCLUSIVE' IO_INTENT.

Example:

```
DRV_HANDLE handle;

// Configure the instance DRV_TMR_INDEX_1 with the configuration
handle = DRV_TMR_Open(DRV_TMR_INDEX_1, DRV_IO_INTENT_EXCLUSIVE);

if( handle == DRV_HANDLE_INVALID )
{
    // Client cannot open the instance.
}
```

The function DRV_TMR_Close closes an already opened instance of the Timer Driver, invalidating the handle. DRV_TMR_Open must have been

called to obtain a valid opened device handle.

Example:
```
DRV_HANDLE handle;

// Configure the instance DRV_TMR_INDEX_1 with the configuration
handle = DRV_TMR_Open(DRV_TMR_INDEX_1, DRV_IO_INTENT_EXCLUSIVE);

/*...*/

DRV_TMR_Close( handle );
```

The client has the option to check the status through the interface DRV_TMR_ClientStatus.

Example:
```
DRV_HANDLE handle;

// Configure the instance DRV_TMR_INDEX_1 with the configuration
handle = DRV_TMR_Open(DRV_TMR_INDEX_1, DRV_IO_INTENT_EXCLUSIVE);

if ( DRV_TMR_CLIENT_STATUS_READY != DRV_TMR_ClientStatus( handle ) )
   return 0;
```

Modification

This section describes Period modification for the different types of Timers (i.e., 16-/32-bit).

Description

These set of functions help modify the Timer periodicity at the client level.

Period Modification

Periodicity of Timer (16/32-bit) can be modified using DRV_TMR_AlarmPeriodSet and the current period can be obtained using DRV_TMR_AlarmPeriodGet.

Example:
```
DRV_HANDLE handle;
/* Open the client */
handle = DRV_TMR_Open( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

/* ... */

/* Update the new period */
DRV_TMR_AlarmPeriodSet( handle, 0xC350);
```

Counter Modification

This section describes counter modification for the different types of Timers (i.e., 8-/16-/32-bit).

Description

These set of functions help modify the initial value of the Timer counters to help adjust any errors in the periodicity.

Counter Modification

The Timer initial value can be modified using DRV_TMR_CounterValueSet and the current counter value can be obtained using DRV_TMR_CounterValueGet.

Example:
```
DRV_HANDLE handle;
/* Open the client */
handle = DRV_TMR_Open( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

/* ... */

/* Update the counter value */
/* Following code updates the initial value from 0x0000 to 0x0010
   to cover up any error in the previously set periodicity */

DRV_TMR_CounterValueSet( handle, 0x0010);
```

Core Functionality

This section describes core functionality of the Timer Driver.

Description

Core functionality provides an extremely basic interface for the driver operation.

Applications using the Timer core functionality need to perform the following:

1. The system should have completed the necessary initialization and DRV_TMR_Tasks should be called in a polled/interrupt environment.
2. Open_the driver using DRV_TMR_Open. The Timer Driver only supports exclusive access.
3. The Timer can be updated using DRV_TMR_AlarmPeriodSet. The previously set value can be retrieved using DRV_TMR_AlarmPeriodGet.
4. Start the driver using DRV_TMR_Start.
5. Poll for the elapsed alarm status using DRV_TMR_AlarmHasElapsed.
6. The client will be able to stop the started Timer instance using DRV_TMR_Stop at any time and will be able to close it using DRV_TMR_Close when it is no longer required.

Example:

```
/* Open the client */
handle = DRV_TMR_Open( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );
DRV_TMR_Start (handle);
unsigned int alarmCount = 0;
while (1)
{
    if (true == DRV_TMR_AlarmHasElapsed (handle))
    {
        alarmCount++;
        // Do something
    }
}
```

Notes:

1. The user needs to stop the Timer before any updates on the counter or period and restart it later.
2. The Timer alarm count gets reset after any call to DRV_TMR_AlarmHasElapsed.
3. The Timer alarm status remains unchanged if the user stops the timer and restarts later.

Alarm Functionality

This section describes the Timer Driver alarm functionality.

Description

The Timer Driver provides alarm functionality.

Applications using the Timer alarm functionality, need to perform the following:

1. The system should have completed the necessary initialization and DRV_TMR_Tasks should be running in either a polled environment or in an interrupt environment.
2. Open the driver using DRV_TMR_Open. The Timer Driver supports exclusive access only.
3. Configure the alarm using DRV_TMR_AlarmRegister.
4. Start the driver using DRV_TMR_Start.
5. If a callback is supplied, the Timer Driver will call the callback function when the alarm expires.
6. The client will be able to stop the started Timer module instance using DRV_TMR_Stop at any time and will be able to close it using DRV_TMR_Close when it is no longer required.
7. The client can deregister the callback by using DRV_TMR_AlarmDeregister.

Example:

```
DRV_HANDLE handle;
/* Open the client */
handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
/* Configure the timer alarm feature */
uint32_t myFreq = 1000; // 1KHz
uint32_t clkFreq = DRV_TMR_CounterFrequencyGet(tmrHandle);   // timer running frequency

// calculate the divider needed
uint32_t divider = clkFreq / myFreq;

// Start the alarm
if(!DRV_TMR_AlarmRegister ( tmrHandle, divider, true, 0, CallBackFreq ))
```

```
{
    // divider value could not be obtain;
    // handle the error
    //
    return;
}

DRV_TMR_Start (handle);

// The driver tasks function calls the client registered callback after the alarm expires.
void CallBackFreq (uintptr_t context, uint32_t alarmCount)
{
    // Do something specific on an alarm event trigger
}
```

Optional Interfaces

This section describes additional/optional client interfaces.

Description

Additional/Optional client interfaces include the following:

Get Operating Frequency

The function DRV_TMR_CounterFrequencyGet provides the client with the information on the Timer operating frequency.

Example:

```
DRV_HANDLE handle;
uint32_t freq;

/* Open the client */
handle = DRV_TMR_Open (DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);

freq = DRV_TMR_OperatingFrequencyGet (handle);
```

Example Usage of the Timer Driver

This section describes typical usage of the Timer Driver for various Timer modules in polling/interrupt advanced/core modes.

Description

The user can pass NULL to the driver initialize interface. However, the respective configuration parameters need to be configured in the correct manner.

Example:

```
//Polled mode under 32-bit count mode for a PIC32 device using the alarm feature
SYS_MODULE_OBJ object;

// main
DRV_TMR_INIT init;
DRV_HANDLE handle;

init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId            = TMR_ID_2;

    return 0;

DRV_TMR_Deinitialize (object);
// end main

void AlarmCallback (uintptr_t context, uint32_t alarmCount)
{
  // Do something specific on an alarm event trigger
}
```

Configuring the Library

Macros

	Name	Description
	DRV_TMR_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_TMR_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_TMR_CLOCK_PRESCALER	Sets the default timer driver clock prescaler.
	DRV_TMR_MODE	Sets the default timer driver clock operating mode.
	DRV_TMR_MODULE_ID	Sets the default timer module ID to be used by the timer driver.
	DRV_TMR_MODULE_INIT	Sets the default module init value for the timer driver.
	DRV_TMR_INTERRUPT_SOURCE	Sets the default timer driver clock interrupt source
	DRV_TMR_ASYNC_WRITE_ENABLE	Controls Asynchronous Write mode of the Timer.
	DRV_TMR_CLOCK_SOURCE	Sets the default timer driver clock source.
	DRV_TMR_CLIENTS_NUMBER	Sets up the maximum number of clients that can be supported by an instance of the dynamic driver.

Description

The configuration of the Timer Driver Library is based on the file `system_config.h`.

This header file contains the configuration selection for the Timer Driver Library build. Based on the selections made here and the system setup, the Timer Driver may support the selected features. These configuration settings will apply to all instances of the driver.

This header can be placed anywhere in the application-specific folders and the path of this header needs to be presented to the include search for a successful build. Refer to the Applications Help section for more details.

DRV_TMR_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported by the dynamic driver.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_INSTANCES_NUMBER 5
```

Description

Hardware instances support

This definition sets up the maximum number of hardware instances that can be supported by the dynamic driver.

Remarks

None

DRV_TMR_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_INTERRUPT_MODE true
```

Description

TMR Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of timer operation is desired
- false - Select if polling mode of timer operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

DRV_TMR_CLOCK_PRESCALER Macro

Sets the default timer driver clock prescaler.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_CLOCK_PRESCALER (TMR_PRESCALE_VALUE_256)
```

Description

Default timer driver clock prescaler

This macro sets the default timer driver clock prescaler.

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_MODE Macro

Sets the default timer driver clock operating mode.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_MODE (DRV_TMR_OPERATION_MODE_16_BIT)
```

Description

Default timer driver clock operating mode

This macro sets the default timer driver clock operating mode.

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_MODULE_ID Macro

Sets the default timer module ID to be used by the timer driver.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_MODULE_ID (TMR_ID_2)
```

Description

Default timer driver index

This macro sets the default timer module ID to be used by the timer driver.

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_MODULE_INIT Macro

Sets the default module init value for the timer driver.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_MODULE_INIT (SYS_MODULE_POWER_RUN_FULL)
```

Description

Default module init object configuration

This macro sets the default module init value for the timer driver.

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_INTERRUPT_SOURCE Macro

Sets the default timer driver clock interrupt source

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_INTERRUPT_SOURCE (INT_SOURCE_TIMER_2)
```

Description

Default timer driver clock interrupt source

This macro sets the default timer driver clock interrupt source

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_ASYNC_WRITE_ENABLE Macro

Controls Asynchronous Write mode of the Timer.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_ASYNC_WRITE_ENABLE false
```

Description

TMR Asynchronous write mode configuration

This macro controls the Asynchronous Write mode of the Timer. This macro accepts the following values:

- true - Configures the Timer to enable asynchronous write control
- false - Configures the Timer to disable asynchronous write control
- DRV_CONFIG_NOT_SUPPORTED - When the feature is not supported on the instance.

Remarks

This feature is not available in all modules/devices. Refer to the specific device data sheet for more information.

DRV_TMR_CLOCK_SOURCE Macro

Sets the default timer driver clock source.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_CLOCK_SOURCE (DRV_TMR_CLKSOURCE_INTERNAL)
```

Description

Default timer driver clock source

This macro sets the default timer driver clock source.

Remarks

This value can be overridden by a run time initialization value.

DRV_TMR_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be supported by an instance of the dynamic driver.

File

drv_tmr_config_template.h

C

```
#define DRV_TMR_CLIENTS_NUMBER 1
```

Description

Client instances support

This definition sets up the maximum number of clients that can be supported by an instance of the dynamic driver.

Remarks

Currently each client is required to get exclusive access to the timer module. Therfore the DRV_TMR_CLIENTS_NUMBER should always be set to 1.

Building the Library

This section lists the files that are available in the Timer Driver Library.

Description

This section list the files that are available in the `\src` folder of the Timer Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/tmr`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_tmr.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_tmr_dynamic.c`	Basic Timer driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library

Module Dependencies

The Timer Driver Library depends on the following modules:

- Clock System Service Library
- Interrupt System Service Library
- Interrupt Peripheral Library
- Device Control System Service Library

Library Interface

a) System Interaction Functions

	Name	Description
	DRV_TMR_Deinitialize	Deinitializes the specified instance of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_Initialize	Initializes the Timer driver. **Implementation:** Static/Dynamic
	DRV_TMR_Status	Provides the current status of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_Tasks	Maintains the driver's state machine. **Implementation:** Dynamic
	DRV_TMR_ClockSet	Sets the timers clock by selecting the source and prescaler. **Implementation:** Dynamic
	DRV_TMR_GateModeSet	Enables the Gate mode. **Implementation:** Dynamic

b) Core Functions

	Name	Description
	DRV_TMR_ClientStatus	Gets the status of the client operation. **Implementation:** Dynamic
	DRV_TMR_Close	Closes an opened instance of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_Open	Opens the specified Timer driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_TMR_Start	Starts the Timer counting. **Implementation:** Static/Dynamic
	DRV_TMR_Stop	Stops the Timer from counting. **Implementation:** Static/Dynamic

c) Alarm Functions

	Name	Description
	DRV_TMR_AlarmHasElapsed	Provides the status of Timer's period elapse. **Implementation:** Dynamic
	DRV_TMR_AlarmDisable	Disables an alarm signal. **Implementation:** Dynamic
	DRV_TMR_AlarmEnable	Re-enables an alarm signal. **Implementation:** Dynamic
	DRV_TMR_AlarmDeregister	Removes a previously set alarm. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriodGet	Provides the Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriodSet	Updates the Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmRegister	Sets up an alarm. **Implementation:** Dynamic

d) Counter Control Functions

	Name	Description
	DRV_TMR_CounterFrequencyGet	Provides the Timer input frequency. **Implementation:** Dynamic
	DRV_TMR_CounterClear	Clears the Timer's counter register. **Implementation:** Static/Dynamic
	DRV_TMR_CounterValueGet	Reads the Timer's counter register. **Implementation:** Static/Dynamic
	DRV_TMR_CounterValueSet	Updates the Timer's counter register. **Implementation:** Static/Dynamic

e) Miscellaneous Functions

	Name	Description
	DRV_TMR_GateModeClear	Enables the Gate mode. **Implementation:** Dynamic
	DRV_TMR_PrescalerGet	This function gets the currently selected prescaler. **Implementation:** Dynamic
	DRV_TMR_OperationModeGet	This function gets the currently selected operation mode. **Implementation:** Dynamic
	DRV_TMR_DividerRangeGet	Returns the Timer divider values. **Implementation:** Dynamic

f) Data Types and Constants

Name	Description
DRV_TMR_CALLBACK	Pointer to a Timer driver callback function data type.
DRV_TMR_INIT	Defines the Timer driver initialization data.
DRV_TMR_CLIENT_STATUS	Identifies the client-specific status of the Timer driver
DRV_TMR_DIVIDER_RANGE	This data structure specifies the divider values that can be obtained by the timer module.
DRV_TMR_OPERATION_MODE	Lists the operation modes available for timer driver.
DRV_TMR_INDEX_COUNT	Number of valid Timer driver indices.
DRV_TMR_INDEX_0	Timer driver index definitions
DRV_TMR_INDEX_1	This is macro DRV_TMR_INDEX_1.
DRV_TMR_INDEX_2	This is macro DRV_TMR_INDEX_2.
DRV_TMR_INDEX_3	This is macro DRV_TMR_INDEX_3.
DRV_TMR_INDEX_4	This is macro DRV_TMR_INDEX_4.
DRV_TMR_INDEX_5	This is macro DRV_TMR_INDEX_5.
DRV_TMR_INDEX_6	This is macro DRV_TMR_INDEX_6.
DRV_TMR_INDEX_7	This is macro DRV_TMR_INDEX_7.
DRV_TMR_INDEX_8	This is macro DRV_TMR_INDEX_8.

	DRV_TMR_INDEX_9	This is macro DRV_TMR_INDEX_9.
	DRV_TMR_INDEX_10	This is macro DRV_TMR_INDEX_10.
	DRV_TMR_INDEX_11	This is macro DRV_TMR_INDEX_11.

Description

This section describes the functions of the Timer Driver Library.

Refer to each section for a detailed description.

a) System Interaction Functions

DRV_TMR_Deinitialize Function

Deinitializes the specified instance of the Timer driver.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the Timer driver, disabling its operation (and any hardware). All internal data is invalidated.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_TMR_Status operation. The system has to use DRV_TMR_Status to find out when the module is in the ready state.

Preconditions

The DRV_TMR_Initialize function must have been called before calling this function and a valid SYS_MODULE_OBJ must have been returned.

Example

```
SYS_MODULE_OBJ      tmrObject;     //  Returned from DRV_TMR_Initialize
SYS_STATUS          tmrStatus;

DRV_TMR_Deinitialize ( tmrObject );

tmrStatus = DRV_TMR_Status ( tmrObject );

if ( SYS_MODULE_UNINITIALIZED == tmrStatus )
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TMR_Initialize

Function

void DRV_TMR_Deinitialize (SYS_MODULE_OBJ object)

DRV_TMR_Initialize Function

Initializes the Timer driver.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
SYS_MODULE_OBJ DRV_TMR_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver object. Otherwise, it returns SYS_MODULE_OBJ_INVALID. The returned object must be passed as argument to DRV_TMR_Deinitialize, DRV_TMR_Tasks and DRV_TMR_Status functions.

Description

This function initializes the Timer driver, making it ready for clients to open and use it.

Remarks

This function must be called before any other Timer driver function is called.

This function should only be called once during system initialization unless DRV_TMR_Deinitialize is called to deinitialize the driver instance.

This function will NEVER block for hardware access. The system must use DRV_TMR_Status to find out when the driver is in the ready state.

Build configuration options may be used to statically override options in the "init" structure and will take precedence over initialization data passed using this function.

Preconditions

None.

Example

```
DRV_TMR_INIT    init;
SYS_MODULE_OBJ  objectHandle;

// Populate the timer initialization structure
init.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;
init.tmrId            = TMR_ID_2;
init.clockSource      = DRV_TMR_CLKSOURCE_INTERNAL;
init.prescale         = TMR_PRESCALE_VALUE_256;
init.interruptSource  = INT_SOURCE_TIMER_2;
init.mode             = DRV_TMR_OPERATION_MODE_16_BIT;
init.asyncWriteEnable = false;

// Do something

objectHandle = DRV_TMR_Initialize ( DRV_TMR_INDEX_0, (SYS_MODULE_INIT*)&init );

if ( SYS_MODULE_OBJ_INVALID == objectHandle )
{
    // Handle error
}
```

Parameters

Parameters	Description
drvIndex	Index for the driver instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_TMR_Initialize

(

const SYS_MODULE_INDEX drvIndex,

const SYS_MODULE_INIT * const init

)

DRV_TMR_Status Function

Provides the current status of the Timer driver.

Implementation: Dynamic

File

drv_tmr.h

C

```
SYS_STATUS DRV_TMR_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is initialized and ready for operation

Description

This function provides the current status of the Timer driver.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_STATUS_ERROR - Indicates that the driver is in an error state

Any value less than SYS_STATUS_ERROR is also an error state.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

The this operation can be used to determine when any of the driver's module level operations has completed.

Once the status operation returns SYS_STATUS_READY, the driver is ready for operation.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

Preconditions

The DRV_TMR_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TMR_Initialize
SYS_STATUS          tmrStatus;

tmrStatus = DRV_TMR_Status ( object );

else if ( SYS_STATUS_ERROR >= tmrStatus )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TMR_Initialize

Function

SYS_STATUS DRV_TMR_Status (SYS_MODULE_OBJ object)

DRV_TMR_Tasks Function

Maintains the driver's state machine.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Tasks(SYS_MODULE_OBJ object);
```

Returns

None

Description

This function is used to maintain the driver's internal state machine and processes the timer events..

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks)

Preconditions

The DRV_TMR_Initialize function must have been called for the specified Timer driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TMR_Initialize

while (true)
{
    DRV_TMR_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TMR_Initialize)

Function

void DRV_TMR_Tasks (SYS_MODULE_OBJ object)

DRV_TMR_ClockSet Function

Sets the timers clock by selecting the source and prescaler.

Implementation: Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_ClockSet(DRV_HANDLE handle, DRV_TMR_CLK_SOURCES clockSource, TMR_PRESCALE preScale);
```

Returns

- true - if the operation is successful
- false - either the handle is invalid or the clockSource and/or prescaler are not supported

Description

This function sets the timer clock by selecting the source and prescaler. The clock sources are device specific, refer device datasheet for supported clock sources. If unsupported clock source is passed then the behaviour of this function is unpredictable.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called. Must have selected 32-Bit timer mode if mode selection is applicable.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE              tmrHandle;  // Returned from DRV_TMR_Open

DRV_TMR_ClockSet ( tmrHandle, DRV_TMR_CLKSOURCE_INTERNAL, TMR_PRESCALE_VALUE_256 );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
clockSource	Clock source of the timer
preScale	Timer's Prescaler divisor

Function

bool DRV_TMR_ClockSet
(
DRV_HANDLE handle,
DRV_TMR_CLK_SOURCES clockSource,
TMR_PRESCALE preScale
)

DRV_TMR_GateModeSet Function

Enables the Gate mode.

Implementation: Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_GateModeSet(DRV_HANDLE handle);
```

Returns

- true - if the operation is successful
- false - either the handle is invalid or the gate mode is not supported

Description

This function enables the Gated mode of Timer. User can measure the duration of an external signal in this mode. Once the Gate mode is enabled, Timer will start on the raising edge of the external signal. It will keep counting until the next falling edge.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

DRV_TMR_GateModeSet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

bool DRV_TMR_GateModeSet (DRV_HANDLE handle)

b) Core Functions

DRV_TMR_ClientStatus Function

Gets the status of the client operation.

Implementation: Dynamic

File

drv_tmr.h

C

```
DRV_TMR_CLIENT_STATUS DRV_TMR_ClientStatus(DRV_HANDLE handle);
```

Returns

None

Description

This function gets the status of the recently completed client level operation.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called for the specified Timer driver instance.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
DRV_TMR_CLIENT_STATUS tmrDrvStatus;

tmrDrvStatus = DRV_TMR_ClientStatus ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_TMR_CLIENT_STATUS DRV_TMR_ClientStatus (DRV_HANDLE handle)

DRV_TMR_Close Function

Closes an opened instance of the Timer driver.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the Timer driver, invalidating the handle.

Remarks

After calling this function, the handle passed in "handle" must not be used with any of the remaining driver functions. A new handle must be obtained by calling DRV_TMR_Open before the caller may use the driver again.

Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_TMR_Initialize function must have been called for the specified Timer driver instance.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TMR_Open

DRV_TMR_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TMR_Close (DRV_HANDLE handle)

DRV_TMR_Open Function

Opens the specified Timer driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_tmr.h

C

```
DRV_HANDLE DRV_TMR_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Returns

If successful, the function returns a valid open instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID.

Description

This function opens the specified Timer driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. Timer driver does not support multiple clients. If two tasks want to use the timer, one should wait until the other one gets closed.

Remarks

The handle returned is valid until the DRV_TMR_Close function is called.

This function will NEVER block waiting for hardware.

If the requested intent flags are not supported, the function will return DRV_HANDLE_INVALID.

The Timer driver does not support DRV_IO_INTENT_SHARED. Only exclusive access is supported for now.

Preconditions

The DRV_TMR_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_TMR_Open ( DRV_TMR_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

if ( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_TMR_Open

(

const SYS_MODULE_INDEX index,

const DRV_IO_INTENT intent

)

DRV_TMR_Start Function

Starts the Timer counting.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_Start(DRV_HANDLE handle);
```

Returns

- true - if the operation succeeded
- false - the supplied handle is invalid or the client doesn't have the needed parameters to run (alarm callback and period)

Description

This function starts the Timer counting.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Timer parameters must have been set by a call to DRV_TMR_AlarmRegister.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

DRV_TMR_AlarmRegister(tmrHandle, 0x100, true, 0, myTmrCallback);
DRV_TMR_Start ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

bool DRV_TMR_Start (DRV_HANDLE handle)

DRV_TMR_Stop Function

Stops the Timer from counting.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_Stop(DRV_HANDLE handle);
```

Returns

None.

Description

This function stops the running Timer from counting.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TMR_Open
```

```
DRV_TMR_Stop ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TMR_Stop (DRV_HANDLE handle)

c) Alarm Functions

DRV_TMR_AlarmHasElapsed Function

Provides the status of Timer's period elapse.

Implementation: Dynamic

File

drv_tmr.h

C

```
uint32_t DRV_TMR_AlarmHasElapsed(DRV_HANDLE handle);
```

Returns

Number of times timer has elapsed since the last call.

Description

This function returns the number of times Timer's period has elapsed since last call to this API has made. On calling this API, the internally maintained counter will be cleared and count will be started again from next elapse.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      tmrHandle;  // Returned from DRV_TMR_Open
bool            elapseStatus;
SYS_MODULE_OBJ  tmrObject // Returned by DRV_TMR_Initialize
unsigned int    appInternalTime = 0;

Sys_Tasks()
{
    //Timer task will be called from ISR

    APP_TimeUpdate_Task();

    //Other Tasks
}

void APP_TimeUpdate_Task ( void )
{
    //We will not miss a count even though we are late
    appInternalTime += DRV_TMR_AlarmHasElapsed ( tmrHandle );
}
```

Parameters

Parameters	Description
handle	A valid handle, returned from the DRV_TMR_Open

Function

unsigned int DRV_TMR_AlarmHasElapsed (DRV_HANDLE handle)

DRV_TMR_AlarmDisable Function

Disables an alarm signal.

Implementation: Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_AlarmDisable(DRV_HANDLE handle);
```

Returns

The current status of the alarm:

- true if the alarm was currently enabled
- false if the alarm was currently disabled

Description

This function allows the client to disable an alarm generation. Use DRV_TMR_AlarmEnable to re-enable.

Remarks

When the driver operates in interrupts this call resolves to a device interrupt disable.

Do NOT disable the timer except for very short periods of time. If the time that the interrupt is disabled is longer than a wrap around period and the interrupt is missed, the hardware has no means of recovering and the resulting timing will be inaccurate.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

A client alarm must be active.

Example

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open

Function

bool DRV_TMR_AlarmDisable (DRV_HANDLE handle);

DRV_TMR_AlarmEnable Function

Re-enables an alarm signal.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_AlarmEnable(DRV_HANDLE handle, bool enable);
```

Returns

None

Description

This function allows the client to re-enable an alarm after it has been disabled by a DRV_TMR_AlarmDisable call.

Remarks

When the driver operates in interrupts this call resolves to a device interrupt re-enable.

Preconditions

The DRV_TMR_Initialize function must have been called. DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open
enable	boolean to enable the current callback

Function

void DRV_TMR_AlarmEnable (DRV_HANDLE handle, bool enable);

DRV_TMR_AlarmDeregister Function

Removes a previously set alarm.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_AlarmDeregister(DRV_HANDLE handle);
```

Returns

None.

Description

This function removes a previously set alarm.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

DRV_TMR_AlarmRegister function must have been called before.

Example

```
// Example of a key debounce check

static unsigned int lastReadKey, readKey, keyCount, globalKeyState;
DRV_HANDLE              tmrHandle;  // Returned from DRV_TMR_Open

void keyPressDetect ()
{
    // Calculate the count to be passed on from the clock input
    DRV_TMR_AlarmRegister ( tmrHandle, 0xFF00, true, DebounceCheck );
}

void DebounceCheck ( uintptr_t context )
{
    readKey = AppReadKey();

    if ( readKey != lastReadKey )
    {
        lastReadKey = readKey;
        keyCount = 0;
    }
    else
    {
        if ( keyCount > 20 )
        {
```

```
            globalKeyState = readKey;
            DRV_TMR_AlarmDeregister ( tmrHandle );
        }
        keyCount++;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TMR_AlarmDeregister (DRV_HANDLE handle)

DRV_TMR_AlarmPeriodGet Function

Provides the Timer's period.

Implementation: Dynamic

File

drv_tmr.h

C

```
uint32_t DRV_TMR_AlarmPeriodGet(DRV_HANDLE handle);
```

Returns

Timer period value:

- a 16 bit value if the timer is configured in 16 bit mode
- a 32 bit value if the timer is configured in 32 bit mode

Description

This function gets the Timer's period.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
uint32_t period;

period = DRV_TMR_AlarmPeriodGet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_TMR_AlarmPeriodGet (DRV_HANDLE handle)

DRV_TMR_AlarmPeriodSet Function

Updates the Timer's period.

Implementation: Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_AlarmPeriodSet(DRV_HANDLE handle, uint32_t value);
```

Returns

None.

Description

This function updates the Timer's period.

Remarks

- The period value will be truncated to a 16 bit value if the timer is

configured in 16 bit mode.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TMR_Open

DRV_TMR_AlarmPeriodSet ( handle, 0x1000 );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
value	Period value • a 16 bit value if the timer is configured in 16 bit mode • a 32 bit value if the timer is configured in 32 bit mode

Function

void DRV_TMR_AlarmPeriodSet (DRV_HANDLE handle, uint32_t value)

DRV_TMR_AlarmRegister Function

Sets up an alarm.

Implementation: Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_AlarmRegister(DRV_HANDLE handle, uint32_t divider, bool isPeriodic, uintptr_t context,
DRV_TMR_CALLBACK callBack);
```

Returns

- true - if the call succeeded
- false - the obtained divider could not be obtained or the passed handle was invalid

Description

This function sets up an alarm, allowing the client to receive a callback from the driver when the timer counter reaches zero. Alarms can be one-shot or periodic. A periodic alarm will reload the timer and generate alarm until stopped. The alarm frequency is: DRV_TMR_CounterFrequencyGet() / divider;

Remarks

The divider value will be truncated to a 16 bit value if the timer is configured in 16 bit mode. The timer should be started using DRV_TMR_Start API to get a callback.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

divider value has to be within the timer divider range (see DRV_TMR_DividerSpecGet).

Example

```
//Do the initialization with 'mode' set to DRV_TMR_OPERATION_MODE_16_BIT

void setupTask ()
{
    DRV_HANDLE              tmrHandle;  // Returned from DRV_TMR_Open

    uint32_t myFreq = 1000; // 1KHz
    uint32_t clkFreq = DRV_TMR_CounterFrequencyGet(tmrHandle);   // timer running frequency

    // calculate the divider needed
    uint32_t divider = clkFreq / myFreq;

    // Start the alarm
    if(!DRV_TMR_AlarmRegister ( tmrHandle, divider, true, 0, CallBackFreq ))
    {
        // divider value could not be obtain;
        // handle the error
        //
    }
}
```

Parameters

Parameters	Description
handle	A valid handle, returned from DRV_TMR_Open
divider	The value to divide the timer clock source to obtain the required alarm frequency. • a 16 bit value if the timer is configured in 16 bit mode • a 32 bit value if the timer is configured in 32 bit mode
isPeriodic	Flag indicating whether the alarm should be one-shot or periodic.
context	A reference, call back function will be called with the same reference.
callBack	A call back function which will be called on time out.

Function

bool DRV_TMR_AlarmRegister
(
    DRV_HANDLE handle,
uint32_t divider,
bool isPeriodic,
uintptr_t context,
    DRV_TMR_CALLBACK callBack
)

d) Counter Control Functions

DRV_TMR_CounterFrequencyGet Function

Provides the Timer input frequency.

Implementation: Dynamic

File

drv_tmr.h

C

```
uint32_t DRV_TMR_CounterFrequencyGet(DRV_HANDLE handle);
```

Returns

32-bit value corresponding to the running frequency. If Timer clock source is external, then this function returns 0.

Description

This function provides the Timer input frequency. Input frequency is the clock to the Timer register and it is considering the prescaler divisor.

Remarks

On most processors, the Timer's base frequency is the same as the peripheral bus clock.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
uint32_t   clkFreqHz;

clkFreqHz = DRV_TMR_CounterFrequencyGet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_TMR_CounterFrequencyGet (DRV_HANDLE handle)

DRV_TMR_CounterClear Function

Clears the Timer's counter register.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_CounterClear(DRV_HANDLE handle);
```

Returns

None.

Description

This function clears the Timer's value in the counter register.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TMR_CounterClear (DRV_HANDLE handle)

DRV_TMR_CounterValueGet Function

Reads the Timer's counter register.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
uint32_t DRV_TMR_CounterValueGet(DRV_HANDLE handle);
```

Returns

Timer current period:

- a 16 bit value if the timer is configured in 16 bit mode
- a 32 bit value if the timer is configured in 32 bit mode

Description

This function returns the Timer's value in the counter register.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
//Example to use timer for precision time measurement
//without configuring an alarm (interrupt based)
char appState = 0;
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

switch ( appState )
{
    case 0:
        //Calculate and set the counter period
        DRV_TMR_CounterValueSet ( tmrHandle, ( 0xFFFF - 0x1000 ) );

        //counter starts
        DRV_TMR_Start ( tmrHandle );

        //Trigger an application operation
        app_trigger_operation();

        //Check for time-out in the next state
        appState++;
    case 1:
        //Overflows and stops at 0 if no alarm is set
        if ( DRV_TMR_CounterValueGet ( tmrHandle ) == 0 )
        {
            //Time-out
            return false;
        }
        else if ( app_operation_isComplete( ) )
        {
            //Operation is complete before time-out
            return true;
        }
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint32_t DRV_TMR_CounterValueGet (DRV_HANDLE handle)

DRV_TMR_CounterValueSet Function

Updates the Timer's counter register.

Implementation: Static/Dynamic

File

drv_tmr.h

C

```
void DRV_TMR_CounterValueSet(DRV_HANDLE handle, uint32_t counterPeriod);
```

Returns

None.

Description

This function updates the Timer's value in the counter register.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
counterPeriod	counter period value • a 16 bit value if the timer is configured in 16 bit mode • a 32 bit value if the timer is configured in 32 bit mode

Function

void DRV_TMR_CounterValueSet (DRV_HANDLE handle, uint32_t counterPeriod)

e) Miscellaneous Functions

DRV_TMR_GateModeClear Function

Enables the Gate mode.

Implementation: Dynamic

File

drv_tmr.h

C

```
bool DRV_TMR_GateModeClear(DRV_HANDLE handle);
```

Returns

- true - if the operation is successful
- false - either the handle is invalid or the gate mode is not supported

Description

This function enables the Gated mode of Timer. User can measure the duration of an external signal in this mode. Once the Gate mode is enabled, Timer will start on the raising edge of the external signal. It will keep counting until the next falling edge.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open

DRV_TMR_GateModeClear ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

bool DRV_TMR_GateModeClear (DRV_HANDLE handle)

DRV_TMR_PrescalerGet Function

This function gets the currently selected prescaler.

Implementation: Dynamic

File

drv_tmr.h

C

```
TMR_PRESCALE DRV_TMR_PrescalerGet(DRV_HANDLE handle);
```

Returns

Timer prescaler.

Description

This function gets the currently selected prescaler.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
TMR_PRESCALE preScale;

preScale = DRV_TMR_PrescalerGet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

TMR_PRESCALE DRV_TMR_PrescalerGet (DRV_HANDLE handle)

DRV_TMR_OperationModeGet Function

This function gets the currently selected operation mode.

Implementation: Dynamic

File

drv_tmr.h

C

```
DRV_TMR_OPERATION_MODE DRV_TMR_OperationModeGet(DRV_HANDLE handle);
```

Returns

A DRV_TMR_OPERATION_MODE value showing how the timer is currently configured. DRV_TMR_OPERATION_MODE_NONE is returned for an invalid client handle.

Description

This function gets the currently selected 16/32 bit operation mode.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
DRV_TMR_OPERATION_MODE operMode;

operMode = DRV_TMR_OperationModeGet ( tmrHandle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_TMR_OPERATION_MODE DRV_TMR_OperationModeGet(DRV_HANDLE handle)

DRV_TMR_DividerRangeGet Function

Returns the Timer divider values.

Implementation: Dynamic

File

drv_tmr.h

C

```
DRV_TMR_OPERATION_MODE DRV_TMR_DividerRangeGet(DRV_HANDLE handle, DRV_TMR_DIVIDER_RANGE* pDivRange);
```

Returns

- A DRV_TMR_OPERATION_MODE value showing how the timer is currently configured. The pDivRange is updated with the supported range values.
- DRV_TMR_OPERATION_MODE_NONE for invalid client handle

Description

This function provides the Timer operating mode and divider range.

Remarks

None.

Preconditions

The DRV_TMR_Initialize function must have been called.

DRV_TMR_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE tmrHandle;  // Returned from DRV_TMR_Open
DRV_TMR_OPERATION_MODE  timerMode;
DRV_TMR_DIVIDER_RANGE   timerRange;

DRV_TMR_DividerRangeGet(handle, &timerRange);
```

```
uint32_t   clkFreqHz = DRV_TMR_CounterFrequencyGet ( tmrHandle );

uint32_t    maxFreqHz = clkFreqHz / timerRange.dividerMin;
uint32_t    minFreqHz = clkFreqHz / timerRange.dividerMax;
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
pDivRange	Address to store the timer divider range.

Function

DRV_TMR_OPERATION_MODE DRV_TMR_DividerRangeGet
(
DRV_HANDLE handle,
DRV_TMR_DIVIDER_RANGE* pDivRange
)

f) Data Types and Constants

DRV_TMR_CALLBACK Type

Pointer to a Timer driver callback function data type.

File

drv_tmr.h

C

```
typedef void (* DRV_TMR_CALLBACK)(uintptr_t context, uint32_t alarmCount);
```

Description

Timer Driver Callback Function Pointer

This data type defines a pointer to a Timer driver callback function.

Remarks

Useful only when timer alarm callback support is enabled by defining the DRV_TMR_ALARM_ENABLE configuration option.

DRV_TMR_INIT Structure

Defines the Timer driver initialization data.

File

drv_tmr.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  TMR_MODULE_ID tmrId;
  DRV_TMR_CLK_SOURCES clockSource;
  TMR_PRESCALE prescale;
  INT_SOURCE interruptSource;
  DRV_TMR_OPERATION_MODE mode;
  bool asyncWriteEnable;
} DRV_TMR_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization.
TMR_MODULE_ID tmrId;	Identifies timer hardware module (PLIB-level) ID
DRV_TMR_CLK_SOURCES clockSource;	Clock Source select.
TMR_PRESCALE prescale;	Prescaler Selection from the processor enumeration

INT_SOURCE interruptSource;	Interrupt Source for TMR module. If 'DRV_TMR_OPERATION_MODE_32_BIT' flag is selected the interrupt will be generated by the 2nd timer of the pair, the odd numbered one.
DRV_TMR_OPERATION_MODE mode;	Select 16/32 bit operation mode. 32 bit mode will combine two 16 bit timer modules to form a 32 bit one. This is usually only necessary for very long delays.
bool asyncWriteEnable;	Asynchronous write enable configuration. If true the asynchronous write is enabled. For timers that do not support this feature the value is ignored

Description

Timer Driver Initialize Data

This data type defines data required to initialize the Timer driver.

Remarks

Not all initialization features are available on all devices.

DRV_TMR_CLIENT_STATUS Enumeration

Identifies the client-specific status of the Timer driver

File

drv_tmr.h

C

```
typedef enum {
  DRV_TMR_CLIENT_STATUS_INVALID,
  DRV_TMR_CLIENT_STATUS_BUSY,
  DRV_TMR_CLIENT_STATUS_READY,
  DRV_TMR_CLIENT_STATUS_RUNNING
} DRV_TMR_CLIENT_STATUS;
```

Members

Members	Description
DRV_TMR_CLIENT_STATUS_INVALID	Driver is invalid (or unopened) state
DRV_TMR_CLIENT_STATUS_BUSY	An operation is currently in progress
DRV_TMR_CLIENT_STATUS_READY	Ready, no operations running
DRV_TMR_CLIENT_STATUS_RUNNING	Timer started and running, processing transactions

Description

Timer Driver Client Status

This enumeration identifies the client-specific status of the Timer driver.

Remarks

None.

DRV_TMR_DIVIDER_RANGE Structure

This data structure specifies the divider values that can be obtained by the timer module.

File

drv_tmr.h

C

```
typedef struct {
  uint32_t dividerMin;
  uint32_t dividerMax;
  uint32_t dividerStep;
} DRV_TMR_DIVIDER_RANGE;
```

Members

Members	Description
uint32_t dividerMin;	The minimum divider value that the timer module can obtain
uint32_t dividerMax;	The maximum divider value that the timer module can obtain
uint32_t dividerStep;	The divider step value, between 2 divider values Should be 1 for most timers

Description

Timer Driver divider operating specification

This data structure specifies the divider values that can be obtained by the timer hardware.

Remarks

None.

DRV_TMR_OPERATION_MODE Enumeration

Lists the operation modes available for timer driver.

File

drv_tmr.h

C

```
typedef enum {
  DRV_TMR_OPERATION_MODE_NONE,
  DRV_TMR_OPERATION_MODE_16_BIT,
  DRV_TMR_OPERATION_MODE_32_BIT
} DRV_TMR_OPERATION_MODE;
```

Members

Members	Description
DRV_TMR_OPERATION_MODE_NONE	The timer module operating mode none/invalid
DRV_TMR_OPERATION_MODE_16_BIT	The timer module operates in 16 bit mode
DRV_TMR_OPERATION_MODE_32_BIT	The timer module operates in 32 bit mode This will combine two 16 bit timer modules

Description

Timer Driver Operation mode

This enumeration lists all the available operation modes that are valid for the timer hardware.

Remarks

Not all modes are available on all devices.

DRV_TMR_INDEX_COUNT Macro

Number of valid Timer driver indices.

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_COUNT TMR_NUMBER_OF_MODULES
```

Description

Timer Driver Module Index Count

This constant identifies Timer driver index definitions.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is device-specific.

DRV_TMR_INDEX_0 Macro

Timer driver index definitions

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_0 0
```

Description

Timer Driver Module Index Numbers

These constants provide Timer driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_TMR_Initialize and DRV_TMR_Open functions to identify the driver instance in use.

DRV_TMR_INDEX_1 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_1 1
```

Description

This is macro DRV_TMR_INDEX_1.

DRV_TMR_INDEX_2 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_2 2
```

Description

This is macro DRV_TMR_INDEX_2.

DRV_TMR_INDEX_3 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_3 3
```

Description

This is macro DRV_TMR_INDEX_3.

DRV_TMR_INDEX_4 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_4 4
```

Description

This is macro DRV_TMR_INDEX_4.

DRV_TMR_INDEX_5 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_5 5
```

Description

This is macro DRV_TMR_INDEX_5.

DRV_TMR_INDEX_6 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_6 6
```

Description

This is macro DRV_TMR_INDEX_6.

DRV_TMR_INDEX_7 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_7 7
```

Description

This is macro DRV_TMR_INDEX_7.

DRV_TMR_INDEX_8 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_8 8
```

Description

This is macro DRV_TMR_INDEX_8.

DRV_TMR_INDEX_9 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_9 9
```

Description

This is macro DRV_TMR_INDEX_9.

DRV_TMR_INDEX_10 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_10 10
```

Description

This is macro DRV_TMR_INDEX_10.

DRV_TMR_INDEX_11 Macro

File

drv_tmr.h

C

```
#define DRV_TMR_INDEX_11 11
```

Description

This is macro DRV_TMR_INDEX_11.

Files

Files

Name	Description
drv_tmr.h	Timer device driver interface header file.
drv_tmr_config_template.h	Timer driver configuration definitions for the template version.

Description

This section lists the source and header files used by the Timer Driver Library.

drv_tmr.h

Timer device driver interface header file.

Enumerations

	Name	Description
	DRV_TMR_CLIENT_STATUS	Identifies the client-specific status of the Timer driver
	DRV_TMR_OPERATION_MODE	Lists the operation modes available for timer driver.

Functions

	Name	Description
	DRV_TMR_AlarmDeregister	Removes a previously set alarm. **Implementation:** Dynamic
	DRV_TMR_AlarmDisable	Disables an alarm signal. **Implementation:** Dynamic
	DRV_TMR_AlarmEnable	Re-enables an alarm signal. **Implementation:** Dynamic
	DRV_TMR_AlarmHasElapsed	Provides the status of Timer's period elapse. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriodGet	Provides the Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmPeriodSet	Updates the Timer's period. **Implementation:** Dynamic
	DRV_TMR_AlarmRegister	Sets up an alarm. **Implementation:** Dynamic

	DRV_TMR_ClientStatus	Gets the status of the client operation. **Implementation:** Dynamic
	DRV_TMR_ClockSet	Sets the timers clock by selecting the source and prescaler. **Implementation:** Dynamic
	DRV_TMR_Close	Closes an opened instance of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_CounterClear	Clears the Timer's counter register. **Implementation:** Static/Dynamic
	DRV_TMR_CounterFrequencyGet	Provides the Timer input frequency. **Implementation:** Dynamic
	DRV_TMR_CounterValueGet	Reads the Timer's counter register. **Implementation:** Static/Dynamic
	DRV_TMR_CounterValueSet	Updates the Timer's counter register. **Implementation:** Static/Dynamic
	DRV_TMR_Deinitialize	Deinitializes the specified instance of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_DividerRangeGet	Returns the Timer divider values. **Implementation:** Dynamic
	DRV_TMR_GateModeClear	Enables the Gate mode. **Implementation:** Dynamic
	DRV_TMR_GateModeSet	Enables the Gate mode. **Implementation:** Dynamic
	DRV_TMR_Initialize	Initializes the Timer driver. **Implementation:** Static/Dynamic
	DRV_TMR_Open	Opens the specified Timer driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_TMR_OperationModeGet	This function gets the currently selected operation mode. **Implementation:** Dynamic
	DRV_TMR_PrescalerGet	This function gets the currently selected prescaler. **Implementation:** Dynamic
	DRV_TMR_Start	Starts the Timer counting. **Implementation:** Static/Dynamic
	DRV_TMR_Status	Provides the current status of the Timer driver. **Implementation:** Dynamic
	DRV_TMR_Stop	Stops the Timer from counting. **Implementation:** Static/Dynamic
	DRV_TMR_Tasks	Maintains the driver's state machine. **Implementation:** Dynamic

Structures

	Name	Description
	DRV_TMR_DIVIDER_RANGE	This data structure specifies the divider values that can be obtained by the timer module.
	DRV_TMR_INIT	Defines the Timer driver initialization data.

Types

	Name	Description
	DRV_TMR_CALLBACK	Pointer to a Timer driver callback function data type.

Description

Timer Device Driver Interface Definition

This header file contains the function prototypes and definitions of the data types and constants that make up the interface to the Timer device driver.

File Name

drv_tmr.h

Company

Microchip Technology Inc.

drv_tmr_config_template.h

Timer driver configuration definitions for the template version.

Macros

	Name	Description
	DRV_TMR_ASYNC_WRITE_ENABLE	Controls Asynchronous Write mode of the Timer.
	DRV_TMR_CLIENTS_NUMBER	Sets up the maximum number of clients that can be supported by an instance of the dynamic driver.
	DRV_TMR_CLOCK_PRESCALER	Sets the default timer driver clock prescaler.
	DRV_TMR_CLOCK_SOURCE	Sets the default timer driver clock source.
	DRV_TMR_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported by the dynamic driver.
	DRV_TMR_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_TMR_INTERRUPT_SOURCE	Sets the default timer driver clock interrupt source
	DRV_TMR_MODE	Sets the default timer driver clock operating mode.
	DRV_TMR_MODULE_ID	Sets the default timer module ID to be used by the timer driver.
	DRV_TMR_MODULE_INIT	Sets the default module init value for the timer driver.

Description

Timer Driver Configuration Definitions for the Template Version

These definitions set up the driver for the default mode of operation of the driver.

Touch Driver Libraries Help

This section describes the Touch Driver Libraries.

Generic Touch Driver API

This library help section outlines the generic Touch Driver API to be followed by anyone who wants to use a custom created touch driver to go with the MPLAB Harmony framework for their applications.

Description

This generic driver would still be used with the Touch System Service as described by the API. It provides the data structures and functions required for the touch driver to interface with the graphics library as well as the Touch System Services.

The APIs provide routines to read the touch input data from the touch screen. The driver is based on the device notifying the availability of touch input data through external interrupt.

Currently, the API and the system services only supports non-gestural single-fingered touch input.

Library Interface

Functions

	Name	Description
	DRV_TOUCH_Close	Closes an opened instance of an TOUCH module driver.
	DRV_TOUCH_Deinitialize	Deinitializes the index instance of the TOUCH module.
	DRV_TOUCH_Initialize	Initializes hardware and data for the index instance of the TOUCH module.
	DRV_TOUCH_Open	Opens the specified instance of the Touch driver for use and provides an "open-instance" handle.
	DRV_TOUCH_Read	Notifies the driver that there is current touch data to read
	DRV_TOUCH_Reinitialize	
	DRV_TOUCH_Status	Provides the current status of the index instance of the TOUCH module.
	DRV_TOUCH_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic

Data Types and Constants

	Name	Description
	DRV_TOUCH_INIT	Defines the data required to initialize or reinitialize the TOUCH driver
	DRV_TOUCH_PEN_STATE	Identifies the current state of the pen.
	DRV_TOUCH_POSITION_STATUS	Identifies the current status of the current touch point.
	DRV_TOUCH_SAMPLE_POINTS	This is type DRV_TOUCH_SAMPLE_POINTS.
	DRV_TOUCH_INDEX_0	Touch driver index definitions.
	DRV_TOUCH_INDEX_1	This is macro DRV_TOUCH_INDEX_1.
	DRV_TOUCH_INDEX_COUNT	Number of valid TOUCH driver indices.

Description

Functions

DRV_TOUCH_Close Function

Closes an opened instance of an TOUCH module driver.

File

drv_touch.h

C

```
void DRV_TOUCH_Close(DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened instance of an TOUCH module driver, making the specified handle invalid.

Preconditions

The DRV_TOUCH_Initialize routine must have been called for the specified TOUCH device instance and the DRV_TOUCH_Status must have returned SYS_STATUS_READY.

DRV_TOUCH_Open must have been called to obtain a valid opened device handle.

Example

```
myTouchHandle = DRV_TOUCH_Open(DRV_TOUCH_ID_1, DRV_IO_INTENT_NONBLOCKING|DRV_IO_INTENT_READWRITE);

DRV_TOUCH_Close(myTouchHandle);
```

Parameters

Parameters	Description
drvHandle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TOUCH_Close (const DRV_HANDLE drvHandle)

DRV_TOUCH_Deinitialize Function

Deinitializes the index instance of the TOUCH module.

File

drv_touch.h

C

```
void DRV_TOUCH_Deinitialize(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

This function deinitializes the index instance of the TOUCH module, disabling its operation (and any hardware for driver modules). It deinitializes only the specified module instance. It also resets all the internal data structures and fields for the specified instance to the default settings.

Preconditions

The DRV_TOUCH_Initialize function should have been called before calling this function.

Example

```
SYS_STATUS   touchstatus;

DRV_TOUCH_Deinitialize(DRV_TOUCH_ID_1);

touchstatus = DRV_TOUCH_Status(DRV_TOUCH_ID_1);
```

Parameters

Parameters	Description
index	Index, identifying the instance of the TOUCH module to be deinitialized

Function

void DRV_TOUCH_Deinitialize (const SYS_MODULE_ID index)

DRV_TOUCH_Initialize Function

Initializes hardware and data for the index instance of the TOUCH module.

File

drv_touch.h

C

```
SYS_MODULE_OBJ DRV_TOUCH_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

None

Description

This function initializes hardware for the index instance of the TOUCH module, using the hardware initialization given data. It also initializes any internal driver data structures making the driver ready to be opened.

Preconditions

None.

Example

```
DRV_TOUCH_INIT_DATA         touchInitData;
SYS_STATUS                  touchStatus;

// Populate the touchInitData structure
touchInitData.moduleInit.powerState = SYS_MODULE_POWER_RUN_FULL;
touchInitData.moduleInit.moduleCode = (DRV_TOUCH_INIT_DATA_MASTER | DRV_TOUCH_INIT_DATA_SLAVE);

DRV_TOUCH_Initialize(DRV_TOUCH_ID_1, (SYS_MODULE_INIT*)&touchInitData);
touchStatus = DRV_TOUCH_Status(DRV_TOUCH_ID_1);
```

Parameters

Parameters	Description
index	Index, identifying the instance of the TOUCH module to be initialized
data	Pointer to the data structure containing any data necessary to initialize the hardware. This pointer may be null if no data is required and the default initialization is to be used.

Function

void DRV_TOUCH_Initialize (const TOUCH_MODULE_ID index,

const SYS_MODULE_INIT *const data)

DRV_TOUCH_Open Function

Opens the specified instance of the Touch driver for use and provides an "open-instance" handle.

File

drv_touch.h

C

```
DRV_HANDLE DRV_TOUCH_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a value identifying both the caller and the module instance). If an error occurs, the returned value is DRV_HANDLE_INVALID.

Description

This function opens the specified instance of the Touch module for use and provides a handle that is required to use the remaining driver routines.

This function opens a specified instance of the Touch module driver for use by any client module and provides an "open-instance" handle that must be provided to any of the other Touch driver operations to identify the caller and the instance of the Touch driver/hardware module.

Preconditions

The DRV_TOUCH_Initialize routine must have been called for the specified TOUCH device instance and the DRV_TOUCH_Status must have returned SYS_STATUS_READY.

Example

```
DRV_HANDLE                 touchHandle;
DRV_TOUCH_CLIENT_STATUS    touchClientStatus;

touchHandle = DRV_TOUCH_Open(DRV_TOUCH_ID_1, DRV_IO_INTENT_NONBLOCKING|DRV_IO_INTENT_READWRITE);
if (DRV_HANDLE_INVALID == touchHandle)
{
    // Handle open error
}
```

```
touchClientStatus = DRV_TOUCH_ClientStatus(touchHandle);

// Close the device when it is no longer needed.
DRV_TOUCH_Close(touchHandle);
```

Parameters

Parameters	Description
index	Index, identifying the instance of the TOUCH module to be opened.
intent	Flags parameter identifying the intended usage and behavior of the driver. Multiple flags may be ORed together to specify the intended usage of the device. See the DRV_IO_INTENT definition.

Function

DRV_HANDLE DRV_TOUCH_Open (const SYS_MODULE_INDEX index,
const DRV_IO_INTENT intent)

DRV_TOUCH_Read Function

Notifies the driver that there is current touch data to read

File

drv_touch.h

C

```
size_t DRV_TOUCH_Read(DRV_HANDLE drvHandle, void * buffer, size_t size);
```

Description

Notifies the driver that there is current touch data to read

Example

Function

size_t DRV_TOUCH_Read (DRV_HANDLE drvHandle, void *buffer, size_t size)

DRV_TOUCH_Reinitialize Function

File

drv_touch.h

C

```
void DRV_TOUCH_Reinitialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT *const data);
```

Returns

None.

Preconditions

The DRV_TOUCH_Initialize function should have been called before calling this function.

Example

```
SYS_MODULE_INIT touchInit;
SYS_STATUS      touchStatus;

DRV_TOUCH_Reinitialize(DRV_TOUCH_ID_1, &touchStatus);
```

Parameters

Parameters	Description
index	Index, identifying the instance of the TOUCH module to be reinitialized
data	Pointer to the data structure containing any data necessary to reinitialize the hardware. This pointer may be null if no data is required and default configuration is to be used.

Function

void DRV_TOUCH_Reinitialize(const SYS_MODULE_ID index,
const SYS_MODULE_INIT *const data)

DRV_TOUCH_Status Function

Provides the current status of the index instance of the TOUCH module.

File

drv_touch.h

C

```
SYS_STATUS DRV_TOUCH_Status(const SYS_MODULE_INDEX index);
```

Description

This function provides the current status of the index instance of the TOUCH module.

Preconditions

The DRV_TOUCH_Initialize function should have been called before calling this function.

Function

SYS_STATUS DRV_TOUCH_Status (const TOUCH_MODULE_ID index)

DRV_TOUCH_Tasks Function

Maintains the driver's state machine and implements its task queue processing.

Implementation: Dynamic

File

drv_touch.h

C

```
void DRV_TOUCH_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal state machine and implement its command queue processing. It is always called from SYS_Tasks() function. This routine decodes the touch input data available.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks)

Preconditions

The DRV_TOUCH_Initialize routine must have been called for the specified MTCH6301 driver instance.

Example

```
SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_MTCH6301_Initialize

void SYS_Tasks( void )
{
    DRV_TOUCH_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TOUCH_Initialize)

Function

void DRV_TOUCH_Tasks (SYS_MODULE_OBJ object);

Data Types and Constants

DRV_TOUCH_INIT Structure

Defines the data required to initialize or reinitialize the TOUCH driver

File

drv_touch.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  int touchId;
  SYS_MODULE_OBJ (* drvInitialize)(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
  DRV_HANDLE (* drvOpen)(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
  void (* drvCalibrationSet)(DRV_TOUCH_SAMPLE_POINTS * samplePoints);
  short (* drvTouchGetX)(uint8_t touchNumber);
  short (* drvTouchGetY)(uint8_t touchNumber);
  DRV_TOUCH_POSITION_STATUS (* drvTouchStatus)(const SYS_MODULE_INDEX index);
  void (* drvTouchDataRead)(const SYS_MODULE_INDEX index);
  DRV_TOUCH_PEN_STATE (* drvTouchPenGet)(uint8_t touchNumber);
  INT_SOURCE interruptSource;
  uint16_t orientation;
  uint16_t horizontalResolution;
  uint16_t verticalResolution;
  uint16_t (* pReadFunc)(uint32_t);
  void (* pWriteFunc)(uint16_t, uint32_t);
  void (* pSectorErase)(uint32_t);
  int32_t minTouchDetectDelta;
} DRV_TOUCH_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
int touchId;	ID
uint16_t orientation;	Orientation of the display (given in degrees of 0,90,180,270)
uint16_t horizontalResolution;	Horizontal Resolution of the displayed orientation in Pixels
uint16_t (* pReadFunc)(uint32_t);	typedef for read function pointer
void (* pWriteFunc)(uint16_t, uint32_t);	typedef for write function pointer

Description

TOUCH Driver Initialization Data

This data type defines the data required to initialize or reinitialize the TOUCH driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

DRV_TOUCH_PEN_STATE Type

Identifies the current state of the pen.

File

drv_touch.h

C

```
typedef enum DRV_TOUCH_PEN_STATE@2 DRV_TOUCH_PEN_STATE;
```

Description

TOUCH Controller Driver Pen State

Identifies the current state of the pen reported from a touch event.

Remarks

This enumeration is the return type for the TouchGetPen routine.

DRV_TOUCH_POSITION_STATUS Type

Identifies the current status of the current touch point.

File

drv_touch.h

C

```
typedef enum DRV_TOUCH_POSITION_STATUS@2 DRV_TOUCH_POSITION_STATUS;
```

Description

TOUCH Controller Driver Touch status

Identifies the current status of the current touch point.

Remarks

This enumeration is the return type for the status routine for the current touch point

DRV_TOUCH_SAMPLE_POINTS Type

File

drv_touch.h

C

```
typedef struct DRV_TOUCH_SAMPLE_POINTS@2 DRV_TOUCH_SAMPLE_POINTS;
```

Description

This is type DRV_TOUCH_SAMPLE_POINTS.

DRV_TOUCH_INDEX_0 Macro

Touch driver index definitions.

File

drv_touch.h

C

```
#define DRV_TOUCH_INDEX_0 0
```

Description

Touch Driver Module Index Numbers

These constants provide the Touch driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_TOUCH_Initialize and DRV_TOUCH_Open functions to identify the driver instance in use.

DRV_TOUCH_INDEX_1 Macro

File

drv_touch.h

C

```
#define DRV_TOUCH_INDEX_1 1
```

Description

This is macro DRV_TOUCH_INDEX_1.

DRV_TOUCH_INDEX_COUNT Macro

Number of valid TOUCH driver indices.

File

drv_touch.h

C

```
#define DRV_TOUCH_INDEX_COUNT 1
```

Description

TOUCH Driver Module Index Count

This constant identifies the number of valid TOUCH driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

Files

Files

Name	Description
drv_touch.h	Touch device driver interface file.

Description

drv_touch.h

Touch device driver interface file.

Functions

	Name	Description
	DRV_TOUCH_Close	Closes an opened instance of an TOUCH module driver.
	DRV_TOUCH_Deinitialize	Deinitializes the index instance of the TOUCH module.
	DRV_TOUCH_Initialize	Initializes hardware and data for the index instance of the TOUCH module.
	DRV_TOUCH_Open	Opens the specified instance of the Touch driver for use and provides an "open-instance" handle.
	DRV_TOUCH_Read	Notifies the driver that there is current touch data to read
	DRV_TOUCH_Reinitialize	
	DRV_TOUCH_Status	Provides the current status of the index instance of the TOUCH module.

Microchip Technology Inc.

10-bit ADC Touch Driver Library

This topic describes the 10-bit ADC Touch Driver Library.

Introduction

This library provides an interface to manage the 10-bit ADC Touch Driver module on the Microchip family of microcontrollers in different modes of operation.

Description

The MPLAB Harmony 10-bit ADC Touch Driver provides a high-level interface to the 10-bit ADC touch device. This driver provides application routines to read non-gestural single-point touch input data from the touch screen. The 10-bit ADC touch device can notify the availability of touch input data through external interrupt. The 10-bit ADC Touch Driver allows the application to map a controller pin as an external interrupt pin.

Using the Library

This topic describes the basic architecture of the 10-bit ADC Touch Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_adc10bit.h`

The interface to the 10-bit ADC Touch Driver library is defined in the `drv_adc10bit.h` header file. Any C language source (`.c`) file that uses the ADC 10-bit Touch Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the 10-bit ADC Touch Driver module.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, open, close, task, and status functions.

Configuring the Library

Macros

	Name	Description
	DRV_ADC10BIT_CALIBRATION_DELAY	Defines the calibration delay.
	DRV_ADC10BIT_CALIBRATION_INSET	Defines the calibration inset.
	DRV_ADC10BIT_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_ADC10BIT_INDEX	ADC10BIT static index selection.
	DRV_ADC10BIT_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_ADC10BIT_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_ADC10BIT_SAMPLE_POINTS	Defines the sample points.
	DRV_ADC10BIT_TOUCH_DIAMETER	Defines the touch diameter.

Description

The configuration of the 10-bit ADC Touch Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the ADC 10-bit Touch Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the 10-bit ADC Touch Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_ADC10BIT_CALIBRATION_DELAY Macro

Defines the calibration delay.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_CALIBRATION_DELAY 300
```

Description

ADC10BIT Calibration Delay

This macro enables the delay between calibration touch points.

Remarks

None.

DRV_ADC10BIT_CALIBRATION_INSET Macro

Defines the calibration inset.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_CALIBRATION_INSET 25
```

Description

ADC10BIT Calibration Inset

This macro defines the calibration inset.

Remarks

None.

DRV_ADC10BIT_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_CLIENTS_NUMBER 1
```

Description

ADC10BIT client number

This macro selects the maximum number of clients.

This definition selected the maximum number of clients that the ADC10BIT driver can support at run-time.

Remarks

None.

DRV_ADC10BIT_INDEX Macro

ADC10BIT static index selection.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_INDEX DRV_ADC10BIT_INDEX_0
```

Description

ADC10BIT Static Index Selection

This macro specifies the static index selection for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

DRV_ADC10BIT_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_INSTANCES_NUMBER 1
```

Description

ADC10BIT hardware instance configuration

This macro sets up the maximum number of hardware instances that can be supported.

Remarks

None.

DRV_ADC10BIT_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_INTERRUPT_MODE false
```

Description

ADC10BIT Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of ADC10BIT operation is desired
- false - Select if polling mode of ADC10BIT operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

DRV_ADC10BIT_SAMPLE_POINTS Macro

Defines the sample points.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_SAMPLE_POINTS 4
```

Description

ADC10BIT Sample Points

This macro defines the sample points.

Remarks

None.

DRV_ADC10BIT_TOUCH_DIAMETER Macro

Defines the touch diameter.

File

drv_adc10bit_config_template.h

C

```
#define DRV_ADC10BIT_TOUCH_DIAMETER 10
```

Description

ADC10BIT Touch Diameter

This macro defines the touch diameter.

Remarks

None.

Building the Library

This section lists the files that are available in the 10-bit ADC Touch Driver Library.

Description

This section list the files that are available in the `\src` folder of the 10-bit ADC Touch Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/touch/adc10bit`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_adc10bit.h	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/drv_adc10bit.c	Basic 10-bit ADC Touch Driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The 10-bit ADC Touch Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library
- Touch System Service Library
- I2C Driver Library

Library Interface

a) System Functions

	Name	Description
	DRV_TOUCH_ADC10BIT_CalibrationSet	Loads calibration parameters from Non-volatile Memory.
	DRV_TOUCH_ADC10BIT_Close	Closes an opened instance of the 10-bit ADC Driver.
	DRV_TOUCH_ADC10BIT_Deinitialize	Deinitializes the specified instance of the ADC10BIT driver module.
	DRV_TOUCH_ADC10BIT_Initialize	Initializes the 10-bit ADC Driver instance for the specified driver index
	DRV_TOUCH_ADC10BIT_Open	Opens the specified ADC10BIT driver instance and returns a handle to it.
	DRV_TOUCH_ADC10BIT_Status	Provides the current status of the ADC10BIT driver module.
	DRV_TOUCH_ADC10BIT_Tasks	Maintains the driver's state machine and implements its ISR.
	DRV_TOUCH_ADC10BIT_TouchGetRawX	Returns raw x coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchGetRawY	Returns raw y coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchGetX	Returns x coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchStoreCalibration	Stores calibration parameters into Non-volatile Memory.
	DRV_TOUCH_ADC10BIT_PositionDetect	None.
	DRV_TOUCH_ADC10BIT_TouchGetY	Returns y coordinate status when the touch screen is pressed.
	DRV_TOUCH_ADC10BIT_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_TOUCH_ADC10BIT_TouchStatus	Returns the status of the current touch input.

b) Data Types and Constants

	Name	Description
	_DRV_TOUCH_ADC10BIT_CLIENT_DATA	Defines the data that can be changed per client.
	_DRV_TOUCH_ADC10BIT_INIT	Defines the data required to initialize or reinitialize the 10-bit ADC Driver.
	DRV_ADC10BIT_MODULE_ID	This is type DRV_ADC10BIT_MODULE_ID.
	DRV_TOUCH_ADC10BIT_CLIENT_DATA	Defines the data that can be changed per client.
	DRV_TOUCH_ADC10BIT_HANDLE	Driver handle.
	DRV_TOUCH_ADC10BIT_INIT	Defines the data required to initialize or reinitialize the 10-bit ADC Driver.
	DRV_TOUCH_ADC10BIT_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_ADC10BIT_INDEX_0	ADC10BIT driver index definitions.
	DRV_TOUCH_ADC10BIT_INDEX_1	This is macro DRV_TOUCH_ADC10BIT_INDEX_1.
	DRV_TOUCH_ADC10BIT_INDEX_COUNT	Number of valid ADC10BIT driver indices.

Description

This section describes the API functions of the 10-bit ADC Touch Driver library.

Refer to each section for a detailed description.

a) System Functions

DRV_TOUCH_ADC10BIT_CalibrationSet Function

Loads calibration parameters from Non-volatile Memory.

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_CalibrationSet(DRV_TOUCH_SAMPLE_POINTS * samplePoints);
```

Returns

None.

Description

This function loads calibration parameters from Non-volatile Memory.

Preconditions

The NVM initialization function must be called before calling this function.

Function

void DRV_TOUCH_ADC10BIT_TouchLoadCalibration(void)

DRV_TOUCH_ADC10BIT_Close Function

Closes an opened instance of the 10-bit ADC Driver.

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the 10-bit ADC Driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_TOUCH_ADC10BIT_Open before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

DRV_TOUCH_ADC10BIT_Initialize must have been called for the specified ADC10BIT driver instance.

DRV_TOUCH_ADC10BIT_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TOUCH_ADC10BIT_Open

DRV_TOUCH_ADC10BIT_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TOUCH_ADC10BIT_Close (DRV_HANDLE handle)

DRV_TOUCH_ADC10BIT_Deinitialize Function

Deinitializes the specified instance of the ADC10BIT driver module.

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function deinitializes the specified instance of the 10-bit ADC Driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_TOUCH_ADC10BIT_Status operation. The system has to use DRV_TOUCH_ADC10BIT_Status to determine when the module is in the ready state.

Preconditions

DRV_TOUCH_ADC10BIT_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_TOUCH_ADC10BIT_Initialize
SYS_STATUS          status;

DRV_TOUCH_ADC10BIT_Deinitialize ( object );

status = DRV_TOUCH_ADC10BIT_Status( object );
if( SYS_MODULE_UNINITIALIZED == status )
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TOUCH_ADC10BIT_Initialize

Function

void DRV_TOUCH_ADC10BIT_Deinitialize (SYS_MODULE_OBJ object)

DRV_TOUCH_ADC10BIT_Initialize Function

Initializes the 10-bit ADC Driver instance for the specified driver index

File

drv_adc10bit.h

C

```
SYS_MODULE_OBJ DRV_TOUCH_ADC10BIT_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const
init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This function initializes the 10-bit ADC Driver instance for the specified driver index, making it ready for clients to open and use it. The initialization

data is specified by the 'init' parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the 10-bit ADC Driver module ID. For example, driver instance 0 can be assigned to ADC10BIT2. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_TOUCH_ADC10BIT_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other ADC10BIT routine is called.

This routine should only be called once during system initialization unless DRV_TOUCH_ADC10BIT_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
DRV_TOUCH_ADC10BIT_INIT        init;
SYS_MODULE_OBJ      objectHandle;

// Populate the ADC10BIT initialization structure
init.spiId              = ADC10BIT_ID_1;

objectHandle = DRV_TOUCH_ADC10BIT_Initialize(DRV_TOUCH_ADC10BIT_INDEX_1, (SYS_MODULE_INIT*)usartInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized. Please note this is not the 10-bit ADC Driver ID. The hardware 10-bit ADC Driver ID is set in the initialization structure. This is the index of the driver index to use.
init	Pointer to a data structure containing any data necessary to initialize the driver. If this pointer is NULL, the driver uses the static initialization override macros for each member of the initialization data structure.

Function

SYS_MODULE_OBJ DRV_TOUCH_ADC10BIT_Initialize(const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init)

DRV_TOUCH_ADC10BIT_Open Function

Opens the specified ADC10BIT driver instance and returns a handle to it.

File

drv_adc10bit.h

C

```
DRV_HANDLE DRV_TOUCH_ADC10BIT_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. An error can occur when the following is true:

- if the number of client objects allocated via DRV_TOUCH_ADC10BIT_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid

Description

This function opens the specified USART driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The DRV_IO_INTENT_BLOCKING and DRV_IO_INTENT_NONBLOCKING ioIntent options additionally affect the behavior of the DRV_USART_Read() and DRV_USART_Write() functions. If the ioIntent is DRV_IO_INTENT_NONBLOCKING, then these function will not block even if the required amount of data could not be processed. If the ioIntent is DRV_IO_INTENT_BLOCKING, these functions will block until the required amount of data is processed.

If ioIntent is DRV_IO_INTENT_READ, the client will only be read from the driver. If ioIntent is DRV_IO_INTENT_WRITE, the client will only be able to write to the driver. If the ioIntent in DRV_IO_INTENT_READWRITE, the client will be able to do both, read and write.

Specifying a DRV_IO_INTENT_EXCLUSIVE will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Remarks

The handle returned is valid until the DRV_TOUCH_ADC10BIT_Close routine is called. This routine will NEVER block waiting for hardware. If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

DRV_TOUCH_ADC10BIT_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_TOUCH_ADC10BIT_Open( DRV_TOUCH_ADC10BIT_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Index of the driver initialized with DRV_TOUCH_ADC10BIT_Initialize. Please note this is not the SPI id.
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver

Function

DRV_HANDLE DRV_TOUCH_ADC10BIT_Open (const SYS_MODULE_INDEX drvIndex,

const DRV_IO_INTENT intent)

DRV_TOUCH_ADC10BIT_Status Function

Provides the current status of the ADC10BIT driver module.

File

drv_adc10bit.h

C

```
SYS_STATUS DRV_TOUCH_ADC10BIT_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Description

This function provides the current status of the ADC10BIT driver module.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

This function can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

DRV_TOUCH_ADC10BIT_Initialize must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TOUCH_ADC10BIT_Initialize
SYS_STATUS          status;

status = DRV_TOUCH_ADC10BIT_Status( object );
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TOUCH_ADC10BIT_Initialize

Function

SYS_STATUS DRV_TOUCH_ADC10BIT_Status (SYS_MODULE_OBJ object)

DRV_TOUCH_ADC10BIT_Tasks Function

Maintains the driver's state machine and implements its ISR.

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal state machine and implement its transmit ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks function. In Interrupt mode, this function should be called in the transmit interrupt service routine of the USART that is associated with this USART driver hardware instance.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This function may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

DRV_TOUCH_ADC10BIT_Initialize must have been called for the specified 10-bit ADC Driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TOUCH_ADC10BIT_Initialize

while( true )
{
    DRV_TOUCH_ADC10BIT_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TOUCH_ADC10BIT_Initialize)

Function

void DRV_TOUCH_ADC10BIT_Tasks (SYS_MODULE_OBJ object);

DRV_TOUCH_ADC10BIT_TouchGetRawX Function

Returns raw x coordinate status when the touch screen is pressed.

File

drv_adc10bit.h

C

```
short DRV_TOUCH_ADC10BIT_TouchGetRawX();
```

Returns

- raw x coordinate - Indicates the touch screen was pressed
- -1 - Indicates the touch screen was not pressed

Description

This function returns the raw x coordinate status when the touch screen is pressed.

Remarks

None.

Preconditions

None.

Function

short DRV_TOUCH_ADC10BIT_TouchGetRawX()

DRV_TOUCH_ADC10BIT_TouchGetRawY Function

Returns raw y coordinate status when the touch screen is pressed.

File

drv_adc10bit.h

C

```
short DRV_TOUCH_ADC10BIT_TouchGetRawY();
```

Returns

- raw y coordinate - Indicates the touch screen was pressed
- -1 - Indicates the touch screen was not pressed

Description

This function returns the raw y coordinate status when the touch screen is pressed.

Remarks

None.

Preconditions

None.

Function

short DRV_TOUCH_ADC10BIT_TouchGetRawY()

DRV_TOUCH_ADC10BIT_TouchGetX Function

Returns x coordinate status when the touch screen is pressed.

File

drv_adc10bit.h

C

```
short DRV_TOUCH_ADC10BIT_TouchGetX(uint8_t touchNumber);
```

Returns

- x coordinate - Indicates the touch screen was pressed
- -1 - Indicates the touch screen was not pressed

Description

This function returns the x coordinate status when the touch screen is pressed.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
touchNumber	touch input index.

Function

short DRV_TOUCH_ADC10BIT_TouchGetX(uint8_t touchNumber)

DRV_TOUCH_ADC10BIT_TouchStoreCalibration Function

Stores calibration parameters into Non-volatile Memory.

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_TouchStoreCalibration();
```

Returns

None.

Description

This function stores calibration parameters into Non-volatile Memory.

Remarks

This API is deprecated and its funcationality is handled via SYSTEM_INITIALIZATION

Preconditions

The NVM initialization function must be called before calling this function.

Function

void DRV_TOUCH_ADC10BIT_TouchStoreCalibration(void)

DRV_TOUCH_ADC10BIT_PositionDetect Function

None.

File

drv_adc10bit.h

C

```
short DRV_TOUCH_ADC10BIT_PositionDetect();
```

Returns

None.

Description

None.

Preconditions

None.

Function

void DRV_TOUCH_ADC10BIT_TouchLoadCalibration(void)

DRV_TOUCH_ADC10BIT_TouchGetY Function

Returns y coordinate status when the touch screen is pressed.

File

drv_adc10bit.h

C

```
short DRV_TOUCH_ADC10BIT_TouchGetY(uint8_t touchNumber);
```

Returns

- y coordinate - Indicates the touch screen was pressed
- -1 - Indicates the touch screen was not pressed

Description

This function returns the y coordinate status when the touch screen is pressed.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
handle	driver client handle.
touchNumber	touch input index.

Function

short DRV_TOUCH_ADC10BIT_TouchGetY(DRV_HANDLE handle, uint8_t touchNumber)

DRV_TOUCH_ADC10BIT_TouchDataRead Function

Notifies the driver that the current touch data has been read

File

drv_adc10bit.h

C

```
void DRV_TOUCH_ADC10BIT_TouchDataRead(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

Notifies the driver that the current touch data has been read

Function

void DRV_TOUCH_ADC10BIT_TouchDataRead(const SYS_MODULE_INDEX index)

DRV_TOUCH_ADC10BIT_TouchStatus Function

Returns the status of the current touch input.

File

drv_adc10bit.h

C

```
DRV_TOUCH_POSITION_STATUS DRV_TOUCH_ADC10BIT_TouchStatus(const SYS_MODULE_INDEX index);
```

Returns

It returns the status of the current touch input.

Description

It returns the status of the current touch input.

Function

DRV_TOUCH_POSITION_SINGLE DRV_TOUCH_ADC10BIT_TouchStatus(const SYS_MODULE_INDEX index)

b) Data Types and Constants

DRV_ADC10BIT_MODULE_ID Enumeration

File

drv_adc10bit.h

C

```
typedef enum {
  ADC10BIT_ID_1 = 0,
  ADC10BIT_NUMBER_OF_MODULES
} DRV_ADC10BIT_MODULE_ID;
```

Description

This is type DRV_ADC10BIT_MODULE_ID.

DRV_TOUCH_ADC10BIT_CLIENT_DATA Structure

Defines the data that can be changed per client.

File

drv_adc10bit.h

C

```
typedef struct _DRV_TOUCH_ADC10BIT_CLIENT_DATA {
} DRV_TOUCH_ADC10BIT_CLIENT_DATA;
```

Description

Macro: ADC10BIT Driver Client Specific Configuration

This data type defines the data can be configured per client. This data can be per client, and overrides the configuration data contained inside of DRV_TOUCH_ADC10BIT_INIT.

Remarks

None.

DRV_TOUCH_ADC10BIT_HANDLE Type

Driver handle.

File

drv_adc10bit.h

C

```
typedef uintptr_t DRV_TOUCH_ADC10BIT_HANDLE;
```

Description

Macro: ADC10BIT Driver Handle

Touch screen controller interfacing with the 10-bit Analog-to-Digital (ADC) converter device.

Remarks

None

DRV_TOUCH_ADC10BIT_INIT Structure

Defines the data required to initialize or reinitialize the 10-bit ADC Driver.

File

drv_adc10bit.h

C

```
typedef struct _DRV_TOUCH_ADC10BIT_INIT {
  SYS_MODULE_INIT moduleInit;
  DRV_ADC10BIT_MODULE_ID adc10bitId;
} DRV_TOUCH_ADC10BIT_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
DRV_ADC10BIT_MODULE_ID adc10bitId;	Identifies peripheral (PLIB-level) ID

Description

Macro: ADC10BIT Driver Initialization Data

This data type defines the data required to initialize or reinitialize the 10-bit ADC Driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

DRV_TOUCH_ADC10BIT_HANDLE_INVALID Macro

Definition of an invalid handle.

File

drv_adc10bit.h

C

```
#define DRV_TOUCH_ADC10BIT_HANDLE_INVALID ((DRV_TOUCH_ADC10BIT_HANDLE)(-1))
```

Description

Macro: ADC10BIT Driver Invalid Handle

This is the definition of an invalid handle. An invalid handle is returned by DRV_ADC10BIT_RawRead and DRV_ADC10BIT_RawRead functions if the request was not successful.

Remarks

None.

DRV_TOUCH_ADC10BIT_INDEX_0 Macro

ADC10BIT driver index definitions.

File

drv_adc10bit.h

C

```
#define DRV_TOUCH_ADC10BIT_INDEX_0 0
```

Description

Macro: ADC10BIT Driver Module Index Numbers

These constants provide the 10-bit ADC Driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals.

These values should be passed into the DRV_ADC10BIT_Initialize and DRV_ADC10BIT_Open functions to identify the driver instance in use.

DRV_TOUCH_ADC10BIT_INDEX_1 Macro

File

drv_adc10bit.h

C

```
#define DRV_TOUCH_ADC10BIT_INDEX_1 1
```

Description

This is macro DRV_TOUCH_ADC10BIT_INDEX_1.

DRV_TOUCH_ADC10BIT_INDEX_COUNT Macro

Number of valid ADC10BIT driver indices.

File

drv_adc10bit.h

C

```
#define DRV_TOUCH_ADC10BIT_INDEX_COUNT 2
```

Description

Macro: ADC10BIT Driver Module Index Count

This constant identifies the number of valid 10-bit ADC Driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

	DRV_TOUCH_ADC10BIT_CLIENT_DATA	Defines the data that can be changed per client.
	DRV_TOUCH_ADC10BIT_INIT	Defines the data required to initialize or reinitialize the 10-bit ADC Driver.

Types

	Name	Description
	DRV_TOUCH_ADC10BIT_HANDLE	Driver handle.

Description

10-bit ADC Touch Driver Interface Definition

This is a resistive touch screen driver that is using the Microchip Graphics Library. The calibration values are automatically checked (by reading a specific memory location on the non-volatile memory) when initializing the module if the function pointers to the read and write callback functions are initialized. If the read value is invalid calibration will automatically be executed. Otherwise, the calibration values will be loaded and used. The driver assumes that the application side provides the read and write routines to a non-volatile memory. If the callback functions are not initialized, the calibration routine will always be called at start-up to initialize the global calibration values. This driver assumes that the Graphics Library is initialized and will be using the default font of the library.

ADC Touch Driver Library

This topic describes the ADC Touch Driver Library.

Introduction

This library provides an interface to manage the ADC Touch Driver module on the Microchip family of microcontrollers in different modes of operation.

Description

The MPLAB Harmony ADC Touch Driver provides a high-level interface to the ADC touch device. This driver provides application routines to read the touch input data from the touch screen. . The ADC touch device can notify the availability of touch input data through external interrupt. The ADC Touch Driver allows the application to map a controller pin as an external interrupt pin.

Using the Library

This topic describes the basic architecture of the ADC Touch Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_touch_adc.h`

The interface to the ADC Touch Driver library is defined in the `drv_touch_adc.h` header file. Any C language source (`.c`) file that uses the ADC Touch Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

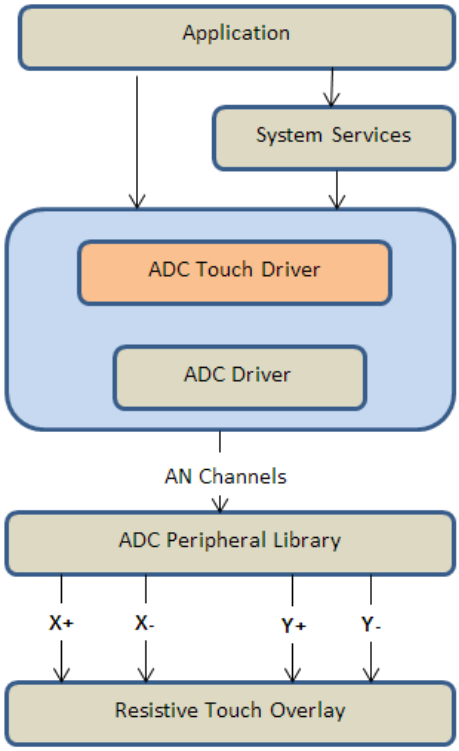
This library provides a low-level abstraction of the ADC Touch Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The ADC Touch Driver has routines to perform the following operations. The driver initialization routines allow the application to initialize the driver. The driver must be initialized before it can be used by application. Once driver is initialized the driver open routine allows retrieving the client handle. Once the touch input is available a touch input read request is sent and input data is retrieved in a buffer. The buffer data is then decoded

to get the x and y coordinate of the touch screen in the form of the number of pixels.

ADC Touch Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the ADC Touch Driver module.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, open, close, task, and status functions.

How the Library Works

The library provides interfaces to support system functions, which provide system module interfaces, device initialization, deinitialization, open, close, task, and status functions.

During steady state operation, the DRV_TOUCH_ADC_Tasks is called continuously in System_Tasks to save the current touch position, or -1 if no touch was detected.

At any time, DRV_TOUCH_ADC_TouchGetX and DRV_TOUCH_ADC_TouchGetY are called to retrieve the last touch position. Touch positions are not queued.

Touch samples are configurable, the default is 300. The return integer can have the value between 0-screenWidth and 0-screenHeight.

Initializing the Driver

Before the ADC Touch Driver can be opened, it must be configured and initialized. The driver build time configuration is defined by the configuration macros. Refer to the Building the Library section for the location of and more information on the various configuration macros and how these macros should be designed. The driver initialization is configured through the DRV_TOUCH_INIT data structure that is passed to the DRV_TOUCH_ADC_Initialize function. The initialization parameters include the interrupt source, interrupt pin remap configuration and touch screen resolution. The following code shows an example of initializing the ADC Touch Touch Driver.

```
/* The following code shows an example of designing the
 *  DRV_TOUCH_INIT data structure. It also shows how an example
 *  usage of the DRV_TOUCH_ADC_Initialize function.
 */
```

```
DRV_TOUCH_INIT drvTouchInitData;
SYS_MODULE_OBJ objectHandle;

/* Touch Module Id*/
drvTouchInitData.touchId                    = DRV_TOUCH_INDEX_0;

/* I2C Bus driver open */
drvTouchInitData.drvOpen                    = DRV_I2C_Open;

/* Interrupt Source for Touch */
drvTouchInitData.interruptSource            = INT_SOURCE_EXTERNAL_1;

/* Interrupt Pin function mapping */
drvTouchInitData.interruptPort.inputFunction = INPUT_FUNC_INT1;

/* Pin to be mapped as interrupt pin */
drvTouchInitData.interruptPort.inputPin     = INPUT_PIN_RPE8;

/* Analog pin number */
drvTouchInitData.interruptPort.analogPin    = PORTS_ANALOG_PIN_25;

/* Pin Mode of analog pin */
drvTouchInitData.interruptPort.pinMode      = PORTS_PIN_MODE_DIGITAL;

/* Interrupt pin port */
drvTouchInitData.interruptPort.channel      = PORT_CHANNEL_E;

/* Interrupt pin port maskl */
drvTouchInitData.interruptPort.dataMask     = 0x8;

/* Touch screen orientation */
drvTouchInitData.orientation                = DISP_ORIENTATION;

/* Touch screen horizontal resolution */
drvTouchInitData.horizontalResolution           = DISP_HOR_RESOLUTION;

/* Touch screen vertical resolution */
drvTouchInitData.verticalResolution         = DISP_VER_RESOLUTION;

/* Driver initialization */
objectHandle = DRV_TOUCH_ADC_Initialize(DRV_TOUCH_INDEX_0,
                                        (SYS_MODULE_INIT*)drvTouchInitData);
    if (SYS_MODULE_OBJ_INVALID == objectHandle)
    {
        // Handle error
    }
```

Opening the Driver

To use the ADC Touch Driver, the application must open the driver. This is done by calling the DRV_TOUCH_ADC_Open function. If successful, the DRV_TOUCH_ADC_Open function will return a handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_TOUCH_ADC_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in other (error) cases as well. The following code shows an example of the driver being opened.

```
DRV_HANDLE handle;
handle = DRV_TOUCH_ADC_Open( DRV_TOUCH_ADC_INDEX_0,
DRV_IO_INTENT_EXCLUSIVE );
if( DRV_HANDLE_INVALID == handle )
{
// Unable
}
```

Tasks Routine

To use the ADC Touch Driver, the application must open the driver. This is done by calling the DRV_TOUCH_ADC_Open function. If successful, the DRV_TOUCH_ADC_Open function will return a handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_TOUCH_ADC_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in

other (error) cases as well. The following code shows an example of the driver being opened.

```
DRV_HANDLE handle;
handle = DRV_TOUCH_ADC_Open( DRV_TOUCH_ADC_INDEX_0,
DRV_IO_INTENT_EXCLUSIVE );
if( DRV_HANDLE_INVALID == handle )
{
// Unable
}
```

Configuring the Library

The configuration of the ADC Touch Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the ADC 10-bit Touch Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the ADC Touch Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Building the Library

This section lists the files that are available in the ADC Touch Driver Library.

Description

This section list the files that are available in the `\src` folder of the ADC Touch Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/touch/touch_adc`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_touch_adc.h	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/drv_touch_adc.c	Basic ADC Touch Driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The ADC Touch Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library
- Touch System Service Library
- I2C Driver Library

Library Interface

This section describes the API functions of the ADC Touch Driver library.

Refer to each section for a detailed description.

a) System Functions

b) Data Types and Constants

Files

This section lists the source and header files used by the ADC Touch Driver Library.

AR1021 Touch Driver Library

This topic describes the AR1021 Touch Driver Library.

Introduction

This library provides a low-level abstraction of the AR1021 Touch Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, thereby hiding differences from one microcontroller variant to another.

Description

The AR1021 Touch Driver Library, in conjunction with the Microchip AR1021 Resistive Touch Screen Controller module, allows an application to:

- Calibrate touch points
- Receive touch points

The following application services are provided by the AR1021 Touch Driver Library:

- Configuring the AR1021 controller (TouchThreshold, PenUpDelay, PenStateReportDelaylist, SensitivityFilter, etc.)
- Saving touch points to EEPROM

The operational services are not typically accessible to the application as this portion of the code resides within the Touch System Service Library software layer and is used by the Graphics Library stack services to receive touch point data.

Using the Library

This topic describes the basic architecture of the AR1021 Touch Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_ar1021.h`

The interface to the AR1021 Touch Driver library is defined in the `drv_ar1021.h` header file. Any C language source (`.c`) file that uses the AR1021 Touch Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the AR1021 Touch Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

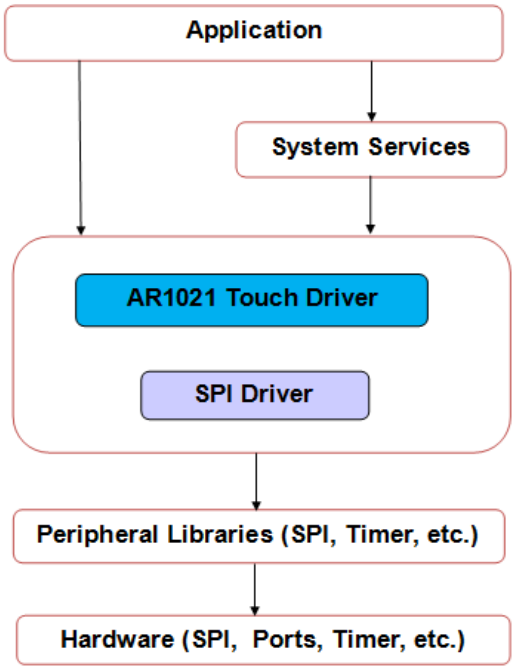
Description

The AR1021 Touch Driver Library provides the following functionality:

- AR1021 library initialization
- AR1021 controller configuration
- AR1021 controller connectivity
- AR1021 polling for pen-down and pen-up touch point events

The abstraction model shown in the following diagram depicts how the AR1021 Touch Driver is positioned in the MPLAB Harmony framework. The AR1021 Touch Driver Library uses the SPI Driver for control and touch data transfers to the AR1021 module.

AR1021 Touch Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the AR1021 Touch Driver module.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, task, and status functions.
Client Functions	Provides functions to open, close, and calibrate the AR1021 Touch Driver.

How the Library Works

The library provides interfaces to support:

- System functions, which provide system module interfaces, device initialization, deinitialization, task, touch, and status functions
- Client functions, which open, close, and calibrate the AR1021 Touch Driver

Initializing the Driver

Before the AR1021 Touch Driver can be opened, it must be configured and initialized. The driver build time configuration is defined by the configuration macros. Refer to the Building the Library section for the location of and more information on the various configuration macros and how these macros should be designed. The driver initialization is configured through the DRV_TOUCH_INIT data structure that is passed to the DRV_TOUCH_AR1021_Initialize function. The initialization parameters include the interrupt source, interrupt pin remap configuration and touch screen resolution. The following code shows an example of initializing the AR1021 Touch Driver.

Example:

```
/* The following code shows an example of designing the
 *  DRV_TOUCH_INIT data structure. It also shows how an example
 *  usage of the DRV_TOUCH_AR1021_Initialize function.
 */

DRV_TOUCH_INIT drvTouchInitData;
SYS_MODULE_OBJ objectHandle;

/* Driver initialization */
objectHandle = DRV_TOUCH_AR1021_Initialize(DRV_TOUCH_INDEX_0,
```

```
                                        (SYS_MODULE_INIT*)drvTouchInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Opening the Driver

To use the AR1021 Touch Driver, the application must open the driver. This is done by calling the DRV_TOUCH_AR1021_Open function.

If successful, the DRV_TOUCH_AR1021_Open function will return a handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_TOUCH_AR1021_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in other (error) cases as well. The following code shows an example of the driver being opened.

```
DRV_HANDLE  handle;

handle = DRV_TOUCH_AR1021_Open( DRV_TOUCH_AR1021_INDEX_0,
                                DRV_IO_INTENT_EXCLUSIVE );

if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Tasks Routine

This routine processes the AR1021 Touch Driver commands from the command queue. If the state of the command is initialize or done it returns. If the read request registration is successful the state of command is to decode input. The tasks routine decodes the input and updates the global variables storing the touch input data in form of x and y coordinates. The AR1021 Touch Driver task routine is to be called from SYS_Tasks. The following code shows an example:

```
SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_AR1021_Initialize

void SYS_Tasks( void )
{
    DRV_TOUCH_AR1021_Tasks ( object );

    // Do other tasks
}
```

Configuring the Library

Macros

	Name	Description
	DRV_AR1021_CALIBRATION_DELAY	Define the calibration delay.
	DRV_AR1021_CALIBRATION_INSET	Define the calibration inset.
	DRV_AR1021_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_AR1021_INDEX	AR1021 static index selection.
	DRV_AR1021_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_AR1021_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_AR1021_SAMPLE_POINTS	Define the sample points.
	DRV_AR1021_TOUCH_DIAMETER	Define the touch diameter.

Description

The configuration of the AR1021 Touch Driver is accomplished through AR1021 Touch Driver selections in the MPLAB Harmony Configurator (MHC). Based on the selections made, a specific AR1021 Touch Driver is established automatically to execute all system configuration, initialization, and steady-state touch acquisitions.

Refer to Volume III: MPLAB Harmony Configurator (MHC) for more details on system configuration. Refer to the Applications Help section for additional information.

DRV_AR1021_CALIBRATION_DELAY Macro

Define the calibration delay.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_CALIBRATION_DELAY 300
```

Description

AR1021 Calibration Delay

This macro enables the delay between calibration touch points.

Remarks

None.

DRV_AR1021_CALIBRATION_INSET Macro

Define the calibration inset.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_CALIBRATION_INSET 25
```

Description

AR1021 Calibration Inset

This macro define the calibration inset.

Remarks

None.

DRV_AR1021_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_CLIENTS_NUMBER 1
```

Description

AR1021 Maximum Number of Clients

This definition selected the maximum number of clients that the AR1021 driver can support at run time.

Remarks

None.

DRV_AR1021_INDEX Macro

AR1021 static index selection.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_INDEX DRV_AR1021_INDEX_0
```

Description

AR1021 Static Index Selection

AR1021 static index selection for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

DRV_AR1021_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_INSTANCES_NUMBER 1
```

Description

AR1021 hardware instance configuration

This macro sets up the maximum number of hardware instances that can be supported.

Remarks

None.

DRV_AR1021_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_INTERRUPT_MODE false
```

Description

AR1021 Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of AR1021 operation is desired
- false - Select if polling mode of AR1021 operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

DRV_AR1021_SAMPLE_POINTS Macro

Define the sample points.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_SAMPLE_POINTS 4
```

Description

AR1021 Sample Points

AR1021 sample points

Remarks

None.

DRV_AR1021_TOUCH_DIAMETER Macro

Define the touch diameter.

File

drv_ar1021_config_template.h

C

```
#define DRV_AR1021_TOUCH_DIAMETER 10
```

Description

AR1021 Touch Diameter

This macro defines the touch diameter

Remarks

None.

Building the Library

This section lists the files that are available in the AR1021 Touch Driver Library.

Description

This section list the files that are available in the `\src` folder of the AR1021 Touch Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/touch/ar1021`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_ar1021.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/drv_ar1021.c`	Basic AR1021 Touch Driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The AR1021 Touch Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library
- Touch System Service Library
- I2C Driver Library

Library Interface

a) System Functions

	Name	Description
	DRV_TOUCH_AR1021_Deinitialize	De-initializes the specified instance of the AR1021 driver module.
	DRV_TOUCH_AR1021_FactoryDefaultSet	Set AR1021 controller to factory default configuration settings.
	DRV_TOUCH_AR1021_Initialize	Initializes the AR1021 instance for the specified driver index

	DRV_TOUCH_AR1021_RegisterConfigWrite	Write a value to the given AR1021 configuration register.
	DRV_TOUCH_AR1021_Status	Provides the current status of the AR1021 driver module.
	DRV_TOUCH_AR1021_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_TOUCH_AR1021_TouchGetX	Returns the x coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchGetY	Returns the y coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchPenGet	Returns the PEN state of the touch event.
	DRV_TOUCH_AR1021_TouchStatus	Returns the status of the current touch input.

b) Client Functions

	Name	Description
	DRV_TOUCH_AR1021_Calibrate	Calibrate the touch screen
	DRV_TOUCH_AR1021_CalibrationSet	Set calibration with pre-defined points..
	DRV_TOUCH_AR1021_Close	Closes an opened instance of the AR1021 driver
	DRV_TOUCH_AR1021_Open	Opens the specified AR1021 driver instance and returns a handle to it. **Implementation:** Dynamic

c) Data Types and Constants

	Name	Description
	DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK	Defines the callback functions required to inform the user of touch and release targets.
	DRV_TOUCH_AR1021_HANDLE	Touch screen controller AR1021 driver handle.
	DRV_TOUCH_AR1021_MODULE_ID	This is type DRV_TOUCH_AR1021_MODULE_ID.
	DRV_TOUCH_AR1021_TASK_STATE	Enumeration defining AR1021 touch controller driver task state.
	DRV_TOUCH_AR1021_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_AR1021_INDEX_0	AR1021 driver index definitions.
	DRV_TOUCH_AR1021_INDEX_COUNT	Number of valid AR1021 driver indices.

Description

This section describes the API functions of the AR1021 Touch Driver Library.

a) System Functions

DRV_TOUCH_AR1021_Deinitialize Function

De-initializes the specified instance of the AR1021 driver module.

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

De-initializes the specified instance of the AR1021 driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the De-initialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_TOUCH_AR1021_Status operation. The system has to use DRV_TOUCH_AR1021_Status to find out when the module is in the ready state.

Preconditions

Function DRV_TOUCH_AR1021_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_TOUCH_AR1021_Initialize
SYS_STATUS          status;

DRV_TOUCH_AR1021_Deinitialize ( object );

status = DRV_TOUCH_AR1021_Status( object );
if( SYS_MODULE_UNINITIALIZED == status )
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TOUCH_AR1021_Initialize

Function

void DRV_TOUCH_AR1021_Deinitialize (SYS_MODULE_OBJ object)

DRV_TOUCH_AR1021_FactoryDefaultSet Function

Set AR1021 controller to factory default configuration settings.

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_FactoryDefaultSet();
```

Returns

None

Description

This function returns the AR1021 to operate on factory default configuration settings.

Remarks

A power cycle is required to run on the default settings.

Preconditions

The DRV_TOUCH_AR1021_Open routine must have been called for the specified AR1021 driver instance.

Example

```
DRV_TOUCH_AR1021_FactoryDefaultSet ( void );
```

Function

void DRV_TOUCH_AR1021_FactoryDefaultSet(void)

DRV_TOUCH_AR1021_Initialize Function

Initializes the AR1021 instance for the specified driver index

File

drv_ar1021.h

C

```
SYS_MODULE_OBJ DRV_TOUCH_AR1021_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const
init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the AR1021 driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the 'init' parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the AR1021 module ID. For example, driver instance 0 can be assigned to AR10212. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_TOUCH_AR1021_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other AR1021 routine is called.

This routine should only be called once during system initialization unless DRV_TOUCH_AR1021_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
DRV_TOUCH_INIT      drvAr1021InitData;
SYS_MODULE_OBJ      objectHandle;

objectHandle = DRV_TOUCH_AR1021_Initialize(DRV_TOUCH_AR1021_INDEX_1, (SYS_MODULE_INIT*)drvAr1021InitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized. Please note this is not the AR1021 id. The hardware AR1021 id is set in the initialization structure. This is the index of the driver index to use.
init	Pointer to a data structure containing any data necessary to initialize the driver. If this pointer is NULL, the driver uses the static initialization override macros for each member of the initialization data structure.

Function

SYS_MODULE_OBJ DRV_TOUCH_AR1021_Initialize(const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init)

DRV_TOUCH_AR1021_RegisterConfigWrite Function

Write a value to the given AR1021 configuration register.

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_RegisterConfigWrite(uint16_t regOffset, uint8_t Value);
```

Returns

None

Description

This function set a value to the given AR1021 configuration register.

Remarks

none

Preconditions

The DRV_TOUCH_AR1021_Open routine must have been called for the specified AR1021 driver instance.

Example

```
DRV_TOUCH_AR1021_RegisterConfigWrite(uint16_t regOffset, uint8_t Value);
```

Function

void DRV_TOUCH_AR1021_RegisterConfigWrite(uint16_t regOffset, uint8_t Value)

DRV_TOUCH_AR1021_Status Function

Provides the current status of the AR1021 driver module.

File

drv_ar1021.h

C

```
SYS_STATUS DRV_TOUCH_AR1021_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

Description

This function provides the current status of the AR1021 driver module.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

This function can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

The DRV_TOUCH_AR1021_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TOUCH_AR1021_Initialize
SYS_STATUS          status;

status = DRV_TOUCH_AR1021_Status( object );
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TOUCH_AR1021_Initialize

Function

SYS_STATUS DRV_TOUCH_AR1021_Status (SYS_MODULE_OBJ object)

DRV_TOUCH_AR1021_Tasks Function

Maintains the driver's state machine and implements its task queue processing.

Implementation: Dynamic

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal state machine and implement its command queue processing. It is always called from SYS_Tasks() function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks)

Preconditions

The DRV_TOUCH_AR1021_Initialize routine must have been called for the specified AR1021 driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_TOUCH_AR1021_Initialize

while( true )
{
    DRV_TOUCH_AR1021_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TOUCH_AR1021_Initialize)

Function

void DRV_TOUCH_AR1021_Tasks (SYS_MODULE_OBJ object);

DRV_TOUCH_AR1021_TouchDataRead Function

Notifies the driver that the current touch data has been read

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_TouchDataRead(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

Notifies the driver that the current touch data has been read

Function

void DRV_TOUCH_AR1021_TouchDataRead(const SYS_MODULE_INDEX index)

DRV_TOUCH_AR1021_TouchGetX Function

Returns the x coordinate of touch input.

Implementation: Dynamic

File

drv_ar1021.h

C

```
short DRV_TOUCH_AR1021_TouchGetX(uint8_t touchNumber);
```

Returns

It returns the x coordinate of the touch input in terms of number of pixels.

Description

It returns the x coordinate in form of number of pixels for a touch input denoted by touchNumber.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

short DRV_TOUCH_AR1021_TouchGetX(uint8 touchNumber)

DRV_TOUCH_AR1021_TouchGetY Function

Returns the y coordinate of touch input.

Implementation: Dynamic

File

drv_ar1021.h

C

```
short DRV_TOUCH_AR1021_TouchGetY(uint8_t touchNumber);
```

Returns

It returns the y coordinate of the touch input in terms of number of pixels.

Description

It returns the y coordinate in form of number of pixes for a touch input denoted by touchNumber.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

short DRV_TOUCH_AR1021_TouchGetY(uint8 touchNumber)

DRV_TOUCH_AR1021_TouchPenGet Function

Returns the PEN state of the touch event.

File

drv_ar1021.h

C

```
DRV_TOUCH_PEN_STATE DRV_TOUCH_AR1021_TouchPenGet(uint8_t touchNumber);
```

Returns

It returns DRV_TOUCH_PEN_STATE

Description

It returns the PEN state of the last touch event corresponding to the x and y position.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

DRV_TOUCH_PEN_STATE DRV_TOUCH_AR1021_TouchPenGet(uint8_t touchNumber)

DRV_TOUCH_AR1021_TouchStatus Function

Returns the status of the current touch input.

File

drv_ar1021.h

C

```
DRV_TOUCH_POSITION_STATUS DRV_TOUCH_AR1021_TouchStatus(const SYS_MODULE_INDEX index);
```

Returns

It returns the status of the current touch input.

Description

It returns the status of the current touch input.

Function

DRV_TOUCH_POSITION_SINGLE DRV_TOUCH_AR1021_TouchStatus(const SYS_MODULE_INDEX index)

b) Client Functions

DRV_TOUCH_AR1021_Calibrate Function

Calibrate the touch screen

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_Calibrate(const DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK * prompt);
```

Returns

None

Description

This function display calibration points on the display to enable calibration.

Remarks

None

Preconditions

The DRV_TOUCH_AR1021_Initialize routine must have been called for the specified AR1021 driver instance.

Example

```
DRV_TOUCH_AR1021_Calibrate ( handle );
```

Function

void DRV_TOUCH_AR1021_Calibrate ((const DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK * prompt))

DRV_TOUCH_AR1021_CalibrationSet Function

Set calibration with pre-defined points..

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_CalibrationSet(DRV_TOUCH_SAMPLE_POINTS * samplePoints);
```

Returns

None

Description

This function allows for the setting of pre-loaded calibration points.

Remarks

None

Preconditions

The DRV_TOUCH_AR1021_Open routine must have been called for the specified AR1021 driver instance.

Example

```
DRV_TOUCH_AR1021_CalibrationSet ( void );
```

Function

void DRV_TOUCH_AR1021_CalibrationSet(void)

DRV_TOUCH_AR1021_Close Function

Closes an opened instance of the AR1021 driver

File

drv_ar1021.h

C

```
void DRV_TOUCH_AR1021_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the AR1021 driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_TOUCH_AR1021_Open before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_TOUCH_AR1021_Initialize routine must have been called for the specified AR1021 driver instance.

DRV_TOUCH_AR1021_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TOUCH_AR1021_Open

DRV_TOUCH_AR1021_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TOUCH_AR1021_Close (DRV_HANDLE handle)

DRV_TOUCH_AR1021_Open Function

Opens the specified AR1021 driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_ar1021.h

C

```
DRV_HANDLE DRV_TOUCH_AR1021_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. An error can occur when the following is true:

- if the number of client objects allocated via DRV_TOUCH_AR1021_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid

Description

This routine opens the specified AR1021 driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The current version of driver does not support the DRV_IO_INTENT feature. The driver is by default non-blocking. The driver can perform both read and write to the AR1021 device. The driver supports single client only.

Remarks

The handle returned is valid until the DRV_TOUCH_AR1021_Close routine is called. This routine will NEVER block waiting for hardware. If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

The DRV_TOUCH_AR1021_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_TOUCH_AR1021_Open( DRV_TOUCH_AR1021_INDEX_0, DRV_IO_INTENT_EXCLUSIVE );

if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Index of the driver initialized with DRV_TOUCH_AR1021_Initialize().
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver. The current version of driver does not support the selective IO intent feature.

Function

DRV_HANDLE DRV_TOUCH_AR1021_Open (const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent)

c) Data Types and Constants

DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK Structure

Defines the callback functions required to inform the user of touch and release targets.

File

drv_ar1021.h

C

```
typedef struct {
  void (* firstPromptCallback)(void);
  void (* secondPromptCallback)(void);
  void (* thirdPromptCallback)(void);
  void (* fourthPromptCallback)(void);
  void (* completeCallback)(void);
} DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK;
```

Members

Members	Description
void (* firstPromptCallback)(void);	first calibration target
void (* secondPromptCallback)(void);	second calibration target
void (* thirdPromptCallback)(void);	third calibration target
void (* fourthPromptCallback)(void);	fourth calibration target
void (* completeCallback)(void);	complete calibration

Description

TOUCH Driver Calibration Initialization Data

This data type defines the callback function pointers required to inform of touch and release targets. The driver will invoke each callback in sequential order. The host code can display graphic and/or textual content to direct the user when a where on the LCD display to touch and release.

Remarks

None.

DRV_TOUCH_AR1021_HANDLE Type

Touch screen controller AR1021 driver handle.

File

drv_ar1021.h

C

```
typedef uintptr_t DRV_TOUCH_AR1021_HANDLE;
```

Description

AR1021 Driver Handle

Touch controller AR1021 driver handle is a handle for the driver client object. Each driver with successful open call will return a new handle to the client object.

Remarks

None.

DRV_TOUCH_AR1021_MODULE_ID Enumeration

File

drv_ar1021.h

C

```
typedef enum {
  AR1021_ID_1 = 0,
  AR1021_NUMBER_OF_MODULES
} DRV_TOUCH_AR1021_MODULE_ID;
```

Description

This is type DRV_TOUCH_AR1021_MODULE_ID.

DRV_TOUCH_AR1021_TASK_STATE Enumeration

Enumeration defining AR1021 touch controller driver task state.

File

drv_ar1021.h

C

```
typedef enum {
  DRV_TOUCH_AR1021_TASK_STATE_INIT = 0,
  DRV_TOUCH_AR1021_TASK_STATE_DONE
} DRV_TOUCH_AR1021_TASK_STATE;
```

Members

Members	Description
DRV_TOUCH_AR1021_TASK_STATE_INIT = 0	Task initialize state
DRV_TOUCH_AR1021_TASK_STATE_DONE	Task complete state

Description

AR1021 Touch Controller Driver Task State

This enumeration defines the AR1021 touch controller driver task state. The task state helps to synchronize the operations of initialization the the task, adding the read input task to the task queue once the touch controller notifies the available touch input and a decoding the touch input received.

Remarks

None.

DRV_TOUCH_AR1021_HANDLE_INVALID Macro

Definition of an invalid handle.

File

drv_ar1021.h

C

```
#define DRV_TOUCH_AR1021_HANDLE_INVALID ((DRV_TOUCH_AR1021_HANDLE)(-1))
```

Description

AR1021 Driver Invalid Handle

This is the definition of an invalid handle. An invalid handle is is returned by DRV_TOUCH_AR1021_Open() and DRV_AR1021_Close() functions if the request was not successful.

Remarks

None.

DRV_TOUCH_AR1021_INDEX_0 Macro

AR1021 driver index definitions.

File

drv_ar1021.h

C

```
#define DRV_TOUCH_AR1021_INDEX_0 0
```

Description

AR1021 Driver Module Index Numbers

These constants provide the AR1021 driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_AR1021_Initialize and

DRV_AR1021_Open functions to identify the driver instance in use.

DRV_TOUCH_AR1021_INDEX_COUNT Macro

Number of valid AR1021 driver indices.

File

drv_ar1021.h

C

```
#define DRV_TOUCH_AR1021_INDEX_COUNT 1
```

Description

AR1021 Driver Module Index Count

This constant identifies the number of valid AR1021 driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

Files

Files

Name	Description
drv_ar1021.h	Touch controller AR1021 driver implementation.

Description

This section lists the source and header files used by the AR1021 Touch Driver Library.

drv_ar1021.h

Touch controller AR1021 driver implementation.

Enumerations

	Name	Description
	DRV_TOUCH_AR1021_MODULE_ID	This is type DRV_TOUCH_AR1021_MODULE_ID.
	DRV_TOUCH_AR1021_TASK_STATE	Enumeration defining AR1021 touch controller driver task state.

Functions

	Name	Description
	DRV_TOUCH_AR1021_Calibrate	Calibrate the touch screen
	DRV_TOUCH_AR1021_CalibrationSet	Set calibration with pre-defined points..
	DRV_TOUCH_AR1021_Close	Closes an opened instance of the AR1021 driver
	DRV_TOUCH_AR1021_Deinitialize	De-initializes the specified instance of the AR1021 driver module.
	DRV_TOUCH_AR1021_FactoryDefaultSet	Set AR1021 controller to factory default configuration settings.
	DRV_TOUCH_AR1021_Initialize	Initializes the AR1021 instance for the specified driver index
	DRV_TOUCH_AR1021_Open	Opens the specified AR1021 driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_RegisterConfigWrite	Write a value to the given AR1021 configuration register.
	DRV_TOUCH_AR1021_Status	Provides the current status of the AR1021 driver module.
	DRV_TOUCH_AR1021_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_TOUCH_AR1021_TouchGetX	Returns the x coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchGetY	Returns the y coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_AR1021_TouchPenGet	Returns the PEN state of the touch event.

	DRV_TOUCH_AR1021_TouchStatus	Returns the status of the current touch input.

Macros

	Name	Description
	DRV_TOUCH_AR1021_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_AR1021_INDEX_0	AR1021 driver index definitions.
	DRV_TOUCH_AR1021_INDEX_COUNT	Number of valid AR1021 driver indices.

Structures

	Name	Description
	DRV_TOUCH_AR1021_CALIBRATION_PROMPT_CALLBACK	Defines the callback functions required to inform the user of touch and release targets.

Types

	Name	Description
	DRV_TOUCH_AR1021_HANDLE	Touch screen controller AR1021 driver handle.

Description

Touch controller AR1021 driver file

This file consist of touch controller AR1021 driver interfaces. It implements the driver interfaces which read the touch input data from AR1021 through SPI bus.

File Name

drv_ar1021.c

MTCH6301 Touch Driver Library

This topic describes the MTCH6301 Touch Driver Library.

Introduction

This library provides an interface to manage the MTCH6301 Touch Driver module on the Microchip family of microcontrollers in different modes of operation.

Description

The MPLAB Harmony MTCH6301 Touch Driver provides a high-level interface to the MTCH6301 touch controller device. This driver provides application routines to read the touch input data from the touch screen. The MTCH6301 device can notify the availability of touch input data through external interrupt. The MTCH6301 driver allows the application to map a controller pin as an external interrupt pin.

Currently, the MTCH6301 Touch Driver only supports non-gestural single-fingered touch input.

Using the Library

This topic describes the basic architecture of the MTCH6301 Touch Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_mtch6301.h`

The interface to the MTCH6301 Touch Driver library is defined in the `drv_mtch6301.h` header file. Any C language source (`.c`) file that uses the MTCH6301 Touch Driver library should include this header.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the MTCH6301 Touch Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

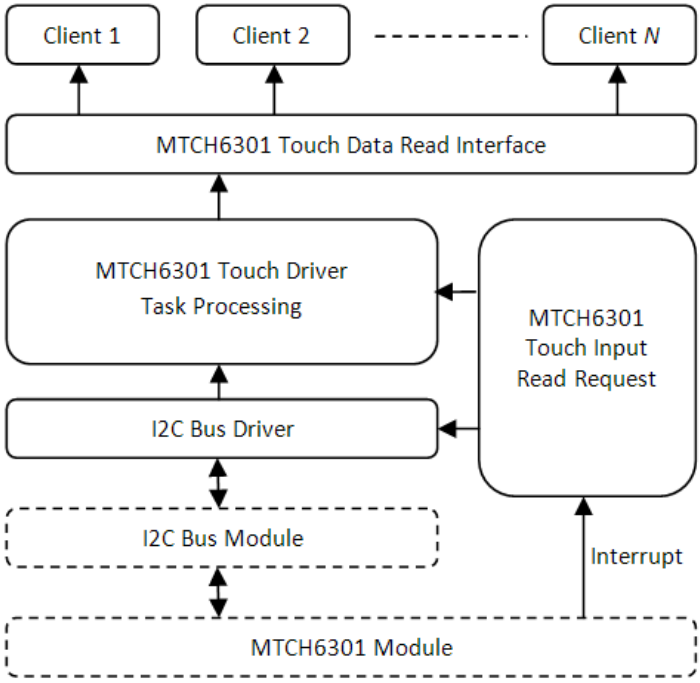
The MTCH6301 Touch Driver has routines to perform the following operations:

- Sending read request
- Reading the touch input data

- Access to the touch input data

The driver initialization routines allow the application to initialize the driver. The driver must be initialized before it can be used by application. Once the driver is initialized the driver open routine allows to retrieve the client handle. Once the touch input is available a touch input read request is sent and input data is retrieved in a buffer. The buffer data is then decoded to get the x and y coordinate of the touch screen in the form of the number of pixels.

MTCH6301 Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the MTCH6301 Touch Driver.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, open, close, task, and status functions.

How the Library Works

The library provides interfaces to support:

- System functions, which provide system module interfaces, device initialization, deinitialization, open, close, task, and status functions.
- Read Request function, which provides Touch input data read request function
- Read Touch Input function, which provides functions retrieving updated Touch input in the form x and y coordinates.

Initializing the Driver

Before the MTCH6301 Touch Driver can be opened, it must be configured and initialized. The driver build time configuration is defined by the configuration macros. Refer to the Building the Library section for the location of and more information on the various configuration macros and how these macros should be designed. The driver initialization is configured through the DRV_TOUCH_INIT data structure that is passed to the DRV_TOUCH_MTCH6301_Initialize function. The initialization parameters include the interrupt source, interrupt pin remap configuration and touch screen resolution. The following code shows an example of initializing the MTCH6301 Touch Driver.

Example:

```
/* The following code shows an example of designing the
 *  DRV_TOUCH_INIT data structure. It also shows how an example
 *  usage of the DRV_TOUCH_MTCH6301_Initialize function.
 */
```

```
DRV_TOUCH_INIT drvTouchInitData;
SYS_MODULE_OBJ objectHandle;

/* Touch Module Id*/
drvTouchInitData.touchId                    = DRV_TOUCH_INDEX_0;

/* I2C Bus driver open */
drvTouchInitData.drvOpen                    = DRV_I2C_Open;

/* Interrupt Source for Touch */
drvTouchInitData.interruptSource            = INT_SOURCE_EXTERNAL_1;

/* Interrupt Pin function mapping */
drvTouchInitData.interruptPort.inputFunction = INPUT_FUNC_INT1;

/* Pin to be mapped as interrupt pin */
drvTouchInitData.interruptPort.inputPin     = INPUT_PIN_RPE8;

/* Analog pin number */
drvTouchInitData.interruptPort.analogPin    = PORTS_ANALOG_PIN_25;

/* Pin Mode of analog pin */
drvTouchInitData.interruptPort.pinMode      = PORTS_PIN_MODE_DIGITAL;

/* Interrupt pin port */
drvTouchInitData.interruptPort.channel      = PORT_CHANNEL_E;

/* Interrupt pin port maskl */
drvTouchInitData.interruptPort.dataMask     = 0x8;

/* Touch screen orientation */
drvTouchInitData.orientation                = DISP_ORIENTATION;

/* Touch screen horizontal resolution */
drvTouchInitData.horizontalResolution           = DISP_HOR_RESOLUTION;

/* Touch screen vertical resolution */
drvTouchInitData.verticalResolution         = DISP_VER_RESOLUTION;

/* Driver initialization */
objectHandle = DRV_TOUCH_MTCH6301_Initialize(DRV_TOUCH_INDEX_0,
                                             (SYS_MODULE_INIT*)drvTouchInitData);
    if (SYS_MODULE_OBJ_INVALID == objectHandle)
    {
        // Handle error
    }
```

Opening the Driver

To use the MTCH6301 Touch Driver, the application must open the driver. This is done by calling the DRV_TOUCH_MTCH6301_Open function.

If successful, the DRV_TOUCH_MTCH6301_Open function will return a handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_TOUCH_MTCH6301_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in other (error) cases as well. The following code shows an example of the driver being opened.

```
    DRV_HANDLE  handle;

    handle = DRV_TOUCH_MTCH6301_Open( DRV_TOUCH_MTCH6301_INDEX_0,
                                      DRV_IO_INTENT_EXCLUSIVE );

    if( DRV_HANDLE_INVALID == handle )
    {
        // Unable to open the driver
    }
```

Touch Input Read Request

To read the touch input from the MTCH6301 touch controller device, a read request must be registered. This is done by calling the DRV_TOUCH_MTCH6301_ReadRequest. If successful it registers a buffer read request to the I2C command queue. It also adds a input decode command to the MTCH6301 command queue once the I2C returns with touch input data. It can return error if the driver instance object is invalid or the MTCH6301 command queue is full. The read request is to be called from the MTCH6301 ISR. This ISR is triggered once the touch input is available. The following code shows an example of a MTCH6301 read request registration:

```
SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_MTCH6301_Initialize

void __ISR(_EXTERNAL_INT_VECTOR, ipl5) _IntHandlerDrvMtch6301(void)
{
    DRV_TOUCH_MTCH6301_ReadRequest ( object );

    // Do other tasks
}
```

Tasks Routine

This routine processes the MTCH6301 commands from the command queue. If the state of the command is initialize or done it returns. If the read request registration is successful the state of command is to decode input. The tasks routine decodes the input and updates the global variables storing the touch input data in form of x and y coordinates. The MTCH6301 Touch Driver task routine is to be called from SYS_Tasks. The following code shows an example:

```
SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_MTCH6301_Initialize

void SYS_Tasks( void )
{
    DRV_TOUCH_MTCH6301_Tasks ( object );

    // Do other tasks
}
```

Configuring the Library

Macros

	Name	Description
	DRV_MTCH6301_CALIBRATION_DELAY	Defines the calibration delay.
	DRV_MTCH6301_CALIBRATION_INSET	Defines the calibration inset.
	DRV_MTCH6301_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_MTCH6301_INDEX	MTCH6301 static index selection.
	DRV_MTCH6301_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_MTCH6301_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_MTCH6301_SAMPLE_POINTS	Define the sample points.
	DRV_MTCH6301_TOUCH_DIAMETER	Defines the touch diameter.

Description

The configuration of the MTCH6301 Touch Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the MTCH6301 Touch Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the MTCH6301 Touch Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_MTCH6301_CALIBRATION_DELAY Macro

Defines the calibration delay.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_CALIBRATION_DELAY 300
```

Description

MTCH6301 Calibration Delay

This macro enables the delay between calibration touch points.

Remarks

None.

DRV_MTCH6301_CALIBRATION_INSET Macro

Defines the calibration inset.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_CALIBRATION_INSET 25
```

Description

MTCH6301 Calibration Inset

This macro defines the calibration inset.

Remarks

None.

DRV_MTCH6301_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_CLIENTS_NUMBER 1
```

Description

MTCH6301 maximum number of clients

This macro selects the maximum number of clients.

This definition selected the maximum number of clients that the MTCH6301 driver can support at run time.

Remarks

None.

DRV_MTCH6301_INDEX Macro

MTCH6301 static index selection.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_INDEX DRV_MTCH6301_INDEX_0
```

Description

MTCH6301 Static Index Selection

This macro specifies the static index selection for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

DRV_MTCH6301_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_INSTANCES_NUMBER 1
```

Description

MTCH6301 hardware instance configuration

This macro sets up the maximum number of hardware instances that can be supported.

Remarks

None.

DRV_MTCH6301_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_INTERRUPT_MODE false
```

Description

MTCH6301 Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of MTCH6301 operation is desired
- false - Select if polling mode of MTCH6301 operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

DRV_MTCH6301_SAMPLE_POINTS Macro

Define the sample points.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_SAMPLE_POINTS 4
```

Description

MTCH6301 Sample Points

MTCH6301 sample points

Remarks

None.

DRV_MTCH6301_TOUCH_DIAMETER Macro

Defines the touch diameter.

File

drv_mtch6301_config_template.h

C

```
#define DRV_MTCH6301_TOUCH_DIAMETER 10
```

Description

MTCH6301 Touch Diameter

This macro defines the touch diameter

Remarks

None.

Building the Library

This section lists the files that are available in the MTCH6301 Touch Driver Library.

Description

This section list the files that are available in the \src folder of the MTCH6301 Touch Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/touch/mtch6301`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_mtch6301.h	Header file that exports the driver API.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/drv_mtch6301.c	Basic MTCH6301 Touch Driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The MTCH6301 Touch Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library
- Touch System Service Library
- I2C Driver Library

Library Interface

a) System Functions

	Name	Description
	DRV_TOUCH_MTCH6301_Close	Closes an opened instance of the MTCH6301 driver. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Deinitialize	Deinitializes the specified instance of the MTCH6301 driver module. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Initialize	Initializes the MTCH6301 instance for the specified driver index. **Implementation:** Dynamic

	DRV_TOUCH_MTCH6301_Open	Opens the specified MTCH6301 driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Status	Provides the current status of the MTCH6301 driver module. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_ReadRequest	Sends a read request to I2C bus driver and adds the read task to queue. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchGetX	Returns the x coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchGetY	Returns the y coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_TOUCH_MTCH6301_TouchStatus	Returns the status of the current touch input.

b) Data Types and Constants

	Name	Description
	_DRV_MTCH6301_CLIENT_OBJECT	MTCH6301 Driver client object maintaining client data.
	DRV_TOUCH_MTCH6301_HANDLE	Touch screen controller MTCH6301 driver handle.
	DRV_TOUCH_MTCH6301_MODULE_ID	Number of valid MTCH6301 driver indices.
	DRV_TOUCH_MTCH6301_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE	I2C Frame size for reading MTCH6301 touch input.
	DRV_TOUCH_MTCH6301_CLIENT_OBJECT	MTCH6301 Driver client object maintaining client data.
	DRV_TOUCH_MTCH6301_INDEX_0	MTCH6301 driver index definitions.
	DRV_TOUCH_MTCH6301_INDEX_1	This is macro DRV_TOUCH_MTCH6301_INDEX_1.
	DRV_TOUCH_MTCH6301_INDEX_COUNT	Number of valid Touch controller MTCH6301 driver indices.
	DRV_TOUCH_MTCH6301_OBJECT	Defines the data structure maintaining MTCH6301 driver instance object.
	DRV_TOUCH_MTCH6301_TASK_QUEUE	Defines the MTCH6301 Touch Controller driver task data structure.
	DRV_TOUCH_MTCH6301_TASK_STATE	Enumeration defining MTCH6301 touch controller driver task state.
	DRV_TOUCH_MTCH6301_I2C_MASTER_READ_ID	MTCH6301 input read, I2C address from where master reads touch input data.
	DRV_TOUCH_MTCH6301_I2C_MASTER_WRITE_ID	MTCH6301 command register write, I2C address where master sends the commands.

Description

This section describes the API functions of the MTCH6301 Touch Driver library.

Refer to each section for a detailed description.

a) System Functions

DRV_TOUCH_MTCH6301_Close Function

Closes an opened instance of the MTCH6301 driver.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
void DRV_TOUCH_MTCH6301_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the MTCH6301 driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_TOUCH_MTCH6301_Open before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_TOUCH_MTCH6301_Initialize routine must have been called for the specified MTCH6301 driver instance.

DRV_TOUCH_MTCH6301_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_TOUCH_MTCH6301_Open

DRV_TOUCH_MTCH6301_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_TOUCH_MTCH6301_Close (DRV_HANDLE handle)

DRV_TOUCH_MTCH6301_Deinitialize Function

Deinitializes the specified instance of the MTCH6301 driver module.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
void DRV_TOUCH_MTCH6301_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the MTCH6301 driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the De-initialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_TOUCH_MTCH6301_Status operation. The system has to use DRV_TOUCH_MTCH6301_Status to determine when the module is in the ready state.

Preconditions

Function DRV_TOUCH_MTCH6301_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Parameter: object - Driver object handle, returned from DRV_TOUCH_MTCH6301_Initialize

Example

```
SYS_MODULE_OBJ      object;    //Returned from DRV_TOUCH_MTCH6301_Initialize
SYS_STATUS          status;

DRV_TOUCH_MTCH6301_Deinitialize ( object );

status = DRV_TOUCH_MTCH6301_Status( object );
if( SYS_MODULE_UNINITIALIZED == status )
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Function

void DRV_TOUCH_MTCH6301_Deinitialize (SYS_MODULE_OBJ object)

DRV_TOUCH_MTCH6301_Initialize Function

Initializes the MTCH6301 instance for the specified driver index.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
SYS_MODULE_OBJ DRV_TOUCH_MTCH6301_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the MTCH6301 driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the 'init' parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the MTCH6301 module ID. For example, driver instance 0 can be assigned to MTCH63012. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_TOUCH_MTCH6301_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other MTCH6301 routine is called.

This routine should only be called once during system initialization unless DRV_TOUCH_MTCH6301_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
DRV_TOUCH_MTCH6301_INIT        init;
SYS_MODULE_OBJ      objectHandle;

// Populate the MTCH6301 initialization structure
// Touch Module Id
init.touchId                      = DRV_TOUCH_INDEX_0;

// I2C Bus driver open
init.drvOpen                      = DRV_I2C_Open;

// Interrupt Source for Touch
init.interruptSource              = INT_SOURCE_EXTERNAL_1;

// Interrupt Pin function mapping
init.interruptPort.inputFunction  = INPUT_FUNC_INT1;

// Pin to be mapped as interrupt pin
init.interruptPort.inputPin       = INPUT_PIN_RPE8;

// Analog pin number
init.interruptPort.analogPin      = PORTS_ANALOG_PIN_25;

// Pin Mode of analog pin
init.interruptPort.pinMode        = PORTS_PIN_MODE_DIGITAL;

// Interrupt pin port
init.interruptPort.channel        = PORT_CHANNEL_E;

// Interrupt pin port maskl
init.interruptPort.dataMask       = 0x8;
```

```
// Touch screen orientation
init.orientation                = DISP_ORIENTATION;

// Touch screen horizontal resolution
init.horizontalResolution       = DISP_HOR_RESOLUTION;

// Touch screen vertical resolution
init.verticalResolution         = DISP_VER_RESOLUTION;

objectHandle = DRV_TOUCH_MTCH6301_Initialize(DRV_TOUCH_INDEX_0,
                                             (SYS_MODULE_INIT*)init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized. Please note this is not the MTCH6301 ID. The hardware MTCH6301 ID is set in the initialization structure. This is the index of the driver index to use.
init	Pointer to a data structure containing any data necessary to initialize the driver. If this pointer is NULL, the driver uses the static initialization override macros for each member of the initialization data structure.

Function

SYS_MODULE_OBJ DRV_TOUCH_MTCH6301_Initialize(const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init)

DRV_TOUCH_MTCH6301_Open Function

Opens the specified MTCH6301 driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
DRV_HANDLE DRV_TOUCH_MTCH6301_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. An error can occur when the following is true:

- if the number of client objects allocated via DRV_TOUCH_MTCH6301_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid

Description

This routine opens the specified MTCH6301 driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The current version of driver does not support the DRV_IO_INTENT feature. The driver is by default non-blocking. The driver can perform both read and write to the MTCH6301 device. The driver supports single client only.

Remarks

The handle returned is valid until the DRV_TOUCH_MTCH6301_Close routine is called. This routine will NEVER block waiting for hardware. If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

The DRV_TOUCH_MTCH6301_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  handle;
```

```
handle = DRV_TOUCH_MTCH6301_Open( DRV_TOUCH_MTCH6301_INDEX_0,
                                  DRV_IO_INTENT_EXCLUSIVE );

if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Index of the driver initialized with DRV_TOUCH_MTCH6301_Initialize().
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver. The current version of driver does not support the selective IO intent feature.

Function

DRV_HANDLE DRV_TOUCH_MTCH6301_Open (const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent)

DRV_TOUCH_MTCH6301_Status Function

Provides the current status of the MTCH6301 driver module.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
SYS_STATUS DRV_TOUCH_MTCH6301_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system-level operation and cannot start another

Description

This function provides the current status of the MTCH6301 driver module.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

This function can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

The DRV_TOUCH_MTCH6301_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;  // Returned from DRV_TOUCH_MTCH6301_Initialize
SYS_STATUS          status;

status = DRV_TOUCH_MTCH6301_Status( object );
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_TOUCH_MTCH6301_Initialize

Function

SYS_STATUS DRV_TOUCH_MTCH6301_Status (SYS_MODULE_OBJ object)

DRV_TOUCH_MTCH6301_Tasks Function

Maintains the driver's state machine and implements its task queue processing.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
void DRV_TOUCH_MTCH6301_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal state machine and implement its command queue processing. It is always called from SYS_Tasks() function. This routine decodes the touch input data available in drvI2CReadFrameData.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks)

Preconditions

The DRV_TOUCH_MTCH6301_Initialize routine must have been called for the specified MTCH6301 driver instance.

Example

```
SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_MTCH6301_Initialize

void SYS_Tasks( void )
{
    DRV_TOUCH_MTCH6301_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TOUCH_MTCH6301_Initialize)

Function

void DRV_TOUCH_MTCH6301_Tasks (SYS_MODULE_OBJ object);

DRV_TOUCH_MTCH6301_ReadRequest Function

Sends a read request to I2C bus driver and adds the read task to queue.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
void DRV_TOUCH_MTCH6301_ReadRequest(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to send a touch input read request to the I2C bus driver and adding the input read decode task to the queue. It is always called from MTCH6301 interrupt ISR routine.

Remarks

This function is normally not called directly by an application. It is called by the MTCH6301 ISR routine.

Preconditions

The DRV_TOUCH_MTCH6301_Initialize routine must have been called for the specified MTCH6301 driver instance.

Example

```
SYS_MODULE_OBJ      object;   // Returned from DRV_TOUCH_MTCH6301_Initialize

void __ISR(_EXTERNAL_INT_VECTOR, ipl5) _IntHandlerDrvMtch6301(void)
{
    DRV_TOUCH_MTCH6301_ReadRequest ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_TOUCH_MTCH6301_Initialize)

Function

void DRV_TOUCH_MTCH6301_ReadRequest(SYS_MODULE_OBJ object)

DRV_TOUCH_MTCH6301_TouchGetX Function

Returns the x coordinate of touch input.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
short DRV_TOUCH_MTCH6301_TouchGetX(uint8_t touchNumber);
```

Returns

It returns the x coordinate of the touch input in terms of number of pixels.

Description

It returns the x coordinate in form of number of pixes for a touch input denoted by touchNumber.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

short DRV_TOUCH_MTCH6301_TouchGetX(uint8 touchNumber)

DRV_TOUCH_MTCH6301_TouchGetY Function

Returns the y coordinate of touch input.

Implementation: Dynamic

File

drv_mtch6301.h

C

```
short DRV_TOUCH_MTCH6301_TouchGetY(uint8_t touchNumber);
```

Returns

It returns the y coordinate of the touch input in terms of number of pixels.

Description

It returns the y coordinate in form of number of pixes for a touch input denoted by touchNumber.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

short DRV_TOUCH_MTCH6301_TouchGetY(uint8 touchNumber)

DRV_TOUCH_MTCH6301_TouchDataRead Function

Notifies the driver that the current touch data has been read

File

drv_mtch6301.h

C

```
void DRV_TOUCH_MTCH6301_TouchDataRead(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

Notifies the driver that the current touch data has been read

Function

void DRV_TOUCH_MTCH6301_TouchDataRead(const SYS_MODULE_INDEX index)

DRV_TOUCH_MTCH6301_TouchStatus Function

Returns the status of the current touch input.

File

drv_mtch6301.h

C

```
DRV_TOUCH_POSITION_STATUS DRV_TOUCH_MTCH6301_TouchStatus(const SYS_MODULE_INDEX index);
```

Returns

It returns the status of the current touch input.

Description

It returns the status of the current touch input.

Function

DRV_TOUCH_POSITION_SINGLE DRV_TOUCH_MTCH6301_TouchStatus(const SYS_MODULE_INDEX index)

b) Data Types and Constants

DRV_TOUCH_MTCH6301_HANDLE Type

Touch screen controller MTCH6301 driver handle.

File

drv_mtch6301.h

C

```
typedef uintptr_t DRV_TOUCH_MTCH6301_HANDLE;
```

Description

MTCH6301 Driver Handle

Touch controller MTCH6301 driver handle is a handle for the driver client object. Each driver with succesful open call will return a new handle to the client object.

Remarks

None.

DRV_TOUCH_MTCH6301_MODULE_ID Enumeration

Number of valid MTCH6301 driver indices.

File

drv_mtch6301.h

C

```
typedef enum {
  MTCH6301_ID_1 = 0,
  MTCH6301_NUMBER_OF_MODULES
} DRV_TOUCH_MTCH6301_MODULE_ID;
```

Description

MTCH6301 Driver Module Index Count

This constant identifies the number of valid MTCH6301 driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

DRV_TOUCH_MTCH6301_HANDLE_INVALID Macro

Definition of an invalid handle.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_HANDLE_INVALID ((DRV_TOUCH_MTCH6301_HANDLE)(-1))
```

Description

MTCH6301 Driver Invalid Handle

This is the definition of an invalid handle. An invalid handle is is returned by DRV_TOUCH_MTCH6301_Open() and DRV_MTCH6301_Close() functions if the request was not successful.

Remarks

None.

DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE Macro

I2C Frame size for reading MTCH6301 touch input.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE 7
```

Description

MTCH6301 Driver Module I2C Frame Size

This constant identifies the size of I2C frame required to read from MTCH6301 touch controller. MTCH6301 notifies the availability of input data through interrupt pin.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific data sheets.

DRV_TOUCH_MTCH6301_CLIENT_OBJECT Structure

MTCH6301 Driver client object maintaining client data.

File

drv_mtch6301.h

C

```
typedef struct _DRV_MTCH6301_CLIENT_OBJECT {
  DRV_TOUCH_MTCH6301_OBJECT* driverObject;
  DRV_IO_INTENT intent;
  struct DRV_TOUCH_MTCH6301_CLIENT_OBJECT* pNext;
} DRV_TOUCH_MTCH6301_CLIENT_OBJECT;
```

Members

Members	Description
DRV_TOUCH_MTCH6301_OBJECT* driverObject;	Driver Object associated with the client
DRV_IO_INTENT intent;	The intent with which the client was opened
struct DRV_TOUCH_MTCH6301_CLIENT_OBJECT* pNext;	Next driver client object

Description

MTCH6301 Driver client object

This defines the object required for the maintenance of the software clients instance. This object exists once per client instance.

Remarks

None.

DRV_TOUCH_MTCH6301_INDEX_0 Macro

MTCH6301 driver index definitions.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_INDEX_0 0
```

Description

MTCH6301 Driver Module Index Numbers

These constants provide the MTCH6301 driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_MTCH6301_Initialize and DRV_MTCH6301_Open functions to identify the driver instance in use.

DRV_TOUCH_MTCH6301_INDEX_1 Macro

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_INDEX_1 1
```

Description

This is macro DRV_TOUCH_MTCH6301_INDEX_1.

DRV_TOUCH_MTCH6301_INDEX_COUNT Macro

Number of valid Touch controller MTCH6301 driver indices.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_INDEX_COUNT 2
```

Description

MTCH6301 Driver Module Index Count

This constant identifies the number of valid Touch Controller MTCH6301 driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific header files defined as part of the peripheral libraries.

DRV_TOUCH_MTCH6301_OBJECT Structure

Defines the data structure maintaining MTCH6301 driver instance object.

File

drv_mtch6301.h

C

```
typedef struct {
  SYS_STATUS status;
  int touchId;
  SYS_MODULE_INDEX drvIndex;
  bool inUse;
  bool isExclusive;
  uint8_t numClients;
  INT_SOURCE interruptSource;
  uint16_t orientation;
  uint16_t horizontalResolution;
  uint16_t verticalResolution;
  DRV_HANDLE (* drvOpen)(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);
  int32_t readRequest;
  DRV_TOUCH_MTCH6301_TASK_QUEUE* taskQueue;
  DRV_HANDLE drvI2CHandle;
  DRV_TOUCH_POSITION_STATUS touchStatus;
} DRV_TOUCH_MTCH6301_OBJECT;
```

Members

Members	Description
SYS_STATUS status;	The status of the driver
int touchId;	The peripheral Id associated with the object
SYS_MODULE_INDEX drvIndex;	Save the index of the driver. Important to know this as we are using reference based accessing
bool inUse;	Flag to indicate instance in use
bool isExclusive;	Flag to indicate module used in exclusive access mode

uint8_t numClients;	Number of clients possible with the hardware instance
INT_SOURCE interruptSource;	Touch input interrupt source
uint16_t orientation;	Orientation of the display (given in degrees of 0,90,180,270)
uint16_t horizontalResolution;	Horizontal Resolution of the displayed orientation in Pixels
uint16_t verticalResolution;	Vertical Resolution of the displayed orientaion in Pixels
DRV_HANDLE (* drvOpen)(const SYS_MODULE_INDEX index, const DRV_IO_INTENT intent);	Callback for I2C Driver Open call
int32_t readRequest;	Touch Input read request counter
DRV_TOUCH_MTCH6301_TASK_QUEUE* taskQueue;	Head of the task queue
DRV_HANDLE drvI2CHandle;	I2C bus driver handle
DRV_TOUCH_POSITION_STATUS touchStatus;	Touch status

Description

MTCH6301 Driver Instance Object.

This data structure maintains the MTCH6301 driver instance object. The object exists once per hardware instance.

Remarks

None.

DRV_TOUCH_MTCH6301_TASK_QUEUE Structure

Defines the MTCH6301 Touch Controller driver task data structure.

File

drv_mtch6301.h

C

```
typedef struct {
  bool inUse;
  DRV_TOUCH_MTCH6301_TASK_STATE taskState;
  DRV_I2C_BUFFER_HANDLE drvI2CReadBufferHandle;
  uint8_t drvI2CReadFrameData[DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE];
} DRV_TOUCH_MTCH6301_TASK_QUEUE;
```

Members

Members	Description
bool inUse;	Flag denoting the allocation of task
DRV_TOUCH_MTCH6301_TASK_STATE taskState;	Enum maintaining the task state
DRV_I2C_BUFFER_HANDLE drvI2CReadBufferHandle;	I2C Buffer handle
uint8_t drvI2CReadFrameData[DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE];	Response to Read Touch Input Command • Response = { MTCH6301 Read Address, • Input Data Size, • Touch Id, Pen status, • Touch X coordinate (0 to 6), • Touch X coordinate (7 to 11), • Touch Y coordinate (0 to 6), • Touch Y coordinate (7 to 11) }

Description

MTCH6301 Touch Controller driver task data structure.

This data type defines the data structure maintaing task context in the task queue. The inUse flag denotes the task context allocation for a task. The enum variable taskState maintains the current task state. The I2C buffer handle drvI2CReadBufferHandle maintains the I2C driver buffer handle returned by the I2C driver read request. The byte array variable drvI2CReadFrameData maintains the I2C frame data sent by MTCH6301 after a successful read request.

Remarks

None.

DRV_TOUCH_MTCH6301_TASK_STATE Enumeration

Enumeration defining MTCH6301 touch controller driver task state.

File

drv_mtch6301.h

C

```
typedef enum {
  DRV_TOUCH_MTCH6301_TASK_STATE_INIT = 0,
  DRV_TOUCH_MTCH6301_TASK_STATE_READ_INPUT,
  DRV_TOUCH_MTCH6301_TASK_STATE_DECODE_INPUT,
  DRV_TOUCH_MTCH6301_TASK_STATE_DONE
} DRV_TOUCH_MTCH6301_TASK_STATE;
```

Members

Members	Description
DRV_TOUCH_MTCH6301_TASK_STATE_INIT = 0	Task initialize state
DRV_TOUCH_MTCH6301_TASK_STATE_READ_INPUT	Task read touch input request state
DRV_TOUCH_MTCH6301_TASK_STATE_DECODE_INPUT	Task touch input decode state
DRV_TOUCH_MTCH6301_TASK_STATE_DONE	Task complete state

Description

MTCH6301 Touch Controller Driver Task State

This enumeration defines the MTCH6301 touch controller driver task state. The task state helps to synchronize the operations of initialization the the task, adding the read input task to the task queue once the touch controller notifies the available touch input and a decoding the touch input received.

Remarks

None.

DRV_TOUCH_MTCH6301_I2C_MASTER_READ_ID Macro

MTCH6301 input read, I2C address from where master reads touch input data.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_I2C_MASTER_READ_ID 0x4B
```

Description

MTCH6301 Driver Module Master Input Read I2C address

This constant defines the MTCH6301 touch input read I2C address. This address is used as I2C address to read Touch input from MTCH6301 Touch controller.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific data sheets.

DRV_TOUCH_MTCH6301_I2C_MASTER_WRITE_ID Macro

MTCH6301 command register write, I2C address where master sends the commands.

File

drv_mtch6301.h

C

```
#define DRV_TOUCH_MTCH6301_I2C_MASTER_WRITE_ID 0x4A
```

Description

MTCH6301 Driver Module Master Command Write I2C Address

This constant defines the MTCH6301 command register I2C write address. This address is used as I2C address to write commands into MTCH6301 Touch controller register.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific data sheets.

Files

Files

Name	Description
drv_mtch6301.h	Touch controller MTCH6301 Driver interface header file.
drv_mtch6301_config_template.h	MTCH6301 Touch Driver configuration template.

Description

This section lists the source and header files used by the MTCH6301 Touch Driver Library.

drv_mtch6301.h

Touch controller MTCH6301 Driver interface header file.

Enumerations

	Name	Description
	DRV_TOUCH_MTCH6301_MODULE_ID	Number of valid MTCH6301 driver indices.
	DRV_TOUCH_MTCH6301_TASK_STATE	Enumeration defining MTCH6301 touch controller driver task state.

Functions

	Name	Description
	DRV_TOUCH_MTCH6301_Close	Closes an opened instance of the MTCH6301 driver. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Deinitialize	Deinitializes the specified instance of the MTCH6301 driver module. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Initialize	Initializes the MTCH6301 instance for the specified driver index. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Open	Opens the specified MTCH6301 driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_ReadRequest	Sends a read request to I2C bus driver and adds the read task to queue. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Status	Provides the current status of the MTCH6301 driver module. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_TOUCH_MTCH6301_TouchGetX	Returns the x coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchGetY	Returns the y coordinate of touch input. **Implementation:** Dynamic
	DRV_TOUCH_MTCH6301_TouchStatus	Returns the status of the current touch input.

Macros

	Name	Description
	DRV_TOUCH_MTCH6301_HANDLE_INVALID	Definition of an invalid handle.
	DRV_TOUCH_MTCH6301_I2C_MASTER_READ_ID	MTCH6301 input read, I2C address from where master reads touch input data.
	DRV_TOUCH_MTCH6301_I2C_MASTER_WRITE_ID	MTCH6301 command register write, I2C address where master sends the commands.

	DRV_TOUCH_MTCH6301_I2C_READ_FRAME_SIZE	I2C Frame size for reading MTCH6301 touch input.
	DRV_TOUCH_MTCH6301_INDEX_0	MTCH6301 driver index definitions.
	DRV_TOUCH_MTCH6301_INDEX_1	This is macro DRV_TOUCH_MTCH6301_INDEX_1.
	DRV_TOUCH_MTCH6301_INDEX_COUNT	Number of valid Touch controller MTCH6301 driver indices.

Structures

	Name	Description
	_DRV_MTCH6301_CLIENT_OBJECT	MTCH6301 Driver client object maintaining client data.
	DRV_TOUCH_MTCH6301_CLIENT_OBJECT	MTCH6301 Driver client object maintaining client data.
	DRV_TOUCH_MTCH6301_OBJECT	Defines the data structure maintaining MTCH6301 driver instance object.
	DRV_TOUCH_MTCH6301_TASK_QUEUE	Defines the MTCH6301 Touch Controller driver task data structure.

Types

	Name	Description
	DRV_TOUCH_MTCH6301_HANDLE	Touch screen controller MTCH6301 driver handle.

Description

Touch Controller MTCH6301 Driver Interface File

This header file describes the macros, data structure and prototypes of the touch controller MTCH6301 driver interface.

File Name

drv_mtch6301.c

drv_mtch6301_config_template.h

MTCH6301 Touch Driver configuration template.

Macros

	Name	Description
	DRV_MTCH6301_CALIBRATION_DELAY	Defines the calibration delay.
	DRV_MTCH6301_CALIBRATION_INSET	Defines the calibration inset.
	DRV_MTCH6301_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_MTCH6301_INDEX	MTCH6301 static index selection.
	DRV_MTCH6301_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_MTCH6301_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_MTCH6301_SAMPLE_POINTS	Define the sample points.
	DRV_MTCH6301_TOUCH_DIAMETER	Defines the touch diameter.

Description

MTCH6301 Touch Driver Configuration Template

This header file contains the build-time configuration selections for the MTCH6301 Touch Driver. This is the template file which give all possible configurations that can be made. This file should not be included in any project.

File Name

drv_mtch6301_config_template.h

Company

Microchip Technology Inc.

MTCH6303 Touch Driver Library

This topic describes the MTCH6303 Touch Driver Library.

Introduction

This library provides an interface to manage the MTCH6303 Touch Driver module on the Microchip family of microcontrollers in different modes of operation.

Description

The MPLAB Harmony MTCH6303 Touch Driver provides a high-level interface to the MTCH6303 touch controller device. This driver provides application routines to read the touch input data from the touch screen. The MTCH6303 device can notify the availability of touch input data through external interrupt. The MTCH6303 driver allows the application to map a controller pin as an external interrupt pin.

Currently, the MTCH6303 Touch Driver only supports non-gestural single-finger touch screen input.

Using the Library

This topic describes the basic architecture of the MTCH6303 Touch Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_mtch6303_static.h`

The interface to the MTCH6303 Touch Driver Library is defined in the `drv_mtch6303_static.h` header file. This file is generated by the MPLAB Harmony Configurator (MHC) during application code generation. It is included in `system_definitions.h` by MHC during application code generation. Any configuration macros required for MTCH6303 Driver are included in `system_config.h` by MHC during code generation. Any C language source (`.c`) file that uses the MTCH6303 Touch Driver Library should include `system_config.h` and `system_definitions.h`, respectively.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the MTCH6303 Touch Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

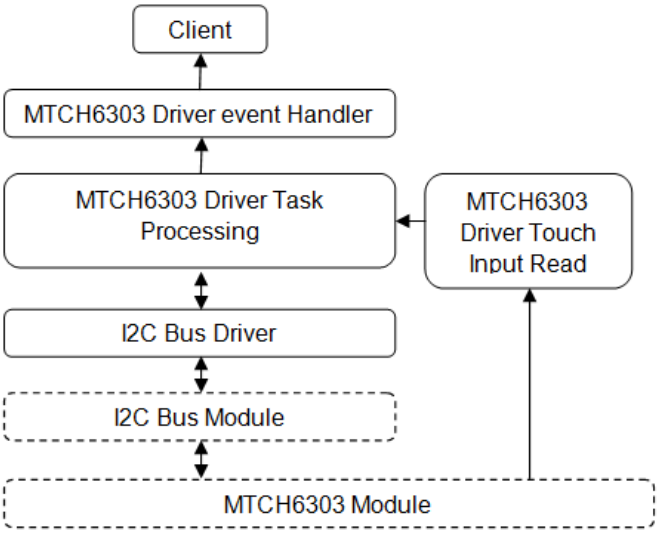
The MTCH6303 Touch Driver has routines to perform the following operations:

- MTCH6303 register read and write
- MTCh6303 message read and write
- MTCH6303 touch input read
- Mapping of the touch input to screen resolution

The driver Initialization routine allows the application to initialize the driver. The driver must be initialized before it can be used by the application. Once the driver is initialized, the driver Open function allows retrieval of the client handle. If the client handle is valid, an event handler routine needs to be registered by the application. The MTCH6303 Touch Driver triggers an interrupt once touch input is available to be read from the MTCH6303 registers. A touch input Read function is called from the interrupt handler to initiate the touch input read task. An Event Handler function is called once the touch input read task is completed. A valid touch input will be available only after the event handler routine is triggered. The touch input must be read inside of the event handler function.

The touch input data is a raw value and needs to be mapped to the target screen resolution. At zero degree orientation, touch input is mapped on the x axis from zero at the left and the maximum value at the right. At zero degree orientation, touch input is mapped on the y axis from zero at the top and the maximum value at the bottom.

MTCH6303 Driver Abstraction Model



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the MTCH6303 Touch Driver.

Library Interface Section	Description
System Functions	Provides system module interfaces, device initialization, deinitialization, reinitialization, tasks, and status functions.
Client Setup Functions	Provides open, close, status, and other setup function.
Read and Write Functions	Provides functions to read and write to the MTCH6303 registers, messages, and touch data.
Miscellaneous Functions	Provides miscellaneous functions.

How the Library Works

The library provides interfaces to support:

- System functions, which provide system module interfaces, device initialization, deinitialization, task, and status functions
- Client setup functions, which provide client interfaces such as open, close and event handler registration
- Read and write functions, initiate the touch input or register or message read and write tasks
- Miscellaneous functions such as touch input map function are provided to process the raw touch input data

Configuring the Library

The configuration of the MTCH6303 Touch Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the MTCH6303 Touch Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the MTCH6303 Touch Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Building the Library

This section lists the files that are available in the MTCH6303 Touch Driver Library.

Description

This section list the files that are available in the `/src` folder of the MTCH6303 Touch Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/touch/mtch6303`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_mtch6303_static.h`	Header file that exports the driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/drv_mtch6303_static.c`	Basic MTCH6303 Touch Driver implementation file.
`/src/drv_mtch6303_buffer_queue_i2c_static.c`	MTCH6303 I2C buffer queue implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
/drv_mtch6303_buffer_queue_touch_static.c	MTCH6303 message buffer queue implementation file.

Module Dependencies

The MTCH6303 Touch Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library
- I2C Driver Library

Library Interface

a) System Functions

	Name	Description
	DRV_MTCH6303_Deinitialize	Deinitializes the instance of the MTCH6303 driver module.
	DRV_MTCH6303_Initialize	Initializes the MTCH6303 static single instance.
	DRV_MTCH6303_Status	Gets the current status of the MTCH6303 driver module.
	DRV_MTCH6303_Tasks	Maintains the driver's register read/write state machine and implements its ISR.

b) Client Setup Functions

	Name	Description
	DRV_MTCH6303_Close	Closes an opened-instance of the MTCH6303 driver.
	DRV_MTCH6303_ErrorGet	This function returns the error associated with the last client request.
	DRV_MTCH6303_Open	Opens the MTCH6303 driver instance and returns a handle to it.

c) Read and Write Functions

	Name	Description
	DRV_MTCH6303_AddRegisterRead	Schedules a non-blocking register read request to read I2C accessible MTCH6303 registers.
	DRV_MTCH6303_AddRegisterWrite	Schedule a non-blocking driver register write operation to write I2C accessible MTCH6303 registers.
	DRV_MTCH6303_TOUCH_AddMessageCommandWrite	Schedule a non-blocking driver command message write operation to write command message to MTCH6303 registers.
	DRV_MTCH6303_TOUCH_AddMessageReportRead	Schedules a non-blocking report message read request to read the report message from MTCH6303 device.
	DRV_MTCH6303_TOUCH_AddTouchInputRead	Schedules a non-blocking read buffer request to read touch input from MTCH6303.
	DRV_MTCH6303_TOUCH_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued message transfers have finished.
	DRV_MTCH6303_TOUCH_Tasks	Maintains the driver's message state machine and implements its ISR.
	DRV_MTCH6303_TouchInputMap	Maps the raw touch input to display resolution.
	DRV_MTCH6303_TouchInputRead	Schedules a non-blocking read buffer request to read touch input from MTCH6303.
	DRV_MTCH6303_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

d) Data Types and Constants

	Name	Description
	DRV_MTCH6303_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_MTCH6303_TOUCH_NUM_INPUTS	Definition of number of touch input packets can be identified by MTCH6303.
	DRV_MTCH6303_BUFFER_EVENT	Lists the different conditions that happens during a buffer transfer.
	DRV_MTCH6303_BUFFER_EVENT_HANDLER	Points to a callback after completion of an register read -write or message stream read - write.
	DRV_MTCH6303_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.

	DRV_MTCH6303_CLIENT_STATUS	Defines the client-specific status of the MTCH6303 driver.
	DRV_MTCH6303_ERROR	Defines the possible errors that can occur during driver operation.
	DRV_MTCH6303_TOUCH_BUFFER_EVENT	Lists the different conditions that happens during a touch message buffer transfer.
	DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER	Points to a callback after completion of an message report read or message command write.
	DRV_MTCH6303_TOUCH_BUFFER_HANDLE	Handle identifying a read or write touch message buffer passed to the driver.
	DRV_MTCH6303_TOUCH_DATA	Defines MTCH6303 I2C Touch Data
	DRV_MTCH6303_TOUCH_INPUT	Defines MTCH6303 Touch Input Packet
	DRV_MTCH6303_TOUCH_MESSAGE	Defines MTCH6303 Touch Message.
	DRV_MTCH6303_TOUCH_MESSAGE_HEADER	Defines Touch Message Header.
	DRV_MTCH6303_TOUCH_NIBBLE_0	Defines the I2C Nibble 0 of MTCH6303 Touch input packet.
	DRV_MTCH6303_TOUCH_STATUS	Defines the I2C touch status register bits
	DRV_TOUCH_MTCH6303_MSG_ID	List of report or command message identification.
	DRV_TOUCH_MTCH6303_I2C_REGISTER_MAP	List of MTCH6303 I2C Accessible Register Identification.

Description

This section describes the API functions of the MTCH6303 Touch Driver library.

Refer to each section for a detailed description.

a) System Functions

DRV_MTCH6303_Deinitialize Function

Deinitializes the instance of the MTCH6303 driver module.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_Deinitialize();
```

Returns

None.

Description

Deinitializes the instance of the MTCH6303 driver module, disabling its operation. Invalidates all the internal data.

Remarks

once the initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. this routine will NEVER block waiting for hardware.

Preconditions

Function DRV_MTCH6303_Initialize should have been called before calling this function.

Example

```
SYS_STATUS    status;

DRV_MTCH6303_Deinitialize();

status = DRV_MTCH6303_Status();
if(SYS_MODULE_DEINITIALIZED != status)
{
    //check again later if you need to know
    //when the driver is deinitialized
}
```

Function

void DRV_MTCH6303_Deinitialize(void)

DRV_MTCH6303_Initialize Function

Initializes the MTCH6303 static single instance.

File

drv_mtch6303.h

C

```
SYS_MODULE_OBJ DRV_MTCH6303_Initialize();
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the MTCH6303 static driver instance. It makes the instance ready for a client to open and use it. The instance parameters are initialized by values set by MPLAB Harmony Configurator.

Preconditions

None.

Example

```
// The following code snippet shows an example MTCH6303 driver initialization.

SYS_MODULE_OBJ    objectHandle;

objectHandle = DRV_MTCH6303_Initialize();
if( SYS_MODULE_OBJ_INVALID == objectHandle )
{
   // Handle error
}
Remarks:   This routine must be called before any other MTCH6303 routine is called.

   This routine should only be called once during system initialization unless
   DRV_MTCH6303_Deinitialize is called to deinitialize the driver instance.
   This routine will NEVER block for hardware access.
```

Function

SYS_MODULE_OBJ DRV_MTCH6303_Initialize (void)

DRV_MTCH6303_Status Function

Gets the current status of the MTCH6303 driver module.

File

drv_mtch6303.h

C

```
SYS_STATUS DRV_MTCH6303_Status();
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another.

SYS_STATUS_DEINITIALIZED - Indicates that the driver has been deinitialized.

Description

This routine provides the current status of the MTCH6303 driver module.

Remarks

A driver can opened only when its status is SYS_STATUS_READY.

Preconditions

Function DRV_MTCH6303_Initialize should have been called before calling this function.

Example

```
SYS_STATUS mtch6303Status;

mtch6303Status = DRV_MTCH6303_Status();
if(SYS_STATUS_READY == mtch6303Status)
{
    // This means the driver can be opened using the
    // DRV_MTCH6303_Open() function.
}
```

Function

SYS_STATUS DRV_MTCH6303_Status(void)

DRV_MTCH6303_Tasks Function

Maintains the driver's register read/write state machine and implements its ISR.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_Tasks();
```

Returns

None.

Description

This routine is used to maintain the driver's register read/write state machine and implement its ISR for interrupt-driven implementations. In interrupt mode, this function is called in I2C Driver event Handler routine. The I2C Driver event Handler routine is registered by MTCH6303 event Handler register routine.

Remarks

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

Function DRV_MTCH6303_Initialize should have been called before calling this function. It also needs registration of the MTCH6303 Driver event handler routine.

Function

void DRV_MTCH6303_Tasks(void)

b) Client Setup Functions

DRV_MTCH6303_Close Function

Closes an opened-instance of the MTCH6303 driver.

File

drv_mtch6303.h

C

```
DRV_MTCH6303_CLIENT_STATUS DRV_MTCH6303_Close();
```

Returns

DRV_MTCH6303_CLIENT_STATUS_ERROR - if driver fails to remove buffer objects from queue.

DRV_MTCHC6303_CLIENT_STATUS_CLOSED - client is successfully closed

Description

This routine closes an opened-instance of the MTCH6303 driver. Any buffers in the driver queue that were submitted by this client will be removed. DRV_MTCH6303_Open must be called to before using the driver again.

Remarks

The driver will abort any ongoing operations when this routine is called.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called. DRV_MTCH6303_Open must have been called.

Example

```
DRV_MTH6303_CLIENT_STATUS mtch6303Status;

mtch6303Status = DRV_MTCH6303_Close()
if( DRV_MTCH6303_CLIENT_STATUS_ERROR == mtch6303Status )
{
    //retry closing the driver client
}
```

Function

DRV_MTCH6303_CLIENT_STATUS DRV_MTCH6303_Close (void)

DRV_MTCH6303_ErrorGet Function

This function returns the error associated with the last client request.

File

drv_mtch6303.h

C

```
DRV_MTCH6303_ERROR DRV_MTCH6303_ErrorGet();
```

Returns

DRV_MTCH6303_ERROR_NONE - no error

Description

This function returns the error associated with the last client request.

Remarks

This routine always return DRV_MTCH6303_ERROR_NONE the client error is currently not updated by any of the MTCH6303 operations API's.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called. DRV_MTCH6303_Open must have been called to open a device client.

Function

DRV_MTCH6303_ERROR DRV_MTCH6303_ErrorGet (void)

DRV_MTCH6303_Open Function

Opens the MTCH6303 driver instance and returns a handle to it.

File

drv_mtch6303.h

C

```
DRV_HANDLE DRV_MTCH6303_Open();
```

Returns

If successful, the routine returns a valid open-instance handle. If an error occurs, the return value is DRV_HANDLE_INVALID. Error can occur

- if the driver is not ready to be opened, typically when the initialize routine has not completed execution.
- if the bus driver fails to open
- if the client is trying to open the driver but driver has been opened exclusively by another client.

Description

This routine opens the specified MTCH6303 driver instance and provides a handle.

Remarks

The handle returned is valid until the DRV_MTCH6303_Close routine is called. This routine will NEVER block waiting for hardware.If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application.

Preconditions

Function DRV_MTCH6303_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_MTCH6303_Open( );
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

Function

DRV_HANDLE DRV_MTCH6303_Open { void }

c) Read and Write Functions

DRV_MTCH6303_AddRegisterRead Function

Schedules a non-blocking register read request to read I2C accessible MTCH6303 registers.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_AddRegisterRead(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle, uint8_t source, size_t nBytes,
uint8_t * destination);
```

Returns

None.

Description

This function schedules a non-blocking register read request to read I2C accessible MTCH6303 registers. The function returns with a valid buffer handle in the bufferHandle argument if the register read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_MTCH6303_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. The register data is collected into destination and can be read once a buffer event complete is reported. A event handler is called on buffer event complete where the register data must be read from destination.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t registerData[NUM_REGISTERS];
DRV_MTCH6303_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver
```

```
DRV_MTCH6303_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                    (uintptr_t)&myAppObj);

DRV_MTCH6303_AddRegisterRead( &bufferHandle,
                              DRV_MTCH6303_REG_TOUCH_STATUS,
                              NUM_REGISTERS,
                              &registerData );

if(DRV_MTCH6303_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_BUFFER_EVENT event,
                                     DRV_MTCH6303_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
Remarks:   None.
```

Parameters

Parameters	Description
bufferHandle	Handle to the buffer scheduled.
source	Register index.
nBytes	Number of registers to be read, starting from source.
destination	buffer collecting register data.

Function

void DRV_MTCH6303_AddRegisterRead(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle,

uint8_t source,

size_t nBytes,

uint8_t * destination)

DRV_MTCH6303_AddRegisterWrite Function

Schedule a non-blocking driver register write operation to write I2C accessible MTCH6303 registers.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_AddRegisterWrite(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle, uint8_t destination, size_t
nBytes, uint8_t * source);
```

Returns

None.

Description

This function schedules a non-blocking register write request to write I2C accessible MTCH6303 registers. The function returns with a valid buffer handle in the bufferHandle argument if the register write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_MTCH6303_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the write queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. A event handler is called on buffer event complete where the application data is written to the I2C accessible MTCH6303 Register.

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
uint8_t registerData[NUM_REGISTERS];
DRV_MTCH6303_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver

DRV_MTCH6303_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                    (uintptr_t)&myAppObj);

DRV_MTCH6303_AddRegisterWrite( &bufferHandle,
                               DRV_MTCH6303_REG_TOUCH_STATUS,
                               NUM_REGISTERS,
                               &registerData );

if(DRV_MTCH6303_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_BUFFER_EVENT event,
                                     DRV_MTCH6303_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;
```

```
            default:
                break;
        }
    }
```

Parameters

Parameters	Description
bufferHandle	Pointer to an argument that will contain the return buffer handle.
destination	Index to the start of destination register list.
nBytes	number of registers.
source	pointer to the data to be written to the register.

Function

void DRV_MTCH6303_AddRegisterWrite(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle,

uint8_t destination,

size_t nBytes,

uint8_t * source)

DRV_MTCH6303_TOUCH_AddMessageCommandWrite Function

Schedule a non-blocking driver command message write operation to write command message to MTCH6303 registers.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TOUCH_AddMessageCommandWrite(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_MESSAGE * messageCmd, size_t messageSize);
```

Returns

None.

Description

This function schedules a non-blocking command message write request to write command message to MTCH6303. The function returns with a valid buffer handle in the bufferHandle argument if the register command message write request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. While the request is in the queue, the application message buffer is owned by the driver and should not be modified. The function returns DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the message write queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. A event handler is called on buffer event complete where the application command message is written to MTCH6303.

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
DRV_MTCH6303_TOUCH_MESSAGE messageCommand;
DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver
```

```
DRV_MTCH6303_TOUCH_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                          (uintptr_t)&myAppObj);

DRV_MTCH6303_TOUCH_AddMessageCommandWrite( &bufferHandle,
                                           &messageCommand,
                                           MY_MESSAGE_SIZE );

if(DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
                                     DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferHandle	Pointer to an argument that will contain the return buffer handle.
messageCmd	command message to write to MTCH6303.
messageSize	command message size. It includes message header and payload size.

Function

void DRV_MTCH6303_TOUCH_AddMessageCommandWrite
(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_MESSAGE * messageCmd,
size_t messageSize)

DRV_MTCH6303_TOUCH_AddMessageReportRead Function

Schedules a non-blocking report message read request to read the report message from MTCH6303 device.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TOUCH_AddMessageReportRead(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_MESSAGE * messageRep, size_t messageSize);
```

Returns

None.

Description

This function schedules a non-blocking report message read request to read the report message from MTCH6303 device. The function returns with a valid buffer handle in the bufferHandle argument if the register read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. The register data is collected into destination and can be read once a buffer event complete is reported. A event handler is called on buffer event complete where the register data must be read from destination.

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
DRV_MTCH6303_TOUCH_MESSAGE messageReport;
DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver

DRV_MTCH6303_TOUCH_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                          (uintptr_t)&myAppObj);

DRV_MTCH6303_TOUCH_AddMessageReportRead( &bufferHandle,
                                         &messageReport,
                                         MY_MESSAGE_SIZE );

if(DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
                                     DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
```

```
    }
}
```

Parameters

Parameters	Description
bufferHandle	Handle to the buffer scheduled.
messageRep	report message buffer.
messageSize	report message size. It includes message header and payload size.

Function

void DRV_MTCH6303_TOUCH_AddMessageReportRead
(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_MESSAGE * messageRep,
size_t messageSize)

DRV_MTCH6303_TOUCH_AddTouchInputRead Function

Schedules a non-blocking read buffer request to read touch input from MTCH6303.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TOUCH_AddTouchInputRead(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_DATA * touchData);
```

Returns

None.

Description

This function schedules a non-blocking read buffer request to read touch input from MTCH6303. The function returns with a valid buffer handle in the bufferHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. The touch data is collected into touchData and can be read once a buffer event complete is reported. A event handler is called on buffer event complete where the touch data must be read from touchData.

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
DRV_MTCH6303_TOUCH_DATA touchData;
DRV_MTCH6303_BUFFER_HANDLE bufferHandle;

// Client registers an event handler with driver

DRV_MTCH6303_TOUCH_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                          (uintptr_t)&myAppObj);

DRV_MTCH6303_TOUCH_AddTouchInputRead( &bufferHandle, &touchData );
```

```
if(DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
                                     DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferHandle	Handle to the buffer scheduled.
touchData	Buffer collecting touch data.

Function

void DRV_MTCH6303_TOUCH_AddTouchInputRead
(DRV_MTCH6303_TOUCH_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_DATA * touchData)

DRV_MTCH6303_TOUCH_BufferEventHandlerSet Function

Allows a client to identify a buffer event handling function for the driver to call back when queued message transfers have finished.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TOUCH_BufferEventHandlerSet(const DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER eventHandler,
const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify a message event handling function for the driver to call back when queued message transfers have finished. When a client calls either the DRV_MTCH6303_TOUCH_AddTouchInputRead, DRV_MTCH6303_TOUCH_AddMessageReportRead or DRV_MTCH6303_TOUCH_AddMessageCommandWrite function, it is provided with a handle identifying the message that was added to the driver's message queue. The driver will pass this handle back to the client by calling "eventHandler" function when the message transfer has completed.

The event handler should be set before the client performs any "message add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;
DRV_MTCH6303_TOUCH_MESSAGE messageReport;
DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle;

// myMTCH6303Handle is the handle returned
// by the DRV_MTCH6303_Open function.

// Client registers an event handler with driver. This is done once

DRV_MTCH6303_TOUCH_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                (uintptr_t)&myAppObj );

DRV_MTCH6303_TOUCH_AddMessageReportRead( &bufferHandle, &messageReport );

if(DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
                                     DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_MTCH6303_TOUCH_BufferEventHandlerSet

(

const DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER eventHandler,
const uintptr_t context
)

DRV_MTCH6303_TOUCH_Tasks Function

Maintains the driver's message state machine and implements its ISR.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TOUCH_Tasks();
```

Returns

None.

Description

This routine is used to maintain the driver's message state machine and implement its ISR for interrupt-driven implementations. In interrupt mode, this function is called in I2C Driver event Handler routine. The I2C Driver event Handler routine is registered by MTCH6303 Touch event Handler register routine.

Remarks

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

Function DRV_MTCH6303_Initialize should have been called before calling this function. It also needs registration of the MTCH6303 Driver Touch event handler routine.

Function

void DRV_MTCH6303_TOUCH_Tasks(void)

DRV_MTCH6303_TouchInputMap Function

Maps the raw touch input to display resolution.

File

drv_mtch6303.h

C

```
inline uint16_t DRV_MTCH6303_TouchInputMap(uint16_t touchValue, uint16_t dispResolution);
```

Returns

This function returns the raw touch input mapped to display resolution in form of number of pixels.

Description

This function maps the raw touch input to display resolution. Raw touch input touchValue is obtained from the individual x or y value of DRV_MTCH6303_TOUCH_DATA. Raw touch value varies from 0 to 0x7FFF. The displayResolution is either horizontal or vertical resolution of the display in pixels. The function returns the raw touch input mapped to display resolution in form of number of pixels.

Remarks

None.

Preconditions

None.

Example

```
// Display with resolution 800 x 480
#define DISP_HOR_RESOUTION  800
#define DISP_VER_RESOLUTION 480

DRV_MTCH6303_TOUCH_DATA touchData;
uint16_t rawTouchX;
```

```
uint16_t rawTouchY;
uint16_t touchX;
uint16_t touchY;

// map 0th touch packet to display resolution
rawTouchX = touchData.touch[0].x;
rawTouchY = touchData.touch[0].y;

// map raw touch input in x direction to display horizontal resolution
touchX = DRV_MTCH6303_TouchInputMap( rawTouchX, DISP_HOR_RESOLUTION );

// map raw touch input in y direction to display vertical resolution
touchY = DRV_MTCH6303_TouchInputMap( rawTouchY, DISP_VER_RESOLUTION );

// use touchX and touchY as input to graphics objects.
```

Parameters

Parameters	Description
touchValue	raw touch input either in x or y direction (0 - 0x7FFF).
dispResolution	display resolution specifying either width or height of the display in pixels.

Function

uint16_t DRV_MTCH6303_TouchInputMap(uint16_t touchValue, uint16_t dispResolution)

DRV_MTCH6303_TouchInputRead Function

Schedules a non-blocking read buffer request to read touch input from MTCH6303.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_TouchInputRead(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle, DRV_MTCH6303_TOUCH_DATA *
touchData);
```

Returns

None.

Description

This function schedules a non-blocking read buffer request to read touch input from MTCH6303. The function returns with a valid buffer handle in the bufferHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance queue and returns immediately. The function returns DRV_MTCH6303_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_MTCH6303_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or DRV_MTCH6303_BUFFER_EVENT_ERROR event if the buffer was not processed successfully. The touch data is collected into touchData and can be read once a buffer event complete is reported. A event handler is called on buffer event complete where the touch data must be read from touchData.

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

DRV_MTCH6303_Open must have been called to obtain a valid opened device handle.

Example

```
MY_APP_OBJ myAppObj;
DRV_MTCH6303_TOUCH_DATA touchData;
DRV_MTCH6303_BUFFER_HANDLE bufferHandle;
```

```
// Client registers an event handler with driver

DRV_MTCH6303_BufferEventHandlerSet( APP_MTCH6303BufferEventHandler,
                                    (uintptr_t)&myAppObj);

DRV_MTCH6303_TouchInputRead( &bufferHandle, &touchData );

if(DRV_MTCH6303_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandler( DRV_MTCH6303_BUFFER_EVENT event,
                                     DRV_MTCH6303_BUFFER_HANDLE bufferHandle,
                                     uintptr_t contextHandle )
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferHandle	Handle to the buffer scheduled.
touchData	Buffer collecting touch data.

Function

void DRV_MTCH6303_TouchInputRead(DRV_MTCH6303_BUFFER_HANDLE * bufferHandle,
DRV_MTCH6303_TOUCH_DATA * touchData)

DRV_MTCH6303_BufferEventHandlerSet Function

Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

File

drv_mtch6303.h

C

```
void DRV_MTCH6303_BufferEventHandlerSet(const DRV_MTCH6303_BUFFER_EVENT_HANDLER eventHandler, const
uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. When a client calls either the DRV_MTCH6303_TouchInputRead, DRV_MTCH6303_AddRegisterRead or DRV_MTCH6303_AddRegisterWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by

calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "buffer add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

None.

Preconditions

The DRV_MTCH6303_Initialize routine must have been called and the DRV_MTCH6303_Status must have returned SYS_STATUS_READY.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];

// myMTCH6303Handle is the handle returned
// by the DRV_MTCH6303_Open function.

// Client registers an event handler with driver. This is done once

DRV_MTCH6303_BufferEventHandlerSet( APP_MTCH6303BufferEventHandle,
                                    (uintptr_t)&myAppObj );

DRV_MTCH6303_AddRegisterRead( &bufferHandle
                              DRV_MTCH6303_REG_TOUCH_STATUS,
                              MY_BUFFER_SIZE,
                              &mybuffer);

if(DRV_MTCH6303_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_MTCH6303BufferEventHandle( DRV_MTCH6303_BUFFER_EVENT event,
                                    DRV_MTCH6303_BUFFER_HANDLE handle,
                                    uintptr_t context)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_MTCH6303_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_MTCH6303_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
eventHandler	Pointer to the event handler function.

context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_MTCH6303_BufferEventHandlerSet
(
const DRV_MTCH6303_BUFFER_EVENT_HANDLER eventHandler,
const uintptr_t context
)

d) Data Types and Constants

DRV_MTCH6303_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_mtch6303.h

C

```
#define DRV_MTCH6303_BUFFER_HANDLE_INVALID
```

Description

MTCH6303 Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_MTCH6303_AddRegisterRead, DRV_MTCH6303_AddRegisterWrite or DRV_MTCH6303_TouchInputRead functions if the request was not successful.

Remarks

None

DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID Macro

Definition of an invalid buffer handle.

File

drv_mtch6303.h

C

```
#define DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID
```

Description

MTCH6303 Driver Invalid Buffer Handle

This is the definition of an invalid buffer handle. An invalid buffer handle is returned by DRV_MTCH6303_TOUCH_AddMessageReportRead, DRV_MTCH6303_TOUCH_AddMessageCommandWrite or DRV_MTCH6303_TOUCH_AddTouchInputRead functions if the request was not successful.

Remarks

None

DRV_MTCH6303_TOUCH_NUM_INPUTS Macro

Definition of number of touch input packets can be identified by MTCH6303.

File

drv_mtch6303.h

C

```
#define DRV_MTCH6303_TOUCH_NUM_INPUTS 0xA
```

Description

MTCH6303 Number of touch input packets

MTCH6303 supports multi-touch and can identify upto 10 different touch input packets.

Remarks

None.

DRV_MTCH6303_BUFFER_EVENT Enumeration

Lists the different conditions that happens during a buffer transfer.

File

drv_mtch6303.h

C

```
typedef enum {
  DRV_MTCH6303_BUFFER_EVENT_COMPLETE,
  DRV_MTCH6303_BUFFER_EVENT_ERROR,
  DRV_MTCH6303_BUFFER_EVENT_ABORT
} DRV_MTCH6303_BUFFER_EVENT;
```

Members

Members	Description
DRV_MTCH6303_BUFFER_EVENT_COMPLETE	Event buffer transfer complete
DRV_MTCH6303_BUFFER_EVENT_ERROR	Event buffer transfer error
DRV_MTCH6303_BUFFER_EVENT_ABORT	Event buffer transfer abort

Description

MTCH6303 Buffer Events

This enumeration identifies the different conditions that can happen during a buffer transaction. Callbacks can be made with the appropriate buffer condition passed as a parameter to execute the desired action.

The values act like flags and multiple flags can be set.

Remarks

None.

DRV_MTCH6303_BUFFER_EVENT_HANDLER Type

Points to a callback after completion of an register read -write or message stream read - write.

File

drv_mtch6303.h

C

```
typedef void (* DRV_MTCH6303_BUFFER_EVENT_HANDLER)(DRV_MTCH6303_BUFFER_EVENT event,
DRV_MTCH6303_BUFFER_HANDLE bufferHandle, uintptr_t context);
```

Description

MTCH6303 Buffer Event Callback

This type identifies the MTCH6303 Buffer Event. It allows the client driver to register a callback using DRV_MTCH6303_BUFFER_EVENT_HANDLER. By using this mechanism, the driver client will be notified at the completion of the corresponding transfer.

Remarks

A transfer can be composed of various transfer segments. Once a transfer is completed the driver will call the client registered transfer callback.

The callback could be called from ISR context and should be kept as short as possible. It is meant for signaling and it should not be blocking.

Parameters

Parameters	Description
DRV_MTCH6303_BUFFER_EVENT	Status of MTCH6303 transfer

bufferHandle	Handle that identifies the particular Buffer Object
context	pointer to the object to be processed.

Function

void (*DRV_MTCH6303_BUFFER_EVENT_HANDLER) (DRV_MTCH6303_BUFFER_EVENT event,
DRV_MTCH6303_BUFFER_HANDLE bufferHandle,
uintptr_t context)

DRV_MTCH6303_BUFFER_HANDLE Type

Handle identifying a read or write buffer passed to the driver.

File

drv_mtch6303.h

C

```
typedef uintptr_t DRV_MTCH6303_BUFFER_HANDLE;
```

Description

MTCH6303 Driver Buffer Handle

A buffer handle value is returned by a call to the DRV_MTCH6303_AddRegisterRead, DRV_MTCH6303_AddRegisterWrite or DRV_MTCH6303_TouchInputRead functions. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from these functions is returned back to the client by the "event handler callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None

DRV_MTCH6303_CLIENT_STATUS Enumeration

Defines the client-specific status of the MTCH6303 driver.

File

drv_mtch6303.h

C

```
typedef enum {
  DRV_MTCH6303_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR,
  DRV_MTCH6303_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED,
  DRV_MTCH6303_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY,
  DRV_MTCH6303_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY
} DRV_MTCH6303_CLIENT_STATUS;
```

Members

Members	Description
DRV_MTCH6303_CLIENT_STATUS_ERROR = DRV_CLIENT_STATUS_ERROR	An error has occurred.
DRV_MTCH6303_CLIENT_STATUS_CLOSED = DRV_CLIENT_STATUS_CLOSED	The driver is closed, no operations for this client are ongoing, and/or the given handle is invalid.
DRV_MTCH6303_CLIENT_STATUS_BUSY = DRV_CLIENT_STATUS_BUSY	The driver is currently busy and cannot start additional operations.
DRV_MTCH6303_CLIENT_STATUS_READY = DRV_CLIENT_STATUS_READY	The module is running and ready for additional operations

Description

MTCH6303 Client-Specific Driver Status

This enumeration defines the client-specific status codes of the MTCH6303 driver.

Remarks

Returned by the DRV_MTCH6303_ClientStatus function.

DRV_MTCH6303_ERROR Enumeration

Defines the possible errors that can occur during driver operation.

File

drv_mtch6303.h

C

```
typedef enum {
} DRV_MTCH6303_ERROR;
```

Description

MTCH6303 Driver Errors.

This data type defines the possible errors that can occur when occur during MTCH6303 driver operation. These values are returned by DRV_MTCH6303_ErrorGet function.

Remarks

None

DRV_MTCH6303_TOUCH_BUFFER_EVENT Enumeration

Lists the different conditions that happens during a touch message buffer transfer.

File

drv_mtch6303.h

C

```
typedef enum {
  DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE,
  DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR,
  DRV_MTCH6303_TOUCH_BUFFER_EVENT_ABORT
} DRV_MTCH6303_TOUCH_BUFFER_EVENT;
```

Members

Members	Description
DRV_MTCH6303_TOUCH_BUFFER_EVENT_COMPLETE	Event touch message buffer transfer complete
DRV_MTCH6303_TOUCH_BUFFER_EVENT_ERROR	Event touch message buffer transfer error
DRV_MTCH6303_TOUCH_BUFFER_EVENT_ABORT	Event touch message buffer transfer abort

Description

MTCH6303 Touch Message Buffer Events

This enumeration identifies the different conditions that can happen during a touch message buffer transaction. Callbacks can be made with the appropriate touch message buffer condition passed as a parameter to execute the desired action.

The values act like flags and multiple flags can be set.

Remarks

None.

DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER Type

Points to a callback after completion of an message report read or message command write.

File

drv_mtch6303.h

C

```
typedef void (* DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER)(DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle, uintptr_t context);
```

Description

MTCH6303 Touch Buffer Event Callback

This type identifies the MTCH6303 Touch Buffer Event. It allows the client driver to register a callback using DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER. By using this mechanism, the driver client will be notified at the completion of the corresponding transfer.

Remarks

A transfer can be composed of various transfer segments. Once a transfer is completed the driver will call the client registered transfer callback.

The callback could be called from ISR context and should be kept as short as possible. It is meant for signaling and it should not be blocking.

Parameters

Parameters	Description
DRV_MTCH6303_TOUCH_BUFFER_EVENT	Status of MTCH6303 touch message transfer
bufferHandle	Handle that identifies the particular Buffer Object
context	pointer to the object to be processed.

Function

void (*DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER) (DRV_MTCH6303_TOUCH_BUFFER_EVENT event,
DRV_MTCH6303_TOUCH_BUFFER_HANDLE bufferHandle,
uintptr_t context)

DRV_MTCH6303_TOUCH_BUFFER_HANDLE Type

Handle identifying a read or write touch message buffer passed to the driver.

File

drv_mtch6303.h

C

```
typedef uintptr_t DRV_MTCH6303_TOUCH_BUFFER_HANDLE;
```

Description

MTCH6303 Driver Touch Message Queue Buffer Handle

A touch message buffer handle value is returned by a call to the DRV_MTCH6303_TOUCH_AddMessageReportRead, DRV_MTCH6303_TOUCH_AddMessageCommandWrite or DRV_MTCH6303_TOUCH_AddTouchInputRead. This handle is associated with the buffer passed into the function and it allows the application to track the completion of the data from (or into) that buffer. The buffer handle value returned from these functions is returned back to the client by the "event handler callback" function registered with the driver.

The buffer handle assigned to a client request expires when the client has been notified of the completion of the buffer transfer (after event handler function that notifies the client returns) or after the buffer has been retired by the driver if no event handler callback was set.

Remarks

None.

DRV_MTCH6303_TOUCH_DATA Structure

Defines MTCH6303 I2C Touch Data

File

drv_mtch6303.h

C

```
typedef struct {
  uint8_t i2cReadAddr;
  DRV_MTCH6303_TOUCH_STATUS status;
  DRV_MTCH6303_TOUCH_INPUT touch[ DRV_MTCH6303_TOUCH_NUM_INPUTS ];
} DRV_MTCH6303_TOUCH_DATA;
```

Members

Members	Description
uint8_t i2cReadAddr;	Dummy I2C Read Address required for bitbang driver
DRV_MTCH6303_TOUCH_STATUS status;	MTCH6303 Touch Status
DRV_MTCH6303_TOUCH_INPUT touch[DRV_MTCH6303_TOUCH_NUM_INPUTS];	MTCH6303 Touch Input array of size DRV_MTCH6303_TOUCH_NUM_INPUTS

Description

MTCH6303 I2C Touch Data

This structure defines MTCH6303 I2C Touch Data. The structure DRV_MTCH6303_TOUCH_DATA is passed to API's DRV_MTCH6303_AddRegisterRead or DRV_MTCH6303_TOUCH_AddTouchInputRead. The API's will update the structure with touch input.

Remarks

It is packed to form structure of size 62 bytes. The structure member i2cReadAddr is only applicable if the I2C driver is of type bitbang. Otherwise the variable required to be commented out.

DRV_MTCH6303_TOUCH_INPUT Structure

Defines MTCH6303 Touch Input Packet

File

drv_mtch6303.h

C

```
typedef struct {
  DRV_MTCH6303_TOUCH_NIBBLE_0 nibble_0;
  uint8_t touchId;
  uint16_t x;
  uint16_t y;
} DRV_MTCH6303_TOUCH_INPUT;
```

Members

Members	Description
DRV_MTCH6303_TOUCH_NIBBLE_0 nibble_0;	MTCH6303 I2C Touch Input Packet Nibble 0
uint8_t touchId;	MTCH6303 I2C Touch Input Packet ID (0 - 16)
uint16_t x;	MTCH6303 I2C Touch Input Packet position x (0 - 0x7FFF)
uint16_t y;	MTCH6303 I2C Touch Input Packet position y (0 - 0x7FFF)

Description

MTCH6303 Touch Input Packet.

This structure defines the MTCH6303 Touch Input Packet.

Remarks

It is part of DRV_MTCH6303_TOUCH_DATA structure. It is packed to form structure of size 6 bytes.

DRV_MTCH6303_TOUCH_MESSAGE Structure

Defines MTCH6303 Touch Message.

File

drv_mtch6303.h

C

```
typedef struct {
  DRV_MTCH6303_TOUCH_MESSAGE_HEADER header;
  uint8_t payload[0x3E];
} DRV_MTCH6303_TOUCH_MESSAGE;
```

Members

Members	Description
DRV_MTCH6303_TOUCH_MESSAGE_HEADER header;	MTCH6303 Touch Message Header
uint8_t payload[0x3E];	MTCH6303 Touch Message payload. First byte of payload is of type DRV_TOUCH_MTCH6303_MSG_ID in case of first fragment of message. Otherwise the first byte acts as a normal payload.

Description

MTCH6303 Touch Message

This structure defines MTCH6303 Touch Message. The variable pointer of type DRV_MTCH6303_TOUCH_MESSAGE is passed to the API's

DRV_MTCH6303_TOUCH_AddMessageReportRead or DRV_MTCH6303_TOUCH_AddMessageCommandWrite.

Remarks

It is packed to form structure of size 63 bytes.

DRV_MTCH6303_TOUCH_MESSAGE_HEADER Structure

Defines Touch Message Header.

File

drv_mtch6303.h

C

```
typedef struct {
  uint32_t msgFragSize : 6;
  uint32_t continued : 1;
  uint32_t moreMessages : 1;
} DRV_MTCH6303_TOUCH_MESSAGE_HEADER;
```

Members

Members	Description
uint32_t msgFragSize : 6;	MTCH6303 Message Fragment Size. If Message Fragment size is 0x3F the Fragment is incomplete and uses up ALL of the parent transport layer packet.
uint32_t continued : 1;	MTCH6303 Message continued from last fragment if set to 1.
uint32_t moreMessages : 1;	MTCH6303 more messages to follow in this block if set to 1.

Description

MTCH6303 Touch Message Header

This structure defines Touch Message Header.

Remarks

It is part of structure DRV_MTCH6303_TOUCH_MESSAGE. It is packed to form structure of size 1 byte.

DRV_MTCH6303_TOUCH_NIBBLE_0 Structure

Defines the I2C Nibble 0 of MTCH6303 Touch input packet.

File

drv_mtch6303.h

C

```
typedef struct {
  uint32_t touchState : 1;
  uint32_t inRange : 1;
  uint32_t reserved : 6;
} DRV_MTCH6303_TOUCH_NIBBLE_0;
```

Members

Members	Description
uint32_t touchState : 1;	Touch packet available
uint32_t inRange : 1;	Touch packet in range
uint32_t reserved : 6;	Reserved bits

Description

MTCH6303 I2C Touch Input Packet Nibble 0

This structure defines the I2C Nibble 0 of MTCH6303 Touch input packet.

Remarks

It is part of DRV_MTCH6303_TOUCH_INPUT structure. It is packed to form structure of size 1 byte.

DRV_MTCH6303_TOUCH_STATUS Structure

Defines the I2C touch status register bits

File

drv_mtch6303.h

C

```
typedef struct {
  uint32_t nTouch : 4;
  uint32_t streamReady : 1;
  uint32_t gestureReady : 1;
  uint32_t gestICData : 1;
  uint32_t reserved : 1;
} DRV_MTCH6303_TOUCH_STATUS;
```

Members

Members	Description
uint32_t nTouch : 4;	Number of available touch packets
uint32_t streamReady : 1;	stream data ready
uint32_t gestureReady : 1;	gesture data ready
uint32_t gestICData : 1;	GestIC data ready
uint32_t reserved : 1;	reserved bit

Description

MTCH6303 I2C touch status

This structure defines the I2C touch status register bits.

Remarks

It is part of DRV_MTCH6303_TOUCH_DATA structure. It is packed to form structure of size 1 byte.

DRV_TOUCH_MTCH6303_MSG_ID Enumeration

List of report or command message identification.

File

drv_mtch6303.h

C

```
typedef enum {
  DRV_TOUCH_MTCH6303_MSG_CMD_QUERY_VERSION
} DRV_TOUCH_MTCH6303_MSG_ID;
```

Members

Members	Description
DRV_TOUCH_MTCH6303_MSG_CMD_QUERY_VERSION	Message sends firmware version query command. Bytes 124:127 = Rev[2].Minor.Major

Description

MTCH6303 Touch message Identification.

This enumeration identifies the different report or command messages supported by MTCH6303. This identifier identifies the type of the message. The identifier is passed in the message DRV_MTCH6303_TOUCH_MESSAGE as first byte of the payload. It is applicable only for first fragment of message. If message involves multiple fragments, the payload of message fragments other than first fragment should start with normal payload byte. The touch message is read or send to MTCH6303 by using DRV_MTCH6303_TOUCH_AddMessageReportRead or DRV_MTCH6303_TOUCH_AddMessageCommandWrite.

Remarks

To be passed as first byte of message payload. Applicable only for first fragment of message.

DRV_TOUCH_MTCH6303_I2C_REGISTER_MAP Enumeration

List of MTCH6303 I2C Accessible Register Identification.

File

drv_mtch6303.h

C

```
typedef enum {
} DRV_TOUCH_MTCH6303_I2C_REGISTER_MAP;
```

Description

MTCH6303 I2C Accessible Register Identification.

This enumeration identifies the different I2C accessible MTCH6303 Registers. The identifier is passed as source to the register read routine or as destination to the register write routine. The MTCH6303 driver routine to read the I2C accessible MTCH6303 registers is DRV_MTCH6303_AddRegisterRead. The MTCH6303 driver routine to write the I2C accessible MTCH6303 registers is DRV_MTCH6303_AddRegisterWrite.

Remarks

To read or write multiple registers, identifier of only first register is sufficient as source or destination respectively.

Files

Files

Name	Description
drv_mtch6303.h	MTCH6303 driver interface declarations for the static single instance driver.

Description

drv_mtch6303.h

MTCH6303 driver interface declarations for the static single instance driver.

Enumerations

	Name	Description
	DRV_MTCH6303_BUFFER_EVENT	Lists the different conditions that happens during a buffer transfer.
	DRV_MTCH6303_CLIENT_STATUS	Defines the client-specific status of the MTCH6303 driver.
	DRV_MTCH6303_ERROR	Defines the possible errors that can occur during driver operation.
	DRV_MTCH6303_TOUCH_BUFFER_EVENT	Lists the different conditions that happens during a touch message buffer transfer.
	DRV_TOUCH_MTCH6303_I2C_REGISTER_MAP	List of MTCH6303 I2C Accessible Register Identification.
	DRV_TOUCH_MTCH6303_MSG_ID	List of report or command message identification.

Functions

	Name	Description
	DRV_MTCH6303_AddRegisterRead	Schedules a non-blocking register read request to read I2C accessible MTCH6303 registers.
	DRV_MTCH6303_AddRegisterWrite	Schedule a non-blocking driver register write operation to write I2C accessible MTCH6303 registers.
	DRV_MTCH6303_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.
	DRV_MTCH6303_Close	Closes an opened-instance of the MTCH6303 driver.
	DRV_MTCH6303_Deinitialize	Deinitializes the instance of the MTCH6303 driver module.
	DRV_MTCH6303_ErrorGet	This function returns the error associated with the last client request.
	DRV_MTCH6303_Initialize	Initializes the MTCH6303 static single instance.
	DRV_MTCH6303_Open	Opens the MTCH6303 driver instance and returns a handle to it.
	DRV_MTCH6303_Status	Gets the current status of the MTCH6303 driver module.

	DRV_MTCH6303_Tasks	Maintains the driver's register read/write state machine and implements its ISR.
	DRV_MTCH6303_TOUCH_AddMessageCommandWrite	Schedule a non-blocking driver command message write operation to write command message to MTCH6303 registers.
	DRV_MTCH6303_TOUCH_AddMessageReportRead	Schedules a non-blocking report message read request to read the report message from MTCH6303 device.
	DRV_MTCH6303_TOUCH_AddTouchInputRead	Schedules a non-blocking read buffer request to read touch input from MTCH6303.
	DRV_MTCH6303_TOUCH_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued message transfers have finished.
	DRV_MTCH6303_TOUCH_Tasks	Maintains the driver's message state machine and implements its ISR.
	DRV_MTCH6303_TouchInputMap	Maps the raw touch input to display resolution.
	DRV_MTCH6303_TouchInputRead	Schedules a non-blocking read buffer request to read touch input from MTCH6303.

Macros

	Name	Description
	DRV_MTCH6303_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_MTCH6303_TOUCH_BUFFER_HANDLE_INVALID	Definition of an invalid buffer handle.
	DRV_MTCH6303_TOUCH_NUM_INPUTS	Definition of number of touch input packets can be identified by MTCH6303.

Structures

	Name	Description
	DRV_MTCH6303_TOUCH_DATA	Defines MTCH6303 I2C Touch Data
	DRV_MTCH6303_TOUCH_INPUT	Defines MTCH6303 Touch Input Packet
	DRV_MTCH6303_TOUCH_MESSAGE	Defines MTCH6303 Touch Message.
	DRV_MTCH6303_TOUCH_MESSAGE_HEADER	Defines Touch Message Header.
	DRV_MTCH6303_TOUCH_NIBBLE_0	Defines the I2C Nibble 0 of MTCH6303 Touch input packet.
	DRV_MTCH6303_TOUCH_STATUS	Defines the I2C touch status register bits

Types

	Name	Description
	DRV_MTCH6303_BUFFER_EVENT_HANDLER	Points to a callback after completion of an register read -write or message stream read - write.
	DRV_MTCH6303_BUFFER_HANDLE	Handle identifying a read or write buffer passed to the driver.
	DRV_MTCH6303_TOUCH_BUFFER_EVENT_HANDLER	Points to a callback after completion of an message report read or message command write.
	DRV_MTCH6303_TOUCH_BUFFER_HANDLE	Handle identifying a read or write touch message buffer passed to the driver.

Description

MTCH6303 Driver Interface Declarations for Static Single Instance Driver

The MTCH6303 device driver provides a simple interface to manage the MTCH6303 module. This file defines the interface Declarations for the MTCH6303 driver.

Remarks

Static single instance driver interface eliminates the need for an object ID or object handle. Static single-open interfaces also eliminate the need for the open handle.

mXT336T Touch Driver Library

This topic describes the mXT336T Touch Driver Library.

Introduction

This library provides an interface to manage the mXT336T Touch Driver module on the Microchip family of microcontrollers in different modes of operation.

Description

The MPLAB Harmony mXT336T Touch Driver provides a high-level interface to the mXT336T touch controller device. This driver provides application routines to read the touch input data from the touch screen. The mXT336T device can notify the availability of touch input data through external interrupt. The mXT336T driver allows the application to map a controller pin as an external interrupt pin.

Currently, the mXT336T Touch Driver only supports non-gestural single-fingered touch input.

Using the Library

This topic describes the basic architecture of the mXT336T Touch Driver Library and provides information and examples on its use.

Description

Interface Header Files: `drv_mxt336t.h`, `drv_mxt.h`

The interface to the mXT336T Touch Driver library is defined in the `drv_mxt336t.h` and `drv_mxt.h` header files. Any C language source (`.c`) file that uses the mXT336T Touch Driver library should include this header.

The mXT336T Touch Driver is based on the Object Protocol for the Atmel® maXTouch® mXT336T Touchscreen Controller.

The functioning of the driver is divided into two file sets:

- `drv_mxt.h` has the system touch interface (API's, Initialization and tasks)
- `drv_mxt336t.h` has the device specific interface for getting the device ready for communication and receiving commands.

The device specific interface is based on the Object Protocol previously mentioned.

The aria_quickstart demonstration interfaces with the mXT336T Touch Driver Library. Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the mXT336T Touch Driver Library on the Microchip family microcontrollers with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

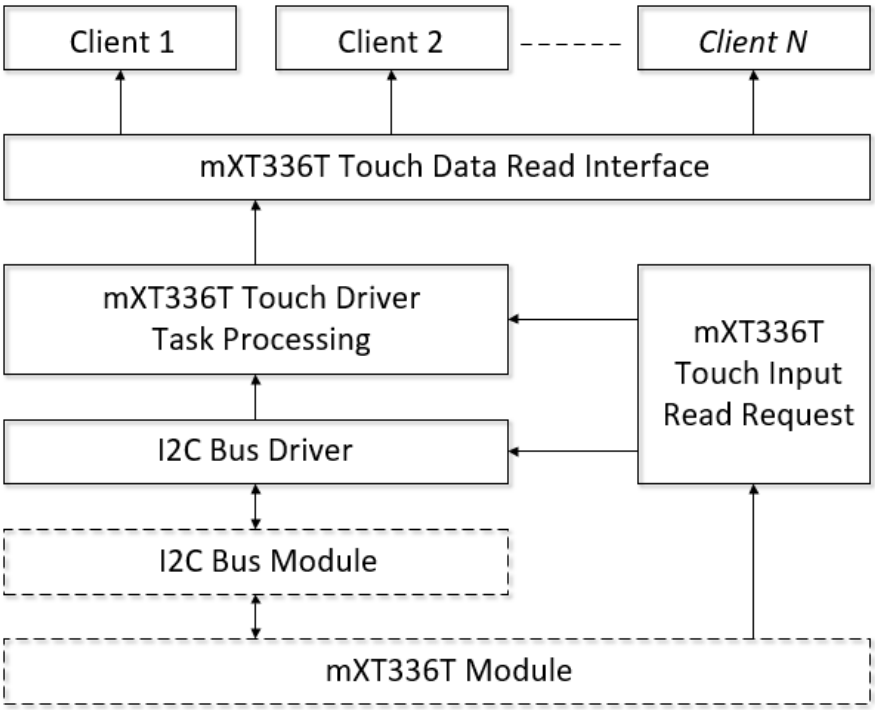
Description

The mXT336T Touch Driver has routines to perform the following operations:

- Sending read request
- Reading the touch input data
- Access to the touch input data

The driver initialization routines allow the application to initialize the driver. The driver must be initialized before it can be used by application. Once the driver is initialized the driver open routine allows retrieving the client handle. Once the touch input is available a touch input read request is sent and input data is retrieved in a buffer. The buffer data is then decoded to get the x and y coordinate of the touch screen in the form of the number of pixels.

mXT336T Driver Abstraction Model



Library Overview

This section contains information about how the Touch Driver operates in a system.

Description

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the mXT336T Touch Driver.

Library Interface Section	Description
Device-specific Functions	Provides mXT336T-specific system module interfaces, device initialization, deinitialization, open, close, task, and status functions.
Generic Functions	Provides generic system module interfaces, device initialization, deinitialization, open, close, task, and status functions.

How the Library Works

This section describes the workings of the Touch Driver Library.

Description

The library provides interfaces to support:

- System functions, which provide system module interfaces, device initialization, deinitialization, open, close, task, and status functions.
- Read Request function, which provides Touch input data read request function
- Read Touch Input function, which provides functions retrieving updated Touch input in the form x and y coordinates.

Initializing the Driver

Before the mXT336T Touch Driver can be opened, it must be configured and initialized. The driver build time configuration is defined by the configuration macros. Refer to the Building the Library section for the location of and more information on the various configuration macros and how these macros should be designed. The driver initialization is configured through the `DRV_TOUCH_INIT` data structure that is passed to the `DRV_MXT336T_Initialize` and the `DRV_MXT_Initialize` functions. The initialization parameters include the interrupt source, interrupt pin remap configuration and touch screen resolution. The following code shows an example of initializing the mXT336T Touch Driver.

Example:

```
/* The following code shows an example of designing the
* DRV_TOUCH_INIT data structure. It also shows how an example
* usage of the DRV_TOUCH_MXT336T_Initialize function.
```

```
*/
DRV_TOUCH_INIT drvTouchInitData;
DRV_MXT_INIT drvMxtInitData;
SYS_MODULE_OBJ objectHandle;

const DRV_MXT336T_INIT drvTouchInitData =
{
 .moduleInit = {0},
 .touchId = DRV_TOUCH_INDEX_0,
 .drvInitialize = NULL,
 .drvOpen = DRV_I2C_Open,
 .orientation = 0,
 .horizontalResolution = 480,
 .verticalResolution = 272,
 .interruptSource = INT_SOURCE_EXTERNAL_1,
 .interruptChannel = PORT_CHANNEL_E,
 .interruptPin = PORTS_BIT_POS_8,
 .resetChannel = PORT_CHANNEL_A,
 .resetPin = PORTS_BIT_POS_2,
};

const DRV_MXT_INIT drvMxtInitData =
{
 .moduleInit = {0},
 .mxtId = DRV_MXT_INDEX_0,
 .drvInitialize = NULL,
 .orientation = 0,
 .horizontalResolution = 480,
 .verticalResolution = 272,
};

/* Driver initialization */
 sysObj.drvMXT336T = DRV_MXT336T_Initialize(DRV_MXT336T_INDEX_0,
 (SYS_MODULE_INIT *)&drvTouchInitData);

 sysObj.drvMxt0 = DRV_MXT_Initialize(DRV_MXT_INDEX_0,
 (SYS_MODULE_INIT *)&drvMxtInitData);
```

Opening the Driver

To use the mXT336T Touch Driver, the application must open the driver. This is done by calling the DRV_MXT_Open function.

If successful, the DRV_MXT_Open function will return a handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_MXT_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in other (error) cases as well. The following code shows an example of the driver being opened.

The open function in the driver is called from the system initialization routine by assigning a function pointer from sys_init object.

```
const DRV_TOUCH_INIT sysTouchInit0 =
{
 .drvInitialize = DRV_MXT_Initialize,
 .drvOpen = DRV_MXT_Open,
.
.

};

SYS_TOUCH_HANDLE SYS_TOUCH_Open
(
 const SYS_MODULE_INDEX moduleIndex
)
{
 SYS_TOUCH_CLIENT_OBJ *clientObj;
 SYS_TOUCH_OBJ *dObj;
 .
 .
 .

 /* open touch driver */
 dObj->driverInitData->drvOpen(moduleIndex, DRV_IO_INTENT_READWRITE);
```

```
}
```

Touch Input Read Request

To read the touch input from the mXT336T touch controller device, a read request must be registered. This is done by calling DRV_MXT336T_ReadRequest. If successful, it registers a buffer read request to the I2C command queue. It also adds an input decode command to the mXT336T command queue once the I2C returns with touch input data. It can return error if the driver instance object is invalid or the mXT336T command queue is full. The read request is to be called from the mXT336T ISR. This ISR is triggered once the touch input is available. The following code shows an example of a mXT336T read request registration:

```
SYS_MODULE_OBJ object; // Returned from DRV_TOUCH_MXT336T_Initialize

void ISR(_EXTERNAL_INT_VECTOR, ipl5) _IntHandlerDrvMxt336t(void)
{
DRV__MXT336T_ReadRequest ( object );

// Do other tasks
```

Tasks Routine

This routine processes the mXT336T commands from the command queue. If the state of the command is initialize or done it returns. If the read request registration is successful the state of command is to decode input. The tasks routine decodes the input and updates the global variables storing the touch input data in form of x and y coordinates. The mXT336T Touch Driver task routine is to be called from SYS_Tasks. The following code shows an example:

```
 SYS_MODULE_OBJ drvMXT336T;
 SYS_MODULE_OBJ drvMxt0;; // Returned from DRV_TOUCH_MXT336T_Initialize

void SYS_Tasks( void )
{
 DRV_MXT336T_Tasks(sysObj.drvMXT336T);
 DRV_MXT_Tasks(sysObj.drvMxt0);

// Do other tasks
}
```

Configuring the Library

Macros

	Name	Description
	DRV_MXT336T_CALIBRATION_DELAY	Defines the calibration delay.
	DRV_MXT336T_CALIBRATION_INSET	Defines the calibration inset.
	DRV_MXT336T_CLIENTS_NUMBER	Selects the maximum number of clients.
	DRV_MXT336T_INDEX	MXT336T static index selection.
	DRV_MXT336T_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_MXT336T_INTERRUPT_MODE	Controls operation of the driver in the interrupt or polled mode.
	DRV_MXT336T_SAMPLE_POINTS	Define the sample points.
	DRV_MXT336T_TOUCH_DIAMETER	Defines the touch diameter.

Description

The configuration of the mXT336T Touch Driver is based on the file system_config.h.

This header file contains the configuration selection for the mXT336T Touch Driver. Based on the selections made, the driver may support the selected features. These configuration settings will apply to all instances of the mXT336T Touch Driver.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_MXT336T_CALIBRATION_DELAY Macro

Defines the calibration delay.

File

drv_mxt336t_config_template.h

C

```
#define DRV_MXT336T_CALIBRATION_DELAY 300
```

Description

MXT336T Calibration Delay

This macro enables the delay between calibration touch points.

Remarks

None.

DRV_MXT336T_CALIBRATION_INSET Macro

Defines the calibration inset.

File

drv_mxt336t_config_template.h

C

```
#define DRV_MXT336T_CALIBRATION_INSET 25
```

Description

MXT336T Calibration Inset

This macro defines the calibration inset.

Remarks

None.

DRV_MXT336T_CLIENTS_NUMBER Macro

Selects the maximum number of clients.

File

drv_mxt336t_config_template.h

C

```
#define DRV_MXT336T_CLIENTS_NUMBER 5
```

Description

MXT336T maximum number of clients

This macro selects the maximum number of clients.

This definition selected the maximum number of clients that the MXT336T driver can support at run time.

Remarks

None.

DRV_MXT336T_INDEX Macro

MXT336T static index selection.

File

drv_mxt336t_config_template.h

C

```
#define DRV_MXT336T_INDEX DRV_MXT336T_INDEX_0
```

Description

MXT336T Static Index Selection

This macro specifies the static index selection for the driver object reference.

Remarks

This index is required to make a reference to the driver object.

DRV_MXT336T_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_mxt336t_config_template.h

C

```
#define DRV_MXT336T_INSTANCES_NUMBER 1
```

Description

MXT336T hardware instance configuration

This macro sets up the maximum number of hardware instances that can be supported.

Remarks

None.

DRV_MXT336T_INTERRUPT_MODE Macro

Controls operation of the driver in the interrupt or polled mode.

File

drv_mxt336t_config_template.h

C

```
#define DRV_MXT336T_INTERRUPT_MODE false
```

Description

MXT336T Interrupt And Polled Mode Operation Control

This macro controls the operation of the driver in the interrupt mode of operation. The possible values of this macro are:

- true - Select if interrupt mode of MXT336T operation is desired
- false - Select if polling mode of MXT336T operation is desired

Not defining this option to true or false will result in a build error.

Remarks

None.

DRV_MXT336T_SAMPLE_POINTS Macro

Define the sample points.

File

drv_mxt336t_config_template.h

C

```
#define DRV_MXT336T_SAMPLE_POINTS 4
```

Description

MXT336T Sample Points

MXT336T sample points

Remarks

None.

DRV_MXT336T_TOUCH_DIAMETER Macro

Defines the touch diameter.

File

drv_mxt336t_config_template.h

C

```
#define DRV_MXT336T_TOUCH_DIAMETER 10
```

Description

MXT336T Touch Diameter

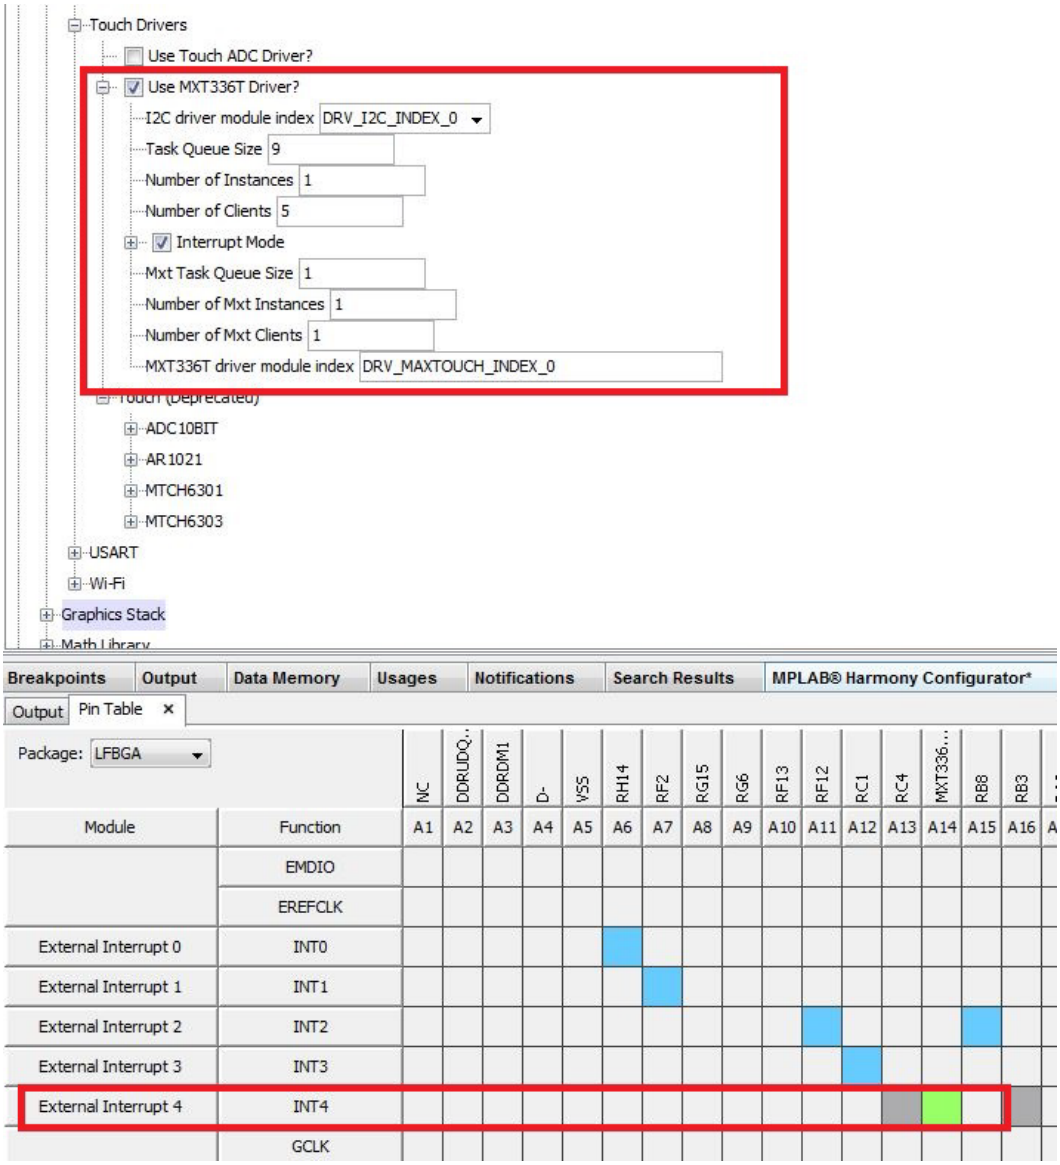
This macro defines the touch diameter

Remarks

None.

Configuring the MHC

The following figure details the settings required to configure the MHC for the mXT336T Touch Driver.



Building the Library

This section lists the files that are available in the mXT336T Touch Driver Library.

Description

This section list the files that are available in the `\src` folder of the mXT336T Touch Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/touch/mxt336t`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_mxt336t.h	Header file that exports the device-specific driver API.
/drv_mxt.h	Header file for generic driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
src/drv_mxt336t.c	Basic mXT336T Touch Driver implementation file.
src/drv_mxt.c	Generic maXTouch touch driver implementation file.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The mXT336T Touch Driver Library depends on the following modules:

- Interrupt System Service Library
- Ports System Service Library
- Touch System Service Library
- I2C Driver Library

Library Interface

a) Device-specific Functions

	Name	Description
	DRV_MXT336T_Close	Closes an opened instance of the MXT336T driver. **Implementation:** Dynamic
	DRV_MXT336T_ReadRequest	Sends a read request to I2C bus driver and adds the read task to queue. **Implementation:** Dynamic
	DRV_MXT336T_Open	Opens the specified MXT336T driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_MXT336T_CloseObject	Closes an opened instance of the MXT336T client object
	DRV_MXT336T_OpenObject	Opens the specified MXT336T object driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_MXT336T_DEVICE_ClientObjectEventHandlerSet	Sets the event handler for a MXT336T client object
	DRV_MXT336T_Deinitialize	Deinitializes the specified instance of the MXT336T driver module. **Implementation:** Dynamic
	DRV_MXT336T_Initialize	Initializes the MXT336T instance for the specified driver index
	DRV_MXT336T_Status	Provides the current status of the MXT336T driver module. **Implementation:** Dynamic

	DRV_MXT336T_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic

b) Generic Functions

	Name	Description
	DRV_MXT_Close	Closes an opened instance of the MXT driver. **Implementation:** Dynamic
	DRV_MXT_MaxtouchEventCallback	
	DRV_MXT_Deinitialize	Deinitializes the specified instance of the MXT driver module. **Implementation:** Dynamic
	DRV_MXT_Open	Opens the specified MXT driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_MXT_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_MXT_Initialize	Initializes the MXT instance for the specified driver index. **Implementation:** Dynamic
	DRV_MXT_ReadRequest	Sends a read request to I2C bus driver and adds the read task to queue. **Implementation:** Dynamic
	DRV_MXT_TouchGetX	Returns the x coordinate of touch input. **Implementation:** Dynamic
	DRV_MXT_TouchGetY	Returns the y coordinate of touch input. **Implementation:** Dynamic
	DRV_MXT_Status	Provides the current status of the MXT driver module. **Implementation:** Dynamic
	DRV_MXT_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic
	DRV_MXT_TouchStatus	Returns the status of the current touch input.

c) Data Types and Constants

	Name	Description
	_DRV_MXT_CLIENT_OBJECT	MXT Driver client object maintaining client data.
	DRV_MXT_CLIENT_OBJECT	MXT Driver client object maintaining client data.
	DRV_MXT_HANDLE	Touch screen controller MXT driver handle.
	DRV_MXT_INIT	Defines the data required to initialize or reinitialize the MXT driver
	DRV_MXT_MODULE_ID	Number of valid MXT driver indices.
	DRV_MXT_OBJECT	Defines the data structure maintaining MXT driver instance object.
	DRV_MXT_TASK_QUEUE	Defines the MXT Touch Controller driver task data structure.
	DRV_MXT_TASK_STATE	Enumeration defining MXT touch controller driver task state.
	DRV_MXT336T_CLIENT_CALLBACK	Pointer to a MXT336T client callback function data type.
	DRV_MXT336T_HANDLE	Touch screen controller MXT336T driver handle.
	DRV_MXT336T_INIT	Defines the data required to initialize or reinitialize the MXT336T driver
	DRV_MXT336T_OBJECT_CLIENT_EVENT_DATA	This structure maintains the information associated with each msg received or event that occurs
	DRV_MXT336T_OBJECT_TYPE	The enum lists the different objects supported by the maxtouch device.
	DRV_MXT_HANDLE_INVALID	Definition of an invalid handle.
	_DRV_MXT336T_H	This is macro _DRV_MXT336T_H.
	DRV_MXT_I2C_MASTER_READ_ID	MXT input read, I2C address from where master reads touch input data.
	DRV_MXT_I2C_MASTER_WRITE_ID	MXT command register write, I2C address where master sends the commands.
	DRV_MXT_I2C_READ_FRAME_SIZE	I2C Frame size for reading MXT touch input.
	DRV_MXT_INDEX_0	MXT driver index definitions.
	DRV_MXT_INDEX_1	This is macro DRV_MXT_INDEX_1.
	DRV_MXT_INDEX_COUNT	Number of valid Touch controller MXT driver indices.
	DRV_MXT336T_HANDLE_INVALID	Definition of an invalid handle.
	DRV_MXT336T_I2C_FRAME_SIZE	I2C Frame size for reading MXT336T touch input.
	DRV_MXT336T_I2C_MASTER_READ_ID	MXT336T input read, I2C address from where master reads touch input data.

	DRV_MXT336T_I2C_MASTER_WRITE_ID	MXT336T command register write, I2C address where master sends the commands.
	DRV_MXT336T_I2C_READ_ID_FRAME_SIZE	This is macro DRV_MXT336T_I2C_READ_ID_FRAME_SIZE.
	DRV_MXT336T_INDEX_0	MXT336T driver index definitions.
	DRV_MXT336T_INDEX_1	This is macro DRV_MXT336T_INDEX_1.
	DRV_MXT336T_INDEX_COUNT	Number of valid Touch controller MXT336T driver indices.
	t100_event	Types of touch events reported by the Maxtouch Multi touch object
	t100_type	Types of touch types reported by the Maxtouch Multi touch object
	DRV_MXT336T_T100_XRANGE	MXT336T Driver Object Register Adresses for the registers being read in the driver
	DRV_MXT336T_T100_YRANGE	This is macro DRV_MXT336T_T100_YRANGE.

Description

This section describes the functions of the mXT336T Touch Driver Library.

Refer to each section for a detailed description.

a) Device-specific Functions

DRV_MXT336T_Close Function

Closes an opened instance of the MXT336T driver.

Implementation: Dynamic

File

drv_mxt336t.h

C

```
void DRV_MXT336T_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the MXT336T driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_MXT336T_Open before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_MXT336T_Initialize routine must have been called for the specified MXT336T driver instance.

DRV_MXT336T_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_MXT336T_Open

DRV_MXT336T_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_MXT336T_Close (DRV_HANDLE handle)

DRV_MXT336T_ReadRequest Function

Sends a read request to I2C bus driver and adds the read task to queue.

Implementation: Dynamic

File

drv_mxt336t.h

C

```
void DRV_MXT336T_ReadRequest(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to send a touch input read request to the I2C bus driver and adding the input read decode task to the queue. It is always called from MXT336T interrupt ISR routine.

Remarks

This function is normally not called directly by an application. It is called by the MXT336T ISR routine.

Preconditions

The DRV_MXT336T_Initialize routine must have been called for the specified MXT336T driver instance.

Example

```
SYS_MODULE_OBJ      object;   // Returned from DRV_MXT336T_Initialize

void __ISR(_EXTERNAL_INT_VECTOR, ipl5) _IntHandlerDrvMXT(void)
{
    DRV_MXT336T_ReadRequest ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_MXT336T_Initialize)

Function

void DRV_MXT336T_ReadRequest(SYS_MODULE_OBJ object)

DRV_MXT336T_Open Function

Opens the specified MXT336T driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_mxt336t.h

C

```
DRV_HANDLE DRV_MXT336T_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. An error can occur when the following is true:

- if the number of client objects allocated via DRV_MXT336T_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid

Description

This routine opens the specified MXT336T driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The current version of driver does not support the DRV_IO_INTENT feature. The driver is by default non-blocking. The driver can perform both read and write to the MXT336T device. The driver supports single client only.

Remarks

The handle returned is valid until the DRV_MXT336T_Close routine is called. This routine will NEVER block waiting for hardware. If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

The DRV_MXT336T_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_MXT336T_Open( DRV_MXT336T_INDEX_0,
                                  DRV_IO_INTENT_EXCLUSIVE );

if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Index of the driver initialized with DRV_MXT336T_Initialize().
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver. The current version of driver does not support the selective IO intent feature.

Function

DRV_HANDLE DRV_MXT336T_Open (const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent)

DRV_MXT336T_CloseObject Function

Closes an opened instance of the MXT336T client object

File

drv_mxt336t.h

C

```
void DRV_MXT336T_CloseObject(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the MXT336T client object, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_MXT336T_OpenObject before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_MXT336T_Initialize routine must have been called for the specified MXT336T driver instance.

DRV_MXT336T_OpenObject must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_MXT336T_Open

DRV_MXT336T_CloseObject ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_MXT336T_CloseObject (DRV_HANDLE handle)

DRV_MXT336T_OpenObject Function

Opens the specified MXT336T object driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_mxt336t.h

C

```
DRV_HANDLE DRV_MXT336T_OpenObject(const DRV_HANDLE deviceHandle, const uint8_t objType, const uint8_t
objInstance);
```

Returns

If successful, the routine returns a valid object-instance handle (

Description

This routine opens the specified MXT336T object driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver.

Preconditions

The DRV_MXT336T_Initialize function must have been called before calling this function. The driver must have been opened.

Example

```
DRV_HANDLE  handle;

handle = DRV_MXT336T_OpenObject(drvHandle, GEN_PROCESSOR_T5, 1);
```

Parameters

Parameters	Description
deviceHandle	Handle of the MXT336T device
objType	Object type being requested
objInstance	Instance of the object of this type

Function

DRV_HANDLE DRV_MXT336T_OpenObject (const DRV_HANDLE deviceHandle, const uint8_t objType,
const uint8_t objInstance)

DRV_MXT336T_DEVICE_ClientObjectEventHandlerSet Function

Sets the event handler for a MXT336T client object

File

drv_mxt336t.h

C

```
bool DRV_MXT336T_DEVICE_ClientObjectEventHandlerSet(const DRV_HANDLE clientHandle, const
DRV_MXT336T_CLIENT_CALLBACK callback, uintptr_t context);
```

Returns

bool - true if the handler was successfully set

- false if the handler could not be set

Description

This function sets the event handler used to handle report messages from a MXT336T object.

Preconditions

The DRV_MXT336T_OpenObject routine must have been called for the specified MXT336T driver instance.

DRV_MXT336T_OpenObject must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_MXT336T_OpenObject

DRV_MXT336T_DEVICE_ClientObjectEventHandlerSet(handle, objectCallback, NULL);
```

Parameters

Parameters	Description
clientHandle	A valid open-instance handle, returned from the driver's openobject routine
callback	A callback function to handle report messages
context	The context for the call

Function

bool DRV_MXT336T_DEVICE_ClientObjectEventHandlerSet(const DRV_HANDLE clientHandle,

const DRV_MXT336T_CLIENT_CALLBACK callback, uintptr_t context)

DRV_MXT336T_Deinitialize Function

Deinitializes the specified instance of the MXT336T driver module.

Implementation: Dynamic

File

drv_mxt336t.h

C

```
void DRV_MXT336T_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the MXT336T driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the De-initialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_MXT336T_Status operation. The system has to use DRV_MXT336T_Status to determine when the module is in the ready state.

Preconditions

Function DRV_MXT336T_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Parameter: object - Driver object handle, returned from DRV_MXT336T_Initialize

Example

```
SYS_MODULE_OBJ      object;    //Returned from DRV_MXT336T_Initialize
SYS_STATUS          status;

DRV_MXT336T_Deinitialize ( object );

status = DRV_MXT336T_Status( object );
if( SYS_MODULE_UNINITIALIZED == status )
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Function

void DRV_MXT336T_Deinitialize (SYS_MODULE_OBJ object)

DRV_MXT336T_Initialize Function

Initializes the MXT336T instance for the specified driver index

File

drv_mxt336t.h

C

```
SYS_MODULE_OBJ DRV_MXT336T_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the MXT336T driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the 'init' parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the MXT336T module ID. For example, driver instance 0 can be assigned to MXT336T2. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_MXT336T_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other MXT336T routine is called.

This routine should only be called once during system initialization unless DRV_MXT336T_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
DRV_MXT336T_INIT        init;
SYS_MODULE_OBJ      objectHandle;

// Populate the MXT336T initialization structure
// Touch Module Id
init.moduleInit                 = {0},
init.touchId                    = DRV_TOUCH_INDEX_0,
init.drvInitialize              = NULL,
init.drvOpen                    = DRV_I2C_Open,
init.interruptSource            = INT_SOURCE_EXTERNAL_1,
init.interruptChannel           = PORT_CHANNEL_D,
init.interruptPin               = PORTS_BIT_POS_1,
init.resetChannel               = PORT_CHANNEL_A,
init.resetPin                   = PORTS_BIT_POS_14,

objectHandle = DRV_MXT336T_Initialize(DRV_TOUCH_INDEX_0,
                                      (SYS_MODULE_INIT*)init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized. Please note this is not the MXT336T ID. The hardware MXT336T ID is set in the initialization structure. This is the index of the driver index to use.
init	Pointer to a data structure containing any data necessary to initialize the driver. If this pointer is NULL, the driver uses the static initialization override macros for each member of the initialization data structure.

Function

SYS_MODULE_OBJ DRV_MXT336T_Initialize(const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init)

DRV_MXT336T_Status Function

Provides the current status of the MXT336T driver module.

Implementation: Dynamic

File

drv_mxt336t.h

C

```
SYS_STATUS DRV_MXT336T_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system-level operation and cannot start another

Description

This function provides the current status of the MXT336T driver module.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

This function can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

The DRV_MXT336T_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;  // Returned from DRV_MXT336T_Initialize
SYS_STATUS          status;

status = DRV_MXT336T_Status( object );
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_MXT336T_Initialize

Function

SYS_STATUS DRV_MXT336T_Status (SYS_MODULE_OBJ object)

DRV_MXT336T_Tasks Function

Maintains the driver's state machine and implements its task queue processing.

Implementation: Dynamic

File

drv_mxt336t.h

C

```
void DRV_MXT336T_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal state machine and implement its command queue processing. It is always called from SYS_Tasks() function. This routine decodes the touch input data available in drvI2CReadFrameData.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks)

Preconditions

The DRV_MXT336T_Initialize routine must have been called for the specified MXT336T driver instance.

Example

```
SYS_MODULE_OBJ      object;   // Returned from DRV_MXT336T_Initialize

void SYS_Tasks( void )
{
    DRV_MXT336T_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_MXT336T_Initialize)

Function

void DRV_MXT336T_Tasks (SYS_MODULE_OBJ object);

b) Generic Functions

DRV_MXT_Close Function

Closes an opened instance of the MXT driver.

Implementation: Dynamic

File

drv_mxt.h

C

```
void DRV_MXT_Close(DRV_HANDLE handle);
```

Returns

None

Description

This function closes an opened instance of the MXT driver, invalidating the handle.

Remarks

After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines. A new handle must be obtained by calling DRV_MXT_Open before the caller may use the driver again. This function is thread safe in a RTOS application.

Usually, there is no need for the driver client to verify that the Close operation has completed.

Preconditions

The DRV_MXT_Initialize routine must have been called for the specified MXT driver instance.

DRV_MXT_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_MXT_Open
```

```
DRV_MXT_Close ( handle );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_MXT_Close (DRV_HANDLE handle)

DRV_MXT_MaxtouchEventCallback Function

File

drv_mxt.h

C

```
void DRV_MXT_MaxtouchEventCallback(DRV_HANDLE clientObject, DRV_MXT336T_OBJECT_CLIENT_EVENT_DATA *
updateObject, uintptr_t context);
```

Remarks

See prototype in app.h.

Function

void DRV_MXT_MaxtouchEventCallback (DRV_HANDLE clientObject,

DRV_MAXTOUCH_OBJECT_CLIENT_EVENT_DATA *updateObject, uintptr_t context);

DRV_MXT_Deinitialize Function

Deinitializes the specified instance of the MXT driver module.

Implementation: Dynamic

File

drv_mxt.h

C

```
void DRV_MXT_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the MXT driver module, disabling its operation (and any hardware) and invalidates all of the internal data.

Remarks

Once the Initialize operation has been called, the De-initialize operation must be called before the Initialize operation can be called again.

This function will NEVER block waiting for hardware. If the operation requires time to allow the hardware to complete, this will be reported by the DRV_MXT_Status operation. The system has to use DRV_MXT_Status to determine when the module is in the ready state.

Preconditions

Function DRV_MXT_Initialize must have been called before calling this routine and a valid SYS_MODULE_OBJ must have been returned.

Parameter: object - Driver object handle, returned from DRV_MXT_Initialize

Example

```
SYS_MODULE_OBJ      object;    //Returned from DRV_MXT_Initialize
SYS_STATUS          status;

DRV_MXT_Deinitialize ( object );

status = DRV_MXT_Status( object );
if( SYS_MODULE_UNINITIALIZED == status )
{
    // Check again later if you need to know
```

```
    // when the driver is deinitialized.
}
```

Function

void DRV_MXT_Deinitialize (SYS_MODULE_OBJ object)

DRV_MXT_Open Function

Opens the specified MXT driver instance and returns a handle to it.

Implementation: Dynamic

File

drv_mxt.h

C

```
DRV_HANDLE DRV_MXT_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. An error can occur when the following is true:

- if the number of client objects allocated via DRV_MXT_CLIENTS_NUMBER is insufficient
- if the client is trying to open the driver but driver has been opened exclusively by another client
- if the driver hardware instance being opened is not initialized or is invalid

Description

This routine opens the specified MXT driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The current version of driver does not support the DRV_IO_INTENT feature. The driver is by default non-blocking. The driver can perform both read and write to the MXT device. The driver supports single client only.

Remarks

The handle returned is valid until the DRV_MXT_Close routine is called. This routine will NEVER block waiting for hardware. If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application. It should not be called in an ISR.

Preconditions

The DRV_MXT_Initialize function must have been called before calling this function.

Example

```
DRV_HANDLE  handle;

handle = DRV_MXT_Open( DRV_MXT_INDEX_0,
                                    DRV_IO_INTENT_EXCLUSIVE );

if( DRV_HANDLE_INVALID == handle )
{
    // Unable to open the driver
}
```

Parameters

Parameters	Description
drvIndex	Index of the driver initialized with DRV_MXT_Initialize().
intent	Zero or more of the values from the enumeration DRV_IO_INTENT ORed together to indicate the intended use of the driver. The current version of driver does not support the selective IO intent feature.

Function

DRV_HANDLE DRV_MXT_Open (const SYS_MODULE_INDEX drvIndex,

const DRV_IO_INTENT intent)

DRV_MXT_TouchDataRead Function

Notifies the driver that the current touch data has been read

File

drv_mxt.h

C

```
void DRV_MXT_TouchDataRead(const SYS_MODULE_INDEX index);
```

Returns

None.

Description

Notifies the driver that the current touch data has been read

Function

void DRV_MXT_TouchDataRead(const SYS_MODULE_INDEX index)

DRV_MXT_Initialize Function

Initializes the MXT instance for the specified driver index.

Implementation: Dynamic

File

drv_mxt.h

C

```
SYS_MODULE_OBJ DRV_MXT_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the MXT driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the 'init' parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the MXT module ID. For example, driver instance 0 can be assigned to MXT2. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_MXT_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other MXT routine is called.

This routine should only be called once during system initialization unless DRV_MXT_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
DRV_MXT_INIT        init;
SYS_MODULE_OBJ      objectHandle;

// Populate the MXT initialization structure
// Touch Module Id
init.touchId                    = DRV_TOUCH_INDEX_0;

// I2C Bus driver open
init.drvOpen                    = DRV_I2C_Open;

// Interrupt Source for Touch
init.interruptSource            = INT_SOURCE_EXTERNAL_1;

// Interrupt Pin function mapping
```

```
init.interruptPort.inputFunction  = INPUT_FUNC_INT1;

// Pin to be mapped as interrupt pin
init.interruptPort.inputPin       = INPUT_PIN_RPE8;

// Analog pin number
init.interruptPort.analogPin      = PORTS_ANALOG_PIN_25;

// Pin Mode of analog pin
init.interruptPort.pinMode        = PORTS_PIN_MODE_DIGITAL;

// Interrupt pin port
init.interruptPort.channel        = PORT_CHANNEL_E;

// Interrupt pin port maskl
init.interruptPort.dataMask       = 0x8;

// Touch screen orientation
init.orientation                  = DISP_ORIENTATION;

// Touch screen horizontal resolution
init.horizontalResolution         = DISP_HOR_RESOLUTION;

// Touch screen vertical resolution
init.verticalResolution           = DISP_VER_RESOLUTION;

objectHandle = DRV_MXT_Initialize(DRV_TOUCH_INDEX_0,
                                  (SYS_MODULE_INIT*)init);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized. Please note this is not the MXT ID. The hardware MXT ID is set in the initialization structure. This is the index of the driver index to use.
init	Pointer to a data structure containing any data necessary to initialize the driver. If this pointer is NULL, the driver uses the static initialization override macros for each member of the initialization data structure.

Function

SYS_MODULE_OBJ DRV_MXT_Initialize(const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init)

DRV_MXT_ReadRequest Function

Sends a read request to I2C bus driver and adds the read task to queue.

Implementation: Dynamic

File

drv_mxt.h

C

```
void DRV_MXT_ReadRequest(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to send a touch input read request to the I2C bus driver and adding the input read decode task to the queue. It is always called from MXT interrupt ISR routine.

Remarks

This function is normally not called directly by an application. It is called by the MXT ISR routine.

Preconditions

The DRV_MXT_Initialize routine must have been called for the specified MXT driver instance.

Example

```
SYS_MODULE_OBJ      object;   // Returned from DRV_MXT_Initialize

void __ISR(_EXTERNAL_INT_VECTOR, ipl5) _IntHandlerDrvMXT(void)
{
    DRV_MXT_ReadRequest ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_MXT_Initialize)

Function

void DRV_MXT_ReadRequest(SYS_MODULE_OBJ object)

DRV_MXT_TouchGetX Function

Returns the x coordinate of touch input.

Implementation: Dynamic

File

drv_mxt.h

C

```
short DRV_MXT_TouchGetX(uint8_t touchNumber);
```

Returns

It returns the x coordinate of the touch input in terms of number of pixels.

Description

It returns the x coordinate in form of number of pixes for a touch input denoted by touchNumber.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

short DRV_MXT_TouchGetX(uint8 touchNumber)

DRV_MXT_TouchGetY Function

Returns the y coordinate of touch input.

Implementation: Dynamic

File

drv_mxt.h

C

```
short DRV_MXT_TouchGetY(uint8_t touchNumber);
```

Returns

It returns the y coordinate of the touch input in terms of number of pixels.

Description

It returns the y coordinate in form of number of pixes for a touch input denoted by touchNumber.

Parameters

Parameters	Description
touchNumber	index to the touch input.

Function

short DRV_MXT_TouchGetY(uint8 touchNumber)

DRV_MXT_Status Function

Provides the current status of the MXT driver module.

Implementation: Dynamic

File

drv_mxt.h

C

```
SYS_STATUS DRV_MXT_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system-level operation and cannot start another

Description

This function provides the current status of the MXT driver module.

Remarks

Any value greater than SYS_STATUS_READY is also a normal running state in which the driver is ready to accept new operations.

SYS_MODULE_UNINITIALIZED - Indicates that the driver has been deinitialized

This value is less than SYS_STATUS_ERROR.

This function can be used to determine when any of the driver's module level operations has completed.

If the status operation returns SYS_STATUS_BUSY, the previous operation has not yet completed. Once the status operation returns SYS_STATUS_READY, any previous operations have completed.

The value of SYS_STATUS_ERROR is negative (-1). Any value less than that is also an error state.

This function will NEVER block waiting for hardware.

If the Status operation returns an error value, the error may be cleared by calling the reinitialize operation. If that fails, the deinitialize operation will need to be called, followed by the initialize operation to return to normal operations.

Preconditions

The DRV_MXT_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;  // Returned from DRV_MXT_Initialize
SYS_STATUS          status;

status = DRV_MXT_Status( object );
if( SYS_STATUS_READY != status )
{
    // Handle error
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from DRV_MXT_Initialize

Function

SYS_STATUS DRV_MXT_Status (SYS_MODULE_OBJ object)

DRV_MXT_Tasks Function

Maintains the driver's state machine and implements its task queue processing.

Implementation: Dynamic

File

drv_mxt.h

C

```
void DRV_MXT_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal state machine and implement its command queue processing. It is always called from SYS_Tasks() function. This routine decodes the touch input data available in drvI2CReadFrameData.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks)

Preconditions

The DRV_MXT_Initialize routine must have been called for the specified MXT driver instance.

Example

```
SYS_MODULE_OBJ      object;   // Returned from DRV_MXT_Initialize

void SYS_Tasks( void )
{
    DRV_MXT_Tasks ( object );

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_MXT_Initialize)

Function

void DRV_MXT_Tasks (SYS_MODULE_OBJ object);

DRV_MXT_TouchStatus Function

Returns the status of the current touch input.

File

drv_mxt.h

C

```
DRV_TOUCH_POSITION_STATUS DRV_MXT_TouchStatus(const SYS_MODULE_INDEX index);
```

Returns

It returns the status of the current touch input.

Description

It returns the status of the current touch input.

Function

DRV_TOUCH_POSITION_SINGLE DRV_MXT_TouchStatus(const SYS_MODULE_INDEX index)

c) Data Types and Constants

DRV_MXT_CLIENT_OBJECT Structure

MXT Driver client object maintaining client data.

File

drv_mxt.h

C

```
typedef struct _DRV_MXT_CLIENT_OBJECT {
  DRV_MXT_OBJECT* driverObject;
  DRV_IO_INTENT intent;
} DRV_MXT_CLIENT_OBJECT;
```

Members

Members	Description
DRV_MXT_OBJECT* driverObject;	Driver Object associated with the client
DRV_IO_INTENT intent;	The intent with which the client was opened

Description

Structure DRV_MXT_CLIENT_OBJECT

This defines the object required for the maintenance of the software clients instance. This object exists once per client instance.

Remarks

None.

DRV_MXT_HANDLE Type

Touch screen controller MXT driver handle.

File

drv_mxt.h

C

```
typedef uintptr_t DRV_MXT_HANDLE;
```

Description

MXT Driver Handle

Touch controller MXT driver handle is a handle for the driver client object. Each driver with succesful open call will return a new handle to the client object.

Remarks

None.

DRV_MXT_INIT Structure

Defines the data required to initialize or reinitialize the MXT driver

File

drv_mxt.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  int mxtId;
  SYS_MODULE_OBJ (* drvInitialize)(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
  SYS_MODULE_INDEX maxtouchID;
  uint16_t orientation;
  uint16_t horizontalResolution;
  uint16_t verticalResolution;
} DRV_MXT_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System module initialization
int mxtId;	ID
SYS_MODULE_OBJ (* drvInitialize)(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);	initialize function for module (normally called statically
SYS_MODULE_INDEX maxtouchID;	index for the maxtouch driver instance used by this driver
uint16_t orientation;	Orientation of the display (given in degrees of 0,90,180,270)
uint16_t horizontalResolution;	Horizontal Resolution of the displayed orientation in Pixels

Description

Structure DRV_MXT_INIT

This data type defines the data required to initialize or reinitialize the MXT driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

DRV_MXT_MODULE_ID Enumeration

Number of valid MXT driver indices.

File

drv_mxt.h

C

```
typedef enum {
  MXT_ID_1 = 0,
  MXT_NUMBER_OF_MODULES
} DRV_MXT_MODULE_ID;
```

Description

Enumeration: DRV_MXT_MODULE_ID

This constant identifies the number of valid MXT driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific header files defined as part of the peripheral libraries.

DRV_MXT_OBJECT Structure

Defines the data structure maintaining MXT driver instance object.

File

drv_mxt.h

C

```
typedef struct {
  SYS_STATUS status;
  int mxtId;
  SYS_MODULE_INDEX drvIndex;
  bool inUse;
  bool isExclusive;
  uint8_t numClients;
  uint16_t orientation;
  uint16_t horizontalResolution;
  uint16_t verticalResolution;
  int32_t readRequest;
  SYS_MODULE_INDEX maxtouchID;
  DRV_HANDLE hMaxtouch;
  DRV_HANDLE hMaxtouchGestureClient;
  DRV_TOUCH_POSITION_STATUS touchStatus;
```

```
    bool maxtouchDataAvailable;
    uint8_t maxtouchData[32];
    uint16_t xRange;
    uint16_t yRange;
} DRV_MXT_OBJECT;
```

Members

Members	Description
SYS_STATUS status;	The status of the driver
int mxtId;	The peripheral Id associated with the object
SYS_MODULE_INDEX drvIndex;	Save the index of the driver. Important to know this as we are using reference based accessing
bool inUse;	Flag to indicate instance in use
bool isExclusive;	Flag to indicate module used in exclusive access mode
uint8_t numClients;	Number of clients possible with the hardware instance
uint16_t orientation;	Orientation of the display (given in degrees of 0,90,180,270)
uint16_t horizontalResolution;	Horizontal Resolution of the displayed orientation in Pixels
uint16_t verticalResolution;	Vertical Resolution of the displayed orientaion in Pixels
int32_t readRequest;	Touch Input read request counter
SYS_MODULE_INDEX maxtouchID;	index of the maxtouch driver being used
DRV_HANDLE hMaxtouch;	handle for the maxtouch driver being used
DRV_HANDLE hMaxtouchGestureClient;	handle for the maxtouch driver object we are listening to
DRV_TOUCH_POSITION_STATUS touchStatus;	Touch status
bool maxtouchDataAvailable;	flag to indicate new maxtouch data is available
uint8_t maxtouchData[32];	data from the maxtouch device

Description

Structure DRV_MXT_OBJECT

This data structure maintains the MXT driver instance object. The object exists once per hardware instance.

Remarks

None.

DRV_MXT_TASK_QUEUE Structure

Defines the MXT Touch Controller driver task data structure.

File

drv_mxt.h

C

```
typedef struct {
  bool inUse;
  DRV_MXT_TASK_STATE taskState;
  DRV_I2C_BUFFER_HANDLE drvI2CReadBufferHandle;
  uint8_t drvI2CReadFrameData[DRV_MXT_I2C_READ_FRAME_SIZE];
} DRV_MXT_TASK_QUEUE;
```

Members

Members	Description
bool inUse;	Flag denoting the allocation of task
DRV_MXT_TASK_STATE taskState;	Enum maintaining the task state
DRV_I2C_BUFFER_HANDLE drvI2CReadBufferHandle;	I2C Buffer handle

uint8_t drvI2CReadFrameData[DRV_MXT_I2C_READ_FRAME_SIZE];	Response to Read Touch Input Command • Response = { MXT Read Address, • Input Data Size, • Touch Id, Pen status, • Touch X coordinate (0 to 6), • Touch X coordinate (7 to 11), • Touch Y coordinate (0 to 6), • Touch Y coordinate (7 to 11) }

Description

Structure DRV_MXT_TASK_QUEUE

This data type defines the data structure maintaing task context in the task queue. The inUse flag denotes the task context allocation for a task. The enum variable taskState maintains the current task state. The I2C buffer handle drvI2CReadBufferHandle maintains the I2C driver buffer handle returned by the I2C driver read request. The byte array variable drvI2CReadFrameData maintains the I2C frame data sent by MXT after a successful read request.

Remarks

None.

DRV_MXT_TASK_STATE Enumeration

Enumeration defining MXT touch controller driver task state.

File

drv_mxt.h

C

```
typedef enum {
  DRV_MXT_TASK_STATE_INIT = 0,
  DRV_MXT_TASK_STATE_READ_INPUT,
  DRV_MXT_TASK_STATE_DECODE_INPUT,
  DRV_MXT_TASK_STATE_DONE
} DRV_MXT_TASK_STATE;
```

Members

Members	Description
DRV_MXT_TASK_STATE_INIT = 0	Task initialize state
DRV_MXT_TASK_STATE_READ_INPUT	Task read touch input request state
DRV_MXT_TASK_STATE_DECODE_INPUT	Task touch input decode state
DRV_MXT_TASK_STATE_DONE	Task complete state

Description

Enumeration DRV_MXT_TASK_STATE

This enumeration defines the MXT touch controller driver task state. The task state helps to synchronize the operations of initialization the the task, adding the read input task to the task queue once the touch controller notifies the available touch input and a decoding the touch input received.

Remarks

None.

DRV_MXT336T_CLIENT_CALLBACK Type

Pointer to a MXT336T client callback function data type.

File

drv_mxt336t.h

C

```
typedef void (* DRV_MXT336T_CLIENT_CALLBACK)(DRV_HANDLE clientObject, DRV_MXT336T_OBJECT_CLIENT_EVENT_DATA
*updateObject, uintptr_t context);
```

Description

MXT336T Driver Callback Function Pointer

This data type defines a pointer to a MXT336T client callback function.

DRV_MXT336T_HANDLE Type

Touch screen controller MXT336T driver handle.

File

drv_mxt336t.h

C

```
typedef uintptr_t DRV_MXT336T_HANDLE;
```

Description

MXT336T Driver Handle

Touch controller MXT336T driver handle is a handle for the driver client object. Each driver with successful open call will return a new handle to the client object.

Remarks

None.

DRV_MXT336T_INIT Type

Defines the data required to initialize or reinitialize the MXT336T driver

File

drv_mxt336t.h

C

```
typedef struct DRV_MXT336T_INIT@2 DRV_MXT336T_INIT;
```

Description

Structure DRV_MXT336T_INIT

This data type defines the data required to initialize or reinitialize the MXT336T driver. If the driver is built statically, the members of this data structure are statically over-ridden by static override definitions in the system_config.h file.

Remarks

None.

DRV_MXT336T_OBJECT_CLIENT_EVENT_DATA Structure

This structure maintains the information associated with each msg received or event that occurs

File

drv_mxt336t.h

C

```
typedef struct {
  uint8_t reportID;
  uint8_t dataSize;
  uint8_t * pData;
  uint16_t xRange;
  uint16_t yRange;
} DRV_MXT336T_OBJECT_CLIENT_EVENT_DATA;
```

Members

Members	Description
uint8_t reportID;	report ID within the object
uint8_t dataSize;	max size of data
uint8_t * pData;	data associated with the report

Description

Structure DRV_MXT336T_OBJECT_CLIENT_EVENT_DATA

This structure maintains the information associated with each msg received or event that occurs. Each msg gets a reportID that identifies the object reporting the change in status. For touch messages the xRange and yRange for the touch device gets reported and the data pointer contains the status msg information which has the touch type, touch event and touch coordinates.

Remarks

None.

DRV_MXT336T_OBJECT_TYPE Enumeration

The enum lists the different objects supported by the maxtouch device.

File

drv_mxt336t.h

C

```
typedef enum {
  DRV_MXT336T_OBJECT_RESERVED_T0 = 0,
  DRV_MXT336T_OBJECT_RESERVED_T1 = 1,
  DRV_MXT336T_OBJECT_DEBUG_DELTAS_T2 = 2,

} DRV_MXT336T_OBJECT_TYPE;
```

Description

Enumeration DRV_MXT336T_OBJECT_TYPE

The MAxtouch devices follow a Object protocol for their driver implementation. This makes it possible to implement a generic driver for many maxtouch devices. The device communicates the different properties or status like touch messages etc with the driver through an Object table. The different types of objects associated with the maxtouch device are listed in the enum below.

Remarks

None.

DRV_MXT_HANDLE_INVALID Macro

Definition of an invalid handle.

File

drv_mxt.h

C

```
#define DRV_MXT_HANDLE_INVALID ((DRV_MXT_HANDLE)(-1))
```

Description

MXT Driver Invalid Handle

This is the definition of an invalid handle. An invalid handle is is returned by DRV_MXT_Open() and DRV_MXT_Close() functions if the request was not successful.

Remarks

None.

_DRV_MXT336T_H Macro

File

drv_mxt336t.h

C

```
#define _DRV_MXT336T_H
```

Description

This is macro _DRV_MXT336T_H.

DRV_MXT_I2C_MASTER_READ_ID Macro

MXT input read, I2C address from where master reads touch input data.

File

drv_mxt.h

C

```
#define DRV_MXT_I2C_MASTER_READ_ID 0x4B
```

Description

MXT Driver Module Master Input Read I2C address

This constant defines the MXT touch input read I2C address. This address is used as I2C address to read Touch input from MXT Touch controller.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific data sheets.

DRV_MXT_I2C_MASTER_WRITE_ID Macro

MXT command register write, I2C address where master sends the commands.

File

drv_mxt.h

C

```
#define DRV_MXT_I2C_MASTER_WRITE_ID 0x4A
```

Description

MXT Driver Module Master Command Write I2C Address

This constant defines the MXT command register I2C write address. This address is used as I2C address to write commands into MXT Touch controller register.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific data sheets.

DRV_MXT_I2C_READ_FRAME_SIZE Macro

I2C Frame size for reading MXT touch input.

File

drv_mxt.h

C

```
#define DRV_MXT_I2C_READ_FRAME_SIZE 7
```

Description

MXT Driver Module I2C Frame Size

This constant identifies the size of I2C frame required to read from MXT touch controller. MXT notifies the availability of input data through interrupt pin.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific data sheets.

DRV_MXT_INDEX_0 Macro

MXT driver index definitions.

File

drv_mxt.h

C

```
#define DRV_MXT_INDEX_0 0
```

Description

MXT Driver Module Index Numbers

These constants provide the MXT driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_MXT_Initialize and DRV_MXT_Open functions to identify the driver instance in use.

DRV_MXT_INDEX_1 Macro

File

drv_mxt.h

C

```
#define DRV_MXT_INDEX_1 1
```

Description

This is macro DRV_MXT_INDEX_1.

DRV_MXT_INDEX_COUNT Macro

Number of valid Touch controller MXT driver indices.

File

drv_mxt.h

C

```
#define DRV_MXT_INDEX_COUNT 2
```

Description

MXT Driver Module Index Count

This constant identifies the number of valid Touch Controller MXT driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific header files defined as part of the peripheral libraries.

DRV_MXT336T_HANDLE_INVALID Macro

Definition of an invalid handle.

File

drv_mxt336t.h

C

```
#define DRV_MXT336T_HANDLE_INVALID ((DRV_MXT336T_HANDLE)(-1))
```

Description

MXT336T Driver Invalid Handle

This is the definition of an invalid handle. An invalid handle is is returned by DRV_MXT336T_Open() and DRV_MXT336T_Close() functions if the request was not successful.

Remarks

None.

DRV_MXT336T_I2C_FRAME_SIZE Macro

I2C Frame size for reading MXT336T touch input.

File

drv_mxt336t.h

C

```
#define DRV_MXT336T_I2C_FRAME_SIZE 32
```

Description

MXT336T Driver Module I2C Frame Size

This constant identifies the size of I2C frame required to read from MXT336T touch controller. MXT336T notifies the availability of input data through interrupt pin.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific data sheets.

DRV_MXT336T_I2C_MASTER_READ_ID Macro

MXT336T input read, I2C address from where master reads touch input data.

File

drv_mxt336t.h

C

```
#define DRV_MXT336T_I2C_MASTER_READ_ID 0x95
```

Description

MXT336T Driver Module Master Input Read I2C address

This constant defines the MXT336T touch input read I2C address. This address is used as I2C address to read Touch input from MXT336T Touch controller.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific data sheets.

DRV_MXT336T_I2C_MASTER_WRITE_ID Macro

MXT336T command register write, I2C address where master sends the commands.

File

drv_mxt336t.h

C

```
#define DRV_MXT336T_I2C_MASTER_WRITE_ID 0x94
```

Description

MXT336T Driver Module Master Command Write I2C Address

This constant defines the MXT336T command register I2C write address. This address is used as I2C address to write commands into MXT336T Touch controller register.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific data sheets.

DRV_MXT336T_I2C_READ_ID_FRAME_SIZE Macro

File

drv_mxt336t.h

C

```
#define DRV_MXT336T_I2C_READ_ID_FRAME_SIZE 8
```

Description

This is macro DRV_MXT336T_I2C_READ_ID_FRAME_SIZE.

DRV_MXT336T_INDEX_0 Macro

MXT336T driver index definitions.

File

drv_mxt336t.h

C

```
#define DRV_MXT336T_INDEX_0 0
```

Description

MXT336T Driver Module Index Numbers

These constants provide the MXT336T driver index definitions.

Remarks

These constants should be used in place of hard-coded numeric literals. These values should be passed into the DRV_MXT336T_Initialize and DRV_MXT336T_Open functions to identify the driver instance in use.

DRV_MXT336T_INDEX_1 Macro

File

drv_mxt336t.h

C

```
#define DRV_MXT336T_INDEX_1 1
```

Description

This is macro DRV_MXT336T_INDEX_1.

DRV_MXT336T_INDEX_COUNT Macro

Number of valid Touch controller MXT336T driver indices.

File

drv_mxt336t.h

C

```
#define DRV_MXT336T_INDEX_COUNT 2
```

Description

MXT336T Driver Module Index Count

This constant identifies the number of valid Touch Controller MXT336T driver indices.

Remarks

This constant should be used in place of hard-coded numeric literals. This value is derived from device-specific header files defined as part of the peripheral libraries.

t100_event Enumeration

Types of touch events reported by the Maxtouch Multi touch object

File

drv_mxt.h

C

```
enum t100_event {
  MXT_T100_EVENT_NO_EVENT = 0,
  MXT_T100_EVENT_MOVE = 1,
  MXT_T100_EVENT_UNSUP = 2,
  MXT_T100_EVENT_SUP = 3,
  MXT_T100_EVENT_DOWN = 4,
  MXT_T100_EVENT_UP = 5,
  MXT_T100_EVENT_UNSUPSUP = 6,
  MXT_T100_EVENT_UNSUPUP = 7,
  MXT_T100_EVENT_DOWNSUP = 8,
  MXT_T100_EVENT_DOWNUP = 9
};
```

Description

Enumeration: t100_event

The maxtouch multi touch object DRV_MXT336T_OBJECT_TOUCH_MULTITOUCHSCREEN_T100 return a number of different types of touch events. Each touch event has a return type associated with it. These are listed in this enum. These events are returned in the touch status message associated with the multi touch object.

Remarks

None.

t100_type Enumeration

Types of touch types reported by the Maxtouch Multi touch object

File

drv_mxt.h

C

```
enum t100_type {
  MXT_T100_TYPE_FINGER = 1,
  MXT_T100_TYPE_PASSIVE_STYLUS = 2,
  MXT_T100_TYPE_ACTIVE_STYLUS = 3,
  MXT_T100_TYPE_HOVERING_FINGER = 4,
  MXT_T100_TYPE_GLOVE = 5,
  MXT_T100_TYPE_LARGE_TOUCH = 6
};
```

Description

Enumeration: t100_type

The maxtouch multi touch object DRV_MXT336T_OBJECT_TOUCH_MULTITOUCHSCREEN_T100 return a number of different types of touch types. These are listed in this enum. The touch type is returned in the touch status message associated with the multi touch object.

Remarks

None.

DRV_MXT336T_T100_XRANGE Macro

MXT336T Driver Object Register Adresses for the registers being read in the driver

File

drv_mxt336t.h

C

```
#define DRV_MXT336T_T100_XRANGE 13
```

Description

MXT336T Driver Object Register Adresses for the registers being read in the driver

MXT336T Objects have different registers that contain certain values regarding display resoltuion etc. These register addresses are used to read the values from object tables.

Remarks

This constant should be used in place of hard-coded numeric literals.

This value is derived from device-specific protocol guides.

DRV_MXT336T_T100_YRANGE Macro

File

drv_mxt336t.h

C

```
#define DRV_MXT336T_T100_YRANGE 24
```

Description

This is macro DRV_MXT336T_T100_YRANGE.

Files

Files

Name	Description
drv_mxt.h	Touch controller MXT Driver interface header file.

drv_mxt336t.h	Touch controller MXT336T Driver interface header file.

Description

drv_mxt.h

Touch controller MXT Driver interface header file.

Enumerations

	Name	Description
	t100_event	Types of touch events reported by the Maxtouch Multi touch object
	t100_type	Types of touch types reported by the Maxtouch Multi touch object
	DRV_MXT_MODULE_ID	Number of valid MXT driver indices.
	DRV_MXT_TASK_STATE	Enumeration defining MXT touch controller driver task state.

Functions

	Name	Description
	DRV_MXT_Close	Closes an opened instance of the MXT driver. **Implementation:** Dynamic
	DRV_MXT_Deinitialize	Deinitializes the specified instance of the MXT driver module. **Implementation:** Dynamic
	DRV_MXT_Initialize	Initializes the MXT instance for the specified driver index. **Implementation:** Dynamic
	DRV_MXT_MaxtouchEventCallback	
	DRV_MXT_Open	Opens the specified MXT driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_MXT_ReadRequest	Sends a read request to I2C bus driver and adds the read task to queue. **Implementation:** Dynamic
	DRV_MXT_Status	Provides the current status of the MXT driver module. **Implementation:** Dynamic
	DRV_MXT_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic
	DRV_MXT_TouchDataRead	Notifies the driver that the current touch data has been read
	DRV_MXT_TouchGetX	Returns the x coordinate of touch input. **Implementation:** Dynamic
	DRV_MXT_TouchGetY	Returns the y coordinate of touch input. **Implementation:** Dynamic
	DRV_MXT_TouchStatus	Returns the status of the current touch input.

Macros

	Name	Description
	DRV_MXT_HANDLE_INVALID	Definition of an invalid handle.
	DRV_MXT_I2C_MASTER_READ_ID	MXT input read, I2C address from where master reads touch input data.
	DRV_MXT_I2C_MASTER_WRITE_ID	MXT command register write, I2C address where master sends the commands.
	DRV_MXT_I2C_READ_FRAME_SIZE	I2C Frame size for reading MXT touch input.
	DRV_MXT_INDEX_0	MXT driver index definitions.
	DRV_MXT_INDEX_1	This is macro DRV_MXT_INDEX_1.
	DRV_MXT_INDEX_COUNT	Number of valid Touch controller MXT driver indices.

Structures

	Name	Description
	_DRV_MXT_CLIENT_OBJECT	MXT Driver client object maintaining client data.
	DRV_MXT_CLIENT_OBJECT	MXT Driver client object maintaining client data.
	DRV_MXT_INIT	Defines the data required to initialize or reinitialize the MXT driver
	DRV_MXT_OBJECT	Defines the data structure maintaining MXT driver instance object.
	DRV_MXT_TASK_QUEUE	Defines the MXT Touch Controller driver task data structure.

Types

	Name	Description
	DRV_MXT_HANDLE	Touch screen controller MXT driver handle.

Description

Touch Controller MXT Driver Interface File

This header file describes the macros, data structure and prototypes of the touch controller MXT driver interface.

File Name

drv_MXT.c

drv_mxt336t.h

Touch controller MXT336T Driver interface header file.

Enumerations

	Name	Description
	DRV_MXT336T_OBJECT_TYPE	The enum lists the different objects supported by the maxtouch device.

Functions

	Name	Description
	DRV_MXT336T_Close	Closes an opened instance of the MXT336T driver. **Implementation:** Dynamic
	DRV_MXT336T_CloseObject	Closes an opened instance of the MXT336T client object
	DRV_MXT336T_Deinitialize	Deinitializes the specified instance of the MXT336T driver module. **Implementation:** Dynamic
	DRV_MXT336T_DEVICE_ClientObjectEventHandlerSet	Sets the event handler for a MXT336T client object
	DRV_MXT336T_Initialize	Initializes the MXT336T instance for the specified driver index
	DRV_MXT336T_Open	Opens the specified MXT336T driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_MXT336T_OpenObject	Opens the specified MXT336T object driver instance and returns a handle to it. **Implementation:** Dynamic
	DRV_MXT336T_ReadRequest	Sends a read request to I2C bus driver and adds the read task to queue. **Implementation:** Dynamic
	DRV_MXT336T_Status	Provides the current status of the MXT336T driver module. **Implementation:** Dynamic
	DRV_MXT336T_Tasks	Maintains the driver's state machine and implements its task queue processing. **Implementation:** Dynamic

Macros

	Name	Description
	_DRV_MXT336T_H	This is macro _DRV_MXT336T_H.
	DRV_MXT336T_HANDLE_INVALID	Definition of an invalid handle.
	DRV_MXT336T_I2C_FRAME_SIZE	I2C Frame size for reading MXT336T touch input.
	DRV_MXT336T_I2C_MASTER_READ_ID	MXT336T input read, I2C address from where master reads touch input data.
	DRV_MXT336T_I2C_MASTER_WRITE_ID	MXT336T command register write, I2C address where master sends the commands.
	DRV_MXT336T_I2C_READ_ID_FRAME_SIZE	This is macro DRV_MXT336T_I2C_READ_ID_FRAME_SIZE.
	DRV_MXT336T_INDEX_0	MXT336T driver index definitions.
	DRV_MXT336T_INDEX_1	This is macro DRV_MXT336T_INDEX_1.
	DRV_MXT336T_INDEX_COUNT	Number of valid Touch controller MXT336T driver indices.
	DRV_MXT336T_T100_XRANGE	MXT336T Driver Object Register Adresses for the registers being read in the driver
	DRV_MXT336T_T100_YRANGE	This is macro DRV_MXT336T_T100_YRANGE.

Structures

	Name	Description
	DRV_MXT336T_OBJECT_CLIENT_EVENT_DATA	This structure maintains the information associated with each msg received or event that occurs

Types

	Name	Description
	DRV_MXT336T_CLIENT_CALLBACK	Pointer to a MXT336T client callback function data type.
	DRV_MXT336T_HANDLE	Touch screen controller MXT336T driver handle.
	DRV_MXT336T_INIT	Defines the data required to initialize or reinitialize the MXT336T driver

Description

Touch Controller MXT336T Driver Interface File

This header file describes the macros, data structure and prototypes of the touch controller MXT336T driver interface.

File Name

drv_MXT336T.c

USB Driver Libraries

Common Interface

Provides information on the USB Driver interface that is common to all PIC32 devices.

Description

The USB Driver Common Interface definition specifies the functions and their behavior that a USB Driver must implement so that the driver can be used by the MPLAB Harmony USB Host and Device Stack.

Note: The MPLAB Harmony USB Driver for PIC32MX and PIC32MZ devices implements the USB Driver Common Interface.

The USB Driver Common Interface contains functions that are grouped as follows:

- *Driver System Functions* - These functions are called by MPLAB Harmony to initialize and maintain the operational state of the USB Driver. The system functions can vary between different PIC32 device USB Drivers. As such, the USB Driver Common Interface does not require these functions to be of the same type. These functions are not called by the USB Host or Device Stack and therefore are allowed to (and can) vary across different PIC32 device USB Drivers. A description of these functions, along with a description of how to initialize the USB Driver for Host, Device or Dual Role operation, is provided in the specific PIC32 device USB Driver help section (see PIC32MX USB Driver and PIC32MZ USB Driver).
- *Driver General Client Functions* -These functions are called by the USB Host or Device Stack to gain access to the driver
- *Driver Host Mode Client Functions* - These functions are called exclusively by the USB Host Stack to operate and access the USB as a Host
- *Driver Device Mode Client Functions* - These functions are called exclusively by the USB Device Stack to operate and access the USB as a Device

The USB Driver Common Interface is defined in the `<install-dir>\framework\driver\usb\drv_usb.h` file. This file contains the data types and structures that define the interface. Specifically, the DRV_USB_HOST_INTERFACE structure, contained in this file, is the common interface for USB Driver Host mode functions. It is a structure of function pointers, pointing to functions that define the Driver Host mode Client functions. The following code example shows this structure and the function pointer it contains.

```
// *****************************************************************************
/* USB Driver Client Functions Interface (For Host mode)

  Summary:
    Group of function pointers to the USB Driver Host mode Client Functions.

  Description:
    This structure is a group of function pointers pointing to the USB Driver
    Host mode Client routines. The USB Driver should export this group of
    functions so that the Host layer can access the driver functionality.

  Remarks:
    None.
*/
```

```
typedef struct
{
    /* This is a pointer to the driver Open function. This function may be
     * called twice in a Dual Role application, once by the Host Stack and then
     * by the Device Stack */
    DRV_HANDLE (*open)(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);

    /* This is pointer to the driver Close function */
    void (*close)(DRV_HANDLE handle);

    /* This is a pointer to the event call back set function */
    void (*eventHandlerSet)(DRV_HANDLE handle, uintptr_t hReferenceData,
           DRV_USB_EVENT_CALLBACK eventHandler);

    /* This is a pointer to the Host IRP submit function */
    USB_ERROR (*hostIRPSubmit)(DRV_USB_HOST_PIPE_HANDLE pipeHandle, USB_HOST_IRP * irp);

    /* This is a pointer to the Host IRP Cancel all function */
    void (*hostIRPCancel)(USB_HOST_IRP * irp);

    /* This is pointer to the Host event disable function */
    bool (*hostEventsDisable)(DRV_HANDLE handle);

    /* This is a pointer to the Host event enable function */
    void (*hostEventsEnable)(DRV_HANDLE handle, bool eventContext);

    /* This is a pointer to the Host pipe setup function */
    DRV_USB_HOST_PIPE_HANDLE (*hostPipeSetup)
    (
        DRV_HANDLE client,
        uint8_t deviceAddress,
        USB_ENDPOINT endpointAndDirection,
        uint8_t hubAddress,
        uint8_t hubPort,
        USB_TRANSFER_TYPE pipeType,
        uint8_t bInterval,
        uint16_t wMaxPacketSize,
        USB_SPEED speed
    );

    /* This is a pointer to the Host Pipe Close function */
    void (*hostPipeClose)(DRV_USB_HOST_PIPE_HANDLE pipeHandle);

    /* This is a pointer to the Host Root Hub functions */
    DRV_USB_ROOT_HUB_INTERFACE rootHubInterface;

} DRV_USB_HOST_INTERFACE;
```

The DRV_USB_DEVICE_INTERFACE structure, contained in this file, is the common interface for USB Driver Device mode functions. It is a structure of function pointers, pointer to functions that define the Driver Device mode Client functions. The following code example shows this structure and the function pointer it contains.

```
// *****************************************************************************
/* USB Driver Client Functions Interface (For Device Mode)

  Summary:
    Group of function pointers to the USB Driver Device Mode Client Functions.

  Description:
    This structure is a group of function pointers pointing to the USB Driver
    Device Mode Client routines. The USB Driver should export this group of
    functions so that the Device Layer can access the driver functionality.

  Remarks:
    None.
*/

typedef struct
{
    /* This is a pointer to the driver Open function */
    DRV_HANDLE (*open)(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

```
    /* This is pointer to the driver Close function */
    void (*close)(DRV_HANDLE handle);

    /* This is a pointer to the event call back set function */
    void (*eventHandlerSet)(DRV_HANDLE handle, uintptr_t hReferenceData,
           DRV_USB_EVENT_CALLBACK eventHandler);

    /* This is a pointer to the device address set function */
    void (*deviceAddressSet)(DRV_HANDLE handle, uint8_t address);

    /* This is a pointer to the device current speed get function */
    USB_SPEED (*deviceCurrentSpeedGet)(DRV_HANDLE handle);

    /* This is a pointer to the SOF Number get function */
    uint16_t (*deviceSOFNumberGet)(DRV_HANDLE handle);

    /* This is a pointer to the device attach function */
    void (*deviceAttach)(DRV_HANDLE handle);

    /* This is a pointer to the device detach function */
    void (*deviceDetach)(DRV_HANDLE handle);

    /* This is a pointer to the device endpoint enable function */
    USB_ERROR (*deviceEndpointEnable)(DRV_HANDLE handle, USB_ENDPOINT endpoint,
                USB_TRANSFER_TYPE transferType, uint16_t endpointSize);

    /* This is a pointer to the device endpoint disable function */
    USB_ERROR (*deviceEndpointDisable)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is a pointer to the device endpoint stall function */
    USB_ERROR (*deviceEndpointStall)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is a pointer to the device endpoint stall clear function */
    USB_ERROR (*deviceEndpointStallClear)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is pointer to the device endpoint enable status query function */
    bool (*deviceEndpointIsEnabled)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is pointer to the device endpoint stall status query function */
    bool (*deviceEndpointIsStalled)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is a pointer to the device IRP submit function */
    USB_ERROR (*deviceIRPSubmit)(DRV_HANDLE handle, USB_ENDPOINT endpoint,
                USB_DEVICE_IRP * irp);

    /* This is a pointer to the device IRP Cancel all function */
    USB_ERROR (*deviceIRPCancelAll)(DRV_HANDLE handle, USB_ENDPOINT endpoint);

    /* This is a pointer to the device remote wakeup start function */
    void (*deviceRemoteWakeupStart)(DRV_HANDLE handle);

    /* This is a pointer to the device remote wakeup stop function */
    void (*deviceRemoteWakeupStop)(DRV_HANDLE handle);

    /* This is a pointer to the device Test mode enter function */
    USB_ERROR (*deviceTestModeEnter)(DRV_HANDLE handle, USB_TEST_MODE_SELECTORS testMode);

} DRV_USB_DEVICE_INTERFACE;
```

Both of these structures also contain pointers to General Client functions. The specific PIC32 device USB Driver allocates and initializes such a structure. The following code example shows how the PIC32MX USB Host mode Driver allocates and initializes the DRV_USB_HOST_INTERFACE structure. This code is contained in the `<install-dir>\framework\driver\usb\usbhs\src\dynamic\drv_usbfs_host.c` file.

```
/*****************************************************
 * This structure is a set of pointer to the USBFS driver
 * functions. It is provided to the Host layer as the
 * interface to the driver.
 * ****************************************************/
```

```
DRV_USB_HOST_INTERFACE gDrvUSBFSHostInterface =
{
    .open = DRV_USBFS_Open,
    .close = DRV_USBFS_Close,
    .eventHandlerSet = DRV_USBFS_ClientEventCallBackSet,
    .hostIRPSubmit = DRV_USBFS_HOST_IRPSubmit,
    .hostIRPCancel = DRV_USBFS_HOST_IRPCancel,
    .hostPipeSetup = DRV_USBFS_HOST_PipeSetup,
    .hostPipeClose = DRV_USBFS_HOST_PipeClose,
    .hostEventsDisable = DRV_USBFS_HOST_EventsDisable,
    .hostEventsEnable = DRV_USBFS_HOST_EventsEnable,
    .rootHubInterface.rootHubPortInterface.hubPortReset = DRV_USBFS_HOST_ROOT_HUB_PortReset,
    .rootHubInterface.rootHubPortInterface.hubPortSpeedGet =
                                                    DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet,
    .rootHubInterface.rootHubPortInterface.hubPortResetIsComplete =
                                                    DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete,
    .rootHubInterface.rootHubPortInterface.hubPortSuspend = DRV_USBFS_HOST_ROOT_HUB_PortSuspend,
    .rootHubInterface.rootHubPortInterface.hubPortResume = DRV_USBFS_HOST_ROOT_HUB_PortResume,
    .rootHubInterface.rootHubMaxCurrentGet = DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet,
    .rootHubInterface.rootHubPortNumbersGet = DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet,
    .rootHubInterface.rootHubSpeedGet = DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet,
    .rootHubInterface.rootHubInitialize = DRV_USBFS_HOST_ROOT_HUB_Initialize,
    .rootHubInterface.rootHubOperationEnable = DRV_USBFS_HOST_ROOT_HUB_OperationEnable,
    .rootHubInterface.rootHubOperationIsEnabled = DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled,
};
```

Similarly, the PIC32MX USB Device mode Driver allocates and initializes the DRV_USB_DEVICE_INTERFACE structure. This can be reviewed in the <install-dir>\framework\driver\usb\usbhs\src\dynamic\drv_usbfs_device.c file.

```
/*************************************************
 * This structure is a pointer to a set of USB Driver
 * Device mode functions. This set is exported to the
 * Device Layer when the Device Layer must use the
 * PIC32MX USB Controller.
 *************************************************/

DRV_USB_DEVICE_INTERFACE gDrvUSBFSDeviceInterface =
{
    .open = DRV_USBFS_Open,
    .close = DRV_USBFS_Close,
    .eventHandlerSet = DRV_USBFS_ClientEventCallBackSet,
    .deviceAddressSet = DRV_USBFS_DEVICE_AddressSet,
    .deviceCurrentSpeedGet = DRV_USBFS_DEVICE_CurrentSpeedGet,
    .deviceSOFNumberGet = DRV_USBFS_DEVICE_SOFNumberGet,
    .deviceAttach = DRV_USBFS_DEVICE_Attach,
    .deviceDetach = DRV_USBFS_DEVICE_Detach,
    .deviceEndpointEnable = DRV_USBFS_DEVICE_EndpointEnable,
    .deviceEndpointDisable = DRV_USBFS_DEVICE_EndpointDisable,
    .deviceEndpointStall = DRV_USBFS_DEVICE_EndpointStall,
    .deviceEndpointStallClear = DRV_USBFS_DEVICE_EndpointStallClear,
    .deviceEndpointIsEnabled = DRV_USBFS_DEVICE_EndpointIsEnabled,
    .deviceEndpointIsStalled = DRV_USBFS_DEVICE_EndpointIsStalled,
    .deviceIRPSubmit = DRV_USBFS_DEVICE_IRPSubmit,
    .deviceIRPCancelAll = DRV_USBFS_DEVICE_IRPCancelAll,
    .deviceRemoteWakeupStop = DRV_USBFS_DEVICE_RemoteWakeupStop,
    .deviceRemoteWakeupStart = DRV_USBFS_DEVICE_RemoteWakeupStart,
    .deviceTestModeEnter = NULL

};
```

A pointer to the DRV_USB_HOST_INTERFACE structure is passed to the USB Host Stack as part of USB Host Stack initialization. The following code example shows how this is done.

```
/*********************************************************************************
 * This is a table of the USB Host mode drivers that this application will
 * support. Also contained in the driver index. In this example, the
 * application will want to use instance 0 of the PIC32MX USB Full-Speed driver.
 * ********************************************************************************/
const USB_HOST_HCD hcdTable =
{
    .drvIndex = DRV_USBFS_INDEX_0,
```

```
    .hcdInterface = DRV_USBFS_HOST_INTERFACE
};

/* Here the pointer to the USB Driver Common Interface is provided to the USB
 * Host Layer via the hostControllerDrivers member of the Host Layer
 * Initialization data structure. */
const USB_HOST_INIT usbHostInitData =
{
    .nTPLEntries = 1 ,
    .tplList = (USB_HOST_TPL_ENTRY *)USBTPList,
    .hostControllerDrivers = (USB_HOST_HCD *)&hcdTable

};
```

A pointer to the DRV_USB_DEVICE_INTERFACE structure is passed to the USB Device Stack as part of the USB Device Stack initialization. The Host Stack and Device Stack then access the driver functions through the function pointers contained in these structures.

The Driver General Client, Host mode and Device mode Client functions are described in this section. Any references to a USB Driver Client in the following sections, implies the client is a USB Host Stack and/or the USB Device Stack.

Driver General Client Functions

Provides information on the General Client functions for the USB Driver.

Description

The DRV_USB_HOST_INTERFACE and the DRV_USB_DEVICE_INTERFACE structures contain pointers to the USB Driver's General Client functions. These functions are not specific to the operation mode (Host, Device, or Dual Role) of the driver. A USB Driver must implement these functions and ensure that the Host or Device Stack can access these functions through the driver's common interface structures. The common interface contains three general client functions:

- Driver Open Function
- Driver Close Function
- Driver Event Handler Set Function

Driver Open Function

The `open` member of the DRV_USB_HOST_INTERFACE and the DRV_USB_DEVICE_INTERFACE structures should point to the USB Driver Open function. The signature of the Open function is as follows:

```
DRV_HANDLE (*open)(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

The USB Driver Open function must match this signature. The Driver Client uses the USB Driver index (drvIndex) to specify the instance of the USB module that Host Stack or the Device Stack should open. The USB Driver should ignore the `intent` parameter. The function should return a driver handle. If the driver is not ready to be opened, it should return an invalid handle (DRV_HANDLE_INVALID). In such a case, the client will continue trying to open the driver by calling the Open function again. The driver may also fail to open for an invalid `index` parameter or if USB module is in an error condition.

When supporting Dual Role operation, both the Host Stack and Device Stack will call the Driver Open function in one application. The USB Driver must support multiple calls to the Open function in the same application. The Open function should be thread-safe.

Driver Close Function

The `close` member of the DRV_USB_HOST_INTERFACE and the DRV_USB_DEVICE_INTERFACE structures should point to the USB Driver Close function. The signature of the Close function is as follows:

```
void (*close)(DRV_HANDLE handle);
```

The USB Driver Close function must match this signature. The Driver Client passes the handle obtained from the Driver Open function as a parameter to the close. The USB Host Stack or USB Device Stack will close the driver only when the stack is deinitialized (which is typically a rare case). The USB Driver should deallocate any client-related resources in the Close function. If the specified driver handle is not valid, the Close function should not have any side effects. The USB Driver expects the Close function to be called from the context of the thread in which the driver was opened; therefore, this function *is not* expected to be thread-safe.

Driver Event Handler Set Function

The `eventHandlerSet` member of the DRV_USB_HOST_INTERFACE and the DRV_USB_DEVICE_INTERFACE structures should point to the USB Driver Event Handler Set function. The signature of the Event Handler Set function is as follows:

```
void (*eventHandlerSet)(DRV_HANDLE handle, uintptr_t hReferenceData, DRV_USB_EVENT_CALLBACK eventHandler);
```

The USB Driver Event Handler Set function must match this signature. The signature of the Client Event Handling function should match DRV_USB_EVENT_CALLBACK. The USB Driver calls this function when it must communicate USB events to the client. The client can set the `eventHandler` parameter to NULL if it does not want to receive USB Driver events. The client will receive Host mode events if the USB Driver is operating in Host mode. It will receive Device mode events if the USB Driver is operating in Device mode. The DRV_USB_EVENT type enumeration contains all the possible events that the USB Driver would generate. The following code example shows the enumeration.

```
// *****************************************************************************
/* USB Driver Events Enumeration
```

```
  Summary:
    Identifies the different events that the USB Driver provides.

  Description:
    Identifies the different events that the USB Driver provides. The USB Driver
    should be able to provide these events.

  Remarks:
    None.
*/

typedef enum
{
    /* Bus error occurred and was reported. This event can be generated in both
     * Host and Device mode. */
    DRV_USB_EVENT_ERROR = 1,

    /* Host has issued a device Reset. This event occurs only in Device mode */
    DRV_USB_EVENT_RESET_DETECT,

    /* Resume detected while USB in suspend mode. This event can be generated in
     * both Host and Device mode. In Host mode, the events occurs when a remote
     * wakeup capable device has generated resume signaling. In Device mode,
     * this event will occur when the Host has issued resume signaling. */
    DRV_USB_EVENT_RESUME_DETECT,

    /* This event is generated in Device mode only. It occurs when the Host
     * suspends the bus and the bus goes idle. */
    DRV_USB_EVENT_IDLE_DETECT,

    /* This event is generated in Host mode and Device mode. In Host mode, this
     * event occurs when the device has stalled the Host. In Device mode, this
     * event occurs when the Host has accessed a stalled endpoint thus
     * triggering the device to send a STALL to the Host. */
    DRV_USB_EVENT_STALL,

    /* This event is generated in Host mode and Device mode. In Device mode,
     * this event occurs when a SOF has been generated by the Host. In Host
     * mode, this event occurs when controller is about to generate an SOF.
     * */
    DRV_USB_EVENT_SOF_DETECT,

    /* This event is generated in Device mode when the VBUS voltage is above
     * VBUS session valid. */
    DRV_USB_EVENT_DEVICE_SESSION_VALID,

    /* This event is generated in Device mode when the VBUS voltage falls
     * below VBUS session valid. */
    DRV_USB_EVENT_DEVICE_SESSION_INVALID,

} DRV_USB_EVENT;
```

This completes the discussion on the Driver General Client Functions.

Driver Host Mode Client Functions

Provides information on the Host mode Client functions for the USB Driver.

Description

The DRV_USB_HOST_INTERFACE structure contains pointers to the USB Driver's Host mode Client functions. These functions are only applicable when the USB module is operating as a USB Host. Along with the function pointers to the driver's Host mode specific functions, the DRV_USB_HOST_INTERFACE structure also contains another structure of function pointers of the type DRV_USB_ROOT_HUB_INTERFACE. This structure contains function pointers to the USB Driver's Root Hub functions. A USB Driver must implement these functions and ensure that the Host Stack can access these functions through the driver's DRV_USB_HOST_INTERFACE structure. The Driver Host mode Client functions in the DRV_USB_HOST_INTERFACE structure are:

- Driver Host Pipe Setup Function
- Driver Host Pipe Close Function

- Driver Host Events Disable Function
- Driver Host Events Enable Function
- Driver Host IRP Submit Function
- Driver Host IRP Cancel Function

Driver Host Pipe Setup Function

The `hostPipeSetup` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host Pipe Setup function. The signature of the Host Pipe Setup function is as follows:

```
DRV_USB_HOST_PIPE_HANDLE (*hostPipeSetup)  ( DRV_HANDLE client,  uint8_t deviceAddress,
                           USB_ENDPOINT endpointAndDirection, uint8_t hubAddress,
                           uint8_t hubPort, USB_TRANSFER_TYPE pipeType, uint8_t bInterval,
                           uint16_t wMaxPacketSize, USB_SPEED speed);
```

The USB Driver Host mode Pipe Setup function must match this signature. The USB Host Stack calls this function to create a communication pipe to the attached device. The function parameters define the property of this communication pipe. The `driverHandle` parameter is the handle to the driver obtained through the driver Open function. The `deviceAddress` and the `endpointAddress` parameters specify the address of the USB device and the endpoint on this device to which this pipe must connect.

If the device is connected to the Host though a hub, `hubAddress` and `hubPort` must specify the address of the hub and port to which the device is connected. The USB Driver will use these parameters to schedule split transactions if the target device is a Low-Speed or Full-Speed device and is connected to the Host through a high-speed hub. If the device is connected directly to the Host, these parameters should be set to zero ('0').

The `pipeType` parameter specifies the type of USB transfers that this pipe would support. The `bInterval` parameter is interpreted as per the USB 2.0 Specification based on the transfer type and the speed of the pipe. The `wMaxPacketSize` parameter defines the maximum size of a transaction that the driver should use while transporting a transfer on the pipe. The Host layer will use the information obtained from the USB device descriptors of the attached device to decide the `wMaxPacketSize` parameter.

The Driver Host Pipe Setup function should be thread-safe, but does not have to be event safe. The Host layer (or the Host Client Drivers) will not, and should not attempt to create a pipe in an interrupt, and therefore, an event context. The function should return DRV_USB_PIPE_HANDLE_INVALID if the driver could not open the pipe. The driver may not be able to open a pipe due to incorrect function parameters or due to lack of resources.

Driver Host Pipe Close Function

The `hostPipeClose` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host Pipe Close function. The signature of the Host Pipe Close function is as follows:

```
void (*hostPipeClose)(DRV_USB_HOST_PIPE_HANDLE pipeHandle);
```

The USB Driver Host mode Pipe Close function must match this signature. The USB Host Stack calls this function to close communication pipes. The `pipeHandle` parameter is the pipe handle obtained from the Pipe Setup function. The Host Client Driver typically closes pipes when a device detach was detected. The Client Driver may also close pipes when a device configuration needs to change or when the Client Driver is being unloaded by the Host. The Pipe Close function has no side effect if the pipe handle is invalid. Closing the pipe will abort all I/O Request Packets (IRP) that are scheduled on the pipe. Any transaction in progress will complete. The IRP callback functions for each IRP scheduled in the pipe will be called with a USB_HOST_IRP_STATUS_ABORTED status.

The USB Driver Pipe Close function must be thread-safe and event-safe. The latter requirement allows the Pipe Close function to be called in the context of the device detach Interrupt Service Routine.

Driver Host Event Disable Function

The `hostEventsDisable` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host mode Driver Events Disable function. The signature of the Events Disable function is as follows:

```
bool (*hostEventsDisable)(DRV_HANDLE handle);
```

The USB Driver Host mode Driver Events Disable function must match this signature. The Host Stack will call this function when it wants to execute a section of code that should not be interrupted by the USB Driver. Calling this function should disable USB Driver event generation. The `handle` parameter is set to the driver handle obtained via the driver Open function. The function will return the present state of the event generation, whether it is enabled or disabled. The Host Stack will pass this value to the USB Driver Host mode Driver Events Enable function when it needs to enable the driver events.

Driver Host Events Enable Function

The `hostEventsEnable` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host mode Driver Events Enable function. The signature of the events enable function is as follows:

```
void (*hostEventsEnable)(DRV_HANDLE handle, bool eventContext);
```

The USB Driver Host mode Driver Events Enable function must match this signature. The USB Host Stack calls this function to re-enable the USB Driver Host mode Events (if they were enabled) after it called the USB Driver Host mode Events Disable function to disable driver events. The `handle` parameter is set to the driver handle obtained via the driver Open function. The `eventContext` parameter is set to the value returned by the Host mode Driver Events Disable function. The USB Driver will use the `eventContext` parameter to restore the event generation status (enabled or disabled) to what it was when the USB Driver Host mode Driver Events Disable function was called.

Driver Host IRP Submit Function

The `hostIRPSubmit` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host IRP Submit function. The

signature of the IRP Submit function is as follows:
```
USB_ERROR (*hostIRPSubmit)(DRV_USB_HOST_PIPE_HANDLE pipeHandle, USB_HOST_IRP * irp);
```

The USB Driver Host IRP Submit function must match this signature. The Host Stack calls this function to submit an IRP to the USB Driver. The USB Driver provides this mechanism to transfer data between the Host Stack and the attached device. The `pipeHandle` parameter should be set to the pipe handle obtained by the Pipe Setup function. The pipe handle specifies the pipe, and therefore, the target device, endpoint, speed and transfer type, on which the I/O must be processed. The `irp` parameter should point to the IRP data structure. The IRP data structure will transport an entire transfer over the pipe. The USB Driver will split up the transfer into transactions based on the parameters specified at the time of pipe creation. This process does not require Host Stack intervention.

The function will return USB_ERROR_HOST_PIPE_INVALID if the pipe handle is not valid. It will return USB_ERROR_OSAL_FUNCTION if an error occurred while performing a RTOS-related operation. It will return USB_ERROR_NONE if the IRP was submitted successfully.

The USB Driver will queue the IRP if there is already an IRP being processed on the pipe. The completion of the IRP processing is indicated by the USB Driver calling the IRP Callback function specified within the IRP. The Host IRP Submit function must be thread-safe and IRP callback-safe. The Host Stack may resubmit the IRP within the IRP Callback function. The IRP Callback function itself executes within an interrupt context. The completion status of the IRP will be available in the `status` member of the IRP when the IRP callback function is invoked.

Driver Host IRP Cancel Function

The `hostIRPCancel` member of the DRV_USB_HOST_INTERFACE structure should point to the USB Driver Host IRP Cancel function. The signature of the IRP Cancel function is as follows
```
void (*hostIRPCancel)(USB_HOST_IRP * irp);
```

The USB Driver Host IRP Cancel function must match this signature. The Host Stack and Host Client Drivers will call this function to cancel an IRP that was submitted. The IRP will be aborted successfully if it is not in progress. If the IRP processing has begun, the on-going transaction will complete and pending transactions in the transfer will be aborted. In either case, the IRP Callback function will be called with the IRP status as USB_HOST_IRP_STATUS_ABORTED.

Driver Host USB Root Hub Port Interface

Provides information on the Root Hub Port interface of the USB Host Driver.

Description

The `rootHubPortInterface` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Port functions. The data type of this member is USB_HUB_INTERFACE. This data type is a structure containing function pointers pointing to the port control functions of the root hub. The USB Driver must assign the function pointers in this structure to the root hub port control functions. These same functions are also exported by a Hub Driver to the USB Host Stack, which allow the Host Stack to control a device regardless of whether it is connected to a root hub or an external hub. The port functions are valid only when a device is attached to the port. The behavior of these functions on a port to which no device is connected is not defined. Descriptions of the port control functions are provided, which include:

- Driver Host Hub Port Reset Function
- Driver Host Hub Port Reset Completion Status Function
- Driver Host Hub Port Suspend Function
- Driver Host Hub Port Resume Function
- Driver Host Hub Port Speed Get Function

Driver Host Hub Port Reset Function

The `hubPortReset` member of the USB_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Reset function. The signature of this function is as follows:
```
USB_ERROR (*hubPortReset)(uintptr_t hubAddress, uint8_t port);
```

The USB Driver Root Hub Port Reset function must follow this signature. This function starts reset signaling on the port. If the device is connected to the root hub, the USB Host Stack will set the `hubAddress` parameter to the driver handle obtained through the driver Open function. The USB Host Stack uses the parent identifier provided by the root hub driver when the USB_HOST_DeviceEnumerate function was called to query the driver handle that is linked to this root hub. If the device is connected to an external hub, the `hubAddress` parameter is directly set to the parent identifier.

For the PIC32MX and PIC32MZ USB Drivers, the `port` parameter is ignored. For an external hub, this must be set to the port to which the device is connected. The function returns USB_ERROR_NONE if the function was successful. If the reset signaling is already in progress on the port, calling this function has no effect. The USB Driver will itself time duration of the reset signal. This does not require USB Host Stack intervention. The USB Host Stack will call the port reset completion status function to check if the reset signaling has completed. Calling this function on a port which exists on an external hub will cause the hub driver to issue a control transfer to start the port reset procedure.

Driver Host Hub Port Reset Completion Status Function

The `hubPortResetIsComplete` member of the USB_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Reset Completion Status function. The signature of this function is as follows:
```
bool (*hubPortResetIsComplete)(uintptr_t hubAddress, uint8_t port);
```

The USB Driver Root Hub Port Reset Completion Status function must follow this signature. The USB Host Stack calls this function to check if the port reset sequence that was started on a port has completed. The function returns true if the reset signaling has completed. If the device is connected to the root hub, the USB Host Stack will set the `hubAddress` parameter to the driver handle obtained through the driver Open function.

If the device is connected to an external hub, the `hubAddress` parameter is directly set to the parent identifier.

For the PIC32MX and PIC32MZ USB Drivers, the `port` parameter is ignored. For an external hub, this parameter must be set to the port to which the device is connected.

Driver Host Hub Port Suspend Function

The `hubPortSuspend` member of the USB_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Suspend function. The signature of this function is as follows:

```
USB_ERROR(*hubPortSuspend)(uintptr_t hubAddress, uint8_t port);
```

The USB Driver Root Hub Port Suspend function must follow this signature. The USB Host Stack calls this function to suspend the port. If the device is connected to the root hub, the USB Host Stack will set the `hubAddress` parameter to the driver handle obtained through the driver Open function. If the device is connected to an external hub, the `hubAddress` parameter is directly set to the parent identifier.

For the PIC32MX and PIC32MZ USB Drivers, the `port` parameter is ignored. For an external hub, this parameter must be set to the port to which the device is connected. The function returns USB_ERROR_NONE if the request was successful. Calling this function on a suspended port will not have any effect.

Driver Host Hub Port Resume Function

The `hubPortResume` member of the USB_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Resume function. The signature of this function is as follows:

```
USB_ERROR(*hubPortResume)(uintptr_t hubAddress, uint8_t port);
```

The USB Driver Root Hub Port Resume function must follow this signature. The USB Host Stack calls this function to resume a suspended port. If the device is connected to the root hub, the USB Host Stack will set the `hubAddress` parameter to the driver handle obtained through the driver Open function. If the device is connected to an external hub, the `hubAddress` parameter is directly set to the parent identifier.

For the PIC32MX and PIC32MZ USB Drivers, the `port` parameter is ignored. For an external hub, this parameter must be set to the port to which the device is connected. The function returns USB_ERROR_NONE if the request was successful. Calling this function on a port that is not suspended will not have any effect.

Driver Host Hub Port Speed Get Function

The `hubPortSpeedGet` member of the USB_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Speed Get function. The signature of this function is as follows:

```
USB_SPEED(*hubPortSpeedGet)(uintptr_t hubAddress, uint8_t port);
```

The USB Driver Root Hub Port Speed Get function must follow this signature. The USB Host Stack calls this function to obtain the USB speed of the device that is attached to the port. The Host Stack calls this function only after it has completed reset of the port. If the device is connected to the root hub, the USB Host Stack will set the `hubAddress` parameter to the driver handle obtained through the driver Open function. If the device is connected to an external hub, the `hubAddress` parameter is directly set to the parent identifier.

For the PIC32MX and PIC32MZ USB Drivers, the `port` parameter is ignored. For an external hub, this parameter must be set to the port to which the device is connected. The function returns USB_SPEED_ERROR if the request was not successful. It will return the functional USB speed otherwise.

This concludes the section describing the USB Driver Host mode Client Functions. The USB Driver Device Mode Client Functions are discussed in the next section.

Driver Host Root Hub Interface

Provides information on the Root Hub interface for the USB Host Driver.

Description

The USB Driver Common Interface requires the USB Driver to be operating in Host mode to provide root hub control functions. If the USB peripheral does not contain root hub features in hardware, these features must be emulated in software by the driver. The USB peripheral on PIC32MX and PIC32MZ devices does not contain root hub features; therefore, the USB Driver for these peripherals emulates the root hub functionality in software. The `rootHubInterface` member of the DRV_USB_HOST_INTERFACE structure is a structure of type DRV_USB_ROOT_HUB_INTERFACE. The members of this structure are function pointers to the root hub control functions of the USB Driver.

Along with other Host mode functions, the USB Driver while operating in Host mode must also ensure that the `rootHubInterface` member of DRV_USB_HOST_INTERFACE is set up correctly so that the USB Host Stack can access the root hub functions. Descriptions of the function pointer types in the DRV_USB_ROOT_HUB_INTERFACE include:

- Driver Host Root Hub Speed Get Function
- Driver Host Root Hub Port Numbers Get Function
- Driver Host Root Hub Maximum Current Get Function
- Driver Host Root Hub Operation Enable Function
- Driver Host Root Hub Operation Enable Status Function
- Driver Host Root Hub Initialize Function

Driver Host Root Hub Speed Get Function

The `rootHubSpeedGet` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Speed Get

function. The signature of this function is as follows:
```
USB_SPEED (*rootHubSpeedGet)(DRV_HANDLE handle);
```

The USB Driver Root Hub Speed Get function must match this signature. The USB Host Stack calls this function to identify the speed at which the root hub is operating. The `handle` parameter is the handle obtained by calling the USB Driver Open function. The operation speed is configured by the USB Driver initialization and depends on the capability of the USB peripheral. For example, the USB peripheral on PIC32MZ devices supports both Hi-Speed and Full-Speed Host mode operation. It can be configured through initialization to only operate at Full-Speed. The Root Hub Speed Get function must return the USB speed at which the USB peripheral is operating. This should not be confused with the speed of the attached device.

Driver Host Root Hub Port Numbers Get Function

The `rootHubPortNumbersGet` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Port Numbers Get function. The signature of this function is as follows:
```
USB_SPEED (*rootHubSpeedGet)(DRV_HANDLE handle);
```

The USB Driver Root Hub Speed Get function must match this signature. This function should return the number of ports that the root hub contains. On the USB peripheral for both PIC32MZ and PIC32MX devices, this value is always '1'.

Driver Host Root Hub Maximum Current Get Function

The `rootHubMaxCurrentGet` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Maximum Current Get function. The signature of this function is as follows:
```
uint32_t (*rootHubMaxCurrentGet)(DRV_HANDLE handle);
```

The USB Driver Root Hub Maximum Current Get function must match this signature. This function returns the maximum VBUS current that the root hub can provide. The USB Host Stack calls this function to know the maximum current that the root hub VBUS power supply can provide. This value is then used to determine if the Host can support the current requirements of the attached device. The `handle` parameter is the driver handle obtained by calling the driver Open function.

The PIC32MX and the PIC32MZ USB peripherals cannot supply VBUS. The root hub driver only switches the VBUS supply. The current rating of the VBUS is specified through the USB Driver initialization. The root hub maximum current get function implementation in these drivers returns this value to the Host Stack.

Driver Host Root Hub Operation Enable Function

The `rootHubOperationEnable` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Operation Enable function. The signature of this function is as follows"
```
void (*rootHubOperationEnable)(DRV_HANDLE handle, bool enable);
```

The USB Driver Root Hub Operation Enable function must match this signature. The USB Host Stack calls this function when it ready to receive device attach events from the root hub. Calling this function will cause the USB Driver root hub functionality to enable detection of device attach and detach. The USB Driver will then raise events to the USB Host Stack. The `handle` parameter is the driver handle obtained by calling the driver Open function. Setting the `enable` parameter to true enables the root hub operation. Setting the `enable` parameter to false disables the root hub operation.

Driver Host Root Hub Operation Enable Status Function

The `rootHubOperationIsEnabled` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Operation Enable Status function. The signature of this function is as follows:
```
bool (*rootHubOperationIsEnabled)(DRV_HANDLE handle);
```

The USB Driver Root Hub Operation Enable Status function must match this signature. This USB Host Stack calls this function after calling the operation enable function to check if this has completed. The function returns true if the operation enable function has completed. The USB Host Stack will call this function periodically until it returns true.

Driver Host Root Hub Initialize Function

The `rootHubInitialize` member of the DRV_USB_ROOT_HUB_INTERFACE structure should point to the USB Driver Root Hub Initialize function. The signature of this function is as follows:
```
void (*rootHubInitialize)(DRV_HANDLE handle, USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo);
```

The USB Driver Root Hub Initialize function must match this signature. The USB Host Stack calls this function to assign a device identifier (usbHostDeviceInfo) to the root hub. This function is called before the Host Stack enables the root hub operation. The USB Driver root hub should use this identifier as the parent identifier when it calls the USB_HOST_DeviceEnumerate function to enumerate the attached device. At the time of enumeration, the USB Host Stack will use this parent identifier to identify the parent hub (whether root hub or external hub) of the attached device. The USB Driver root hub should retain the `usbHostDeviceInfo` parameter for the life time of its operation.

Driver Device Mode Client Functions

Provides information on the USB Driver Device mode Client functions.

Description

The DRV_USB_DEVICE_INTERFACE structure contains pointers to the USB Driver's Device mode Client Functions. These functions are only applicable when the USB module is operating as a USB Device. A USB Driver must implement these functions and ensure that the Device Stack

can access these functions through the driver's DRV_USB_DEVICE_INTERFACE structure. Descriptions of the Driver Device Mode Client functions in the DRV_USB_DEVICE_INTERFACE structure include:

- Driver Device Address Set Function
- Driver Device Current Speed Get Function
- Driver Device SOF Number Get Function
- Driver Device Attach Function
- Driver Device Detach Function
- Driver Device Endpoint Enable Function
- Driver Device Endpoint Disable Function
- Driver Device Endpoint Stall Function
- Driver Device Endpoint Stall Clear Function
- Driver Device Endpoint Enable Status Function
- Driver Device Endpoint Stall Status Function
- Driver Device IRP Submit Function
- Driver Device IRP Cancel All Function
- Driver Device IRP Cancel Function
- Driver Device Remote Wakeup Start Function
- Driver Device Remote Wakeup Stop Function
- Driver Device Test Mode Enter Function

The PIC32MZ and the PIC32MX USB peripheral drivers implement the Device mode functions and export these functions to the Device Stack though their respective DRV_USB_DEVICE_INTERFACE structure.

Driver Device Address Set Function

The `deviceAddressSet` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device Address Set function. The signature of this function is as follows:

```
void (*deviceAddressSet)(DRV_HANDLE handle, uint8_t address);
```

The USB Driver Device Address Set Function should match this signature. The USB Device Stack will call this function to set the Device USB Address. The function will be called in an interrupt context and hence the function implementation must be interrupt-safe. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `address` parameter is the address provided by the USB Host through the Set Device Address Standard request.

Driver Device Current Speed Get Function

The `deviceCurrentSpeedGet` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Current Speed Get function. The signature of this function is as follows:

```
USB_SPEED (*deviceCurrentSpeedGet)(DRV_HANDLE handle);
```

The USB Driver Device Current Speed Get function should match this signature. The USB Device Stack will call this function to obtain the speed at which the device has connected to the USB. It will call this function after reset signaling has completed. The `handle` parameter is driver handle obtained from calling the driver Open function. This function is called in an interrupt context and should be interrupt-safe.

Driver Device SOF Number Get Function

The `deviceSOFNumberGet` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Start-Of-Frame Number Get function. The signature of this function is as follows:

```
uint16_t (*deviceSOFNumberGet)(DRV_HANDLE handle);
```

The USB Driver SOF Number Get function should match this signature. The USB Device Stack will call this function to obtain the current SOF number. The USB peripheral uses a 16 bit counter to count the number of SOFs that have occurred since USB reset. This value is returned along with the Device Stack Start of Frame event. This function is called from an interrupt context and should be interrupt-safe. The `handle` parameter is the driver handle obtained from calling the driver Open function.

Driver Device Attach Function

The `deviceAttach` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Attach function. The signature of this function is as follows:

```
uint16_t(*deviceAttach)(DRV_HANDLE handle);
```

The USB Driver Attach function should match this signature. The USB Device Stack will call this function when the Device application calls the USB Device Stack Device Attach function. The USB Driver will enable the required signaling resistors for indicate attach to the Host. The application could call this function in response to a VBUS power available event. This function must be interrupt-safe. The `handle` parameter is the driver handle obtained from calling the driver Open function.

Driver Device Detach Function

The deviceDetach member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Detach function. The signature of this function is as follows:

uint16_t(*deviceDetach)(DRV_HANDLE handle);

The USB Driver Detach function should match this signature. The USB Device Stack will call this function when the Device application calls the USB Device Stack Device Detach function. The USB Driver will disable the required signaling resistors to indicate detach to the Host. The application could call this function in response to a VBUS power not available event. This function should be interrupt-safe. The `handle` parameter is driver handle obtained from calling the driver Open function.

Driver Device Endpoint Enable Function

The `deviceEndpointEnable` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Enable function. The signature of this function is as follows:

```
USB_ERROR (*deviceEndpointEnable)(DRV_HANDLE handle, USB_ENDPOINT endpoint,
            USB_TRANSFER_TYPE transferType, uint16_t endpointSize);
```

The USB Driver Endpoint Enable function should match this signature. The USB Device Stack Function Driver will call this function when it is initialized by the USB Device Layer. The Device Layer, on receiving the Set Configuration request from the Host, identifies the function drivers that are required by the configuration and initializes them. The function drivers will call the endpoint enable function to enable the endpoints required for their operation. Enabling the endpoint will cause it reply to transaction requests from the Host and accept transfer requests from the device application.

The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) that should be enabled. The transferType is the type of the USB transfer that this endpoint will handle. The endpointSize is the size of the maximum transaction that the endpoint will handle. This should match the endpoint size communicated to the Host via the device endpoint descriptors.

The function will return USB_ERRROR_NONE if the endpoint was configured successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

The endpoint enable function will be called in an interrupt context and should be interrupt-safe. It is not expected to be thread safe. For standard function drivers, the endpoint enable function will be called in the context of the USB Device Layer Client. For vendor USB devices, the vendor application must call the endpoint enable function in response to and within the context of the device configured event. Again this event itself will execute in the context of the Device Layer.

Driver Device Endpoint Disable Function

The `deviceEndpointDisable` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Disable function. The signature of this function is as follows:

```
USB_ERROR (*deviceEndpointDisable)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Endpoint Disable function should match this signature. The USB Device Stack Function Driver will call this function when it is deinitialized by the USB Device Layer. The Device Layer will deinitialize function drivers when it receives a USB reset event from the driver or on receiving the Set Configuration request from the Host with configuration parameter 0. Disabling the endpoint will cause it NAK transaction request from the Host and not accept transfer requests from the device application.

The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) that should be disabled.

The function will return USB_ERRROR_NONE if the function executed successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

The endpoint disable function will be called in an interrupt context and should be interrupt-safe. It is not expected to be thread safe. For standard function drivers, the endpoint disable function will be called in the context of the USB Device Layer Client. For vendor USB devices, the vendor application must call the endpoint enable function in response to and within the context of the device reset event. Again this event itself will execute in the context of the Device Layer. Disabling the endpoint will not cancel any transfers that have been queued against the endpoint. The function drivers will call the IRP Cancel All function to cancel any pending transfers.

Driver Device Endpoint Stall Function

The `deviceEndpointStall` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Stall function. The signature of this function is as follows:

```
USB_ERROR (*deviceEndpointStall)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Endpoint Stall function should match this signature. The USB Device Stack Function Driver will call this function to stall an endpoint. The Device Layer itself will stall endpoint 0 for several reasons including non-support of the Host request or failure while executing the request. A function driver will also stall an endpoint for protocol specific reasons. The driver will stall both, receive and transmit directions when stalling Endpoint 0. The driver will stall the specified direction while stalling a non-zero endpoint.

This function must be thread safe and interrupt safe. Stalling the endpoint will abort all the transfers queued on the endpoint with the completion status set to USB_DEVICE_IRP_STATUS_ABORTED_ENDPOINT_HALT. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) that should be stalled. The function will return USB_ERRROR_NONE if the function executed successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

Driver Device Endpoint Stall Clear Function

The `deviceEndpointStallClear` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Stall Clear function. The signature of this function is as follows:

```
USB_ERROR (*deviceEndpointStallClear)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Endpoint Stall Clear function should match this signature. The USB Device Stack Function Driver will call this function to clear the stall on a non-zero endpoint. The Device Layer will call this function to clear the stall condition on Endpoint 0. Clearing the stall on a non-zero endpoint will clear all transfers scheduled on the endpoint and transfer completion status will be set to USB_DEVICE_IRP_STATUS_TERMINATED_BY_HOST. When the stall is cleared, the data toggle for non-zero endpoint will be set to DATA0. The data toggle on Endpoint 0 OUT endpoint will be set to DATA1. The USB Driver will clear the Stall condition on an endpoint even if it was not stalled.

This function must be thread safe and interrupt safe. Stalling the endpoint will flush all the transfers queued on the endpoint. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) whose stall condition must be cleared. The function will return USB_ERRROR_NONE if the function executed successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

Driver Device Endpoint Enable Status Function

The `deviceEndpointIsEnabled` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Enable Status function. The signature of this function is as follows:

```
bool (*deviceEndpointIsEnabled)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Endpoint Enable Status function should match this signature. The USB Device Stack function will call this function to check if an endpoint has been enabled. The function returns true if the endpoint is enabled. The endpoint is enabled through the USB Driver Endpoint Enable function. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) whose enable status needs to be queried.

Driver Device Endpoint Stall Status Function

The `deviceEndpointIsStalled` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Endpoint Stall Status function. The signature of this function is as follows:

```
bool (*deviceEndpointIsStalled)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Endpoint Stall Status function should match this signature. The USB Device Stack function will call this function to check if an endpoint has been stalled. The function returns true if the endpoint is stalled. The endpoint is stalled through the USB Driver Endpoint Stall function. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) whose stall status needs to be queried.

Driver Device IRP Submit Function

The deviceIRPSubmit member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device IRP Submit function. The signature of the IRP submit function is as follows:

```
USB_ERROR (*deviceIRPSubmit)(DRV_HANDLE handle, USB_ENDPOINT endpoint, USB_DEVICE_IRP * irp);
```

The USB Driver Device IRP Submit function must match this signature. The Device Stack (USB Device calls this function to submit an IRP to the USB Driver. The USB Driver provides this mechanism to transfer data between the device and the Host. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter should set to endpoint through which transfer must be processed. The `irp` parameter should point to the Device IRP data structure. The IRP data structure will transport an entire transfer over the endpoint. The USB Driver will split up the transfer into transactions based on the endpoint size specified at the time of enabling the endpoint. This process does not require Device Stack intervention.

The function will return USB_ERRROR_NONE if the function executed successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid. It will return USB_ERROR_DEVICE_IRP_IN_USE if an in progress IRP is resubmitted. It will return USB_ERROR_ENDPOINT_NOT_CONFIGURED if the IRP is submitted to an endpoint that is not enabled.

The USB Driver will queue the IRP if there is already an IRP being processed on the endpoint. The completion of the IRP processing is indicated by the USB Driver calling the IRP callback function specified within the IRP. The Device IRP Submit function must be thread safe and IRP callback safe. The Device Stack may resubmit the IRP within the IRP callback function. The IRP callback function itself executes within an interrupt context. The completion status of the IRP will be available in the status member of the IRP when the IRP callback function is invoked.

Driver Device IRP Cancel All Function

The `deviceIRPCancelAll` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device IRP Cancel All function. The signature of this is as follows:

```
USB_ERROR (*deviceIRPCancelAll)(DRV_HANDLE handle, USB_ENDPOINT endpoint);
```

The USB Driver Device IRP Cancel All function must match this signature. The USB Device Stack will call this function before disabling the endpoint. Calling this function will call all IRPs that are queued on the endpoint to be canceled. The callback of each IRP will be invoked and the IRP completion status will be set to USB_DEVICE_IRP_STATUS_ABORTED. If an IRP is in progress, an ongoing transaction will be allowed to complete and pending transactions will be canceled. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `endpoint` parameter is the USB endpoint (which indicates the direction along with endpoint number) whose queued IRPs must be canceled.

The function is thread safe and interrupt safe and will return USB_ERRROR_NONE if it executed successfully. The function will return USB_ERROR_DEVICE_ENDPOINT_INVALID if the specified endpoint is not provisioned in the system configuration. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

Driver Device IRP Cancel Function

The `deviceIRPCancel` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device IRP Cancel function. The signature of this is as follows:

```
USB_ERROR (*deviceIRPCancel)(DRV_HANDLE handle, USB_DEVICE_IRP * IRP);
```

The USB Driver Device IRP Cancel function must match this signature. This function is called by the USB Device Stack function driver to cancel a scheduled IRP. If the IRP is in the queue but it's processing has not started, the IRP will removed from the queue and the IRP callback function will be called from within the cancel function. The callback will be invoked with the IRP completion status set to USB_DEVICE_IRP_STATUS_ABORTED. If an IRP is in progress, an ongoing transaction will be allowed to complete and pending transactions will be canceled. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `irp` parameter is the IRP to be canceled.

The function is thread safe and will return USB_ERRROR_NONE if it executed successfully. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid or if the IRP has status indicates that this IRP is not queued or not in progress. The application should not release the data memory associated with IRP unless the callback has been received.

Driver Device Remote Wakeup Start Function

The `deviceRemoteWakeupStart` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device Remote Wakeup Start function. The signature of this function is as follows:

```
void (*deviceRemoteWakeupStart)(DRV_HANDLE handle);
```

The USB Driver Device Remote Wakeup Start function must match this signature. The USB Device Stack will call the function when the device application wants to start remote wakeup signaling. This would happen if the device supports remote wake-up capability and this has been enabled by the Host. The `handle` parameter is the driver handle obtained from calling the driver Open function.

Driver Device Remote Wakeup Stop Function

The `deviceRemoteWakeupStop` member of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device Remote Wakeup Stop function. The signature of this function is as follows:

```
void (*deviceRemoteWakeupStop)(DRV_HANDLE handle);
```

The USB Driver Device Remote Wakeup Stop function must match this signature. The USB Device Stack will call the function when the device application wants to stop remote wakeup signaling. The application would call after calling the remote wakeup start function. The `handle` parameter is the driver handle obtained from calling the driver Open function.

Driver Device Test Mode Enter Function

The `deviceTestModeEnter` parameter of the DRV_USB_DEVICE_INTERFACE structure should point to the USB Driver Device Test Mode Enter function. The signature of this function is as follows:

```
USB_ERROR (*deviceTestModeEnter)(DRV_HANDLE handle, USB_TEST_MODE_SELECTORS testMode);
```

The USB Driver Device Test Mode Enter function should match this signature. The USB Device Stack calls this driver function to place the driver into test mode. This is required when the USB Host (operating at Hi-Speed) send the Set Feature request with the feature selector test set to test mode. This request also specifies which of the test mode signals, the driver should enable. The `handle` parameter is the driver handle obtained from calling the driver Open function. The `testMode` parameter should be set to one of the test modes as defined in table 9-7 of the USB 2.0 specification.

The test mode enter function is only supported by the PIC32MZ USB Driver as the USB peripheral on this controller supports Hi-Speed operation. The function will return USB_ERRROR_NONE if it executed successfully. It will return USB_ERROR_PARAMETER_INVALID if the driver handle is not valid.

This concludes the discussion on the DRV_USB_DEVICE_INTERFACE structure. The following sections describe using the USB Common Driver.

Opening the Driver

Provides information and examples for opening the driver.

Description

The USB Host Stack and the USB Device Stack must obtain a handle to the USB Driver to access the functionality of the driver. This handle is obtained through the USB Driver Open function. The DRV_USB_DEVICE_INTERFACE structure and DRV_USB_DEVICE_HOST_INTERFACE structure provide access to the USB Driver Open function through the `open` member of these structures. Calling the Open function may not return a valid driver handle the first time the function is called. In fact, the USB Driver will return an invalid driver handle until the driver is ready to be opened. The Host and the Device Stack call the Open function repetitively in a state machine, until the function returns a valid handle.

The USB Host Stack can open the USB Driver but can call its Host mode functions only if the USB Driver was initialized for Host mode or Dual Role operation. The USB Host Stack accesses the driver functions through the DRV_USB_HOST_INTERFACE pointer that was provided to the Host Layer through the Host Stack initialization. The USB Device Stack can open the USB Driver but can call its Device mode functions only if the USB Driver was initialized for Device mode or Dual Role operation. The USB Device Stack accesses the driver functions through the DRV_USB_HOST_INTERFACE pointer that was provided to the Host Layer through the Host Stack initialization

The following code example shows how the USB Host Layer opens the USB Driver.

```
/* This code example shows how the Host Layer open the HCD via the hcdInterface.
 * The driver handle is stored in hcdHandle member of the busObj data structure.
```

```
 * The busObj data structure Host Layer local data structure. The Host Layer
 * opens the HCD when the bus is enabled. This operation takes place in the
 * USB_HOST_BUS_STATE_ENABLING state. */

/* Note the Host Layer calls the Open function by accessing the open member of
 * the hcdInterface which is of the type DRV_USB_HOST_INTERFACE. Also note how
 * the function is called repetitively until the Open function returns a valid
 * handle. */

case USB_HOST_BUS_STATE_ENABLING:

    /* The bus is being enabled. Try opening the HCD */
    busObj->hcdHandle = busObj->hcdInterface->open(busObj->hcdIndex, DRV_IO_INTENT_EXCLUSIVE |
            DRV_IO_INTENT_NONBLOCKING | DRV_IO_INTENT_READWRITE );

    /* Validate the Open function status */
    if (DRV_HANDLE_INVALID == busObj->hcdHandle )
    {
        /* The driver may not open the first time. This is okay. We
         * should try opening it again. The state of bus is not
         * changed. */
    }
```

The following code example shows how the USB Device Layer opens the USB Driver.

```
/* This code example shows how the USB Device Layer calls the USBCD open
 * function to open the USBCD. The Device Layer accesses the USBCD Open function
 * through the driverInterface member of the usbDeviceInstanceState object. The
 * driverInterface member is a DRV_USB_DEVICE_INTERFACE type. The
 * usbDeviceInstanceState is a USB Device Layer local object. */

/* The Device Layer attempts to open the USBCD when it is initializing. Note how
 * the Device Layer advances to the next state only when the USBCD returns a
 * valid handle.   */

switch(usbDeviceThisInstance->taskState)
{
    case USB_DEVICE_TASK_STATE_OPENING_USBCD:

        /* Try to open the driver handle. This could fail if the driver is
         * not ready to be opened. */
        usbDeviceThisInstance->usbCDHandle =
           usbDeviceThisInstance->driverInterface->open( usbDeviceThisInstance->driverIndex,
           DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_NONBLOCKING|DRV_IO_INTENT_READWRITE);

        /* Check if the driver was opened */
        if(usbDeviceThisInstance->usbCDHandle != DRV_HANDLE_INVALID)
        {
            /* Yes the driver could be opened. */

            /* Advance the state to the next state */
            usbDeviceThisInstance->taskState = USB_DEVICE_TASK_STATE_RUNNING;

            /* Update the USB Device Layer state to indicate that it can be
             * opened */
            usbDeviceThisInstance->usbDeviceInstanceState = SYS_STATUS_READY;
        }

        break;
```

USB Driver Host Mode Operation

Provides information on Host mode operation.

Description

The USB Driver operates or can operate in the Host mode when it is initialized for Host mode or Dual Role operation. When operating in Host mode, the USB Driver is also referred to as the Host Controller Driver (HCD). In Dual Role mode, the USB Driver will switch to Host mode when the USB Driver Host Root Hub Operation Enable function is called.

The USB Driver Client must perform these steps to operate the USB Driver in Host mode.

1. Open the USB Driver to obtain the driver handle.
2. Set the event handler.
3. Call the Root Hub Control function to obtain the speed of the root hub, the number of ports that the root hub supports, and the maximum current that the root hub VBUS can supply.
4. Calls the Root Hub Initialize function with an identifier parameter. This `identifier` parameter allows the Host Stack to uniquely identify the root hub when where there are multiple root hubs.
5. The Driver Client will then enable the root hub operation and will wait until the root hub operation is enabled.
6. The Driver Client can now call the USB Driver Host mode functions.

The following sections explain Steps 2 through 6 in more detail.

Handling Host Mode Driver Events

Currently, the HCD does not provide any events to the client. The client can optionally register an event handler through the eventHandlerSet function pointer in the DRV_USB_HOST_INTERFACE structure. Future releases of the USB Driver may contain features that provide events to the Driver Client. Please refer to the following **Root Hub Operation** section for details on how the driver indicates device attach and detach to the client.

Root Hub Operation

A key feature of the HCD is the Root Hub Driver. The Root Hub Driver emulates hub operation in USB Driver software and provides a hub like interface to the USB Host Layer. The USB Host Layer treats the root hub like an external hub. This simplifies the implementation of USB Host Layer while supporting multiple devices through a hub. In that, the USB Host layer does not have to treat a device connected directly to the USB peripheral differently than a device connected to an external hub. The following code example shows how the USB Host Layer calls the root hub function to obtain information about the root hub.

```
/* This code example shows how the USB Host Layer calls the root hub functions to
 * obtain information about the root. The USB Host Layer first opens the HCD and
 * then accesses the root hub functions through the rootHubInterface member of
 * hcdInterface. rootHubInterface is of the type DRV_USB_ROOT_HUB_INTERFACE and
 * the hcdInterface is of the type of DRV_USB_HOST_INTERFACE. */

/* The code example shows how the Host Layer gets to know the root hub operation
 * speed, number of root hub ports and the maximum amount of current that the
 * root can supply. These function can be called only after HCD was opened and a
 * valid driver handle obtained. */

case USB_HOST_BUS_STATE_ENABLING:

    /* The bus is being enabled. Try opening the HCD */
    busObj->hcdHandle = busObj->hcdInterface->open(busObj->hcdIndex, DRV_IO_INTENT_EXCLUSIVE |
            DRV_IO_INTENT_NONBLOCKING | DRV_IO_INTENT_READWRITE );

    /* Validate the Open function status */
    if (DRV_HANDLE_INVALID == busObj->hcdHandle )
    {
        /* The driver may not open the first time. This is okay. We
         * should try opening it again. The state of bus is not
         * changed. */
    }
    else
    {
        /* Update the bus root hub information with the
         * details of the controller. Get the bus speed, number of
         * ports, the maximum current that the HCD can supply,
         * pointer to the root hub port functions. */

        SYS_DEBUG_PRINT(SYS_ERROR_INFO,
             "\r\nUSB Host Layer: Bus %d Root Hub Driver Opened.",hcCount);

        busObj->rootHubInfo.speed =
             busObj->hcdInterface->rootHubInterface.rootHubSpeedGet(busObj->hcdHandle);

        busObj->rootHubInfo.ports =
             busObj->hcdInterface->rootHubInterface.rootHubPortNumbersGet(busObj->hcdHandle);

        busObj->rootHubInfo.power =
             busObj->hcdInterface->rootHubInterface.rootHubMaxCurrentGet(busObj->hcdHandle);

        busObj->rootHubInfo.rootHubPortInterface =
             busObj->hcdInterface->rootHubInterface.rootHubPortInterface;
```

The USB Host Layer must initialize and enable the operation of the root hub. While initializing the Root Hub Driver, the Host layer will assign a unique identifier to the root hub. The root hub will return this value as the parent identifier while calling the USB_HOST_DeviceEnumerate function. The USB Host Layer must then enable the operation of the root hub driver. This will cause the root hub driver to detect device attach and detach. The following code example shows how the USB Host Layer initializes and enables the root hub driver

```
/* The following code example show how the USB Host Layer initializes the root
 * hub and then enables the root hub operation. The
 * rootHubDevice->deviceIdentifier is a unique identifier that allows the USB
 * Host layer to identify this root hub. It is returned by the root hub driver
 * in the USB_HOST_DeviceEnumerate() function as the parent identifier when the
 * device is connected to the root hub. */

/* The hcdHandle is the driver handle. The hcdInterface pointer is of the type
 * DRV_USB_HOST_INTERFACE and points to the HCD interface. */

busObj->hcdInterface->rootHubInterface.rootHubInitialize( busObj->hcdHandle ,
                                                          rootHubDevice->deviceIdentifier );
busObj->hcdInterface->rootHubInterface.rootHubOperationEnable( busObj->hcdHandle , true );
```

When a device is attached, the Root Hub Driver will implement the required settling attach settling delay and will then call the USB Host Layer's USB_HOST_DeviceEnumerate function to enumerate the device. While calling this function, the root hub driver will provide the identifier that was provided to it in its initialize function. The USB_HOST_DeviceEnumerate function will return an identifier which uniquely identifies the attached device. The root hub driver uses this value to identify the device to the Host when the USB_HOST_DeviceDenumerate function is called on device detach. The following code example shows how the Root Hub driver calls the USB_HOST_DeviceEnumerate and the USB_HOST_DeviceDenumerate functions.

```
/* The following code shows how the root hub driver calls the
 * USB_HOST_DeviceEnumerate() function in the device attach interrupt. As seen
 * here, the root hub returns the identifier that the USB Host Layer assigned to
 * it the rootHubInitialize function call. The pUSBDrvObj->usbHostDeviceInfo
 * variable contains this identifier. */

if(PLIB_USB_InterruptFlagGet(usbID, USB_INT_ATTACH))
{
    /* We can treat this as a valid attach. We then clear the
     * detach flag and enable the detach interrupt. We enable
     * the Transaction interrupt */

    PLIB_USB_InterruptFlagClear(usbID, USB_INT_HOST_DETACH);
    PLIB_USB_InterruptEnable(usbID, USB_INT_HOST_DETACH);
    PLIB_USB_InterruptEnable(usbID, USB_INT_TOKEN_DONE);

    /* Ask the Host layer to enumerate this device. While calling
     * this function, the UHD of the parent device which is the
     * root hub in this case.
     * */
    pUSBDrvObj->attachedDeviceObjHandle = USB_HOST_DeviceEnumerate
                                          (pUSBDrvObj->usbHostDeviceInfo, 0);
}

/* The following code example shows how the root hub driver calls the
 * USB_HOST_DeviceDenumerate() function in the device detach interrupt. Note how
 * the attachedDeviceObjHandle that was assigned at the time of device
 * enumeration is returned to the Host Layer to let the Host know which device
 * is being detached. */

if((usbInterrupts & USB_INT_HOST_DETACH) && (enabledUSBInterrupts & USB_INT_HOST_DETACH))
{
    /* Perform other detach related handling */

    /* Ask the Host Layer to de-enumerate this device. */
    USB_HOST_DeviceDenumerate (pUSBDrvObj->attachedDeviceObjHandle);

    /* Disable the LS Direct Connect. It may have been enabled if the last
     attach was for a Low-Speed device. */
    PLIB_USB_EP0LSDirectConnectDisable(pUSBDrvObj->usbID);

    /* Continue to perform detach handling */
}
```

Root Hub Port Operation

The HCD Root Hub Driver exposes a set of port related functions that allow the USB Host Layer to control the port. The most commonly used functions are the function to reset the port and get the port speed. In this case, this is the speed of the attached device. The following code example shows how the USB Host Layer calls the hubPortReset, hubPortResetIsComplete and hubPortSpeedGet port functions.

```
/* The following code shows an example of how the Host Layer called the
 * hubPortReset function to reset the port to which the device is connected.
 * The code proceeds with the port reset if no device on the bus is in an
 * enumeration state. It will then call the hubPortReset function of the parent
 * hub of the device. The parent hub, hubInterface member of deviceObj points to
 * this driver, can be the root hub or an external hub */

if(!busObj->deviceIsEnumerating)
{
    /* Remember which device is enumerating */
    busObj->enumeratingDeviceIdentifier = deviceObj->deviceIdentifier;

    /* Grab the flag */
    busObj->deviceIsEnumerating = true;

    /* Reset the device */
    deviceObj->hubInterface->hubPortReset( deviceObj->hubHandle, deviceObj->devicePort );
}

/* The following code example shows how the Host checks if the port reset
 * operation has completed. If the reset operation has completed, the speed of
 * the attached device can be obtained. The reset settling delay can then be
 * started. */

 case USB_HOST_DEVICE_STATE_WAITING_FOR_RESET_COMPLETE:

    /* Check if the reset has completed */
    if(deviceObj->hubInterface->hubPortResetIsComplete
                ( deviceObj->hubHandle ,deviceObj->devicePort ))
    {
        /* The reset has completed. We can also obtain the speed of the
         * device. We give a reset recovery delay to the device */

        deviceObj->speed = deviceObj->hubInterface->hubPortSpeedGet
                           (deviceObj->hubHandle, deviceObj->devicePort);

        deviceObj->deviceState = USB_HOST_DEVICE_STATE_START_RESET_SETTLING_DELAY;
    }
```

Opening and Closing a Pipe

The HCD client can open a pipe to the device after resetting the device. The USB Host Layer calls the hostPipeSetup function in the DRV_USB_HOST_INTERFACE structure to open a pipe. The USB Host Layer must open a pipe to communicate to a specific endpoint on a target device. While opening the pipe, the USB Host Layer must specify parameters which specify the address of the target device, the type of the transfer that the pipe must support and the speed of the pipe. If the device is connected to a hub, the address of the hub must be specified. The HCD Pipe Setup function *is not* interrupt-safe. It should not be called in any event handler that executes in an interrupt context.

The Pipe Setup function returns a valid pipe handle if the pipe was opened successfully. Pipe creation may fail if the target device was disconnected or if there are insufficient resources to open the pipe. The pipe handle is then used along with the hostIRPSubmit function to transfer data between the Host and the device. The following code shows example usage of a Pipe Open function.

```
/* The following code example shows how the Host Layer uses the hostPipeSetup
 * function to open a control pipe to the attached device. Most of the
 * parameters that are passed to this function become known when the device is
 * attached. The pipe handle is checked for validity after the hostPipeSetup
 * function call. */

if(busObj->timerExpired)
{
    busObj->busOperationsTimerHandle = SYS_TMR_HANDLE_INVALID;
    /* Settling delay has completed. Now we can open default address
     * pipe and and get the configuration descriptor */

    SYS_DEBUG_PRINT(SYS_ERROR_INFO,
                    "\r\nUSB Host Layer: Bus %d Device Reset Complete.", busIndex);
```

```
    deviceObj->controlPipeHandle =
              deviceObj->hcdInterface->hostPipeSetup( deviceObj->hcdHandle,
              USB_HOST_DEFAULT_ADDRESS , 0 /* Endpoint */,
              deviceObj->hubAddress /* Address of the hub */,
              deviceObj->devicePort /* Address of the port */,
              USB_TRANSFER_TYPE_CONTROL, /* Type of pipe to open */
              0 /* bInterval */, 8 /* Endpoint Size */, deviceObj->speed );

    if(DRV_USB_HOST_PIPE_HANDLE_INVALID == deviceObj->controlPipeHandle)
    {
        /* We need a pipe else we cannot proceed */
        SYS_DEBUG_PRINT(SYS_ERROR_DEBUG,
        "\r\nUSB Host Layer: Bus %d Could not open control pipe. Device not supported.", busIndex);
    }
}
```

An open pipe consumes computational and memory resources and must therefore must be closed if it will not be used. This is especially true of pipes to a device that is detached. The Host Layer calls the hostPipeClose function in the DRV_USB_HOST_INTERFACE structure to close the pipe. The pipe to be closed is specified by the pipe handle. The Pipe Close function can be called from an event handler. It is interrupt safe. Closing a pipe will cancel all pending transfers on that pipe. The IRP callback for such canceled transfers will be called with the status USB_HOST_IRP_STATUS_ABORTED. The following code example shows an example of closing the pipe.

```
/* The following code example shows an example of how the Host Layer calls the
 * hostPipeClose function to close an open pipe. Pipe should be closed if it
 * will not used. An open pipe consumes memory resources. In this example, the
 * Host Layer closes the pipe if it was not able successfully submit an IRP to
 * this pipe. */

/* Submit the IRP */
if(USB_ERROR_NONE != deviceObj->hcdInterface->hostIRPSubmit
                  ( deviceObj->controlPipeHandle, & (deviceObj->controlTransferObj.controlIRP)))
{
    /* We need to be able to send the IRP. We move the device to
     * an error state. Close the pipe and send an event to the
     * application. The assigned address will be released when
     * the device in unplugged. */

    SYS_DEBUG_PRINT(SYS_ERROR_DEBUG,
        "\r\nUSB Host Layer: Bus %d Set Address IRP failed. Device not supported.", busIndex);

    /* Move the device to error state */
    deviceObj->deviceState = USB_HOST_DEVICE_STATE_ERROR;

    /* Close the pipe as we are about mark this device as unsupported. */
    deviceObj->hcdInterface->hostPipeClose(deviceObj->controlPipeHandle);
}
```

Transferring Data to an Attached Device

The USB Host Layer, the HCD client, needs to transfer data to the attached device to understand the device capabilities and to operate the device. The HCD uses a concept of Input Output Request Packet (IRP) to transfer data to and from the attached device. IRPs are transported over pipes which are setup by calling the USB Driver Pipe Setup function.

A Host IRP is a USB_HOST_IRP type data structure. The IRP is created by the Host layer and submitted to the HCD for processing through the hostIRPSubmit function. At the time of submitting the IRP, the pipe over which the IRP must be transported is specified. The data request in the IRP is transported using the attributes of pipe. When an IRP is submitted to the HCD, it is owned by the HCD and cannot be modified by the Host Layer until the HCD issues an IRP callback. The HCD will issue the IRP callback when it has completed or terminated processing of the IRP.

An IRP does not have its own transfer type. It inherits the properties of the pipe to which it is submitted. Hence an IRP becomes a control transfer IRP it was submitted to a control transfer pipe. A pipe allows multiple IRPs to be queued. This allows the Host Layer to submit IRPs to a pipe even while an IRP is being processed on the pipe. The HCD will process an IRP in the order that it was received. The following code example shows the USB_HOST_IRP data structure.

```
/* The following code example shows the USB_HOST_IRP structure. The Host Layer
 * uses this structure to place data transfer requests on a pipe. */

typedef struct _USB_HOST_IRP
{
    /* Points to the 8 byte setup command packet in case this is a IRP is
     * scheduled on a CONTROL pipe. Should be NULL otherwise */
    void * setup;

    /* Pointer to data buffer */
    void * data;
```

```
    /* Size of the data buffer */
    unsigned int size;

    /* Status of the IRP */
    USB_HOST_IRP_STATUS status;

    /* Request specific flags */
    USB_HOST_IRP_FLAG flags;

    /* User data */
    uintptr_t userData;

    /* Pointer to function to be called when IRP is terminated. Can be NULL, in
     * which case the function will not be called. */
    void (*callback)(struct _USB_HOST_IRP * irp);

    /*************************************
     * These members of the IRP should not be
     * modified by client
     *************************************/
   uintptr_t privateData[7];

} USB_HOST_IRP;
```

The `setup` member of the USB_HOST_IRP structure must point to the 8 byte setup packet for control transfers. The driver will send this 8 byte data in the Setup phase of the control transfer. It can be NULL for non-control transfers. This member is only considered if the IRP is submitted to a control transfer pipe. It is ignored for non-control transfer pipes. The structure of the setup command should match that specified in the USB 2.0 specification.

The `data` member of the USB_HOST_IRP structure points to a data buffer. This data buffer will contain the data that needs to be sent to the device for data stage of a OUT transfer, or it will contain the data that was received from the device during an IN transfer. Any hardware specific cache coherency and address alignment requirements must be considered while allocating this data buffer. The Driver Client should not modify or examine the contents of the IRP after the IRP has been submitted and is being processed. It can be examined after the driver has released the IRP.

The `size` member of the USB_HOST_IRP structure contains the size of the transfer. for Bulk transfers, the size of the transfer can exceed the size of the transaction (which is equal to size of the endpoint reported by the device). The HCD in such a case will split up the transfer into transactions. This process does not require external intervention. For control transfers, the size of the transfer is specified in the setup packet (pointed to by the `setup` member of the USB_HOST_IRP structure). The driver will itself process the Setup, Data (if required) and Handshake stages of control transfer. This process again does not require external intervention. For interrupt and isochronous transfers, the size of transfer specified in the IRP cannot exceed the size of the transaction. If size is specified as 0, then the driver will send a zero length packet. The `size` parameter of the IRP is updated by the driver when IRP processing is completed. This will contain the size of the completed transfer.

The `status` member of the IRP provides the completion status of the IRP and should be checked only when the IRP processing has completed. This is indicated by the driver calling the IRP callback function. The IRP status is a USB_HOST_IRP_STATUS type. The following code example shows the different possible values of the `status` member and an example of submit a control transfer IRP.

```
/* The following code shows an example of how the Host Layer populates
 * the IRP object and then submits it. IRP_Callback function is called when an
 * IRP has completed processing. The status of the IRP at completion can be
 * checked in the status flag. The size field of the irp will contain the amount
 * of data transferred. */

void IRP_Callback(USB_HOST_IRP * irp)
{
    /* irp is pointing to the IRP for which the callback has occurred. In most
     * cases this function will execute in an interrupt context. The application
     * should not perform any hardware access or interrupt unsafe operations in
     * this function. */

    switch(irp->status)
    {
        case USB_HOST_IRP_STATUS_ERROR_UNKNOWN:
            /* IRP was terminated due to an unknown error */
            break;

        case USB_HOST_IRP_STATUS_ABORTED:
            /* IRP was terminated by the application */
            break;

        case USB_HOST_IRP_STATUS_ERROR_BUS:
            /* IRP was terminated due to a bus error */
```

```
            break;

        case USB_HOST_IRP_STATUS_ERROR_DATA:
            /* IRP was terminated due to data error */
            break;

        case USB_HOST_IRP_STATUS_ERROR_NAK_TIMEOUT:
            /* IRP was terminated because of a NAK timeout */
            break;

        case USB_HOST_IRP_STATUS_ERROR_STALL:
            /* IRP was terminated because of a device sent a STALL */
            break;

        case USB_HOST_IRP_STATUS_COMPLETED:
            /* IRP has been completed */
            break;

        case USB_HOST_IRP_STATUS_COMPLETED_SHORT:
            /* IRP has been completed but the amount of data processed was less
             * than requested. */
            break;

        default:
            break;
    }
}

/* In the following code example the a control transfer IRP is submitted to a
 * control pipe. The setup parameter of the IRP points to the Setup command of
 * the control transfer. The direction of the data stage is specified by the
 * Setup packet. */

USB_HOST_IRP irp;
USB_ERROR result;
USB_HOST_PIPE_HANDLE controlPipe;
USB_SETUP_PACKET setup;
uint8_t controlTransferData[32];

irp.setup = setup;
irp.data = controlTransferData;
irp.size = 32;
irp.flags = USB_HOST_IRP_FLAG_NONE ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

result = DRV_USBFS_HOST_IRPSubmit(controlPipeHandle, &irp);

switch(result)
{
    case USB_ERROR_NONE:
        /* The IRP was submitted successfully */
        break;

    case USB_ERROR_HOST_PIPE_INVALID:
        /* The specified pipe handle is not valid */
        break;

    case USB_ERROR_OSAL_FUNCTION:
        /* An error occurred while trying to grab mutex */
        break;

    default:
        break;
}
```

The `flags` member of the USB_HOST_IRP structure specifies flags which affect the behavior of the IRP. The USB_HOST_IRP_FLAG enumeration specifies the available option. The USB_HOST_IRP_FLAG_SEND_ZLP causes the driver to add a Zero Length Packet (ZLP) to the data stage of the transfer when the transfer size is an exact multiple of the endpoint size. The USB_HOST_IRP_WAIT_FOR_ZLP flag will cause the driver to wait for a ZLP from the device in a case where the size of data received thus far in the transfer is an exact multiple of the endpoint

size.

The `callback` member of the USB_HOST_IRP structure points to a function which the driver calls when the IRP processing is completed. The Driver Client must implement this function and assign the pointer to this function to the `callback` member of the IRP. Every IRP can have its own callback function or one common callback function could be used. The callback function will execute in an interrupt context. The Driver Client should not execute interrupt unsafe, blocking, or computationally intensive operations in the callback function. The client can call hostIRPSubmit function in the IRP callback function to submit another IRP or resubmit the same IRP. The client can check the status and size of the IRP in the callback function.

The `userData` member of the USB_HOST_IRP structure can be used by the client to associate a client specific context with the Host. This context can then be used by the client, in the IRP callback function to identify the context in which the IRP was submitted. This member is particularly useful if the client wants to implement one callback function for all IRPs.

The `privateData` member of the IRP is used by the driver and should not be accessed or manipulated by the Driver Client. The following code examples show usage of IRPs to transfer data between the Host and the attached device and along with the different flags.

```
/* The following code shows an example of submitting an IRP to send data
 * to a device. In this example we will request the driver to send a ZLP after
 * sending the last transaction. The driver will send the ZLP only if the size
 * of the transfer is a multiple of the endpoint size. This is not a control
 * transfer IRP. So the setup field of the IRP will be ignored.  */

USB_HOST_IRP irp;
USB_ERROR result;
USB_HOST_PIPE_HANDLE bulkOUTPipeHandle;
uint8_t data[128];

irp.data = data;
irp.size = 128;
irp.flags = USB_HOST_IRP_FLAG_SEND_ZLP ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

result = DRV_USBFS_HOST_IPRSubmit( bulkOUTPipeHandle, &irp );

/* The following code shows an example of submitting an IRP to receive
 * data to a device. In this example we will request the driver to wait for a
 * ZLP after receiving the last transaction. The driver will wait for the ZLP
 * only if the size of the transfer is a multiple of the endpoint size. This is
 * not a control transfer IRP. So the setup field of the IRP will be ignored.
 * */

USB_HOST_IRP irp;
USB_ERROR result;
USB_HOST_PIPE_HANDLE bulkINPipeHandle;
uint8_t data[128];

irp.data = data;
irp.size = 128;
irp.flags = USB_HOST_IRP_FLAG_WAIT_FOR_ZLP ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

result = DRV_USBFS_HOST_IPRSubmit( bulkINPipeHandle, &irp );
```

USB Driver Device Mode Operation

Provides information on Device mode operation.

Description

The USB Driver operates can operate in the Device mode when it is initialized for Device mode or Dual Role operation. When operating in Device mode, the USB Driver is also referred to as the USB Controller Driver (USBCD). In Dual-Role mode, the USB Driver will switch to USBCD mode when the USB Driver Device Attach function is called.

The USB Driver Client must perform these steps to operate the USB Driver in Device mode.

1. Open the USB Driver to obtain the driver handle.
2. Set the event handler.
3. Wait for the application to attach the device to the bus.
4. Enable Endpoint 0 and respond to USB Host Enumeration requests.
5. Allow the application and function drivers to enable other endpoints and communicate with the Host.

The following sections discuss these operations in more detail.

General Device Mode Operations

Provides information on general Device mode operations.

Description

This section describes the USBCD operations such as setting event handlers and attaching and detaching the device.

Handling Device Mode Driver Events

The Device Layer will call the USBCD eventHandlerSet function to register the Device mode event handling function. The USBCD generates various events that indicate different states of the USB. These events are defined by the DRV_USB_EVENT enumeration. The following code example shows how the Device Layer registers the driver event handling function.

```
/* This code example shows the implementation of the USB_DEVICE_Attach and the
 * USB_DEVICE_Detach function. These functions are actually macro that map
 * directly deviceAttach and the deviceDetach function of the driverInterface
 * member of the deviceClient Object (which is the macro parameter) */

#define USB_DEVICE_Attach( x )  ((USB_DEVICE_OBJ *)x)->driverInterface->deviceAttach
                                ( ((USB_DEVICE_OBJ *)(x))->usbCDHandle)
#define USB_DEVICE_Detach( x )  ((USB_DEVICE_OBJ *)x)->driverInterface->deviceDetach
                                ( ((USB_DEVICE_OBJ *)x)->usbCDHandle)
```

If the driver is operating in interrupt mode, the client event handling function will execute in an interrupt context. The client should not call interrupt unsafe, computationally intensive or blocking functions in the event handler. The following code shows a small example of the Device Layer USBCD Event Handler:

```
/* This code example shows a partial implementation of the USB Device Layer
 * event handler. Note how the code type casts the referenceHandle parameter to
 * a USB_DEVICE_OBJ type. This referenceHandle is the same value that the Device
 * Layer passed when the event handler was set. This now easily allows one
 * implementation of the event handling code to be used by multiple Device
 * Layer instances. */

    void _USB_DEVICE_EventHandler
(
    uintptr_t referenceHandle,
    DRV_USB_EVENT eventType,
    void * eventData
)
{
    USB_DEVICE_OBJ* usbDeviceThisInstance;
    USB_DEVICE_MASTER_DESCRIPTOR * ptrMasterDescTable;
    USB_DEVICE_EVENT_DATA_SOF SOFFrameNumber;

    usbDeviceThisInstance = (USB_DEVICE_OBJ *)referenceHandle;

    /* Handle events, only if this instance is in initialized state */
    if( usbDeviceThisInstance->usbDeviceInstanceState <= SYS_STATUS_UNINITIALIZED )
    {
        /* The device should anyway not be attached when the Device Layer is
         * not initialized. If we receive driver event when the Device Layer is
         * not initialized, there is nothing we can do but ignore them. */
        return;
    }

    switch(eventType)
    {
        case DRV_USB_EVENT_RESET_DETECT:

            /* Clear the suspended state */
            usbDeviceThisInstance->usbDeviceStatusStruct.isSuspended = false;

            /* Cancel any IRP already submitted in the RX direction. */
            DRV_USB_DEVICE_IRPCancelAll( usbDeviceThisInstance->usbCDHandle,
                    controlEndpointRx );

            /* Code not shown for the sake of brevity. */
```

```
    }
}
```

In the previous code example, the Device Layer (the Driver Client) sets the `hReferenceData` parameter, of the Event Handler Set function, to point to a local object. This pointer is returned to the Device Layer, in the event handler when an event occurs. For multiple instances of USB drivers in one application, this allows the Device Layer to easily associate a Device Layer specific context to the driver instance, thus simplifying implementation of the event handler.

Attaching and Detaching the Device

The USB Device Layer calls the USBCD deviceAttach and deviceDetach functions to attach and detach the device on the USB. The USB Device Layer should be ready to handle events which would occur when the device is attached on the bus. Hence the USB Device Layer should register the USBCD event handler before the attach function is called. The deviceAttach and deviceDetach functions can be called in an interrupt context. These functions are respectively called when the USB Device application detects a valid VBUS voltage and when the VBUS voltage is not valid.

Setting the Device Address

The USB Device Layer will call the USBCD deviceAddressSet function to set the USB address of the device. The Device Layer will do this when it receives the Set Address control request from the Host. The USBCD will reset the device address to '0' when it has received reset signaling from the root hub. The following code example shows how the USB Device Layer calls this function.

```
/* The following code example shows how the USB Device Layer calls the
 * DRV_USB_DEVICE_AddressSet function to set the address. The
 * DRV_USB_DEVICE_AddressSet function is actually a macro that calls the
 * deviceAddressSet function of the driverInterface of usbDeviceThisInstance
 * object. The usbDeviceThisInstance is Device Layer object.
 *
 * As seen in this code, the Device Layer calls the address set function when
 * the it a pending set address control request from the Host has completed. */

void _USB_DEVICE_Ep0TransmitCompleteCallback(USB_DEVICE_IRP * handle)
{
    USB_DEVICE_IRP * irpHandle = (USB_DEVICE_IRP *)handle;
    USB_DEVICE_OBJ * usbDeviceThisInstance;
    USB_DEVICE_CONTROL_TRANSFER_STRUCT * controlTransfer;

    usbDeviceThisInstance = (USB_DEVICE_OBJ *)irpHandle->userData;
    controlTransfer = &(usbDeviceThisInstance->controlTransfer);

    if(irpHandle->status == USB_DEVICE_IRP_STATUS_ABORTED)
    {
        return;
    }

    if(usbDeviceThisInstance->usbDeviceStatusStruct.setAddressPending)
    {
        DRV_USB_DEVICE_AddressSet(usbDeviceThisInstance->usbCDHandle,
                                  usbDeviceThisInstance->deviceAddress);
        usbDeviceThisInstance->usbDeviceStatusStruct.setAddressPending = false;
    }

    /* Code not shown for the sake of brevity */

}
```

Device Current Speed and SOF Number

The USB Device Layer will call the USBCD deviceCurrentSpeedGet function to know the speed at which the device is attached to the USB. This allows the Device Layer to select the correct endpoint settings at the time of processing the Set Configuration request issued by the Host. The USB Device Layer will call the deviceSOFNumberGet function to return the SOF number at the time of the SOF event.

Device Remote Wake-up

The USB Device Layer will call the USBCD deviceRemoteWakeupStop and deviceRemoteWakeupStart functions to stop and start remote signaling. The Device layer application will call the USB Device Layer Stop and Start Remote Wakeup Signaling functions to remotely let the root hub know that the device is ready to be woken up. The timing of the remote signaling is controlled by the Device Layer. The client should call the remote wakeup function only when the device is suspended by the Host.

Device Endpoint Operations

Provides information on Device Endpoint operations.

Description

The UBSCD Endpoint functions allow the Driver Client to enable, disable, stall and clear the stall condition on an endpoint. The client submits requests to transmit and receive data from the USB Host on an endpoint.

Endpoint Enable and Disable functions

The USBCD client must enable an endpoint it must use the endpoint for communicating with the USB Host. The client will call the USBCD deviceEndpointEnable function to enable the endpoint. While calling this function, the client must specify the endpoint address, the transfer type to be processed on this endpoint and the maximum size of a transaction on this endpoint. This function is thread-safe when called in an RTOS application. The USBCD allows an endpoint to be accessed by one thread only. The USB Device Layer and the device function drivers will enable the endpoint when the Host sets the device configuration. The USBCD deviceEndpointIsEnabled function is available to check if an endpoint is enabled. The following code example shows how the USB Device Layer enables the device endpoint.

```
/* The following code example shows the USB Device Layer enables Endpoint 0 to
 * prepare for the enumeration process after it has received reset signaling
 * from the Host. The Device Layer calls the deviceEndpointEnable function to
 * to enable the endpoint. The driverInterface member of the
 * usbDeviceThisInstance structure points to the USB Device Mode Driver Common
 * Interface. */

void _USB_DEVICE_EventHandler
(
    uintptr_t referenceHandle,
    DRV_USB_EVENT eventType,
    void * eventData
)
{
    /* Code not shown due to space constraints */

    switch(eventType)
    {
        case DRV_USB_EVENT_RESET_DETECT:

            /* Clear the suspended state */
            usbDeviceThisInstance->usbDeviceStatusStruct.isSuspended = false;

            /* Cancel any IRP already submitted in the RX direction. */
            DRV_USB_DEVICE_IRPCancelAll( usbDeviceThisInstance->usbCDHandle,
                    controlEndpointRx );

            /* Cancel any IRP already submitted in the TX direction. */
            DRV_USB_DEVICE_IRPCancelAll( usbDeviceThisInstance->usbCDHandle,
                    controlEndpointTx );

            /* Deinitialize all function drivers.*/
            _USB_DEVICE_DeInitializeAllFunctionDrivers ( usbDeviceThisInstance );

            /* Disable all endpoints except for EP0.*/
            DRV_USB_DEVICE_EndpointDisableAll(usbDeviceThisInstance->usbCDHandle);

            /* Enable EP0 endpoint in RX direction */
            (void)usbDeviceThisInstance->driverInterface->deviceEndpointEnable
                  (usbDeviceThisInstance->usbCDHandle,
                    controlEndpointTx, USB_TRANSFER_TYPE_CONTROL, USB_DEVICE_EP0_BUFFER_SIZE);

            /* Code not shown due to space constraints */

            break;
    }
}
```

The USB Device Layer and the Function drivers will disable an endpoint when the Host sets a zero-device configuration or when the Host resets the device. The USBCD deviceEndpointDisable function disables an endpoint. When an endpoint is disabled, it does not accept requests for Host communication. Disabling an endpoint does not cancel any communication requests that that have been submitted on the endpoint. These requests must be canceled explicitly.

Device Endpoint Stall and Stall Clear

The USBCD client can call the deviceEndpointStall and deviceEndpointStallClear functions to stall and cleat the stall on an endpoint respectively. The USB Device Layer and function driver may stall endpoint to indicate error or to indicate a protocol state. The endpoint stall condition may be

cleared in response to a USB Host Clear Feature request. Stalling or clearing the stall on an endpoint will cause all communication requests on the endpoint to be canceled. The function calls are thread safe and interrupt safe. The deviceEndpointIsStalled function is also available to check if an endpoint is in a stalled state. The following code example shows how the USB Device Layer calls these functions to stall and clear the stall on an endpoint.

```
/* The following code example shows how the USB Device Layer calls the driver
 * endpoint stall function (deviceEndpointStall) to stall an endpoint when the a
 * Host send a Set Feature request with feature selector set to endpoint halt.
 * The endpoint to be halted is identified in the setup packet and is identified
 * in this code example as usbEndpoint. Also shown is how the stall clear
 * (deviceEndpointStallClear) and stall status check (deviceEndpointIsStalled)
 * functions are called. */

/* The driverInterface member of the usbDeviceThisInstance structure is a
 * pointer to the USB Driver Common Interface. */

void _USB_DEVICE_ProcessStandardEndpointRequest
(
    USB_DEVICE_OBJ * usbDeviceThisInstance,
    uint8_t interfaceNumber,
    USB_SETUP_PACKET * setupPkt
)
{
    USB_ENDPOINT usbEndpoint;
    usbEndpoint = setupPkt->bEPID;

    if( setupPkt->bRequest == USB_REQUEST_GET_STATUS )
    {
        usbDeviceThisInstance->getStatusResponse.status = 0x00;
        usbDeviceThisInstance->getStatusResponse.endPointHalt
            =  usbDeviceThisInstance->driverInterface->deviceEndpointIsStalled
               (usbDeviceThisInstance->usbCDHandle, usbEndpoint );

        USB_DEVICE_ControlSend( (USB_DEVICE_HANDLE)usbDeviceThisInstance,
                (uint8_t *)&usbDeviceThisInstance->getStatusResponse, 2 );
    }
    else if( setupPkt->bRequest == USB_REQUEST_CLEAR_FEATURE )
    {
        if( setupPkt->wValue == USB_FEATURE_SELECTOR_ENDPOINT_HALT )
        {
            usbDeviceThisInstance->driverInterface->deviceEndpointStallClear
            (usbDeviceThisInstance->usbCDHandle, usbEndpoint );
            USB_DEVICE_ControlStatus((USB_DEVICE_HANDLE)usbDeviceThisInstance,
                                     USB_DEVICE_CONTROL_STATUS_OK );
        }
    }
    else if (setupPkt->bRequest == USB_REQUEST_SET_FEATURE )
    {
        if( setupPkt->wValue == USB_FEATURE_SELECTOR_ENDPOINT_HALT )
        {
            usbEndpoint = setupPkt->bEPID;
            usbDeviceThisInstance->driverInterface->deviceEndpointStall
                                 (usbDeviceThisInstance->usbCDHandle, usbEndpoint );
            USB_DEVICE_ControlStatus((USB_DEVICE_HANDLE)usbDeviceThisInstance,
                                     USB_DEVICE_CONTROL_STATUS_OK );
        }
    }

    /* Additional code is not shown due to space constraints */
}
```

Transferring Data to the Host

Provides information on transferring data to the Host.

Description

The USB Device Layer, the USBCD client, needs to transfer data to the Host in response to enumeration requests for general operation on the device. The USB uses a concept of Input Output Request Packet (IRP) to transfer data to and from the Host. IRPs are transported over endpoints which are enabled by calling the USBCD Endpoint Enable function.

A Device IRP is a USB_DEVICE_IRP type data structure. The IRP is created by the Device Layer and submitted to the USBCD for processing through the deviceIRPSubmit function. At the time of submitting the IRP, the endpoint over which the IRP must be transported is specified. The data request in the IRP is transported using the attributes of the endpoint. When an IRP is submitted to the USBCD, it is owned by the USBCD and cannot be modified by the Device Layer until the USBCD issues an IRP callback. The USBCD will issue the IRP callback when it has completed or terminated processing of the IRP.

An IRP does not have its own transfer type. It inherits the properties of the endpoint to which it is submitted. Hence an IRP becomes a control transfer IRP it was submitted to a control endpoint. An endpoint allows multiple IRPs to be queued. This allows the Device Layer to submit IRPs to an endpoint even while an IRP is being processed on the endpoint. The USBCD will process an IRP in the order that it was received. The following code example shows the USB_DEVICE_IRP data structure:

```
/* This code example shows the USB_DEVICE_IPR structure. The Device Layer
 * uses such a structure to transfer data through the driver. A structure of
 * this type is allocated by the Device Layer and the other function drivers and
 * passed to the deviceIRPSubmit function. */

typedef struct _USB_DEVICE_IRP
{
    /* Pointer to the data buffer */
    void * data;

    /* Size of the data buffer */
    unsigned int size;

    /* Status of the IRP */
    USB_DEVICE_IRP_STATUS status;

    /* IRP Callback. If this is NULL, then there is no callback generated */
    void (*callback)(struct _USB_DEVICE_IRP * irp);

    /* Request specific flags */
    USB_DEVICE_IRP_FLAG flags;

    /* User data */
    uintptr_t userData;

    /**********************************
     * The following members should not
     * be modified by the client
     **********************************/
    uint32_t privateData[3];

} USB_DEVICE_IRP;
```

The `data` member of the USB_DEVICE_IRP structure points to a data buffer. This data buffer will contain the data that needs to be sent to the Host for the data stage of an IN transfer. For an OUT transfer, it will contain the data that was received from the Host. Any hardware specific cache coherency and address alignment requirements must be considered while allocating this data buffer. The Driver Client should not modify or examine the contents of the IRP after the IRP has been submitted and is being processed. It can be examined after the driver has released the IRP.

The `size` member of the USB_DEVICE_IRP structure specifies the size of the data buffer. The transfer will end when the device has sent or received size number of bytes. While sending data to the Host, the IRP size can exceed the size of the transaction (which is equal to the size of the endpoint). The USBCD in such a case will split up the transfer into transactions. This process does not require external intervention. The driver uses receive and transmit IRPs to process control transfers. When the driver receives a Setup packet, the IRP completion status would be USB_DEVICE_IRP_STATUS. The Driver Client should then use additional receive and transmit IRPs to complete the control transfer.

For interrupt and isochronous transfers, the size of transfer specified in the IRP cannot exceed the size of the transaction. If size is specified as 0, then the driver will send or expect a zero length packet. The `size` parameter of the IRP is updated by the driver when IRP processing is completed. This will contain the size of the completed transfer.

The `status` member of the IRP provides the completion status of the IRP and should be checked only when the IRP processing has completed. This is indicated by the driver calling the IRP callback function. The IRP status is a USB_DEVICE_IRP_STATUS type. The following code example shows the different possible values of the `status` member and example usage of IRPs to transfer data between the device and the Host.

```
/* The followoing code shows example usage of the device IRP. The submit status
 * of the IRP is available when IRP submit function returns. The completion
 * status of the IRP is available when the IRP has terminated and the IRP
 * callback function is invoked. The IRP callback
 * function shown in this example shows the possible complete status of the IRP.
 * The end application may or may not handle all the cases. Multiple IRPs can be
 * queued on an endpoint. */

void IRP_Callback(USB_DEVICE_IRP * irp)
{
```

```
    /* irp is pointing to the IRP for which the callback has occurred. In most
     * cases this function will execute in an interrupt context. The application
     * should not perform any hardware access or interrupt unsafe operations in
     * this function. */

    switch(irp->status)
    {
        case USB_DEVICE_IRP_STATUS_TERMINATED_BY_HOST:
            /* The IRP was aborted because the Host cleared the stall on the
             * endpoint */
            break;

        case USB_DEVICE_IRP_STATUS_ABORTED_ENDPOINT_HALT:
            /* IRP was aborted because the endpoint halted */
            break;

        case USB_DEVICE_IRP_STATUS_ABORTED:
            /* USB Device IRP was aborted by the function driver */
            break;

        case USB_DEVICE_IRP_STATUS_ERROR:
            /* An error occurred on the bus when the IRP was being processed */
            break;

        case USB_DEVICE_IRP_STATUS_COMPLETED:
            /* The IRP was completed */
            break;

        case USB_DEVICE_IRP_STATUS_COMPLETED_SHORT:
            /* The IRP was completed but the amount of data received was less
             * than the requested size */
            break;

        default:
            break;

}

/* In the following example, the IRP is submitted to Endpoint 0x84. This is
 * interpreted as an IN direction endpoint (MSB of 0x84 is 1) and Endpoint 4.
 * The data contained in source will be sent to the USB Host. Assuming
 * the endpoint size is 64, the 130 bytes of data in this case will be sent to
 * the Host in three transaction of 64, 64 and 2 bytes. A transaction completes
 * when the Host polls (sends an IN token) the device.  The callback function
 * will then called indicating the completion status of the IRP. The application
 * should not modify the privateData field of the IRP. If the IRP was submitted
 * successfully, the buffer will be owned by the driver until the IRP callback
 * function has been called. Because the size of the transfer is not a multiple
 * of the endpoint size, the IRP flag must be set
 * USB_DEVICE_IRP_FLAG_DATA_COMPLETE. This directs the driver to not perform any
 * explicit signaling to the Host to indicate end of transfer. The last packet
 * in this case is a short packet and this signals the end of the transfer. */

     * In this case data will be pointing to a buffer where the received data will
     * be stored. Note that the size of the IRP should be a multiple of the endpoint
     * size. The flags parameter is ignored in the data receive case. The IRP
     * terminates when the specified size of bytes has been received (the Host sends
     * OUT packets) or when a short packet has been received. */

    USB_DEVICE_IRP irp;
    USB_ERROR result;
    uint8_t destination[128];

    irp.data = destination;
    irp.size = 128;
    irp.called = IRP_Callback;
    userData = &someApplicationObject;

    result = DRV_USBFS_DEVICE_IRPSubmit(driverHandle, 0x04, &irp);
```

For IRPs submitted to an Interrupt or Isochronous endpoints, the driver will always send either the less than or equal to the maximum endpoint packet size worth of bytes in a transaction. The application could either submit an IRP per Interrupt/Isochronous polling interval or it could submit one IRP for multiple polling intervals.

The `flags` member of the USB_DEVICE_IRP structure specifies flags which affect the behavior of the IRP. The USB_DEVICE_IRP_FLAG enumeration specifies the available option. The USB_DEVICE_IRP_FLAG_DATA_COMPLETE causes the driver to add a Zero Length Packet (ZLP) to the data stage of the IN transfer when the transfer size is an exact multiple of the endpoint size. If the transfer size is not a multiple of the endpoint size, no ZLP will be sent. The USB_DEVICE_IRP_FLAG_PENDING flag will cause the driver to not send a ZLP in a case where the size of the IN transfer is an exact multiple of the endpoint size. The following code example demonstrates this.

```
/* In the following code example, the IRP is submitted to an IN endpoint whose size
 * is 64. The transfer size is 128, which is an exact multiple of the endpoint
```

```
 * size. The flag is set to USB_DEVICE_IRP_FLAG_DATA_COMPLETE. The driver
 * will send two transactions of 64 bytes each and will then automatically send a
 * Zero Length Packet (ZLP), thus completing the transfer. The IRP callback will
 * be invoked when the ZLP transaction has completed. */

USB_DEVICE_IRP irp;
USB_ERROR result;
uint8_t source[128];

irp.data = source;
irp.size = 128;
irp.called = IRP_Callback;
flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
userData = &someApplicationObject;

result = DRV_USBFS_DEVICE_IRPSubmit(driverHandle, 0x84, &irp);

/* In the following code example, the IRP is submitted to an IN endpoint whose size
 * is 64. The transfer size is 128, which is an exact multiple of the endpoint
 * size. The flag is set to to USB_DEVICE_IRP_FLAG_DATA_PENDING. The driver will
 * send two transactions of 64 bytes each but will not send a ZLP. The USB Host
 * can then consider that there is more data pending in the transfer. The IRP
 * callback will be invoked when the two transactions have completed. */

USB_DEVICE_IRP irp;
USB_ERROR result;
uint8_t source[128];

irp.data = source;
irp.size = 128;
irp.called = IRP_Callback;
flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
userData = &someApplicationObject;

result = DRV_USBFS_DEVICE_IRPSubmit(driverHandle, 0x84, &irp);
```

The `callback` member of the USB_DEVICE_IRP structure points to a function which the driver calls when the IRP processing is completed. The Driver Client must implement this function and assign the pointer to this function to the `callback` member of the IRP. Every IRP can have its own callback function or one common callback function could be used. The callback function will execute in an interrupt context. The Driver Client should not execute interrupt unsafe, blocking or computationally intensive operations in the callback function. The client can call deviceIRPSubmit function in the IRP callback function to submit another IRP or resubmit the same IRP. The client can check the status and size of the IRP in the callback function.

The `userData` member of the USB_DEVICE_IRP structure can be used by the client to associate a client specific context with the Host. This context can then be used by the client, in the IRP callback function to identify the context in which the IRP was submitted. This member is particularly useful if the client wants to implement one callback function for all IRPs.

The `privateData` member of the IRP is used by the driver and should not be accessed or manipulated by the Driver Client.

PIC32MX USB Driver

Provides information on the USB Driver specific to PIC32MX devices.

Description

The PIC32MX USB Driver in MPLAB Harmony provides API functions that allow the MPLAB Harmony USB Host and Device Stack to access the USB while operating on a PIC32MX microcontroller. The driver implements the USB Driver Common Interface required by the USB Host and Device Stack. It abstracts the USB module operational details from the Host and Device Stack and provides the stacks with a modular access mechanism to the USB. The PIC32MX USB Driver features the following:

- USB 2.0 Full Speed operation in Peripheral mode
- USB 2.0 Full Speed and Low Speed USB Peripheral Support in Host mode
- Designed for Dual Role Operation
- Capable of operating multiple USB modules
- Features non-blocking function and is interoperable with other MPLAB Harmony modules
- Features thread safe functions when operating within an RTOS
- Capable of operating in Polled and Interrupt modes
- Implements the USB Driver Common Interface required by the MPLAB Harmony USB Host and Device Stack
- Completely configurable through MPLAB Harmony Configurator (MHC) tool
- Implements feature separation (Host and Device mode functions are implemented across different files)

Note: This help section only discusses features that are unique to the PIC32MX USB Driver and are not a part of the USB Driver Common Interface. The driver functions that implement the USB Driver Common Interface are described in the Common Interface Help section.

While the PIC32MX USB module supports USB "On-The-Go" (OTG), this release of the PIC32MX Driver does not implement USB OTG protocol support.

This help section only provides relevant information about the operation of the USB. The reader is encouraged to refer to the USB 2.0 Specification available at www.usb.org for a detailed explanation of USB protocol.

Using the Library

This topic describes the basic architecture of the PIC32MX USB Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_usbfs.h`

The interface to the PIC32MX USB Driver library is defined in the `drv_usbfs.h` header file.

Please refer to the What is MPLAB Harmony? section for how the Driver interacts with the framework.

Library Overview

Provides an overview of the library.

Description

The PIC32MX USB Driver will typically be used by a USB Host and/or Device Stack. The USB Host and Device Stack operate as driver client applications. The driver is initialized as part of the MPLAB Harmony System Initialization. The driver initialization data structure specifies the operation mode (Host, Device, or Dual Role) of the driver. The driver features task routines to be called in the MPLAB Harmony application tasks function (SYS_Tasks function) and the USB Module Interrupt Service Routine (ISR).

The Host and the Device Stack can open the driver only when initialization has completed. It will continue to return an invalid driver handle while the initialization is in progress. Once opened, the Device Mode function can be called if the driver is operating in Device mode. The Host Mode function can be called if the driver is operating in Host mode. In Dual Role operation mode, the driver supports Host and Device operation in the same application. Even then, the driver will either operate as a USB Host or Device. OTG operation is not supported.

The PIC32MX USB Driver features RTOS thread-safe functions. This allows the driver client application to safely call driver functions across different RTOS threads. Not all of the driver functions are interrupt-safe.

In addition to the USB Driver, which implements the USB Driver Common Interface, the PIC32MX USB Driver implements functions which are required for its operation in the MPLAB Harmony framework. The following table lists the different categories of functions in the PIC32MX USB Driver.

Library Interface Section	Description
System Function	These functions are accessed by the MPLAB Harmony System module. They allow the driver to be initialized, deinitialized and maintained. These functions are implemented in the `drv_usbfs.c` source file.
Client Core Functions	These functions allow the USB Host and Device Stack to open, close and perform other general driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbfs.c` source file.
Device Mode Operation Functions	These functions allow the USB Device Stack to perform USB Device mode specific driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbfs_device.c` source file
Host Mode Operation Functions	These functions allow the USB Host Stack to perform USB Host mode specific driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbfs_host.c` source file.
Root Hub Functions	These functions allow the USB Host Stack to access the driver Root hub operation. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbfs_host.c` source file.

Abstraction Model

Provides information on the abstraction model for the library.

Description

The PIC32MX USB Driver implements the abstraction model defined by the USB Driver Common interface. This interface abstracts USB module specific details and provides a module independent interface to the driver client applications.

While operating in Device mode, the driver expects the client application (the USB Device Stack) to enable endpoints and then submit I/O request

packet (IRP) requests to the enabled endpoints. Multiple IRPs can be queued on an endpoint. The driver calls the IRP callback function when the IRP is processed. The driver allows the client application to also attach and detach the device on the bus. It generates events which indicate USB states.

While operating in Host mode, the driver expects the client application (the USB Host Stack) to open pipes to endpoints on the connected device. The client application can then submit IRPs to the pipes. Multiple IRPs can be queued on a pipe. The driver calls the IRP callback function when the IRP is processed. The driver will call application defined functions to enumerate and denumerate a device. These functions are called when the driver detect device attach and detach respectively. The driver also exports root hub functions to the client application. This allows the client application to treat the driver as a single port hub

Please refer to the PIC32 USB Driver Common Interface help section for more details on the driver abstraction model.

How the Library Works

Provides information on how the library works.

Description

This section only explains aspects of driver operation which are unique to the PIC32MX USB Driver. Major driver operations are described in the PIC32 USB Driver Common Interface help section.

Driver Initialization

Note: While generating a MPLAB Harmony USB project with MHC, the initialization code for the driver is generated automatically based on selections made in the USB Host stack or Device Stack Configuration trees.

The PIC32MX USB Driver must be initialized so that a client application can open. The client application will not be able to open the driver if the initialization is in progress or has failed. The driver is initialized by calling the DRV_USBFS_Initialize function. This function is called from the SYS_Initialize function in the MPLAB Harmony application project and accepts two input parameters. The index parameter defines the instance of the USB Driver to be initialized. This becomes significant when the PIC32MX microcontroller has more than one USB module. The init parameter is a driver specific data structure of the type DRV_USBFS_INIT. This structure is shown in the following code example.

```
/* This code snippet show the PIC32MX USB Driver Initialization data structure.
 * A structure of this type must be provided to the DRV_USBFS_Initialize()
 * function. */

typedef struct
{
    /* System Module Initialization */
    SYS_MODULE_INIT moduleInit;

    /* Identifies the USB peripheral to be used. This should be the USB PLIB
       module instance identifier. */
    uint8_t usbID;

    /* This should be set to true if the USB module must stop operation in IDLE
       mode */
    bool stopInIdle;

    /* This should be set to true if the USB module must suspend when the CPU
       enters sleep mode. */
    bool suspendInSleep;

    /* Specify the interrupt source for the USB module. This should be Interrupt
       PLIB Interrupt source identifier for the USB module instance specified in
       usbID. */
    INT_SOURCE interruptSource;

    /* Specify the operational speed of the USB module. This should always be
       set to USB_SPEED_FULL. The use of this parameter is deprecated. */
    USB_SPEED operationSpeed;

    /* Specify the operation mode of the USB module. This defines if the USB
     * module will support Device, Host or Dual Role operation */
    DRV_USBFS_OPMODES operationMode;

    /* A pointer to the endpoint descriptor table. This should be aligned at 512
       byte address boundary. The size of the table is equal to the
       DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE times the number of endpoints needed
       in the application. */
    void * endpointTable;
```

```
    /* Root hub available current in mA. This specifies the amount of current
       that root hub can provide to the attached device. This should be
       specified in mA. This is required when the driver is required to operate
       in host mode. */
    uint32_t rootHubAvailableCurrent;

    /* When operating in Host mode, the application can specify a Root Hub port
       enable function. This parameter should point to Root Hub port enable
       function. If this parameter is NULL, it implies that the Port is always
       enabled. */
    DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;

    /* When operating in Host mode, the application can specify a Root Port
       Indication. This parameter should point to the Root Port Indication
       function. If this parameter is NULL, it implies that Root Port Indication
       is not supported. */
    DRV_USBFS_ROOT_HUB_PORT_INDICATION portIndication;

    /* When operating is Host mode, the application can specify a Root Port
       Overcurrent detection. This parameter should point to the Root Port
       Indication function. If this parameter is NULL, it implies that
       Overcurrent detection is not supported. */
    DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;

} DRV_USBFS_INIT;
```

The operationMode parameter defines by the driver operation mode. parameter in the initialization data structure. This can be set DRV_USBFS_OPMODE_DEVICE, DRV_USBFS_OPMODE_HOST or DRV_USBFS_OPMODE_DUAL_ROLE for device, host and dual role operation respectively.

The `endpointTable` parameter must point to a byte array. The size of the array depends on the maximum number of device endpoints that application needs. A direction of an endpoint counts as one endpoint. Each endpoint requires 32 bytes. Therefore, if the USB Device requires 3 endpoints (Endpoint 0 + Endpoint 1 IN + Endpoint 2 OUT), the size of the array will 96 bytes (32 * 3). The byte array start address must be located on a 512 byte boundary. When operating in host mode, the driver will use only one endpoint and size of the endpoint table array should be set to 32.

The `rootHubAvailableCurrent` parameter should be set to the maximum current that VBUS power supply can provide on the bus. The driver does not use this information directly. It provides this data to the client application while operating in host mode.

The `portPowerEnable` parameter must point to a Port Power Enable function. The driver, while operating in host mode, will call this function to enable the VBUS switch. This function should activate the VBUS switch if the driver calls this function with the enable parameter set to true. It should deactivate the switch if the driver calls this function with the enable parameter set to false. This parameter should be set to NULL if such a switch (of the switch control) is not available in the application.

The `portIndication` parameter must point to a Port Indication function. The driver, while operating in host mode, will call this function to indicate the current state of the port. The driver will call this function with LED color status as defined in the Chapter 11 of the USB 2.0 Specification. This parameter should be set to NULL if such a LED indication is not available in the application.

The `portOverCurrentDetect` parameter must point to a Port Overcurrent Detect function. The driver, while operating in Host mode, will call this function periodically to check if the attached device is overdrawing current. If the function should return true if such a condition exists. This parameter should be set to NULL if such detection is not available in the application.

The following code example shows initialization of the driver for device mode operation.

```
/* This code shows an example of DRV_USBFS_INIT data structure for
 * device mode operation. Here the driver is initialized to work with USB1 USB
 * module. Note how the endPointTable is defined. It should be aligned on a 512
 * byte boundary. */

DRV_USBFS_INIT init;
SYS_MODULE_OBJ usbDriverObj;

uint8_t __attribute__((aligned(512))) endPointTable[DRV_USBFS_ENDPOINTS_NUMBER * 32];

const DRV_USBFS_INIT drvUSBInit =
{
    /* Assign the endpoint table */
    .endpointTable = endPointTable,

    /* Interrupt Source for USB module */
    .interruptSource = INT_SOURCE_USB_1,

    /* System module initialization. */
    .moduleInit = {SYS_MODULE_POWER_RUN_FULL},
```

```
    /* Configure the driver for device mode operation. */
    .operationMode = DRV_USBFS_OPMODE_DEVICE,

    /* Configure the driver to operate at full speed. */
    .operationSpeed = USB_SPEED_FULL,

    /* Stop in idle */
    .stopInIdle = false,

    /* Suspend in sleep */
    .suspendInSleep = false,

    /* Identifies peripheral (PLIB-level) ID */
    .usbID = USB_ID_1
};

void SYS_Initialize(void)
{
    /* Initialize the USB Driver. Note how the init parameter is typecasted to
     * SYS_MODULE_INIT type. The SYS_MODULE_OBJ returned by this function call
     * is passed to the driver tasks routine. DRV_USBFS_INDEX_0 is helper
     * constant defined in drv_usbfs.h */

    usbDriverObj = DRV_USBFS_Initialize(DRV_USBFS_INDEX_0, (SYS_MODULE_INIT *)(drvUSBInit));
}

void SYS_Tasks(void)
{
    /* The polled state of the USB driver is updated by calling the
     * DRV_USBFS_Tasks function in the SYS_Tasks() function. The
     * DRV_USBFS_Tasks() takes the driver module object returned by the
     * DRV_USBFS_Initialize funciton as a parameter. */

    DRV_USBFS_Tasks(usbDriverObj);
}

void __ISR(_USB_1_VECTOR, ipl4AUTO) _IntHandlerUSBInstance0(void)
{
    /* The DRV_USBFS_Tasks_ISR function update the interrupt state of the USB
     * Driver. If the driver is configured for polling mode, this function need
     * not be invoked or included in the project. */

    DRV_USBFS_Tasks_ISR(sysObj.drvUSBObject);
}
```

The following code example shows initialization of the driver for host mode operation.

```
/* This code shows an example of the USBFS driver can be configured for
 * host mode operation. For host mode operation, only one endpoint is needed and
 * hence the size of the endpoint table is 32 bytes (for one endpoint). In this
 * example, the BSP_USBVBUSSwitchOverCurrentDetect function checks for over
 * current condition and the BSP_USBVBUSPowerEnable function enables the VBUS
 * power. The port indication function is not implemented and hence the
 * portIndication member of the initialization data structure is set to NULL. */

/* The implementation of the port over current detect, indication and the VBUS
 * power supply functions is discussed later in this help section. */

uint8_t __attribute__((aligned(512))) endpointTable[32];

DRV_USBFS_INIT drvUSBFSInit =
{
    /* Pointer to the endpoint table */
    .endpointTable = endpointTable,

    /* Interrupt Source for the USB module */
    .interruptSource = INT_SOURCE_USB_1,

    /* This should always be set to SYS_MODULE_POWER_RUN_FULL. */
    .moduleInit = {SYS_MODULE_POWER_RUN_FULL},
```

```
    /* Configure for host mode operation. */
    .operationMode = DRV_USBFS_OPMODE_HOST,

    /* The driver should run at full speed. */
    .operationSpeed = USB_SPEED_FULL,

    /* Port indication function is not implemented. */
    .portIndication = NULL,

    /* This is the over current detect function. */
    .portOverCurrentDetect = BSP_USBVBUSSwitchOverCurrentDetect,

    /* This is the VBUS Power enable function */
    .portPowerEnable = BSP_USBVBUSPowerEnable,

    /* Here we state that the VBUS power supply can provide at most 500 mA of
     * current */
    .rootHubAvailableCurrent = 500,

    /* Module will operate in IDLE. */
    .stopInIdle = false,

    /* Module will not suspend automatically in sleep */
    .suspendInSleep = false,

    /* USB Module ID is 1 */
    .usbID = USB_ID_1
};

void SYS_Initialize(void)
{
    /* Initialize the USB Driver. Note how the init parameter is typecasted to
     * SYS_MODULE_INIT type. The SYS_MODULE_OBJ returned by this function call
     * is passed to the driver tasks routine. DRV_USBFS_INDEX_0 is helper
     * constant defined in drv_usbfs.h */

    usbDriverObj = DRV_USBFS_Initialize(DRV_USBFS_INDEX_0,
                                        (SYS_MODULE_INIT *)(drvUSBInit));
}

void SYS_Tasks(void)
{
    /* The polled state of the USB driver is updated by calling the
     * DRV_USBFS_Tasks function in the SYS_Tasks() function. The
     * DRV_USBFS_Tasks() takes the driver module object returned by the
     * DRV_USBFS_Initialize funciton as a parameter. */

    DRV_USBFS_Tasks(usbDriverObj);
}

void __ISR(_USB_1_VECTOR, ipl4AUTO) _IntHandlerUSBInstance0(void)
{
    /* The DRV_USBFS_Tasks_ISR function update the interrupt state of the USB
     * Driver. If the driver is configured for polling mode, this function need
     * not be invoked or included in the project. */

    DRV_USBFS_Tasks_ISR(sysObj.drvUSBObject);
}
```

The PIC32MX USB Driver requires definition of configuration constants to be available in the `system_config.h` file of the MPLAB Harmony Application Project Configuration. Refer to the Configuring the Library section for details.

Multi-client Operation

The PIC32MX USB Driver supports multi-client operation. In that, it can be opened by two application clients. This is required where Dual Operation is desired. The following should be noted when using multi-client operation:

- The driver should be initialized for Dual Role Operation mode.
- The DRV_USBFS_Open function can be called at the most twice in the application. The driver supports a maximum of two clients.

- A client can access either the host or device functionality of the driver. It cannot do both.
- It is possible for the two clients to operate in two different threads while operating with an RTOS.

Note: The typical the application clients for PIC32MX USB Driver would be the MPLAB Harmony USB Host and Device Stack. The complexity of operating the driver in Dual Role mode is handled by the stack operation. The MHC will configure the driver for Dual Role operation when such operation is selected in USB Stack configuration tree.

USB Driver Common Interface

The PIC32MX USB Driver exports its implementation of the USB Driver Common Interface to the Host and Device Layer via the DRV_USBFS_HOST_INTERFACE and DRV_USBFS_DEVICE_INTERFACE structures. The DRV_USBFS_HOST_INTERFACE structure is defined in the `drv_usbfs_host.c` file. The following code example shows this structure.

```
/*********************************************************
 * This structure is a set of pointer to the USBFS driver
 * functions. It is provided to the host and device layer
 * as the interface to the driver.
 * *******************************************************/

DRV_USB_HOST_INTERFACE gDrvUSBFSHostInterface =
{
    .open = DRV_USBFS_Open,
    .close = DRV_USBFS_Close,
    .eventHandlerSet = DRV_USBFS_ClientEventCallBackSet,
    .hostIRPSubmit = DRV_USBFS_HOST_IRPSubmit,
    .hostIRPCancel = DRV_USBFS_HOST_IRPCancel,
    .hostPipeSetup = DRV_USBFS_HOST_PipeSetup,
    .hostPipeClose = DRV_USBFS_HOST_PipeClose,
    .hostEventsDisable = DRV_USBFS_HOST_EventsDisable,
    .hostEventsEnable = DRV_USBFS_HOST_EventsEnable,
    .rootHubInterface.rootHubPortInterface.hubPortReset = DRV_USBFS_HOST_ROOT_HUB_PortReset,
    .rootHubInterface.rootHubPortInterface.hubPortSpeedGet = DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet,
    .rootHubInterface.rootHubPortInterface.hubPortResetIsComplete =
DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete,
    .rootHubInterface.rootHubPortInterface.hubPortSuspend = DRV_USBFS_HOST_ROOT_HUB_PortSuspend,
    .rootHubInterface.rootHubPortInterface.hubPortResume = DRV_USBFS_HOST_ROOT_HUB_PortResume,
    .rootHubInterface.rootHubMaxCurrentGet = DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet,
    .rootHubInterface.rootHubPortNumbersGet = DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet,
    .rootHubInterface.rootHubSpeedGet = DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet,
    .rootHubInterface.rootHubInitialize = DRV_USBFS_HOST_ROOT_HUB_Initialize,
    .rootHubInterface.rootHubOperationEnable = DRV_USBFS_HOST_ROOT_HUB_OperationEnable,
    .rootHubInterface.rootHubOperationIsEnabled = DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled,
};
```

The DRV_USBFS_DEVICE_INTERFACE structure is defined in the `drv_usbfs_device.c` file. The following code example shows this structure. The MPLAB Harmony USB Host and Device stack perform driver independent access through the function pointers contained in these structures.

```
/*************************************************
 * This structure is a pointer to a set of USB Driver
 * Device mode functions. This set is exported to the
 * device layer when the device layer must use the
 * PIC32MX USB Controller.
 ************************************************/

DRV_USB_DEVICE_INTERFACE gDrvUSBFSDeviceInterface =
{
    .open = DRV_USBFS_Open,
    .close = DRV_USBFS_Close,
    .eventHandlerSet = DRV_USBFS_ClientEventCallBackSet,
    .deviceAddressSet = DRV_USBFS_DEVICE_AddressSet,
    .deviceCurrentSpeedGet = DRV_USBFS_DEVICE_CurrentSpeedGet,
    .deviceSOFNumberGet = DRV_USBFS_DEVICE_SOFNumberGet,
    .deviceAttach = DRV_USBFS_DEVICE_Attach,
    .deviceDetach = DRV_USBFS_DEVICE_Detach,
    .deviceEndpointEnable = DRV_USBFS_DEVICE_EndpointEnable,
    .deviceEndpointDisable = DRV_USBFS_DEVICE_EndpointDisable,
    .deviceEndpointStall = DRV_USBFS_DEVICE_EndpointStall,
    .deviceEndpointStallClear = DRV_USBFS_DEVICE_EndpointStallClear,
    .deviceEndpointIsEnabled = DRV_USBFS_DEVICE_EndpointIsEnabled,
    .deviceEndpointIsStalled = DRV_USBFS_DEVICE_EndpointIsStalled,
    .deviceIRPSubmit = DRV_USBFS_DEVICE_IRPSubmit,
```

```
    .deviceIRPCancel = DRV_USBFS_DEVICE_IRPCancel,
    .deviceIRPCancelAll = DRV_USBFS_DEVICE_IRPCancelAll,
    .deviceRemoteWakeupStop = DRV_USBFS_DEVICE_RemoteWakeupStop,
    .deviceRemoteWakeupStart = DRV_USBFS_DEVICE_RemoteWakeupStart,
    .deviceTestModeEnter = NULL

};
```

Operation with RTOS

The PIC32MX USB Driver is designed to operate with a RTOS. The driver implementation uses the MPLAB Harmony Operating System Abstraction Layer (OSAL). This allows the driver to function with entire range of RTOSes supported in MPLAB Harmony. The following points must be considered while using the driver with an RTOS.

- The driver can be opened from different threads
- In Device mode, an enabled endpoint should only be accessed from one thread. For example, if an application requires two endpoints, Endpoint 2 and Endpoint 3, the application could contain two threads, one accessing Endpoint 2 and another accessing Endpoint 3. The thread accessing Endpoint 2 cannot access Endpoint 3.
- While operating in Host mode, endpoint pipes can be opened from different threads. A pipe handle to an open pipe cannot be shared across threads.

Host Mode Attach Detach Operation

When the PIC32MX USB Driver operating in Host mode detects a device attach or detach, it implements debouncing before signaling attach detach signal to the USB Host Stack. When the device is attached, the driver waits for DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION milliseconds to allow for the mechanical chatter, which occurs when the device is inserted into the host receptacle, to settle. If the device is still attached after the DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION expires, the driver calls the USB_HOST_DeviceEnumerate function to let the host stack enumerate the device. It also starts checking for Device Detach.

When the device is detached, the driver waits for DRV_USBFS_POST_DETACH_DELAY milliseconds to allow for the detach operation to settle. If the device is indeed detached after the DRV_USBFS_POST_DETACH_DELAY delay expires, the driver calls USB_HOST_DeviceDenumerate function to let the USB Host stack denumerate the device. It then starts checking for device attach.

Root Hub Operation

The PIC32MX USB Driver implements a Root Hub Driver Interface. This allows the driver to emulate a hub. The USB Host Stack enumerates the Root Hub as a device. The Host Stack then does not differentiate between an external hub and the root hub. While emulating a hub, the PIC32MX USB Driver Root Hub appears as a single port hub.

As a part of the root hub interface, the PIC32MX USB Driver requires the application to supply functions for hub features that it does not implement. These features are:

- Port Overcurrent Detect
- VBUS Switch Control
- Port Indication

A pointer to these functions (if implemented) must be supplied through the driver initialization data (of the type DRV_USBFS_INIT) structure at the time of driver initialization. The application has the option of not implementing these functions. In such a case, the function pointers for the unimplemented function, in the initialization data structure should be set to NULL.

The root hub driver must also be able to communicate the maximum current capability of its port to the USB Host Layer. The PIC32MX USB Controller does not contain built-in (hardware implemented) functionality for controlling the root hub port current. To facilitate this request, the driver will report the current capability that was specified in the `rootHubAvailableCurrent` parameter of the driver initialization data structure. The application must set this parameter to report the current supply capability of the VBUS power supply. The USB Host Layer uses this value to manage the bus current budget. If a connected device reports a configuration that requires more current than what the VBUS power supply can provide, the host will not set the configuration.

Port Overcurrent Detect

The Root Hub operation in PIC32MX USB Driver will periodically call a Port Overcurrent Detect function to detect if an overcurrent condition is active on the port. The application must supply this function if port overcurrent detection is needed. The PIC32MX USB Controller does not contain built-in (hardware implemented) functionality for checking overcurrent condition. The overcurrent condition on the port can occur in a case where the attached device has malfunctioned or when the USB VBUS line has short circuited to ground.

The signature of the function and an example implementation is shown in the following code example. The function must return (and must continue to return) true if an overcurrent condition exists on the port.

```
/* This code shows an example implementation of the
 * portOverCurrentDetect function. The PIC32MX USB Driver will call this
 * function periodically to check if an over current condition exists on the
 * port. In this example, we assume that the over current detect pin from an
 * external circuit in the system, is connected to  port RD0 and the pin logic
 * is active high. The function must return true if an over current condition is
 * present on this pin */
```

```
bool BSP_USBVBUSSwitchOverCurrentDetect(uint8_t port)
{
    if(PLIB_PORTS_PinGet(PORTS_ID_0, PORT_CHANNEL_D, 0) == 1)
    {
        return(true);
    }
    else
    {
        return(false);
    }
}
```

VBUS Switch Control

The PIC32MX USB Driver Root Hub operation will attempt to control the VBUS power supply to the port. Because the PIC32MX USB Controller does not contain built-in (hardware implemented) functionality for checking controlling VBUS, such a control function must be supplied by the application. The root hub operation will access this function when the PIC32MX USB Driver will call the portPowerEnable function as a part of the Bus Enable sequence.

The following code shows an example of how this function can be implemented.

```
/* This code shows an example implementation of the VBUS Power Enable
 * function. The PIC32MX USB Driver will call this function as a part of bus
 * enable function. In this example, it is assumed that system contains an
 * external VBUS power switch and this is control by port RB5.
 */

void BSP_USBVBUSPowerEnable(uint8_t port, bool enable)
{
    if(enable)
    {
        PLIB_PORTS_PinSet(PORTS_ID_0, PORT_CHANNEL_B, PORTS_BIT_POS_5);
    }
    else
    {
        PLIB_PORTS_PinClear(PORTS_ID_0, PORT_CHANNEL_B, PORTS_BIT_POS_5);
    }
}
```

Port Indication function

The Root Hub Operation in the PIC32MX USB Driver allows display of Port LED status. If the application requires this indication, it must implement a function which the Root Hub operation would call when a change in the Root Hub port has occurred. The port indication operation is specified in Section 11.5.3 of the USB 2.0 Specification.

```
/* This code shows an example implementation of the port indication
 * function. The PIC32MX USB Driver calls this function when it wants to indicate
 * port status. It is assumed that three function to switch off, blink and
 * switch on an LED are available. It is further assumed that these function
 * accept the color of the LED to operated on. */

void BSP_RootHubPortIndication
(
    uint8_t port,
    USB_HUB_PORT_INDICATOR_COLOR color,
    USB_HUB_PORT_INDICATOR_STATE state
)
{
    /* The color parameter indicates the color of the LED to be affected. The
     * color will be either USB_HUB_PORT_INDICATOR_COLOR_GREEN or
     * USB_HUB_PORT_INDICATOR_COLOR_AMBER. */

    switch (state)
    {
        case USB_HUB_PORT_INDICATOR_STATE_OFF:
            BSP_SwitchLEDOff(color);
            break;
        case USB_HUB_PORT_INDICATOR_STATE_BLINKING:
            BSP_LEDBlink(color);
            break;
        case USB_HUB_PORT_INDICATOR_STATE_ON:
            BSP_SwitchLEDOn(color);
            break;
```

```
            default:
                break;
        }
    }
```

Configuring the Library

Provides information on the configuring the library.

Macros

	Name	Description
	DRV_USBFS_DEVICE_SUPPORT	Determines if the USB Device Functionality should be enabled.
	DRV_USBFS_ENDPOINTS_NUMBER	Configures the number of endpoints to be provisioned in the driver.
	DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION	Configures the time duration (in milliseconds) that the driver will wait to re-confirm a device attach.
	DRV_USBFS_HOST_NAK_LIMIT	Configures the NAK Limit for Host Mode Control Transfers.
	DRV_USBFS_HOST_PIPES_NUMBER	Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.
	DRV_USBFS_HOST_RESET_DURATION	Configures the time duration (in milliseconds) of the Reset Signal.
	DRV_USBFS_HOST_SUPPORT	Determines if the USB Host Functionality should be enabled.
	DRV_USBFS_INSTANCES_NUMBER	Specifies the number of driver instances to be enabled in the application.
	DRV_USBFS_INTERRUPT_MODE	Configures the driver for interrupt or polling mode operation.

Description

The PIC32MX USB Driver requires the specification of compile-time configuration macros. These macros define resource usage, feature availability, and dynamic behavior of the driver. These configuration macros should be defined in the `system_config.h` file.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_USBFS_DEVICE_SUPPORT Macro

Determines if the USB Device Functionality should be enabled.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_DEVICE_SUPPORT true
```

Description

USB Full Speed Driver Device Mode Support.

This constant should be set to true if USB device support is required in the application. It should be set to false if device support is not required.

Remarks

This constant should always be defined.

DRV_USBFS_ENDPOINTS_NUMBER Macro

Configures the number of endpoints to be provisioned in the driver.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_ENDPOINTS_NUMBER 3
```

Description

USB Full Speed Driver Endpoint Numbers.

This constant configures the number of endpoints that the driver needs to manage. When DRV_USBFS_DEVICE_SUPPORT is enabled, this constant should be set to the total number of endpoints to be enabled in the device. When enabled, a endpoint can be used for communication.

Using any direction of an endpoint will require that entire endpoint to be enabled.

Consider the case of a composite USB Device that containing a CDC and MSD function. The CDC function will require 1 Bulk endpoint (OUT and IN directions) and 1 Interrupt endpoint (IN direction). The MSD function will require 1 Bulk endpoint (IN and OUT directions). This design can be implemented by using 4 endpoints. Endpoint 0 is used for the mandatory control interface. Endpoint 1 is used for CDC Bulk interface. Endpoint 2 is used for CDC interrupt interface and endpoint 3 is used for MSD Bulk Interface. The constant should then be set to 4.

For Host mode operation, this constant should be set to 1. Setting this to greater than 1 will result in unused data memory allocation.

Remarks

This constant should always be defined.

DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION Macro

Configures the time duration (in milliseconds) that the driver will wait to re-confirm a device attach.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION 500
```

Description

USB Full Speed Driver Host Mode Attach Debounce Duration.

This constant configures the time duration (in milliseconds) that driver will wait to re-confirm a device attach. When the driver first detects device attach, it start, it will start a timer for the duration specified by the constant. When the timer expires, the driver will check if the device is still attached. If so, the driver will then signal attach to the host stack. The duration allows for device attach to become electro-mechanically stable.

Remarks

This constant should always be defined when DRV_USBFS_HOST_SUPPORT is set to true.

DRV_USBFS_HOST_NAK_LIMIT Macro

Configures the NAK Limit for Host Mode Control Transfers.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_HOST_NAK_LIMIT 2000
```

Description

USB Full Speed Driver Host Mode Control Transfers NAK Limit.

This constant configures the number of NAKs that the driver can accept from the device in the data stage of a control transfer before aborting the control transfer with a USB_HOST_IRP_STATUS_ERROR_NAK_TIMEOUT. Setting this constant to 0 will disable NAK limit checking. This constant should be adjusted to enable USB host compatibility with USB Devices which require more time to process control transfers.

Remarks

This constant should always be defined when DRV_USBFS_HOST_SUPPORT is set to true.

DRV_USBFS_HOST_PIPES_NUMBER Macro

Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_HOST_PIPES_NUMBER 10
```

Description

USB Full Speed Driver Host Mode Pipes Number.

This constant configures the maximum number of pipes that can be opened when the driver is operating in Host mode. Calling the DRV_USBFS_HOST_PipeSetup function will cause a pipe to be opened. Calling this function when DRV_USBFS_HOST_PIPES_NUMBER

number of pipes have already been opened will cause the function to return an Invalid Pipe Handle. This constant should be configured to account for the maximum number of devices and the device types to be supported by the host application.

For example if the USB Host application must support 2 USB Mass Storage devices and 1 CDC device, it must set this constant 9 (4 bulk pipes for 2 Mass Storage devices + 2 bulk pipes and 1 interrupt pipe for 1 CDC device and 2 control pipes for 2 devices). Allocating pipes consumes data memory.

Remarks

This constant should always be defined when DRV_USBFS_HOST_SUPPORT is set to true.

DRV_USBFS_HOST_RESET_DURATION Macro

Configures the time duration (in milliseconds) of the Reset Signal.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_HOST_RESET_DURATION 100
```

Description

USB Full Speed Driver Host Mode Reset Duration.

This constant configures the duration of the reset signal. The driver generates reset signal when the USB Host stack requests for root hub port reset. The driver will generate the reset signal for the duration specified by this constant and will then stop generating the reset signal.

Remarks

This constant should always be defined when DRV_USBFS_HOST_SUPPORT is set to true.

DRV_USBFS_HOST_SUPPORT Macro

Determines if the USB Host Functionality should be enabled.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_HOST_SUPPORT false
```

Description

USB Full Speed Driver Host Mode Support.

This constant should be set to true if USB Host mode support is required in the application. It should be set to false if host support is not required.

Remarks

This constant should always be defined.

DRV_USBFS_INSTANCES_NUMBER Macro

Specifies the number of driver instances to be enabled in the application.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_INSTANCES_NUMBER 1
```

Description

USB Full Speed Driver Instances Number.

This constant defines the number of driver instances to be enabled in the application. This will be typically be the number of USB controllers to be used in the application. On PIC32MX microcontrollers that have one USB controller, this value will always be 1. On PIC32MX microcontrollers which have 2 USB controllers, this value could 1 or 2, depending on whether 1 or 2 USB segments are required. To conserve data memory, this constant should be set to exactly the number of USB controller that are required in the system.

Remarks

This constant should always be defined.

DRV_USBFS_INTERRUPT_MODE Macro

Configures the driver for interrupt or polling mode operation.

File

drv_usbfs_config_template.h

C

```
#define DRV_USBFS_INTERRUPT_MODE true
```

Description

USB Full Speed Driver Interrupt Mode.

This constant configures the driver for interrupt or polling operation. If this flag is set to true, the driver will operate in interrupt mode. If the flag is set to false, the driver will operate in polled mode. In polled, the driver interrupt state machine gets updated in the SYS_Tasks(). If the driver is configured interrupt mode, the driver interrupt state machine gets updated in the driver interrupt service routine. It is always recommended for the driver to operate in interrupt mode.

Remarks

This constant should always be defined.

Building the Library

This section lists the files that are available in the PIC32MX USB Driver Library.

Description

This section list the files that are available in the `\src` folder of the PIC32MX USB Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/usb/usbfs`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_usbfs.h	This file should be included by any `.c` file which accesses the PIC32MX USB Driver API. This one file contains the prototypes for all driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/dynamic/drv_usbfs.c	This file should always be included in the project when using the PIC3MX USB Driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
/src/dynamic/drv_usbfs_device.c	This file should be included in the project if Device mode operation is required.
/src/dynamic/drv_usbfs_host.c	This file should be included in the project if Host mode operation is required.

Module Dependencies

The PIC32MX USB Driver Library depends on the following modules:

- Interrupt System Service Library

Library Interface

a) System Functions

	Name	Description
	DRV_USBFS_Status	Provides the current status of the USB Driver module.
	DRV_USBFS_Tasks	Maintains the driver's state machine when the driver is configured for Polled mode.
	DRV_USBFS_Tasks_ISR	Maintains the driver's Interrupt state machine and implements its ISR.

b) Client Core Functions

	Name	Description
	DRV_USBFS_ClientEventCallBackSet	This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.
	DRV_USBFS_Close	Closes an opened-instance of the USB Driver.
	DRV_USBFS_Initialize	Initializes the USB Driver.
	DRV_USBFS_Open	Opens the specified USB Driver instance and returns a handle to it.

c) Device Mode Operation Functions

	Name	Description
	DRV_USBFS_DEVICE_AddressSet	This function will set the USB module address that is obtained from the Host.
	DRV_USBFS_DEVICE_Attach	This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.
	DRV_USBFS_DEVICE_CurrentSpeedGet	This function returns the USB speed at which the device is operating.
	DRV_USBFS_DEVICE_Detach	This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.
	DRV_USBFS_DEVICE_EndpointDisable	This function disables an endpoint.
	DRV_USBFS_DEVICE_EndpointDisableAll	This function disables all provisioned endpoints.
	DRV_USBFS_DEVICE_EndpointEnable	This function enables an endpoint for the specified direction and endpoint size.
	DRV_USBFS_DEVICE_EndpointIsEnabled	This function returns the enable/disable status of the specified endpoint and direction.
	DRV_USBFS_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	DRV_USBFS_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.
	DRV_USBFS_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	DRV_USBFS_DEVICE_IRPCancel	This function cancels the specific IRP that are queued and in progress at the specified endpoint.
	DRV_USBFS_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	DRV_USBFS_DEVICE_IRPSubmit	This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.
	DRV_USBFS_DEVICE_RemoteWakeupStart	This function causes the device to start Remote Wakeup Signalling on the bus.
	DRV_USBFS_DEVICE_RemoteWakeupStop	This function causes the device to stop the Remote Wakeup Signalling on the bus.
	DRV_USBFS_DEVICE_SOFNumberGet	This function will return the USB SOF packet number.

d) Host Mode Operation Functions

	Name	Description
	DRV_USBFS_HOST_EventsDisable	Disables Host mode events.
	DRV_USBFS_HOST_EventsEnable	Restores the events to the specified the original value.
	DRV_USBFS_HOST_IRPCancel	Cancels the specified IRP.
	DRV_USBFS_HOST_IRPSubmit	Submits an IRP on a pipe.
	DRV_USBFS_HOST_PipeClose	Closes an open pipe.
	DRV_USBFS_HOST_PipeSetup	Open a pipe with the specified attributes.

e) Root Hub Functions

	Name	Description
	DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet	This function returns the operating speed of the bus to which this root hub is connected.
	DRV_USBFS_HOST_ROOT_HUB_Initialize	This function initializes the root hub driver.

	DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet	Returns the maximum amount of current that this root hub can provide on the bus.
	DRV_USBFS_HOST_ROOT_HUB_OperationEnable	This function enables or disables root hub operation.
	DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled	Returns the operation enabled status of the root hub.
	DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet	Returns the number of ports this root hub contains.
	DRV_USBFS_HOST_ROOT_HUB_PortReset	Resets the specified root hub port.
	DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete	Returns true if the root hub has completed the port reset operation.
	DRV_USBFS_HOST_ROOT_HUB_PortResume	Resumes the specified root hub port.
	DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet	Returns the speed of at which the port is operating.
	DRV_USBFS_HOST_ROOT_HUB_PortSuspend	Suspends the specified root hub port.

f) Data Types and Constants

	Name	Description
	DRV_USBFS_EVENT	Identifies the different events that the USB Driver provides.
	DRV_USBFS_EVENT_CALLBACK	Type of the USB Driver event callback function.
	DRV_USBFS_HOST_PIPE_HANDLE	Defines the USB Driver Host Pipe Handle type.
	DRV_USBFS_INIT	This type definition defines the Driver Initialization Data Structure.
	DRV_USBFS_OPMODES	Identifies the operating modes supported by the USB Driver.
	DRV_USBFS_ROOT_HUB_PORT_INDICATION	USB Root hub Application Hooks (Port Indication).
	DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT	USB Root hub Application Hooks (Port Overcurrent detection).
	DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE	USB Root hub Application Hooks (Port Power Enable/ Disable).
	DRV_USBFS_DEVICE_INTERFACE	USB Driver Device Mode Interface Functions.
	DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE	USB Driver Endpoint Table Entry Size in bytes.
	DRV_USBFS_HOST_INTERFACE	USB Driver Host Mode Interface Functions.
	DRV_USBFS_HOST_PIPE_HANDLE_INVALID	Value of an Invalid Host Pipe Handle.
	DRV_USBFS_INDEX_0	USB Driver Module Index 0 Definition.
	DRV_USBFS_INDEX_1	USB Driver Module Index 1 Definition.

Description

This section describes the functions of the PIC32MX USB Driver Library.

Refer to each section for a detailed description.

a) System Functions

DRV_USBFS_Status Function

Provides the current status of the USB Driver module.

File

drv_usbfs.h

C

```
SYS_STATUS DRV_USBFS_Status(SYS_MODULE_OBJ object);
```

Returns

- SYS_STATUS_READY - Indicates that the driver is ready.
- SYS_STATUS_UNINITIALIZED - Indicates that the driver has never been initialized.

Description

This function provides the current status of the USB Driver module.

Remarks

None.

Preconditions

The DRV_USBFS_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USBFS_Initialize
SYS_STATUS          status;
DRV_USBFS_INIT moduleInit;

uint8_t __attribute__((aligned(512))) endpointTable[DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE * 2];

usbInitData.usbID               = USB_ID_1;
usbInitData.opMode              = DRV_USBFS_OPMODE_DEVICE;
usbInitData.stopInIdle          = false;
usbInitData.suspendInSleep      = false;
usbInitData.operationSpeed      = USB_SPEED_FULL;
usbInitData.interruptSource     = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize
// function.

DRV_USBFS_Initialize(DRV_USBFS_INDEX_0, (SYS_MODULE_INIT *) &usbInitData);

// The status of the driver can be checked.
status = DRV_USBFS_Status(object);
if(SYS_STATUS_READY == status)
{
    // Driver is ready to be opened.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USBFS_Initialize function.

Function

SYS_STATUS DRV_USBFS_Status (SYS_MODULE_OBJ object)

DRV_USBFS_Tasks Function

Maintains the driver's state machine when the driver is configured for Polled mode.

File

drv_usbfs.h

C

```
void DRV_USBFS_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Maintains the driver's Polled state machine. This function should be called from the SYS_Tasks function.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks). This function will never block.

Preconditions

The DRV_USBFS_Initialize function must have been called for the specified USB Driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USBFS_Initialize

while (true)
{
    DRV_USBFS_Tasks(object);
```

```
    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USBFS_Initialize function).

Function

void DRV_USBFS_Tasks(SYS_MODULE_OBJ object)

DRV_USBFS_Tasks_ISR Function

Maintains the driver's Interrupt state machine and implements its ISR.

File

drv_usbfs.h

C

```
void DRV_USBFS_Tasks_ISR(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal Interrupt state machine and implement its ISR for interrupt-driven implementations.

Remarks

This routine should be called from the USB interrupt service routine. In case of multiple USB modules, it should be ensured that the correct USB driver system module object is passed to this routine.

Preconditions

The DRV_USBFS_Initialize function must have been called for the specified USB Driver instance.

Example

```
SYS_MODULE_OBJ object;     // Returned from DRV_USBFS_Initialize

while (true)
{
    DRV_USBFS_Tasks_ISR (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USBFS_Initialize).

Function

void DRV_USBFS_Tasks_ISR(SYS_MODULE_OBJ object)

b) Client Core Functions

DRV_USBFS_ClientEventCallBackSet Function

This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.

File

drv_usbfs.h

C

```
void DRV_USBFS_ClientEventCallBackSet(DRV_HANDLE handle, uintptr_t hReferenceData, DRV_USB_EVENT_CALLBACK
```

```
myEventCallBack);
```

Returns

None.

Description

This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events. The callback is disabled by either not calling this function after the DRV_USBFS_Open function has been called or by setting the myEventCallBack argument as NULL. When the callback function is called, the hReferenceData argument is returned.

Remarks

Typical usage of the USB Driver requires a client to register a callback.

Preconditions

None.

Example

```
// Set the client event callback for the Device Layer.  The
// USBDeviceLayerEventHandler function is the event handler. When this
// event handler is invoked by the driver, the driver returns back the
// second argument specified in the following function (which in this case
// is the Device Layer data structure). This allows the application
// firmware to identify, as an example, the Device Layer object associated
// with this callback.

DRV_USBFS_ClientEventCallBackSet(myUSBDevice.usbDriverHandle, (uintptr_t)&myUSBDevice,
USBDeviceLayerEventHandler);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
hReferenceData	Object (could be a pointer) that is returned with the callback.
myEventCallBack	Callback function for all USB events.

Function

void DRV_USBFS_ClientEventCallBackSet

(

DRV_HANDLE handle,

uintptr_t hReferenceData,

DRV_USBFS_EVENT_CALLBACK myEventCallBack

);

DRV_USBFS_Close Function

Closes an opened-instance of the USB Driver.

File

drv_usbfs.h

C

```
void DRV_USBFS_Close(DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the USB Driver, invalidating the handle.

Remarks

After calling this function, the handle passed in handle parameter must not be used with any of the other driver functions. A new handle must be obtained by calling DRV_USBFS_Open function before the caller may use the driver again.

Preconditions

The DRV_USBFS_Initialize function must have been called for the specified USB Driver instance. DRV_USBFS_Open function must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_USBFS_Open

DRV_USBFS_Close(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

void DRV_USBFS_Close(DRV_HANDLE handle)

DRV_USBFS_Initialize Function

Initializes the USB Driver.

File

drv_usbfs.h

C

```
SYS_MODULE_OBJ DRV_USBFS_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

- SYS_MODULE_OBJ_INVALID - The driver initialization failed.
- A valid System Module Object - The driver initialization was able to start. It may have not completed and requires the DRV_USBFS_Tasks function to be called periodically. This value will never be the same as SYS_MODULE_OBJ_INVALID.

Description

This function initializes the USB Driver, making it ready for clients to open. The driver initialization does not complete when this function returns. The DRV_USBFS_Tasks function must called periodically to complete the driver initialization. The DRV_USBHS_Open function will fail if the driver was not initialized or if initialization has not completed.

Remarks

This routine must be called before any other USB driver routine is called. This routine should only be called once during system initialization unless DRV_USBFS_Deinitialize is called to deinitialize the driver instance.

Preconditions

None.

Example

```
 // The following code shows an example initialization of the
 // driver. The USB module to be used is USB1.  The module should not
 // automatically suspend when the  microcontroller enters Sleep mode.  The
 // module should continue  operation when the CPU enters Idle mode.  The
 // power state is set to run at full clock speeds. Device Mode operation
 // should be at FULL speed. The size of the endpoint table is set for 2
 // endpoints.

DRV_USBFS_INIT moduleInit;

uint8_t __attribute__((aligned(512))) endpointTable[DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE * 2];

usbInitData.usbID               = USB_ID_1;
usbInitData.opMode              = DRV_USBFS_OPMODE_DEVICE;
usbInitData.stopInIdle          = false;
usbInitData.suspendInSleep      = false;
usbInitData.operationSpeed      = USB_SPEED_FULL;
usbInitData.interruptSource     = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;
```

```
// This is how this data structure is passed to the initialize
// function.

DRV_USBFS_Initialize(DRV_USBFS_INDEX_0, (SYS_MODULE_INIT *) &usbInitData);
```

Parameters

Parameters	Description
drvIndex	Ordinal number of driver instance to be initialized. This should be set to DRV_USBFS_INDEX_0 if driver instance 0 needs to be initialized.
init	Pointer to a data structure containing data necessary to initialize the driver. This should be a DRV_USBFS_INIT structure reference typecast to SYS_MODULE_INIT reference.

Function

SYS_MODULE_OBJ DRV_USBHS_Initialize

(

const SYS_MODULE_INDEX drvIndex,

const SYS_MODULE_INIT * const init

)

DRV_USBFS_Open Function

Opens the specified USB Driver instance and returns a handle to it.

File

drv_usbfs.h

C

```
DRV_HANDLE DRV_USBFS_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

- DRV_HANDLE_INVALID - The driver could not be opened successfully.This can happen if the driver initialization was not complete or if an internal error has occurred.
- A Valid Driver Handle - This is an arbitrary value and is returned if the function was successful. This value will never be the same as DRV_HANDLE_INVALID.

Description

This function opens the specified USB Driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The intent flag should always be DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NON_BLOCKING. Any other setting of the intent flag will return a invalid driver handle. A driver instance can only support one client. Trying to open a driver that has an existing client will result in an unsuccessful function call.

Remarks

The handle returned is valid until the DRV_USBFS_Close function is called. The function will typically return DRV_HANDLE_INVALID if the driver was not initialized. In such a case the client should try to open the driver again.

Preconditions

Function DRV_USBFS_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

// This code assumes that the driver has been initialized.
handle = DRV_USBFS_Open(DRV_USBFS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

if(DRV_HANDLE_INVALID == handle)
{
    // The application should try opening the driver again.
}
```

Parameters

Parameters	Description
drvIndex	Identifies the driver instance to be opened. As an example, this value can be set to DRV_USBFS_INDEX_0 if instance 0 of the driver has to be opened.
intent	Should always be (DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_READWRITE| DRV_IO_INTENT_NON_BLOCKING).

Function

```
DRV_HANDLE DRV_USBFS_Open
(
const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent
)
```

c) Device Mode Operation Functions

DRV_USBFS_DEVICE_AddressSet Function

This function will set the USB module address that is obtained from the Host.

File

drv_usbfs.h

C

```
void DRV_USBFS_DEVICE_AddressSet(DRV_HANDLE handle, uint8_t address);
```

Returns

None.

Description

This function will set the USB module address that is obtained from the Host in a setup transaction. The address is obtained from the SET_ADDRESS command issued by the Host. The primary (first) client of the driver uses this function to set the module's USB address after decoding the setup transaction from the Host.

Remarks

None.

Preconditions

None.

Example

```
// This function should be called by the first client of the driver,
// which is typically the Device Layer. The address to set is obtained
// from the Host during enumeration.

DRV_USBFS_DEVICE_AddressSet(deviceLayer, 4);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
address	The address of this module on the USB bus.

Function

void DRV_USBFS_DEVICE_AddressSet(DRV_HANDLE handle, uint8_t address);

DRV_USBFS_DEVICE_Attach Function

This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on

the bus.

File

drv_usbfs.h

C

```
void DRV_USBFS_DEVICE_Attach(DRV_HANDLE handle);
```

Returns

None.

Description

This function enables the pull-up resistors on the D+ or D- lines thus letting the USB Host know that a device has been attached on the bus . This function should be called when the driver client is ready to receive communication from the Host (typically after all initialization is complete). The USB 2.0 specification requires VBUS to be detected before the data line pull-ups are enabled. The application must ensure the same.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// Open the device driver and attach the device to the USB.
handle = DRV_USBFS_Open(DRV_USBFS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

// Register a callback
DRV_USBFS_ClientEventCallBackSet(handle, (uintptr_t)&myDeviceLayer, MyDeviceLayerEventCallback);

// The device can be attached when VBUS Session Valid event occurs
void MyDeviceLayerEventCallback(uintptr_t handle, DRV_USBFS_EVENT event, void * hReferenceData)
{
    switch(event)
    {
        case DRV_USBFS_EVENT_DEVICE_SESSION_VALID:
            // A valid VBUS was detected.
            DRV_USBFS_DEVICE_Attach(handle);
            break;

        case DRV_USBFS_EVENT_DEVICE_SESSION_INVALID:
            // VBUS is not valid anymore. The device can be disconnected.
            DRV_USBFS_DEVICE_Detach(handle);
            break;

        default:
            break;
        }
    }
}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

void DRV_USBFS_DEVICE_Attach(DRV_HANDLE handle);

DRV_USBFS_DEVICE_CurrentSpeedGet Function

This function returns the USB speed at which the device is operating.

File

drv_usbfs.h

C

```
USB_SPEED DRV_USBFS_DEVICE_CurrentSpeedGet(DRV_HANDLE handle);
```

Returns

- USB_SPEED_ERROR - The device speed is not valid.
- USB_SPEED_FULL - The device is operating at Full speed.

Description

This function returns the USB speed at which the device is operating.

Remarks

None.

Preconditions

Only valid after the device is attached to the Host and Host has completed reset signaling.

Example

```
// Get the current speed.

USB_SPEED deviceSpeed;

deviceSpeed = DRV_USBFS_DEVICE_CurrentSpeedGet(deviceLayer);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

USB_SPEED DRV_USBFS_DEVICE_CurrentSpeedGet(DRV_HANDLE handle);

DRV_USBFS_DEVICE_Detach Function

This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.

File

drv_usbfs.h

C

```
void DRV_USBFS_DEVICE_Detach(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables the pull-up resistors on the D+ or D- lines. This function should be called when the application wants to disconnect the device from the bus (typically to implement a soft detach or switch to Host mode operation). A self-powered device should be detached from the bus when the VBUS is not valid.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// Open the device driver and attach the device to the USB.
handle = DRV_USBFS_Open(DRV_USBFS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

// Register a callback
DRV_USBFS_ClientEventCallBackSet(handle, (uintptr_t)&myDeviceLayer, MyDeviceLayerEventCallback);
```

```
// The device can be detached when VBUS Session Invalid event occurs
void MyDeviceLayerEventCallback(uintptr_t handle, DRV_USBFS_EVENT event, void * hReferenceData)
{
    switch(event)
    {
        case DRV_USBFS_EVENT_DEVICE_SESSION_VALID:
            // A valid VBUS was detected.
            DRV_USBFS_DEVICE_Attach(handle);
            break;

        case DRV_USBFS_EVENT_DEVICE_SESSION_INVALID:
            // VBUS is not valid anymore. The device can be disconnected.
            DRV_USBFS_DEVICE_Detach(handle);
            break;

        default:
            break;
        }
    }
}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

void DRV_USBFS_DEVICE_Detach(DRV_HANDLE handle);

DRV_USBFS_DEVICE_EndpointDisable Function

This function disables an endpoint.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_EndpointDisable(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - The endpoint that is being accessed is not a valid endpoint (endpoint was not provisioned through the DRV_USBFS_ENDPOINTS_NUMBER configuration constant) defined for this driver instance.

Description

This function disables an endpoint. If the endpoint type is a control endpoint type, both directions are disabled. For non-control endpoints, the function disables the specified direction only. The direction to be disabled is specified by the Most Significant Bit (MSB) of the endpointAndDirection parameter.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to disable
// a control endpoint. Note that the direction parameter is ignored.
// For a control endpoint, both the directions are disabled.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 0);

DRV_USBFS_DEVICE_EndpointDisable(handle, ep );
```

```
// This code shows an example of how to disable a BULK IN
// endpoint

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBFS_DEVICE_EndpointDisable(handle, ep );
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

USB_ERROR DRV_USBFS_DEVICE_EndpointDisable
(
DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection
)

DRV_USBFS_DEVICE_EndpointDisableAll Function

This function disables all provisioned endpoints.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_EndpointDisableAll(DRV_HANDLE handle);
```

Returns

- USB_ERROR_NONE - The function exited successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is invalid.

Description

This function disables all provisioned endpoints in both directions.

Remarks

This function is typically called by the USB Device Layer to disable all endpoints upon detecting a bus reset.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to disable all endpoints.

DRV_USBFS_DEVICE_EndpointDisableAll(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

USB_ERROR DRV_USBFS_DEVICE_EndpointDisableAll(DRV_HANDLE handle)

DRV_USBFS_DEVICE_EndpointEnable Function

This function enables an endpoint for the specified direction and endpoint size.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_EndpointEnable(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection,
USB_TRANSFER_TYPE transferType, uint16_t endpointSize);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is not a valid endpoint defined for this driver instance. The value of DRV_USBFS_ENDPOINTS_NUMBER configuration constant should be adjusted.
- USB_ERROR_PARAMETER_INVALID - The driver handle is invalid.

Description

This function enables an endpoint for the specified direction and endpoint size. The function will enable the endpoint for communication in one direction at a time. It must be called twice if the endpoint is required to communicate in both the directions, with the exception of control endpoints. If the endpoint type is a control endpoint, the endpoint is always bidirectional and the function needs to be called only once.

The size of the endpoint must match the wMaxPacketSize reported in the endpoint descriptor for this endpoint. A transfer that is scheduled over this endpoint will be scheduled in wMaxPacketSize transactions. The function does not check if the endpoint is already in use. It is the client's responsibility to make sure that a endpoint is not accidentally reused.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to enable Endpoint
// 0 for control transfers. Note that for a control endpoint, the
// direction parameter is ignored. A control endpoint is always
// bidirectional. Endpoint size is 64 bytes.

uint8_t ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 0);

DRV_USBFS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_CONTROL, 64);

// This code shows an example of how to set up a endpoint
// for BULK IN transfer. For an IN transfer, data moves from device
// to Host. In this example, Endpoint 1 is enabled. The maximum
// packet size is 64.

uint8_t ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBFS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);

// If Endpoint 1 must also be set up for BULK OUT, the
// DRV_USBFS_DEVICE_EndpointEnable function must be called again, as shown
// here.

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_HOST_TO_DEVICE, 1);

DRV_USBFS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.
transferType	Should be USB_TRANSFER_TYPE_CONTROL for control endpoint, USB_TRANSFER_TYPE_BULK for bulk endpoint, USB_TRANSFER_TYPE_INTERRUPT for interrupt endpoint and USB_TRANSFER_TYPE_ISOCHRONOUS for isochronous endpoint.
endpointSize	Maximum size (in bytes) of the endpoint as reported in the endpoint descriptor.

Function

```
USB_ERROR DRV_USBFS_DEVICE_EndpointEnable
(
    DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection,
USB_TRANSFER_TYPE transferType,
uint16_t endpointSize
);
```

DRV_USBFS_DEVICE_EndpointIsEnabled Function

This function returns the enable/disable status of the specified endpoint and direction.

File

drv_usbfs.h

C

```
bool DRV_USBFS_DEVICE_EndpointIsEnabled(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection);
```

Returns

- true - The endpoint is enabled.
- false - The endpoint is disabled.

Description

This function returns the enable/disable status of the specified endpoint and direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how the
// DRV_USBFS_DEVICE_EndpointIsEnabled function can be used to obtain the
// status of Endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

if(DRV_USBFS_ENDPOINT_STATE_DISABLED ==
            DRV_USBFS_DEVICE_EndpointIsEnabled(handle, ep))
{
    // Endpoint is disabled. Enable endpoint.

    DRV_USBFS_DEVICE_EndpointEnable(handle, ep, USB_ENDPOINT_TYPE_BULK, 64);

}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

bool DRV_USBFS_DEVICE_EndpointIsEnabled
(
DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection
)

DRV_USBFS_DEVICE_EndpointIsStalled Function

This function returns the stall status of the specified endpoint and direction.

File

drv_usbfs.h

C

```
bool DRV_USBFS_DEVICE_EndpointIsStalled(DRV_HANDLE client, USB_ENDPOINT endpoint);
```

Returns

- true - The endpoint is stalled.
- false - The endpoint is not stalled.

Description

This function returns the stall status of the specified endpoint and direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how the
// DRV_USBFS_DEVICE_EndpointIsStalled function can be used to obtain the
// stall status of Endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

if(true == DRV_USBFS_DEVICE_EndpointIsStalled (handle, ep))
{
    // Endpoint stall is enabled. Clear the stall.

    DRV_USBFS_DEVICE_EndpointStallClear(handle, ep);

}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

bool DRV_USBFS_DEVICE_EndpointIsStalled
(

DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection
)

DRV_USBFS_DEVICE_EndpointStall Function

This function stalls an endpoint in the specified direction.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_EndpointStall(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.
- USB_ERROR_OSAL_FUNCTION - An error with an OSAL function called in this function.

Description

This function stalls an endpoint in the specified direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to stall an endpoint. In
// this example, Endpoint 1 IN direction is stalled.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBFS_DEVICE_EndpointStall(handle, ep);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

USB_ERROR DRV_USBFS_DEVICE_EndpointStall
(
DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection
)

DRV_USBFS_DEVICE_EndpointStallClear Function

This function clears the stall on an endpoint in the specified direction.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_EndpointStallClear(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Description

This function clears the stall on an endpoint in the specified direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to clear a stall. In this
// example, the stall condition on Endpoint 1 IN direction is cleared.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBFS_DEVICE_EndpointStallClear(handle, ep);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

USB_ERROR DRV_USBFS_DEVICE_EndpointStallClear

(

DRV_HANDLE handle,

USB_ENDPOINT endpointAndDirection

)

DRV_USBFS_DEVICE_IRPCancel Function

This function cancels the specific IRP that are queued and in progress at the specified endpoint.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_IRPCancel(DRV_HANDLE client, USB_DEVICE_IRP * irp);
```

Returns

- USB_ERROR_NONE - The IRP have been canceled successfully.
- USB_ERROR_PARAMETER_INVALID - Invalid parameter or the IRP already has been aborted or completed
- USB_ERROR_OSAL_FUNCTION - An OSAL function called in this function did not execute successfully.

Description

This function attempts to cancel the processing of a queued IRP. An IRP that was in the queue but yet to be processed will be cancelled successfully and the IRP callback function will be called from this function with the USB_DEVICE_IRP_STATUS_ABORTED status. The application can release the data buffer memory used by the IRP when this callback occurs. If the IRP was in progress (a transaction in on the bus) when the cancel function was called, the IRP will be canceled only when an ongoing or the next transaction has completed. The IRP callback

function will then be called in an interrupt context. The application should not release the related data buffer unless the IRP callback has occurred.

Remarks

The size returned after the ABORT callback will be always 0 regardless of the amount of data that has been sent or received. The client should not assume any data transaction has happened for an canceled IRP. If the last transaction of the IRP was in progress, the IRP cancel does not have any effect. The first transaction of any ongoing IRP cannot be canceled.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to cancel IRP.  In this example the IRP
// has been scheduled from a device to the Host.

USB_ENDPOINT ep;
USB_DEVICE_IRP irp;

ep.direction = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

irp.data = myDataBufferToSend;
irp.size = 130;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

if (DRV_USBFS_DEVICE_IRPSubmit(handle, ep, &irp) != USB_ERROR_NONE)
{
    // This means there was an error.
}
else
{
    // Check the status of the IRP.
    if(irp.status != USB_DEVICE_IRP_STATUS_COMPLETED)
    {
        // Cancel the submitted IRP.
        if (DRV_USBFS_DEVICE_IRPCancel(handle, &irp) != USB_ERROR_NONE)
        {
            // The IRP Cancel request submission was successful.
            // IRP cancel status will be notified through the callback
            // function.
        }
        else
        {
            // The IRP may have been completed before IRP cancel operation.
            // could start. No callback notification will be generated.
        }
    }
    else
    {
        // The IRP processing must have been completed before IRP cancel was
        // submitted.
    }
}

void MyIRPCallback(USB_DEVICE_IRP * irp)
{
    // Check if the IRP callback is for a Cancel request
    if(irp->status == USB_DEVICE_IRP_STATUS_ABORTED)
    {
        // IRP cancel completed
    }
 }
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
irp	Pointer to the IRP to cancel.

Function

USB_ERROR DRV_USBFS_DEVICE_IRPCancel
(
DRV_HANDLE client,
USB_DEVICE_IRP * irp
)

DRV_USBFS_DEVICE_IRPCancelAll Function

This function cancels all IRPs that are queued and in progress at the specified endpoint.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_IRPCancelAll(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_OSAL_FUNCTION - An OSAL function called in this function did not execute successfully.

Description

This function cancels all IRPs that are queued and in progress at the specified endpoint.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to cancel all IRPs.

void MyIRPCallback(USB_DEVICE_IRP * irp)
{
    // Check if this is setup command

    if(irp->status == USB_DEVICE_IRP_STATUS_SETUP)
    {
        if(IsSetupCommandSupported(irp->data) == false)
        {
            // This means that this setup command is not
            // supported. Stall the some related endpoint and cancel all
            // queue IRPs.

            DRV_USBFS_DEVICE_EndpointStall(handle, ep);
            DRV_USBFS_DEVICE_IRPCancelAll(handle, ep);
        }
     }
 }
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

USB_ERROR DRV_USBFS_DEVICE_IRPCancelAll

```
(
    DRV_HANDLE client,
USB_ENDPOINT endpointAndDirection
);
```

DRV_USBFS_DEVICE_IRPSubmit Function

This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_DEVICE_IRPSubmit(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection, USB_DEVICE_IRP *
irp);
```

Returns

- USB_ERROR_NONE - if the IRP was submitted successful.
- USB_ERROR_IRP_SIZE_INVALID - if the size parameter of the IRP is not correct.
- USB_ERROR_PARAMETER_INVALID - If the client handle is not valid.
- USB_ERROR_ENDPOINT_NOT_CONFIGURED - If the endpoint is not enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - The specified endpoint is not valid.
- USB_ERROR_OSAL_FUNCTION - An OSAL call in the function did not complete successfully.

Description

This function submits an I/O Request Packet (IRP) for processing to the USB Driver. The IRP allows a client to send and receive data from the USB Host. The data will be sent or received through the specified endpoint. The direction of the data transfer is indicated by the direction flag in the endpointAndDirection parameter. Submitting an IRP arms the endpoint to either send data to or receive data from the Host. If an IRP is already being processed on the endpoint, the subsequent IRP submit operation will be queued. The contents of the IRP (including the application buffers) should not be changed until the IRP has been processed.

Particular attention should be paid to the size parameter of IRP. The following should be noted:

- The size parameter while sending data to the Host can be less than, greater than, equal to, or be an exact multiple of the maximum packet size for the endpoint. The maximum packet size for the endpoint determines the number of transactions required to process the IRP.
- If the size parameter, while sending data to the Host is less than the maximum packet size, the transfer will complete in one transaction.
- If the size parameter, while sending data to the Host is greater than the maximum packet size, the IRP will be processed in multiple transactions.
- If the size parameter, while sending data to the Host is equal to or an exact multiple of the maximum packet size, the client can optionally ask the driver to send a Zero Length Packet(ZLP) by specifying the USB_DEVICE_IRP_FLAG_DATA_COMPLETE flag as the flag parameter.
- The size parameter, while receiving data from the Host must be an exact multiple of the maximum packet size of the endpoint. If this is not the case, the driver will return a USB_ERROR_IRP_SIZE_INVALID result. If while processing the IRP, the driver receives less than maximum packet size or a ZLP from the Host, the driver considers the IRP as processed. The size parameter at this point contains the actual amount of data received from the Host. The IRP status is returned as USB_DEVICE_IRP_STATUS_COMPLETED_SHORT.
- If a ZLP needs to be sent to Host, the IRP size should be specified as 0 and the flag parameter should be set as USB_DEVICE_IRP_FLAG_DATA_COMPLETE.
- If the IRP size is an exact multiple of the endpoint size, the client can request the driver to not send a ZLP by setting the flag parameter to USB_DEVICE_IRP_FLAG_DATA_PENDING. This flag indicates that there is more data pending in this transfer.
- Specifying a size less than the endpoint size along with the USB_DEVICE_IRP_FLAG_DATA_PENDING flag will cause the driver to return a USB_ERROR_IRP_SIZE_INVALID.
- If the size is greater than but not a multiple of the endpoint size, and the flag is specified as USB_DEVICE_IRP_FLAG_DATA_PENDING, the driver will send multiple of endpoint size number of bytes. For example, if the IRP size is 130 and the endpoint size if 64, the number of bytes sent will 128.

Remarks

This function can be called from the ISR of the USB module to associated with the client.

Preconditions

The Client handle should be valid.

Example

```
// The following code shows an example of how to schedule a IRP to send data
// from a device to the Host. Assume that the max packet size is 64 and
// and this data needs to sent over Endpoint 1. In this example, the
```

```
// transfer is processed as three transactions of 64, 64 and 2 bytes.

USB_ENDPOINT ep;
USB_DEVICE_IRP irp;

ep.direction = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

irp.data = myDataBufferToSend;
irp.size = 130;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

if (DRV_USBFS_DEVICE_IRPSubmit(handle, ep, &irp) != USB_ERROR_NONE)
{
    // This means there was an error.
}
else
{
    // The status of the IRP can be checked.
    while(irp.status != USB_DEVICE_IRP_STATUS_COMPLETED)
    {
        // Wait or run a task function.
    }
}

// The following code shows how the client can request
// the driver to send a ZLP when the size is an exact multiple of
// endpoint size.

irp.data = myDataBufferToSend;
irp.size = 128;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

// Note that while  receiving data from the Host, the size should be an
// exact multiple of the maximum packet size of the endpoint. In the
// following example, the DRV_USBFS_DEVICE_IRPSubmit function will return a
// USB_DEVICE_IRP_SIZE_INVALID value.

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_HOST_TO_DEVICE, 1);

irp.data = myDataBufferToSend;
irp.size = 60; // THIS SIZE IS NOT CORRECT
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).
endpointAndDirection	Specifies the endpoint and direction.
irp	Pointer to the IRP to be added to the queue for processing.

Function

USB_ERROR DRV_USBFS_DEVICE_IRPSubmit

(

DRV_HANDLE client,

USB_ENDPOINT endpointAndDirection,

USB_DEVICE_IRP * irp

);

DRV_USBFS_DEVICE_RemoteWakeupStart Function

This function causes the device to start Remote Wakeup Signalling on the bus.

File

drv_usbfs.h

C

```
void DRV_USBFS_DEVICE_RemoteWakeupStart(DRV_HANDLE handle);
```

Returns

None.

Description

This function causes the device to start Remote Wakeup Signalling on the bus. This function should be called when the device, presently placed in suspend mode by the Host, wants to be wakeup. Note that the device can do this only when the Host has enabled the device's Remote Wakeup capability.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
DRV_HANDLE handle;

// If the Host has enabled the Remote Wakeup capability, and if the device
// is in suspend mode, then start Remote Wakeup signaling.

if(deviceIsSuspended && deviceRemoteWakeupEnabled)
{
    DRV_USBFS_DEVICE_RemoteWakeupStart(handle);
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

void DRV_USBFS_DEVICE_RemoteWakeupStart(DRV_HANDLE handle);

DRV_USBFS_DEVICE_RemoteWakeupStop Function

This function causes the device to stop the Remote Wakeup Signalling on the bus.

File

drv_usbfs.h

C

```
void DRV_USBFS_DEVICE_RemoteWakeupStop(DRV_HANDLE handle);
```

Returns

None.

Description

This function causes the device to stop Remote Wakeup Signalling on the bus. This function should be called after the DRV_USBFS_DEVICE_RemoteWakeupStart function was called to start the Remote Wakeup signaling on the bus.

Remarks

This function should be 1 to 15 milliseconds after the DRV_USBFS_DEVICE_RemoteWakeupStart function was called.

Preconditions

The handle should be valid. The DRV_USBFS_DEVICE_RemoteWakeupStart function was called to start the Remote Wakeup signaling on the bus.

Example

```
DRV_HANDLE handle;

// If the Host has enabled the Remote Wakeup capability, and if the device
// is in suspend mode, then start Remote Wakeup signaling. Wait for 10
// milliseconds and then stop the Remote Wakeup signaling

if(deviceIsSuspended && deviceRemoteWakeupEnabled)
{
    DRV_USBFS_DEVICE_RemoteWakeupStart(handle);
    DelayMilliSeconds(10);
    DRV_USBFS_DEVICE_RemoteWakeupStop(handle);
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

void DRV_USBFS_DEVICE_RemoteWakeupStop(DRV_HANDLE handle);

DRV_USBFS_DEVICE_SOFNumberGet Function

This function will return the USB SOF packet number.

File

drv_usbfs.h

C

```
uint16_t DRV_USBFS_DEVICE_SOFNumberGet(DRV_HANDLE handle);
```

Returns

The SOF packet number.

Description

This function will return the USB SOF packet number..

Remarks

None.

Preconditions

This function will return a valid value only when the device is attached to the bus. The SOF packet count will not increment if the bus is suspended.

Example

```
// This code shows how the DRV_USBFS_DEVICE_SOFNumberGet function is called
// to read the current SOF number.

DRV_HANDLE handle;
uint16_t sofNumber;

sofNumber = DRV_USBFS_DEVICE_SOFNumberGet(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

uint16_t DRV_USBFS_DEVICE_SOFNumberGet(DRV_HANDLE handle);

d) Host Mode Operation Functions

DRV_USBFS_HOST_EventsDisable Function

Disables Host mode events.

File

drv_usbfs.h

C

```
bool DRV_USBFS_HOST_EventsDisable(DRV_HANDLE handle);
```

Returns

- true - Driver event generation was enabled when this function was called.
- false - Driver event generation was not enabled when this function was called.

Description

This function disables the Host mode events. This function is called by the Host Layer when it wants to execute code atomically.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
// This code shows how the DRV_USBFS_HOST_EventsDisable and
// DRV_USBFS_HOST_EventsEnable function can be called to disable and enable
// events.

DRV_HANDLE driverHandle;
bool eventsWereEnabled;

// Disable the driver events.
eventsWereEnabled = DRV_USBFS_HOST_EventsDisable(driverHandle);

// Code in this region will not be interrupted by driver events.

// Enable the driver events.
DRV_USBFS_HOST_EventsEnable(driverHandle, eventsWereEnabled);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBFS_Open function).

Function

bool DRV_USBFS_HOST_EventsDisable

(

DRV_HANDLE handle

);

DRV_USBFS_HOST_EventsEnable Function

Restores the events to the specified the original value.

File

drv_usbfs.h

C

```
void DRV_USBFS_HOST_EventsEnable(DRV_HANDLE handle, bool eventContext);
```

Returns

None.

Description

This function will restore the enable disable state of the events. The eventRestoreContext parameter should be equal to the value returned by the DRV_USBFS_HOST_EventsDisable function.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
// This code shows how the DRV_USBFS_HOST_EventsDisable and
// DRV_USBFS_HOST_EventsEnable function can be called to disable and enable
// events.

DRV_HANDLE driverHandle;
bool eventsWereEnabled;

// Disable the driver events.
eventsWereEnabled = DRV_USBFS_HOST_EventsDisable(driverHandle);

// Code in this region will not be interrupted by driver events.

// Enable the driver events.
DRV_USBFS_HOST_EventsEnable(driverHandle, eventsWereEnabled);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
eventRestoreContext	Value returned by the DRV_USBFS_HOST_EventsDisable function.

Function

void DRV_USBFS_HOST_EventsEnable

(

DRV_HANDLE handle

bool eventRestoreContext

);

DRV_USBFS_HOST_IRPCancel Function

Cancels the specified IRP.

File

drv_usbfs.h

C

```
void DRV_USBFS_HOST_IRPCancel(USB_HOST_IRP * inputIRP);
```

Returns

None.

Description

This function attempts to cancel the specified IRP. If the IRP is queued and its processing has not started, it will be cancelled successfully. If the IRP in progress, the ongoing transaction will be allowed to complete.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how a submitted IRP can be cancelled.

USB_HOST_IRP irp;
USB_ERROR result;
USB_HOST_PIPE_HANDLE controlPipe;
USB_SETUP_PACKET setup;
uint8_t controlTransferData[32];

irp.setup = setup;
irp.data = controlTransferData;
irp.size = 32;
irp.flags = USB_HOST_IRP_FLAG_NONE ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

DRV_USBFS_HOST_IRPSubmit(controlPipeHandle, &irp);

// Additional application logic may come here. This logic may decide to
// cancel the submitted IRP.

DRV_USBFS_HOST_IRPCancel(&irp);
```

Parameters

Parameters	Description
inputIRP	Pointer to the IRP to cancel.

Function

void DRV_USBFS_HOST_IRPCancel(USB_HOST_IRP * inputIRP);

DRV_USBFS_HOST_IRPSubmit Function

Submits an IRP on a pipe.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_HOST_IRPSubmit(DRV_USBFS_HOST_PIPE_HANDLE hPipe, USB_HOST_IRP * pinputIRP);
```

Returns

- USB_ERROR_NONE - The IRP was submitted successfully.
- USB_ERROR_PARAMETER_INVALID - The pipe handle is not valid.
- USB_ERROR_OSAL_FUNCTION - An error occurred in an OSAL function called in this function.

Description

This function submits an IRP on the specified pipe. The IRP will be added to the queue and will be processed in turn. The data will be transferred on the bus based on the USB bus scheduling rules. When the IRP has been processed, the callback function specified in the IRP will be called. The IRP status will be updated to reflect the completion status of the IRP.

Remarks

An IRP can also be submitted in an IRP callback function.

Preconditions

The pipe handle should be valid.

Example

```
// The following code shows an example of how the host layer populates
// the IRP object and then submits it. IRP_Callback function is called when an
// IRP has completed processing. The status of the IRP at completion can be
// checked in the status flag. The size field of the irp will contain the amount
// of data transferred.

void IRP_Callback(USB_HOST_IRP * irp)
{
    // irp is pointing to the IRP for which the callback has occurred. In most
    // cases this function will execute in an interrupt context. The application
    // should not perform any hardware access or interrupt un-safe operations in
    // this function.

    switch(irp->status)
    {
        case USB_HOST_IRP_STATUS_ERROR_UNKNOWN:
            // IRP was terminated due to an unknown error
            break;

        case USB_HOST_IRP_STATUS_ABORTED:
            // IRP was terminated by the application
            break;

        case USB_HOST_IRP_STATUS_ERROR_BUS:
            // IRP was terminated due to a bus error
            break;

        case USB_HOST_IRP_STATUS_ERROR_DATA:
            // IRP was terminated due to data error
            break;

        case USB_HOST_IRP_STATUS_ERROR_NAK_TIMEOUT:
            // IRP was terminated because of a NAK timeout
            break;

        case USB_HOST_IRP_STATUS_ERROR_STALL:
            // IRP was terminated because of a device sent a STALL
            break;

        case USB_HOST_IRP_STATUS_COMPLETED:
            // IRP has been completed
            break;

        case USB_HOST_IRP_STATUS_COMPLETED_SHORT:
            // IRP has been completed but the amount of data processed was less
            // than requested.
            break;

        default:
            break;
    }
}

// In the following code snippet the a control transfer IRP is submitted to a
// control pipe. The setup parameter of the IRP points to the Setup command of
// the control transfer. The direction of the data stage is specified by the
// Setup packet.

USB_HOST_IRP irp;
USB_ERROR result;
USB_HOST_PIPE_HANDLE controlPipe;
USB_SETUP_PACKET setup;
uint8_t controlTransferData[32];
```

```
irp.setup = setup;
irp.data = controlTransferData;
irp.size = 32;
irp.flags = USB_HOST_IRP_FLAG_NONE ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

result = DRV_USBFS_HOST_IRPSubmit(controlPipeHandle, &irp);
```

Parameters

Parameters	Description
hPipe	Handle to the pipe to which the IRP has to be submitted.
pInputIRP	Pointer to the IRP.

Function

USB_ERROR DRV_USBFS_HOST_IRPSubmit

(

DRV_USBFS_HOST_PIPE_HANDLE hPipe,

USB_HOST_IRP * pInputIRP

);

DRV_USBFS_HOST_PipeClose Function

Closes an open pipe.

File

drv_usbfs.h

C

```
void DRV_USBFS_HOST_PipeClose(DRV_USBFS_HOST_PIPE_HANDLE pipeHandle);
```

Returns

None.

Description

This function closes an open pipe. Any IRPs scheduled on the pipe will be aborted and IRP callback functions will be called with the status as DRV_USB_HOST_IRP_STATE_ABORTED. The pipe handle will become invalid and the pipe will not accept IRPs.

Remarks

None.

Preconditions

The pipe handle should be valid.

Example

```
// This code shows how an open Host pipe can be closed.

DRV_HANDLE driverHandle;
DRV_USBFS_HOST_PIPE_HANDLE pipeHandle;

// Close the pipe.
DRV_USBFS_HOST_PipeClose(pipeHandle);
```

Parameters

Parameters	Description
pipeHandle	Handle to the pipe to close.

Function

void DRV_USBFS_HOST_PipeClose

(

```
    DRV_USBFS_HOST_PIPE_HANDLE pipeHandle
);
```

DRV_USBFS_HOST_PipeSetup Function

Open a pipe with the specified attributes.

File

drv_usbfs.h

C

```
DRV_USBFS_HOST_PIPE_HANDLE DRV_USBFS_HOST_PipeSetup(DRV_HANDLE client, uint8_t deviceAddress, USB_ENDPOINT
endpointAndDirection, uint8_t hubAddress, uint8_t hubPort, USB_TRANSFER_TYPE pipeType, uint8_t bInterval,
uint16_t wMaxPacketSize, USB_SPEED speed);
```

Returns

- DRV_USB_HOST_PIPE_HANDLE_INVALID - The pipe could not be created.
- A valid Pipe Handle - The pipe was created successfully. This is an arbitrary value and will never be the same as DRV_USB_HOST_PIPE_HANDLE_INVALID.

Description

This function opens a communication pipe between the Host and the device endpoint. The transfer type and other attributes are specified through the function parameters. The driver does not check for available bus bandwidth, which should be done by the application (the USB Host Layer in this case)

Remarks

None.

Preconditions

The driver handle should be valid.

Example

```
// This code shows how the DRV_USBFS_HOST_PipeSetup function is called for
// create a communication pipe. In this example, Bulk pipe is created
// between the Host and a device. The Device address is 2 and the target
// endpoint on this device is 4 . The direction of the data transfer over
// this pipe is from the Host to the device. The device is connected to Port
// 1 of a Hub, whose USB address is 3. The maximum size of a transaction
// on this pipe is 64 bytes. This is a Bulk Pipe and hence the bInterval
// field is set to 0. The target device is operating at Full Speed.

DRV_HANDLE driverHandle;
DRV_USBFS_HOST_PIPE_HANDLE pipeHandle;

pipeHandle = DRV_USBFS_HOST_PipeSetup(driverHandle, 0x02, 0x14, 0x03, 0x01, USB_TRANSFER_TYPE_BULK, 0, 64,
USB_SPEED_FULL);

if(pipeHandle != DRV_USBFS_HOST_PIPE_HANDLE_INVALID)
{
    // The pipe was created successfully.
}
```

Parameters

Parameters	Description
client	Handle to the driver (returned from DRV_USBFS_Open function).
deviceAddress	USB Address of the device to connect to.
endpoint	Endpoint on the device to connect to.
hubAddress	Address of the hub to which this device is connected. If not connected to a hub, this value should be set to 0.
hubPort	Port number of the hub to which this device is connected.
pipeType	Transfer type of the pipe to open.
bInterval	Polling interval for periodic transfers. This should be specified as defined by the USB 2.0 Specification.

wMaxPacketSize	This should be set to the endpoint size reported by the device in its configuration descriptors. This defines the maximum size of the transaction in a transfer on this pipe.
speed	The speed of the pipe. This should match the speed at which the device connected to the Host.

Function

```
DRV_USBFS_HOST_PIPE_HANDLE DRV_USBFS_HOST_PipeSetup
(
    DRV_HANDLE client,
uint8_t deviceAddress,
USB_ENDPOINT endpointAndDirection,
uint8_t hubAddress,
uint8_t hubPort,
USB_TRANSFER_TYPE pipeType,
uint8_t bInterval,
uint16_t wMaxPacketSize,
USB_SPEED speed
);
```

e) Root Hub Functions

DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet Function

This function returns the operating speed of the bus to which this root hub is connected.

File

drv_usbfs.h

C

```
USB_SPEED DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet(DRV_HANDLE handle);
```

Returns

- USB_SPEED_FULL - The Root hub is connected to a bus that is operating at Full Speed.

Description

This function returns the operating speed of the bus to which this root hub is connected.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet function is
// called to know the operating speed of the bus to which this Root hub is
// connected.

DRV_HANDLE driverHandle;
USB_SPEED speed;

speed = DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

USB_SPEED DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet(DRV_HANDLE handle);

DRV_USBFS_HOST_ROOT_HUB_Initialize Function

This function initializes the root hub driver.

File

drv_usbfs.h

C

```
void DRV_USBFS_HOST_ROOT_HUB_Initialize(DRV_HANDLE handle, USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo);
```

Returns

None.

Description

This function initializes the root hub driver. It is called by the Host Layer at the time of processing the root hub devices. The Host Layer assigns a USB_HOST_DEVICE_INFO reference to this root hub driver. This identifies the relationship between the root hub and the Host Layer.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the USB Host Layer calls the
// DRV_USBFS_HOST_ROOT_HUB_Initialize function. The usbHostDeviceInfo
// parameter is an arbitrary identifier assigned by the USB Host Layer. Its
// interpretation is opaque to the Root hub Driver.

DRV_HANDLE drvHandle;
USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo = 0x10003000;

DRV_USBFS_HOST_ROOT_HUB_Initialize(drvHandle, usbHostDeviceInfo);
```

Parameters

Parameters	Description
handle	Handle to the driver.
usbHostDeviceInfo	Reference provided by the Host.

Function

void DRV_USBFS_HOST_ROOT_HUB_Initialize

(

DRV_HANDLE handle,

USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo,

)

DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet Function

Returns the maximum amount of current that this root hub can provide on the bus.

File

drv_usbfs.h

C

```
uint32_t DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet(DRV_HANDLE handle);
```

Returns

Returns the maximum current (in milliamperes) that the root hub can supply.

Description

This function returns the maximum amount of current that this root hub can provide on the bus.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet
// function is called to obtain the maximum VBUS current that the Root hub
// can supply.

DRV_HANDLE driverHandle;
uint32_t currentMilliAmperes;

currentMilliAmperes = DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

uint32_t DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet(DRV_HANDLE);

DRV_USBFS_HOST_ROOT_HUB_OperationEnable Function

This function enables or disables root hub operation.

File

drv_usbfs.h

C

```
void DRV_USBFS_HOST_ROOT_HUB_OperationEnable(DRV_HANDLE handle, bool enable);
```

Returns

None.

Description

This function enables or disables root hub operation. When enabled, the root hub will detect devices attached to the port and will request the Host Layer to enumerate the device. This function is called by the Host Layer when it is ready to receive enumeration requests from the Host. If the operation is disabled, the root hub will not detect attached devices.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_OperationEnable and the
// DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled functions are called to enable
// the Root hub operation.

DRV_HANDLE driverHandle;

// Enable Root hub operation.
```

```
DRV_USBFS_HOST_ROOT_HUB_OperationEnable(driverHandle);

// Wait till the Root hub operation is enabled.
if(DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled(driverHandle) == false)
{
    // The operation has not completed. Call the
    // DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled function again to check if
    // the operation has completed. Note that the DRV_USBFS_Tasks function
    // must be allowed to run at periodic intervals to allow the enable
    // operation to completed.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
enable	If this is set to true, root hub operation is enabled. If this is set to false, root hub operation is disabled.

Function

void DRV_USBFS_HOST_ROOT_HUB_OperationEnable

(

DRV_HANDLE handle,

bool enable

);

DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled Function

Returns the operation enabled status of the root hub.

File

drv_usbfs.h

C

```
bool DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled(DRV_HANDLE handle);
```

Returns

- true - Root hub operation is enabled.
- false - Root hub operation is not enabled.

Description

This function returns true if the DRV_USBFS_HOST_ROOT_HUB_OperationEnable function has completed enabling the Host.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_OperationEnable and the
// DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled functions are called to enable
// the Root hub operation.

DRV_HANDLE driverHandle;

// Enable Root hub operation.
DRV_USBFS_HOST_ROOT_HUB_OperationEnable(driverHandle);

// Wait till the Root hub operation is enabled.
if(DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled(driverHandle) == false)
{
    // The operation has not completed. Call the
    // DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled function again to check if
    // the operation has completed. Note that the DRV_USBFS_Tasks function
```

```
    // must be allowed to run at periodic intervals to allow the enable
    // operation to completed.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

bool DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled(DRV_HANDLE handle);

DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet Function

Returns the number of ports this root hub contains.

File

drv_usbfs.h

C

```
uint8_t DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet(DRV_HANDLE handle);
```

Returns

This function will always return 1.

Description

This function returns the number of ports that this root hub contains.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet function can
// be called to obtain the number of Root hub ports.

DRV_HANDLE driverHandle;
uint8_t nPorts;

nPorts = DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).

Function

uint8_t DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet(DRV_HANDLE handle);

DRV_USBFS_HOST_ROOT_HUB_PortReset Function

Resets the specified root hub port.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_HOST_ROOT_HUB_PortReset(DRV_HANDLE handle, uint8_t port);
```

Returns

None.

Description

This function resets the root hub port. The reset duration is defined by DRV_USBFS_ROOT_HUB_RESET_DURATION. The status of the reset signaling can be checked using the DRV_USBFS_ROOT_HUB_PortResetIsComplete function.

Remarks

The root hub on the PIC32MZ USB controller contains only one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USB_HOST_ROOT_HUB_PortReset and the
// DRV_USBFS_ROOT_HUB_PortResetIsComplete functions are called to complete a
// port reset sequence.

DRV_HANDLE driverHandle;

// Reset Port 0.
DRV_USB_HOST_ROOT_HUB_PortReset(driverHandle, 0);

// Check if the Reset operation has completed.
if(DRV_USBFS_ROOT_HUB_PortResetIsComplete(driverHandle, 0) == false)
{
    // This means that the Port Reset operation has not completed yet. The
    // DRV_USBFS_ROOT_HUB_PortResetIsComplete function should be called
    // again after some time to check the status.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
port	Port to reset.

Function

void DRV_USBFS_ROOT_HUB_PortReset(DRV_HANDLE handle, uint8_t port);

DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete Function

Returns true if the root hub has completed the port reset operation.

File

drv_usbfs.h

C

```
bool DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete(DRV_HANDLE handle, uint8_t port);
```

Returns

- true - The reset signaling has completed.
- false - The reset signaling has not completed.

Description

This function returns true if the port reset operation has completed. It should be called after the DRV_USB_HOST_ROOT_HUB_PortReset function to check if the reset operation has completed.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USB_HOST_ROOT_HUB_PortReset and the
// DRV_USBFS_ROOT_HUB_PortResetIsComplete functions are called to complete a
// port reset sequence.

DRV_HANDLE driverHandle;

// Reset Port 0.
DRV_USB_HOST_ROOT_HUB_PortReset(driverHandle, 0);

// Check if the Reset operation has completed.
if(DRV_USBFS_ROOT_HUB_PortResetIsComplete(driverHandle, 0) == false)
{
    // This means that the Port Reset operation has not completed yet. The
    // DRV_USBFS_ROOT_HUB_PortResetIsComplete function should be called
    // again after some time to check the status.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
port	Port to check

Function

bool DRV_USBFS_ROOT_HUB_PortResetIsComplete

(

DRV_HANDLE handle,

uint8_t port

);

DRV_USBFS_HOST_ROOT_HUB_PortResume Function

Resumes the specified root hub port.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_HOST_ROOT_HUB_PortResume(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid or the port number does not exist.

Description

This function resumes the root hub. The resume duration is defined by DRV_USBFS_ROOT_HUB_RESUME_DURATION. The status of the resume signaling can be checked using the DRV_USBFS_ROOT_HUB_PortResumeIsComplete function.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_PortResume function is
// called to resume the specified port.

DRV_HANDLE driverHandle;

// Resume Port 0.
DRV_USBFS_HOST_ROOT_HUB_PortResume(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
port	Port to resume.

Function

USB_ERROR DRV_USBFS_HOST_ROOT_HUB_PortResume
(
DRV_HANDLE handle,
uint8_t port
);

DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet Function

Returns the speed of at which the port is operating.

File

drv_usbfs.h

C

```
USB_SPEED DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_SPEED_ERROR - This value is returned if the driver handle is not or if the speed information is not available or if the specified port is not valid.
- USB_SPEED_FULL - A Full Speed device has been connected to the port.
- USB_SPEED_LOW - A Low Speed device has been connected to the port.

Description

This function returns the speed at which the port is operating.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet function is
// called to know the operating speed of the port. This also indicates the
// operating speed of the device connected to this port.

DRV_HANDLE driverHandle;
USB_SPEED speed;

speed = DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
port	Port number of the port to be analyzed..

Function

USB_SPEED DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet
(
DRV_HANDLE handle,
uint8_t port
);

DRV_USBFS_HOST_ROOT_HUB_PortSuspend Function

Suspends the specified root hub port.

File

drv_usbfs.h

C

```
USB_ERROR DRV_USBFS_HOST_ROOT_HUB_PortSuspend(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid or the port number does not exist.

Description

This function suspends the root hub port.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBFS_HOST_ROOT_HUB_PortSuspend function is
// called to suspend the specified port.

DRV_HANDLE driverHandle;

// Suspend Port 0.
DRV_USBFS_HOST_ROOT_HUB_PortSuspend(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBFS_Open function).
port	Port to suspend.

Function

USB_ERROR DRV_USBFS_ROOT_HUB_PortSuspend(DRV_HANDLE handle, uint8_t port);

f) Data Types and Constants

DRV_USBFS_EVENT Enumeration

Identifies the different events that the USB Driver provides.

File

drv_usbfs.h

C

```
typedef enum {
  DRV_USBFS_EVENT_ERROR = DRV_USB_EVENT_ERROR,
  DRV_USBFS_EVENT_RESET_DETECT = DRV_USB_EVENT_RESET_DETECT,
  DRV_USBFS_EVENT_RESUME_DETECT = DRV_USB_EVENT_RESUME_DETECT,
  DRV_USBFS_EVENT_IDLE_DETECT = DRV_USB_EVENT_IDLE_DETECT,
  DRV_USBFS_EVENT_STALL = DRV_USB_EVENT_STALL,
  DRV_USBFS_EVENT_SOF_DETECT = DRV_USB_EVENT_SOF_DETECT,
  DRV_USBFS_EVENT_DEVICE_SESSION_VALID = DRV_USB_EVENT_DEVICE_SESSION_VALID,
  DRV_USBFS_EVENT_DEVICE_SESSION_INVALID = DRV_USB_EVENT_DEVICE_SESSION_INVALID
} DRV_USBFS_EVENT;
```

Members

Members	Description
DRV_USBFS_EVENT_ERROR = DRV_USB_EVENT_ERROR	Bus error occurred and was reported
DRV_USBFS_EVENT_RESET_DETECT = DRV_USB_EVENT_RESET_DETECT	Host has issued a device reset
DRV_USBFS_EVENT_RESUME_DETECT = DRV_USB_EVENT_RESUME_DETECT	Resume detected while USB in suspend mode
DRV_USBFS_EVENT_IDLE_DETECT = DRV_USB_EVENT_IDLE_DETECT	Idle detected
DRV_USBFS_EVENT_STALL = DRV_USB_EVENT_STALL	Stall handshake has occurred
DRV_USBFS_EVENT_SOF_DETECT = DRV_USB_EVENT_SOF_DETECT	Either Device received SOF or SOF threshold was reached in the Host mode operation
DRV_USBFS_EVENT_DEVICE_SESSION_VALID = DRV_USB_EVENT_DEVICE_SESSION_VALID	Session valid
DRV_USBFS_EVENT_DEVICE_SESSION_INVALID = DRV_USB_EVENT_DEVICE_SESSION_INVALID	Session Invalid

Description

USB Driver Events Enumeration.

This enumeration identifies the different events that are generated by the USB Driver.

Remarks

None.

DRV_USBFS_EVENT_CALLBACK Type

Type of the USB Driver event callback function.

File

drv_usbfs.h

C

```
typedef void (* DRV_USBFS_EVENT_CALLBACK)(uintptr_t hClient, DRV_USBFS_EVENT eventType, void * eventData);
```

Returns

None.

Description

Type of the USB Driver Event Callback Function.

Define the type of the USB Driver event callback function. The client should register an event callback function of this type when it intends to receive events from the USB Driver. The event callback function is registered using the DRV_USBFS_ClientEventCallBackSet function.

Remarks

None.

Parameters

Parameters	Description
hClient	Handle to the driver client that registered this callback function.
eventType	This parameter identifies the event that caused the callback function to be called.
eventData	Pointer to a data structure that is related to this event. This value will be NULL if the event has no related data.

DRV_USBFS_HOST_PIPE_HANDLE Type

Defines the USB Driver Host Pipe Handle type.

File

drv_usbfs.h

C

```
typedef uintptr_t DRV_USBFS_HOST_PIPE_HANDLE;
```

Description

USB Driver Host Pipe Handle.

This type definition defines the type of the USB Driver Host Pipe Handle.

Remarks

None.

DRV_USBFS_INIT Structure

This type definition defines the Driver Initialization Data Structure.

File

drv_usbfs.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  USB_MODULE_ID usbID;
  bool stopInIdle;
  bool suspendInSleep;
  INT_SOURCE interruptSource;
  USB_SPEED operationSpeed;
  DRV_USBFS_OPMODES operationMode;
  void * endpointTable;
  uint32_t rootHubAvailableCurrent;
  DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;
  DRV_USBFS_ROOT_HUB_PORT_INDICATION portIndication;
  DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;
} DRV_USBFS_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System Module Initialization
USB_MODULE_ID usbID;	Identifies the USB peripheral to be used. This should be the USB PLIB module instance identifier.
bool stopInIdle;	This should be set to true if the USB module must stop operation in IDLE mode
bool suspendInSleep;	This should be set to true if the USB module must suspend when the CPU enters sleep mode.
INT_SOURCE interruptSource;	Specify the interrupt source for the USB module. This should be the interrupt source identifier for the USB module instance specified in usbID.
USB_SPEED operationSpeed;	Specify the operational speed of the USB module. This should always be set to USB_SPEED_FULL.
DRV_USBFS_OPMODES operationMode;	Specify the operation mode of the USB module. This specifies if the USB module should operate as a Device, Host, or both (Dual Role operation).
void * endpointTable;	A pointer to the endpoint descriptor table. This should be aligned at 512 byte address boundary. The size of the table is equal to DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE times the number of endpoints needed in the application.
uint32_t rootHubAvailableCurrent;	Root hub available current in milliamperes. This specifies the amount of current that root hub can provide to the attached device. This should be specified in mA. This is required when the driver is required to operate in host mode.
DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;	When operating in Host mode, the application can specify a Root Hub port enable function. This parameter should point to Root Hub port enable function. If this parameter is NULL, it implies that the Port is always enabled.
DRV_USBFS_ROOT_HUB_PORT_INDICATION portIndication;	When operating in Host mode, the application can specify a Root Port Indication. This parameter should point to the Root Port Indication function. If this parameter is NULL, it implies that Root Port Indication is not supported.
DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;	When operating is Host mode, the application can specify a Root Port Overcurrent detection. This parameter should point to the Root Port Indication function. If this parameter is NULL, it implies that Overcurrent detection is not supported.

Description

USB Device Driver Initialization Data.

This structure contains all the data necessary to initialize the USB Driver. A pointer to a structure of this type, containing the desired initialization data, must be passed into the DRV_USBFS_Initialize function.

Remarks

None.

DRV_USBFS_OPMODES Enumeration

Identifies the operating modes supported by the USB Driver.

File

drv_usbfs.h

C

```
typedef enum {
  DRV_USBFS_OPMODE_DUAL_ROLE = DRV_USB_OPMODE_DUAL_ROLE,
  DRV_USBFS_OPMODE_DEVICE = DRV_USB_OPMODE_DEVICE,
  DRV_USBFS_OPMODE_HOST = DRV_USB_OPMODE_HOST,
  DRV_USBFS_OPMODE_OTG = DRV_USB_OPMODE_OTG
} DRV_USBFS_OPMODES;
```

Members

Members	Description
DRV_USBFS_OPMODE_DUAL_ROLE = DRV_USB_OPMODE_DUAL_ROLE	The driver should be able to switch between host and device mode
DRV_USBFS_OPMODE_DEVICE = DRV_USB_OPMODE_DEVICE	The driver should support device mode operation only
DRV_USBFS_OPMODE_HOST = DRV_USB_OPMODE_HOST	The driver should support host mode operation only
DRV_USBFS_OPMODE_OTG = DRV_USB_OPMODE_OTG	The driver should support the OTG protocol

Description

USB Operating Modes Enumeration.

This enumeration identifies the operating modes supported by the USB Driver.

Remarks

None.

DRV_USBFS_ROOT_HUB_PORT_INDICATION Type

USB Root hub Application Hooks (Port Indication).

File

drv_usbfs.h

C

```
typedef void (* DRV_USBFS_ROOT_HUB_PORT_INDICATION)(uint8_t port, USB_HUB_PORT_INDICATOR_COLOR color,
USB_HUB_PORT_INDICATOR_STATE state);
```

Description

USB Root hub Application Hooks (Port Indication).

A function of the type defined here should be provided to the driver root to implement Port Indication. The root hub driver calls this function when it needs to update the state of the port indication LEDs. The application can choose to implement the Amber and Green colors as one LED or two different LEDs. The root hub driver specifies the color and the indicator attribute (on, off or blinking) when it calls this function.

Remarks

None.

DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT Type

USB Root hub Application Hooks (Port Overcurrent detection).

File

drv_usbfs.h

C

```
typedef bool (* DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT)(uint8_t port);
```

Description

USB Root hub Application Hooks (Port Overcurrent detection).

A function of the type defined here should be provided to the driver root hub to check for port over current condition. This function will be called periodically by the root hub driver to check the Overcurrent status of the port. It should continue to return true while the Overcurrent condition exists on the port. It should return false when the Overcurrent condition does not exist.

Remarks

None.

DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE Type

USB Root hub Application Hooks (Port Power Enable/ Disable).

File

drv_usbfs.h

C

```
typedef void (* DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE)(uint8_t port, bool control);
```

Description

USB Root hub Application Hooks (Port Power Enable/ Disable).

A function of the type defined here should be provided to the driver root to control port power. The root hub driver will call this function when it needs to enable port power. If the application circuit contains a VBUS switch, the switch should be accessed and controlled by this function. If the enable parameter is true, the switch should be enabled and VBUS should be available on the port. If the enable parameter is false, the switch should be disabled and VBUS should not be available on the port.

Remarks

None.

DRV_USBFS_DEVICE_INTERFACE Macro

USB Driver Device Mode Interface Functions.

File

drv_usbfs.h

C

```
#define DRV_USBFS_DEVICE_INTERFACE
```

Description

USB Driver Device Mode Interface Functions.

The Device Driver interface in the Device Layer Initialization data structure should be set to this value so that Device Layer can access the USB Driver Device Mode functions.

Remarks

None.

DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE Macro

USB Driver Endpoint Table Entry Size in bytes.

File

drv_usbfs.h

C

```
#define DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE 32
```

Description

USB Driver Endpoint Table Entry Size in bytes.

This constant defines the size (in bytes) of an entry in the endpoint table.

Remarks

None.

DRV_USBFS_HOST_INTERFACE Macro

USB Driver Host Mode Interface Functions.

File

drv_usbfs.h

C

```
#define DRV_USBFS_HOST_INTERFACE
```

Description

USB Driver Host Mode Interface Functions.

The Host Controller Driver interface in the Host Layer Initialization data structure should be set to this value so that Host Layer can access the USB Driver Host Mode functions.

Remarks

None.

DRV_USBFS_HOST_PIPE_HANDLE_INVALID Macro

Value of an Invalid Host Pipe Handle.

File

drv_usbfs.h

C

```
#define DRV_USBFS_HOST_PIPE_HANDLE_INVALID ((DRV_USBFS_HOST_PIPE_HANDLE)(-1))
```

Description

USB Driver Invalid Host Pipe Handle.

This constant defines the value of an Invalid Host Pipe Handle.

Remarks

None.

DRV_USBFS_INDEX_0 Macro

USB Driver Module Index 0 Definition.

File

drv_usbfs.h

C

```
#define DRV_USBFS_INDEX_0 0
```

Description

USB Driver Module Index 0 Definition.

This constant defines the value of USB Driver Index 0. The SYS_MODULE_INDEX parameter of the DRV_USBFS_Initialize and

DRV_USBFS_Open functions should be set to this value to identify instance 0 of the driver.

Remarks

These constants should be used in place of hard-coded numeric literals and should be passed into the DRV_USBFS_Initialize and DRV_USBFS_Open functions to identify the driver instance in use. These are not indicative of the number of modules that are actually supported by the microcontroller.

DRV_USBFS_INDEX_1 Macro

USB Driver Module Index 1 Definition.

File

drv_usbfs.h

C

```
#define DRV_USBFS_INDEX_1 1
```

Description

USB Driver Module Index 1 Definition.

This constant defines the value of USB Driver Index 1. The SYS_MODULE_INDEX parameter of the DRV_USBFS_Initialize and DRV_USBFS_Open functions should be set to this value to identify instance 1 of the driver.

Remarks

These constants should be used in place of hard-coded numeric literals and should be passed into the DRV_USBFS_Initialize and DRV_USBFS_Open functions to identify the driver instance in use. These are not indicative of the number of modules that are actually supported by the microcontroller.

PIC32MX USB Module Driver Interface File.

Enumerations

	Name	Description
	DRV_USBFS_EVENT	Identifies the different events that the USB Driver provides.
	DRV_USBFS_OPMODES	Identifies the operating modes supported by the USB Driver.

Functions

	Name	Description
	DRV_USBFS_ClientEventCallBackSet	This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.
	DRV_USBFS_Close	Closes an opened-instance of the USB Driver.
	DRV_USBFS_DEVICE_AddressSet	This function will set the USB module address that is obtained from the Host.
	DRV_USBFS_DEVICE_Attach	This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.
	DRV_USBFS_DEVICE_CurrentSpeedGet	This function returns the USB speed at which the device is operating.
	DRV_USBFS_DEVICE_Detach	This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.

	DRV_USBFS_DEVICE_EndpointDisable	This function disables an endpoint.
	DRV_USBFS_DEVICE_EndpointDisableAll	This function disables all provisioned endpoints.
	DRV_USBFS_DEVICE_EndpointEnable	This function enables an endpoint for the specified direction and endpoint size.
	DRV_USBFS_DEVICE_EndpointIsEnabled	This function returns the enable/disable status of the specified endpoint and direction.
	DRV_USBFS_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	DRV_USBFS_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.
	DRV_USBFS_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	DRV_USBFS_DEVICE_IRPCancel	This function cancels the specific IRP that are queued and in progress at the specified endpoint.
	DRV_USBFS_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	DRV_USBFS_DEVICE_IRPSubmit	This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.
	DRV_USBFS_DEVICE_RemoteWakeupStart	This function causes the device to start Remote Wakeup Signalling on the bus.
	DRV_USBFS_DEVICE_RemoteWakeupStop	This function causes the device to stop the Remote Wakeup Signalling on the bus.
	DRV_USBFS_DEVICE_SOFNumberGet	This function will return the USB SOF packet number.
	DRV_USBFS_HOST_EventsDisable	Disables Host mode events.
	DRV_USBFS_HOST_EventsEnable	Restores the events to the specified the original value.
	DRV_USBFS_HOST_IRPCancel	Cancels the specified IRP.
	DRV_USBFS_HOST_IRPSubmit	Submits an IRP on a pipe.
	DRV_USBFS_HOST_PipeClose	Closes an open pipe.
	DRV_USBFS_HOST_PipeSetup	Open a pipe with the specified attributes.
	DRV_USBFS_HOST_ROOT_HUB_BusSpeedGet	This function returns the operating speed of the bus to which this root hub is connected.
	DRV_USBFS_HOST_ROOT_HUB_Initialize	This function initializes the root hub driver.
	DRV_USBFS_HOST_ROOT_HUB_MaximumCurrentGet	Returns the maximum amount of current that this root hub can provide on the bus.
	DRV_USBFS_HOST_ROOT_HUB_OperationEnable	This function enables or disables root hub operation.
	DRV_USBFS_HOST_ROOT_HUB_OperationIsEnabled	Returns the operation enabled status of the root hub.
	DRV_USBFS_HOST_ROOT_HUB_PortNumbersGet	Returns the number of ports this root hub contains.
	DRV_USBFS_HOST_ROOT_HUB_PortReset	Resets the specified root hub port.
	DRV_USBFS_HOST_ROOT_HUB_PortResetIsComplete	Returns true if the root hub has completed the port reset operation.
	DRV_USBFS_HOST_ROOT_HUB_PortResume	Resumes the specified root hub port.
	DRV_USBFS_HOST_ROOT_HUB_PortSpeedGet	Returns the speed of at which the port is operating.
	DRV_USBFS_HOST_ROOT_HUB_PortSuspend	Suspends the specified root hub port.
	DRV_USBFS_Initialize	Initializes the USB Driver.
	DRV_USBFS_Open	Opens the specified USB Driver instance and returns a handle to it.
	DRV_USBFS_Status	Provides the current status of the USB Driver module.
	DRV_USBFS_Tasks	Maintains the driver's state machine when the driver is configured for Polled mode.
	DRV_USBFS_Tasks_ISR	Maintains the driver's Interrupt state machine and implements its ISR.

Macros

	Name	Description
	DRV_USBFS_DEVICE_INTERFACE	USB Driver Device Mode Interface Functions.
	DRV_USBFS_ENDPOINT_TABLE_ENTRY_SIZE	USB Driver Endpoint Table Entry Size in bytes.
	DRV_USBFS_HOST_INTERFACE	USB Driver Host Mode Interface Functions.
	DRV_USBFS_HOST_PIPE_HANDLE_INVALID	Value of an Invalid Host Pipe Handle.
	DRV_USBFS_INDEX_0	USB Driver Module Index 0 Definition.
	DRV_USBFS_INDEX_1	USB Driver Module Index 1 Definition.

Structures

	Name	Description
	DRV_USBFS_INIT	This type definition defines the Driver Initialization Data Structure.

Types

	Name	Description
	DRV_USBFS_EVENT_CALLBACK	Type of the USB Driver event callback function.
	DRV_USBFS_HOST_PIPE_HANDLE	Defines the USB Driver Host Pipe Handle type.
	DRV_USBFS_ROOT_HUB_PORT_INDICATION	USB Root hub Application Hooks (Port Indication).
	DRV_USBFS_ROOT_HUB_PORT_OVER_CURRENT_DETECT	USB Root hub Application Hooks (Port Overcurrent detection).
	DRV_USBFS_ROOT_HUB_PORT_POWER_ENABLE	USB Root hub Application Hooks (Port Power Enable/ Disable).

Description

PIC32MX USB Module Driver Interface Header File.

The PIC32MX Full speed USB Module driver provides a simple interface to manage the "USB" peripheral on PIC32MX microcontrollers. This file defines the interface definitions and prototypes for the USB driver. The driver interface meets the requirements of the MPLAB Harmony USB Host and Device Layer.

File Name

drv_usbfs.h

Company

Microchip Technology Inc.

drv_usbfs_config_template.h

USB Full Speed (USBFS) Driver Configuration Template.

Macros

	Name	Description
	DRV_USBFS_DEVICE_SUPPORT	Determines if the USB Device Functionality should be enabled.
	DRV_USBFS_ENDPOINTS_NUMBER	Configures the number of endpoints to be provisioned in the driver.
	DRV_USBFS_HOST_ATTACH_DEBOUNCE_DURATION	Configures the time duration (in milliseconds) that the driver will wait to re-confirm a device attach.
	DRV_USBFS_HOST_NAK_LIMIT	Configures the NAK Limit for Host Mode Control Transfers.
	DRV_USBFS_HOST_PIPES_NUMBER	Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.
	DRV_USBFS_HOST_RESET_DURATION	Configures the time duration (in milliseconds) of the Reset Signal.
	DRV_USBFS_HOST_SUPPORT	Determines if the USB Host Functionality should be enabled.
	DRV_USBFS_INSTANCES_NUMBER	Specifies the number of driver instances to be enabled in the application.
	DRV_USBFS_INTERRUPT_MODE	Configures the driver for interrupt or polling mode operation.

Description

USB Full Speed Driver Configuration Template.

This file lists all the configurations constants that affect the operation of the USBFS Driver.

PIC32MZ USB Driver

Provides information on the USB Driver specific to PIC32MZ devices.

Description

The PIC32MZ USB Driver in MPLAB Harmony provides API functions that allow the MPLAB Harmony USB Host and Device Stack to access the

USB while operating on a PIC32MZ microcontroller. The driver implements the USB Driver Common Interface required by the USB Host and Device Stack. It abstracts the USB module operational details from the Host and Device Stack and provides the stacks with a modular access mechanism to the USB. The PIC32MZ USB Driver features the following:

- USB 2.0 High Speed and Full Speed operation in Peripheral mode
- USB 2.0 High Speed, Full Speed and Low Speed USB Peripheral Support in Host mode
- Designed for Dual Role Operation
- Capable of operating multiple USB modules
- Features non-blocking function and is interoperable with other MPLAB Harmony modules
- Features thread safe functions when operating within an RTOS
- Capable of operating in Polled and Interrupt modes
- Implements the USB Driver Common Interface required by the MPLAB Harmony USB Host and Device Stack
- Completely configurable through the MPLAB Harmony Configurator (MHC)
- Implements feature separation (Host and Device mode functions are implemented across different files)
- Designed to use the module's built-in DMA controller and transfer scheduler

Note: This help section only discusses features that are unique to the PIC32MZ USB Driver and are not a part of the USB Driver Common Interface. The driver functions that implement the USB Driver Common Interface are described in the Common Interface Help section.

While the PIC32MZ USB module supports USB "On-The-Go" (OTG), the PIC32MZ Driver does not currently implement USB OTG protocol support.

This help section only provides relevant information about the operation of the USB. The reader is encouraged to refer to the USB 2.0 Specification available at www.usb.org for a detailed explanation of USB protocol.

Using the Library

This topic describes the basic architecture of the USB PIC32MZ Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_usbhs.h`

The interface to the PIC32MZ USB Driver library is defined in the `drv_usbhs.h` header file.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Library Overview

Provides an overview of the library.

Description

The PIC32MZ USB Driver will typically be used by a USB Host and/or Device Stack. The USB Host and Device Stack operate as driver client applications. The driver is initialized as part of the MPLAB Harmony System Initialization. The driver initialization data structure specifies the operation mode (Host, Device, or Dual Role) of the driver. The driver features task routines to be called in the MPLAB Harmony application tasks function (SYS_Tasks function) and the USB Module Interrupt Service Routine (ISR).

The Host and the Device Stack can open the driver only when initialization has completed. It will continue to return an invalid driver handle while the initialization is in progress. Once opened, the Device Mode function can be called if the driver is operating in Device mode. The Host Mode function can be called if the driver is operating in Host mode. In Dual Role operation mode, the driver supports Host and Device operation in the same application. Even then, the driver will either operate as a USB Host or Device. OTG operation is not supported.

The PIC32MZ USB Driver features RTOS thread-safe functions. This allows the driver client application to safely call driver functions across different RTOS threads. Not all of the driver functions are interrupt-safe.

In addition to the USB Driver, which implements the USB Driver Common Interface, the PIC32MZ USB Driver implements functions which are required for its operation in the MPLAB Harmony framework. The following table lists the different categories of functions in the PIC32MZ USB Driver.

Library Interface Section	Description
System Function	These functions are accessed by the MPLAB Harmony System module. They allow the driver to be initialized, deinitialized and maintained. These functions are implemented in the `drv_usbhs.c` source file.
Client Core Functions	These functions allow the USB Host and Device Stack to open, close and perform other general driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbhs.c` source file.
Device Mode Operation Functions	These functions allow the USB Device Stack to perform USB Device mode specific driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbhs_device.c` source file

Host Mode Operation Functions	These functions allow the USB Host Stack to perform USB Host mode specific driver operations. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbhs_host.c` source file.
Root Hub Functions	These functions allow the USB Host Stack to access the driver Root hub operation. These functions are a part of the USB Driver Common Interface and are implemented in `drv_usbhs_host.c` source file.

Abstraction Model

Provides information on the abstraction model for the library.

Description

The PIC32MZ USB Driver implements the abstraction model defined by the USB Driver Common interface. This interface abstracts USB module specific details and provides a module independent interface to the driver client applications.

While operating in Device mode, the driver expects the client application (the USB Device Stack) to enable endpoints and then submit I/O request packet (IRP) requests to the enabled endpoints. Multiple IRPs can be queued on an endpoint. The driver calls the IRP callback function when the IRP is processed. The driver allows the client application to also attach and detach the device on the bus. It generates events which indicate USB states.

While operating in Host mode, the driver expects the client application (the USB Host Stack) to open pipes to endpoints on the connected device. The client application can then submit IRPs to the pipes. Multiple IRPs can be queued on a pipe. The driver calls the IRP callback function when the IRP is processed. The driver will call application defined functions to enumerate and denumerate a device. These functions are called when the driver detect device attach and detach respectively. The driver also exports root hub functions to the client application. This allows the client application to treat the driver as a single port hub

Please refer to the PIC32 USB Driver Common Interface help section for more details on the driver abstraction model.

How the Library Works

Provides information on how the library works.

Description

This section only explains aspects of driver operation which are unique to the PIC32MZ USB Driver. Major driver operations are described in the PIC32 USB Driver Common Interface help section.

Driver Initialization

Note: While generating a MPLAB Harmony USB project with MHC, the initialization code for the driver is generated automatically based on selections made in the USB Host stack or Device Stack Configuration trees.

The PIC32MZ USB Driver must be initialized so that a client application can open. The client application will not be able to open the driver if the initialization is in progress or has failed. The driver is initialized by calling the DRV_USBHS_Initialize function. This function is called from the SYS_Initialize function in the MPLAB Harmony application project and accepts two input parameters. The `index` parameter defines the instance of the USB Driver to be initialized. This becomes significant when the PIC32MZ microcontroller has more than one USB module. The `init` parameter is a driver-specific data structure of the type DRV_USBHS_INIT. This structure is shown in the following code example.

```
/* This code show the PIC32MZ USB Driver Initialization data structure.
 * A structure of this type must be provided to the DRV_USBHS_Initialize
 * function. */

typedef struct
{
    /* System Module Initialization */
    SYS_MODULE_INIT moduleInit;

    /* Identifies the USB peripheral to be used. This should be the USB PLIB
       module instance identifier. */
    uint8_t usbID;

    /* This should be set to true if the USB module must stop operation in Idle
       mode */
    bool stopInIdle;

    /* This should be set to true if the USB module must suspend when the CPU
       enters Sleep mode. */
    bool suspendInSleep;

    /* Specify the interrupt source for the USB module. This should be Interrupt
```

```
    PLIB Interrupt source identifier for the USB module instance specified in
    usbID. */
INT_SOURCE interruptSource;

/* Specify the interrupt source for the USB module specific DMA controller.
 * This should be the PLIB Interrupt source identified for the USB
 * module instance specified in usbID. */
INT_SOURCE interruptSourceUSBDma;

/* Specify the operational speed of the USB module. This should always be
   set to USB_SPEED_FULL. */
USB_SPEED operationSpeed;

/* Specify the operation mode of the USB module. This defines if the USB
 * module will support Device, Host or Dual Role operation */
DRV_USBHS_OPMODES operationMode;

/* A pointer to the endpoint descriptor table. This should be aligned at 512
   byte address boundary. The size of the table is equal to the
   DRV_USBHS_ENDPOINT_TABLE_ENTRY_SIZE times the number of endpoints needed
   in the application. */
void * endpointTable;

/* Root hub available current in mA. This specifies the amount of current
   that root hub can provide to the attached device. This should be
   specified in mA. This is required when the driver is required to operate
   in host mode. */
uint32_t rootHubAvailableCurrent;

/* When operating in Host mode, the application can specify a Root Hub port
   enable function. This parameter should point to Root Hub port enable
   function. If this parameter is NULL, it implies that the Port is always
   enabled. */
DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;

/* When operating in Host mode, the application can specify a Root Port
   Indication. This parameter should point to the Root Port Indication
   function. If this parameter is NULL, it implies that Root Port Indication
   is not supported. */
DRV_USBHS_ROOT_HUB_PORT_INDICATION portIndication;

/* When operating is Host mode, the application can specify a Root Port
   Overcurrent detection. This parameter should point to the Root Port
   Indication function. If this parameter is NULL, it implies that
   Overcurrent detection is not supported. */
DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;

} DRV_USBHS_INIT;
```

The operationMode parameter defines the driver operation mode. This can be set to DRV_USBFS_OPMODE_DEVICE, DRV_USBFS_OPMODE_HOST, or DRV_USBFS_OPMODE_DUAL_ROLE for Device, Host and Dual Role operation, respectively.

The `rootHubAvailableCurrent` parameter should be set to the maximum current that the VBUS power supply can provide on the bus. The driver does not use this information directly. It provides this data to the client application while operating in Host mode.

The `portPowerEnable` parameter must point to a Port Power Enable function. The driver, while operating in Host mode, will call this function to enable the VBUS switch. This function should activate the VBUS switch if the driver calls this function with the enable parameter set to true. It should deactivate the switch if the driver calls this function with the `enable` parameter set to false. This parameter should be set to NULL if such a switch (of the switch control) is not available in the application.

The `portIndication` parameter must point to a Port Indication function. The driver, while operating in Host mode, will call this function to indicate the current state of the port. The driver will call this function with LED color status as defined in Chapter 11 of the USB 2.0 Specification. This parameter should be set to NULL if such a LED indication is not available in the application.

The `portOverCurrentDetect` parameter must point to a Port Overcurrent Detect function. The driver, while operating in Host mode, will call this function periodically to check if the attached device is overdrawing current. If the function should return true if such a condition exists. This parameter should be set to NULL if such detection is not available in the application.

The following code example shows initialization of the driver for Device mode operation.

```
/* This code shows an example of DRV_USBHS_INIT data structure for
 * Device mode operation. Here the driver is initialized to work with USB0 USB
 * module. */
```

```
DRV_USBHS_INIT init;
SYS_MODULE_OBJ usbDriverObj;

const DRV_USBHS_INIT drvUSBInit =
{
    /* Interrupt Source for USB module */
    .interruptSource = INT_SOURCE_USB_1,

    /* DMA Interrupt Source for USB module */
    .interruptSourceUSBDma = INT_SOURCE_USB_1_DMA,

    /* System module initialization */
    .moduleInit = {SYS_MODULE_POWER_RUN_FULL},

    /* Module operate in device mode */
    .operationMode = DRV_USBHS_OPMODE_DEVICE,

    /* Module operated at high speed */
    .operationSpeed = USB_SPEED_HIGH,

    /* Stop in idle */
    .stopInIdle = false,

    /* Suspend in sleep */
    .suspendInSleep = false,

    /* Identifies peripheral (PLIB-level) ID */
    .usbID = USBHS_ID_0
};

void SYS_Initialize(void)
{
    /* Initialize the USB Driver. Note how the init parameter is typecast to
     * SYS_MODULE_INIT type. The SYS_MODULE_OBJ returned by this function call
     * is passed to the driver tasks routine. DRV_USBHS_INDEX_0 is helper
     * constant defined in drv_usbfs.h */

    usbDriverObj = DRV_USBHS_Initialize(DRV_USBHS_INDEX_0, (SYS_MODULE_INIT *)(drvUSBInit));
}

void SYS_Tasks(void)
{
    /* The polled state of the USB driver is updated by calling the
     * DRV_USBHS_Tasks function in the SYS_Tasks() function. The
     * DRV_USBHS_Tasks() takes the driver module object returned by the
     * DRV_USBHS_Initialize funciton as a parameter. */

    DRV_USBHS_Tasks(usbDriverObj);
}

void __ISR(_USB_VECTOR, ipl4AUTO) _IntHandlerUSBInstance0(void)
{
    /* The DRV_USBHS_Tasks_ISR function update the interrupt state of the USB
     * Driver. If the driver is configured for Polling mode, this function need
     * not be invoked or included in the project. */

    DRV_USBHS_Tasks_ISR(usbDriverObj);
}

void __ISR ( _USB_DMA_VECTOR,ipl4AUTO) _IntHandlerUSBInstance0_USBDMA ( void )
{
    DRV_USBHS_Tasks_ISR_USBDMA(usbDriverObj);
}
```

The following code example shows initialization of the driver for Host mode operation.

```
/* This code shows an example of how the Hi-Speed USB (USBHS) driver can be configured
 * for Host mode operation. In this example, the
 * BSP_USBVBUSSwitchOverCurrentDetect function checks for over current condition
 * and the BSP_USBVBUSPowerEnable function enables the VBUS power. The port
```

```
    * indication function is not implemented and hence the portIndication member of
    * the initialization data structure is set to NULL. */

   /* The implementation of the port over current detect, indication and the VBUS
    * power supply functions is discussed later in this help section. */

   DRV_USBHS_INIT drvUSBHSInit =
   {
       /* This should always be set to SYS_MODULE_POWER_RUN_FULL. */
       .moduleInit = {SYS_MODULE_POWER_RUN_FULL},

       /* Interrupt Source for the USB module */
       .interruptSource = INT_SOURCE_USB_1,

       /* Interrupt Source for the USB DMA module */
       .interruptSourceUSBDma = INT_SOURCE_USB_1_DMA,

       /* Configure for host mode operation. */
       .operationMode = DRV_USBHS_OPMODE_HOST,

       /* The driver should run at high speed. */
       .operationSpeed = USB_SPEED_HIGH,

       /* Port indication function is not implemented and is not available */
       .portIndication = NULL,

       /* This is the VBUS Power enable function */
       .portPowerEnable = BSP_USBVBUSPowerEnable,

       /* This is the over current detect function. */
       .portOverCurrentDetect = BSP_USBVBUSSwitchOverCurrentDetect,

       /* Here we state that the VBUS power supply can provide at most 500 mA of
        * current */
       .rootHubAvailableCurrent = 500,

       /* Moudule will operate in IDLE. */
       .stopInIdle = false,

       /* Module will not suspend automatically in sleep */
       .suspendInSleep = false,

       /* USB Module ID is 1 */
       .usbID = USBHS_ID_0

   };

   void SYS_Initialize(void)
   {
       /* Initialize the USB Driver. Note how the init parameter is typecast to
        * SYS_MODULE_INIT type. The SYS_MODULE_OBJ returned by this function call
        * is passed to the driver tasks routine. DRV_USBHS_INDEX_0 is helper
        * constant defined in drv_usbfs.h */

       usbDriverObj = DRV_USBHS_Initialize(DRV_USBHS_INDEX_0, (SYS_MODULE_INIT *)(drvUSBInit));
   }

   void SYS_Tasks(void)
   {
       /* The polled state of the USB driver is updated by calling the
        * DRV_USBHS_Tasks function in the SYS_Tasks() function. The
        * DRV_USBHS_Tasks takes the driver module object returned by the
        * DRV_USBHS_Initialize funciton as a parameter. */

       DRV_USBHS_Tasks(usbDriverObj);
   }

   void __ISR( _USB_VECTOR , IPL4AUTO)_IntHandler_USB_stub ( void )
   {
```

```
    /* The DRV_USBHS_Tasks_ISR function updates the interrupt state of the USB
     * Driver. If the driver is configured for polling mode, this function need
     * not be invoked or included in the project. */

    DRV_USBHS_Tasks_ISR(usbDriverObj);
}

void __ISR ( _USB_DMA_VECTOR, IPL4AUTO)  _IntHandlerUSBInstance0_USBDMA ( void )
{
    /* The DRV_USBHS_Tasks_ISR_USBDMA function update the DMA transfer state of
     * the USB Driver. */

     DRV_USBHS_Tasks_ISR_USBDMA(usbDriverObj);
}
```

The PIC32MX USB Driver requires definition of configuration constants to be available in the `system_config.h` file of the MPLAB Harmony Application Project Configuration. Refer to the Configuring the Library section for details.

Multi-client Operation

The PIC32MZ USB Driver supports multi-client operation. In that, it can be opened by two application clients. This is required where Dual Operation is desired. The following should be noted when using multi-client operation:

- The driver should be initialized for Dual Role Operation mode.
- The DRV_USBHS_Open function can be called at the most twice in the application. The driver supports a maximum of two clients.
- A client can access either the host or device functionality of the driver. It cannot do both.
- It is possible for the two clients to operate in two different threads while operating with an RTOS.

Note: The typical the application clients for PIC32MZ USB Driver would be the MPLAB Harmony USB Host and Device Stack. The complexity of operating the driver in Dual Role mode is handled by the stack operation. The MHC will configure the driver for Dual Role operation when such operation is selected in USB Stack configuration tree.

USB Driver Common Interface

The PIC32MZ USB Driver exports its implementation of the USB Driver Common Interface to the Host and Device Layer via the DRV_USBHS_HOST_INTERFACE and DRV_USBHS_DEVICE_INTERFACE structures. The DRV_USBHS_HOST_INTERFACE structure is defined in the `drv_usbhs_host.c` file. The following code example shows this structure.

```
/*********************************************************
 * This structure is a set of pointer to the USBHS driver
 * functions. It is provided to the host and device layer
 * as the interface to the driver.
 * *******************************************************/

DRV_USB_HOST_INTERFACE gDrvUSBHSHostInterface =
{
    .open = DRV_USBHS_Open,
    .close = DRV_USBHS_Close,
    .eventHandlerSet = DRV_USBHS_ClientEventCallBackSet,
    .hostIRPSubmit = DRV_USBHS_HOST_IRPSubmit,
    .hostIRPCancel = DRV_USBHS_HOST_IRPCancel,
    .hostPipeSetup = DRV_USBHS_HOST_PipeSetup,
    .hostPipeClose = DRV_USBHS_HOST_PipeClose,
    .hostEventsDisable = DRV_USBHS_HOST_EventsDisable,
    .hostEventsEnable = DRV_USBHS_HOST_EventsEnable,
    .rootHubInterface.rootHubPortInterface.hubPortReset = DRV_USBHS_HOST_ROOT_HUB_PortReset,
    .rootHubInterface.rootHubPortInterface.hubPortSpeedGet = DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet,
    .rootHubInterface.rootHubPortInterface.hubPortResetIsComplete =
DRV_USBHS_HOST_ROOT_HUB_PortResetIsComplete,
    .rootHubInterface.rootHubPortInterface.hubPortSuspend = DRV_USBHS_HOST_ROOT_HUB_PortSuspend,
    .rootHubInterface.rootHubPortInterface.hubPortResume = DRV_USBHS_HOST_ROOT_HUB_PortResume,
    .rootHubInterface.rootHubMaxCurrentGet = DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet,
    .rootHubInterface.rootHubPortNumbersGet = DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet,
    .rootHubInterface.rootHubSpeedGet = DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet,
    .rootHubInterface.rootHubInitialize = DRV_USBHS_HOST_ROOT_HUB_Initialize,
    .rootHubInterface.rootHubOperationEnable = DRV_USBHS_HOST_ROOT_HUB_OperationEnable,
    .rootHubInterface.rootHubOperationIsEnabled = DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled,
};
```

The DRV_USBFS_DEVICE_INTERFACE structure is defined in the `drv_usbhs_device.c` file. The following code example shows this structure.

The MPLAB Harmony USB Host and Device stack perform driver independent access through the function pointers contained in these structures.

```
/*************************************************
```

```
 * This structure is a pointer to a set of USB Driver
 * Device mode functions. This set is exported to the
 * device layer when the device layer must use the
 * PIC32MZ USB Controller.
 ************************************************/

DRV_USB_DEVICE_INTERFACE gDrvUSBHSDeviceInterface =
{
    .open = DRV_USBHS_Open,
    .close = DRV_USBHS_Close,
    .eventHandlerSet = DRV_USBHS_ClientEventCallBackSet,
    .deviceAddressSet = DRV_USBHS_DEVICE_AddressSet,
    .deviceCurrentSpeedGet = DRV_USBHS_DEVICE_CurrentSpeedGet,
    .deviceSOFNumberGet = DRV_USBHS_DEVICE_SOFNumberGet,
    .deviceAttach = DRV_USBHS_DEVICE_Attach,
    .deviceDetach = DRV_USBHS_DEVICE_Detach,
    .deviceEndpointEnable = DRV_USBHS_DEVICE_EndpointEnable,
    .deviceEndpointDisable = DRV_USBHS_DEVICE_EndpointDisable,
    .deviceEndpointStall = DRV_USBHS_DEVICE_EndpointStall,
    .deviceEndpointStallClear = DRV_USBHS_DEVICE_EndpointStallClear,
    .deviceEndpointIsEnabled = DRV_USBHS_DEVICE_EndpointIsEnabled,
    .deviceEndpointIsStalled = DRV_USBHS_DEVICE_EndpointIsStalled,
    .deviceIRPSubmit = DRV_USBHS_DEVICE_IRPSubmit,
    .deviceIRPCancelAll = DRV_USBHS_DEVICE_IRPCancelAll,
    .deviceRemoteWakeupStop = DRV_USBHS_DEVICE_RemoteWakeupStop,
    .deviceRemoteWakeupStart = DRV_USBHS_DEVICE_RemoteWakeupStart,
    .deviceTestModeEnter = DRV_USBHS_DEVICE_TestModeEnter

};
```

Operation with RTOS

The PIC32MZ USB Driver is designed to operate with a RTOS. The driver implementation uses the MPLAB Harmony Operating System Abstraction Layer (OSAL). This allows the driver to function with entire range of RTOSes supported in MPLAB Harmony. The following points must be considered while using the driver with an RTOS.

- The driver can be opened from different threads
- In Device mode, an enabled endpoint should only be accessed from one thread. For example, if an application requires two endpoints, Endpoint 2 and Endpoint 3, the application could contain two threads, one accessing Endpoint 2 and another accessing Endpoint 3. The thread accessing Endpoint 2 cannot access Endpoint 3.
- While operating in Host mode, endpoint pipes can be opened from different threads. A pipe handle to an open pipe cannot be shared across threads.

USB DMA Operation

The PIC32MZ USB module features a built-in DMA controller. This controller works independently of the PIC32MZ DMA controller. The PIC32MZ USB Driver uses USB DMA controller to expedite transfer of memory from the USB module FIFO to user application memory. The following should be noted for the USB DMA controller:

- If the PIC32MZ USB Driver could not allocate a DMA channel (all channels are busy), it will use the CPU instructions to unload the endpoint FIFOs
- The USB module and the USB DMA controller interrupt priorities should be the same
- The application buffer start address should always be aligned on a 16-byte boundary and should be placed in coherent memory. Refer to the description of the DRV_USBHS_HOST_IRPSubmit and DRV_USBHS_DEVICE_IRPSubmit functions for details on how the user application buffer should be allocated.

Root Hub Operation

The PIC32MZ USB Driver implements a Root Hub Driver Interface. This allows the driver to emulate a hub. The USB Host Stack enumerates the Root Hub as a device. The Host Stack then does not differentiate between an external hub and the root hub. While emulating a hub, the PIC32MZ USB Driver Root Hub appears as a single port hub.

As a part of the Root Hub interface, the PIC32MZ USB Driver requires the application to supply functions for hub features that it does not implement. These features are:

- Port Overcurrent Detect
- VBUS Switch Control
- Port Indication

A pointer to these functions (if implemented) must be supplied through the driver initialization data (of the type DRV_USBHS_INIT) structure at the time of driver initialization. The application has the option of not implementing these functions. In such a case, the function pointers for the unimplemented function, in the initialization data structure should be set to NULL.

The root hub driver must also be able to communicate the maximum current capability of its port to the USB Host Layer. The PIC32MZ USB Controller does not contain built-in (hardware implemented) functionality for controlling the root hub port current. To facilitate this request, the driver will report the current capability that was specified in the `rootHubAvailableCurrent` parameter of the driver initialization data structure. The application must set this parameter to report the current supply capability of the VBUS power supply. The USB Host Layer uses this value to manage the bus current budget. If a connected device reports a configuration that requires more current than what the VBUS power supply can provide, the host will not set the configuration.

Port Overcurrent Detect

The Root Hub operation in PIC32MZ USB Driver will periodically call a Port Overcurrent Detect function to detect if an overcurrent condition is active on the port. The application must supply this function if port overcurrent detection is needed. The PIC32MZ USB Controller does not contain built-in (hardware implemented) functionality for checking overcurrent condition. The overcurrent condition on the port can occur in a case where the attached device has malfunctioned or when the USB VBUS line has short circuited to ground.

The signature of the function and an example implementation is shown in the following code example. The function must return (and must continue to return) true if an overcurrent condition exists on the port.

```
/* This code shows an example implementation of the
 * portOverCurrentDetect function. The PIC32MZ USB Driver will call this
 * function periodically to check if an over current condition exists on the
 * port. In this example, we assume that the over current detect pin from an
 * external circuit in the system, is connected to  port RD0 and the pin logic
 * is active high. The function must return true if an over current condition is
 * present on this pin */

bool BSP_USBVBUSSwitchOverCurrentDetect(uint8_t port)
{
    if(PLIB_PORTS_PinGet(PORTS_ID_0, PORT_CHANNEL_D, 0) == 1)
    {
        return(true);
    }
    else
    {
        return(false);
    }
}
```

VBUS Switch Control

The PIC32MZ USB Driver Root Hub operation will attempt to control the VBUS power supply to the port. Because the PIC32MZ USB Controller does not contain built-in (hardware implemented) functionality for checking controlling VBUS, such a control function must be supplied by the application. The root hub operation will access this function when the PIC32MX USB Driver will call the portPowerEnable function as a part of the Bus Enable sequence.

The following code shows an example of how this function can be implemented.

```
/* This code shows an example implementation of the VBUS Power Enable
 * function. The PIC32MZ USB Driver will call this function as a part of bus
 * enable function. In this example, it is assumed that system contains an
 * external VBUS power switch and this is control by port RB5.
 */

void BSP_USBVBUSPowerEnable(uint8_t port, bool enable)
{
    if(enable)
    {
        PLIB_PORTS_PinSet(PORTS_ID_0, PORT_CHANNEL_B, PORTS_BIT_POS_5);
    }
    else
    {
        PLIB_PORTS_PinClear(PORTS_ID_0, PORT_CHANNEL_B, PORTS_BIT_POS_5);
    }
}
```

Port Indication Function

The Root Hub Operation in the PIC32MZ USB Driver allows display of Port LED status. If the application requires this indication, it must implement a function which the Root Hub operation would call when a change in the Root Hub port has occurred. The port indication operation is specified in Section 11.5.3 of the USB 2.0 Specification.

```
/* This code shows an example implementation of the port indication
 * function. The PIC32MZ USB Driver call this function when it wants to indicate
 * port status. It is assumed that three function to switch off, blink and
 * switch on an LED are available. It is further assumed that these function
```

```
 * accept the color of the LED to operated on. */

void BSP_RootHubPortIndication
(
    uint8_t port,
    USB_HUB_PORT_INDICATOR_COLOR color,
    USB_HUB_PORT_INDICATOR_STATE state
)
{
    /* The color parameter indicates the color of the LED to be affected. The
     * color will be either USB_HUB_PORT_INDICATOR_COLOR_GREEN or
     * USB_HUB_PORT_INDICATOR_COLOR_AMBER. */

    switch (state)
    {
        case USB_HUB_PORT_INDICATOR_STATE_OFF:
            BSP_SwitchLEDOff(color);
            break;
        case USB_HUB_PORT_INDICATOR_STATE_BLINKING:
            BSP_LEDBlink(color);
            break;
        case USB_HUB_PORT_INDICATOR_STATE_ON:
            BSP_SwitchLEDOn(color);
            break;
        default:
            break;
    }
}
```

Configuring the Library

Provides information on the configuring the library.

Macros

	Name	Description
	DRV_USBHS_DEVICE_SUPPORT	Determines if the USB Device Functionality should be enabled.
	DRV_USBHS_ENDPOINTS_NUMBER	Configures the number of endpoints to be provisioned in the driver.
	DRV_USBHS_HOST_ATTACH_DEBOUNCE_DURATION	Configures the time duration (in milliseconds) that the driver will wait to reconfirm a device attach.
	DRV_USBHS_HOST_NAK_LIMIT	Configures the NAK Limit for Host Mode Control Transfers.
	DRV_USBHS_HOST_PIPES_NUMBER	Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.
	DRV_USBHS_HOST_RESET_DURATION	Configures the time duration (in milliseconds) of the Reset Signal.
	DRV_USBHS_HOST_SUPPORT	Determines if the USB Host Functionality should be enabled.
	DRV_USBHS_INSTANCES_NUMBER	Specifies the number of driver instances to be enabled in the application.
	DRV_USBHS_INTERRUPT_MODE	Configures the driver for interrupt or polling mode operation.

Description

The PIC32MZ USB Driver requires the specification of compile-time configuration macros. These macros define resource usage, feature availability, and dynamic behavior of the driver. These configuration macros should be defined in the `system_config.h` file.

This header can be placed anywhere, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

DRV_USBHS_DEVICE_SUPPORT Macro

Determines if the USB Device Functionality should be enabled.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_DEVICE_SUPPORT true
```

Description

Hi-Speed USB Driver Device Mode Support.

This constant should be set to true if USB device support is required in the application. It should be set to false if device support is not required.

Remarks

This constant should always be defined.

DRV_USBHS_ENDPOINTS_NUMBER Macro

Configures the number of endpoints to be provisioned in the driver.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_ENDPOINTS_NUMBER 3
```

Description

Hi-Speed USB Driver Endpoint Numbers.

This constant configures the number of endpoints that the driver needs to manage. When DRV_USBHS_DEVICE_SUPPORT is enabled, this constant should be set to the total number of endpoints to be enabled in the device. When enabled, an endpoint can be used for communication. Using any direction of an endpoint will require that the entire endpoint to be enabled.

Consider the case of a composite USB Device that contains a CDC and MSD function. The CDC function will require one Bulk endpoint (OUT and IN directions) and one Interrupt endpoint (IN direction). The MSD function will require one Bulk endpoint (IN and OUT directions). This design can be implemented by using four endpoints. Endpoint 0 is used for the mandatory control interface. Endpoint 1 is used for CDC Bulk interface. Endpoint 2 is used for CDC Interrupt interface and Endpoint 3 is used for MSD Bulk Interface. The constant should then be set to 4.

For Host mode operation, this constant should be set to 1. Setting this value to greater than 1 will result in unused data memory allocation.

Remarks

This constant should always be defined.

DRV_USBHS_HOST_ATTACH_DEBOUNCE_DURATION Macro

Configures the time duration (in milliseconds) that the driver will wait to reconfirm a device attach.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_HOST_ATTACH_DEBOUNCE_DURATION 500
```

Description

Hi-Speed USB Driver Host Mode Attach Debounce Duration.

This constant configures the time duration (in milliseconds) that the driver will wait to reconfirm a device attach. When the driver first detects a device attach, it will start a timer for the duration specified by the constant. When the timer expires, the driver will check if the device is still attached. If so, the driver will then signal an attach event to the host stack. The duration allows for the device attach to become electro-mechanically stable.

Remarks

This constant should always be defined when DRV_USBHS_HOST_SUPPORT is set to true.

DRV_USBHS_HOST_NAK_LIMIT Macro

Configures the NAK Limit for Host Mode Control Transfers.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_HOST_NAK_LIMIT 2000
```

Description

Hi-Speed USB Driver Host Mode Control Transfers NAK Limit.

This constant configures the number of NAKs that the driver can accept from the device in the data stage of a control transfer before aborting the control transfer with a USB_HOST_IRP_STATUS_ERROR_NAK_TIMEOUT. Setting this constant to 0 will disable NAK limit checking. This constant should be adjusted to enable USB host compatibility with USB Devices that require more time to process control transfers.

Remarks

This constant should always be defined when DRV_USBHS_HOST_SUPPORT is set to true.

DRV_USBHS_HOST_PIPES_NUMBER Macro

Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_HOST_PIPES_NUMBER 10
```

Description

Hi-Speed USB Driver Host Mode Pipes Number.

This constant configures the maximum number of pipes that can be opened when the driver is operating in Host mode. Calling the DRV_USBHS_HOST_PipeSetup function will cause a pipe to be opened. Calling this function when DRV_USBHS_HOST_PIPES_NUMBER number of pipes have already been opened will cause the function to return an Invalid Pipe Handle. This constant should be configured to account for the maximum number of devices and the device types to be supported by the host application.

For example, if the USB Host application must support two USB Mass Storage devices and one CDC device. A CDC device requires four pipes and a Mass Storage Device requires three pipes. This constant should therefore be set to a value of 9 (four bulk pipes for two Mass Storage devices + two bulk pipes and one Interrupt pipe for one CDC device and two control pipes for two devices). Allocating pipes consumes data memory.

While enabling support for multiple devices, through a Hub, the application should consider the worst case requirement while configuring this constant. For example, a case where devices with the most number of pipe requirements are connected to the hub. At the same time, setting this constant to more than what is required will consume data memory.

Remarks

This constant should always be defined when DRV_USBHS_HOST_SUPPORT is set to true.

DRV_USBHS_HOST_RESET_DURATION Macro

Configures the time duration (in milliseconds) of the Reset Signal.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_HOST_RESET_DURATION 100
```

Description

Hi-Speed USB Driver Host Mode Reset Duration.

This constant configures the duration of the reset signal. The driver generates a reset signal when the USB Host stack requests for a root hub port reset. The driver will generate the reset signal for the duration specified by this constant and will then stop generating the reset signal.

Remarks

This constant should always be defined when DRV_USBHS_HOST_SUPPORT is set to true.

DRV_USBHS_HOST_SUPPORT Macro

Determines if the USB Host Functionality should be enabled.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_HOST_SUPPORT false
```

Description

Hi-Speed USB Driver Host Mode Support.

This constant should be set to true if USB Host mode support is required in the application. It should be set to false if host support is not required.

Remarks

This constant should always be defined.

DRV_USBHS_INSTANCES_NUMBER Macro

Specifies the number of driver instances to be enabled in the application.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_INSTANCES_NUMBER 1
```

Description

Hi-Speed USB Driver Instances Number.

This constant defines the number of driver instances to be enabled in the application. This will be typically be the number of USB controllers to be used in the application. On PIC32MZ microcontrollers that have one USB controller, this value will always be 1. On PIC32MZ microcontrollers that have two USB controllers, this value could be one or two, depending on whether one or two USB segments are required. To conserve data memory, this constant should be set to exactly the number of USB controllers that are required in the system.

Remarks

This constant should always be defined.

DRV_USBHS_INTERRUPT_MODE Macro

Configures the driver for interrupt or polling mode operation.

File

drv_usbhs_config_template.h

C

```
#define DRV_USBHS_INTERRUPT_MODE true
```

Description

Hi-Speed USB Driver Interrupt Mode.

This constant configures the driver for interrupt or polling operation. If this flag is set to true, the driver will operate in Interrupt mode. If the flag is set to false, the driver will operate in Polled mode. In Polled mode, the driver interrupt state machine gets updated in the SYS_Tasks function. If the driver is configured for Interrupt mode, the driver Interrupt state machine gets updated in the driver Interrupt Service Routine(ISR). It is always recommended for the driver to operate in Interrupt mode.

Remarks

This constant should always be defined.

Building the Library

This section lists the files that are available in the PIC32MZ USB Driver Library.

Description

This section list the files that are available in the `\src` folder of the PIC32MZ USB Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/usb/usbhs`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
/drv_usbhs.h	This file should be included by any .c file which accesses the PIC32MZ USB Driver API. This one file contains the prototypes for all driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
/src/dynamic/drv_usbhs.c	This file should always be included in the project when using the PIC3MZ USB Driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
/src/dynamic/drv_usbhs_device.c	This file should be included in the project if Device mode operation is required.
/src/dynamic/drv_usbhs_host.c	This file should be included in the project if Host mode operation is required.

Module Dependencies

The PIC32MZ USB Driver Library depends on the following modules:

- Interrupt System Service Library

Library Interface

a) System Functions

	Name	Description
	DRV_USBHS_Initialize	Initializes the Hi-Speed USB Driver.
	DRV_USBHS_Status	Provides the current status of the Hi-Speed USB Driver module.
	DRV_USBHS_Tasks	Maintains the driver's state machine when the driver is configured for Polled mode.
	DRV_USBHS_Tasks_ISR	Maintains the driver's Interrupt state machine and implements its ISR.
	DRV_USBHS_Tasks_ISR_USBDMA	Maintains the driver's DMA Transfer state machine and implements its ISR.

b) Client Core Functions

	Name	Description
	DRV_USBHS_ClientEventCallBackSet	This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.
	DRV_USBHS_Close	Closes an opened-instance of the Hi-Speed USB Driver.
	DRV_USBHS_Open	Opens the specified Hi-Speed USB Driver instance and returns a handle to it.

c) Device Mode Operation Functions

	Name	Description
	DRV_USBHS_DEVICE_AddressSet	This function will set the USB module address that is obtained from the Host.
	DRV_USBHS_DEVICE_Attach	This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.
	DRV_USBHS_DEVICE_CurrentSpeedGet	This function will return the USB speed at which the device is operating.
	DRV_USBHS_DEVICE_Detach	This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.
	DRV_USBHS_DEVICE_EndpointDisable	This function disables an endpoint.
	DRV_USBHS_DEVICE_EndpointDisableAll	This function disables all provisioned endpoints.
	DRV_USBHS_DEVICE_EndpointEnable	This function enables an endpoint for the specified direction and endpoint size.
	DRV_USBHS_DEVICE_EndpointIsEnabled	This function returns the enable/disable status of the specified endpoint and direction.
	DRV_USBHS_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	DRV_USBHS_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.

	DRV_USBHS_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	DRV_USBHS_DEVICE_IRPCancel	This function cancels the specific IRP that are queued and in progress at the specified endpoint.
	DRV_USBHS_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	DRV_USBHS_DEVICE_IRPSubmit	This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.
	DRV_USBHS_DEVICE_RemoteWakeupStart	This function causes the device to start Remote Wakeup Signalling on the bus.
	DRV_USBHS_DEVICE_RemoteWakeupStop	This function causes the device to stop the Remote Wakeup Signalling on the bus.
	DRV_USBHS_DEVICE_SOFNumberGet	This function will return the USB SOF packet number.
	DRV_USBHS_DEVICE_TestModeEnter	This function enables the specified USB 2.0 Test Mode.
	DRV_USBHS_DEVICE_TestModeExit	This function disables the specified USB 2.0 Test Mode.

d) Host Mode Operation Functions

	Name	Description
	DRV_USBHS_HOST_EventsDisable	Disables Host mode events.
	DRV_USBHS_HOST_EventsEnable	Restores the events to the specified the original value.
	DRV_USBHS_HOST_IRPCancel	Cancels the specified IRP.
	DRV_USBHS_HOST_IRPSubmit	Submits an IRP on a pipe.
	DRV_USBHS_HOST_PipeClose	Closes an open pipe.
	DRV_USBHS_HOST_PipeSetup	Open a pipe with the specified attributes.

e) Root Hub Functions

	Name	Description
	DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet	This function returns the operating speed of the bus to which this root hub is connected.
	DRV_USBHS_HOST_ROOT_HUB_Initialize	This function initializes the root hub driver.
	DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet	Returns the maximum amount of current that this root hub can provide on the bus.
	DRV_USBHS_HOST_ROOT_HUB_OperationEnable	This function enables or disables root hub operation.
	DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled	Returns the operation enabled status of the root hub.
	DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet	Returns the number of ports this root hub contains.
	DRV_USBHS_HOST_ROOT_HUB_PortReset	Resets the specified root hub port.
	DRV_USBHS_HOST_ROOT_HUB_PortResetIsComplete	Returns true if the root hub has completed the port reset operation.
	DRV_USBHS_HOST_ROOT_HUB_PortResume	Resumes the specified root hub port.
	DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet	Returns the speed of at which the port is operating.
	DRV_USBHS_HOST_ROOT_HUB_PortSuspend	Suspends the specified root hub port.

f) Data Types and Constants

	Name	Description
	DRV_USBHS_EVENT	Identifies the different events that the Hi-Speed USB Driver provides.
	DRV_USBHS_EVENT_CALLBACK	Type of the Hi-Speed USB Driver event callback function.
	DRV_USBHS_HOST_PIPE_HANDLE	Defines the Hi-Speed USB Driver Host Pipe Handle type.
	DRV_USBHS_INIT	This type definition defines the Driver Initialization Data Structure.
	DRV_USBHS_OPMODES	Identifies the operating modes supported by the Hi-Speed USB Driver.
	DRV_USBHS_ROOT_HUB_PORT_INDICATION	USB Root hub Application Hooks (Port Indication).
	DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT	USB Root hub Application Hooks (Port Overcurrent detection).
	DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE	USB Root hub Application Hooks (Port Power Enable/ Disable).
	DRV_USBHS_DEVICE_INTERFACE	Hi-Speed USB Driver Device Mode Interface Functions.
	DRV_USBHS_HOST_INTERFACE	Hi-Speed USB Driver Host Mode Interface Functions.
	DRV_USBHS_HOST_PIPE_HANDLE_INVALID	Value of an Invalid Host Pipe Handle.
	DRV_USBHS_INDEX_0	Hi-Speed USB Driver Module Index 0 Definition.

Description

This section describes the functions of the PIC32MZ USB Driver Library.

Refer to each section for a detailed description.

a) System Functions

DRV_USBHS_Initialize Function

Initializes the Hi-Speed USB Driver.

File

drv_usbhs.h

C

```
SYS_MODULE_OBJ DRV_USBHS_Initialize(const SYS_MODULE_INDEX drvIndex, const SYS_MODULE_INIT * const init);
```

Returns

- SYS_MODULE_OBJ_INVALID - The driver initialization failed.
- A valid System Module Object - The driver initialization was able to start. It may have not completed and requires the DRV_USBHS_Tasks function to be called periodically. This value will never be the same as SYS_MODULE_OBJ_INVALID.

Description

This function initializes the Hi-Speed USB Driver, making it ready for clients to open. The driver initialization does not complete when this function returns. The DRV_USBHS_Tasks function must called periodically to complete the driver initialization. The DRV_USBHS_Open function will fail if the driver was not initialized or if initialization has not completed.

Remarks

This function must be called before any other Hi-Speed USB Driver function is called. This function should only be called once during system initialization unless DRV_USBHS_Deinitialize is called to deinitialize the driver instance.

Preconditions

None.

Example

```
 // The following code shows an example initialization of the
 // driver. The USB module to be used is USB1.  The module should not
 // automatically suspend when the  microcontroller enters Sleep mode.  The
 // module should continue  operation when the module enters Idle mode.  The
 // power state is set to run at full clock speeds. Device Mode operation
 // should be at FULL speed. The size of the endpoint table is set for two
 // endpoints.

DRV_USBHS_INIT moduleInit;

usbInitData.usbID               = USBHS_ID_0;
usbInitData.opMode              = DRV_USBHS_OPMODE_DEVICE;
usbInitData.stopInIdle          = false;
usbInitData.suspendInSleep      = false;
usbInitData.operationSpeed      = USB_SPEED_FULL;
usbInitData.interruptSource     = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize
// function.

DRV_USBHS_Initialize(DRV_USBHS_INDEX_0, (SYS_MODULE_INIT *) &usbInitData);
```

Parameters

Parameters	Description
drvIndex	Ordinal number of driver instance to be initialized. This should be set to DRV_USBHS_INDEX_0 if driver instance 0 needs to be initialized.
init	Pointer to a data structure containing data necessary to initialize the driver. This should be a DRV_USBHS_INIT structure reference typecast to SYS_MODULE_INIT reference.

Function

SYS_MODULE_OBJ DRV_USBHS_Initialize
(
const SYS_MODULE_INDEX drvIndex,
const SYS_MODULE_INIT * const init
)

DRV_USBHS_Status Function

Provides the current status of the Hi-Speed USB Driver module.

File

drv_usbhs.h

C

```
SYS_STATUS DRV_USBHS_Status(SYS_MODULE_OBJ object);
```

Returns

- SYS_STATUS_READY - Indicates that the driver is ready.
- SYS_STATUS_UNINITIALIZED - Indicates that the driver has never been initialized.

Description

This function provides the current status of the Hi-Speed USB Driver module.

Remarks

None.

Preconditions

The DRV_USBHS_Initialize function must have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USBHS_Initialize
SYS_STATUS          status;
DRV_USBHS_INIT moduleInit;

usbInitData.usbID                = USBHS_ID_0;
usbInitData.opMode               = DRV_USBHS_OPMODE_DEVICE;
usbInitData.stopInIdle           = false;
usbInitData.suspendInSleep       = false;
usbInitData.operationSpeed       = USB_SPEED_FULL;
usbInitData.interruptSource      = INT_SOURCE_USB;

usbInitData.sysModuleInit.powerState = SYS_MODULE_POWER_RUN_FULL ;

// This is how this data structure is passed to the initialize
// function.

DRV_USBHS_Initialize(DRV_USBHS_INDEX_0, (SYS_MODULE_INIT *) &usbInitData);

// The status of the driver can be checked.
status = DRV_USBHS_Status(object);
if(SYS_STATUS_READY == status)
{
    // Driver is ready to be opened.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USBHS_Initialize function.

Function

SYS_STATUS DRV_USBHS_Status (SYS_MODULE_OBJ object)

DRV_USBHS_Tasks Function

Maintains the driver's state machine when the driver is configured for Polled mode.

File

drv_usbhs.h

C

```
void DRV_USBHS_Tasks(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Maintains the driver's Polled state machine. This function should be called from the SYS_Tasks function.

Remarks

This function is normally not called directly by an application. It is called by the system's Tasks function (SYS_Tasks). This function will never block.

Preconditions

The DRV_USBHS_Initialize function must have been called for the specified Hi-Speed USB Driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USBHS_Initialize

while (true)
{
    DRV_USBHS_Tasks(object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USBHS_Initialize function).

Function

void DRV_USBHS_Tasks(SYS_MODULE_OBJ object)

DRV_USBHS_Tasks_ISR Function

Maintains the driver's Interrupt state machine and implements its ISR.

File

drv_usbhs.h

C

```
void DRV_USBHS_Tasks_ISR(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal Interrupt state machine and implement its ISR for interrupt-driven implementations.

Remarks

This function should be called from the USB ISR. For multiple USB modules, it should be ensured that the correct Hi-Speed USB Driver system module object is passed to this function.

Preconditions

The DRV_USBHS_Initialize function must have been called for the specified Hi-Speed USB Driver instance.

Example

```
SYS_MODULE_OBJ object;     // Returned from DRV_USBHS_Initialize

while (true)
{
    DRV_USBHS_Tasks_ISR (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USBHS_Initialize).

Function

void DRV_USBHS_Tasks_ISR(SYS_MODULE_OBJ object)

DRV_USBHS_Tasks_ISR_USBDMA Function

Maintains the driver's DMA Transfer state machine and implements its ISR.

File

drv_usbhs.h

C

```
void DRV_USBHS_Tasks_ISR_USBDMA(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This function is used to maintain the driver's internal DMA Transfer state machine and implement its ISR for interrupt-driven implementations.

Remarks

This function should be called from the USB DMA ISR. For multiple USB modules, it should be ensured that the correct Hi-Speed USB Driver system module object is passed to this function.

Preconditions

The DRV_USBHS_Initialize function must have been called for the specified Hi-Speed USB Driver instance.

Example

```
SYS_MODULE_OBJ object;     // Returned from DRV_USBHS_Initialize

while (true)
{
    DRV_USBHS_Tasks_ISR_USBDMA (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USBHS_Initialize).

Function

void DRV_USBHS_Tasks_ISR_USBDMA(SYS_MODULE_OBJ object)

b) Client Core Functions

DRV_USBHS_ClientEventCallBackSet Function

This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.

File

drv_usbhs.h

C

```
void DRV_USBHS_ClientEventCallBackSet(DRV_HANDLE handle, uintptr_t hReferenceData, DRV_USB_EVENT_CALLBACK
myEventCallBack);
```

Returns

None.

Description

This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events. The callback is disabled by either not calling this function after the DRV_USBHS_Open function has been called or by setting the myEventCallBack argument as NULL. When the callback function is called, the hReferenceData argument is returned.

Remarks

Typical usage of the Hi-Speed USB Driver requires a client to register a callback.

Preconditions

None.

Example

```
// Set the client event callback for the Device Layer.  The
// USBDeviceLayerEventHandler function is the event handler. When this
// event handler is invoked by the driver, the driver returns back the
// second argument specified in the following function (which in this case
// is the Device Layer data structure). This allows the application
// firmware to identify, as an example, the Device Layer object associated
// with this callback.

DRV_USBHS_ClientEventCallBackSet(myUSBDevice.usbDriverHandle, (uintptr_t)&myUSBDevice,
USBDeviceLayerEventHandler);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
hReferenceData	Object (could be a pointer) that is returned with the callback.
myEventCallBack	Callback function for all USB events.

Function

void DRV_USBHS_ClientEventCallBackSet

(

DRV_HANDLE handle,

uintptr_t hReferenceData,

DRV_USBHS_EVENT_CALLBACK myEventCallBack

);

DRV_USBHS_Close Function

Closes an opened-instance of the Hi-Speed USB Driver.

File

drv_usbhs.h

C

```
void DRV_USBHS_Close(DRV_HANDLE handle);
```

Returns

None.

Description

This function closes an opened-instance of the Hi-Speed USB Driver, invalidating the handle.

Remarks

After calling this function, the handle passed in handle parameter must not be used with any of the other driver functions. A new handle must be obtained by calling DRV_USBHS_Open function before the caller may use the driver again.

Preconditions

The DRV_USBHS_Initialize function must have been called for the specified Hi-Speed USB Driver instance. DRV_USBHS_Open function must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_USBHS_Open

DRV_USBHS_Close(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

void DRV_USBHS_Close(DRV_HANDLE handle)

DRV_USBHS_Open Function

Opens the specified Hi-Speed USB Driver instance and returns a handle to it.

File

drv_usbhs.h

C

```
DRV_HANDLE DRV_USBHS_Open(const SYS_MODULE_INDEX drvIndex, const DRV_IO_INTENT intent);
```

Returns

- DRV_HANDLE_INVALID - The driver could not be opened successfully.This can happen if the driver initialization was not complete or if an internal error has occurred.
- A Valid Driver Handle - This is an arbitrary value and is returned if the function was successful. This value will never be the same as DRV_HANDLE_INVALID.

Description

This function opens the specified Hi-Speed USB Driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The intent flag should always be DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NON_BLOCKING. Any other setting of the intent flag will return a invalid driver handle. A driver instance can only support one client. Trying to open a driver that has an existing client will result in an unsuccessful function call.

Remarks

The handle returned is valid until the DRV_USBHS_Close function is called. The function will typically return DRV_HANDLE_INVALID if the driver was not initialized. In such a case the client should try to open the driver again.

Preconditions

Function DRV_USBHS_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

// This code assumes that the driver has been initialized.
handle = DRV_USBHS_Open(DRV_USBHS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);
```

```
if(DRV_HANDLE_INVALID == handle)
{
    // The application should try opening the driver again.
}
```

Parameters

Parameters	Description
drvIndex	Identifies the driver instance to be opened. As an example, this value can be set to DRV_USBHS_INDEX_0 if instance 0 of the driver has to be opened.
intent	Should always be (DRV_IO_INTENT_EXCLUSIVE|DRV_IO_INTENT_READWRITE| DRV_IO_INTENT_NON_BLOCKING).

Function

DRV_HANDLE DRV_USBHS_Open
(
const SYS_MODULE_INDEX drvIndex,
const DRV_IO_INTENT intent
)

c) Device Mode Operation Functions

DRV_USBHS_DEVICE_AddressSet Function

This function will set the USB module address that is obtained from the Host.

File

drv_usbhs.h

C

```
void DRV_USBHS_DEVICE_AddressSet(DRV_HANDLE handle, uint8_t address);
```

Returns

None.

Description

This function will set the USB module address that is obtained from the Host in a setup transaction. The address is obtained from the SET_ADDRESS command issued by the Host. The primary (first) client of the driver uses this function to set the module's USB address after decoding the setup transaction from the Host.

Remarks

None.

Preconditions

None.

Example

```
// This function should be called by the first client of the driver,
// which is typically the Device Layer. The address to set is obtained
// from the Host during enumeration.

DRV_USBHS_DEVICE_AddressSet(deviceLayer, 4);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
address	The address of this module on the USB bus.

Function

void DRV_USBHS_DEVICE_AddressSet(DRV_HANDLE handle, uint8_t address);

DRV_USBHS_DEVICE_Attach Function

This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.

File

drv_usbhs.h

C

```
void DRV_USBHS_DEVICE_Attach(DRV_HANDLE handle);
```

Returns

None.

Description

This function enables the pull-up resistors on the D+ or D- lines thus letting the USB Host know that a device has been attached on the bus . This function should be called when the driver client is ready to receive communication from the Host (typically after all initialization is complete). The USB 2.0 specification requires VBUS to be detected before the data line pull-ups are enabled. The application must ensure the same.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// Open the device driver and attach the device to the USB.
handle = DRV_USBHS_Open(DRV_USBHS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

// Register a callback
DRV_USBHS_ClientEventCallBackSet(handle, (uintptr_t)&myDeviceLayer, MyDeviceLayerEventCallback);

// The device can be attached when VBUS Session Valid event occurs
void MyDeviceLayerEventCallback(uintptr_t handle, DRV_USBHS_EVENT event, void * hReferenceData)
{
    switch(event)
    {
        case DRV_USBHS_EVENT_DEVICE_SESSION_VALID:
            // A valid VBUS was detected.
            DRV_USBHS_DEVICE_Attach(handle);
            break;

        case DRV_USBHS_EVENT_DEVICE_SESSION_INVALID:
            // VBUS is not valid anymore. The device can be disconnected.
            DRV_USBHS_DEVICE_Detach(handle);
            break;

        default:
            break;
        }
    }
}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

void DRV_USBHS_DEVICE_Attach(DRV_HANDLE handle);

DRV_USBHS_DEVICE_CurrentSpeedGet Function

This function will return the USB speed at which the device is operating.

File

drv_usbhs.h

C

```
USB_SPEED DRV_USBHS_DEVICE_CurrentSpeedGet(DRV_HANDLE handle);
```

Returns

Returns a member of the USB_SPEED type.

Description

This function will return the USB speed at which the device is operating.

Remarks

None.

Preconditions

Only valid after the device is attached to the Host and Host has completed reset signaling.

Example

```
// Get the current speed.

USB_SPEED deviceSpeed;

deviceSpeed = DRV_USBHS_DEVICE_CurrentSpeedGet(deviceLayer);

if(deviceLayer == USB_SPEED_HIGH)
{
    // Possibly adjust buffers for higher throughput.
}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

USB_SPEED DRV_USBHS_DEVICE_CurrentSpeedGet(DRV_HANDLE handle);

DRV_USBHS_DEVICE_Detach Function

This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.

File

drv_usbhs.h

C

```
void DRV_USBHS_DEVICE_Detach(DRV_HANDLE handle);
```

Returns

None.

Description

This function disables the pull-up resistors on the D+ or D- lines. This function should be called when the application wants to disconnect the device from the bus (typically to implement a soft detach or switch to Host mode operation). A self-powered device should be detached from the bus when the VBUS is not valid.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// Open the device driver and attach the device to the USB.
handle = DRV_USBHS_Open(DRV_USBHS_INDEX_0, DRV_IO_INTENT_EXCLUSIVE| DRV_IO_INTENT_READWRITE|
DRV_IO_INTENT_NON_BLOCKING);

// Register a callback
DRV_USBHS_ClientEventCallBackSet(handle, (uintptr_t)&myDeviceLayer, MyDeviceLayerEventCallback);

// The device can be detached when VBUS Session Invalid event occurs
void MyDeviceLayerEventCallback(uintptr_t handle, DRV_USBHS_EVENT event, void * hReferenceData)
{
    switch(event)
    {
        case DRV_USBHS_EVENT_DEVICE_SESSION_VALID:
            // A valid VBUS was detected.
            DRV_USBHS_DEVICE_Attach(handle);
            break;

        case DRV_USBHS_EVENT_DEVICE_SESSION_INVALID:
            // VBUS is not valid anymore. The device can be disconnected.
            DRV_USBHS_DEVICE_Detach(handle);
            break;

        default:
            break;
        }
    }
}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

void DRV_USBHS_DEVICE_Detach(DRV_HANDLE handle);

DRV_USBHS_DEVICE_EndpointDisable Function

This function disables an endpoint.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_EndpointDisable(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - The endpoint that is being accessed is not a valid endpoint (endpoint was not provisioned through the DRV_USBHS_ENDPOINTS_NUMBER configuration constant) defined for this driver instance.

Description

This function disables an endpoint. If the endpoint type is a control endpoint type, both directions are disabled. For non-control endpoints, the function disables the specified direction only. The direction to be disabled is specified by the Most Significant Bit (MSB) of the endpointAndDirection parameter.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to disable
```

```
// a control endpoint. Note that the direction parameter is ignored.
// For a control endpoint, both the directions are disabled.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 0);

DRV_USBHS_DEVICE_EndpointDisable(handle, ep );

// This code shows an example of how to disable a BULK IN
// endpoint

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBHS_DEVICE_EndpointDisable(handle, ep );
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

USB_ERROR DRV_USBHS_DEVICE_EndpointDisable
(
DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection
)

DRV_USBHS_DEVICE_EndpointDisableAll Function

This function disables all provisioned endpoints.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_EndpointDisableAll(DRV_HANDLE handle);
```

Returns

- USB_ERROR_NONE - The function exited successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is invalid.

Description

This function disables all provisioned endpoints in both directions.

Remarks

This function is typically called by the USB Device Layer to disable all endpoints upon detecting a bus reset.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to disable all endpoints.

DRV_USBHS_DEVICE_EndpointDisableAll(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

USB_ERROR DRV_USBHS_DEVICE_EndpointDisableAll(DRV_HANDLE handle)

DRV_USBHS_DEVICE_EndpointEnable Function

This function enables an endpoint for the specified direction and endpoint size.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_EndpointEnable(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection,
USB_TRANSFER_TYPE transferType, uint16_t endpointSize);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is not a valid endpoint defined for this driver instance. The value of DRV_USBHS_ENDPOINTS_NUMBER configuration constant should be adjusted.
- USB_ERROR_PARAMETER_INVALID - The driver handle is invalid.

Description

This function enables an endpoint for the specified direction and endpoint size. The function will enable the endpoint for communication in one direction at a time. It must be called twice if the endpoint is required to communicate in both the directions, with the exception of control endpoints. If the endpoint type is a control endpoint, the endpoint is always bidirectional and the function needs to be called only once.

The size of the endpoint must match the wMaxPacketSize reported in the endpoint descriptor for this endpoint. A transfer that is scheduled over this endpoint will be scheduled in wMaxPacketSize transactions. The function does not check if the endpoint is already in use. It is the client's responsibility to make sure that a endpoint is not accidentally reused.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to enable Endpoint
// 0 for control transfers. Note that for a control endpoint, the
// direction parameter is ignored. A control endpoint is always
// bidirectional. Endpoint size is 64 bytes.

uint8_t ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 0);

DRV_USBHS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_CONTROL, 64);

// This code shows an example of how to set up a endpoint
// for BULK IN transfer. For an IN transfer, data moves from device
// to Host. In this example, Endpoint 1 is enabled. The maximum
// packet size is 64.

uint8_t ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBHS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);

// If Endpoint 1 must also be set up for BULK OUT, the
// DRV_USBHS_DEVICE_EndpointEnable function must be called again, as shown
// here.

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_HOST_TO_DEVICE, 1);
```

```
DRV_USBHS_DEVICE_EndpointEnable(handle, ep, USB_TRANSFER_TYPE_BULK, 64);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.
transferType	Should be USB_TRANSFER_TYPE_CONTROL for control endpoint, USB_TRANSFER_TYPE_BULK for bulk endpoint, USB_TRANSFER_TYPE_INTERRUPT for interrupt endpoint and USB_TRANSFER_TYPE_ISOCHRONOUS for isochronous endpoint.
endpointSize	Maximum size (in bytes) of the endpoint as reported in the endpoint descriptor.

Function

```
USB_ERROR DRV_USBHS_DEVICE_EndpointEnable
(
    DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection,
USB_TRANSFER_TYPE transferType,
uint16_t endpointSize
);
```

DRV_USBHS_DEVICE_EndpointIsEnabled Function

This function returns the enable/disable status of the specified endpoint and direction.

File

drv_usbhs.h

C

```
bool DRV_USBHS_DEVICE_EndpointIsEnabled(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection);
```

Returns

- true - The endpoint is enabled.
- false - The endpoint is disabled.

Description

This function returns the enable/disable status of the specified endpoint and direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how the
// DRV_USBHS_DEVICE_EndpointIsEnabled function can be used to obtain the
// status of Endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

if(DRV_USBHS_ENDPOINT_STATE_DISABLED ==
            DRV_USBHS_DEVICE_EndpointIsEnabled(handle, ep))
{
    // Endpoint is disabled. Enable endpoint.

    DRV_USBHS_DEVICE_EndpointEnable(handle, ep, USB_ENDPOINT_TYPE_BULK, 64);

}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

bool DRV_USBHS_DEVICE_EndpointIsEnabled
(
DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection
)

DRV_USBHS_DEVICE_EndpointIsStalled Function

This function returns the stall status of the specified endpoint and direction.

File

drv_usbhs.h

C

```
bool DRV_USBHS_DEVICE_EndpointIsStalled(DRV_HANDLE client, USB_ENDPOINT endpoint);
```

Returns

- true - The endpoint is stalled.
- false - The endpoint is not stalled.

Description

This function returns the stall status of the specified endpoint and direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how the
// DRV_USBHS_DEVICE_EndpointIsStalled function can be used to obtain the
// stall status of Endpoint 1 and IN direction.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

if(true == DRV_USBHS_DEVICE_EndpointIsStalled (handle, ep))
{
    // Endpoint stall is enabled. Clear the stall.

    DRV_USBHS_DEVICE_EndpointStallClear(handle, ep);

}
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

bool DRV_USBHS_DEVICE_EndpointIsStalled
(

DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection
)

DRV_USBHS_DEVICE_EndpointStall Function

This function stalls an endpoint in the specified direction.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_EndpointStall(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.
- USB_ERROR_OSAL_FUNCTION - An error with an OSAL function called in this function.

Description

This function stalls an endpoint in the specified direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to stall an endpoint. In
// this example, Endpoint 1 IN direction is stalled.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBHS_DEVICE_EndpointStall(handle, ep);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

USB_ERROR DRV_USBHS_DEVICE_EndpointStall
(
DRV_HANDLE handle,
USB_ENDPOINT endpointAndDirection
)

DRV_USBHS_DEVICE_EndpointStallClear Function

This function clears the stall on an endpoint in the specified direction.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_EndpointStallClear(DRV_HANDLE handle, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.

Description

This function clears the stall on an endpoint in the specified direction.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to clear a stall. In this
// example, the stall condition on Endpoint 1 IN direction is cleared.

USB_ENDPOINT ep;

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

DRV_USBHS_DEVICE_EndpointStallClear(handle, ep);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

USB_ERROR DRV_USBHS_DEVICE_EndpointStallClear

(

DRV_HANDLE handle,

USB_ENDPOINT endpointAndDirection

)

DRV_USBHS_DEVICE_IRPCancel Function

This function cancels the specific IRP that are queued and in progress at the specified endpoint.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_IRPCancel(DRV_HANDLE client, USB_DEVICE_IRP * irp);
```

Returns

- USB_ERROR_NONE - The IRP have been canceled successfully.
- USB_ERROR_PARAMETER_INVALID - Invalid parameter or the IRP already has been aborted or completed
- USB_ERROR_OSAL_FUNCTION - An OSAL function called in this function did not execute successfully.

Description

This function attempts to cancel the processing of a queued IRP. An IRP that was in the queue but yet to be processed will be cancelled successfully and the IRP callback function will be called from this function with the USB_DEVICE_IRP_STATUS_ABORTED status. The application can release the data buffer memory used by the IRP when this callback occurs. If the IRP was in progress (a transaction in on the bus) when the cancel function was called, the IRP will be canceled only when an ongoing or the next transaction has completed. The IRP callback

function will then be called in an interrupt context. The application should not release the related data buffer unless the IRP callback has occurred.

Remarks

The size returned after the ABORT callback will be always 0 regardless of the amount of data that has been sent or received. The client should not assume any data transaction has happened for an canceled IRP. If the last transaction of the IRP was in progress, the IRP cancel does not have any effect. The first transaction of any ongoing IRP cannot be canceled.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to cancel IRP.  In this example the IRP
// has been scheduled from a device to the Host.

USB_ENDPOINT ep;
USB_DEVICE_IRP irp;

ep.direction = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

irp.data = myDataBufferToSend;
irp.size = 130;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

if (DRV_USBHS_DEVICE_IRPSubmit(handle, ep, &irp) != USB_ERROR_NONE)
{
    // This means there was an error.
}
else
{
    // Check the status of the IRP.
    if(irp.status != USB_DEVICE_IRP_STATUS_COMPLETED)
    {
        // Cancel the submitted IRP.
        if (DRV_USBHS_DEVICE_IRPCancel(handle, &irp) != USB_ERROR_NONE)
        {
            // The IRP Cancel request submission was successful.
            // IRP cancel status will be notified through the callback
            // function.
        }
        else
        {
            // The IRP may have been completed before IRP cancel operation.
            // could start. No callback notification will be generated.
        }
    }
    else
    {
        // The IRP processing must have been completed before IRP cancel was
        // submitted.
    }
}

void MyIRPCallback(USB_DEVICE_IRP * irp)
{
    // Check if the IRP callback is for a Cancel request
    if(irp->status == USB_DEVICE_IRP_STATUS_ABORTED)
    {
        // IRP cancel completed
    }
 }
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
irp	Pointer to the IRP to cancel.

Function

USB_ERROR DRV_USBHS_DEVICE_IRPCancel
(
DRV_HANDLE client,
USB_DEVICE_IRP * irp
)

DRV_USBHS_DEVICE_IRPCancelAll Function

This function cancels all IRPs that are queued and in progress at the specified endpoint.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_IRPCancelAll(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection);
```

Returns

- USB_ERROR_NONE - The endpoint was successfully enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - If the endpoint that is being accessed is out of the valid endpoint defined for this driver instance.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid.
- USB_ERROR_OSAL_FUNCTION - An OSAL function called in this function did not execute successfully.

Description

This function cancels all IRPs that are queued and in progress at the specified endpoint.

Remarks

None.

Preconditions

The Client handle should be valid.

Example

```
// This code shows an example of how to cancel all IRPs.

void MyIRPCallback(USB_DEVICE_IRP * irp)
{
    // Check if this is setup command

    if(irp->status == USB_DEVICE_IRP_STATUS_SETUP)
    {
        if(IsSetupCommandSupported(irp->data) == false)
        {
            // This means that this setup command is not
            // supported. Stall the some related endpoint and cancel all
            // queue IRPs.

            DRV_USBHS_DEVICE_EndpointStall(handle, ep);
            DRV_USBHS_DEVICE_IRPCancelAll(handle, ep);
        }
     }
 }
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.

Function

USB_ERROR DRV_USBHS_DEVICE_IRPCancelAll

(
DRV_HANDLE client,
USB_ENDPOINT endpointAndDirection
);

DRV_USBHS_DEVICE_IRPSubmit Function

This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_IRPSubmit(DRV_HANDLE client, USB_ENDPOINT endpointAndDirection, USB_DEVICE_IRP *
irp);
```

Returns

- USB_ERROR_NONE - if the IRP was submitted successful.
- USB_ERROR_IRP_SIZE_INVALID - if the size parameter of the IRP is not correct.
- USB_ERROR_PARAMETER_INVALID - If the client handle is not valid.
- USB_ERROR_ENDPOINT_NOT_CONFIGURED - If the endpoint is not enabled.
- USB_ERROR_DEVICE_ENDPOINT_INVALID - The specified endpoint is not valid.
- USB_ERROR_OSAL_FUNCTION - An OSAL call in the function did not complete successfully.

Description

This function submits an I/O Request Packet (IRP) for processing to the USB Driver. The IRP allows a client to send and receive data from the USB Host. The data will be sent or received through the specified endpoint. The direction of the data transfer is indicated by the direction flag in the endpointAndDirection parameter. Submitting an IRP arms the endpoint to either send data to or receive data from the Host. If an IRP is already being processed on the endpoint, the subsequent IRP submit operation will be queued. The contents of the IRP (including the application buffers) should not be changed until the IRP has been processed.

Particular attention should be paid to the size parameter of IRP. The following should be noted:

- The size parameter while sending data to the Host can be less than, greater than, equal to, or be an exact multiple of the maximum packet size for the endpoint. The maximum packet size for the endpoint determines the number of transactions required to process the IRP.
- If the size parameter, while sending data to the Host is less than the maximum packet size, the transfer will complete in one transaction.
- If the size parameter, while sending data to the Host is greater than the maximum packet size, the IRP will be processed in multiple transactions.
- If the size parameter, while sending data to the Host is equal to or an exact multiple of the maximum packet size, the client can optionally ask the driver to send a Zero Length Packet(ZLP) by specifying the USB_DEVICE_IRP_FLAG_DATA_COMPLETE flag as the flag parameter.
- The size parameter, while receiving data from the Host must be an exact multiple of the maximum packet size of the endpoint. If this is not the case, the driver will return a USB_ERROR_IRP_SIZE_INVALID result. If while processing the IRP, the driver receives less than maximum packet size or a ZLP from the Host, the driver considers the IRP as processed. The size parameter at this point contains the actual amount of data received from the Host. The IRP status is returned as USB_DEVICE_IRP_STATUS_COMPLETED_SHORT.
- If a ZLP needs to be sent to Host, the IRP size should be specified as 0 and the flag parameter should be set as USB_DEVICE_IRP_FLAG_DATA_COMPLETE.
- If the IRP size is an exact multiple of the endpoint size, the client can request the driver to not send a ZLP by setting the flag parameter to USB_DEVICE_IRP_FLAG_DATA_PENDING. This flag indicates that there is more data pending in this transfer.
- Specifying a size less than the endpoint size along with the USB_DEVICE_IRP_FLAG_DATA_PENDING flag will cause the driver to return a USB_ERROR_IRP_SIZE_INVALID.
- If the size is greater than but not a multiple of the endpoint size, and the flag is specified as USB_DEVICE_IRP_FLAG_DATA_PENDING, the driver will send multiple of endpoint size number of bytes. For example, if the IRP size is 130 and the endpoint size if 64, the number of bytes sent will 128.

Remarks

This function can be called from the ISR of the USB module to associated with the client.

Preconditions

The Client handle should be valid.

Example

```
// The following code shows an example of how to schedule a IRP to send data
// from a device to the Host. Assume that the max packet size is 64 and
// and this data needs to sent over Endpoint 1. In this example, the
```

```
// transfer is processed as three transactions of 64, 64 and 2 bytes.

USB_ENDPOINT ep;
USB_DEVICE_IRP irp;

ep.direction = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_DEVICE_TO_HOST, 1);

irp.data = myDataBufferToSend;
irp.size = 130;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

if (DRV_USBHS_DEVICE_IRPSubmit(handle, ep, &irp) != USB_ERROR_NONE)
{
    // This means there was an error.
}
else
{
    // The status of the IRP can be checked.
    while(irp.status != USB_DEVICE_IRP_STATUS_COMPLETED)
    {
        // Wait or run a task function.
    }
}

// The following code shows how the client can request
// the driver to send a ZLP when the size is an exact multiple of
// endpoint size.

irp.data = myDataBufferToSend;
irp.size = 128;
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;

// Note that while  receiving data from the Host, the size should be an
// exact multiple of the maximum packet size of the endpoint. In the
// following example, the DRV_USBHS_DEVICE_IRPSubmit function will return a
// USB_DEVICE_IRP_SIZE_INVALID value.

ep = USB_ENDPOINT_AND_DIRECTION(USB_DATA_DIRECTION_HOST_TO_DEVICE, 1);

irp.data = myDataBufferToSend;
irp.size = 60; // THIS SIZE IS NOT CORRECT
irp.flags = USB_DEVICE_IRP_FLAG_DATA_COMPLETE;
irp.callback = MyIRPCompletionCallback;
irp.referenceData = (uintptr_t)&myDeviceLayerObj;
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).
endpointAndDirection	Specifies the endpoint and direction.
irp	Pointer to the IRP to be added to the queue for processing.

Function

```
USB_ERROR DRV_USBHS_DEVICE_IRPSubmit
(
    DRV_HANDLE client,
USB_ENDPOINT endpointAndDirection,
USB_DEVICE_IRP * irp
);
```

DRV_USBHS_DEVICE_RemoteWakeupStart Function

This function causes the device to start Remote Wakeup Signalling on the bus.

File

drv_usbhs.h

C

```
void DRV_USBHS_DEVICE_RemoteWakeupStart(DRV_HANDLE handle);
```

Returns

None.

Description

This function causes the device to start Remote Wakeup Signalling on the bus. This function should be called when the device, presently placed in suspend mode by the Host, wants to be wakeup. Note that the device can do this only when the Host has enabled the device's Remote Wakeup capability.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
DRV_HANDLE handle;

// If the Host has enabled the Remote Wakeup capability, and if the device
// is in suspend mode, then start Remote Wakeup signaling.

if(deviceIsSuspended && deviceRemoteWakeupEnabled)
{
    DRV_USBHS_DEVICE_RemoteWakeupStart(handle);
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

void DRV_USBHS_DEVICE_RemoteWakeupStart(DRV_HANDLE handle);

DRV_USBHS_DEVICE_RemoteWakeupStop Function

This function causes the device to stop the Remote Wakeup Signalling on the bus.

File

drv_usbhs.h

C

```
void DRV_USBHS_DEVICE_RemoteWakeupStop(DRV_HANDLE handle);
```

Returns

None.

Description

This function causes the device to stop Remote Wakeup Signalling on the bus. This function should be called after the DRV_USBHS_DEVICE_RemoteWakeupStart function was called to start the Remote Wakeup signaling on the bus.

Remarks

This function should be 1 to 15 milliseconds after the DRV_USBHS_DEVICE_RemoteWakeupStart function was called.

Preconditions

The handle should be valid. The DRV_USBHS_DEVICE_RemoteWakeupStart function was called to start the Remote Wakeup signaling on the bus.

Example

```
DRV_HANDLE handle;

// If the Host has enabled the Remote Wakeup capability, and if the device
// is in suspend mode, then start Remote Wakeup signaling. Wait for 10
// milliseconds and then stop the Remote Wakeup signaling

if(deviceIsSuspended && deviceRemoteWakeupEnabled)
{
    DRV_USBHS_DEVICE_RemoteWakeupStart(handle);
    DelayMilliSeconds(10);
    DRV_USBHS_DEVICE_RemoteWakeupStop(handle);
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

void DRV_USBHS_DEVICE_RemoteWakeupStop(DRV_HANDLE handle);

DRV_USBHS_DEVICE_SOFNumberGet Function

This function will return the USB SOF packet number.

File

drv_usbhs.h

C

```
uint16_t DRV_USBHS_DEVICE_SOFNumberGet(DRV_HANDLE handle);
```

Returns

The SOF packet number.

Description

This function will return the USB SOF packet number..

Remarks

None.

Preconditions

This function will return a valid value only when the device is attached to the bus. The SOF packet count will not increment if the bus is suspended.

Example

```
// This code shows how the DRV_USBHS_DEVICE_SOFNumberGet function is called
// to read the current SOF number.

DRV_HANDLE handle;
uint16_t sofNumber;

sofNumber = DRV_USBHS_DEVICE_SOFNumberGet(handle);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

uint16_t DRV_USBHS_DEVICE_SOFNumberGet(DRV_HANDLE handle);

DRV_USBHS_DEVICE_TestModeEnter Function

This function enables the specified USB 2.0 Test Mode.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_TestModeEnter(DRV_HANDLE handle, USB_TEST_MODE_SELECTORS testMode);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The handle or the value of testMode parameter is not valid.

Description

This function causes the device to enter the specified USB 2.0 defined test mode. It is called in response to Set Feature command from the host. The wValue field of this command specifies the Test Mode to enter. The USB module will perform the action identified by the testMode parameter.

Remarks

This function should be called only when the USB device has attached to the Host at High speed and only in response to the Set Feature command from the Host.

Preconditions

The handle should be valid.

Example

```
DRV_HANDLE handle;

// This code shows how the DRV_USBHS_DEVICE_TestModeEnter function is
// called to make the USB device enter the Test_J test mode.

DRV_USBHS_DEVICE_TestModeEnter(handle, USB_TEST_MODE_SELECTOR_TEST_J);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
testMode	This parameter identifies the USB 2.0 specification test mode (see table 9-7 of the USB 2.0 specification).

Function

USB_ERROR DRV_USBHS_DEVICE_TestModeEnter

(

DRV_HANDLE handle,

USB_TEST_MODE_SELECTORS testMode

);

DRV_USBHS_DEVICE_TestModeExit Function

This function disables the specified USB 2.0 Test Mode.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_DEVICE_TestModeExit(DRV_HANDLE handle, USB_TEST_MODE_SELECTORS testMode);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The handle or the value of testMode parameter is not valid.

Description

This function causes the device to stop the specified USB 2.0 defined test mode. This function can be called after calling the DRV_USBHS_DEVICE_TestModeEnter function to stop the test mode execution.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
DRV_HANDLE handle;

// This code shows how the DRV_USBHS_DEVICE_TestModeEnter function is
// called to make the USB device enter the Test_J test mode.

DRV_USBHS_DEVICE_TestModeEnter(handle, USB_TEST_MODE_SELECTOR_TEST_J);

// Now the DRV_USBHS_DEVICE_TestModeExit function is called to stop the
// Test_J test mode.

DRV_USBHS_DEVICE_TestModeExit(handle, USB_TEST_MODE_SELECTOR_TEST_J);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
testMode	This parameter identifies the USB 2.0 specification test mode (see table 9-7 of the USB 2.0 specification).

Function

USB_ERROR DRV_USBHS_DEVICE_TestModeExit
(
    DRV_HANDLE handle,
USB_TEST_MODE_SELECTORS testMode
);

d) Host Mode Operation Functions

DRV_USBHS_HOST_EventsDisable Function

Disables Host mode events.

File

drv_usbhs.h

C

```
bool DRV_USBHS_HOST_EventsDisable(DRV_HANDLE handle);
```

Returns

- true - Driver event generation was enabled when this function was called.
- false - Driver event generation was not enabled when this function was called.

Description

This function disables the Host mode events. This function is called by the Host Layer when it wants to execute code atomically.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
// This code shows how the DRV_USBHS_HOST_EventsDisable and
// DRV_USBHS_HOST_EventsEnable function can be called to disable and enable
// events.

DRV_HANDLE driverHandle;
bool eventsWereEnabled;

// Disable the driver events.
eventsWereEnabled = DRV_USBHS_HOST_EventsDisable(driverHandle);

// Code in this region will not be interrupted by driver events.

// Enable the driver events.
DRV_USBHS_HOST_EventsEnable(driverHandle, eventsWereEnabled);
```

Parameters

Parameters	Description
handle	Client's driver handle (returned from DRV_USBHS_Open function).

Function

bool DRV_USBHS_HOST_EventsDisable

(

DRV_HANDLE handle

);

DRV_USBHS_HOST_EventsEnable Function

Restores the events to the specified the original value.

File

drv_usbhs.h

C

```
void DRV_USBHS_HOST_EventsEnable(DRV_HANDLE handle, bool eventContext);
```

Returns

None.

Description

This function will restore the enable disable state of the events. The eventRestoreContext parameter should be equal to the value returned by the DRV_USBHS_HOST_EventsDisable function.

Remarks

None.

Preconditions

The handle should be valid.

Example

```
// This code shows how the DRV_USBHS_HOST_EventsDisable and
// DRV_USBHS_HOST_EventsEnable function can be called to disable and enable
// events.

DRV_HANDLE driverHandle;
```

```
bool eventsWereEnabled;

// Disable the driver events.
eventsWereEnabled = DRV_USBHS_HOST_EventsDisable(driverHandle);

// Code in this region will not be interrupted by driver events.

// Enable the driver events.
DRV_USBHS_HOST_EventsEnable(driverHandle, eventsWereEnabled);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
eventRestoreContext	Value returned by the DRV_USBHS_HOST_EventsDisable function.

Function

void DRV_USBHS_HOST_EventsEnable

(

DRV_HANDLE handle

bool eventRestoreContext

);

DRV_USBHS_HOST_IRPCancel Function

Cancels the specified IRP.

File

drv_usbhs.h

C

```
void DRV_USBHS_HOST_IRPCancel(USB_HOST_IRP * inputIRP);
```

Returns

None.

Description

This function attempts to cancel the specified IRP. If the IRP is queued and its processing has not started, it will be cancelled successfully. If the IRP in progress, the ongoing transaction will be allowed to complete.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how a submitted IRP can be cancelled.

USB_HOST_IRP irp;
USB_ERROR result;
USB_HOST_PIPE_HANDLE controlPipe;
USB_SETUP_PACKET setup;
uint8_t controlTransferData[32];

irp.setup = setup;
irp.data = controlTransferData;
irp.size = 32;
irp.flags = USB_HOST_IRP_FLAG_NONE ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

DRV_USBHS_HOST_IRPSubmit(controlPipeHandle, &irp);
```

```
// Additional application logic may come here. This logic may decide to
// cancel the submitted IRP.

DRV_USBHS_HOST_IRPCancel(&irp);
```

Parameters

Parameters	Description
inputIRP	Pointer to the IRP to cancel.

Function

void DRV_USBHS_HOST_IRPCancel(USB_HOST_IRP * inputIRP);

DRV_USBHS_HOST_IRPSubmit Function

Submits an IRP on a pipe.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_HOST_IRPSubmit(DRV_USBHS_HOST_PIPE_HANDLE hPipe, USB_HOST_IRP * pinputIRP);
```

Returns

- USB_ERROR_NONE - The IRP was submitted successfully.
- USB_ERROR_PARAMETER_INVALID - The pipe handle is not valid.
- USB_ERROR_OSAL_FUNCTION - An error occurred in an OSAL function called in this function.

Description

This function submits an IRP on the specified pipe. The IRP will be added to the queue and will be processed in turn. The data will be transferred on the bus based on the USB bus scheduling rules. When the IRP has been processed, the callback function specified in the IRP will be called. The IRP status will be updated to reflect the completion status of the IRP.

Remarks

An IRP can also be submitted in an IRP callback function.

Preconditions

The pipe handle should be valid.

Example

```
// The following code shows an example of how the host layer populates
// the IRP object and then submits it. IRP_Callback function is called when an
// IRP has completed processing. The status of the IRP at completion can be
// checked in the status flag. The size field of the irp will contain the amount
// of data transferred.

void IRP_Callback(USB_HOST_IRP * irp)
{
    // irp is pointing to the IRP for which the callback has occurred. In most
    // cases this function will execute in an interrupt context. The application
    // should not perform any hardware access or interrupt un-safe operations in
    // this function.

    switch(irp->status)
    {
        case USB_HOST_IRP_STATUS_ERROR_UNKNOWN:
            // IRP was terminated due to an unknown error
            break;

        case USB_HOST_IRP_STATUS_ABORTED:
            // IRP was terminated by the application
            break;

        case USB_HOST_IRP_STATUS_ERROR_BUS:
            // IRP was terminated due to a bus error
```

```
            break;

        case USB_HOST_IRP_STATUS_ERROR_DATA:
            // IRP was terminated due to data error
            break;

        case USB_HOST_IRP_STATUS_ERROR_NAK_TIMEOUT:
            // IRP was terminated because of a NAK timeout
            break;

        case USB_HOST_IRP_STATUS_ERROR_STALL:
            // IRP was terminated because of a device sent a STALL
            break;

        case USB_HOST_IRP_STATUS_COMPLETED:
            // IRP has been completed
            break;

        case USB_HOST_IRP_STATUS_COMPLETED_SHORT:
            // IRP has been completed but the amount of data processed was less
            // than requested.
            break;

        default:
            break;
    }
}

// In the following code snippet the a control transfer IRP is submitted to a
// control pipe. The setup parameter of the IRP points to the Setup command of
// the control transfer. The direction of the data stage is specified by the
// Setup packet.

USB_HOST_IRP irp;
USB_ERROR result;
USB_HOST_PIPE_HANDLE controlPipe;
USB_SETUP_PACKET setup;
uint8_t controlTransferData[32];

irp.setup = setup;
irp.data = controlTransferData;
irp.size = 32;
irp.flags = USB_HOST_IRP_FLAG_NONE ;
irp.userData = &someApplicationObject;
irp.callback = IRP_Callback;

result = DRV_USBHS_HOST_IRPSubmit(controlPipeHandle, &irp);
```

Parameters

Parameters	Description
hPipe	Handle to the pipe to which the IRP has to be submitted.
pInputIRP	Pointer to the IRP.

Function

```
USB_ERROR DRV_USBHS_HOST_IRPSubmit
(
    DRV_USBHS_HOST_PIPE_HANDLE  hPipe,
USB_HOST_IRP * pInputIRP
);
```

DRV_USBHS_HOST_PipeClose Function

Closes an open pipe.

File

drv_usbhs.h

C

```
void DRV_USBHS_HOST_PipeClose(DRV_USBHS_HOST_PIPE_HANDLE pipeHandle);
```

Returns

None.

Description

This function closes an open pipe. Any IRPs scheduled on the pipe will be aborted and IRP callback functions will be called with the status as DRV_USB_HOST_IRP_STATE_ABORTED. The pipe handle will become invalid and the pipe and will not accept IRPs.

Remarks

None.

Preconditions

The pipe handle should be valid.

Example

```
// This code shows how an open Host pipe can be closed.

DRV_HANDLE driverHandle;
DRV_USBHS_HOST_PIPE_HANDLE pipeHandle;

// Close the pipe.
DRV_USBHS_HOST_PipeClose(pipeHandle);
```

Parameters

Parameters	Description
pipeHandle	Handle to the pipe to close.

Function

void DRV_USBHS_HOST_PipeClose

(

DRV_USBHS_HOST_PIPE_HANDLE pipeHandle

);

DRV_USBHS_HOST_PipeSetup Function

Open a pipe with the specified attributes.

File

drv_usbhs.h

C

```
DRV_USBHS_HOST_PIPE_HANDLE DRV_USBHS_HOST_PipeSetup(DRV_HANDLE client, uint8_t deviceAddress, USB_ENDPOINT endpointAndDirection, uint8_t hubAddress, uint8_t hubPort, USB_TRANSFER_TYPE pipeType, uint8_t bInterval, uint16_t wMaxPacketSize, USB_SPEED speed);
```

Returns

- DRV_USB_HOST_PIPE_HANDLE_INVALID - The pipe could not be created.
- A valid Pipe Handle - The pipe was created successfully. This is an arbitrary value and will never be the same as DRV_USB_HOST_PIPE_HANDLE_INVALID.

Description

This function opens a communication pipe between the Host and the device endpoint. The transfer type and other attributes are specified through the function parameters. The driver does not check for available bus bandwidth, which should be done by the application (the USB Host Layer in this case)

Remarks

None.

Preconditions

The driver handle should be valid.

Example

```
// This code shows how the DRV_USBHS_HOST_PipeSetup function is called for
// create a communication pipe. In this example, Bulk pipe is created
// between the Host and a device. The Device address is 2 and the target
// endpoint on this device is 4 . The direction of the data transfer over
// this pipe is from the Host to the device. The device is connected to Port
// 1 of a Hub, whose USB address is 3. The maximum size of a transaction
// on this pipe is 64 bytes. This is a Bulk Pipe and hence the bInterval
// field is set to 0. The target device is operating at Full Speed.

DRV_HANDLE driverHandle;
DRV_USBHS_HOST_PIPE_HANDLE pipeHandle;

pipeHandle = DRV_USBHS_HOST_PipeSetup(driverHandle, 0x02, 0x14, 0x03, 0x01, USB_TRANSFER_TYPE_BULK, 0, 64,
USB_SPEED_FULL);

if(pipeHandle != DRV_USBHS_HOST_PIPE_HANDLE_INVALID)
{
    // The pipe was created successfully.
}
```

Parameters

Parameters	Description
client	Handle to the driver (returned from DRV_USBHS_Open function).
deviceAddress	USB Address of the device to connect to.
endpoint	Endpoint on the device to connect to.
hubAddress	Address of the hub to which this device is connected. If not connected to a hub, this value should be set to 0.
hubPort	Port number of the hub to which this device is connected.
pipeType	Transfer type of the pipe to open.
bInterval	Polling interval for periodic transfers. This should be specified as defined by the USB 2.0 Specification.
wMaxPacketSize	This should be set to the endpoint size reported by the device in its configuration descriptors. This defines the maximum size of the transaction in a transfer on this pipe.
speed	The speed of the pipe. This should match the speed at which the device connected to the Host.

Function

```
  DRV_USBHS_HOST_PIPE_HANDLE DRV_USBHS_HOST_PipeSetup
(
    DRV_HANDLE client,
uint8_t deviceAddress,
USB_ENDPOINT endpointAndDirection,
uint8_t hubAddress,
uint8_t hubPort,
USB_TRANSFER_TYPE pipeType,
uint8_t bInterval,
uint16_t wMaxPacketSize,
USB_SPEED speed
);
```

e) Root Hub Functions

DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet Function

This function returns the operating speed of the bus to which this root hub is connected.

File

drv_usbhs.h

C

```
USB_SPEED DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet(DRV_HANDLE handle);
```

Returns

- USB_SPEED_HIGH - The Root hub is connected to a bus that is operating at High Speed.
- USB_SPEED_FULL - The Root hub is connected to a bus that is operating at Full Speed.

Description

This function returns the operating speed of the bus to which this root hub is connected.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet function is
// called to know the operating speed of the bus to which this Root hub is
// connected.

DRV_HANDLE driverHandle;
USB_SPEED speed;

speed = DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

USB_SPEED DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet(DRV_HANDLE handle);

DRV_USBHS_HOST_ROOT_HUB_Initialize Function

This function initializes the root hub driver.

File

drv_usbhs.h

C

```
void DRV_USBHS_HOST_ROOT_HUB_Initialize(DRV_HANDLE handle, USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo);
```

Returns

None.

Description

This function initializes the root hub driver. It is called by the Host Layer at the time of processing the root hub devices. The Host Layer assigns a USB_HOST_DEVICE_INFO reference to this root hub driver. This identifies the relationship between the root hub and the Host Layer.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the USB Host Layer calls the
// DRV_USBHS_HOST_ROOT_HUB_Initialize function. The usbHostDeviceInfo
// parameter is an arbitrary identifier assigned by the USB Host Layer. Its
// interpretation is opaque to the Root hub Driver.

DRV_HANDLE drvHandle;
USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo = 0x10003000;

DRV_USBHS_HOST_ROOT_HUB_Initialize(drvHandle, usbHostDeviceInfo);
```

Parameters

Parameters	Description
handle	Handle to the driver.
usbHostDeviceInfo	Reference provided by the Host.

Function

void DRV_USBHS_HOST_ROOT_HUB_Initialize

(

DRV_HANDLE handle,

USB_HOST_DEVICE_OBJ_HANDLE usbHostDeviceInfo,

)

DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet Function

Returns the maximum amount of current that this root hub can provide on the bus.

File

drv_usbhs.h

C

```
uint32_t DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet(DRV_HANDLE handle);
```

Returns

Returns the maximum current (in milliamperes) that the root hub can supply.

Description

This function returns the maximum amount of current that this root hub can provide on the bus.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet
// function is called to obtain the maximum VBUS current that the Root hub
// can supply.

DRV_HANDLE driverHandle;
uint32_t currentMilliAmperes;

currentMilliAmperes = DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

uint32_t DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet(DRV_HANDLE);

DRV_USBHS_HOST_ROOT_HUB_OperationEnable Function

This function enables or disables root hub operation.

File

drv_usbhs.h

C

```
void DRV_USBHS_HOST_ROOT_HUB_OperationEnable(DRV_HANDLE handle, bool enable);
```

Returns

None.

Description

This function enables or disables root hub operation. When enabled, the root hub will detect devices attached to the port and will request the Host Layer to enumerate the device. This function is called by the Host Layer when it is ready to receive enumeration requests from the Host. If the operation is disabled, the root hub will not detect attached devices.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_OperationEnable and the
// DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled functions are called to enable
// the Root hub operation.

DRV_HANDLE driverHandle;

// Enable Root hub operation.
DRV_USBHS_HOST_ROOT_HUB_OperationEnable(driverHandle);

// Wait till the Root hub operation is enabled.
if(DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled(driverHandle) == false)
{
    // The operation has not completed. Call the
    // DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled function again to check if
    // the operation has completed. Note that the DRV_USBHS_Tasks function
    // must be allowed to run at periodic intervals to allow the enable
    // operation to completed.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
enable	If this is set to true, root hub operation is enabled. If this is set to false, root hub operation is disabled.

Function

void DRV_USBHS_HOST_ROOT_HUB_OperationEnable

(

DRV_HANDLE handle,

bool enable

);

DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled Function

Returns the operation enabled status of the root hub.

File

drv_usbhs.h

C

```
bool DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled(DRV_HANDLE handle);
```

Returns

- true - Root hub operation is enabled.
- false - Root hub operation is not enabled.

Description

This function returns true if the DRV_USBHS_HOST_ROOT_HUB_OperationEnable function has completed enabling the Host.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_OperationEnable and the
// DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled functions are called to enable
// the Root hub operation.

DRV_HANDLE driverHandle;

// Enable Root hub operation.
DRV_USBHS_HOST_ROOT_HUB_OperationEnable(driverHandle);

// Wait till the Root hub operation is enabled.
if(DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled(driverHandle) == false)
{
    // The operation has not completed. Call the
    // DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled function again to check if
    // the operation has completed. Note that the DRV_USBHS_Tasks function
    // must be allowed to run at periodic intervals to allow the enable
    // operation to completed.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

bool DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled(DRV_HANDLE handle);

DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet Function

Returns the number of ports this root hub contains.

File

drv_usbhs.h

C

```
uint8_t DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet(DRV_HANDLE handle);
```

Returns

This function will always return 1.

Description

This function returns the number of ports that this root hub contains.

Remarks

None.

Preconditions

None.

Example

```
// This code shows how DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet function can
// be called to obtain the number of Root hub ports.

DRV_HANDLE driverHandle;
uint8_t nPorts;

nPorts = DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet(driverHandle);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).

Function

uint8_t DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet(DRV_HANDLE handle);

DRV_USBHS_HOST_ROOT_HUB_PortReset Function

Resets the specified root hub port.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_HOST_ROOT_HUB_PortReset(DRV_HANDLE handle, uint8_t port);
```

Returns

None.

Description

This function resets the root hub port. The reset duration is defined by DRV_USBHS_ROOT_HUB_RESET_DURATION. The status of the reset signaling can be checked using the DRV_USBHS_ROOT_HUB_PortResetIsComplete function.

Remarks

The root hub on the PIC32MZ USB controller contains only one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USB_HOST_ROOT_HUB_PortReset and the
// DRV_USBHS_ROOT_HUB_PortResetIsComplete functions are called to complete a
// port reset sequence.

DRV_HANDLE driverHandle;

// Reset Port 0.
DRV_USB_HOST_ROOT_HUB_PortReset(driverHandle, 0);

// Check if the Reset operation has completed.
if(DRV_USBHS_ROOT_HUB_PortResetIsComplete(driverHandle, 0) == false)
{
    // This means that the Port Reset operation has not completed yet. The
    // DRV_USBHS_ROOT_HUB_PortResetIsComplete function should be called
```

```
    // again after some time to check the status.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
port	Port to reset.

Function

void DRV_USBHS_ROOT_HUB_PortReset(DRV_HANDLE handle, uint8_t port);

DRV_USBHS_HOST_ROOT_HUB_PortResetIsComplete Function

Returns true if the root hub has completed the port reset operation.

File

drv_usbhs.h

C

```
bool DRV_USBHS_HOST_ROOT_HUB_PortResetIsComplete(DRV_HANDLE handle, uint8_t port);
```

Returns

- true - The reset signaling has completed.
- false - The reset signaling has not completed.

Description

This function returns true if the port reset operation has completed. It should be called after the DRV_USB_HOST_ROOT_HUB_PortReset function to check if the reset operation has completed.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USB_HOST_ROOT_HUB_PortReset and the
// DRV_USBHS_ROOT_HUB_PortResetIsComplete functions are called to complete a
// port reset sequence.

DRV_HANDLE driverHandle;

// Reset Port 0.
DRV_USB_HOST_ROOT_HUB_PortReset(driverHandle, 0);

// Check if the Reset operation has completed.
if(DRV_USBHS_ROOT_HUB_PortResetIsComplete(driverHandle, 0) == false)
{
    // This means that the Port Reset operation has not completed yet. The
    // DRV_USBHS_ROOT_HUB_PortResetIsComplete function should be called
    // again after some time to check the status.
}
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
port	Port to check

Function

bool DRV_USBHS_ROOT_HUB_PortResetIsComplete

(

DRV_HANDLE handle,

uint8_t port
);

DRV_USBHS_HOST_ROOT_HUB_PortResume Function

Resumes the specified root hub port.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_HOST_ROOT_HUB_PortResume(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid or the port number does not exist.

Description

This function resumes the root hub. The resume duration is defined by DRV_USBHS_ROOT_HUB_RESUME_DURATION. The status of the resume signaling can be checked using the DRV_USBHS_ROOT_HUB_PortResumeIsComplete function.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_PortResume function is
// called to resume the specified port.

DRV_HANDLE driverHandle;

// Resume Port 0.
DRV_USBHS_HOST_ROOT_HUB_PortResume(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
port	Port to resume.

Function

USB_ERROR DRV_USBHS_HOST_ROOT_HUB_PortResume
(
DRV_HANDLE handle,
uint8_t port
);

DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet Function

Returns the speed of at which the port is operating.

File

drv_usbhs.h

C

```
USB_SPEED DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_SPEED_ERROR - This value is returned if the driver handle is not or if the speed information is not available or if the specified port is not valid.

- USB_SPEED_HIGH - A High Speed device has been connected to the port.
- USB_SPEED_FULL - A Full Speed device has been connected to the port.
- USB_SPEED_LOW - A Low Speed device has been connected to the port.

Description

This function returns the speed at which the port is operating.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet function is
// called to know the operating speed of the port. This also indicates the
// operating speed of the device connected to this port.

DRV_HANDLE driverHandle;
USB_SPEED speed;

speed = DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
port	Port number of the port to be analyzed..

Function

USB_SPEED DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet

(

DRV_HANDLE handle,

uint8_t port

);

DRV_USBHS_HOST_ROOT_HUB_PortSuspend Function

Suspends the specified root hub port.

File

drv_usbhs.h

C

```
USB_ERROR DRV_USBHS_HOST_ROOT_HUB_PortSuspend(DRV_HANDLE handle, uint8_t port);
```

Returns

- USB_ERROR_NONE - The function executed successfully.
- USB_ERROR_PARAMETER_INVALID - The driver handle is not valid or the port number does not exist.

Description

This function suspends the root hub port.

Remarks

The root hub on this particular hardware only contains one port - port 0.

Preconditions

None.

Example

```
// This code shows how the DRV_USBHS_HOST_ROOT_HUB_PortSuspend function is
// called to suspend the specified port.
```

```
DRV_HANDLE driverHandle;

// Suspend Port 0.
DRV_USBHS_HOST_ROOT_HUB_PortSuspend(driverHandle, 0);
```

Parameters

Parameters	Description
handle	Handle to the driver (returned from DRV_USBHS_Open function).
port	Port to suspend.

Function

USB_ERROR DRV_USBHS_ROOT_HUB_PortSuspend(DRV_HANDLE handle, uint8_t port);

f) Data Types and Constants

DRV_USBHS_EVENT Enumeration

Identifies the different events that the Hi-Speed USB Driver provides.

File

drv_usbhs.h

C

```
typedef enum {
  DRV_USBHS_EVENT_ERROR = DRV_USB_EVENT_ERROR,
  DRV_USBHS_EVENT_RESET_DETECT = DRV_USB_EVENT_RESET_DETECT,
  DRV_USBHS_EVENT_RESUME_DETECT = DRV_USB_EVENT_RESUME_DETECT,
  DRV_USBHS_EVENT_IDLE_DETECT = DRV_USB_EVENT_IDLE_DETECT,
  DRV_USBHS_EVENT_STALL = DRV_USB_EVENT_STALL,
  DRV_USBHS_EVENT_SOF_DETECT = DRV_USB_EVENT_SOF_DETECT,
  DRV_USBHS_EVENT_DEVICE_SESSION_VALID = DRV_USB_EVENT_DEVICE_SESSION_VALID,
  DRV_USBHS_EVENT_DEVICE_SESSION_INVALID = DRV_USB_EVENT_DEVICE_SESSION_INVALID
} DRV_USBHS_EVENT;
```

Members

Members	Description
DRV_USBHS_EVENT_ERROR = DRV_USB_EVENT_ERROR	Bus error occurred and was reported
DRV_USBHS_EVENT_RESET_DETECT = DRV_USB_EVENT_RESET_DETECT	Host has issued a device reset
DRV_USBHS_EVENT_RESUME_DETECT = DRV_USB_EVENT_RESUME_DETECT	Resume detected while USB in suspend mode
DRV_USBHS_EVENT_IDLE_DETECT = DRV_USB_EVENT_IDLE_DETECT	Idle detected
DRV_USBHS_EVENT_STALL = DRV_USB_EVENT_STALL	Stall handshake has occurred
DRV_USBHS_EVENT_SOF_DETECT = DRV_USB_EVENT_SOF_DETECT	Device received SOF operation
DRV_USBHS_EVENT_DEVICE_SESSION_VALID = DRV_USB_EVENT_DEVICE_SESSION_VALID	VBUS voltage had Session valid
DRV_USBHS_EVENT_DEVICE_SESSION_INVALID = DRV_USB_EVENT_DEVICE_SESSION_INVALID	Session Invalid

Description

Hi-Speed USB Driver Events Enumeration.

This enumeration identifies the different events that are generated by the Hi-Speed USB Driver.

Remarks

None.

DRV_USBHS_EVENT_CALLBACK Type

Type of the Hi-Speed USB Driver event callback function.

File

drv_usbhs.h

C

```
typedef void (* DRV_USBHS_EVENT_CALLBACK)(uintptr_t hClient, DRV_USBHS_EVENT eventType, void * eventData);
```

Returns

None.

Description

Type of the Hi-Speed USB Driver Event Callback Function.

Define the type of the Hi-Speed USB Driver event callback function. The client should register an event callback function of this type when it intends to receive events from the Hi-Speed USB Driver. The event callback function is registered using the DRV_USBHS_ClientEventCallBackSet function.

Remarks

None.

Parameters

Parameters	Description
hClient	Handle to the driver client that registered this callback function.
eventType	This parameter identifies the event that caused the callback function to be called.
eventData	Pointer to a data structure that is related to this event. This value will be NULL if the event has no related data.

DRV_USBHS_HOST_PIPE_HANDLE Type

Defines the Hi-Speed USB Driver Host Pipe Handle type.

File

drv_usbhs.h

C

```
typedef uintptr_t DRV_USBHS_HOST_PIPE_HANDLE;
```

Description

Hi-Speed USB Driver Host Pipe Handle.

This type definition defines the type of the Hi-Speed USB Driver Host Pipe Handle.

Remarks

None.

DRV_USBHS_INIT Structure

This type definition defines the Driver Initialization Data Structure.

File

drv_usbhs.h

C

```
typedef struct {
  SYS_MODULE_INIT moduleInit;
  USBHS_MODULE_ID usbID;
  bool stopInIdle;
  bool suspendInSleep;
  INT_SOURCE interruptSource;
  INT_SOURCE interruptSourceUSBDma;
  USB_SPEED operationSpeed;
```

```
  DRV_USBHS_OPMODES operationMode;
  void * endpointTable;
  uint32_t rootHubAvailableCurrent;
  DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;
  DRV_USBHS_ROOT_HUB_PORT_INDICATION portIndication;
  DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;
} DRV_USBHS_INIT;
```

Members

Members	Description
SYS_MODULE_INIT moduleInit;	System Module Initialization
USBHS_MODULE_ID usbID;	Identifies the USB peripheral to be used. This should be the USB PLIB module instance identifier.
bool stopInIdle;	This should be set to true if the USB module must stop operation in Idle mode
bool suspendInSleep;	This should be set to true if the USB module must suspend when the CPU enters Sleep mode.
INT_SOURCE interruptSource;	Specify the interrupt source for the USB module. This should be the interrupt source for the USB module instance specified in usbID.
INT_SOURCE interruptSourceUSBDma;	Specify the interrupt source for the USB module specific DMA controller. This should be the USB DMA interrupt source for the USB Module instance specified in usbID.
USB_SPEED operationSpeed;	Specify the operational speed of the USB module. This should always be set to USB_SPEED_FULL.
DRV_USBHS_OPMODES operationMode;	Specify the operation mode of the USB module. This specifies if the USB module should operate as a Device, Host, or both (Dual Role operation).
void * endpointTable;	A pointer to the endpoint descriptor table. This should be aligned at 512 byte address boundary. The size of the table is equal to the DRV_USBHS_ENDPOINT_TABLE_ENTRY_SIZE times the number of endpoints needed in the application.
uint32_t rootHubAvailableCurrent;	Root hub available current in milliamperes. This specifies the amount of current that root hub can provide to the attached device. This should be specified in mA. This is required when the driver is required to operate in Host mode.
DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE portPowerEnable;	When operating in Host mode, the application can specify a Root hub port enable function. This parameter should point to Root hub port enable function. If this parameter is NULL, it implies that the port is always enabled.
DRV_USBHS_ROOT_HUB_PORT_INDICATION portIndication;	When operating in Host mode, the application can specify a Root Port Indication. This parameter should point to the Root Port Indication function. If this parameter is NULL, it implies that Root Port Indication is not supported.
DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT portOverCurrentDetect;	When operating is Host mode, the application can specify a Root Port Overcurrent detection. This parameter should point to the Root Port Indication function. If this parameter is NULL, it implies that Overcurrent detection is not supported.

Description

USB Device Driver Initialization Data.

This structure contains all the data necessary to initialize the Hi-Speed USB Driver. A pointer to a structure of this type, containing the desired initialization data, must be passed into the DRV_USBHS_Initialize function.

Remarks

None.

DRV_USBHS_OPMODES Enumeration

Identifies the operating modes supported by the Hi-Speed USB Driver.

File

drv_usbhs.h

C

```
typedef enum {
  DRV_USBHS_OPMODE_DUAL_ROLE = DRV_USB_OPMODE_DUAL_ROLE,
  DRV_USBHS_OPMODE_DEVICE = DRV_USB_OPMODE_DEVICE,
  DRV_USBHS_OPMODE_HOST = DRV_USB_OPMODE_HOST,
  DRV_USBHS_OPMODE_OTG = DRV_USB_OPMODE_OTG
} DRV_USBHS_OPMODES;
```

Members

Members	Description
DRV_USBHS_OPMODE_DUAL_ROLE = DRV_USB_OPMODE_DUAL_ROLE	The driver should be able to switch between Host and Device mode
DRV_USBHS_OPMODE_DEVICE = DRV_USB_OPMODE_DEVICE	The driver should support Device mode operation only
DRV_USBHS_OPMODE_HOST = DRV_USB_OPMODE_HOST	The driver should support Host mode operation only
DRV_USBHS_OPMODE_OTG = DRV_USB_OPMODE_OTG	The driver should support the OTG protocol

Description

USB Operating Modes Enumeration.

This enumeration identifies the operating modes supported by the Hi-Speed USB Driver.

Remarks

None.

DRV_USBHS_ROOT_HUB_PORT_INDICATION Type

USB Root hub Application Hooks (Port Indication).

File

drv_usbhs.h

C

```
typedef void (* DRV_USBHS_ROOT_HUB_PORT_INDICATION)(uint8_t port, USB_HUB_PORT_INDICATOR_COLOR color,
USB_HUB_PORT_INDICATOR_STATE state);
```

Description

USB Root hub Application Hooks (Port Indication).

A function of the type defined here should be provided to the driver root to implement Port Indication. The root hub driver calls this function when it needs to update the state of the port indication LEDs. The application can choose to implement the Amber and Green colors as one LED or two different LEDs. The root hub driver specifies the color and the indicator attribute (on, off or blinking) when it calls this function.

Remarks

None.

DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT Type

USB Root hub Application Hooks (Port Overcurrent detection).

File

drv_usbhs.h

C

```
typedef bool (* DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT)(uint8_t port);
```

Description

USB Root hub Application Hooks (Port Overcurrent detection).

A function of the type defined here should be provided to the driver root hub to check for port over current condition. This function will be called periodically by the root hub driver to check the Overcurrent status of the port. It should continue to return true while the Overcurrent condition exists on the port. It should return false when the Overcurrent condition does not exist.

Remarks

None.

DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE Type

USB Root hub Application Hooks (Port Power Enable/ Disable).

File

drv_usbhs.h

C

```
typedef void (* DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE)(uint8_t port, bool control);
```

Description

USB Root hub Application Hooks (Port Power Enable/ Disable).

A function of the type defined here should be provided to the driver root to control port power. The root hub driver will call this function when it needs to enable port power. If the application circuit contains a VBUS switch, the switch should be accessed and controlled by this function. If the enable parameter is true, the switch should be enabled and VBUS should be available on the port. If the enable parameter is false, the switch should be disabled and VBUS should not be available on the port.

Remarks

None.

DRV_USBHS_DEVICE_INTERFACE Macro

Hi-Speed USB Driver Device Mode Interface Functions.

File

drv_usbhs.h

C

```
#define DRV_USBHS_DEVICE_INTERFACE
```

Description

Hi-Speed USB Driver Device Mode Interface Functions.

The Device Controller Driver Interface member of the Device Stack Initialization data structure should be set to this value so that the Device Stack can access the Hi-Speed USB Driver Device Mode functions.

Remarks

None.

DRV_USBHS_HOST_INTERFACE Macro

Hi-Speed USB Driver Host Mode Interface Functions.

File

drv_usbhs.h

C

```
#define DRV_USBHS_HOST_INTERFACE
```

Description

Hi-Speed USB Driver Host Mode Interface Functions.

The Host Controller Driver Interface member of the Host Layer Initialization data structure should be set to this value so that the Host Layer can access the Hi-Speed USB Driver Host Mode functions.

Remarks

None.

DRV_USBHS_HOST_PIPE_HANDLE_INVALID Macro

Value of an Invalid Host Pipe Handle.

File

drv_usbhs.h

C

```
#define DRV_USBHS_HOST_PIPE_HANDLE_INVALID
```

Description

Hi-Speed USB Driver Invalid Host Pipe Handle.

This constant defines the value of an Invalid Host Pipe Handle.

Remarks

None.

DRV_USBHS_INDEX_0 Macro

Hi-Speed USB Driver Module Index 0 Definition.

File

drv_usbhs.h

C

```
#define DRV_USBHS_INDEX_0 0
```

Description

Hi-Speed USB Driver Module Index 0 Definition.

This constant defines the value of Hi-Speed USB Driver Index 0. The SYS_MODULE_INDEX parameter of the DRV_USBHS_Initialize and DRV_USBHS_Open functions should be set to this value to identify instance 0 of the driver.

Remarks

These constants should be used in place of hard-coded numeric literals and should be passed into the DRV_USBHS_Initialize and DRV_USBHS_Open functions to identify the driver instance in use. These are not indicative of the number of modules that are actually supported by the microcontroller.

Enumerations

	Name	Description
	DRV_USBHS_EVENT	Identifies the different events that the Hi-Speed USB Driver provides.
	DRV_USBHS_OPMODES	Identifies the operating modes supported by the Hi-Speed USB Driver.

Functions

	Name	Description
	DRV_USBHS_ClientEventCallBackSet	This function sets up the event callback function that is invoked by the USB controller driver to notify the client of USB bus events.
	DRV_USBHS_Close	Closes an opened-instance of the Hi-Speed USB Driver.
	DRV_USBHS_DEVICE_AddressSet	This function will set the USB module address that is obtained from the Host.
	DRV_USBHS_DEVICE_Attach	This function will enable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that a device has been attached on the bus.
	DRV_USBHS_DEVICE_CurrentSpeedGet	This function will return the USB speed at which the device is operating.

	DRV_USBHS_DEVICE_Detach	This function will disable the attach signaling resistors on the D+ and D- lines thus letting the USB Host know that the device has detached from the bus.
	DRV_USBHS_DEVICE_EndpointDisable	This function disables an endpoint.
	DRV_USBHS_DEVICE_EndpointDisableAll	This function disables all provisioned endpoints.
	DRV_USBHS_DEVICE_EndpointEnable	This function enables an endpoint for the specified direction and endpoint size.
	DRV_USBHS_DEVICE_EndpointIsEnabled	This function returns the enable/disable status of the specified endpoint and direction.
	DRV_USBHS_DEVICE_EndpointIsStalled	This function returns the stall status of the specified endpoint and direction.
	DRV_USBHS_DEVICE_EndpointStall	This function stalls an endpoint in the specified direction.
	DRV_USBHS_DEVICE_EndpointStallClear	This function clears the stall on an endpoint in the specified direction.
	DRV_USBHS_DEVICE_IRPCancel	This function cancels the specific IRP that are queued and in progress at the specified endpoint.
	DRV_USBHS_DEVICE_IRPCancelAll	This function cancels all IRPs that are queued and in progress at the specified endpoint.
	DRV_USBHS_DEVICE_IRPSubmit	This function submits an I/O Request Packet (IRP) for processing to the Hi-Speed USB Driver.
	DRV_USBHS_DEVICE_RemoteWakeupStart	This function causes the device to start Remote Wakeup Signalling on the bus.
	DRV_USBHS_DEVICE_RemoteWakeupStop	This function causes the device to stop the Remote Wakeup Signalling on the bus.
	DRV_USBHS_DEVICE_SOFNumberGet	This function will return the USB SOF packet number.
	DRV_USBHS_DEVICE_TestModeEnter	This function enables the specified USB 2.0 Test Mode.
	DRV_USBHS_DEVICE_TestModeExit	This function disables the specified USB 2.0 Test Mode.
	DRV_USBHS_HOST_EventsDisable	Disables Host mode events.
	DRV_USBHS_HOST_EventsEnable	Restores the events to the specified the original value.
	DRV_USBHS_HOST_IRPCancel	Cancels the specified IRP.
	DRV_USBHS_HOST_IRPSubmit	Submits an IRP on a pipe.
	DRV_USBHS_HOST_PipeClose	Closes an open pipe.
	DRV_USBHS_HOST_PipeSetup	Open a pipe with the specified attributes.
	DRV_USBHS_HOST_ROOT_HUB_BusSpeedGet	This function returns the operating speed of the bus to which this root hub is connected.
	DRV_USBHS_HOST_ROOT_HUB_Initialize	This function initializes the root hub driver.
	DRV_USBHS_HOST_ROOT_HUB_MaximumCurrentGet	Returns the maximum amount of current that this root hub can provide on the bus.
	DRV_USBHS_HOST_ROOT_HUB_OperationEnable	This function enables or disables root hub operation.
	DRV_USBHS_HOST_ROOT_HUB_OperationIsEnabled	Returns the operation enabled status of the root hub.
	DRV_USBHS_HOST_ROOT_HUB_PortNumbersGet	Returns the number of ports this root hub contains.
	DRV_USBHS_HOST_ROOT_HUB_PortReset	Resets the specified root hub port.
	DRV_USBHS_HOST_ROOT_HUB_PortResetIsComplete	Returns true if the root hub has completed the port reset operation.
	DRV_USBHS_HOST_ROOT_HUB_PortResume	Resumes the specified root hub port.
	DRV_USBHS_HOST_ROOT_HUB_PortSpeedGet	Returns the speed of at which the port is operating.
	DRV_USBHS_HOST_ROOT_HUB_PortSuspend	Suspends the specified root hub port.
	DRV_USBHS_Initialize	Initializes the Hi-Speed USB Driver.
	DRV_USBHS_Open	Opens the specified Hi-Speed USB Driver instance and returns a handle to it.
	DRV_USBHS_Status	Provides the current status of the Hi-Speed USB Driver module.
	DRV_USBHS_Tasks	Maintains the driver's state machine when the driver is configured for Polled mode.
	DRV_USBHS_Tasks_ISR	Maintains the driver's Interrupt state machine and implements its ISR.
	DRV_USBHS_Tasks_ISR_USBDMA	Maintains the driver's DMA Transfer state machine and implements its ISR.

Macros

	Name	Description
	DRV_USBHS_DEVICE_INTERFACE	Hi-Speed USB Driver Device Mode Interface Functions.
	DRV_USBHS_HOST_INTERFACE	Hi-Speed USB Driver Host Mode Interface Functions.

	DRV_USBHS_HOST_PIPE_HANDLE_INVALID	Value of an Invalid Host Pipe Handle.
	DRV_USBHS_INDEX_0	Hi-Speed USB Driver Module Index 0 Definition.

Structures

	Name	Description
	DRV_USBHS_INIT	This type definition defines the Driver Initialization Data Structure.

Types

	Name	Description
	DRV_USBHS_EVENT_CALLBACK	Type of the Hi-Speed USB Driver event callback function.
	DRV_USBHS_HOST_PIPE_HANDLE	Defines the Hi-Speed USB Driver Host Pipe Handle type.
	DRV_USBHS_ROOT_HUB_PORT_INDICATION	USB Root hub Application Hooks (Port Indication).
	DRV_USBHS_ROOT_HUB_PORT_OVER_CURRENT_DETECT	USB Root hub Application Hooks (Port Overcurrent detection).
	DRV_USBHS_ROOT_HUB_PORT_POWER_ENABLE	USB Root hub Application Hooks (Port Power Enable/ Disable).

Description

PIC32MZ USB Module Driver Interface Header File

The PIC32MZ Hi-Speed USB Module driver provides a simple interface to manage the "USB" peripheral on the PIC32MZ microcontroller. This file defines the interface definitions and prototypes for the Hi-Speed USB Driver. The driver interface meets the requirements of the MPLAB Harmony USB Host and Device Layer.

File Name

drv_usbhs.h

Microchip Technology Inc.

drv_usbhs_config_template.h

Hi-Speed USB (USBHS) Driver Configuration Template.

Macros

	Name	Description
	DRV_USBHS_DEVICE_SUPPORT	Determines if the USB Device Functionality should be enabled.
	DRV_USBHS_ENDPOINTS_NUMBER	Configures the number of endpoints to be provisioned in the driver.
	DRV_USBHS_HOST_ATTACH_DEBOUNCE_DURATION	Configures the time duration (in milliseconds) that the driver will wait to reconfirm a device attach.
	DRV_USBHS_HOST_NAK_LIMIT	Configures the NAK Limit for Host Mode Control Transfers.
	DRV_USBHS_HOST_PIPES_NUMBER	Configures the maximum number of pipes that are can be opened when the driver is operating in Host mode.
	DRV_USBHS_HOST_RESET_DURATION	Configures the time duration (in milliseconds) of the Reset Signal.
	DRV_USBHS_HOST_SUPPORT	Determines if the USB Host Functionality should be enabled.
	DRV_USBHS_INSTANCES_NUMBER	Specifies the number of driver instances to be enabled in the application.
	DRV_USBHS_INTERRUPT_MODE	Configures the driver for interrupt or polling mode operation.

USART Driver Library

This section describes the USART Driver Library.

Introduction

This section introduces the MPLAB Harmony USART Driver.

Description

The MPLAB Harmony USART Driver (also referred to as the USART Driver) provides a high-level interface to the USART and UART peripherals on Microchip's PIC32 microcontrollers. This driver provides application ready routines to read and write data to the UART using common data transfer models, which eliminates the need for the application to implement this code. The USART driver features the following:

- Provides byte transfer, read/write, and buffer queue data transfer models
- Supports Interrupt and Polled modes of operation
- Supports point-to-point data communication
- Supports multi-client and multi-instance operation
- Provides data transfer events
- Supports blocking and non-blocking operation with the read/write data transfer model
- Features thread-safe functions for use in RTOS applications
- Supports DMA transfers
- Supports high baud rate setting
- Major features are implemented in separate source code files and can be included only if needed. This helps optimize overall application code size.

Using the Library

This topic describes the basic architecture of the USART Driver Library and provides information and examples on its use.

Description

Interface Header File: `drv_usart.h`

The interface to the USART library is defined in the `drv_usart.h` header file.

Please refer to the What is MPLAB Harmony? section for how the driver interacts with the framework.

Abstraction Model

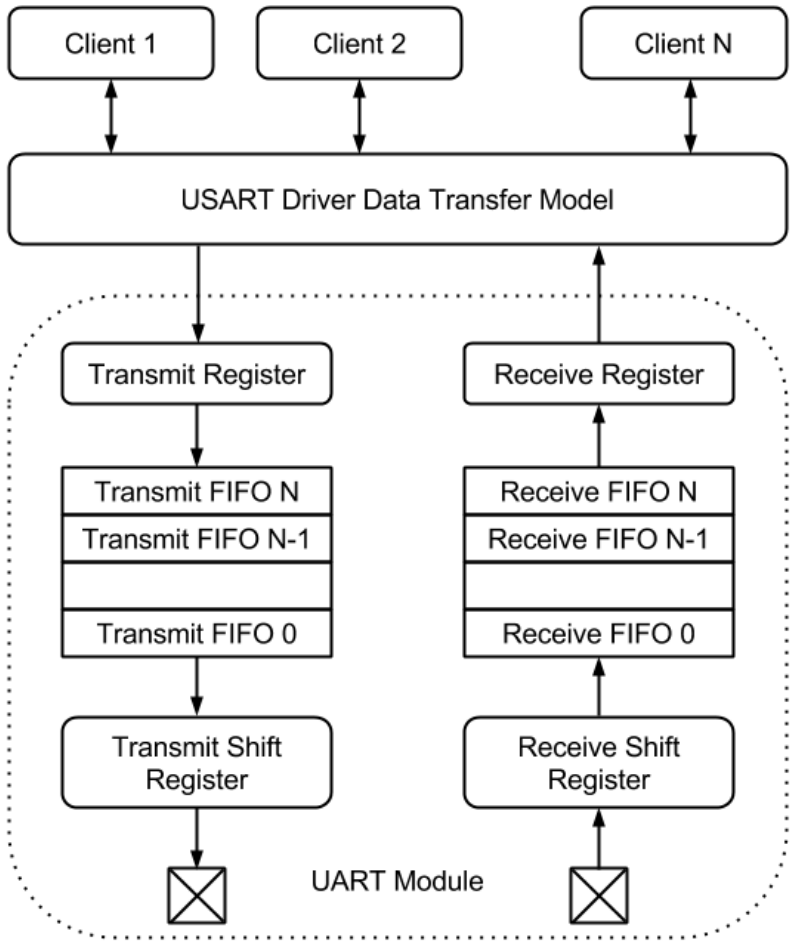
This section describes how the USART Driver abstracts the USART peripheral features.

Description

The USART driver features routines to perform the following functions:

- Driver initialization
- Transfer data
- Manage communication properties of the module

The Driver initialization routines allow the system to initialize the driver. The driver must be initialized before it can be opened by a client. The data transfer routines allow the application to receive and transmit data through the USART. The driver also provides routines to change the communication properties such as USART baud or line control settings.



As seen in the previous figure, the USART driver clients transfer data through the USART Driver Data Transfer model. The driver abstracts out the hardware details of the UART module FIFO mechanism and shift registers, and provides a low overhead data transfer mechanism to the application. The USART driver provides three different data transfer models for transferring data.

- The Byte Transfer Model
- The File I/O Type Read/Write Transfer Model
- Buffer Queue Transfer Model

Byte Transfer Model:

The byte transfer model allows the application to transfer data through USART driver one byte at a time. With this model, the driver reads one byte from the receive FIFO or writes one byte to the transmit FIFO. The application must check if data has been received before reading the data. Similarly, it must check if the transmit FIFO is not full before writing to the FIFO. The byte transfer model places the responsibility of maintaining the USART peripheral on the Application. The driver cannot support other data transfer models if support for this data transfer model is enabled. The byte transfer model is only recommended for simple data transfer applications.

To use the byte transfer model, the `drv_usart_byte_model.c` file must be included in the project and the DRV_USART_BYTE_MODEL_SUPPORT configuration macro should be set to true.

File I/O Type Read/Write Transfer Model:

This data transfer model is similar to file read and write API model in a UNIX operating system application. The application calls the USART driver read and write routines to transfer data through the USART. Unlike the byte transfer model, the read/write data model can process a block of data. Depending on the mode (blocking or non-blocking) in which the client opened the driver, the driver will either block until all of the data is transferred or will immediately return with the number of bytes transferred. The application does not have to check the FIFO status while using this mode. The application can instead use the return status (number of bytes transferred) to maintain its logic and complete the data transfer. The read/write model can be used with the non-DMA buffer queue model. It cannot be used with the byte transfer model and the DMA-enabled buffer queue model in the same application.

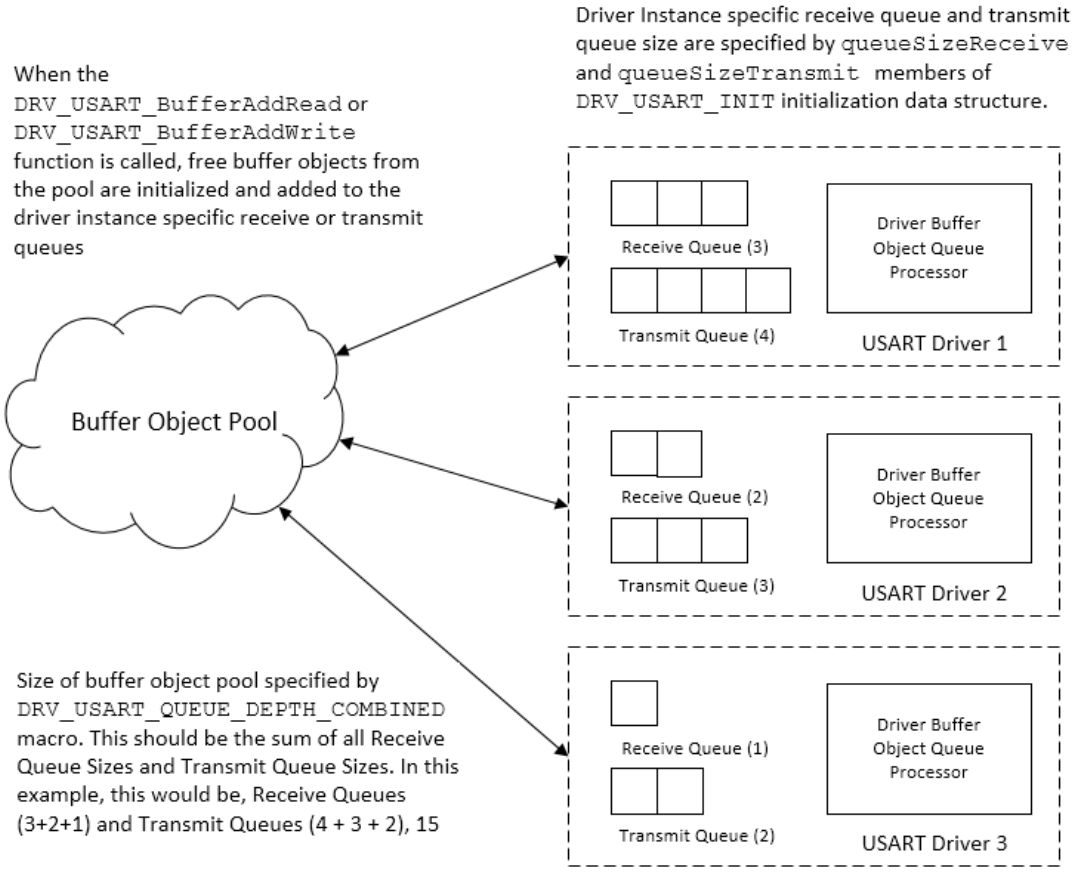
To use the file I/O type read/write data transfer model, the `drv_usart_read_write.c` file must be included in the project and the DRV_USART_READ_WRITE_MODEL_SUPPORT configuration macro should be set to true.

See File I/O Type Read/Write Data Transfer Modef for additional information.

Buffer Queue Transfer Model:

The buffer queue data transfer model allows clients to queue data transfers for processing. This data transfer model is always non-blocking. The USART driver returns a buffer handle for a queued request. The clients can track the completion of a buffer through events and API. If the USART driver is busy processing a data transfer, other data transfer requests are queued. This allows the clients to optimize their application logic and increase throughput. To optimize memory usage, the USART driver implements a shared buffer object pool concept to add a data transfer request to the queue. The following figure shows a conceptual representation of the buffer queue model.

Buffer Queue Transfer Model



As shown in the previous figure, each USART driver hardware instance has a read and write queue. The system designer must configure the sizes of these read and write queues. The USART driver additionally employs a global pool of buffer queue objects. This pool is common to all USART Driver hardware instances and its size is defined by the DRV_USART_QUEUE_DEPTH_COMBINED configuration macro. When a client places a request to add a data transfer, the driver performs the following actions:

- It checks if a buffer object is free in the global pool. If not, the driver rejects the request.
- It then checks if the hardware instance specific queue is full. If not, the buffer object from the global pool is added to the hardware instance specific queue. If the queue is full, the driver rejects the request.

The buffer queue model can be used along with the file I/O type read/write data transfer model.

To use the Buffer Queue Data Transfer model, the `drv_usart_buffer_queue.c` file must be included in the project and DRV_USART_BUFFER_QUEUE_SUPPORT configuration macro should be set to true.

The USART Driver DMA feature is only available while using the Buffer Queue Model. If enabled, the USART Driver uses the DMA module channels to transfer data directly from application memory to USART transmit or receive registers. This reduces CPU resource consumption and improves system performance. To use the buffer queue model with DMA, the `drv_usart_buffer_queue_dma.c` file should be included in the project instead of `drv_usart_buffer_queue.c`.

See Buffer Queue Transfer Model for additional information.

Communication Management

The USART Driver API contains functions to control the USART Driver communication properties. These functions allow the client to change the parity, stop bits, number of data bits and the communication baud rate. A change in the communication setting affects all ongoing communication and all driver clients.

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the USART Driver Library.

Library Interface Section	Description
System Routines	These routines are accessed by the MPLAB Harmony system module. They allow the driver to be initialized, deinitialized and maintained.
Core Client Routines	These routines allow the application client to open and close the driver.
Communication Management Client Routines	These routines allow the client to change the properties of the communication channel (such as baud, parity, etc.).
Buffer Queue Read/Write Client Routines	These routines allow the client to use the buffer queue data transfer model.
File I/O Type Read/Write Routines	These routines allow the client to use the file I/O type read/write routines.
Byte Transfer Routines	These routines allow the client to use the byte data transfer model.

The USART driver must be first initialized. One or more application clients can then open the USART Driver in Blocking or non-Blocking mode. The Open function returns a handle which allows the client to access the driver client functionality. The Driver tasks routines should be invoked regularly from the SYS_Tasks routine in case of Polled mode operation or from USART Driver Interrupt Service Routine (ISR), in case of Interrupt mode.

The driver implementation is split across multiple files to optimize the application project code size. The application project must include the `drv_usart.c` file if the USART driver is needed in the application. If DMA-enabled data transfers are required, the `drv_usart_dma.c` file should be included into the project instead of the `drv_usart.c` file. These files implement the system and core Client routines. Other driver files can be included based on the required driver features.

The USART Driver API, unless otherwise specified, should not be called from an interrupt context. That is, they should not be called from an ISR or from event handlers that are executing within an ISR context.

How the Library Works

This section describes how to use the USART Driver.

Description

Prior to using the USART Driver, the application must decide on which USART data transfer models are required. The application project should then include the USART Driver files, required to support the data transfer model into the application project. Additionally, the application design must consider the need for USART Driver to be opened in blocking or non blocking modes. This will also affect the application flow.

Initializing the USART Driver

Describes how to initialize the USART Driver.

Description

The USART Driver must be configured and initialized for clients to be able to open the driver. The driver build time configuration is defined by the configuration macros. Refer to the Building the Library section for the location of and more information on the various configuration macros and how these macros should be designed. The driver initialization is configured through the DRV_USART_INIT data structure that is passed to the DRV_USART_Initialize function. The initialization parameters include the USART baud, the USART Peripheral, USART interrupts and read queue and write queue sizes (which are applicable only when buffer queue data transfer is used). The following code shows an example of initializing the USART driver for 300 bps and uses USART2. If the driver is configured for Interrupt mode of operation, the priority of the USART interrupts needs to be specified.

```
/* The following code shows an example of designing the
 * DRV_USART_INIT data structure. It also shows how an example
 * usage of the DRV_USART_Initialize() function and how Interrupt
 * System Service routines are used to set USART Interrupt
 * priority. */

DRV_USART_INIT usartInit;
SYS_MODULE_OBJ usartModule1;

/* Set the baud to 300 */
usartInit.baud = 300;

/* Auto Baud detection or Stop Idle is not needed */
usartInit.flags = DRV_USART_INIT_FLAG_NONE;

/* Handshaking is not needed */
usartInit.handshake = DRV_USART_HANDSHAKE_NONE;
```

```
/* USART Error Interrupt source for this USART
 * driver instance. Note that INT_SOURCE_USART_2_ERROR
 * value is defined by the Interrupt System Service and
 * is the error interrupt for USART 2*/
usartInit.interruptError = INT_SOURCE_USART_2_ERROR;

/* USART Receive Interrupt source for this USART
 * driver instance. Note that INT_SOURCE_USART_2_RECEIVE
 * value is defined by the Interrupt System Service and
 * is the error interrupt for USART 2 */
usartInit.interruptReceive = INT_SOURCE_USART_2_RECEIVE;

/* USART Transmit Interrupt source for this USART
 * driver instance. Note that INT_SOURCE_USART_2_TRANSMIT
 * value is defined by the Interrupt System Service and
 * is the error interrupt for USART 2 */
usartInit.interruptTransmit = INT_SOURCE_USART_2_TRANSMIT;

/* Line control mode */
usartInit.lineControl = DRV_USART_LINE_CONTROL_8NONE1;

/* Operation mode is normal. Loopback or addressed is not
 * needed */
usartInit.mode = DRV_USART_OPERATION_MODE_NORMAL;

/* Peripheral Bus clock frequency at which the USART is
 * operating */
usartInit.brgClock = 80000000;

/* System module power setting. Typically set to
 * SYS_MODULE_POWER_RUN_FULL */
usartInit.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;

/* Receive buffer queue size. In this case a maximum of 2
 * receive buffers can be queued. Only applicable if the
 * Buffer Queue Data Transfer Model is included in the
 * application. */
usartInit.queueSizeReceive = 2;

/* Transmit buffer queue size. In this case a maximum of 3
 * transmit buffers can be queued. Only applicable if the
 * Buffer Queue Data Transfer Model is included in the
 * application. */
usartInit.queueSizeTransmit = 3;

/* The USART peripheral instance index associated with this
 * driver instance. Note that this value is defined by the
 * USART Peripheral Library */
usartInit.usartID = USART_ID_2;

/* Initialize USART Driver Instance 0 */
usartModule1 = DRV_USART_Initialize(DRV_USART_0, (SYS_MODULE_INIT*)&usartInit);

/* The result of the driver initialization can be checked */
if(SYS_MODULE_OBJ_INVALID == usartModule1)
{
    /* There was an error in initialization. */
}

/* If the USART driver is configured for interrupt mode of
 * operation, the interrupt priorities should be configured.
 * Here the Interrupt System Service is used to set the
 * priority to level 4 */

/* Initialize the interrupt system service */
SYS_INT_Initialize();

/* Set the USART 2 module interrupt priority to 4*/
SYS_INT_VectorPrioritySet(INT_VECTOR_UART2, INT_PRIORITY_LEVEL4);
```

```
    /* Set the USART 2 module interrupt sub-priority to 0*/
    SYS_INT_VectorSubprioritySet(INT_VECTOR_UART2, INT_SUBPRIORITY_LEVEL0);

    /* Enable global interrupt */
    SYS_INT_Enable();
```

The USART Driver can be configured to transfer data through the DMA. In such a case, the DMA channels to be used for USART transmit and receive need to be specified. The USART Driver depends on the DMA System Service to access the DMA module. The DMA channels to be used for transmit and receive transfers should be specified in the DRV_USART_INIT data structure.

The following code shows an example of using the USART Driver initialization to use DMA for transferring data. The code also shows example initialization of the DMA System Service.

```
  /* The following code shows an example of designing the
   * DRV_USART_INIT data structure. It also shows how an example
   * usage of the DRV_USART_Initialize() function and how Interrupt
   * System Service routines are used to set USART Interrupt
   * priority. */

    DRV_USART_INIT usartInit;
    SYS_DMA_INIT dmaInit;
    SYS_MODULE_OBJ usartModule1;
    SYS_MODULE_OBJ dmaModule;

    /* Set the baud to 300 */
    usartInit.baud = 300;

    /* Auto Baud detection or Stop Idle is not needed */
    usartInit.flags = DRV_USART_INIT_FLAG_NONE;

    /* Handshaking is not needed */
    usartInit.handshake = DRV_USART_HANDSHAKE_NONE;

    /* USART Error Interrupt source for this USART
     * driver instance. Note that INT_SOURCE_USART_2_ERROR
     * value is defined by the Interrupt System Service and
     * is the error interrupt for USART2*/
    usartInit.interruptError = INT_SOURCE_USART_2_ERROR;

    /* USART Receive Interrupt source for this USART
     * driver instance. Note that INT_SOURCE_USART_2_RECEIVE
     * value is defined by the Interrupt System Service and
     * is the receive interrupt for USART2 */
    usartInit.interruptReceive = INT_SOURCE_USART_2_RECEIVE;

    /* USART Transmit Interrupt source for this USART
     * driver instance. Note that INT_SOURCE_USART_2_TRANSMIT
     * value is defined by the Interrupt System Service and
     * is the transmit interrupt for USART2 */
    usartInit.interruptTransmit = INT_SOURCE_USART_2_TRANSMIT;

    /* Line control mode */
    usartInit.lineControl = DRV_USART_LINE_CONTROL_8NONE1;

    /* Operation mode is normal. Loopback or addressed is not
     * needed */
    usartInit.mode = DRV_USART_OPERATION_MODE_NORMAL;

    /* Peripheral Bus clock frequency at which the USART is
     * operating */
    usartInit.brgClock = 80000000;

    /* System module power setting. Typically set to
     * SYS_MODULE_POWER_RUN_FULL */
    usartInit.moduleInit.value = SYS_MODULE_POWER_RUN_FULL;

    /* Receive buffer queue size. In this case a maximum of 2
     * receive buffers can be queued. Only applicable if the
     * Buffer Queue Data Transfer Model is included in the
     * application. */
```

```
usartInit.queueSizeReceive = 2;

/* Transmit buffer queue size. In this case a maximum of 3
 * transmit buffers can be queued. Only applicable if the
 * Buffer Queue Data Transfer Model is included in the
 * application. */
usartInit.queueSizeTransmit = 3;

/* The USART peripheral instance index associated with this
 * driver instance. Note that this value is defined by the
 * USART Peripheral Library */
usartInit.usartID = USART_ID_2;

/* Use DMA channel 1 for transmit. If transmit via DMA is
 * not required, set this to DMA_CHANNEL_NONE. These values
 * are defined by the DMA System Service. */
usartInit.dmaChannelTransmit = DMA_CHANNEL_1;

/* Use DMA channel 2 for receive. If receive via DMA is
 * not required, set this to DMA_CHANNEL_NONE. These values
 * are defined by the DMA System Service. */
usartInit.dmaChannelReceive = DMA_CHANNEL_2;

/* Set the interrupt source for the Transmit DMA channel.
 * This parameter is ignored if the dmaChannelTransmit
 * parameter is set to DMA_CHANNEL_NONE. */
usartInit.dmaInterruptTransmit = INT_SOURCE_DMA_1;

/* Set the interrupt source for the Receive DMA channel.
 * This parameter is ignored if the dmaChannelReceive
 * parameter is set to DMA_CHANNEL_NONE. */
usartInit.dmaInterruptReceive = INT_SOURCE_DMA_2;

/********* End of DRV_USART_INIT Initialization *************/

/* If the USART driver is configured for interrupt mode of
 * operation, the interrupt priorities should be configured.
 * Here the Interrupt System Service is used to set the
 * priority to level 4 */

/* Initialize the interrupt system service */
SYS_INT_Initialize();

/* Set the USART 2 module interrupt priority to 4*/
SYS_INT_VectorPrioritySet(INT_VECTOR_UART2, INT_PRIORITY_LEVEL4);

/* Set the USART 2 module interrupt sub-priority to 0*/
SYS_INT_VectorSubprioritySet(INT_VECTOR_UART2, INT_SUBPRIORITY_LEVEL0);

/* Set the DMA 1 channel interrupt priority to 4*/

/* Set the DMA 1 channel interrupt sub-priority to 0*/
SYS_INT_VectorSubprioritySet(INT_VECTOR_DMA1, INT_SUBPRIORITY_LEVEL0);

/* Set the DMA 2 channel interrupt priority to 4*/
SYS_INT_VectorPrioritySet(INT_VECTOR_DMA2, INT_PRIORITY_LEVEL4);

/* Set the DMA 2 channel interrupt sub-priority to 0*/
SYS_INT_VectorSubprioritySet(INT_VECTOR_DMA2, INT_SUBPRIORITY_LEVEL0);

/* Enable global interrupt */
SYS_INT_Enable();

/* This is the DMA System Service Initialization */
dmaInit.sidl = SYS_DMA_SIDL_DISABLE;
dmaModule = SYS_DMA_Initialize((SYS_MODULE_INIT*)&dmaInit);
```

```
    /* The result of the DMA System Service initialization can be checked */
    if(SYS_MODULE_OBJ_INVALID == dmaModule)
    {
        /* DMA System Service initialization was not successful */
    }

    /* Initialize USART Driver Instance 0 */
    usartModule1 = DRV_USART_Initialize(DRV_USART_0, (SYS_MODULE_INIT*)&usartInit);

    /* The result of the driver initialization can be checked */
    if(SYS_MODULE_OBJ_INVALID == usartModule1)
    {
        /* There was an error in initialization. */
    }
```

Opening the USART Driver

Describes how to open the USART Driver.

Description

To use the USART driver, the application must open the driver. This is done by calling the DRV_USART_Open function. Calling this function with DRV_IO_INTENT_NONBLOCKING will cause the driver to be opened in non blocking mode. The DRV_USART_Read and DRV_USART_Write functions when called by this client will be non blocking. . Calling this function with DRV_IO_INTENT_BLOCKING will cause the driver to be opened in blocking mode. The DRV_USART_Read and DRV_USART_Write functions when called by this client will be blocking.

If successful, the DRV_USART_Open function will return a valid handle to the driver. This handle records the association between the client and the driver instance that was opened. The DRV_USART_Open function may return DRV_HANDLE_INVALID in the situation where the driver is not ready to be opened. When this occurs, the application can try opening the driver again. Note that the open function may return an invalid handle in other (error) cases as well.

The following code shows an example of the driver being opened in different modes.

```
DRV_HANDLE usartHandle1, usartHandle2;

/* Client 1 opens the USART driver in non blocking mode */
usartHandle1 = DRV_USART_Open(DRV_USART_0, DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NONBLOCKING);

/* Check if the handle is valid */
if(DRV_HANDLE_INVALID == usartHandle1)
{
    /* The driver was not opened successfully. The client
     * can try opening it again */
}

/* Client 2 opens the USART driver in blocking mode */
usartHandle2 = DRV_USART_Open(DRV_USART_0, DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_BLOCKING);

/* Check if the handle is valid */
if(DRV_HANDLE_INVALID == usartHandle2)
{
    /* The driver was not opened successfully. The client
     * can try opening it again */
}

/* The client can also open the USART driver in read only mode
 * (DRV_IO_INTENT_READ), write only mode (DRV_IO_INTENT_WRITE)
 * and exclusive mode (DRV_IO_INTENT_EXCLUSIVE). If the driver
 * has been opened exclusively by a client, it cannot be opened
 * again by another client */
```

Byte Transfer Model

Describes the USART Driver byte transfer model.

Description

To use the byte transfer model, the DRV_USART_BYTE_MODEL_SUPPORT configuration macro should be true. The `drv_usart_byte_model.c` function should be included in the application project. The application cannot support the read/write and buffer queue data transfer model when the byte model is enabled.

The following code shows an example of how the DRV_USART_WriteByte function and the DRV_USART_ReadByte function are used.

```
 /* Client uses the a byte model API to write a byte*/
if(!DRV_USART_TransmitBufferIsFull(usartHandle1))
{
    byte = '1';
    DRV_USART_WriteByte(usartHandle1,byte);
}

/* Client waits until data is available and then reads
 * byte */
 while(DRV_USART_ReceiverBufferIsEmpty(usartHandle1));
        byte = DRV_USART_ReadByte(usartHandle1);
```

File I/O Type Read/Write Data Transfer Model

This topic describes the file I/O type read/write data transfer model.

Description

To use the file I/O type read/write data transfer model, the DRV_USART_READ_WRITE_MODEL_SUPPORT configuration macro should be 'true'. The file `drv_usart_read_write.c` file should be included in the application project. The driver can support the non-DMA buffer queue data transfer model along with the file I/O type read/write data transfer model. The byte transfer model and DMA buffer queue model cannot be enabled if the file I/O type read/write data transfer model is enabled.

The DRV_USART_Read and DRV_USART_Write function represent the file I/O type read/write data transfer model. The functional behavior of these API is affected by the mode in which the client opened the driver. If the client opened the driver in blocking mode these API will block. In blocking mode, the DRV_USART_Read and DRV_USART_Write functions will not return until the requested number of bytes have been read or written. When operating in a RTOS application, the application thread that has opened driver in blocking mode, will enter a blocked state when it calls DRV_USART_Write or DRV_USART_Read function. This will allow the RTOS scheduler to schedule other threads which are ready to run. If the client opened the driver in non-blocking mode these API will not block. In non-blocking mode, the DRV_USART_Read and DRV_USART_Write functions will return immediately with the amount of data that could be read or written.

Note: Do not open the driver in Blocking mode when the driver is configured for polling operation (DRV_USART_INTERRUPT_MODE is false) in a bare-metal (non-RTOS) application. This will cause the system to enter an infinite loop condition when the DRV_USART_Read or DRV_USART_Write function is called.

The following code shows an example of file I/O type read/write data transfer model usage when the driver is opened in Blocking mode.

```
/* This code shows the functionality of the DRV_USART_Write and
 * DRV_USART_Read function when the driver is opened in blocking mode */

DRV_HANDLE usartHandle1;
uint8_t myData[10];
size_t bytesProcessed;

/* The driver is opened in blocking mode */
usartHandle1 = DRV_USART_Open(DRV_USART_0, DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_BLOCKING);

/* Check if the driver was opened successfully */
if(DRV_HANDLE_INVALID == usartHandle1)
{
    /* The driver could not be opened successfully */
}

/* Transmit 10 bytes from the myData array. Function will not return until 10 bytes
 * have been accepted by the driver. This is because the client opened the driver
 * in blocking mode. */

bytesProcessed = DRV_USART_Write(usartHandle1, myData, 10);

/* Read 10 bytes from the myData array. Function will not return until all 10 bytes
 * have been received by the driver. This is because the client opened the driver
 * in blocking mode. */

bytesProcessed = DRV_USART_Read(usartHandle1, myData, 10);
```

In non-Blocking mode, the driver uses the internal USART hardware FIFO as storage. The DRV_USART_Read function checks if bytes are available in USART receive hardware FIFO. If bytes are available, these are read and the number of bytes read is returned. The DRV_USART_Write function checks if USART transmit hardware FIFO has empty location. If locations are empty, the bytes to be transmitted are queued up in the FIFO and the number of queued bytes is returned. In either case, the number of bytes read or written may be less than the number requested by the client. The client can, in such a case, call the DRV_USART_Read and/or the DRV_USART_Write functions again to process the pending bytes. The following code shows how this can be done.

```
/* This code shows the functionality of the DRV_USART_Write and
 * DRV_USART_Read functions when the driver is opened in non-blocking mode */

DRV_HANDLE usartHandle1;
uint8_t myData[10];
size_t bytesProcessed;

/* The driver is opened in non-blocking mode */
usartHandle1 = DRV_USART_Open(DRV_USART_0,
        DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NONBLOCKING);

/* Check if the driver was opened successfully */
if(DRV_HANDLE_INVALID == usartHandle1)
{
    /* The driver could not be opened successfully */
}

/* The following code call the DRV_USART_Write function
 * multiple times to write 10 bytes completely. Note how the
 * function return value is used to update the location of
 * user source data. */

bytesProcessed = 0;
do
{
    /* Write data to the USART and use the return value to
     * update the source data pointer and pending bytes number. */
    bytesProcessed += DRV_USART_Write(usartHandle1,
            myData + bytesProcessed, (10 - bytesProcessed));

} while(bytesProcessed < 10);

/* The following code calls the DRV_USART_Read function multiple times to read
 * 10 bytes completely. Note how the function return value is used to update the
 * location of user destination array. */

bytesProcessed = 0;
do
{
    /* Read data from the USART and use the return value to update the
     * destination pointer and pending bytes number. */
    bytesProcessed += DRV_USART_Read(usartHandle1,
            myData + bytesProcessed, (10 - bytesProcessed));

}while (bytesProcessed < 10);
```

Buffer Queue Transfer Model

This topic describes the buffer queue data transfer model.

Description

To use the buffer queue data transfer model, the DRV_USART_BUFFER_QUEUE_SUPPORT configuration macro should be true. The file, `drv_usart_buffer_queue.c`, should be included in the application project. If the DMA-enabled buffer queue model is required, the `drv_usart_buffer_queue_dma.c` file (*and not* the `drv_usart_buffer_queue.c`) should be included in the application project. The DMA and non-DMA buffer queue model API is the same. The driver can support the non-DMA buffer queue data transfer model along with the file I/O type read/write data transfer model. The byte transfer model cannot be enabled if the buffer queue data transfer model is enabled.

The DRV_USART_BufferAddRead and DRV_USART_BufferAddWrite functions represent the buffer queue data transfer model. These functions are always non-blocking. The Buffer Queue Data Transfer Model employs queuing of read and write request. Each driver instance contains a read and write queue. The size of the read queue is determined by the queueSizeRead member of the DRV_USART_INIT data structure. The size of the write queue is determined by the queueSizeWrite member of the DRV_USART_INIT data structure. The driver provides driver events (DRV_USART_BUFFER_EVENT) that indicates termination of the buffer requests.

When the driver is configured for Interrupt mode operation (that is defined and registered by the driver client), the buffer event handler executes in an interrupt context. Calling computationally intensive or hardware polling routines within the event handlers is not recommended. Calling interrupt unsafe functions in the event handler when the driver is configured for Interrupt mode could result in unpredictable system behavior.

When the driver adds request to the queue, it returns a buffer handle. This unique handle allows the client to track the request as it progresses through the queue. The buffer handle is returned with the buffer event and expires when the event associated with the buffer has been generated and the event handler returns. The following code shows an example of using the buffer queue data transfer model.

```
/* This code shows an example of using the
 * Buffer Queue Data Transfer Model. */
DRV_HANDLE usartHandle1;
uint8_t myData1[10], myData2[10];
uint8_t myData3[10], myData4[10];
size_t bytesProcessed;
DRV_USART_BUFFER_HANDLE bufferHandle1, bufferHandle2;
DRV_USART_BUFFER_HANDLE bufferHandle3, bufferHandle4;

/* The driver is opened in non blocking mode */
usartHandle1 = DRV_USART_Open(DRV_USART_0,
        DRV_IO_INTENT_READWRITE|DRV_IO_INTENT_NONBLOCKING);

/* Check if the driver was opened successfully */
if(DRV_HANDLE_INVALID == usartHandle1)
{
    /* The driver could not be opened successfully */
}

/* Register a Buffer Event Handler with USART driver.
 * This event handler function will be called whenever
 * there is a buffer event.  An application defined
 * context can also be specified. This is returned when
 * the event handler is called.
 * */
DRV_USART_BufferEventHandlerSet(usartHandle1,
        APP_USARTBufferEventHandler, NULL);

/* Queue up two buffers for transmit */
DRV_USART_BufferAddWrite(usartHandle1, &bufferHandle1, myData1, 10);
DRV_USART_BufferAddWrite(usartHandle1, &bufferHandle2, myData2, 10);

/* Queue up two buffers for receive */
DRV_USART_BufferAddRead(usartHandle1, &bufferHandle3, myData3, 10);
DRV_USART_BufferAddRead(usartHandle1, &bufferHandle4, myData4, 10);

/* This is application USART Driver Buffer Event Handler */

void APP_USARTBufferEventHandler(DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:
            /* This means the data was transferred */
            break;
        case DRV_USART_BUFFER_EVENT_ERROR:
            /* Error handling here. */
            break;
        default:
            break;
    }
}
```

Driver Tasks Routine

This topic describes the Driver "Task" routines.

Description

The USART driver contains three task routines, DRV_USART_TasksTransmit, DRV_USART_TasksReceive and DRV_USART_TasksError. These task routines implement the USART Driver state machines for transmit, receive and error related operations. If the driver is configured for polling operation, the required task routine should be called in SYS_Tasks routine of the system. If the driver is configured for interrupt mode of operation, the task routine should be called from the ISR. The following code shows an example of both.

```
/* The following code shows an example of
 * USART2 Interrupt Service Routine. This function
 * will be called when a USART2 interrupt occurs
```

```
 * and the driver is configured for interrupt mode
 * operation */

void __ISR ( _UART_2_VECTOR,ipl4 ) _InterruptHandler_USART ( void )
{
    /* usartModule1 is the System Module Object
     * that was returned by the DRV_USART_Initialize
     * function. */

    DRV_USART_TasksTransmit(usartModule1);
    DRV_USART_TasksReceive(usartModule1);
    DRV_USART_TasksError(usartModule1);

}

/* In case of Polled mode, the tasks routines are
 * invoked from the SYS_Tasks() routine. */

void SYS_Tasks(void)
{
    DRV_USART_TasksTransmit(usartModule1);
    DRV_USART_TasksReceive(usartModule1);
    DRV_USART_TasksError(usartModule1);
}

/* The SYS_Tasks routine is invoked from the main
 * application while(1) loop. */

while(1)
{
    SYS_Tasks();
}
```

Using the USART Driver with DMA

This topic provides information on using the USART Driver with DMA.

Description

To use the USART Driver with DMA, the following should be noted:

- Include `drv_usart_dma.c` in the project. Do not include `drv_usart.c`.
- Include `drv_usart_buffer_queue_dma.c` in the project. Do not include `drv_usart_buffer_queue.c`.
- Initialize the driver to use DMA. Refer to Initializing the USART Driver for details.
- Refer to the DMA System Service section for details on initializing and using the DMA system service in Polling or Interrupt mode
- The DRV_USART_INTERRUPT_MODE configuration macro should be set to 'true'
- Do not directly invoke the DRV_USART_TasksTransmit and DRV_USART_TasksReceive functions

Configuring the Library

Macros

	Name	Description
	DRV_USART_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_USART_INDEX	USART Static Index selection.
	DRV_USART_INTERRUPT_MODE	Macro controls interrupt based operation of the driver.
	DRV_USART_INTERRUPT_SOURCE_ERROR	Defines the error interrupt source for the static driver.
	DRV_USART_PERIPHERAL_ID	Configures the USART PLIB Module ID.
	DRV_USART_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_USART_BUFFER_QUEUE_SUPPORT	Specifies if the Buffer Queue support should be enabled.
	DRV_USART_BYTE_MODEL_SUPPORT	Specifies if the Byte Model support should be enabled.
	DRV_USART_INTERRUPT_SOURCE_RECEIVE	Defines the Receive interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_RECEIVE_DMA	Defines the Receive DMA Channel interrupt source for the static driver.

	DRV_USART_INTERRUPT_SOURCE_TRANSMIT	Defines the Transmit interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_TRANSMIT_DMA	Defines the Transmit DMA Channel interrupt source for the static driver.
	DRV_USART_QUEUE_DEPTH_COMBINED	Defines the number of entries of all queues in all instances of the driver.
	DRV_USART_READ_WRITE_MODEL_SUPPORT	Specifies if Read/Write Model support should be enabled.
	DRV_USART_RECEIVE_DMA	Defines the USART Driver Receive DMA Channel for the static driver.
	DRV_USART_TRANSMIT_DMA	Defines the USART Driver Transmit DMA Channel in case of static driver.
	DRV_USART_BAUD_RATE_IDXn	Specifies the USART Baud at which the USART driver is initialized.
	DRV_USART_BYTE_MODEL_BLOCKING	Enables or Disables DRV_USART_ByteWrite function blocking behavior.
	DRV_USART_BYTE_MODEL_CALLBACK	Enables or Disables Callback Feature of the Byte Transfer Model.
	DRV_USART_RCV_QUEUE_SIZE_IDXn	Sets the USART Driver Receive Queue Size while using the Buffer Queue Data Transfer Model.
	DRV_USART_XMIT_QUEUE_SIZE_IDXn	Sets the USART Driver Transmit Queue Size while using the Buffer Queue Data Transfer Model.

Description

The USART Driver requires the specification of compile-time configuration macros. These macros define resource usage, feature availability, and dynamic behavior of the driver. These configuration macros should be defined in the `system_config.h` file.

This header can be placed anywhere in the application specific folders and the path of this header needs to be presented to the include search for a successful build. Refer to the Applications Help section for more details.

Note: Initialization overrides are not supported in this version.

```
/* In this configuration example, the USART driver
 * must manage only on USART peripheral instance.
 * This macro can be greater than one if more
 * USART peripherals are needed. Not defining this
 * macro will cause the driver to be built in
 * static mode */
#define DRV_USART_INSTANCES_NUMBER 1

/* There will be 3 different client that use the
 * one instance of the USART peripheral. Note that
 * this macro configures the total (combined) number of clients
 * across all instance of the USART driver. Not defining
 * this macro will cause the driver to be configured
 * for single client operation */
#define DRV_USART_CLIENTS_NUMBER 3

/* USART Driver should be built for interrupt mode.
 * Set this to false for Polled mode operation */
#define DRV_USART_INTERRUPT_MODE true

/* Combined buffer queue depth is 5. Refer to the
 * description of the Buffer Queue data transfer model
 * and the DRV_USART_QUEUE_DEPTH_COMBINED macro
 * for more details on how this is configured. */
#define DRV_USART_QUEUE_DEPTH_COMBINED 5

/* Set this macro to true is Buffer Queue data
 * transfer model is to be enabled. */
#define DRV_USART_BUFFER_QUEUE_SUPPORT true

/* Set this macro to true if Byte by Byte data
 * transfer model is to be enabled. */
#define DRV_USART_BYTE_MODEL_SUPPORT false

/* Set this macro to true File IO type Read Write
 * data transfer model is to be enabled */
#define DRV_USART_READ_WRITE_MODEL_SUPPORT false
```

DRV_USART_CLIENTS_NUMBER Macro

Sets up the maximum number of clients that can be connected to any hardware instance.

File

drv_usart_config_template.h

C

```
#define DRV_USART_CLIENTS_NUMBER 4
```

Description

USART Client Count Configuration

This macro sets up the maximum number of clients that can be connected to any hardware instance. This value represents the total number of clients to be supported across all hardware instances. Therefore, if USART1 will be accessed by two clients and USART2 will accessed by three clients, this number should be 5. It is recommended that this value be set exactly equal to the number of expected clients, as client support consumes RAM memory space. If this macro is not defined and the DRV_USART_INSTANCES_NUMBER macro is not defined, the driver will be built for static - single client operation. If this macro is defined and the DRV_USART_INSTANCES_NUMBER macro is not defined, the driver will be built for static - multi client operation.

Remarks

None.

DRV_USART_INDEX Macro

USART Static Index selection.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INDEX DRV_USART_INDEX_2
```

Description

Index - Used for static drivers

USART Static Index selection for the driver object reference. This macro defines the driver index for static and static multi-client builds. For example, if this macro is set to DRV_USART_INDEX_2, the static driver APIs would be DRV_USART2_Initialize, DRV_USART2_Open, etc. When building static drivers, this macro should be different for each static build of the USART driver that needs to be included in the project.

Remarks

This index is required to make a reference to the driver object

DRV_USART_INTERRUPT_MODE Macro

Macro controls interrupt based operation of the driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_MODE true
```

Description

USART Interrupt Mode Operation Control

This macro controls the interrupt based operation of the driver. The possible values are:

- true - Enables the interrupt mode
- false - Enables the polling mode

If the macro value is true, the Interrupt Service Routine (ISR) for the interrupt should be defined in the system. The DRV_USART_Tasks routine should be called in the ISR. While using the USART driver with DMA, this flag should always be true.

Remarks

None.

DRV_USART_INTERRUPT_SOURCE_ERROR Macro

Defines the error interrupt source for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_SOURCE_ERROR INT_SOURCE_USART_2_ERROR
```

Description

Error Interrupt Source

This macro defines the Error interrupt source for the static driver. The interrupt source defined by this macro will override the errorInterruptSource member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the USART module error interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_USART_PERIPHERAL_ID Macro

Configures the USART PLIB Module ID.

File

drv_usart_config_template.h

C

```
#define DRV_USART_PERIPHERAL_ID USART_ID_2
```

Description

USART Peripheral Library Module ID

This macro configures the PLIB ID if the driver is built statically. This value will override the usartID member of the DRV_USART_INIT initialization data structure. In that when the driver is built statically, the usartID member of the DRV_USART_INIT data structure will be ignored by the driver initialization routine and this macro will be considered. This should be set to the PLIB ID of USART module (USART_ID_1, USART_ID_2, and so on).

Remarks

None.

DRV_USART_INSTANCES_NUMBER Macro

Sets up the maximum number of hardware instances that can be supported.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INSTANCES_NUMBER 2
```

Description

USART driver objects configuration

This macro sets up the maximum number of hardware instances that can be supported. It is recommended that this number be set exactly equal to the number of USART modules that are needed by the application, as hardware Instance support consumes RAM memory space. If this macro is not defined, the driver will be built statically.

Remarks

None

DRV_USART_BUFFER_QUEUE_SUPPORT Macro

Specifies if the Buffer Queue support should be enabled.

File

drv_usart_config_template.h

C

```
#define DRV_USART_BUFFER_QUEUE_SUPPORT true
```

Description

USART Driver Buffer Queue Support

This macro defines whether or not Buffer Queue support should be enabled. Setting this macro to true will enable buffer queue support and all buffer related driver function. The driver should be built along with the drv_usart_buffer_queue.c file, which contains the functional implementation for buffer queues. If buffer queue operation is enabled, the DRV_USART_BYTE_MODEL_SUPPORT function should not be true. If this macro is set to false, the behavior of the USART Driver Buffer Queue API is not defined. While using the USART driver with DMA, the driver supports Buffer Queue Data transfer model regardless of the value of this configuration macro.

Remarks

None.

DRV_USART_BYTE_MODEL_SUPPORT Macro

Specifies if the Byte Model support should be enabled.

File

drv_usart_config_template.h

C

```
#define DRV_USART_BYTE_MODEL_SUPPORT false
```

Description

USART Driver Byte Model Support

This macro defines whether or Byte Model support should be enabled. Setting this macro to true will enable byte model support and all byte operation related driver functions. The driver should be built along with the drv_usart_byte_model.c file, which contains the functional implementation for byte model operation. If byte model operation is enabled, the driver will not support buffer queue and read write models. The behavior of the byte mode API when this macro is set to false is not defined.

Remarks

None.

DRV_USART_INTERRUPT_SOURCE_RECEIVE Macro

Defines the Receive interrupt source for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_SOURCE_RECEIVE INT_SOURCE_USART_2_RECEIVE
```

Description

Receive Interrupt Source

This macro defines the Receive interrupt source for the static driver. The interrupt source defined by this macro will override the rxInterruptSource member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the USART module receive interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_USART_INTERRUPT_SOURCE_RECEIVE_DMA Macro

Defines the Receive DMA Channel interrupt source for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_SOURCE_RECEIVE_DMA
```

Description

Receive DMA Channel Interrupt Source

This macro defines the Receive DMA Channel interrupt source for the static driver. The interrupt source defined by this macro will override the dmaInterruptReceive member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_USART_INTERRUPT_SOURCE_TRANSMIT Macro

Defines the Transmit interrupt source for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_SOURCE_TRANSMIT INT_SOURCE_USART_2_TRANSMIT
```

Description

Transmit Interrupt Source

This macro defines the TX interrupt source for the static driver. The interrupt source defined by this macro will override the txInterruptSource member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the USART module transmit interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_USART_INTERRUPT_SOURCE_TRANSMIT_DMA Macro

Defines the Transmit DMA Channel interrupt source for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_INTERRUPT_SOURCE_TRANSMIT_DMA
```

Description

Transmit DMA Channel Interrupt Source

This macro defines the TX DMA Channel interrupt source for the static driver. The interrupt source defined by this macro will override the dmaInterruptTransmit member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel interrupt enumeration in the Interrupt PLIB for the microcontroller.

Remarks

None.

DRV_USART_QUEUE_DEPTH_COMBINED Macro

Defines the number of entries of all queues in all instances of the driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_QUEUE_DEPTH_COMBINED 16
```

Description

USART Driver Instance combined queue depth.

This macro defines the number of entries of all queues in all instances of the driver.

Each hardware instance supports a buffer queue for transmit and receive operations. The size of queue is specified either in driver initialization (for dynamic build) or by macros (for static build). The hardware instance transmit buffer queue will queue transmit buffers submitted by the DRV_USART_BufferAddWrite function. The hardware instance receive buffer queue will queue receive buffers submitted by the DRV_USART_BufferAddRead function.

A buffer queue will contain buffer queue entries, with each related to a BufferAdd request. This configuration macro defines the total number of buffer entries that will be available for use between all USART driver hardware instances. The buffer queue entries are allocated to individual hardware instances as requested by hardware instances. Once the request is processed, the buffer queue entry is free for use by other hardware instances.

The total number of buffer entries in the system determines the ability of the driver to service non blocking read and write requests. If a free buffer entry is not available, the driver will not add the request and will return an invalid buffer handle. The greater the number of buffer entries, the greater the ability of the driver to service and add requests to its queue. A hardware instance additionally can queue up as many buffer entries as specified by its transmit and receive buffer queue size.

For example, consider the case of static single client driver application where full duplex non blocking operation is desired without queuing, the minimum transmit queue depth and minimum receive queue depth should be 1. Therefore, the total number of buffer entries should be 2.

As another example, consider the case of a dynamic driver (i.e., two instances) where instance 1 will queue up to three write requests and up to two read requests, and instance 2 will queue up to two write requests and up to six read requests, the value of this macro should be: 13 (2 + 3 + 2 + 6).

Remarks

None.

DRV_USART_READ_WRITE_MODEL_SUPPORT Macro

Specifies if Read/Write Model support should be enabled.

File

drv_usart_config_template.h

C

```
#define DRV_USART_READ_WRITE_MODEL_SUPPORT true
```

Description

USART Driver Read Write Model Support

This macro defines whether or not Read Write Model support should be enabled. Setting this macro to true will enable read write model support and all read/write related driver functions. The driver should be built along with the drv_usart_read_write.c file, which contains the functional implementation for byte model operation. If read/write model operation is enabled, the DRV_USART_BYTE_MODEL_SUPPORT macro should not be true. The behavior of the Read Write Model API when this macro is set to false is not defined.

Remarks

None.

DRV_USART_RECEIVE_DMA Macro

Defines the USART Driver Receive DMA Channel for the static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_RECEIVE_DMA
```

Description

USART Driver Receive DMA Channel

This macro defines the USART Receive DMA Channel for the static driver. The DMA channel defined by this macro will override the dmaReceive member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel in the

DMA PLIB for the microcontroller.

Remarks

None.

DRV_USART_TRANSMIT_DMA Macro

Defines the USART Driver Transmit DMA Channel in case of static driver.

File

drv_usart_config_template.h

C

```
#define DRV_USART_TRANSMIT_DMA
```

Description

USART Driver Transmit DMA Channel

This macro defines the USART Transmit DMA Channel for the static driver. The DMA channel defined by this macro will override the dmaTransmit member of the DRV_USB_INIT initialization data structure in the driver initialization routine. This value should be set to the DMA channel in the DMA PLIB for the microcontroller.

Remarks

None.

DRV_USART_BAUD_RATE_IDXn Macro

Specifies the USART Baud at which the USART driver is initialized.

File

drv_usart_config_template.h

C

```
#define DRV_USART_BAUD_RATE_IDXn
```

Description

USART Driver Baud Selection.

This configuration constant specifies the baud rate at which the USART Driver is initialized. This is the baud rate at which the USART module will operate when the driver initialization has completed. The driver client can call the DRV_USART_BaudSet function after opening the driver to change the USART baud rate after initialization has completed.

Remarks

This constant is automatically generated by MHC and its value is set to the value specified in USART Driver Baud Selection field.

DRV_USART_BYTE_MODEL_BLOCKING Macro

Enables or Disables DRV_USART_ByteWrite function blocking behavior.

File

drv_usart_config_template.h

C

```
#define DRV_USART_BYTE_MODEL_BLOCKING
```

Description

USART Driver Byte Write Blocking Behavior

This USART Driver MHC option controls the blocking behavior of the DRV_USART_ByteWrite function and is only applicable when the USART Driver Byte Transfer model is selected. Selecting this option will cause the DRV_USART_ByteWrite function to block until the byte has been written to the USART Transmit FIFO. Blocking behavior is enabled by default (to enable backward compatibility with previous versions of the driver). This option can be used for simple applications where interoperability with other MPLAB Harmony modules is not a design concern.

If the application uses several other MPLAB Harmony modules (Middleware, File System, etc.), it is recommended to disable this option and use the non-blocking DRV_USART_ByteWrite function. This requires the application to call the DRV_USART_TransmitBufferIsFull function to check if the byte can be written to the USART, as shown in the following code example.

```
if(!DRV_USART_TransmitBufferIsFull(usartHandle1))
{
    byte = '1';
    DRV_USART_WriteByte(usartHandle1,byte);
}
```

Using the non-blocking implementation results in improved application interoperability with other MPLAB Harmony modules.

Remarks

The DRV_USART_BYTE_MODEL_BLOCKING constant is specified for documentation purposes only. It does not affect the configuration of the driver.

DRV_USART_BYTE_MODEL_CALLBACK Macro

Enables or Disables Callback Feature of the Byte Transfer Model.

File

drv_usart_config_template.h

C

```
#define DRV_USART_BYTE_MODEL_CALLBACK
```

Description

USART Driver Byte Model Callback Feature.

This USART Driver MHC option controls the Callback feature of the Byte Transfer model. Selecting this option allows an application to register Byte Transfer Event Callback functions with the driver. These callback functions are invoked on the occurrence of Byte Transfer events. Callback functions can be registered to Byte Transmit, Byte Receive, and USART Error events, as shown in the following code example.

```
// This code shows how a callback function is
// registered for the Byte Receive event.
DRV_USART_ByteReceiveCallbackSet(DRV_USART_INDEX_0, APP_USARTReceiveEventHandler);

// Event Processing Technique. Event is received when
// a byte is received.

void APP_USARTReceiveEventHandler(const SYS_MODULE_INDEX index)
{
    // Byte has been Received. Handle the event.
    // Read byte using DRV_USART_ReadByte.
}
```

When operating in Interrupt mode, the callback functions are invoked in an interrupt context. If this option is not selected, the application must use the DRV_USART_TransmitBufferIsFull, DRV_USART_ReceiverBufferIsEmpty, and DRV_USART_ErrorGet functions to check the status of Byte transmit or receive.

Remarks

The DRV_USART_BYTE_MODEL_CALLBACK constant is specified for documentation purposes only. It does not affect the configuration of the driver.

DRV_USART_RCV_QUEUE_SIZE_IDXn Macro

Sets the USART Driver Receive Queue Size while using the Buffer Queue Data Transfer Model.

File

drv_usart_config_template.h

C

```
#define DRV_USART_RCV_QUEUE_SIZE_IDXn
```

Description

USART Driver Receive Queue Size Selection.

This constant sets the USART Driver Receive queue size when using the Buffer Queue Data Transfer Model. It affects the queuing capacity of the DRV_USART_BufferAddRead function for the selected driver instance. For example, if this option is set to 5 for USART Driver 0, USART Driver 0 can then queue up to a maximum of five driver client receive buffer requests from any driver clients.

Therefore, if USART Driver 0 has two clients and if client 1 has queued up three buffers for receive, client 2 can only queue up to two buffers. If the client attempts to queue up more buffers, DRV_USART_BufferAddRead will not accept the request and will generate an invalid buffer handle (DRV_USART_BUFFER_HANDLE_INVALID).

Remarks

This constant is automatically generated by MHC and its value is set to the value specified in USART Driver Receive Queue Size field.

DRV_USART_XMIT_QUEUE_SIZE_IDXn Macro

Sets the USART Driver Transmit Queue Size while using the Buffer Queue Data Transfer Model.

File

drv_usart_config_template.h

C

```
#define DRV_USART_XMIT_QUEUE_SIZE_IDXn
```

Description

USART Driver Transmit Queue Size Selection.

This constant sets the USART Driver Transmit queue size when using the Buffer Queue Data Transfer Model. It affects the queuing capacity of the DRV_USART_BufferAddWrite function, for the selected driver instance. For example, if this option is set to 5 for USART Driver 0, USART Driver 0 can then queue up to a maximum of five driver client transmit buffer requests from any driver clients.

Therefore if USART Driver 0 has two clients and if client 1 has queued up three buffers for transmit, client 2 can only queue up to two buffers. If the client attempts to queue up more buffers, DRV_USART_BufferAddWrite will not accept the request and will generate an invalid buffer handle (DRV_USART_BUFFER_HANDLE_INVALID).

Remarks

This constant is automatically generated by MHC and its value is set to the value specified in USART Driver Transmit Queue Size field.

Building the Library

This section lists the files that are available in the USART Driver Library.

Description

This section list the files that are available in the \src folder of the USART Driver. It lists which files need to be included in the build based on either a hardware feature present on the board or configuration option selected by the system.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/usart`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/drv_usart.h`	This file should be included by any .c file which accesses the USART Driver API. This one file contains the prototypes for all driver API.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/src/dynamic/drv_usart.c`	This file should always be included in the project when using the USART Driver.
`/src/dynamic/drv_usart_dma.c`	This file should always be included in the project when using the USART driver with DMA.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
`/src/dynamic/drv_usart_byte_model.c`	This file should be included in the project if the USART Driver Byte Model API is required.
`/src/dynamic/drv_usart_buffer_queue.c`	This file should be included in the project if the USART Driver Buffer Queue Model API (without DMA) is required.

/src/dynamic/drv_usart_read_write.c	This file should be included in the project if the USART Driver Read Write Model API is required.
/src/dynamic/drv_usart_buffer_queue_dma.c	This file should be included in the project if the USART Driver Buffer Queue Model API with DMA is required.

Module Dependencies

The USART Driver Library depends on the following modules:

- Interrupt System Service Library
- DMA System Service Library (if USART Driver is configured to use DMA)

Library Interface

a) System Functions

	Name	Description
	DRV_USART_Initialize	Initializes the USART instance for the specified driver index. **Implementation:** Static/Dynamic
	DRV_USART_Deinitialize	Deinitializes the specified instance of the USART driver module. **Implementation:** Static/Dynamic
	DRV_USART_Status	Gets the current status of the USART driver module. **Implementation:** Static/Dynamic
	DRV_USART_TasksReceive	Maintains the driver's receive state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_USART_TasksTransmit	Maintains the driver's transmit state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_USART_TasksError	Maintains the driver's error state machine and implements its ISR. **Implementation:** Static/Dynamic

b) Core Client Functions

	Name	Description
	DRV_USART_Open	Opens the specified USART driver instance and returns a handle to it. **Implementation:** Static/Dynamic
	DRV_USART_Close	Closes an opened-instance of the USART driver. **Implementation:** Static/Dynamic
	DRV_USART_ClientStatus	Gets the current client-specific status the USART driver. **Implementation:** Static/Dynamic
	DRV_USART_ErrorGet	This function returns the error(if any) associated with the last client request. **Implementation:** Static/Dynamic

c) Communication Management Client Functions

	Name	Description
	DRV_USART_BaudSet	This function changes the USART module baud to the specified value. **Implementation:** Static/Dynamic
	DRV_USART_LineControlSet	This function changes the USART module line control to the specified value. **Implementation:** Static/Dynamic

d) Buffer Queue Read/Write Client Functions

	Name	Description
	DRV_USART_BufferAddRead	Schedule a non-blocking driver read operation. **Implementation:** Static/Dynamic
	DRV_USART_BufferAddWrite	Schedule a non-blocking driver write operation. **Implementation:** Static/Dynamic
	DRV_USART_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. **Implementation:** Static/Dynamic
	DRV_USART_BufferProcessedSizeGet	This API will be deprecated and not recommended to use. Use DRV_USART_BufferCompletedBytesGet to get the number of bytes processed for the specified buffer.

	DRV_USART_AddressedBufferAddWrite	Schedule a non-blocking addressed driver write operation. **Implementation:** Dynamic
	DRV_USART_BufferCompletedBytesGet	Returns the number of bytes that have been processed for the specified buffer. **Implementation:** Static/Dynamic
	DRV_USART_BufferRemove	Removes a requested buffer from the queue. **Implementation:** Static/Dynamic

e) File I/O Type Read/Write Functions

	Name	Description
	DRV_USART_Read	Reads data from the USART. **Implementation:** Static/Dynamic
	DRV_USART_Write	Writes data to the USART. **Implementation:** Static/Dynamic

f) Byte Transfer Functions

	Name	Description
	DRV_USART_ReadByte	Reads a byte of data from the USART. **Implementation:** Static/Dynamic
	DRV_USART_WriteByte	Writes a byte of data to the USART. **Implementation:** Static/Dynamic
	DRV_USART_TransmitBufferSizeGet	Returns the size of the transmit buffer. **Implementation:** Static/Dynamic
	DRV_USART_ReceiverBufferSizeGet	Returns the size of the receive buffer. **Implementation:** Static/Dynamic
	DRV_USART_TransferStatus	Returns the transmitter and receiver transfer status. **Implementation:** Static/Dynamic
	DRV_USART_TransmitBufferIsFull	Provides the status of the driver's transmit buffer. **Implementation:** Static/Dynamic
	DRV_USART_ReceiverBufferIsEmpty	Provides the status of the driver's receive buffer. **Implementation:** Static/Dynamic
	DRV_USART_ByteErrorCallbackSet	Registers callback to handle for byte error events.
	DRV_USART_ByteReceiveCallbackSet	Registers receive callback function for byte receive event.
	DRV_USART_ByteTransmitCallbackSet	Registers a callback function for byte transmit event.

Description

This section describes the functions of the USART Driver Library.

Refer to each section for a detailed description.

a) System Functions

DRV_USART_Initialize Function

Initializes the USART instance for the specified driver index.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
SYS_MODULE_OBJ DRV_USART_Initialize(const SYS_MODULE_INDEX index, const SYS_MODULE_INIT * const init);
```

Returns

If successful, returns a valid handle to a driver instance object. Otherwise, returns SYS_MODULE_OBJ_INVALID.

Description

This routine initializes the USART driver instance for the specified driver index, making it ready for clients to open and use it. The initialization data is specified by the init parameter. The initialization may fail if the number of driver objects allocated are insufficient or if the specified driver instance is already initialized. The driver instance index is independent of the USART module ID. For example, driver instance 0 can be assigned to

USART2. If the driver is built statically, then some of the initialization parameters are overridden by configuration macros. Refer to the description of the DRV_USART_INIT data structure for more details on which members on this data structure are overridden.

Remarks

This routine must be called before any other USART routine is called.

This routine should only be called once during system initialization unless DRV_USART_Deinitialize is called to deinitialize the driver instance. This routine will NEVER block for hardware access.

Preconditions

None.

Example

```
// The following code snippet shows an example USART driver initialization.
// The driver is initialized for normal mode and a baud of 300. The
// receive queue size is set to 2 and transmit queue size is set to 3.

DRV_USART_INIT              usartInit;
SYS_MODULE_OBJ              objectHandle;

usartInit.baud  = 300;
usartInit.mode  = DRV_USART_OPERATION_MODE_NORMAL;
usartInit.flags = DRV_USART_INIT_FLAG_NONE;
usartInit.usartID   = USART_ID_2;
usartInit.brgClock  = 80000000;
usartInit.handshake = DRV_USART_HANDSHAKE_NONE;
usartInit.lineControl       = DRV_USART_LINE_CONTROL_8NONE1;
usartInit.interruptError    = INT_SOURCE_USART_2_ERROR;
usartInit.interruptReceive  = INT_SOURCE_USART_2_RECEIVE;
usartInit.queueSizeReceive  = 2;
usartInit.queueSizeTransmit = 3;
usartInit.interruptTransmit = INT_SOURCE_USART_2_TRANSMIT;
usartInit.moduleInit.value  = SYS_MODULE_POWER_RUN_FULL;

objectHandle = DRV_USART_Initialize(DRV_USART_INDEX_1, (SYS_MODULE_INIT*)&usartInitData);
if (SYS_MODULE_OBJ_INVALID == objectHandle)
{
    // Handle error
}
```

Parameters

Parameters	Description
index	Identifier for the instance to be initialized
init	Pointer to a data structure containing any data necessary to initialize the driver.

Function

SYS_MODULE_OBJ DRV_USART_Initialize

(

const SYS_MODULE_INDEX index,

const SYS_MODULE_INIT * const init

)

DRV_USART_Deinitialize Function

Deinitializes the specified instance of the USART driver module.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_Deinitialize(SYS_MODULE_OBJ object);
```

Returns

None.

Description

Deinitializes the specified instance of the USART driver module, disabling its operation (and any hardware). Invalidates all the internal data.

Remarks

Once the Initialize operation has been called, the Deinitialize operation must be called before the Initialize operation can be called again. This routine will NEVER block waiting for hardware.

Preconditions

Function DRV_USART_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     //  Returned from DRV_USART_Initialize
SYS_STATUS          status;

DRV_USART_Deinitialize(object);

status = DRV_USART_Status(object);
if (SYS_MODULE_DEINITIALIZED != status)
{
    // Check again later if you need to know
    // when the driver is deinitialized.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USART_Initialize routine

Function

void DRV_USART_Deinitialize(SYS_MODULE_OBJ object)

DRV_USART_Status Function

Gets the current status of the USART driver module.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
SYS_STATUS DRV_USART_Status(SYS_MODULE_OBJ object);
```

Returns

SYS_STATUS_READY - Indicates that the driver is busy with a previous system level operation and cannot start another

SYS_STATUS_DEINITIALIZED - Indicates that the driver has been deinitialized

Description

This routine provides the current status of the USART driver module.

Remarks

A driver can opened only when its status is SYS_STATUS_READY.

Preconditions

Function DRV_USART_Initialize should have been called before calling this function.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USART_Initialize
SYS_STATUS          usartStatus;

usartStatus = DRV_USART _Status(object);
```

```
if (SYS_STATUS_READY == usartStatus)
{
    // This means the driver can be opened using the
    // DRV_USART_Open() function.
}
```

Parameters

Parameters	Description
object	Driver object handle, returned from the DRV_USART_Initialize routine

Function

SYS_STATUS DRV_USART_Status(SYS_MODULE_OBJ object)

DRV_USART_TasksReceive Function

Maintains the driver's receive state machine and implements its ISR.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_TasksReceive(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal receive state machine and implement its receive ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks function. In interrupt mode, this function should be called in the receive interrupt service routine of the USART that is associated with this USART driver hardware instance.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USART_Initialize

while (true)
{
    DRV_USART_TasksReceive (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USART_Initialize)

Function

void DRV_USART_TasksReceive (SYS_MODULE_OBJ object);

DRV_USART_TasksTransmit Function

Maintains the driver's transmit state machine and implements its ISR.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_TasksTransmit(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal transmit state machine and implement its transmit ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks function. In interrupt mode, this function should be called in the transmit interrupt service routine of the USART that is associated with this USART driver hardware instance.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USART_Initialize

while (true)
{
    DRV_USART_TasksTransmit (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USART_Initialize)

Function

void DRV_USART_TasksTransmit (SYS_MODULE_OBJ object);

DRV_USART_TasksError Function

Maintains the driver's error state machine and implements its ISR.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_TasksError(SYS_MODULE_OBJ object);
```

Returns

None.

Description

This routine is used to maintain the driver's internal error state machine and implement its error ISR for interrupt-driven implementations. In polling mode, this function should be called from the SYS_Tasks function. In interrupt mode, this function should be called in the error interrupt service routine of the USART that is associated with this USART driver hardware instance.

Remarks

This routine is normally not called directly by an application. It is called by the system's Tasks routine (SYS_Tasks) or by the appropriate raw ISR.

This routine may execute in an ISR context and will never block or access any resources that may cause it to block.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
SYS_MODULE_OBJ      object;     // Returned from DRV_USART_Initialize

while (true)
{
    DRV_USART_TasksError (object);

    // Do other tasks
}
```

Parameters

Parameters	Description
object	Object handle for the specified driver instance (returned from DRV_USART_Initialize)

Function

void DRV_USART_TasksError (SYS_MODULE_OBJ object);

b) Core Client Functions

DRV_USART_Open Function

Opens the specified USART driver instance and returns a handle to it.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_HANDLE DRV_USART_Open(const SYS_MODULE_INDEX index, const DRV_IO_INTENT ioIntent);
```

Returns

If successful, the routine returns a valid open-instance handle (a number identifying both the caller and the module instance).

If an error occurs, the return value is DRV_HANDLE_INVALID. Error can occur

- if the number of client objects allocated via DRV_USART_CLIENTS_NUMBER is insufficient.
- if the client is trying to open the driver but driver has been opened exclusively by another client.
- if the driver hardware instance being opened is not initialized or is invalid.
- if the client is trying to open the driver exclusively, but has already been opened in a non exclusive mode by another client.
- if the driver is not ready to be opened, typically when the initialize routine has not completed execution.

Description

This routine opens the specified USART driver instance and provides a handle that must be provided to all other client-level operations to identify the caller and the instance of the driver. The ioIntent parameter defines how the client interacts with this driver instance.

The DRV_IO_INTENT_BLOCKING and DRV_IO_INTENT_NONBLOCKING ioIntent options additionally affect the behavior of the DRV_USART_Read and DRV_USART_Write functions. If the ioIntent is DRV_IO_INTENT_NONBLOCKING, then these function will not block even if the required amount of data could not be processed. If the ioIntent is DRV_IO_INTENT_BLOCKING, these functions will block until the required amount of data is processed. If the driver is configured for polling and bare-metal operation, it will not support DRV_IO_INTENT_BLOCKING. The driver will operation will always be non-blocking.

If ioIntent is DRV_IO_INTENT_READ, the client will only be able to read from the driver. If ioIntent is DRV_IO_INTENT_WRITE, the client will only be able to write to the driver. If the ioIntent is DRV_IO_INTENT_READWRITE, the client will be able to do both, read and write.

Specifying a DRV_IO_INTENT_EXCLUSIVE will cause the driver to provide exclusive access to this client. The driver cannot be opened by any other client.

Remarks

The handle returned is valid until the DRV_USART_Close routine is called. This routine will NEVER block waiting for hardware.If the requested intent flags are not supported, the routine will return DRV_HANDLE_INVALID. This function is thread safe in a RTOS application.

Preconditions

Function DRV_USART_Initialize must have been called before calling this function.

Example

```
DRV_HANDLE handle;

handle = DRV_USART_Open(DRV_USART_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
if (DRV_HANDLE_INVALID == handle)
{
    // Unable to open the driver
    // May be the driver is not initialized or the initialization
    // is not complete.
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
intent	Zero or more of the values from the enumeration DRV_IO_INTENT "ORed" together to indicate the intended use of the driver. See function description for details.

Function

DRV_HANDLE DRV_USART_Open
(
const SYS_MODULE_INDEX index,
const DRV_IO_INTENT ioIntent
)

DRV_USART_Close Function

Closes an opened-instance of the USART driver.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_Close(const DRV_HANDLE handle);
```

Returns

None.

Description

This routine closes an opened-instance of the USART driver, invalidating the handle. Any buffers in the driver queue that were submitted by this client will be removed. After calling this routine, the handle passed in "handle" must not be used with any of the remaining driver routines (with one possible exception described in the "Remarks" section). A new handle must be obtained by calling DRV_USART_Open before the caller may use the driver again

Remarks

Usually there is no need for the client to verify that the Close operation has completed. The driver will abort any ongoing operations when this routine is called. However, if it requires additional time to do so in a non-blocking environment, it will still return from the Close operation but the handle is now a zombie handle. The client can only call the DRV_USART_ClientStatus on a zombie handle to track the completion of the Close operation. The DRV_USART_ClientStatus routine will return DRV_CLIENT_STATUS_CLOSED when the close operation has completed.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE handle;  // Returned from DRV_USART_Open

DRV_USART_Close(handle);
```

```
// After this point, the handle cannot be used with any other function
// except the DRV_USART_ClientStatus function, which can be used to query
// the success status of the DRV_USART_Close function.

while(DRV_USART_CLIENT_STATUS_CLOSED != DRV_USART_ClientStatus(handle));
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

void DRV_USART_Close(DRV_Handle handle)

DRV_USART_ClientStatus Function

Gets the current client-specific status the USART driver.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_CLIENT_STATUS DRV_USART_ClientStatus(DRV_HANDLE handle);
```

Returns

A DRV_USART_CLIENT_STATUS value describing the current status of the driver.

Description

This function gets the client-specific status of the USART driver associated with the given handle. This function can be used to check the status of client after the DRV_USART_Close() function has been called.

Remarks

This function will not block for hardware access and will immediately return the current status. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize function must have been called.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE              handle;  // Returned from DRV_USART_Open
DRV_USART_CLIENT_STATUS   status;

status = DRV_USART_ClientStatus(handle);
if( DRV_USART_CLIENT_STATUS_CLOSED != status )
{
    // The client had not closed.
}
```

Parameters

Parameters	Description
handle	Handle returned from the driver's open function.

Function

DRV_USART_CLIENT_STATUS DRV_USART_ClientStatus(DRV_HANDLE handle)

DRV_USART_ErrorGet Function

This function returns the error(if any) associated with the last client request.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_ERROR DRV_USART_ErrorGet(const DRV_HANDLE client);
```

Returns

A DRV_USART_ERROR type indicating last known error status.

Description

This function returns the error(if any) associated with the last client request. DRV_USART_Read and DRV_USART_Write will update the client error status when these functions return DRV_USART_TRANSFER_ERROR. If the driver send a DRV_USART_BUFFER_EVENT_ERROR to the client, the client can call this function to know the error cause. The error status will be updated on every operation and should be read frequently (ideally immediately after the driver operation has completed) to know the relevant error status.

Remarks

It is the client's responsibility to make sure that the error status is obtained frequently. The driver will update the client error status regardless of whether this has been examined by the client. This function is thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_USART_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver. This is done once.

DRV_USART_BufferEventHandlerSet( myUSARTHandle, APP_USARTBufferEventHandle,
                                 (uintptr_t)&myAppObj );

bufferHandle = DRV_USART_BufferAddRead( myUSARThandle,
                                        myBuffer, MY_BUFFER_SIZE );

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler( DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle )
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;
    size_t processedBytes;

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_ERROR:
```

```
            // Error handling here.
            // We can find out how many bytes were processed in this
            // buffer before the error occurred. We can also find
            // the error cause.

            processedBytes = DRV_USART_BufferCompletedBytesGet(bufferHandle);
            if(DRV_USART_ERROR_RECEIVE_OVERRUN == DRV_USART_ErrorGet(myUSARTHandle))
            {
                // There was an receive over flow error.
                // Do error handling here.
            }

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
bufferhandle	Handle of the buffer of which the processed number of bytes to be obtained.

Function

DRV_USART_ERROR DRV_USART_ErrorGet(DRV_HANDLE client);

c) Communication Management Client Functions

DRV_USART_BaudSet Function

This function changes the USART module baud to the specified value.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_BAUD_SET_RESULT DRV_USART_BaudSet(const DRV_HANDLE client, uint32_t baud);
```

Returns

None.

Description

This function changes the USART module baud to the specified value. Any queued buffer requests will be processed at the updated baud. The USART driver operates at the baud specified in DRV_USART_Initialize function unless the DRV_USART_BaudSet function is called to change the baud.

Remarks

The implementation of this function, in this release of the driver, changes the baud immediately. This may interrupt on-going data transfer. It is recommended that the driver be opened exclusively if this function is to be called. This function is thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

DRV_USART_BaudSet(myUSARTHandle, 9600);
```

Parameters

Parameters	Description
handle	client handle returned by DRV_USART_Open function.
baud	desired baud.

Function

void DRV_USART_BaudSet(DRV_HANDLE client, uint32_t baud);

DRV_USART_LineControlSet Function

This function changes the USART module line control to the specified value.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_LINE_CONTROL_SET_RESULT DRV_USART_LineControlSet(const DRV_HANDLE client, const
DRV_USART_LINE_CONTROL lineControl);
```

Returns

DRV_USART_LINE_CONTROL_SET_SUCCESS if the function was successful. Returns DRV_HANDLE_INVALID if the client handle is not valid.

Description

This function changes the USART module line control parameters to the specified value. Any queued buffer requests will be processed at the updated line control parameters. The USART driver operates at the line control parameters specified in DRV_USART_Initialize function unless the DRV_USART_LineControlSet function is called to change the line control parameters.

Remarks

The implementation of this function, in this release of the driver, changes the line control immediately. This may interrupt on-going data transfer. It is recommended that the driver be opened exclusively if this function is to be called. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

DRV_USART_LineControlSet(myUSARTHandle, DRV_USART_LINE_CONTROL_8NONE1);
```

Parameters

Parameters	Description
handle	client handle returned by DRV_USART_Open function.
lineControl	line control parameters.

Function

void DRV_USART_LineControlSet

(

DRV_HANDLE client,

DRV_USART_LINE_CONTROL lineControl

);

d) Buffer Queue Read/Write Client Functions

DRV_USART_BufferAddRead Function

Schedule a non-blocking driver read operation.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_BufferAddRead(const DRV_HANDLE handle, DRV_USART_BUFFER_HANDLE * const bufferHandle, void *
buffer, const size_t size);
```

Returns

The buffer handle is returned in the bufferHandle argument. This is DRV_USART_BUFFER_HANDLE_INVALID if the request was not successful.

Description

This function schedules a non-blocking read operation. The function returns with a valid buffer handle in the bufferHandle argument if the read request was scheduled successfully. The function adds the request to the hardware instance receive queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. The function returns DRV_USART_BUFFER_HANDLE_INVALID in the bufferHandle argument:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the buffer size is 0
- if the read queue size is full or queue depth is insufficient.
- if the driver handle is invalid

If the requesting client registered an event callback with the driver, the driver will issue a DRV_USART_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully of DRV_USART_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the USART Driver Buffer Event Handler that is registered by the client. It should not be called in the event handler associated with another USART driver instance. It should not be called directly in an ISR.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART device instance and the DRV_USART_Status must have returned SYS_STATUS_READY.

DRV_USART_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_USART_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_USART_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver

DRV_USART_BufferEventHandlerSet(myUSARTHandle,
                APP_USARTBufferEventHandler, (uintptr_t)&myAppObj);

DRV_USART_BufferAddRead(myUSARThandle, &bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler(DRV_USART_BUFFER_EVENT event,
```

```
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the communication channel as returned by the DRV_USART_Open function.
buffer	Buffer where the received data will be stored.
size	Buffer size in bytes.

Function

void DRV_USART_BufferAddRead

(

const DRV_HANDLE handle,

DRV_USART_BUFFER_HANDLE * bufferHandle,

void * buffer,

const size_t size

)

DRV_USART_BufferAddWrite Function

Schedule a non-blocking driver write operation.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_BufferAddWrite(const DRV_HANDLE handle, DRV_USART_BUFFER_HANDLE * bufferHandle, void *
buffer, const size_t size);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_USART_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking write operation. The function returns with a valid buffer handle in the bufferHandle argument if the write request was scheduled successfully. The function adds the request to the hardware instance transmit queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. On returning, the bufferHandle parameter may be DRV_USART_BUFFER_HANDLE_INVALID for the following reasons:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read-only
- if the buffer size is 0

- if the transmit queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_USART_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or a DRV_USART_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the USART Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another USART driver instance. It should not otherwise be called directly in an ISR.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART device instance and the DRV_USART_Status must have returned SYS_STATUS_READY.

DRV_USART_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_USART_Open call.

Example

```
MY_APP_OBJ myAppObj;
uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_USART_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver

DRV_USART_BufferEventHandlerSet(myUSARTHandle,
                APP_USARTBufferEventHandler, (uintptr_t)&myAppObj);

DRV_USART_BufferAddWrite(myUSARThandle, &bufferHandle,
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler(DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	Handle of the communication channel as return by the DRV_USART_Open function.
bufferHandle	Pointer to an argument that will contain the return buffer handle.

buffer	Data to be transmitted.
size	Buffer size in bytes.

Function

void DRV_USART_BufferAddWrite
(
const DRV_HANDLE handle,
DRV_USART_BUFFER_HANDLE * bufferHandle,
void * buffer,
size_t size
);

DRV_USART_BufferEventHandlerSet Function

Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_BufferEventHandlerSet(const DRV_HANDLE handle, const DRV_USART_BUFFER_EVENT_HANDLER
eventHandler, const uintptr_t context);
```

Returns

None.

Description

This function allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. When a client calls either the DRV_USART_BufferAddRead or DRV_USART_BufferAddWrite function, it is provided with a handle identifying the buffer that was added to the driver's buffer queue. The driver will pass this handle back to the client by calling "eventHandler" function when the buffer transfer has completed.

The event handler should be set before the client performs any "buffer add" operations that could generate events. The event handler once set, persists until the client closes the driver or sets another event handler (which could be a "NULL" pointer to indicate no callback).

Remarks

If the client does not want to be notified when the queued buffer transfer has completed, it does not need to register a callback. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_USART_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver. This is done once

DRV_USART_BufferEventHandlerSet( myUSARTHandle, APP_USARTBufferEventHandle,
                                 (uintptr_t)&myAppObj );

DRV_USART_BufferAddRead(myUSARThandle, &bufferHandle
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
```

```
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler(DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE handle, uintptr_t context)
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) context;

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
eventHandler	Pointer to the event handler function.
context	The value of parameter will be passed back to the client unchanged, when the eventHandler function is called. It can be used to identify any client specific data object that identifies the instance of the client module (for example, it may be a pointer to the client module's state structure).

Function

void DRV_USART_BufferEventHandlerSet

(

const DRV_HANDLE handle,

const DRV_USART_BUFFER_EVENT_HANDLER eventHandler,

const uintptr_t context

)

DRV_USART_BufferProcessedSizeGet Function

This API will be deprecated and not recommended to use. Use DRV_USART_BufferCompletedBytesGet to get the number of bytes processed for the specified buffer.

File

drv_usart.h

C

```
size_t DRV_USART_BufferProcessedSizeGet(DRV_USART_BUFFER_HANDLE bufferHandle);
```

Returns

None.

Description

None.

Remarks

None.

Preconditions

None.

Example

None.

Function

size_t DRV_USART_BufferProcessedSizeGet

(

DRV_USART_BUFFER_HANDLE bufferHandle

);

DRV_USART_AddressedBufferAddWrite Function

Schedule a non-blocking addressed driver write operation.

Implementation: Dynamic

File

drv_usart.h

C

```
void DRV_USART_AddressedBufferAddWrite(const DRV_HANDLE hClient, DRV_USART_BUFFER_HANDLE * bufferHandle,
uint8_t address, void * source, size_t nWords);
```

Returns

The bufferHandle parameter will contain the return buffer handle. This will be DRV_USART_BUFFER_HANDLE_INVALID if the function was not successful.

Description

This function schedules a non-blocking addressed write operation. The function returns with a valid buffer handle in the bufferHandle argument if the addressed write request was scheduled successfully. The function adds the request to the hardware instance transmit queue and returns immediately. While the request is in the queue, the application buffer is owned by the driver and should not be modified. On returning, the bufferHandle parameter may be DRV_USART_BUFFER_HANDLE_INVALID for the following reasons:

- if a buffer could not be allocated to the request
- if the input buffer pointer is NULL
- if the client opened the driver for read-only
- if the buffer size is 0
- if the transmit queue is full or the queue depth is insufficient

If the requesting client registered an event callback with the driver, the driver will issue a DRV_USART_BUFFER_EVENT_COMPLETE event if the buffer was processed successfully or a DRV_USART_BUFFER_EVENT_ERROR event if the buffer was not processed successfully.

Remarks

This function is thread safe in a RTOS application. It can be called from within the USART Driver Buffer Event Handler that is registered by this client. It should not be called in the event handler associated with another USART driver instance. It should not otherwise be called directly in an ISR.

The source buffer should be a 16-bit word aligned buffer. The 9th bit of the higher byte 16-bit buffer is used to indicate data/address.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART device instance and the DRV_USART_Status must have returned SYS_STATUS_READY.

DRV_USART_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_USART_Open call.

The operation mode of the driver must be DRV_USART_OPERATION_MODE_ADDRESSED.

Example

```
MY_APP_OBJ myAppObj;
uint16_t mybuffer[MY_BUFFER_SIZE];
DRV_USART_BUFFER_HANDLE bufferHandle;
```

```
uint8_t clientAddress;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver

clientAddress = 0x60;
DRV_USART_BufferEventHandlerSet(myUSARTHandle,
                APP_USARTBufferEventHandler, (uintptr_t)&myAppObj);

DRV_USART_AddressedBufferAddWrite(myUSARThandle, &bufferHandle, clientAddress
                                    myBuffer, MY_BUFFER_SIZE);

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler(DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle)
{
    // contextHandle points to myAppObj.

    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}
```

Parameters

Parameters	Description
hClient	Handle of the communication channel as return by the DRV_USART_Open function.
bufferHandle	Pointer to an argument that will contain the return buffer handle.
address	Address of the receiver client
source	Data to be transmitted.
size	Buffer size in 16-bit words.

Function

void DRV_USART_AddressedBufferAddWrite
(
const DRV_HANDLE hClient,
DRV_USART_BUFFER_HANDLE * bufferHandle,
uint8_t address,
void * source,
size_t nWords
);

DRV_USART_BufferCompletedBytesGet Function

Returns the number of bytes that have been processed for the specified buffer.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
size_t DRV_USART_BufferCompletedBytesGet(DRV_USART_BUFFER_HANDLE bufferHandle);
```

Returns

Returns the number of bytes that have been processed for this buffer.

Returns DRV_USART_BUFFER_HANDLE_INVALID for an invalid or an expired buffer handle.

Description

This function returns number of bytes that have been processed for the specified buffer. The client can use this function, in a case where the buffer has terminated due to an error, to obtain the number of bytes that have been processed. Or in any other use case. This function can be used for non-DMA buffer transfers only. It cannot be used when the USART driver is configured to use DMA.

Remarks

This function is thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Either the DRV_USART_BufferAddRead or DRV_USART_BufferAddWrite function must have been called and a valid buffer handle returned.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_USART_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver. This is done once

DRV_USART_BufferEventHandlerSet( myUSARTHandle, APP_USARTBufferEventHandle,
                                 (uintptr_t)&myAppObj );

bufferHandle = DRV_USART_BufferAddRead( myUSARTHandle,
                                        myBuffer, MY_BUFFER_SIZE );

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler( DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle )
{
    // The context handle was set to an application specific
    // object. It is now retrievable easily in the event handler.
    MY_APP_OBJ myAppObj = (MY_APP_OBJ *) contextHandle;
    size_t processedBytes;

    switch(event)
    {
```

```
            case DRV_USART_BUFFER_EVENT_COMPLETE:

                // This means the data was transferred.
                break;

            case DRV_USART_BUFFER_EVENT_ERROR:

                // Error handling here.
                // We can find out how many bytes were processed in this
                // buffer before the error occurred.

                processedBytes = DRV_USART_BufferCompletedBytesGet(bufferHandle);

                break;

            default:
                break;
        }
    }
```

Parameters

Parameters	Description
bufferhandle	Handle for the buffer of which the processed number of bytes to be obtained.

Function

size_t DRV_USART_BufferCompletedBytesGet
(
DRV_USART_BUFFER_HANDLE bufferHandle
);

DRV_USART_BufferRemove Function

Removes a requested buffer from the queue.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_BUFFER_RESULT DRV_USART_BufferRemove(DRV_USART_BUFFER_HANDLE bufferHandle);
```

Returns

DRV_USART_BUFFER_RESULT_HANDLE_INVALID - Buffer handle is invalid.

DRV_USART_BUFFER_RESULT_HANDLE_EXPIRED - Buffer handle is expired.

DRV_USART_BUFFER_RESULT_REMOVED_SUCCESFULLY - Buffer is removed from the queue successfully.

DRV_USART_BUFFER_RESULT_REMOVAL_FAILED - Failed to remove buffer from the queue because of mutex timeout in RTOS environment.

Description

This function removes a specified buffer from the queue. The client can use this function to delete

1. An unwated stalled buffer.
2. Queued buffers on timeout.

or in any other use case.

Remarks

This function is thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Either the DRV_USART_BufferAddRead or DRV_USART_BufferAddWrite function must have been called and a valid buffer handle returned.

Example

```
// myAppObj is an application specific object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];
DRV_USART_BUFFER_HANDLE bufferHandle;

// myUSARTHandle is the handle returned
// by the DRV_USART_Open function.

// Client registers an event handler with driver. This is done once

DRV_USART_BufferEventHandlerSet( myUSARTHandle, APP_USARTBufferEventHandle,
                                 (uintptr_t)&myAppObj );

bufferHandle = DRV_USART_BufferAddRead( myUSARThandle,
                                        myBuffer, MY_BUFFER_SIZE );

if(DRV_USART_BUFFER_HANDLE_INVALID == bufferHandle)
{
    // Error handling here
}

// Event Processing Technique. Event is received when
// the buffer is processed.

void APP_USARTBufferEventHandler( DRV_USART_BUFFER_EVENT event,
        DRV_USART_BUFFER_HANDLE bufferHandle, uintptr_t contextHandle )
{
    switch(event)
    {
        case DRV_USART_BUFFER_EVENT_COMPLETE:

            // This means the data was transferred.
            break;

        case DRV_USART_BUFFER_EVENT_ERROR:

            // Error handling here.

            break;

        default:
            break;
    }
}

// Timeout function, where remove queued buffer if it still exists.
void APP_TimeOut(void)
{
    DRV_USART_BUFFER_RESULT bufferResult;
    bufferResult = DRV_USART_BufferRemove(bufferHandle);

    if(DRV_USART_BUFFER_RESULT_REMOVED_SUCCESFULLY == bufferResult)
    {
        //Buffer removed succesfully from the queue
    }
    else
    {
        //Either buffer is invalid or expired.
        //Or not able to acquire mutex in RTOS mode.
    }
}
```

Parameters

Parameters	Description
bufferhandle	Handle of the buffer to delete.

Function

DRV_USART_BUFFER_RESULT DRV_USART_BufferRemove(DRV_USART_BUFFER_HANDLE bufferHandle)

e) File I/O Type Read/Write Functions

DRV_USART_Read Function

Reads data from the USART.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
size_t DRV_USART_Read(const DRV_HANDLE handle, void * buffer, const size_t numbytes);
```

Returns

Number of bytes actually copied into the caller's buffer. Returns DRV_USART_READ_ERROR in case of an error.

Description

This routine reads data from the USART. This function is blocking if the driver was opened by the client for blocking operation. This function will not block if the driver was opened by the client for non blocking operation. If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_BLOCKING, this function will only return when (or will block until) numbytes of bytes have been received or if an error occurred. If there are buffers queued for receiving data, these buffers will be serviced first. The function will not return until the requested number of bytes have been read.

If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_NON_BLOCKING, this function will return with the number of bytes that were actually read. The function will not wait until numBytes of bytes have been read. If there are buffer queued for reading data, then the function will not block and will return immediately with 0 bytes read.

Remarks

This function is thread safe in a RTOS application. If the driver is configured for polled operation, this it will not support blocking operation in a bare metal (non-RTOS) application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_READ or DRV_IO_INTENT_READWRITE must have been specified in the DRV_USART_Open call.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
char            myBuffer[MY_BUFFER_SIZE];
unsigned int    count;
unsigned int    total;

total = 0;
do
{
    count  = DRV_USART_Read(myUSARTHandle, &myBuffer[total], MY_BUFFER_SIZE - total);
    if(count == DRV_USART_READ_ERROR)
    {
       // There was an error. The DRV_USART_ErrorGet() function
       // can be called to find the exact error.
    }
    total += count;

    // Do something else...

} while( total < MY_BUFFER_SIZE );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
buffer	Buffer into which the data read from the USART instance will be placed.
numbytes	Total number of bytes that need to be read from the module instance (must be equal to or less than the size of the buffer)

Function

size_t DRV_USART_Read
(
const DRV_HANDLE handle,
void * buffer,
const size_t numbytes
)

DRV_USART_Write Function

Writes data to the USART.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
size_t DRV_USART_Write(const DRV_HANDLE handle, void * buffer, const size_t numbytes);
```

Returns

Number of bytes actually written to the driver. Return DRV_USART_WRITE_ERROR in case of an error.

Description

This routine writes data to the USART. This function is blocking if the driver was opened by the client for blocking operation. This function will not block if the driver was opened by the client for non blocking operation. If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_BLOCKING, this function will only return when (or will block until) numbytes of bytes have been transmitted or if an error occurred. If there are buffers queued for writing, the function will wait until all the preceding buffers are completed. Ongoing buffer transmit operations will not be affected.

If the ioIntent parameter at the time of opening the driver was DRV_IO_INTENT_NON_BLOCKING, this function will return with the number of bytes that were actually accepted for transmission. The function will not wait until numBytes of bytes have been transmitted. If there a buffers queued for transmit, the function will not wait and will return immediately with 0 bytes.

Remarks

This function is thread safe in a RTOS application. This function is thread safe in a RTOS application. If the driver is configured for polled operation, this it will not support blocking operation in a bare metal (non-RTOS) application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

DRV_IO_INTENT_WRITE or DRV_IO_INTENT_READWRITE must have been specified in the DRV_USART_Open call.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
char            myBuffer[MY_BUFFER_SIZE];
int    count;
unsigned int    total;

total = 0;
do
{
    count  = DRV_USART_Write(myUSARTHandle, &myBuffer[total],
                                            MY_BUFFER_SIZE - total);
    total += count;
```

```
    // Do something else...

} while( total < MY_BUFFER_SIZE );
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
buffer	Buffer containing the data to written.
numbytes	size of the buffer

Function

size_t DRV_USART_Write
(
const DRV_HANDLE handle,
void * buffer,
const size_t numbytes
)

f) Byte Transfer Functions

DRV_USART_ReadByte Function

Reads a byte of data from the USART.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
uint8_t DRV_USART_ReadByte(const DRV_HANDLE handle);
```

Returns

A data byte received by the driver.

Description

This routine reads a byte of data from the USART.

Remarks

This function is thread safe when called in a RTOS application. Note that DRV_USART_WriteByte and DRV_USART_ReadByte function cannot co-exist with DRV_USART_BufferAddRead, DRV_USART_BufferAddWrite, DRV_USART_Read and DRV_USART_Write functions in a application. Calling the DRV_USART_ReadByte and DRV_USART_WriteByte functions will disrupt the processing of any queued buffers.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

The transfer status should be checked to see if the receiver is not empty before calling this function.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
char            myBuffer[MY_BUFFER_SIZE];
unsigned int    numBytes;

numBytes = 0;
do
{
    if( DRV_USART_TRANSFER_STATUS_RECEIVER_DATA_PRESENT & DRV_USART_TransferStatus(myUSARTHandle) )
    {
        myBuffer[numBytes++] = DRV_USART_ReadByte(myUSARTHandle);
    }

    // Do something else...
```

```
} while( numBytes < MY_BUFFER_SIZE);
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

uint8_t DRV_USART_ReadByte(const DRV_HANDLE handle)

DRV_USART_WriteByte Function

Writes a byte of data to the USART.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
void DRV_USART_WriteByte(const DRV_HANDLE handle, const uint8_t byte);
```

Returns

None.

Description

This routine writes a byte of data to the USART.

Remarks

This function is thread safe when called in a RTOS application. Note that DRV_USART_WriteByte and DRV_USART_ReadByte function cannot co-exist with DRV_USART_BufferAddRead, DRV_USART_BufferAddWrite, DRV_USART_Read and DRV_USART_Write functions in a application. Calling the DRV_USART_ReadByte and DRV_USART_WriteByte function will disrupt the processing of any queued buffers.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

The transfer status should be checked to see if transmitter is not full before calling this function.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
char            myBuffer[MY_BUFFER_SIZE];
unsigned int    numBytes;

// Preinitialize myBuffer with MY_BUFFER_SIZE bytes of valid data.

numBytes = 0;
while( numBytes < MY_BUFFER_SIZE );
{
    if( !(DRV_USART_TRANSFER_STATUS_TRANSMIT_FULL & DRV_USART_TransferStatus(myUSARTHandle)) )
    {
        DRV_USART_WriteByte(myUSARTHandle, myBuffer[numBytes++]);
    }

    // Do something else...
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine
byte	Data byte to write to the USART

Function

void DRV_USART_WriteByte(const DRV_HANDLE handle, const uint8_t byte)

DRV_USART_TransmitBufferSizeGet Function

Returns the size of the transmit buffer.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
unsigned int DRV_USART_TransmitBufferSizeGet(const DRV_HANDLE handle);
```

Returns

Size of the driver's transmit buffer, in bytes.

Description

This routine returns the size of the transmit buffer and can be used by the application to determine the number of bytes to write with the DRV_USART_WriteByte function.

Remarks

Does not account for client queued buffers. This function is thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
const uint8_t   writeBuffer[5];
unsigned int    size, numBytes = 0;
unsigned int    writeBufferLen = sizeof(writeBuffer);

size     = DRV_USART_TransmitBufferSizeGet (myUSARTHandle);

// Do something based on the transmitter buffer size
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

unsigned int DRV_USART_TransmitBufferSizeGet (const DRV_HANDLE handle)

DRV_USART_ReceiverBufferSizeGet Function

Returns the size of the receive buffer.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
unsigned int DRV_USART_ReceiverBufferSizeGet(const DRV_HANDLE handle);
```

Returns

Size of the driver's receive buffer, in bytes.

Description

This routine returns the size of the receive buffer.

Remarks

Does not account for client queued buffers. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
const uint8_t   readBuffer[5];
unsigned int    size, numBytes = 0;
unsigned int    readbufferLen = sizeof(readBuffer);

size     = DRV_USART_ReceiverBufferSizeGet(myUSARTHandle);

// Do something based on the receiver buffer size
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

unsigned int DRV_USART_ReceiverBufferSizeGet(const DRV_HANDLE handle)

DRV_USART_TransferStatus Function

Returns the transmitter and receiver transfer status.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
DRV_USART_TRANSFER_STATUS DRV_USART_TransferStatus(const DRV_HANDLE handle);
```

Returns

A DRV_USART_TRANSFER_STATUS value describing the current status of the transfer.

Description

This returns the transmitter and receiver transfer status.

Remarks

The returned status may contain a value with more than one of the bits specified in the DRV_USART_TRANSFER_STATUS enumeration set. The caller should perform an "AND" with the bit of interest and verify if the result is non-zero (as shown in the example) to verify the desired status bit. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open

if (DRV_USART_TRANSFER_STATUS_RECEIVER_DATA_PRESENT & DRV_USART_TransferStatus(myUSARTHandle))
{
    // Data has been received that can be read
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

DRV_USART_TRANSFER_STATUS DRV_USART_TransferStatus(const DRV_HANDLE handle)

DRV_USART_TransmitBufferIsFull Function

Provides the status of the driver's transmit buffer.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
bool DRV_USART_TransmitBufferIsFull(const DRV_HANDLE handle);
```

Returns

true - if the transmit buffer is full

false - if the transmit buffer is not full

Description

This routine identifies if the driver's transmit buffer is full or not. This function can be used in conjunction with the DRV_USART_Write and DRV_USART_WriteByte functions.

Remarks

Does not account for client queued buffers. This function is thread safe when called in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE      myUSARTHandle;    // Returned from DRV_USART_Open
unsigned int    numBytes;
int             bytesToWrite;
const uint8_t   writeBuffer[35] = "1234567890ABCDEFGHIJKLMNOPn" ;
int             writebufferLen = strlen((char *)writeBuffer);

numBytes = 0;
while( numBytes < writebufferLen )
{
    if (DRV_USART_TransmitBufferisFull())
    {
        // Do something else until there is some room in the driver's Transmit buffer.
    }
    else
    {
        DRV_USART_WriteByte(myUSARTHandle, writeBuffer[numBytes++]);
    }
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

bool DRV_USART_TransmitBufferIsFull(const DRV_HANDLE handle)

DRV_USART_ReceiverBufferIsEmpty Function

Provides the status of the driver's receive buffer.

Implementation: Static/Dynamic

File

drv_usart.h

C

```
bool DRV_USART_ReceiverBufferIsEmpty(const DRV_HANDLE handle);
```

Returns

true - if the driver's receive buffer is empty

false - if the driver's receive buffer is not empty

Description

This routine indicates if the driver's receiver buffer is empty. This function can be used in conjunction with the DRV_USART_Read and DRV_USART_ReadByte functions.

Remarks

Does not account for client queued buffers. This function is safe thread safe when used in a RTOS application.

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

DRV_USART_Open must have been called to obtain a valid opened device handle.

Example

```
DRV_HANDLE               myUSARTHandle;    // Returned from DRV_USART_Open
char                     myBuffer[MY_BUFFER_SIZE];
unsigned int             numBytes;

numBytes = 0;
while( numBytes < MY_BUFFER_SIZE );
{
    if ( !DRV_USART_ReceiverBufferIsEmpty(myUSARTHandle) )
    {
        if( numBytes < MY_BUFFER_SIZE )
        {
            myBuffer[numBytes++] = DRV_USART_ReadByte (myUSARTHandle);
        }
        else
        {
            break;
        }
    }

    // Do something else while more data is received.
}
```

Parameters

Parameters	Description
handle	A valid open-instance handle, returned from the driver's open routine

Function

bool DRV_USART_ReceiverBufferIsEmpty(const DRV_HANDLE handle)

DRV_USART_ByteErrorCallbackSet Function

Registers callback to handle for byte error events.

File

drv_usart.h

C

```
void DRV_USART_ByteErrorCallbackSet(const SYS_MODULE_INDEX index, const DRV_USART_BYTE_EVENT_HANDLER
eventHandler);
```

Returns

None.

Description

This function allows a callback function to be registered with the driver to handle the error events occurring in the transmit/receive path during byte transfers.

The callback function should be registered as part of the initialization. The callback functionality is available only in the interrupt mode of operation. The driver clears the interrupt after invoking the callback function.

Remarks

None

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];

// myUSARTHandle is the handle returned by the DRV_USART_Open function.
myUSARTHandle = DRV_USART_Open(DRV_USART_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
                                (uintptr_t)&myAppObj );

// Register an event handler with driver. This is done once
DRV_USART_ByteErrorCallbackSet (DRV_USART_INDEX_0, APP_USARTErrorEventHandler);

// Event Processing Technique.
void APP_USARTErrorEventHandler(const SYS_MODULE_INDEX index)
{
    // Error has occurred. Handle the event.
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
eventHandler	Pointer to the event handler function.

Function

void DRV_USART_ByteErrorCallbackSet

(

const SYS_MODULE_INDEX index,

const DRV_USART_BYTE_EVENT_HANDLER eventHandler

)

DRV_USART_ByteReceiveCallbackSet Function

Registers receive callback function for byte receive event.

File

drv_usart.h

C

```
void DRV_USART_ByteReceiveCallbackSet(const SYS_MODULE_INDEX index, const DRV_USART_BYTE_EVENT_HANDLER
eventHandler);
```

Returns

None.

Description

This function allows a receive callback function to be registered with the driver. The callback function is invoked when a byte has been received. The received byte can then be read using DRV_USART_ReadByte() function.

The callback function should be registered with the driver as part of the initialization. The callback functionality is available only in the interrupt mode of operation. The driver clears the interrupt after invoking the callback function.

Remarks

None

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];

// myUSARTHandle is the handle returned by the DRV_USART_Open function.
myUSARTHandle = DRV_USART_Open(DRV_USART_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
                                (uintptr_t)&myAppObj );

// Register an event handler with driver. This is done once
DRV_USART_ByteReceiveCallbackSet(DRV_USART_INDEX_0, APP_USARTReceiveEventHandler);

// Event Processing Technique. Event is received when
// a byte is received.

void APP_USARTReceiveEventHandler(const SYS_MODULE_INDEX index)
{
    // Byte has been Received. Handle the event.
    // Read byte using DRV_USART_ReadByte ()
    // DRV_USART_ReceiverBufferIsEmpty() function can be used to
    // check if the receiver buffer is empty.
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
eventHandler	Pointer to the event handler function.

Function

void DRV_USART_ByteReceiveCallbackSet

(

const SYS_MODULE_INDEX index,

const DRV_USART_BYTE_EVENT_HANDLER eventHandler

)

DRV_USART_ByteTransmitCallbackSet Function

Registers a callback function for byte transmit event.

File

drv_usart.h

C

```
void DRV_USART_ByteTransmitCallbackSet(const SYS_MODULE_INDEX index, const DRV_USART_BYTE_EVENT_HANDLER
eventHandler);
```

Returns

None.

Description

This function allows a transmit callback function to be registered with the driver. The callback function is invoked when a byte has been transmitted using DRV_USART_WriteByte () function.

The callback function should be registered with the driver prior to any writes to the driver. The callback functionality is available only in the interrupt mode of operation. The driver clears the interrupt after invoking the callback function.

Remarks

None

Preconditions

The DRV_USART_Initialize routine must have been called for the specified USART driver instance.

Example

```
// myAppObj is an application specific state data object.
MY_APP_OBJ myAppObj;

uint8_t mybuffer[MY_BUFFER_SIZE];

// myUSARTHandle is the handle returned by the DRV_USART_Open function.
myUSARTHandle = DRV_USART_Open(DRV_USART_INDEX_0, DRV_IO_INTENT_EXCLUSIVE);
                                (uintptr_t)&myAppObj );

// Register an event handler with driver. This is done once
DRV_USART_ByteTransmitCallbackSet (DRV_USART_INDEX_0, APP_USARTTransmitEventHandler);

DRV_USART_WriteByte (myUSARThandle, myBuffer[0]);

// Event Processing Technique. Event is received when
// the byte is transmitted.

void APP_USARTTransmitEventHandler (const SYS_MODULE_INDEX index)
{
    // Byte has been transmitted. Handle the event.
}
```

Parameters

Parameters	Description
index	Identifier for the object instance to be opened
eventHandler	Pointer to the event handler function.

Function

void DRV_USART_ByteTransmitCallbackSet

(

const SYS_MODULE_INDEX index,

const DRV_USART_BYTE_EVENT_HANDLER eventHandler

)

Functions

	Name	Description
	DRV_USART_AddressedBufferAddWrite	Schedule a non-blocking addressed driver write operation. **Implementation:** Dynamic

	DRV_USART_BaudSet	This function changes the USART module baud to the specified value. **Implementation:** Static/Dynamic
	DRV_USART_BufferAddRead	Schedule a non-blocking driver read operation. **Implementation:** Static/Dynamic
	DRV_USART_BufferAddWrite	Schedule a non-blocking driver write operation. **Implementation:** Static/Dynamic
	DRV_USART_BufferCompletedBytesGet	Returns the number of bytes that have been processed for the specified buffer. **Implementation:** Static/Dynamic
	DRV_USART_BufferEventHandlerSet	Allows a client to identify a buffer event handling function for the driver to call back when queued buffer transfers have finished. **Implementation:** Static/Dynamic
	DRV_USART_BufferProcessedSizeGet	This API will be deprecated and not recommended to use. Use DRV_USART_BufferCompletedBytesGet to get the number of bytes processed for the specified buffer.
	DRV_USART_BufferRemove	Removes a requested buffer from the queue. **Implementation:** Static/Dynamic
	DRV_USART_ByteErrorCallbackSet	Registers callback to handle for byte error events.
	DRV_USART_ByteReceiveCallbackSet	Registers receive callback function for byte receive event.
	DRV_USART_ByteTransmitCallbackSet	Registers a callback function for byte transmit event.
	DRV_USART_ClientStatus	Gets the current client-specific status the USART driver. **Implementation:** Static/Dynamic
	DRV_USART_Close	Closes an opened-instance of the USART driver. **Implementation:** Static/Dynamic
	DRV_USART_Deinitialize	Deinitializes the specified instance of the USART driver module. **Implementation:** Static/Dynamic
	DRV_USART_ErrorGet	This function returns the error(if any) associated with the last client request. **Implementation:** Static/Dynamic
	DRV_USART_Initialize	Initializes the USART instance for the specified driver index. **Implementation:** Static/Dynamic
	DRV_USART_LineControlSet	This function changes the USART module line control to the specified value. **Implementation:** Static/Dynamic
	DRV_USART_Open	Opens the specified USART driver instance and returns a handle to it. **Implementation:** Static/Dynamic
	DRV_USART_Read	Reads data from the USART. **Implementation:** Static/Dynamic
	DRV_USART_ReadByte	Reads a byte of data from the USART. **Implementation:** Static/Dynamic
	DRV_USART_ReceiverBufferIsEmpty	Provides the status of the driver's receive buffer. **Implementation:** Static/Dynamic
	DRV_USART_ReceiverBufferSizeGet	Returns the size of the receive buffer. **Implementation:** Static/Dynamic
	DRV_USART_Status	Gets the current status of the USART driver module. **Implementation:** Static/Dynamic
	DRV_USART_TasksError	Maintains the driver's error state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_USART_TasksReceive	Maintains the driver's receive state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_USART_TasksTransmit	Maintains the driver's transmit state machine and implements its ISR. **Implementation:** Static/Dynamic
	DRV_USART_TransferStatus	Returns the transmitter and receiver transfer status. **Implementation:** Static/Dynamic
	DRV_USART_TransmitBufferIsFull	Provides the status of the driver's transmit buffer. **Implementation:** Static/Dynamic
	DRV_USART_TransmitBufferSizeGet	Returns the size of the transmit buffer. **Implementation:** Static/Dynamic
	DRV_USART_Write	Writes data to the USART. **Implementation:** Static/Dynamic
	DRV_USART_WriteByte	Writes a byte of data to the USART. **Implementation:** Static/Dynamic

Description

USART Driver Interface Header File

The USART device driver provides a simple interface to manage the USART or UART modules on Microchip microcontrollers. This file provides the interface definition for the USART driver.

File Name

drv_usart.h

Company

Microchip Technology Inc.

drv_usart_config_template.h

USART Driver Configuration Template.

Macros

	Name	Description
	DRV_USART_BAUD_RATE_IDXn	Specifies the USART Baud at which the USART driver is initialized.
	DRV_USART_BUFFER_QUEUE_SUPPORT	Specifies if the Buffer Queue support should be enabled.
	DRV_USART_BYTE_MODEL_BLOCKING	Enables or Disables DRV_USART_ByteWrite function blocking behavior.
	DRV_USART_BYTE_MODEL_CALLBACK	Enables or Disables Callback Feature of the Byte Transfer Model.
	DRV_USART_BYTE_MODEL_SUPPORT	Specifies if the Byte Model support should be enabled.
	DRV_USART_CLIENTS_NUMBER	Sets up the maximum number of clients that can be connected to any hardware instance.
	DRV_USART_INDEX	USART Static Index selection.
	DRV_USART_INSTANCES_NUMBER	Sets up the maximum number of hardware instances that can be supported.
	DRV_USART_INTERRUPT_MODE	Macro controls interrupt based operation of the driver.
	DRV_USART_INTERRUPT_SOURCE_ERROR	Defines the error interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_RECEIVE	Defines the Receive interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_RECEIVE_DMA	Defines the Receive DMA Channel interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_TRANSMIT	Defines the Transmit interrupt source for the static driver.
	DRV_USART_INTERRUPT_SOURCE_TRANSMIT_DMA	Defines the Transmit DMA Channel interrupt source for the static driver.
	DRV_USART_PERIPHERAL_ID	Configures the USART PLIB Module ID.
	DRV_USART_QUEUE_DEPTH_COMBINED	Defines the number of entries of all queues in all instances of the driver.
	DRV_USART_RCV_QUEUE_SIZE_IDXn	Sets the USART Driver Receive Queue Size while using the Buffer Queue Data Transfer Model.
	DRV_USART_READ_WRITE_MODEL_SUPPORT	Specifies if Read/Write Model support should be enabled.
	DRV_USART_RECEIVE_DMA	Defines the USART Driver Receive DMA Channel for the static driver.
	DRV_USART_TRANSMIT_DMA	Defines the USART Driver Transmit DMA Channel in case of static driver.
	DRV_USART_XMIT_QUEUE_SIZE_IDXn	Sets the USART Driver Transmit Queue Size while using the Buffer Queue Data Transfer Model.

Description

USART Driver Configuration Template

These file provides the list of all the configurations that can be used with the driver. This file should not be included in the driver.

Wi-Fi Driver Libraries

This section describes the Wi-Fi Driver Libraries available in MPLAB Harmony.

Description

MRF24WN0MA Wi-Fi PICtail/PICtail Plus Daughter Board: Part number - AC164153
http://www.microchip.com/Developmenttools/ProductDetails.aspx?PartNO=AC164153

The following table lists the library files available for the Wi-Fi Drivers.

Wi-Fi Library File Matrix

Wi-Fi Device	PIC32MX795F512L	PIC32MZ2048ECH144	PIC32MZ2048EFM144
MRF24WN	wdrvext_mx.a	wdrvext_mz_ec.a	wdrvext_mz_ef.a

MRF24WN Wi-Fi Driver Library

This topic describes the MRF24WN Wi-Fi Driver Library.

Description

The following table lists the library files available for the MRF24WN Wi-Fi Driver.

	Target MCU Device		
Wi-Fi Library File Matrix	PIC32MX795F512L	PIC32MZ2048ECH144	PIC32MZ2048EFM144
Wi-Fi Device MRF24WN	wdrvext_mx.a	wdrvext_mz_ec.a	wdrvext_mz_ef.a

Introduction

This library provides a low-level abstraction of the MRF24WN Wi-Fi Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

The MRF24WN Wi-Fi Driver Library, in conjunction with the MRF24WN module, allows an application to:

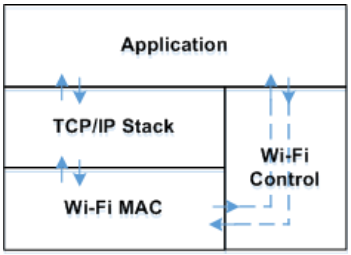
- Join an existing 802.11 Wi-Fi Infrastructure network
- Create a 802.11 Wi-Fi Ad Hoc or Soft AP network

The following application services are provided by the Wi-Fi library:

- Configuring Wi-Fi connection (SSID, security mode, channel list, etc.)
- Join an existing Wi-Fi Infrastructure network
- Create a Wi-Fi Ad Hoc or Soft AP network
- Scan for Wi-Fi Access Point (AP) or Soft AP
- Getting Wi-Fi network status
- Wi-Fi power control
- Wi-Fi console commands

The MAC layer services are not directly accessible to the application; this portion of the code resides under the TCP/IP Stack MAC module software layers and is used by stack services to transmit and receive data over a Wi-Fi network. The following diagram shows the interaction of the primary software blocks in a Wi-Fi application.

Wi-Fi Software Block Diagram



The following table provides information that includes network mode and security mode support by MRF24WN Wi-Fi Driver.

MRF24WN Network Connection Matrix	Network Mode	
	Infrastructure	Soft AP
Security Mode		
Open	YES	YES
WEP40	YES	YES
WEP104	YES	YES
WPA-PSK	YES	YES
WPA2-PSK	YES	YES
WPS Push Button	YES	NA
WPS PIN	YES	NA

Using the Library

This topic describes the basic architecture of the MRF24WN Wi-Fi Driver Library and provides information and examples on its use.

Description

Interface Header Files: `wdrv_mrf24wn_common.h` and `wdrv_mrf24wn_api.h`

The interface to the MRF24WN Wi-Fi Driver Library is defined in the `wdrv_mrf24wn_common.h` and wdrv_mrf24wn_api.h header files.

Please refer to the Understanding MPLAB Harmony section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the MRF24WN Wi-Fi module with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The MRF24WN Wi-Fi Library provides the following functionality:

- Wi-Fi library initialization
- Wi-Fi network configuration
- Wi-Fi network connection
- Scanning for existing Wi-Fi networks
- Wi-Fi event processing
- Wi-Fi status
- Wi-FI console commands

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The Library Interface functions are divided into various sub-sections, which address one of the blocks or the overall operation of the Wi-Fi module.

Library Interface Section	Description
Wi-Fi Initialization Functions	This section provides functions that initialize the Wi-Fi library and allow its API to be used.
Wi-Fi Status Functions	This section provides functions that retrieve the Wi-Fi connection status.
Wi-Fi External Functions	This section provides public functions accessible to TCP/IP applications.
Other Functions	This section provides additional miscellaneous functions for configuring the Wi-Fi connection.

How the Library Works

This section describes how the MRF24WN Wi-Fi Driver Library operates.

Description

Before the driver is ready for use, its should be configured (compile time configuration).

There are few run-time configuration items that are done during initialization of the driver instance, and a few that are client-specific and are done using dedicated functions.

To use the MRF24WN Wi-Fi Driver, initialization and client functions should be invoked in a specific sequence to ensure correct operation.

System Initialization

This section describes initialization and reinitialization features.

Description

Wi-Fi initialization configures the MRF24WN module and then directs it to join (or create) a Wi-Fi network. The MRF24WN module defaults to open security and scans all channels in the domain. Therefore, to initialize and connect with the minimum function call overhead in an open security network, the following functions can be used:

```
WDRV_EXT_CmdSSIDSet("MySsidName",strlen("MySsidName");
WDRV_EXT_CmdConnect();        // start the connection process
```

Alternatively, the following functions could be used to achieve the same effect:

```
WDRV_EXT_CmdNetModeBSSSet();
WDRV_EXT_CmdSecNoneSet();
WDRV_EXT_CmdSSIDSet("MySsidName",strlen("MySsidName");
WDRV_EXT_CmdConnect();
```

Client Functionality

This section describes core operation.

Description

From the client perspective, once Wi-Fi initialization is complete and the connection process has started, the client responds to Wi-Fi events. The client is notified of events by the callback function WDRV_ProcessEvent. The parameters into that function are `event` and `eventInfo`, where `event` is the event code and `eventInfo` is additional information about the event.

Wi-Fi Connection Events

```
/*No Wi-Fi connection exists*/
WDRV_CSTATE_NOT_CONNECTED = 1,

/*Wi-Fi connection in progress*/
WDRV_CSTATE_CONNECTION_IN_PROGRESS = 2,

/*Wi-Fi connected in infrastructure mode*/
WDRV_CSTATE_CONNECTED_INFRASTRUCTURE = 3,

/*Wi-Fi connected in adHoc mode*/
WDRV_CSTATE_CONNECTED_ADHOC = 4,

/*Wi-Fi in process of reconnecting*/
WDRV_CSTATE_RECONNECTION_IN_PROGRESS = 5,

/*Wi-Fi connection temporarily lost*/
WDRV_CSTATE_CONNECTION_TEMPORARY_LOST = 6,

/*Wi-Fi connection permanently lost*/
WDRV_CSTATE_CONNECTION_PERMANENTLY_LOST = 7
```

Scan Events

```
WDRV_SOFTAP_EVENT_CONNECTED = 0,
WDRV_SOFTAP_EVENT_DISCONNECTED = 1
```

Key Events

```
WDRV_SOFTAP_EVENT_LINK_LOST = 0,
WDRV_SOFTAP_EVENT_RECEIVED_DEAUTH = 1
```

Disconnect Events

```
WDRV_DISCONNECT_REASON_NO_NETWORK_AVAIL = 0x01,
WDRV_DISCONNECT_REASON_LOST_LINK = 0x02,
WDRV_DISCONNECT_REASON_DISCONNECT_CMD = 0x03,
```

```
WDRV_DISCONNECT_REASON_BSS_DISCONNECTED = 0x04,
WDRV_DISCONNECT_REASON_AUTH_FAILED = 0x05,
WDRV_DISCONNECT_REASON_ASSOC_FAILED = 0x06,
WDRV_DISCONNECT_REASON_NO_RESOURCES_AVAIL = 0x07,
WDRV_DISCONNECT_REASON_CONNECTION_DENIED = 0x08,
WDRV_DISCONNECT_REASON_INVALID_PROFILE = 0x0A,
WDRV_DISCONNECT_REASON_PROFILE_MISMATCH = 0x0C,
WDRV_DISCONNECT_REASON_CONNECTION_EVICTED = 0x0d
```

Configuring the Library

The configuration of the MRF24WN Wi-Fi Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the Wi-Fi Driver. Based on the selections made, the MRF24WN Wi-Fi Driver may support the selected features. These configuration settings will apply to all instances of the MRF24WN Wi-Fi Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Sample Functionality

The following code provides an example of Wi-Fi Driver configuration.

```
/*** Wi-Fi Driver Configuration ***/

#define WIFI_USE_RTOS

#define WDRV_EXT_INIT_TASK_STACK_SIZE 512u
#define WDRV_EXT_INIT_TASK_PRIO 6u
#define WDRV_EXT_MAIN_TASK_STACK_SIZE 2048u

Building the Library

This section lists the files that are available in the MRF24WN Wi-Fi Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/wifi/mrf24wn`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`wdrv_mrf24wn_common.h`	Contains all data types, define constants for the MRF24WN Wi-Fi Driver.
`wdrv_mrf24wn_api.h`	Contains function prototypes for interfacing to the MRF24WN Wi-Fi Driver.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`wdrv_mrf24wn_cli.c`	Provides access to MRF24WN Wi-Fi Driver controller.
`wdrv_mrf24wn_config_data.c`	Stores and retrieves MRF24WN Wi-Fi Driver configuration information in Non-volatile Memory (NVM).
`wdrv_mrf24wn_connmgr.c`	Provides access to MRF24WN Wi-Fi Driver controller for connection manager.
`wdrv_mrf24wn_events.c`	Provides access to MRF24WN Wi-Fi Driver controller for MAC events.
`wdrv_mrf24wn_iwpriv.c`	Provides functions to configure optional (private) parameters of the MRF24WN Wi-Fi Driver.
`wdrv_mrf24wn_main.c`	Module for Microchip TCP/IP Stack PIC32 implementation for multiple Wi-Fi MAC support.
`wdrv_mrf24wn_misc.c`	Miscellaneous support functions and data types for the MRF24WN Wi-Fi Driver.
`wdrv_mrf24wn_osal.c`	RTOS wrapper functions for the MRF24WN Wi-Fi Driver.
`wdrv_mrf24wn_scan_helper.c`	Provides helper functions to access scan results.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	The MRF24WN Wi-Fi Driver controller has no optional files.

Module Dependencies

The MRF24WN Wi-Fi Driver Library depends on the following modules:

- SPI Driver Library
- NVM Driver Library
- UART Driver Library
- USB Driver Library
- Operating System Abstraction Layer (OSAL) Library Help
- Clock System Service Library
- System Service Library Introduction
- Console System Service Library
- File System Service Library
- Interrupt System Service Library
- Timer System Service Library
- Debug System Service Library
- Ports System Service Library

- FreeRTOS Library Help
- Crypto Library
- Peripheral Libraries

Console Commands

This section describes the console commands available for the MRF24WN Wi-Fi Driver.

Description

Both the Web Server and the EasyConfig demonstrations support the followings commands, which enable control over the Wi-Fi settings.

Command: deleteconf

Parameters	Description
None.	Wi-Fi console command to erase saved Wi-Fi configuration in memory.

Command: iwconfig

Parameters	Description
[ssid <name>]	name: Specifies the name of the SSID (1-32 ASCII characters).
[mode <idle | managed>]	idle: Disconnected from the current configuration. managed: Connects in infrastructure mode to the currently set SSID.
[power <enable | disable>]	enable: Enables all Power-Saving features (PS_POLL). Will wake up to check for all types of traffic (unicast, multicast, and broadcast). disable: Disables any Power-Saving features. Will always be in an active power state.

[security <mode>]	mode: open/wep40/wep104/wpa/wpa2/pin/pbc. For example:
	`iwconfig security open`
	`iwconfig security wep40 <key>`
	`iwconfig security wep104 <key>`
	`iwconfig security wpa <key>`
	`iwconfig security wpa2 <key>`
	`iwconfig security pin <pin>`
	`iwconfig security pbc`

[scan]	Starts a Wi-Fi scan.
[scanget <scan_index>]	scan_index: Retrieves the scan result after the scan completes (1 - n).

Command: mac

Parameters	Description
None.	Wi-Fi console command to retrieve the MAC address of the MRF24WN module.

Command: readconf

Parameters	Description
None.	Wi-Fi console command to read saved Wi-Fi configuration in memory.

Command: saveconf

Parameters	Description
None.	Wi-Fi console command to save Wi-Fi configuration to memory.

Library Interface

a) Wi-Fi Initialization Functions

	Name	Description
	WDRV_SPI_In	Receives data from the module through the SPI bus. **Implementation:** Dynamic

	WDRV_SPI_Out	Sends data out to the module through the SPI bus. **Implementation:** Dynamic
	WDRV_GPIO_Init	Initializes the GPIO objects for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_GPIO_PowerOff	Powers off the MRF24WN module. **Implementation:** Dynamic
	WDRV_GPIO_PowerOn	Powers on the MRF24WN module. **Implementation:** Dynamic
	WDRV_IsPowerOff	Checks if MRF24WN is turned off. **Implementation:** Dynamic
	WDRV_MRF24WN_ISR	Wi-Fi driver (MRF24WN-specific) interrupt service routine. **Implementation:** Dynamic

b) Wi-Fi Status Functions

	Name	Description
	WDRV_EXT_CmdConnectContextChannelGet	Gets the AP channel **Implementation:** Dynamic
	WDRV_EXT_CmdPowerSaveGet	Retrieves current power save status. **Implementation:** Dynamic
	WDRV_EXT_ScanResultGet	Reads the selected scan results back from the MRF24WN module. **Implementation:** Dynamic

c) External Functions

	Name	Description
	WDRV_EXT_CmdNetModeIBSSSet	Sets the Wi-Fi network type to Adhoc. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWPA2Set	Sets Wi-Fi security to WPA2. **Implementation:** Dynamic
	WDRV_EXT_Initialize	Initializes the MRF24WN Wi-Fi driver. **Implementation:** Dynamic
	WDRV_EXT_Initialize	Initializes the WINC1500 Wi-Fi driver. **Implementation:** Dynamic
	WDRV_EXT_PrivConfig	Configures g_wdrvext_priv parameter. **Implementation:** Dynamic

e) Private Configuration Functions

	Name	Description
	iwpriv_config_write	Writes to the Wi-Fi context configuration which is currently used by Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_connstatus_get	Gets the Wi-Fi connection status. **Implementation:** Dynamic
	iwpriv_devinfo_get	Gets the device information. **Implementation:** Dynamic
	iwpriv_initialconn_set	Sets the initial connection status of Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_initstatus_get	Gets the initialization status of Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_is_servermode	Checks if the passed Wi-Fi context configuration is operating in server mode. **Implementation:** Dynamic
	iwpriv_leftclient_get	Gets the left client's information. **Implementation:** Dynamic
	iwpriv_mcastfilter_set	Adds a MAC address to the multi-cast filter. **Implementation:** Dynamic
	iwpriv_nettype_get	Gets the current network type. **Implementation:** Dynamic
	iwpriv_nettype_set	Sets the current network type. **Implementation:** Dynamic

	iwpriv_numberofscanresults_get	Gets the number of scan results. **Implementation:** Dynamic
	iwpriv_powersave_config	Enables or disables Power Save mode in Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_prescan_start	Starts prescan. **Implementation:** Dynamic
	iwpriv_scan_start	Starts scan. **Implementation:** Dynamic
	iwpriv_scanstatus_get	Gets the prescan status. **Implementation:** Dynamic
	iwpriv_ssid_get	Gets the current SSID. **Implementation:** Dynamic
	iwpriv_ssid_set	Sets the current SSID. **Implementation:** Dynamic
	iwpriv_execute	This is function iwpriv_execute.
	iwpriv_get	This is function iwpriv_get.
	iwpriv_prescan_isfinished	Checks if the prescan is complete. **Implementation:** Dynamic
	iwpriv_prescan_option_get	To see if prescan will run before next connection. **Implementation:** Dynamic
	iwpriv_prescan_option_set	To run prescan or not. **Implementation:** Dynamic
	iwpriv_set	This is function iwpriv_set.
	iwpriv_adhocctx_set	Sets the Ad hoc network context information. **Implementation:** Dynamic
	iwpriv_config_read	Reads the Wi-Fi context configuration. **Implementation:** Dynamic

f) Data Types and Constants

	Name	Description
	IWPRIV_CONN_STATUS	This is type IWPRIV_CONN_STATUS.
	IWPRIV_STATUS	This is type IWPRIV_STATUS.
	IWPRIV_CMD	This is type IWPRIV_CMD.
	IWPRIV_EXECUTE_PARAM	This is type IWPRIV_EXECUTE_PARAM.
	IWPRIV_GET_PARAM	This is type IWPRIV_GET_PARAM.
	IWPRIV_PARAM_CLIENTINFO	This is type IWPRIV_PARAM_CLIENTINFO.
	IWPRIV_PARAM_CONTEXT	This is type IWPRIV_PARAM_CONTEXT.
	IWPRIV_PARAM_DEVICEINFO	This is type IWPRIV_PARAM_DEVICEINFO.
	IWPRIV_SCAN_STATUS	This is type IWPRIV_SCAN_STATUS.
	IWPRIV_SET_PARAM	This is type IWPRIV_SET_PARAM.
	IWPRIV_PARAM_CONFIG	This is type IWPRIV_PARAM_CONFIG.
	IWPRIV_PARAM_CONNECT	This is type IWPRIV_PARAM_CONNECT.
	IWPRIV_PARAM_DRIVERSTATUS	This is type IWPRIV_PARAM_DRIVERSTATUS.
	IWPRIV_PARAM_FWUPGRADE	This is type IWPRIV_PARAM_FWUPGRADE.
	IWPRIV_PARAM_MULTICASTFILTER	This is type IWPRIV_PARAM_MULTICASTFILTER.
	IWPRIV_PARAM_NETWORKTYPE	This is type IWPRIV_PARAM_NETWORKTYPE.
	IWPRIV_PARAM_OPERATIONMODE	This is type IWPRIV_PARAM_OPERATIONMODE.
	IWPRIV_PARAM_POWERSAVE	This is type IWPRIV_PARAM_POWERSAVE.
	IWPRIV_PARAM_SCAN	This is type IWPRIV_PARAM_SCAN.
	IWPRIV_PARAM_SSID	This is type IWPRIV_PARAM_SSID.

Description

This section describes the Application Programming Interface (API) functions of the MRF24WN Wi-Fi Driver.

Refer to each section for a detailed description.

a) Wi-Fi Initialization Functions

WDRV_SPI_In Function

Receives data from the module through the SPI bus.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_SPI_In(uint8_t *const OutBuf, uint16_t OutSize, uint8_t *const InBuf, uint16_t InSize);
```

Returns

None.

Description

This function receives data from the module through the SPI bus.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
bufOut	buffer pointer of output command
OutSize	the command size
InBuf	buffer pointer of input data
InSize	the input data size

Function

void WDRV_SPI_In(uint8_t const *const OutBuf, uint16_t OutSize,
uint8_t *const InBuf, uint16_t InSize)

WDRV_SPI_Out Function

Sends data out to the module through the SPI bus.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_SPI_Out(uint8_t *const bufOut, uint16_t OutSize);
```

Returns

None.

Description

This function sends data out to the module through the SPI bus.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
bufOut	buffer pointer of output data

OutSize	the data size

Function

void WDRV_SPI_Out(uint8_t const *const bufOut, uint16_t OutSize)

WDRV_GPIO_Init Function

Initializes the GPIO objects for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_Init();
```

Returns

None.

Description

This function initializes the GPIO objects for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_GPIO_Init(void)

WDRV_GPIO_PowerOff Function

Powers off the MRF24WN module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_PowerOff();
```

Returns

None.

Description

This function powers off the MRF24WN module.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_GPIO_PowerOff(void)

WDRV_GPIO_PowerOn Function

Powers on the MRF24WN module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_PowerOn();
```

Returns

None.

Description

This function powers on the MRF24WN module.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_GPIO_PowerOn(void)

WDRV_IsPowerOff Function

Checks if MRF24WN is turned off.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
bool WDRV_IsPowerOff();
```

Returns

- 0 - Indicates that MRF24WN is turned off
- Non-zero value - Indicates that MRF24WN is on

Description

This function checks if MRF24WN is turned off.

Remarks

None.

Function

bool WDRV_IsPowerOff(void)

WDRV_MRF24WN_ISR Function

Wi-Fi driver (MRF24WN-specific) interrupt service routine.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_MRF24WN_ISR();
```

Returns

None.

Description

This function is the Wi-Fi driver (MRF24WN-specific) interrupt service routine.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_MRF24WN_ISR(void)

b) Wi-Fi Status Functions

WDRV_EXT_CmdConnectContextChannelGet Function

Gets the AP channel

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdConnectContextChannelGet(uint16_t * bssChannel);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function gets the current AP channel.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
bssChannel	pointer where the current AP channel will be written

Function

uint32_t WDRV_EXT_CmdConnectContextChannelGet(uint16_t *bssChannel)

WDRV_EXT_CmdPowerSaveGet Function

Retrieves current power save status.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdPowerSaveGet(bool * enabled);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function retrieves the current power save status.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
enabled	pointer where the current power save status will be written

Function

uint32_t WDRV_EXT_CmdPowerSaveGet(bool *enabled)

WDRV_EXT_ScanResultGet Function

Reads the selected scan results back from the MRF24WN module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_EXT_ScanResultGet(uint16_t idx, WDRV_SCAN_RESULT * p_scanResult);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

After a scan has completed this function is used to read one scan result at a time from the MRF24WN module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
listIndex	index (0 based list) of the scan entry to retrieve
p_scanResult	pointer to where scan result is written

Function

void WDRV_EXT_ScanResultGet(uint8_t listIndex, WDRV_SCAN_RESULT *p_scanResult)

c) External Functions

WDRV_EXT_CmdNetModeIBSSSet Function

Sets the Wi-Fi network type to Adhoc.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdNetModeIBSSSet();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi network type to Adhoc.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

uint32_t WDRV_EXT_CmdNetModeIBSSSet(void)

WDRV_EXT_CmdSecWPA2Set Function

Sets Wi-Fi security to WPA2.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
uint32_t WDRV_EXT_CmdSecWPA2Set(uint8_t * key, uint16_t len);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi security to WPA2. One can only connect to an AP that is running the same WPA2 mode.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and in an unconnected state.

Parameters

Parameters	Description
key	pointer to the WPA2 key buffer
len	WPA2 key length

Function

uint32_t WDRV_EXT_CmdSecWPA2Set(uint8_t *key, uint16_t len)

WDRV_EXT_Initialize Function

Initializes the MRF24WN Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
int32_t WDRV_EXT_Initialize(const WDRV_CALLBACKS *const CB);
```

Returns

- 0 - Indicates success

- non-zero value - Indicates failure

Description

This function initializes the MRF24WN Wi-Fi driver, making it ready for clients to use.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
CB	pointer to callback functions

Function

int32_t WDRV_EXT_Initialize(const WDRV_CALLBACKS *const CB)

WDRV_EXT_Initialize Function

Initializes the WINC1500 Wi-Fi driver.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_Initialize(const WDRV_HOOKS *const ehooks, bool initWait);
```

Returns

None.

Description

This function initializes the WINC1500 Wi-Fi driver, making it ready for clients to use.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
ehooks	pointer to WDRV layer hooks
initWait	true will put WDRV in wait during initialization

Function

void WDRV_EXT_Initialize(const WDRV_HOOKS *const ehooks, bool initWait)

WDRV_EXT_PrivConfig Function

Configures g_wdrvext_priv parameter.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_EXT_PrivConfig(uint32_t * config);
```

Returns

None.

Description

This function configures g_wdrvext_priv parameter.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
config	pointer to the parameter array

Function

void WDRV_EXT_PrivConfig(uint32_t *config)

d) GPIO Functions

e) Private Configuration Functions

iwpriv_config_write Function

Writes to the Wi-Fi context configuration which is currently used by Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_config_write(void * wifi_cfg);
```

Returns

None.

Description

This function reads from a passed pointer, copies everything from it, and writes to the Wi-Fi context configuration, which is currently used by the Wi-Fi driver.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
wifi_cfg	pointer to where the context configuration is stored

Function

void iwpriv_config_write(void *wifi_cfg)

iwpriv_connstatus_get Function

Gets the Wi-Fi connection status.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
IWPRIV_CONN_STATUS iwpriv_connstatus_get();
```

Returns

Status of current Wi-Fi connection. See the definition for the IWPRIV_CONN_STATUS structure.

Description

This function gets the Wi-Fi connection status.

Remarks

IWPRIV_CONNECTION_FAILED does not necessarily mean that the module fails to connect to the network. It stands on the application's perspective, and actually can be customized. For example, in the Web Server demonstrations's use case, WDRV_CSTATE_CONNECTION_PERMANENTLY_LOST is treated as a fail case and will trigger the application to restart.

Preconditions

Wi-Fi initialization must be complete.

Function

IWPRIV_CONN_STATUS iwpriv_connstatus_get(void)

iwpriv_devinfo_get Function

Gets the device information.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_devinfo_get(void * info);
```

Returns

None.

Description

This function returns the device information.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
info	pointer to where the device information is written

Function

void iwpriv_devinfo_get(void *info)

iwpriv_initialconn_set Function

Sets the initial connection status of Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_initialconn_set(bool connect);
```

Returns

None.

Description

This function sets the initial connection status of Wi-Fi driver. After Wi-Fi initialization, it decides whether or not to start the Wi-Fi connection.

Remarks

This function is mainly used to implement prescan. It has to be called before Wi-Fi driver's initialization is finished to be effective.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
connect	boolean value which indicates whether or not to start an initial connect

Function

void iwpriv_initialconn_set(bool connect)

iwpriv_initstatus_get Function

Gets the initialization status of Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
uint8_t iwpriv_initstatus_get();
```

Returns

Current initialization status of the Wi-Fi driver (IWPRIV_READY or IWPRIV_IN_PROGRESS).

Description

This function returns the initialization status of the Wi-Fi driver.

Remarks

None.

Preconditions

None.

Function

uint8_t iwpriv_initstatus_get(void)

iwpriv_is_servermode Function

Checks if the passed Wi-Fi context configuration is operating in server mode.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
bool iwpriv_is_servermode();
```

Returns

- true - Wi-Fi context configuration is operating in server mode

- false - Wi-Fi context configuration is not operating in server mode

Description

This function checks if the passed Wi-Fi context configuration is operating in server mode, which includes Ad hoc mode and SoftAP mode.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

bool iwpriv_is_servermode(void)

iwpriv_leftclient_get Function

Gets the left client's information.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_leftclient_get(bool * updated, TCPIP_MAC_ADDR * addr);
```

Returns

None.

Description

This function returns the left client's information when the Wi-Fi module works in server mode and has the DHCP Server enabled.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
updated	if the left client's information needs to be updated
addr	MAC address of the left client

Function

void iwpriv_leftclient_get(bool *updated, TCPIP_MAC_ADDR *addr)

iwpriv_mcastfilter_set Function

Adds a MAC address to the multi-cast filter.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
IWPRIV_STATUS iwpriv_mcastfilter_set(uint8_t * addr);
```

Returns

Status of the set operation, IWPRIV_READY or IWPRIV_ERROR. See definition for the IWPRIV_STATUS structure.

Description

This function adds a MAC address to the multi-cast filter.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
addr	pointer to where the MAC address is stored

Function

IWPRIV_STATUS iwpriv_mcastfilter_set(uint8_t *addr)

iwpriv_nettype_get Function

Gets the current network type.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_nettype_get(uint8_t * netType);
```

Returns

None.

Description

This function returns the current network type.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
netType	pointer to where the network type is written

Function

void iwpriv_nettype_get(uint8_t *netType)

iwpriv_nettype_set Function

Sets the current network type.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_nettype_set(uint8_t netType);
```

Returns

None.

Description

This function sets the current network type.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
netType	the network type to set

Function

void iwpriv_nettype_set(uint8_t netType)

iwpriv_numberofscanresults_get Function

Gets the number of scan results.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
uint16_t iwpriv_numberofscanresults_get();
```

Returns

Number of scan results.

Description

This function gets the number of scan results.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

uint16_t iwpriv_numberofscanresults_get(void)

iwpriv_powersave_config Function

Enables or disables Power Save mode in Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_powersave_config(bool enabled);
```

Returns

None.

Description

This function enables or disables Power Save mode in Wi-Fi driver, which depends on the passed boolean value.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
enabled	boolean value which indicates to enable or disable Power Save mode in Wi-Fi driver

Function

void iwpriv_powersave_config(bool enabled)

iwpriv_prescan_start Function

Starts prescan.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_prescan_start();
```

Returns

None.

Description

This function directs the Wi-Fi driver to start a prescan.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void iwpriv_prescan_start(void)

iwpriv_scan_start Function

Starts scan.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_scan_start();
```

Returns

None.

Description

The function starts a Wi-Fi scan.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void iwpriv_scan_start(void)

iwpriv_scanstatus_get Function

Gets the prescan status.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
IWPRIV_SCAN_STATUS iwpriv_scanstatus_get();
```

Returns

Prescan status: IWPRIV_SCAN_IDLE, IWPRIV_SCAN_IN_PROGRESS, IWPRIV_SCAN_NO_AP_FOUND or IWPRIV_SCAN_SUCCESSFUL. See the definition for the IWPRIV_SCAN_STATUS structure.

Description

This function gets the prescan status.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

IWPRIV_SCAN_STATUS iwpriv_scanstatus_get(void)

iwpriv_ssid_get Function

Gets the current SSID.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_ssid_get(uint8_t * ssid, uint8_t * ssidLen);
```

Returns

None.

Description

This function returns the current SSID.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
ssid	pointer to where the SSID is written
ssidLen	pointer to where the SSID length is written

Function

void iwpriv_ssid_get(uint8_t *ssid, uint8_t *ssidLen)

iwpriv_ssid_set Function

Sets the current SSID.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_ssid_set(uint8_t * ssid, uint8_t ssidLen);
```

Returns

None.

Description

This function sets the current SSID.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
ssid	pointer to where the SSID is stored
ssidLen	pointer to where the SSID length is stored

Function

void iwpriv_ssid_set(uint8_t *ssid, uint8_t ssidLen)

iwpriv_execute Function

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_execute(IWPRIV_CMD cmd, IWPRIV_EXECUTE_PARAM * params);
```

Description

This is function iwpriv_execute.

iwpriv_get Function

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_get(IWPRIV_CMD cmd, IWPRIV_GET_PARAM * params);
```

Description

This is function iwpriv_get.

iwpriv_prescan_isfinished Function

Checks if the prescan is complete.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
bool iwpriv_prescan_isfinished();
```

Returns

None.

Description

This function checks if the prescan is complete.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

bool iwpriv_prescan_isfinished(void)

iwpriv_prescan_option_get Function

To see if prescan will run before next connection.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
bool iwpriv_prescan_option_get();
```

Returns

None.

Description

This function checks whether or not the prescan will run before next connection.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

bool iwpriv_prescan_option_get(void)

iwpriv_prescan_option_set Function

To run prescan or not.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_prescan_option_set(bool scan);
```

Returns

None.

Description

This function controls whether or not to run prescan.

Remarks

Prescan means the scan runs before the module is connected. It needs to use multiple functions in this file. Please refer to the Easy Configuration demonstration to see the correct usage of prescan.

After the the module is connected, MRF24WN module can also do regular scans. But it cannot perform a scan when the connection is in progress.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
scan	true: run prescan before next connection
false	do not run prescan before next connection

Function

void iwpriv_prescan_option_set(bool scan)

iwpriv_set Function

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_set(IWPRIV_CMD cmd, IWPRIV_SET_PARAM * params);
```

Description

This is function iwpriv_set.

iwpriv_adhocctx_set Function

Sets the Ad hoc network context information.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_adhocctx_set(void * p_cxt);
```

Returns

None.

Description

This function sets the current Ad hoc network context information by reading from a passed pointer.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
p_cxt	pointer to where the Ad hoc network context is stored

Function

void iwpriv_adhocctx_set(void *p_cxt)

iwpriv_config_read Function

Reads the Wi-Fi context configuration.

Implementation: Dynamic

File

wdrv_mrf24wn_iwpriv.h

C

```
void iwpriv_config_read(void * wifi_cfg);
```

Returns

None.

Description

This function reads the current Wi-Fi context configuration, copies and stores the whole structure to the pointer passed to the function.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
wifi_cfg	pointer to where the context configuration is written

Function

void iwpriv_config_read(void *wifi_cfg)

f) Data Types and Constants

IWPRIV_CONN_STATUS Enumeration

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef enum {
  IWPRIV_CONNECTION_FAILED = -1,
  IWPRIV_CONNECTION_SUCCESSFUL,
  IWPRIV_CONNECTION_IDLE,
  IWPRIV_CONNECTION_IN_PROGRESS,
  IWPRIV_CONNECTION_REESTABLISHED
} IWPRIV_CONN_STATUS;
```

Description

This is type IWPRIV_CONN_STATUS.

IWPRIV_STATUS Enumeration

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef enum {
  IWPRIV_ERROR = -1,
  IWPRIV_READY,
  IWPRIV_IN_PROGRESS
} IWPRIV_STATUS;
```

Description

This is type IWPRIV_STATUS.

IWPRIV_CMD Enumeration

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef enum {
  PRESCAN_OPTION_GET,
  PRESCAN_OPTION_SET,
  PRESCAN_START,
  PRESCAN_ISFINISHED_GET,
  SCAN_START,
  SCANSTATUS_GET,
  SCANRESULT_GET,
  SCANRESULTS_COUNT_GET,
  CONFIG_GET,
  CONFIG_SET,
  SSID_GET,
  SSID_SET,
  NETWORKTYPE_GET,
  NETWORKTYPE_SET,
  CONNSTATUS_GET,
  CLIENTINFO_GET,
  DEVICEINFO_GET,
  DRVSTATUS_GET,
  FWUPGRADEREQUEST_GET,
  OPERATIONMODE_GET,
  INITCONN_OPTION_SET,
  ADHOCCTX_SET,
  MULTICASTFILTER_SET,
  POWERSAVE_SET
} IWPRIV_CMD;
```

Description

This is type IWPRIV_CMD.

IWPRIV_EXECUTE_PARAM Union

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef union {
} IWPRIV_EXECUTE_PARAM;
```

Description

This is type IWPRIV_EXECUTE_PARAM.

IWPRIV_GET_PARAM Union

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef union {
  IWPRIV_PARAM_SCAN scan;
  IWPRIV_PARAM_CONFIG cfg;
  IWPRIV_PARAM_SSID ssid;
  IWPRIV_PARAM_NETWORKTYPE netType;
  IWPRIV_PARAM_CONNECT conn;
  IWPRIV_PARAM_CLIENTINFO clientInfo;
  IWPRIV_PARAM_DEVICEINFO devInfo;
```

```
  IWPRIV_PARAM_DRIVERSTATUS driverStatus;
  IWPRIV_PARAM_FWUPGRADE fwUpgrade;
  IWPRIV_PARAM_OPERATIONMODE opMode;
} IWPRIV_GET_PARAM;
```

Description

This is type IWPRIV_GET_PARAM.

IWPRIV_PARAM_CLIENTINFO Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  uint8_t * addr;
  bool updated;
} IWPRIV_PARAM_CLIENTINFO;
```

Members

Members	Description
uint8_t * addr;	it usually points to a MAC address, which is an array of 6 uint8_t elements

Description

This is type IWPRIV_PARAM_CLIENTINFO.

IWPRIV_PARAM_CONTEXT Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  void * context;
} IWPRIV_PARAM_CONTEXT;
```

Description

This is type IWPRIV_PARAM_CONTEXT.

IWPRIV_PARAM_DEVICEINFO Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  void * info;
} IWPRIV_PARAM_DEVICEINFO;
```

Description

This is type IWPRIV_PARAM_DEVICEINFO.

IWPRIV_SCAN_STATUS Enumeration

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef enum {
  IWPRIV_SCAN_SUCCESSFUL,
  IWPRIV_SCAN_IDLE,
  IWPRIV_SCAN_IN_PROGRESS,
```

```
    IWPRIV_SCAN_NO_AP_FOUND
} IWPRIV_SCAN_STATUS;
```

Description

This is type IWPRIV_SCAN_STATUS.

IWPRIV_SET_PARAM Union

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef union {
  IWPRIV_PARAM_SCAN scan;
  IWPRIV_PARAM_CONFIG cfg;
  IWPRIV_PARAM_SSID ssid;
  IWPRIV_PARAM_NETWORKTYPE netType;
  IWPRIV_PARAM_CONNECT conn;
  IWPRIV_PARAM_CONTEXT ctx;
  IWPRIV_PARAM_MULTICASTFILTER multicast;
  IWPRIV_PARAM_POWERSAVE powerSave;
} IWPRIV_SET_PARAM;
```

Description

This is type IWPRIV_SET_PARAM.

IWPRIV_PARAM_CONFIG Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  void * config;
} IWPRIV_PARAM_CONFIG;
```

Description

This is type IWPRIV_PARAM_CONFIG.

IWPRIV_PARAM_CONNECT Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  bool initConnAllowed;
  IWPRIV_CONN_STATUS status;
} IWPRIV_PARAM_CONNECT;
```

Description

This is type IWPRIV_PARAM_CONNECT.

IWPRIV_PARAM_DRIVERSTATUS Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  bool isOpen;
} IWPRIV_PARAM_DRIVERSTATUS;
```

Description

This is type IWPRIV_PARAM_DRIVERSTATUS.

IWPRIV_PARAM_FWUPGRADE Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  bool requested;
} IWPRIV_PARAM_FWUPGRADE;
```

Description

This is type IWPRIV_PARAM_FWUPGRADE.

IWPRIV_PARAM_MULTICASTFILTER Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  uint8_t * addr;
  IWPRIV_STATUS status;
} IWPRIV_PARAM_MULTICASTFILTER;
```

Members

Members	Description
uint8_t * addr;	it usually points to a MAC address, which is an array of 6 uint8_t elements

Description

This is type IWPRIV_PARAM_MULTICASTFILTER.

IWPRIV_PARAM_NETWORKTYPE Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  uint8_t type;
} IWPRIV_PARAM_NETWORKTYPE;
```

Description

This is type IWPRIV_PARAM_NETWORKTYPE.

IWPRIV_PARAM_OPERATIONMODE Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  bool isServer;
} IWPRIV_PARAM_OPERATIONMODE;
```

Description

This is type IWPRIV_PARAM_OPERATIONMODE.

IWPRIV_PARAM_POWERSAVE Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  bool enabled;
} IWPRIV_PARAM_POWERSAVE;
```

Description

This is type IWPRIV_PARAM_POWERSAVE.

IWPRIV_PARAM_SCAN Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  bool prescanAllowed;
  bool prescanFinished;
  IWPRIV_SCAN_STATUS scanStatus;
  uint16_t numberOfResults;
  uint16_t index;
  WDRV_SCAN_RESULT * result;
} IWPRIV_PARAM_SCAN;
```

Description

This is type IWPRIV_PARAM_SCAN.

IWPRIV_PARAM_SSID Structure

File

wdrv_mrf24wn_iwpriv.h

C

```
typedef struct {
  uint8_t * ssid;
  uint8_t ssidLen;
} IWPRIV_PARAM_SSID;
```

Description

This is type IWPRIV_PARAM_SSID.

MRF24WN Interface Functions

Functions

	Name	Description
	WDRV_EXT_CmdConnectContextChannelGet	Gets the AP channel **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeIBSSSet	Sets the Wi-Fi network type to Adhoc. **Implementation:** Dynamic
	WDRV_EXT_CmdPowerSaveGet	Retrieves current power save status. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWPA2Set	Sets Wi-Fi security to WPA2. **Implementation:** Dynamic
	WDRV_EXT_Initialize	Initializes the MRF24WN Wi-Fi driver. **Implementation:** Dynamic
	WDRV_EXT_PrivConfig	Configures g_wdrvext_priv parameter. **Implementation:** Dynamic
	WDRV_EXT_ScanResultGet	Reads the selected scan results back from the MRF24WN module. **Implementation:** Dynamic
	WDRV_GPIO_DeInit	Deinitializes the GPIO objects for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_GPIO_Init	Initializes the GPIO objects for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_GPIO_PowerOff	Powers off the MRF24WN module. **Implementation:** Dynamic
	WDRV_GPIO_PowerOn	Powers on the MRF24WN module. **Implementation:** Dynamic
	WDRV_INTR_Deinit	Deinitializes interrupts for Wi-Fi driver. **Implementation:** Dynamic
	WDRV_INTR_Init	Initializes interrupts for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_INTR_SourceDisable	Disables interrupts from the module. **Implementation:** Dynamic
	WDRV_INTR_SourceEnable	Enables interrupts from the module. **Implementation:** Dynamic
	WDRV_IsPowerOff	Checks if MRF24WN is turned off. **Implementation:** Dynamic
	WDRV_MRF24WN_ISR	Wi-Fi driver (MRF24WN-specific) interrupt service routine. **Implementation:** Dynamic
	WDRV_SPI_Deinit	Deinitializes the SPI object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_SPI_In	Receives data from the module through the SPI bus. **Implementation:** Dynamic
	WDRV_SPI_Init	Initializes the SPI object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_SPI_Out	Sends data out to the module through the SPI bus. **Implementation:** Dynamic

	IWPRIV_CMD	This is type IWPRIV_CMD.
	IWPRIV_CONN_STATUS	This is type IWPRIV_CONN_STATUS.
	IWPRIV_SCAN_STATUS	This is type IWPRIV_SCAN_STATUS.
	IWPRIV_STATUS	This is type IWPRIV_STATUS.

Functions

	Name	Description
	iwpriv_adhocctx_set	Sets the Ad hoc network context information. **Implementation:** Dynamic
	iwpriv_config_read	Reads the Wi-Fi context configuration. **Implementation:** Dynamic
	iwpriv_config_write	Writes to the Wi-Fi context configuration which is currently used by Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_connstatus_get	Gets the Wi-Fi connection status. **Implementation:** Dynamic
	iwpriv_devinfo_get	Gets the device information. **Implementation:** Dynamic
	iwpriv_execute	This is function iwpriv_execute.
	iwpriv_get	This is function iwpriv_get.
	iwpriv_initialconn_set	Sets the initial connection status of Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_initstatus_get	Gets the initialization status of Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_is_servermode	Checks if the passed Wi-Fi context configuration is operating in server mode. **Implementation:** Dynamic
	iwpriv_leftclient_get	Gets the left client's information. **Implementation:** Dynamic
	iwpriv_mcastfilter_set	Adds a MAC address to the multi-cast filter. **Implementation:** Dynamic
	iwpriv_nettype_get	Gets the current network type. **Implementation:** Dynamic
	iwpriv_nettype_set	Sets the current network type. **Implementation:** Dynamic
	iwpriv_numberofscanresults_get	Gets the number of scan results. **Implementation:** Dynamic
	iwpriv_powersave_config	Enables or disables Power Save mode in Wi-Fi driver. **Implementation:** Dynamic
	iwpriv_prescan_isfinished	Checks if the prescan is complete. **Implementation:** Dynamic
	iwpriv_prescan_option_get	To see if prescan will run before next connection. **Implementation:** Dynamic
	iwpriv_prescan_option_set	To run prescan or not. **Implementation:** Dynamic
	iwpriv_prescan_start	Starts prescan. **Implementation:** Dynamic
	iwpriv_scan_start	Starts scan. **Implementation:** Dynamic
	iwpriv_scanstatus_get	Gets the prescan status. **Implementation:** Dynamic
	iwpriv_set	This is function iwpriv_set.
	iwpriv_ssid_get	Gets the current SSID. **Implementation:** Dynamic
	iwpriv_ssid_set	Sets the current SSID. **Implementation:** Dynamic

WILC1000 Wi-Fi Driver Ethernet Mode Library

This topic describes the WILC1000 Wi-Fi Driver Library.

Introduction

This library provides a low-level abstraction of the WILC1000 Wi-Fi Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Note: The WILC1000 Wi-Fi Driver is compatible with the WILC1000 PICtail/PICtail Plus Daughter Board with WILC1000 firmware version 4.2.3 and later in "Ethernet mode".

Description

The Wi-Fi software library, in conjunction with the WILC1000 module, allows an application to:

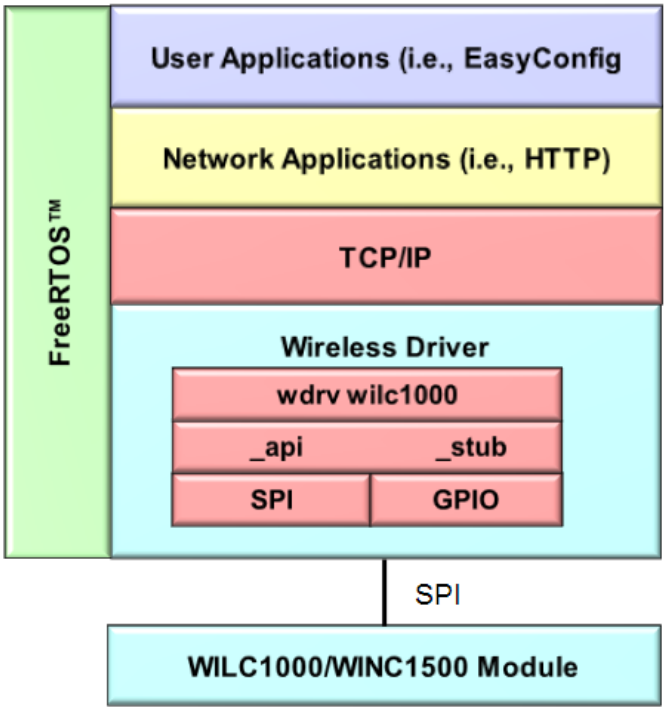
- Join an existing 802.11 Wi-Fi network
- Create a 802.11 Wi-Fi network

The following application services are provided by the Wi-Fi library:

- Configure a Wi-Fi connection (SSID, security mode, and so on)
- Join an existing network or create a "Soft-AP" Wi-Fi network
- Scan for other Wi-Fi devices in the area
- Receive Wi-Fi network status
- Wi-Fi power control

The MAC_layer services are not directly accessible to the application. This portion of the code resides under the TCP/IP Stack MAC module software layers and is used by stack services to transmit and receive data over a Wi-Fi network. The following diagram shows the interaction of the primary software blocks in a Wi-Fi application.

Wi-Fi Software Block Diagram



The following table provides information that includes network mode and security mode support by the WILC1000 Wi-Fi Driver.

WILC1000 Network Connection Matrix	Network Mode	
Security Mode	Infrastructure	SoftAP
Open	YES	YES
WEP40 (64-bit)	YES	YES
WEP104 (128-bit)	YES	YES
WPA-AUTO PSK (TKIP/AES)	YES	NA
WPA-AUTO PSK (AES)	YES	YES
WPS Push Button	YES	NA
WPS PIN	YES	NA

Using the Library

This topic describes the basic architecture of the WILC1000 Wi-Fi Driver Library and provides information and examples on its use.

Description

Interface Header Files: `wdrv_wilc1000_api.h` and `wdrv_wilc1000_stub.h`

The interface to the WILC1000 Wi-Fi Driver Library is defined in the `wdrv_wilc1000_api.h` and `wdrv_wilc1000_stub.h` header files.

Please refer to the Understanding MPLAB Harmony section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the WILC1000 Wi-Fi module with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The WILC1000 Wi-Fi Library provides the following functionality:

- Wi-Fi library initialization
- Wi-Fi network configuration
- Wi-Fi network connection
- Scanning for existing Wi-Fi networks
- Wi-Fi event processing

- Wi-Fi status
- Wi-FI console commands

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

TheLibrary Interface functions are divided into various sub-sections, which address one of the blocks or the overall operation of the Wi-Fi module.

Library Interface Section	Description
Wi-Fi Initialization Functions	This section provides functions that initialize the Wi-Fi library and allow its API to be used.
Wi-Fi Status Functions	This section provides functions that retrieve the Wi-Fi connection status.
Wi-Fi External Functions	This section provides public functions accessible to TCP/IP applications.
Other Functions	This section provides additional miscellaneous functions for configuring the Wi-Fi connection.
Data Types and Constants	This section provides data types and macros.

How the Library Works

This section describes how the WILC1000 Wi-Fi Driver Library operates.

Description

Before the driver is ready for use, it should be configured (compile time configuration).

There are a few run-time configuration items that are done during initialization of the driver instance, and a few that are client-specific and are done using dedicated functions.

To use the WILC1000 Wi-Fi Driver, initialization and client functions should be invoked in a specific sequence to ensure correct operation.

Configuring the Library

This section describes how to configure the WILC1000 Wi-Fi driver.

Description

The configuration of the WILC1000 Wi-Fi Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the Wi-Fi Driver. Based on the selections made, the WILC1000 Wi-Fi Driver may support the selected features. These configuration settings will apply to all instances of the WILC1000 Wi-Fi Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Sample Functionality

The following code provides an example of Wi-Fi Driver configuration. (refer to `system.config.h`)

```
/*** SPI Driver Configuration ***/
#define DRV_SPI_NUMBER_OF_MODULES    4
/*** Driver Compilation and static configuration options. ***/
/*** Select SPI compilation units.***/
#define DRV_SPI_POLLED    0

Building the Library

This section lists the files that are available in the WILC1000 Wi-Fi Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/wifi/wilc1000`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
wdrv_wilc1000_stub.h	Contains Stub function prototypes for interfacing to the WILC1000 Wi-Fi Driver.
wdrv_wilc1000_api.h	Contains API function prototypes for interfacing to the WILC1000 Wi-Fi Driver.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
wdrv_wilc1000_console.c	Console module for the WILC1000 wireless driver.
wdrv_wilc1000_fw_update.c	WILC1000 firmware update support.
wdrv_wilc1000_eint.c	External interrupt handler for the WILC1000 wireless driver.
wdrv_wilc1000_timer.c	Timer functions for the WILC1000 wireless driver.
wdrv_wilc1000_gpio.c	WILC1000 GPIO support for SPI communication.

wdrv_wilc1000_spi.c	WILC1000 support for SPI communication.
wdrv_wilc1000_cli.c	WILC1000 driver CLI implementation.
wdrv_wilc1000_config_data.c	Stores and retrieves Wi-Fi configuration to/from non-volatile memory (NVM).
wdrv_wilc1000_connmgr.c	WILC1000 driver connection manager.
wdrv_wilc1000_events.c	WILC1000 driver MAC events.
wdrv_wilc1000_iwpriv.c	WILC1000 driver connection process functions.
wdrv_wilc1000_main.c	WILC1000 driver Microchip TCP/IP Stack PIC32 MAC support.
wdrv_wilc1000_osal.c	WILC1000 driver OS abstraction layer.
wdrv_wilc1000_scan_helper.c	WILC1000 driver scan helper functions.
wdrext_wilc1000.c	WILC1000 driver extended functions.
wilc1000_task.c	WILC1000 driver task handler.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	The WILC1000 Wi-Fi Driver controller has no optional files.

Module Dependencies

The WILC1000 Wi-Fi Driver Library depends on the following modules:

- SPI Driver Library
- NVM Driver Library
- UART Driver Library
- USB Driver Library
- Operating System Abstraction Layer (OSAL) Library Help
- Clock System Service Library
- System Service Library Introduction
- Console System Service Library
- File System Service Library
- Interrupt System Service Library
- Timer System Service Library
- Debug System Service Library
- Ports System Service Library
- FreeRTOS Library Help
- Crypto Library
- Peripheral Libraries
- Networking Presentation Layer Help
- TCP/IP Stack Library Help
- Command Processor System Service Library
- DMA System Service Library
- Random Number Generator System Service Library
- Common System Service Library
- TCP/IP Ethernet MAC Driver Library

Console Commands

This section describes the console commands available for the WILC1000 Wi-Fi Driver.

Description

Both the Web Server and the EasyConfig demonstrations support the followings commands, which enable control over the Wi-Fi settings.

Command: deleteconf

Parameters	Description
None.	Wi-Fi console command to erase saved Wi-Fi configuration in memory.

Command: iwconfig

Parameters	Description
[ssid <name>]	name: Specifies the name of the SSID (1-32 ASCII characters).
[mode <idle | managed>]	idle: Disconnected from the current configuration. managed: Connects in infrastructure mode to the currently set SSID.
[power <enable | disable>]	enable: Enables all Power-Saving features (PS_POLL). Will wake up to check for all types of traffic (unicast, multicast, and broadcast). disable: Disables any Power-Saving features. Will always be in an active power state.

[security <mode>]	mode: open/wep40/wep104/wpa/wpa2/pin/pbc. For example:
	`iwconfig security open`
	`iwconfig security wep40 <key>`
	`iwconfig security wep104 <key>`
	`iwconfig security wpa <key>`
	`iwconfig security wpa2 <key>`
	`iwconfig security pin <pin>`
	`iwconfig security pbc`

[scan]	Starts a Wi-Fi scan.
[scanget <scan_index>]	scan_index: Retrieves the scan result after the scan completes (1 - n).

Command: mac

Parameters	Description
None.	Wi-Fi console command to retrieve the MAC address of the MRF24WN module.

Command: ota

Parameters	Description
[http://ip-address/] [filename.bin]	Upgrade the WILC1000 firmware over-the-air. For example: http://192.168.0.4/winc1500_ota.bin

Command: readconf

Parameters	Description
None.	Wi-Fi console command to read saved Wi-Fi configuration in memory.

Command: saveconf

Parameters	Description
None.	Wi-Fi console command to save Wi-Fi configuration to memory.

Library Interface

This section describes the Application Programming Interface (API) functions of the WILC1000 Wi-Fi Driver.
Refer to each section for a detailed description.

a) Wi-Fi Initialization Functions

b) Wi-Fi Status Functions

c) Wi-Fi External Functions

d) Other Functions

e) Data Types and Constants

Files

Files

Name	Description
wdrv_wilc1000_api.h	WILC1000 wireless driver APIs.
wdrv_wilc1000_stub.h	WILC1000 wireless driver stub APIs.

Description

This section lists the source and header files used by the MRF24WN Wi-Fi Driver Library.

wdrv_wilc1000_api.h

WILC1000 wireless driver APIs.

Functions

	Name	Description
	WDRV_EXT_CmdScanOptionSet	Sets scan options. **Implementation:** Dynamic
	WDRV_EXT_CmdSSIDSet	Sets the SSID. **Implementation:** Dynamic
	WDRV_EXT_Initialize	Initializes the WILC1000 Wi-Fi driver. **Implementation:** Dynamic
	WDRV_EXT_ScanDoneSet	Indicates when a scan has completed. **Implementation:** Dynamic
	WDRV_EXT_ScanIsInProgress	Check whether host scan is now in progress or not. **Implementation:** Dynamic

Description

WILC1000 wireless driver APIs.

File Name

wdrv_wilc1000_api.h

Company

Microchip Technology Inc.

wdrv_wilc1000_stub.h

WILC1000 wireless driver stub APIs.

Description

WILC1000 wireless driver stub APIs.

File Name

wdrv_wilc1000_stub.h

Company

Microchip Technology Inc.

WINC1500 Wi-Fi Driver Ethernet Mode Library

This topic describes the WINC1500 Wi-Fi Driver Library.

Introduction

This library provides a low-level abstraction of the WINC1500 Wi-Fi Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Note: The WINC1500 Wi-Fi Driver is compatible with the WINC1500 PICtail/PICtail Plus Daughter board with WINC1500 firmware version 19.5.2 and later in "Ethernet mode". The driver will also work with WINC1500 firmware version 19.4.4 with limited backward compatibility.

Description

The Wi-Fi software library, in conjunction with the WINC1500 module, allows an application to:

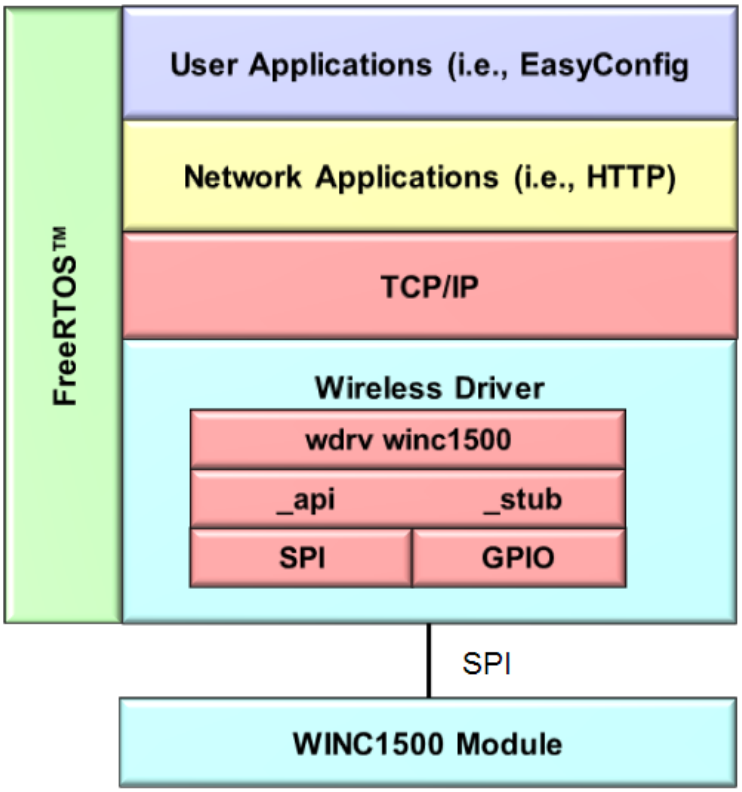
- Join an existing 802.11 Wi-Fi network
- Create a 802.11 Wi-Fi network

The following application services are provided by the Wi-Fi library:

- Configure a Wi-Fi connection (SSID, security mode, and so on)
- Join an existing network or create a "Soft-AP" Wi-Fi network
- Scan for other Wi-Fi devices in the area
- Receive Wi-Fi network status
- Wi-Fi power control

The MAC_layer services are not directly accessible to the application. This portion of the code resides under the TCP/IP Stack MAC module software layers and is used by stack services to transmit and receive data over a Wi-Fi network. The following diagram shows the interaction of the primary software blocks in a Wi-Fi application.

Wi-Fi Software Block Diagram



The following table provides information that includes network mode and security mode support by the WINC1500 Wi-Fi Driver.

WINC1500 Network Connection Matrix	Network Mode	
Security Mode	Infrastructure	SoftAP
Open	YES	YES
WEP40 (64-bit)	YES	YES
WEP104 (128-bit)	YES	YES
WPA-AUTO PSK (TKIP/AES)	YES	NA
WPA-AUTO PSK (AES)	YES	YES
WPS Push Button	YES	NA
WPS PIN	YES	NA

Using the Library

This topic describes the basic architecture of the WINC1500 Wi-Fi Driver Library and provides information and examples on its use.

Description

Interface Header Files: `wdrv_winc1500_api.h` and `wdrv_winc1500_stub.h`

The interface to the WINC1500 Wi-Fi Driver Library is defined in the `wdrv_winc1500_api.h` and `wdrv_winc1500_stub.h` header files.

Please refer to the Understanding MPLAB Harmony section for how the driver interacts with the framework.

Abstraction Model

This library provides a low-level abstraction of the WINC1500 Wi-Fi module with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The WINC1500 Wi-Fi Library provides the following functionality:

- Wi-Fi library initialization
- Wi-Fi network configuration
- Wi-Fi network connection
- Scanning for existing Wi-Fi networks
- Wi-Fi event processing
- Wi-Fi status
- Wi-FI console commands

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

TheLibrary Interface functions are divided into various sub-sections, which address one of the blocks or the overall operation of the Wi-Fi module.

Library Interface Section	Description
Wi-Fi Initialization Functions	This section provides functions that initialize the Wi-Fi library and allow its API to be used.
Wi-Fi Status Functions	This section provides functions that retrieve the Wi-Fi connection status.
Wi-Fi External Functions	This section provides public functions accessible to TCP/IP applications.
Other Functions	This section provides additional miscellaneous functions for configuring the Wi-Fi connection.
Data Types and Constants	This section provides data types and macros.

How the Library Works

This section describes how the WINC1500 Wi-Fi Driver Library operates.

Description

Before the driver is ready for use, it should be configured (compile time configuration).

There are a few run-time configuration items that are done during initialization of the driver instance, and a few that are client-specific and are done using dedicated functions.

To use the WINC1500 Wi-Fi Driver, initialization and client functions should be invoked in a specific sequence to ensure correct operation.

Configuring the Library

This section describes how to configure the WINC1500 Wi-Fi driver.

Description

The configuration of the WINC1500 Wi-Fi Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the Wi-Fi Driver. Based on the selections made, the WINC1500 Wi-Fi Driver may support the selected features. These configuration settings will apply to all instances of the WINC1500 Wi-Fi Driver.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Sample Functionality

The following code provides an example of Wi-Fi Driver configuration. (refer to `system.config.h`)

```
/*** SPI Driver Configuration ***/
#define DRV_SPI_NUMBER_OF_MODULES        4

/*** Driver Compilation and static configuration options. ***/
/*** Select SPI compilation units.***/
#define DRV_SPI_POLLED           0
#define DRV_SPI_ISR              1
#define DRV_SPI_MASTER           1

Building the Library

This section lists the files that are available in the WINC1500 Wi-Fi Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/wifi/winc1500`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
wdrv_winc1500_stub.h	Contains Stub function prototypes for interfacing to the WINC1500 Wi-Fi Driver.
wdrv_winc1500_api.h	Contains API function prototypes for interfacing to the WINC1500 Wi-Fi Driver.

Required File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
wdrv_winc1500_console.c	Console module for the WINC1500 wireless driver.
wdrv_winc1500_fw_update.c	WINC1500 firmware update support.
wdrv_winc1500_eint.c	External interrupt handler for the WINC1500 wireless driver.
wdrv_winc1500_timer.c	Timer functions for the WINC1500 wireless driver.
wdrv_winc1500_gpio.c	WINC1500 GPIO support for SPI communication.
wdrv_winc1500_spi.c	WINC1500 support for SPI communication.
wdrv_winc1500_cli.c	WINC1500 driver CLI implementation.
wdrv_winc1500_config_data.c	Stores and retrieves Wi-Fi configuration to/from non-volatile memory (NVM).
wdrv_winc1500_connmgr.c	WINC1500 driver connection manager.
wdrv_winc1500_events.c	WINC1500 driver MAC events.
wdrv_winc1500_iwpriv.c	WINC1500 driver connection process functions.
wdrv_winc1500_main.c	WINC1500 driver Microchip TCP/IP Stack PIC32 MAC support.
wdrv_winc1500_osal.c	WINC1500 driver OS abstraction layer.
wdrv_winc1500_scan_helper.c	WINC1500 driver scan helper functions.
wdrext_winc1500.c	WINC1500 driver extended functions.
winc1500_task.c	WINC1500 driver task handler.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	The WINC1500 Wi-Fi Driver controller has no optional files.

Module Dependencies

The WINC1500 Wi-Fi Driver Library depends on the following modules:

- SPI Driver Library
- NVM Driver Library

- UART Driver Library
- USB Driver Library
- Operating System Abstraction Layer (OSAL) Library Help
- Clock System Service Library
- System Service Library Introduction
- Console System Service Library
- File System Service Library

Console Commands

This section describes the console commands available for the WINC1500 Wi-Fi Driver.

Description

Both the Web Server and the EasyConfig demonstrations support the followings commands, which enable control over the Wi-Fi settings.

Command: deleteconf

Parameters	Description
None.	Wi-Fi console command to erase saved Wi-Fi configuration in memory.

Command: iwconfig

Parameters	Description
[ssid <name>]	name: Specifies the name of the SSID (1-32 ASCII characters).
[mode <idle | managed>]	idle: Disconnected from the current configuration. managed: Connects in infrastructure mode to the currently set SSID.
[power <enable | disable>]	enable: Enables all Power-Saving features (PS_POLL). Will wake up to check for all types of traffic (unicast, multicast, and broadcast). disable: Disables any Power-Saving features. Will always be in an active power state.

[security <mode>]	mode: open/wep40/wep104/wpa/wpa2/pin/pbc. For example:
	`iwconfig security open`
	`iwconfig security wep40 <key>`
	`iwconfig security wep104 <key>`
	`iwconfig security wpa <key>`
	`iwconfig security wpa2 <key>`
	`iwconfig security pin <pin>`
	`iwconfig security pbc`

[scan]	Starts a Wi-Fi scan.
[scanget <scan_index>]	scan_index: Retrieves the scan result after the scan completes (1 - n).

Command: mac

Parameters	Description
None.	Wi-Fi console command to retrieve the MAC address of the MRF24WN module.

Command: ota

Parameters	Description
[http://ip-address/] [filename.bin]	Upgrade the WINC1500 firmware over-the-air. For example: http://192.168.0.4/winc1500_ota.bin

Command: readconf

Parameters	Description
None.	Wi-Fi console command to read saved Wi-Fi configuration in memory.

Command: saveconf

Parameters	Description
None.	Wi-Fi console command to save Wi-Fi configuration to memory.

Library Interface

a) Wi-Fi Initialization Functions

	Name	Description
	WDRV_CLI_Init	Initializes the console CLI interface. **Implementation:** Dynamic
	WDRV_INTR_Deinit	Deinitializes interrupts for Wi-Fi driver. **Implementation:** Dynamic
	WDRV_INTR_Init	Initializes interrupts for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_SPI_Deinit	Deinitializes the SPI object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_SPI_Init	Initializes the SPI object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_GPIO_DeInit	Deinitializes the GPIO objects for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_EXT_Deinitialize	Deinitializes the WINC1500 Wi-Fi driver. **Implementation:** Dynamic
	WDRV_WINC1500_ISR	Wi-Fi driver (WINC1500-specific) interrupt service routine. **Implementation:** Dynamic

b) Wi-Fi Status Functions

	Name	Description
	WDRV_EXT_CmdFWVersionGet	Retrieves FW version information. **Implementation:** Dynamic
	WDRV_EXT_ScanResultGet	Reads the selected scan results back from the WINC1500 module. **Implementation:** Dynamic
	WDRV_EXT_CmdMacAddressGet	Retrieves the WINC1500 MAC address. **Implementation:** Dynamic
	WDRV_EXT_CmdScanGet	Reads the number of scan results from the WINC1500 module. **Implementation:** Dynamic
	WDRV_EXT_CmdSSIDGet	Gets the SSID. **Implementation:** Dynamic

c) Wi-Fi External Functions

	Name	Description
	WDRV_EXT_CmdPowerSavePut	Puts the module in power save mode. **Implementation:** Dynamic
	WDRV_EXT_HWInterruptHandler	Wi-Fi driver (WINC1500-specific) interrupt service routine. **Implementation:** Dynamic

	WDRV_EXT_CmdScanOptionSet	Sets scan options. **Implementation:** Dynamic
	WDRV_EXT_ModuleUpDown	Enables or disables WINC1500 module. **Implementation:** Dynamic
	WDRV_EXT_MulticastFilterSet	Sets a multicast address filter. **Implementation:** Dynamic
	WDRV_EXT_CmdConnect	Directs the WINC1500 to connect to a Wi-Fi network. **Implementation:** Dynamic
	WDRV_EXT_CmdDisconnect	Directs the WINC1500 to disconnect from a Wi-Fi network. **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeAPSet	Sets the Wi-Fi network type to SoftAP. **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeBSSSet	Sets the Wi-Fi network type to Infrastructure. **Implementation:** Dynamic
	WDRV_EXT_CmdScanStart	Directs the WINC1500 module to start a scan. **Implementation:** Dynamic
	WDRV_EXT_CmdSecNoneSet	Sets Wi-Fi security to open (no security). **Implementation:** Dynamic
	WDRV_EXT_CmdSecWEPSet	Sets Wi-Fi security to use WEP. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWPASet	Sets Wi-Fi security to use WPA/WPA2. **Implementation:** Dynamic
	WDRV_EXT_DataSend	Sends data packets to WINC1500 module. **Implementation:** Dynamic
	WDRV_EXT_ScanDoneSet	Indicates when a scan has completed. **Implementation:** Dynamic
	WDRV_EXT_CmdChannelSet	Sets the channel on which to operate. **Implementation:** Dynamic
	WDRV_EXT_CmdSSIDSet	Sets the SSID. **Implementation:** Dynamic
	WDRV_EXT_CmdFWUpdate	Directs the module to start firmware download and upgrade. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWpsSet	Sets Wi-Fi security to use WPS. **Implementation:** Dynamic
	WDRV_EXT_CmdTxPowerSet	Sets the Tx Power at 3 levels, high, medium and low. **Implementation:** Dynamic
	WDRV_EXT_CmdConnectContextBssidGet	Gets the BSSID **Implementation:** Dynamic
	WDRV_EXT_CmdScanOptionsSet	Sets scan options. **Implementation:** Dynamic
	WDRV_EXT_CmdSSIDSet	Sets the SSID. **Implementation:** Dynamic
	WDRV_EXT_ScanIsInProgress	Check whether host scan is now in progress or not. **Implementation:** Dynamic

d) Other Functions

	Name	Description
	WDRV_INTR_SourceDisable	Disables interrupts from the module. **Implementation:** Dynamic
	WDRV_INTR_SourceEnable	Enables interrupts from the module. **Implementation:** Dynamic
	WDRV_EXT_Initialize	Initializes the WILC1000 Wi-Fi driver. **Implementation:** Dynamic
	WDRV_EXT_RssiRead	Requests RSSI for the connected AP. **Implementation:** Dynamic
	WDRV_EXT_WPSResultsRead	Reads the WPS process results back from the WINC1500 module and updates the configuration data. **Implementation:** Dynamic

	WDRV_STUB_Assert	Dumps out an error message on serial console and resets itself when the driver asserts. **Implementation:** Dynamic
	WDRV_STUB_GPIO_ChipDisable	Disables the WINC1500 chip. **Implementation:** Dynamic
	WDRV_STUB_GPIO_ChipEnable	Enables the WINC1500 chip. **Implementation:** Dynamic
	WDRV_STUB_GPIO_DeInitialize	Deinitializes the GPIO object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_STUB_GPIO_Initialize	Initializes the GPIO object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_STUB_GPIO_ModuleReset	Resets the WINC1500 module. **Implementation:** Dynamic
	WDRV_STUB_GPIO_ModuleUnreset	Unresets the WINC1500 module. **Implementation:** Dynamic
	WDRV_STUB_HardDelay	Waits spinning for the delay milliseconds. **Implementation:** Dynamic
	WDRV_STUB_INTR_Deinit	Deinitializes interrupts for Wi-Fi driver. **Implementation:** Dynamic
	WDRV_STUB_INTR_Init	Initializes interrupts for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_STUB_INTR_SourceDisable	Disables interrupts from the module. **Implementation:** Dynamic
	WDRV_STUB_INTR_SourceEnable	Enables interrupts from the module. **Implementation:** Dynamic
	WDRV_STUB_SPI_Deinitialize	Deinitializes the SPI object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_STUB_SPI_In	Receives data from the module through the SPI bus. **Implementation:** Dynamic
	WDRV_STUB_SPI_Initialize	Initializes the SPI object for the Wi-Fi driver. **Implementation:** Dynamic
	WDRV_STUB_SPI_Out	Sends data out to the module through the SPI bus. **Implementation:** Dynamic

e) Data Types and Constants

	Name	Description
	_WDRV_WINC1500_API_H	This is macro _WDRV_WINC1500_API_H.
	WDRV_STUB_Print	This is macro WDRV_STUB_Print.

Description

This section describes the Application Programming Interface (API) functions of the WINC1500 Wi-Fi Driver.

Refer to each section for a detailed description.

a) Wi-Fi Initialization Functions

WDRV_CLI_Init Function

Initializes the console CLI interface.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
bool WDRV_CLI_Init();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function initializes the console CLI interface.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

bool WDRV_CLI_Init(void)

WDRV_INTR_Deinit Function

Deinitializes interrupts for Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_INTR_Deinit();
```

Returns

None.

Description

This function deinitializes interrupts for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_INTR_Deinit(void)

WDRV_INTR_Init Function

Initializes interrupts for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_INTR_Init();
```

Returns

None.

Description

This function initializes interrupts for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_INTR_Init(void)

WDRV_SPI_Deinit Function

Deinitializes the SPI object for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_SPI_Deinit();
```

Returns

None.

Description

This function deinitializes the SPI object for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_SPI_Deinit(void)

WDRV_SPI_Init Function

Initializes the SPI object for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_SPI_Init();
```

Returns

None.

Description

This function initializes the SPI object for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_SPI_Init(void)

WDRV_GPIO_DeInit Function

Deinitializes the GPIO objects for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_GPIO_DeInit();
```

Returns

None.

Description

This function deinitializes the GPIO objects for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_GPIO_DeInit(void)

WDRV_EXT_Deinitialize Function

Deinitializes the WINC1500 Wi-Fi driver.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_Deinitialize();
```

Returns

None.

Description

This function deinitializes the WINC1500 driver.

Remarks

None

Preconditions

None.

Function

void WDRV_EXT_Deinitialize(void)

WDRV_WINC1500_ISR Function

Wi-Fi driver (WINC1500-specific) interrupt service routine.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_WINC1500_ISR();
```

Returns

None.

Description

This function is the Wi-Fi driver (WINC1500-specific) interrupt service routine.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_WINC1500_ISR(void)

b) Wi-Fi Status Functions

WDRV_EXT_CmdFWVersionGet Function

Retrieves FW version information.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_CmdFWVersionGet(uint32_t * major, uint32_t * minor, uint32_t * patch);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function retrieves the module FW version information.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
major	pointer where the major number will be written
minor	pointer where the minor number will be written
patch	pointer where the patch number will be written

Function

uint32_t WDRV_EXT_CmdFWVersionGet(uint32_t *major, uint32_t *minor, uint32_t *patch);

WDRV_EXT_ScanResultGet Function

Reads the selected scan results back from the WINC1500 module.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_ScanResultGet(uint8_t listIndex, WDRV_SCAN_RESULT * p_scanResult);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

After a scan has completed this function is used to read one scan result at a time from the WINC1500 module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
listIndex	index (0 based list) of the scan entry to retrieve
p_scanResult	pointer to where scan result is written

Function

void WDRV_EXT_ScanResultGet(uint8_t listIndex, WDRV_SCAN_RESULT *p_scanResult)

WDRV_EXT_CmdMacAddressGet Function

Retrieves the WINC1500 MAC address.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_CmdMacAddressGet(uint8_t * MacAddr);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function retrieves the WINC1500 MAC address.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
MacAddr	Pointer where MAC address will be written (must point to a 6 bytes buffer)

Function

uint32_t WDRV_EXT_CmdMacAddressGet(uint8_t *MacAddr)

WDRV_EXT_CmdScanGet Function

Reads the number of scan results from the WINC1500 module.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_CmdScanGet(uint16_t * numOfResults);
```

Returns

None.

Description

This function reads the number of scan results from the WINC1500 module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
numOfResults	pointer where the number of scan results will be written

Function

void WDRV_EXT_CmdScanGet(uint16_t *numOfResults)

WDRV_EXT_CmdSSIDGet Function

Gets the SSID.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_CmdSSIDGet(uint8_t * ssid, uint8_t * length);
```

Returns

None.

Description

This function returns the SSID and SSID Length.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
ssid	pointer to buffer where SSID will be written
length	number of bytes in SSID

Function

void WDRV_EXT_CmdSSIDGet(uint8_t *ssid, uint8_t *length)

c) Wi-Fi External Functions

WDRV_EXT_CmdPowerSavePut Function

Puts the module in power save mode.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_CmdPowerSavePut(bool enable, uint8_t mode, uint16_t listenInterval);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

The function places the module in power save mode.

Remarks

This works only with Infrastructure mode. Do not call this in other modes.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
enable	true will put the module in power save mode.
mode	0 : manual mode - not synchronized to AP beacon ; 1. deep automatic mode - ieee802.11 power save mode.
listenInterval	STA wakes up per this beacon interval.

Function

uint32_t WDRV_EXT_CmdPowerSavePut(bool enable, uint8_t mode, uint16_t listenInterval)

WDRV_EXT_HWInterruptHandler Function

Wi-Fi driver (WINC1500-specific) interrupt service routine.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_HWInterruptHandler();
```

Returns

None.

Description

This function is the Wi-Fi driver (WINC1500-specific) interrupt service routine.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_HWInterruptHandler(void)

WDRV_EXT_CmdScanOptionSet Function

Sets scan options.

Implementation: Dynamic

File

wdrv_wilc1000_api.h

C

```
uint32_t WDRV_EXT_CmdScanOptionSet(uint8_t numOfSlots, uint8_t slotTime, uint8_t probesPerSlot, uint8_t
rssiThreshold);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

The function sets scan options.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
numOfSlots	The min number of slots is 2 for every channel, every slot the module will send Probe Request on air, and wait/listen for PROBE RESP/BEACONS for the slotTime.
slotTime	The time that the module will wait on every channel listening to the frames on air.
probesPerSlot	Number of probe requests to be sent per channel scan slot.
rssiThreshold	The RSSI threshold of the AP which will be connected to directly.

Function

uint32_t WDRV_EXT_CmdScanOptionSet(uint8_t numOfSlots, uint8_t slotTime, uint8_t probesPerSlot, uint8_t rssiThreshold);

WDRV_EXT_ModuleUpDown Function

Enables or disables WINC1500 module.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_ModuleUpDown(uint32_t up);
```

Returns

None.

Description

This function enables or disables WINC1500 module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
up	1: enable; 0: disable.

Function

void WDRV_EXT_ModuleUpDown(uint32_t up)

WDRV_EXT_MulticastFilterSet Function

Sets a multicast address filter.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_MulticastFilterSet(uint8_t * addr);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function allows the application to configure up to 8 Multicast address filters on the WINC1500 module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
addr	the pointer of the multicast mac address.

Function

uint32_t WDRV_EXT_MulticastFilterSet(uint8_t *addr)

WDRV_EXT_CmdConnect Function

Directs the WINC1500 to connect to a Wi-Fi network.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_CmdConnect();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function causes the WINC1500 to connect to a Wi-Fi network. Upon connection, or a failure to connect, an event will be generated.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and relevant connection parameters must have been set.

Function

uint32_t WDRV_EXT_CmdConnect(void)

WDRV_EXT_CmdDisconnect Function

Directs the WINC1500 to disconnect from a Wi-Fi network.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_CmdDisconnect();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function causes the WINC1500 to disconnect from a Wi-Fi network.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and a connection must be in progress.

Function

uint32_t WDRV_EXT_CmdDisconnect(void)

WDRV_EXT_CmdNetModeAPSet Function

Sets the Wi-Fi network type to SoftAP.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_CmdNetModeAPSet();
```

Returns

None.

Description

This function sets the Wi-Fi network type to SoftAP.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_CmdNetModeAPSet(void)

WDRV_EXT_CmdNetModeBSSSet Function

Sets the Wi-Fi network type to Infrastructure.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_CmdNetModeBSSSet();
```

Returns

None.

Description

This function sets the Wi-Fi network type to Infrastructure.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_CmdNetModeBSSSet(void)

WDRV_EXT_CmdScanStart Function

Directs the WINC1500 module to start a scan.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_CmdScanStart();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function directs the WINC1500 module to start a scan.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

uint32_t WDRV_EXT_CmdScanStart(void)

WDRV_EXT_CmdSecNoneSet Function

Sets Wi-Fi security to open (no security).

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_CmdSecNoneSet();
```

Returns

None.

Description

This function sets the Wi-Fi security to open. One can only connect to an AP that is running in open mode.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and in an unconnected state.

Function

void WDRV_EXT_CmdSecNoneSet(void)

WDRV_EXT_CmdSecWEPSet Function

Sets Wi-Fi security to use WEP.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_CmdSecWEPSet(uint8_t * key, uint16_t len);
```

Returns

None.

Description

This function sets the Wi-Fi security to WEP. One can only connect to an AP that is running the same WEP mode.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and in an unconnected state.

Parameters

Parameters	Description
key	pointer to the WEP key buffer
len	WEP key length

Function

void WDRV_EXT_CmdSecWEPSet(uint8_t *key, uint16_t len)

WDRV_EXT_CmdSecWPASet Function

Sets Wi-Fi security to use WPA/WPA2.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_CmdSecWPASet(uint8_t * key, uint16_t len);
```

Returns

None.

Description

This function sets the Wi-Fi security to WPA/WPA2. One can only connect to an AP that is running the same WPA/WPA2 mode.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete and in an unconnected state.

Parameters

Parameters	Description
key	pointer to the WPA key buffer
len	WPA key length

Function

void WDRV_EXT_CmdSecWPASet(uint8_t *key, uint16_t len)

WDRV_EXT_DataSend Function

Sends data packets to WINC1500 module.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_DataSend(uint16_t segSize, uint8_t * p_segData);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sends data packets to the WINC1500 module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
seqSize	data size
p_seqData	pointer to the data buffer

Function

uint32_t WDRV_EXT_DataSend(uint16_t segSize, uint8_t *p_segData)

WDRV_EXT_ScanDoneSet Function

Indicates when a scan has completed.

Implementation: Dynamic

File

wdrv_wilc1000_api.h

C

```
void WDRV_EXT_ScanDoneSet();
```

Returns

None.

Description

This function indicates when a scan has completed.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_ScanDoneSet(void)

WDRV_EXT_CmdChannelSet Function

Sets the channel on which to operate.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_CmdChannelSet(uint16_t channel);
```

Returns

None.

Description

This function sets the channel on which to operate.

Remarks

This works only with SoftAP mode. Do not call this in other modes.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
channel	target channel

Function

void WDRV_EXT_CmdChannelSet(uint16_t channel)

WDRV_EXT_CmdSSIDSet Function

Sets the SSID.

Implementation: Dynamic

File

wdrv_wilc1000_api.h

C

```
void WDRV_EXT_CmdSSIDSet(uint8_t * ssid, uint16_t len);
```

Returns

None.

Description

This function sets the SSID and SSID length.

Remarks

Do not include a string terminator in the SSID length. SSIDs are case-sensitive. SSID length must be less than or equal to 32.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
ssid	pointer to SSID buffer
len	number of bytes in SSID

Function

void WDRV_EXT_CmdSSIDSet(uint8_t *ssid, uint16_t len)

WDRV_EXT_CmdFWUpdate Function

Directs the module to start firmware download and upgrade.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_CmdFWUpdate();
```

Returns

None.

Description

This function directs the module to start the firmware download and upgrade.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_CmdFWUpdate(void)

WDRV_EXT_CmdSecWpsSet Function

Sets Wi-Fi security to use WPS.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_CmdSecWpsSet(bool pinMode, uint8_t * key, uint16_t keyLen);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function sets the Wi-Fi security to WPS. One can only connect to an AP that supports WPS.

Remarks

None

Preconditions

Wi-Fi initialization must be complete and in an unconnected state.

Parameters

Parameters	Description
pinMode	0: PBC mode; 1: PIN mode
key	pointer of the PIN buffer
keyLen	PIN length

Function

int32_t WDRV_EXT_CmdSecWpsSet(bool pinMode, uint8_t *key, uint16_t keyLen)

WDRV_EXT_CmdTxPowerSet Function

Sets the Tx Power at 3 levels, high, medium and low.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_CmdTxPowerSet(uint32_t level);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

The function sets the module's Tx power.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
level	1 : high - 18 dBm PA gain , 2 : medium - 12 dBm PA gain, 3 : low - 6 dBm PA gain.

Function

uint32_t WDRV_EXT_CmdTxPowerSet(uint32_t level)

WDRV_EXT_CmdConnectContextBssidGet Function

Gets the BSSID

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_CmdConnectContextBssidGet(uint8_t * bssId);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function gets the current AP's BSSID.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
bssId	pointer where the current AP's BSSID will be written

Function

uint32_t WDRV_EXT_CmdConnectContextBssidGet(uint8_t *bssId)

WDRV_EXT_CmdScanOptionsSet Function

Sets scan options.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_CmdScanOptionsSet(uint8_t numOfSlots, uint8_t slotTime, uint8_t probesPerSlot, uint8_t
rssiThreshold);
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

The function sets scan options.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
numOfSlots	The min number of slots is 2 for every channel, every slot the module will send Probe Request on air, and wait/listen for PROBE RESP/BEACONS for the slotTime.
slotTime	The time that the module will wait on every channel listening to the frames on air.
probesPerSlot	Number of probe requests to be sent per channel scan slot.
rssiThreshold	The RSSI threshold of the AP which will be connected to directly.

Function

uint32_t WDRV_EXT_CmdScanOptionsSet(uint8_t numOfSlots, uint8_t slotTime, uint8_t probesPerSlot, uint8_t rssiThreshold);

WDRV_EXT_CmdSSIDSet Function

Sets the SSID.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_CmdSSIDSet(uint8_t * ssid, uint8_t len);
```

Returns

None.

Description

This function sets the SSID and SSID length.

Remarks

SSIDs are case-sensitive. SSID length must be less than or equal to 32.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
ssid	pointer to SSID buffer
len	number of bytes in SSID

Function

void WDRV_EXT_CmdSSIDSet(uint8_t *ssid, uint16_t len)

WDRV_EXT_ScanIsInProgress Function

Check whether host scan is now in progress or not.

Implementation: Dynamic

File

wdrv_wilc1000_api.h

C

```
bool WDRV_EXT_ScanIsInProgress();
```

Returns

- true - Host scan is in progress
- false - Host scan is not in progress

Description

Check whether host scan is now in progress or not.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_ScanIsInProgress(void)

d) Other Functions

WDRV_INTR_SourceDisable Function

Disables interrupts from the module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_INTR_SourceDisable();
```

Returns

None.

Description

This function disables interrupts from the module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_INTR_SourceDisable(void)

WDRV_INTR_SourceEnable Function

Enables interrupts from the module.

Implementation: Dynamic

File

wdrv_mrf24wn_api.h

C

```
void WDRV_INTR_SourceEnable();
```

Returns

None.

Description

This function enables interrupts from the module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_INTR_SourceEnable(void)

WDRV_EXT_Initialize Function

Initializes the WILC1000 Wi-Fi driver.

Implementation: Dynamic

File

wdrv_wilc1000_api.h

C

```
void WDRV_EXT_Initialize(WDRV_HOOKS const *const ehooks, bool initWait);
```

Returns

None.

Description

This function initializes the WILC1000 Wi-Fi driver, making it ready for clients to use.

Remarks

None.

Preconditions

None.

Parameters

Parameters	Description
ehooks	pointer to WDRV layer hooks
initWait	true will put WDRV in wait during initialization

Function

void WDRV_EXT_Initialize(WDRV_HOOKS const *const ehooks, bool initWait)

WDRV_EXT_RssiRead Function

Requests RSSI for the connected AP.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
uint32_t WDRV_EXT_RssiRead();
```

Returns

- 0 - Indicates success
- Non-zero value - Indicates failure

Description

This function requests RSSI for the connected AP.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_EXT_RssiRead(void)

WDRV_EXT_WPSResultsRead Function

Reads the WPS process results back from the WINC1500 module and updates the configuration data.

Implementation: Dynamic

File

wdrv_winc1500_api.h

C

```
void WDRV_EXT_WPSResultsRead(WDRV_CONFIG * config, uint32_t * status);
```

Returns

None.

Description

After the WPS process has completed, this function is used to read the WPS process results from the WINC1500 module and update the configuration data.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Parameters

Parameters	Description
config	pointer to where configuration data will be updated
status	pointer to where WPS process status will be written

Function

void WDRV_EXT_WPSResultsRead(WDRV_CONFIG *config, uint32_t *status)

WDRV_STUB_Assert Function

Dumps out an error message on serial console and resets itself when the driver asserts.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_Assert(int condition, const char * msg, const char * file, int line);
```

Returns

None.

Description

Dumps out an error message on serial console and resets itself when the driver asserts.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
condition	asserts if false
msg	error message
file	file name
line	line number where driver asserts.

Function

WDRV_STUB_Assert(int condition, const char *msg, const char *file, int line)

WDRV_STUB_GPIO_ChipDisable Function

Disables the WINC1500 chip.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_GPIO_ChipDisable();
```

Returns

None.

Description

This function disables the WINC1500 chip.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_STUB_GPIO_ChipDisable(void)

WDRV_STUB_GPIO_ChipEnable Function

Enables the WINC1500 chip.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_GPIO_ChipEnable();
```

Returns

None.

Description

This function enables the WINC1500 chip.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_STUB_GPIO_ChipEnable(void)

WDRV_STUB_GPIO_DeInitialize Function

Deinitializes the GPIO object for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_GPIO_DeInitialize();
```

Returns

None.

Description

This function deinitializes the GPIO object for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_STUB_GPIO_DeInitialize(void)

WDRV_STUB_GPIO_Initialize Function

Initializes the GPIO object for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_GPIO_Initialize();
```

Returns

None.

Description

This function initializes the GPIO object for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_STUB_GPIO_Initialize(void)

WDRV_STUB_GPIO_ModuleReset Function

Resets the WINC1500 module.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_GPIO_ModuleReset();
```

Returns

None.

Description

This function resets the WINC1500 module.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_STUB_GPIO_ModuleReset(void)

WDRV_STUB_GPIO_ModuleUnreset Function

Unresets the WINC1500 module.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_GPIO_ModuleUnreset();
```

Returns

None.

Description

This function unresets the WINC1500 module.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
board	Microchip development kit type (i.e., PIC32MZ EC Starter Kit, PIC32 Ethernet Starter Kit, etc.)

Function

void WDRV_STUB_GPIO_ModuleUnreset(void)

WDRV_STUB_HardDelay Function

Waits spinning for the delay milliseconds.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_HardDelay(uint16_t delay);
```

Returns

None.

Description

This function has driver wait spinining for the delay milliseconds.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
board	duration to spin.

Function

WDRV_STUB_HardDelay(uint16_t delay)

WDRV_STUB_INTR_Deinit Function

Deinitializes interrupts for Wi-Fi driver.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_INTR_Deinit();
```

Returns

None.

Description

This function deinitializes interrupts for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Function

void WDRV_STUB_INTR_Deinit(void)

WDRV_STUB_INTR_Init Function

Initializes interrupts for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_INTR_Init(void (*isr)(void));
```

Returns

None.

Description

This function initializes interrupts for the Wi-Fi driver.

Remarks

None.

Preconditions

The TCP/IP stack should be initialized.

Parameters

Parameters	Description
isr	function pointer to the interrupt service handler.

Function

void WDRV_STUB_INTR_Init(void (*isr)(void))

WDRV_STUB_INTR_SourceDisable Function

Disables interrupts from the module.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_INTR_SourceDisable();
```

Returns

None.

Description

This function disables interrupts from the module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_STUB_INTR_SourceDisable(void)

WDRV_STUB_INTR_SourceEnable Function

Enables interrupts from the module.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_INTR_SourceEnable();
```

Returns

None.

Description

This function enables interrupts from the module.

Remarks

None.

Preconditions

Wi-Fi initialization must be complete.

Function

void WDRV_STUB_INTR_SourceEnable(void)

WDRV_STUB_SPI_Deinitialize Function

Deinitializes the SPI object for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_SPI_Deinitialize();
```

Returns

None.

Description

This function deinitializes the SPI object for the Wi-Fi driver.

Remarks

None.

Preconditions

None.

Function

void WDRV_STUB_SPI_Deinitialize(void)

WDRV_STUB_SPI_In Function

Receives data from the module through the SPI bus.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
bool WDRV_STUB_SPI_In(unsigned char *const buf, uint32_t size);
```

Returns

None.

Description

This function receives data from the module through the SPI bus.

Remarks

None.

Preconditions

SPI driver should be initialized.

Parameters

Parameters	Description
buf	buffer pointer of input data
size	the input data size

Function

bool WDRV_STUB_SPI_In(unsigned char *const buf, uint32_t size)

WDRV_STUB_SPI_Initialize Function

Initializes the SPI object for the Wi-Fi driver.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
void WDRV_STUB_SPI_Initialize();
```

Returns

None.

Description

This function initializes the SPI object for the Wi-Fi driver.

Remarks

None.

Preconditions

None.

Function

void WDRV_STUB_SPI_Initialize(void)

WDRV_STUB_SPI_Out Function

Sends data out to the module through the SPI bus.

Implementation: Dynamic

File

wdrv_winc1500_stub.h

C

```
bool WDRV_STUB_SPI_Out(unsigned char *const buf, uint32_t size);
```

Returns

True - Indicates success False - Indicates failure

Description

This function sends data out to the module through the SPI bus.

Remarks

None.

Preconditions

SPI driver should be initialized.

Parameters

Parameters	Description
buf	buffer pointer of output data
size	the output data size

Function

bool WDRV_STUB_SPI_Out(unsigned char const *buf, uint32_t size)

e) Data Types and Constants

_WDRV_WINC1500_API_H Macro

File

wdrv_winc1500_api.h

C

```
#define _WDRV_WINC1500_API_H
```

Description

This is macro _WDRV_WINC1500_API_H.

WDRV_STUB_Print Macro

File

wdrv_winc1500_stub.h

C

```
#define WDRV_STUB_Print(x) SYS_CONSOLE_PRINT x
```

Description

This is macro WDRV_STUB_Print.

wdrv_winc1500_api.h

WINC1500 wireless driver APIs.

Functions

	Name	Description
	WDRV_CLI_Init	Initializes the console CLI interface. **Implementation:** Dynamic
	WDRV_EXT_CmdChannelSet	Sets the channel on which to operate. **Implementation:** Dynamic
	WDRV_EXT_CmdConnect	Directs the WINC1500 to connect to a Wi-Fi network. **Implementation:** Dynamic
	WDRV_EXT_CmdConnectContextBssidGet	Gets the BSSID **Implementation:** Dynamic
	WDRV_EXT_CmdDisconnect	Directs the WINC1500 to disconnect from a Wi-Fi network. **Implementation:** Dynamic
	WDRV_EXT_CmdFWUpdate	Directs the module to start firmware download and upgrade. **Implementation:** Dynamic
	WDRV_EXT_CmdFWVersionGet	Retrieves FW version information. **Implementation:** Dynamic
	WDRV_EXT_CmdMacAddressGet	Retrieves the WINC1500 MAC address. **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeAPSet	Sets the Wi-Fi network type to SoftAP. **Implementation:** Dynamic
	WDRV_EXT_CmdNetModeBSSSet	Sets the Wi-Fi network type to Infrastructure. **Implementation:** Dynamic
	WDRV_EXT_CmdPowerSavePut	Puts the module in power save mode. **Implementation:** Dynamic
	WDRV_EXT_CmdScanGet	Reads the number of scan results from the WINC1500 module. **Implementation:** Dynamic
	WDRV_EXT_CmdScanOptionsSet	Sets scan options. **Implementation:** Dynamic
	WDRV_EXT_CmdScanStart	Directs the WINC1500 module to start a scan. **Implementation:** Dynamic
	WDRV_EXT_CmdSecNoneSet	Sets Wi-Fi security to open (no security). **Implementation:** Dynamic
	WDRV_EXT_CmdSecWEPSet	Sets Wi-Fi security to use WEP. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWPASet	Sets Wi-Fi security to use WPA/WPA2. **Implementation:** Dynamic
	WDRV_EXT_CmdSecWpsSet	Sets Wi-Fi security to use WPS. **Implementation:** Dynamic
	WDRV_EXT_CmdSSIDGet	Gets the SSID. **Implementation:** Dynamic
	WDRV_EXT_CmdSSIDSet	Sets the SSID. **Implementation:** Dynamic
	WDRV_EXT_CmdTxPowerSet	Sets the Tx Power at 3 levels, high, medium and low. **Implementation:** Dynamic
	WDRV_EXT_DataSend	Sends data packets to WINC1500 module. **Implementation:** Dynamic
	WDRV_EXT_Deinitialize	Deinitializes the WINC1500 Wi-Fi driver. **Implementation:** Dynamic
	WDRV_EXT_HWInterruptHandler	Wi-Fi driver (WINC1500-specific) interrupt service routine. **Implementation:** Dynamic
	WDRV_EXT_Initialize	Initializes the WINC1500 Wi-Fi driver. **Implementation:** Dynamic

	WDRV_EXT_ModuleUpDown	Enables or disables WINC1500 module. **Implementation:** Dynamic
	WDRV_EXT_MulticastFilterSet	Sets a multicast address filter. **Implementation:** Dynamic
	WDRV_EXT_RssiRead	Requests RSSI for the connected AP. **Implementation:** Dynamic
	WDRV_EXT_ScanResultGet	Reads the selected scan results back from the WINC1500 module. **Implementation:** Dynamic
	WDRV_EXT_WPSResultsRead	Reads the WPS process results back from the WINC1500 module and updates the configuration data. **Implementation:** Dynamic
	WDRV_WINC1500_ISR	Wi-Fi driver (WINC1500-specific) interrupt service routine. **Implementation:** Dynamic

WINC1500 Socket Mode Driver Library

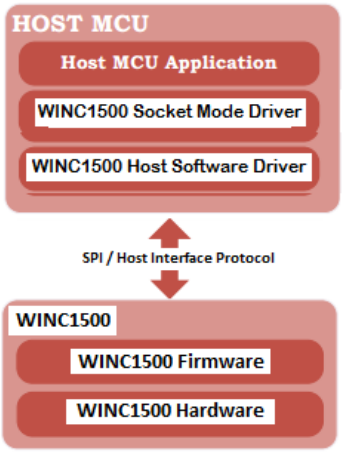
This section provides documentation for the WINC1500 Socket Mode Driver Library.

Introduction

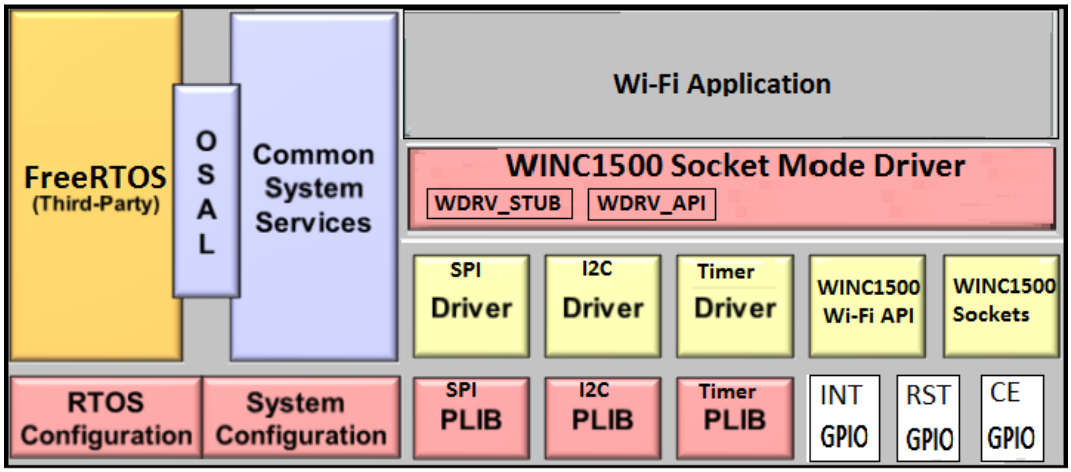
This library provides a low-level abstraction of the WINC1500 Socket Mode Driver Library that is available on the Microchip family of microcontrollers with a convenient C language interface. It can be used to simplify low-level access to the module without the necessity of interacting directly with the module's registers, there by hiding differences from one microcontroller variant to another.

Description

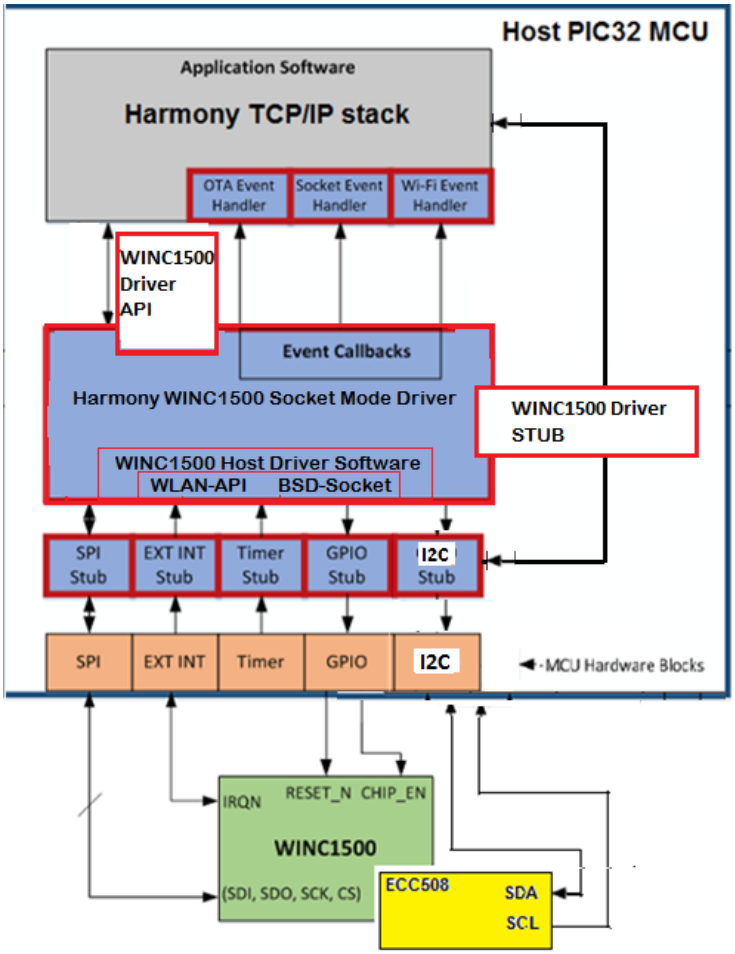
The WINC1500 Socket Mode Driver library is a C library provides the host MCU application with APIs for WLAN and socket operations, off-loading the host MCU TCP/IP networking and transport layer operations to the WINC1500 module firmware.



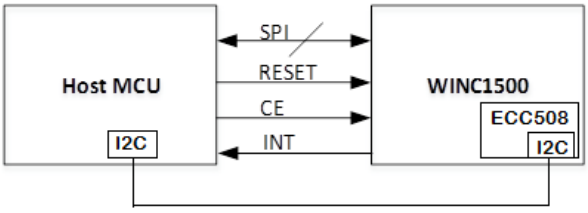
The MPLAB Harmony Integrated Software Framework blocks for the WINC1500 Wi-Fi Application are shown in the following diagram.



The following diagram shows the partitioning of the MPLAB Harmony WINC1500 Socket Mode Driver software on a MCU. Further discussions reference this diagram.



In the previous diagram, the WINC1500 module requires only a SPI interface, a timer, 2 GPIOs for CE and INT, and an interrupt line to connect to the host PIC32 MCU, as shown in the following figure. The figure also shows the I2C interface between the ECC508 device and the Host MCU; however, this feature is not available in the current release and will be available in a future release MPLAB Harmony.



Using the Library

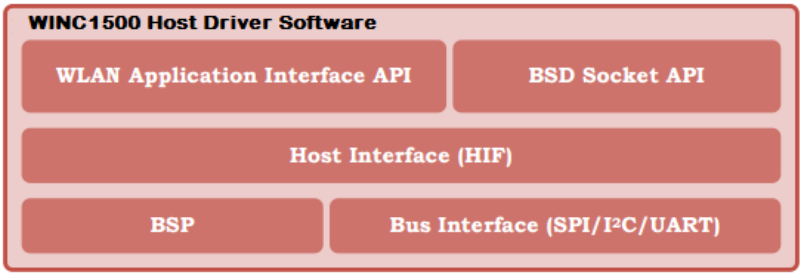
This topic describes the basic architecture of the WINC1500 Wi-Fi Driver Library and provides information and examples on its use.

Description

The WINC1500 Socket Mode Driver Library implements the MPLAB Harmony device driver and communicates with the WINC1500 Host Driver Software to access and control the external WINC1500 module which firmware consists of the following key features:

- Wi-Fi IEEE 802.11 b/g/n STA, AP, and Wi-Fi Direct® modes
- Wi-Fi Protected Setup (WPS)
- Support of WEP, WPA/WPA2 personal, and WPA/WPA2 Enterprise security
- Embedded network stack protocols
- Embedded TCP/IP stack with BSD-style socket API
- Embedded network protocols – DHCP client/server – DNS resolver client – SNTP client for UTC time synchronization
- Embedded TLS security abstracted behind BSD-style socket API
- HTTP Server for provisioning over AP mode
- 8 MB internal Flash memory with OTA firmware upgrade
- Low power consumption with different power saving modes
- SPI, I2C, and UART support

The WINC1500 Host Driver Software is a C library which provides the host MCU application with necessary APIs to perform necessary WLAN and socket operations. The architecture of the WINC1500 Host Driver Software which runs on the host MCU is shown below, and the components of the host driver are described in the following diagram.



WLAN Application Interface API

This module provides an interface to the application for all Wi-Fi operations and any non-IP related operations. This includes the following services:

- Wi-Fi STA management operations
- Wi-Fi Scan
- Wi-Fi Connection management (Connect, Disconnect, Connection status, etc.) – WPS activation/deactivation
- Wi-Fi AP enable/disable
- Wi-Fi Direct enable/disable
- Wi-Fi power save control API
- Wi-Fi monitoring (Sniffer) mode

This interface is defined in the file: m2m_wifi.h.

Socket API

This module provides the socket communication APIs that are mostly compliant with the well-known BSD sockets. To comply with the nature of MCU application environment, there are differences in API prototypes and in usage of some APIs between WINC1500 sockets and BSD sockets.

This interface is defined in the file: socket.h.

Host Interface (HIF)

The Host Interface is responsible for handling the communication between the host driver and the WINC1500 firmware. This includes interrupt handling, DMA and HIF command/response management. The host driver communicates with the firmware in a form of commands and responses formatted by the HIF layer.

The interface is defined in the file: m2m_hif.h.

Board Support Package (BSP)

The Board Support Package abstracts the functionality of a specific host MCU platform. This allows the driver to be portable to a wide range of hardware and hosts. Abstraction includes: pin assignment, power on/off sequence, reset sequence and peripheral definitions (Push buttons, LEDs…etc.).

The minimum required BSP functionality is defined in the file: nm_bsp.h.

Serial Bus Interface

The Serial Bus Interface module abstracts the hardware associated with implementing the bus between the Host and the WINC1500. The serial bus interface abstracts I2C, SPI, or UART bus interface. The basic bus access operations (Read and Write) are implemented in this module as appropriate for the interface type and the specific hardware.

The bus interface APIs are defined in the file: nm_bus_wrapper.h.

Using the WINC1500 Socket Mode Driver Library

The interface to the WINC1500 Socket Driver Library is defined in these header files:

- wdrv_winc1500_api.h
- wdrv_winc1500_stub.h

Any C language source (.c) file that uses the WINC1500 Socket Mode Driver library should include both wdrv_winc1500_api.h and wdrv_winc1500_stub.h.

Abstraction of the WINC1500 Wi-Fi Application

The major blocks of software comprise of a WINC1500 Wi-Fi application are listed and described in the following table.

Software Block	Description
Application Software	This is the application code. Note that three event handlers (OTA, Socket, and Wi-Fi) are part of this block. The event handlers contain callback functions that the driver calls and the application processes.
WINC1500 Socket Mode Driver	This is the WINC1500 Socket Mode driver. The driver API and Stub functions provide application software with setup for the SPI interface between the host MCU and the external WINC1500 module, and provide application software with control and socket data services to the external WINC1500 module via the WINC1500 Host Software Driver.
WINC1500 Socket Mode Driver Stub Functions	The driver Stub functions provide application software with control to the PIC32 MCU hardware blocks (SPI, EXT_INT, Timer, GPIO, I2C) for configuration of Host PIC32 MCU specific hardware and event handling: • SPI Interface • GPIO control • Timer • Interrupt from WINC1500 • Wi-Fi, TPC/IP socket, and OTA event handling
WINC1500 Socket Mode Driver API Functions	The driver Ext functions provide application software access to the driver's system interface for initialize and de-initialize of the driver, as well as setting up the driver hardware interrupt handler and the WINC1500 interrupt service routine. Note: Not all API functions are used in the socket mode driver library. Only these four API functions are used: • WDRV_EXT_Initialize • WDRV_EXT_Deinitialize • WDRV_EXT_HWInterruptHandler • WDRV_WINC1500_ISR
WINC1500 Host Software Driver APIs	The WINC1500 Host Software Driver provides the host MCU application with necessary APIs to perform necessary WLAN and BSD socket operations by offloading these operations to the WINC1500 module firmware. See Section 3 for details of these APIs.

Abstraction Model

This library provides a low-level abstraction of the WINC1500 Wi-Fi module with a convenient C language interface. This topic describes how that abstraction is modeled in software and introduces the library's interface.

Description

The WINC1500 Wi-Fi Library provides the following functionality:

- Wi-Fi library initialization
- Wi-Fi network configuration
- Wi-Fi network connection
- Scanning for existing Wi-Fi networks
- Wi-Fi event processing
- Wi-Fi status
- Wi-FI console commands

Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The Library Interface functions are divided into various sub-sections, which address one of the blocks or the overall operation of the WINC1500 Socket Mode Driver Library.

Library Interface Section	Description
System Interaction Functions	Provides system module interfaces, device initialization, deinitialization, hard interrupt handler, and interrupt service routine. See wdrv_winc1500_api.h, and wdrv_winc1500_stub.h.

Data Transfer Functions	Provides data transfer functions available in the configuration. See wdrv_winc1500_api.h.
Status Functions	Provides status functions. See m2m_wifi.h
Miscellaneous Functions	Provides miscellaneous driver functions.

How the Library Works

This section describes how the WINC1500 Socket Mode Driver Library operates.

Description

The library provides host PIC32 MCU Wi-Fi application with interface support for the external WINC1500 module and offloads Wi-Fi and BSD socket operations to the WINC1500 module firmware.

Configuring the SPI Driver

This section describes the configuration settings for the WINC1500 Socket Mode Driver Library.

Description

Configuration

The WINC1500 hardware requires a specific configuration of the SPI driver to work correctly. Inside the MHC SPI driver configuration make sure to select:

- SPI clock rate of 8000000 or less
- Input phrase of SPI_INPUT_SAMPLING_PHASE_AT_END
- Clock mode of DRV_SPI_CLOCK_MODE_IDLE_LOW_EDGE_FALL

Recommended Settings

- Interrupt Driver mode
- Enhanced Buffer mode
- DMA mode enabled
- DMA Block Transfer Size to 512
- Size of DMA Buffer for dummy data to 512
- Ensure when setting up DMA in interrupt mode that the DMA interrupts are a higher priority than the SPI Driver interrupt

Examples

```
/*** SPI Driver Configuration ***/
#define DRV_SPI_NUMBER_OF_MODULES 6
/*** Driver Compilation and static configuration options. ***/
/*** Select SPI compilation units.***/
#define DRV_SPI_POLLED 0
#define DRV_SPI_ISR 1
#define DRV_SPI_MASTER 1
#define DRV_SPI_SLAVE 0
#define DRV_SPI_RM 1
#define DRV_SPI_EBM 0
#define DRV_SPI_8BIT 1
#define DRV_SPI_16BIT 0
#define DRV_SPI_32BIT 0
#define DRV_SPI_DMA 1
/*** SPI Driver Static Allocation Options ***/
#define DRV_SPI_INSTANCES_NUMBER 1
#define DRV_SPI_CLIENTS_NUMBER 1
#define DRV_SPI_ELEMENTS_PER_QUEUE 10
/*** SPI Driver DMA Options ***/
#define DRV_SPI_DMA_TXFER_SIZE 512
#define DRV_SPI_DMA_DUMMY_BUFFER_SIZE 512
/* SPI Driver Instance 0 Configuration */
#define DRV_SPI_SPI_ID_IDX0 SPI_ID_1
#define DRV_SPI_TASK_MODE_IDX0 DRV_SPI_TASK_MODE_ISR
#define DRV_SPI_SPI_MODE_IDX0 DRV_SPI_MODE_MASTER
#define DRV_SPI_ALLOW_IDLE_RUN_IDX0 false
#define DRV_SPI_SPI_PROTOCOL_TYPE_IDX0 DRV_SPI_PROTOCOL_TYPE_STANDARD
```

```
#define DRV_SPI_COMM_WIDTH_IDX0 SPI_COMMUNICATION_WIDTH_8BITS

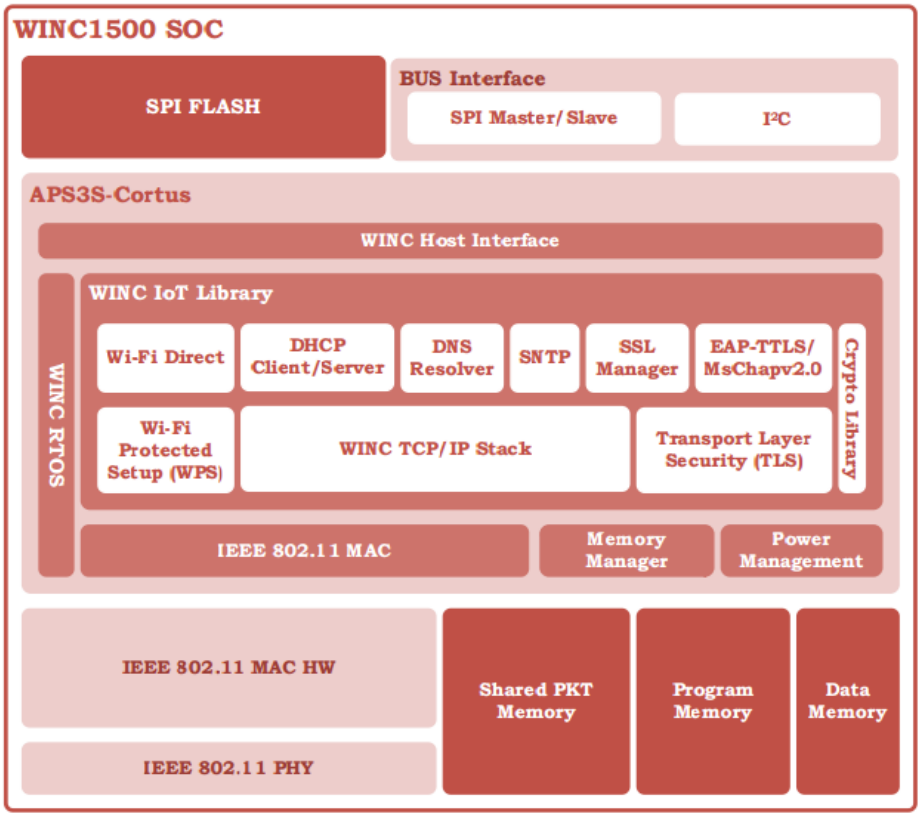
WINC1500 Module Firmware Overview

Provides an overview of the firmware for the WINC1500 Module.

Description

The firmware comprises the Wi-Fi IEEE-802.11 MAC layer and embedded protocol stacks which offload the host MCU. The components of the system are described in the following sub-sections.



WLAN APIs

This WLAN APIs provide an interface to the application for all Wi-Fi operations and any non-IP related operations. This includes the following

services:

- Wi-Fi STA management operations
- Wi-Fi Scan
- Wi-Fi Connection management (Connect, Disconnect, Connection status, etc.)
- WPS activation/deactivation
- Wi-Fi AP enable/disable
- Wi-Fi Direct enable/disable
- Wi-Fi power save control API
- Wi-Fi monitoring (Sniffer) mode

This interface is defined in the file: `m2m_wifi.h`.

Socket API

The socket APIs are mostly compliant with the BSD sockets and to comply with the nature of MCU application environment, there are differences in API prototypes and in usage of some APIs between WINC1500 sockets and BSD sockets.

This interface is defined in the file: `socket.h`.

IoT Library

The IoT library provides a set of networking protocols in WINC1500 firmware. It offloads the host MCU from networking and transport layer protocols. The following sections describe the components of WINC1500 IoT library.

- WINC1500 TCP/IP STACK - The WINC TCP/IP is an IPv4.0 stack based on the uIP TCP/IP stack (pronounced micro IP).
- DHCP CLIENT/SERVER - A DHCP client is embedded in WINC1500 firmware that can obtain an IP configuration automatically after connecting to a Wi-Fi network. WINC1500 firmware provides an instance of a DHCP server that starts automatically when WINC AP mode is enabled. When the host MCU application activates the AP mode, it is allowed to configure the DHCP Server IP address pool range within the AP configuration parameters.
- DNS RESOLVER – WINC1500 firmware contains an instance of an embedded DNS resolver. This module can return an IP address by resolving the host domain names supplied with the socket API call gethostbyname.
- SNTP - The SNTP (Simple Network Time Protocol) module implements an SNTP client used to synchronize the WINC1500 internal clock to the UTC clock.
- EAP-TTLS/MSCHAPV2.0 - This module implements the authentication protocol EAP-TTLS/MsChapv2.0 used for establishing a Wi-Fi connection with an AP by with WPA-Enterprise security.
- TRANSPORT LAYER SECURITY - For TLS implementation.
- WI-FI PROTECTED SETUP - For WPS protocol implementation.
- WI-FI DIRECT - For Wi-Fi Direct protocol implementation.
- CRYPTO LIBRARY - The Crypto Library contains a set of cryptographic algorithms used by common security protocols. This library has an implementation of the following algorithms:
- MD4 - Hash algorithm (Used only for MsChapv2.0 digest calculation)
- MD5 - Hash algorithm
- SHA-1 - Hash algorithm
- SHA-256 - Hash algorithm
- DES Encryption (Used only for MsChapv2.0 digest calculation)
- MS-CHAPv2.0 (Used as the EAP-TTLS inner authentication algorithm)
- AES-128, AES-256 Encryption (Used for securing WPS and TLS traffic)
- BigInt module for large integer arithmetic (for Public Key Cryptographic computations)
- RSA Public Key cryptography algorithms (includes RSA Signature and RSA Encryption algorithms)

Host Interface Driver Wi-Fi Events

Provides information on the Host Interface Driver Wi-Fi events.

Description

There are four categories of events:

• Wi-Fi events

• Socket events

• OTA (Over-The-Air) update events

• Error Events

Wi-Fi Events

Wi-Fi events must be customized to suit the application. The WINC1500 socket driver calls the event callback function to notify the application of Wi-Fi events. The p_eventData parameter points to a ‘C’ union of containing all possible Wi-Fi event data. Not all events have data associated with them – in this case the pointer will be NULL. When an event occurs, the event data should be read as soon as possible before another event

occurs which will overwrite data from the previous event.

If the event data is to be retrieved outside the event handler function, the utility function m2m_wifi_get_wifi_event_data() returns a pointer to the t_wifiEventData union.

Socket Events

Socket events are handled, but must be customized to suit the application. The WINC1500 driver calls the socket event callback function to notify the application of socket events. The p_eventData parameter points to a 'C' union of containing all possible socket event data. Not all events have data associated with them – in this case the pointer will be NULL. When an event occurs, the event data should be read as soon as possible before another event occurs which will overwrite data from the previous event.

If the event data is to be retrieved outside the event handler function, the utility function m2m_wifi_get_socket_event_data() returns a pointer to the t_socketEventData union.

OTA Events

OTA events are associated with downloading and switching to a new WINC1500 firmware image downloaded via the Wi-Fi network. The WINC1500 driver calls the OTA event callback function to notify the application of OTA events. The p_eventData parameter points to a 'C' structure containing the OTA event data.

If the event data is to be retrieved outside the event handler function, the utility function m2m_wifi_get_ota_event_data() returns a pointer to the t_otaEventData structure.

Error Events

The application is notified of error events via the callback. Error codes are defined in: `wf_errors.h`.

Configuring the Library

This section describes how to configure the WINC1500 Wi-Fi driver.

Description

The configuration of the WINC1500 Wi-Fi Driver is based on the file `system_config.h`.

This header file contains the configuration selection for the WINC1500 Socket Mode Driver Library. Based on the selection, the WINC1500 Socket Mode Driver Library may support the selected features. These configuration settings will apply to all instances of the WINC1500 Socket Mode Driver Library.

This header can be placed anywhere; however, the path of this header needs to be present in the include search path for a successful build. Refer to the Applications Help section for more details.

Building the Library

This section lists the files that are available in the WINC1500 Wi-Fi Driver Library.

Description

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/driver/wifi/winc1500`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
wdrv_winc1500_stub.h	Contains Stub function prototypes for interfacing to the WINC1500 Wi-Fi Driver.
wdrv_winc1500_api.h	Contains API function prototypes for interfacing to the WINC1500 Wi-Fi Driver.

Required File(s)

MHC ***All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.***

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source Folder Name	Description
/driver/wifi/winc1500/dev/console/wdrv_winc1500_console.c	Console module for WINC1500 wireless driver.
/driver/wifi/winc1500/dev/gpio/wdrv_winc1500_eint.c	External interrupt handler for WINC1500 wireless driver.

/driver/wifi/winc1500/dev/gpio/wdrv_winc1500_gpio.c	GPIO interface for WINC1500 wireless driver.
/driver/wifi/winc1500/dev/spi/wdrv_winc1500_spi.c	Support SPI communications to the WINC1500 module.
/driver/wifi/winc1500/dev/timer/wdrv_winc1500_timer.c	Timer functions for WINC1500 wireless driver.
/driver/wifi/winc1500/osal/wdrv_winc1500_osal.c	OS abstraction layer for WINC1500 wireless driver.
/driver/wifi/winc1500/wireless_driver_extension/common/source/nm_common.c	This module contains common APIs implementations.
/driver/wifi/winc1500/wireless_driver_extension/driver/source/m2m_hif.c	This module contains M2M host interface API implementations.
/driver/wifi/winc1500/wireless_driver_extension/driver/source/m2m_ota.c	WINC1500 IoT OTA Interface.
/driver/wifi/winc1500/wireless_driver_extension/driver/source/m2m_periph.c	WINC1500 Peripherals Application Interface.
/driver/wifi/winc1500/wireless_driver_extension/driver/source/m2m_wifi.c	This module contains M2M Wi-Fi APIs implementation.
/driver/wifi/winc1500/wireless_driver_extension/driver/source/nmasic.c	This module contains WINC1500 ASIC specific internal APIs.
/driver/wifi/winc1500/wireless_driver_extension/driver/source/nmbus.c	This module contains WINC1500 bus APIs implementation.
/driver/wifi/winc1500/wireless_driver_extension/driver/source/nmdrv.c	This module contains WINC1500 M2M driver APIs implementation.
/driver/wifi/winc1500/wireless_driver_extension/driver/source/nmspi.c	This module contains WINC1500 SPI protocol bus APIs implementation.
/driver/wifi/winc1500/wireless_driver_extension/socket/source/socket.c	WINC1500 BSD Compatible Socket Interface.
/driver/wifi/winc1500/wireless_driver_extension/spi_flash/source/spi_flash.c	WINC1500 SPI flash interface.
/driver/wifi/winc1500/wireless_driver_extension/wdrvext_winc1500.c	WINC1500 wireless driver extension.
/driver/wifi/winc1500/wireless_driver_extension/winc1500_fw_update.c	WINC1500 firmware update support.
/driver/wifi/winc1500/wireless_driver_extension/winc1500_task.c	Entry point of WINC1500 core driver.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	The WINC1500 Wi-Fi Driver controller has no optional files.

Module Dependencies

The WINC1500 Socket Mode Driver Library depends on the following modules:

- SPI Driver Library
- SPI Flash Driver Library
- WINC1500 Wi-Fi Driver Ethernet Mode Library
- Timer Driver Library
- USART Driver Library

Library Interface

This section describes the Application Programming Interface (API) functions of the WINC1500 Socket Mode Driver. Refer to the *WINC1500 Wi-Fi Driver Library* > Library Interface section for information on the APIs in that library that are also used by the WINC1500 Socket Mode Driver.

Refer to each section for a detailed description.

WINC1500 Firmware Update Utility

Refer to WINC1500 Firmware Update Guide for detailed information on using the firmware update utility.

Encoder Libraries Help

This section provides descriptions of the software Encoder libraries that are available in MPLAB Harmony.

Opus Encoder Library

This section describes the Opus Encoder Library, which utilizes the same prebuilt library as the Opus Decoder.

Introduction

Introduces the Opus Encoder Library.

Description

Opus is an open, royalty-free, highly versatile audio codec. Opus is unmatched for interactive speech and music transmission over the Internet, but is also intended for storage and streaming applications. It is standardized by the Internet Engineering Task Force (IETF) as RFC 6716, which incorporated technology from Skype's SILK codec and Xiph.Org's CELT codec.

Opus Features

Supported features are:

- Bit rates from 6 kb/s to 510 kb/s
- Sampling rates from 8 kHz (narrowband) to 48 kHz (fullband)
- Frame sizes from 2.5 ms to 60 ms
- Support for both constant bit rate (CBR) and variable bit rate (VBR)
- Audio bandwidth from narrowband to fullband
- Support for speech and music
- Support for mono and stereo
- Support for up to 255 channels (mult-istream frames)
- Dynamically adjustable bit rate, audio bandwidth, and frame size
- Good loss robustness and packet loss concealment (PLC)
- Floating point and fixed-point implementation

The full specification, RFC 6716, including the reference implementation is available from http://www.opus-codec.org. An up-to-date implementation of the Opus standard is available from the Opus Codec downloads page by visiting: https://www.opus-codec.org/downloads/

Typical Applications

- Building and home safety systems; Intercoms
- Smart appliances
- Walkie-talkies
- Toys
- Robots
- Any application using message playback

Resources

Feature	Option	Usage
Opus Encoder Library Flash Size	Release Build	292 KB
Opus Encoder RAM	Heap Size (Stereo mode, 16 kHz, 16-bit Audio)	31 KB

Using the Library

This topic describes the basic architecture of the Opus Encoder Library and provides information and examples on its use.

Description

Interface Header File: `opus_enc.h`

The interface to the Opus Encoder Library is defined in the `opus.h` header file. Any C language source (`.c`) file that uses the Opus Encoder Library should include `opus_enc.h`.

Please refer to the What is MPLAB Harmony? section for how the Opus Encoder Library interacts with the framework.

Library Overview

The Library Interface routines are divided into various sub-sections, each of which addresses one of the blocks or the overall operation of the Opus Encoder Library module.

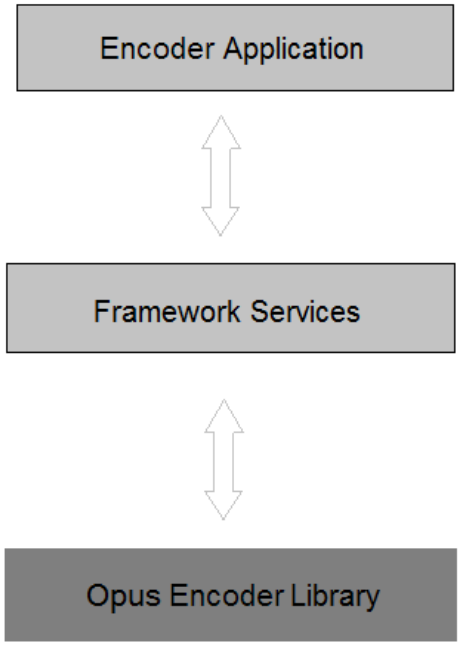
Abstraction Model

Describes the abstraction model for the Opus Encoder Library.

Description

This Opus Library is an Open Source/Free Software patent-free audio compression format designed for interactive speech and music transmission over the Internet. The MPLAB Harmony framework provides an abstraction layer to easily interact with this library. Refer to the universal_audio_decoders demonstration for reference.

Abstraction Model



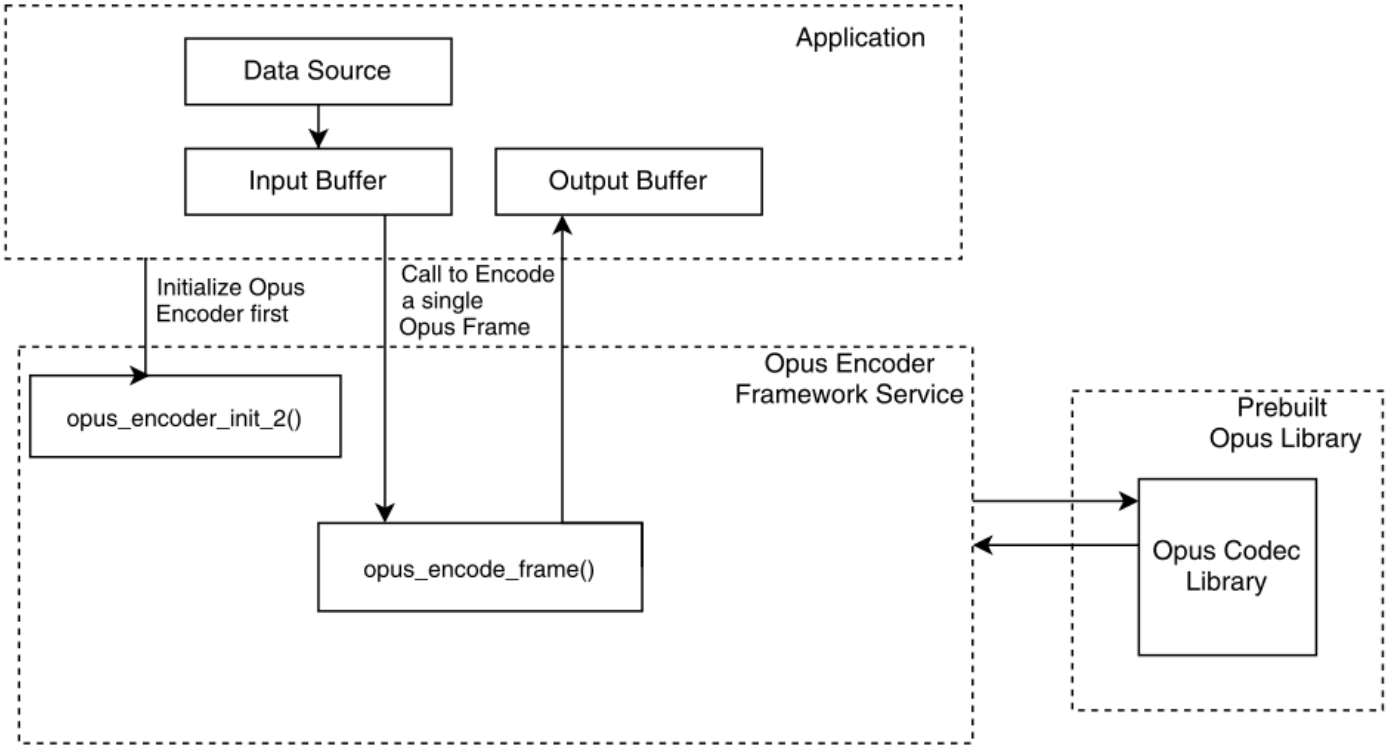
How the Library Works

This section describes how to work with the MPLAB Harmony Opus abstraction layer interface, which provides simplifier APIs for using the Opus Encoder Library.

Description

For complete documentation and how to implement Opus, visit https://www.opus-codec.org.

The following diagram describes the data flow between the Opus Encoder and an application.



Initializing the Opus Encoder

Initialize the Opus Encoder by calling the function opus_encoder_init_2 from the `opus_enc.h` file. This function initializes the Opus Encoder state structure. The application can start to decode Opus frame after initialization.

Decoding an Opus Frame

The opus_encode_frame function in `opus_enc.h` is used to encode a single Opus frame, and write back encoded data into an output buffer.

Code Example

The following code provides an example for initializing the Opus Encoder and encoding a packet.

```
bool encoder_init(EncoderType encoder_type)
{
    // initialize encoder state
    bool ret = false;
    encoder_state.encoder_type = encoder_type;
    ret = opus_encoder_init_2(stream_info.channel, stream_info.sample_rate);
    return ret;
}

void App_Task()
{
    while(1){
        while(not the last packet of audio data){

            // Encode one packet
            bool ret = opus_encode_frame(pin, insize, pout, outsize);
            if(ret == true)
            {
                // continue decoding
            }else{
                // handle decoding errors;
            }

        }
        // Clean up
        opus_encoder_free();
        break;
    }
}
```

Library Interface

This section describes the Application Programming Interface (API) functions of the Opus Encoder Library.

Refer to each section for a detailed description.

a) General Functions

b) Data Types and Constants

Files

This section lists the source and header files used by the Opus Encoder Library.

Speex Encoder Library

This section describes the Speex Encoder Library, which utilizes the same prebuilt library as the Speex Encoder.

Introduction

This section introduces the Speex Encoder Library.

Speex is an open source software audio compression format designed for speech. The Speex Project aims to lower the barrier of entry for voice applications by providing a free alternative to expensive proprietary speech codecs. Speex is well-adapted to Internet applications and provides useful features that are not present in most other codecs. Finally, Speex is part of the GNU Project and is available under the revised BSD license.

Speex Features

Supported features are:

- Narrowband (8 kHz), wideband (16 kHz), and ultra-wideband (32 kHz) compression in the same bitstream
- Intensity stereo encoding
- Packet loss concealment
- Variable bitrate operation (VBR)
- Voice Activity Detection (VAD)
- Discontinuous Transmission (DTX)
- Fixed-point port
- Acoustic echo canceller
- Noise suppression

Feature	Option	Usage
Speex Encoder Library Flash Size	Release Build	20KB
Speex Encoder RAM	Heap Size (narrow band)	33KB ~ 35KBs

Using the Library

This topic describes the basic architecture of the Speex Encoder Library, and provides information and examples on its use.

Description

The interface to the Speex Encoder Library is defined in the `speex_enc.h` header file. Any C language source (`.c`) file that uses the Speex Encoder Library should include `speex _enc.h`.

Please refer to the What is MPLAB Harmony? section for how the Speex Encoder Library interacts with the framework.

Library Overview

The Library Interface routines are divided into various sub-sections, each of which addresses one of the blocks, or the overall operation of the

Speex Encoder Library module.

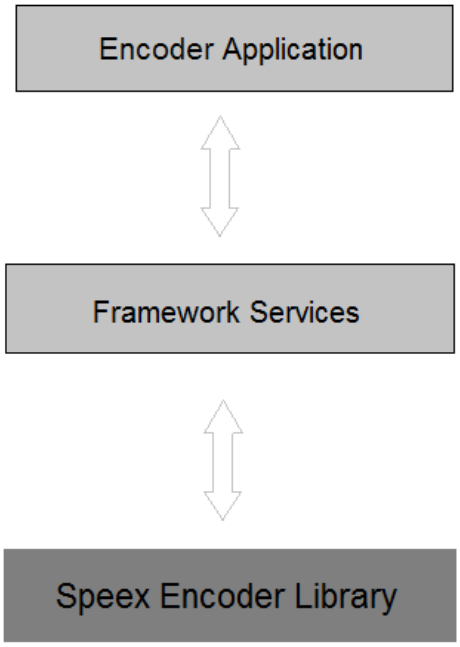
Abstraction Model

This section describes the abstraction model for the Speex Encoder Library.

Description

This Speex Library is an open source, patent-free audio compression format designed speech. The MPLAB Harmony framework provides an abstraction layer to easily interact with this library. Refer to the universal_audio_encoders demonstration for reference.

Abstraction Model



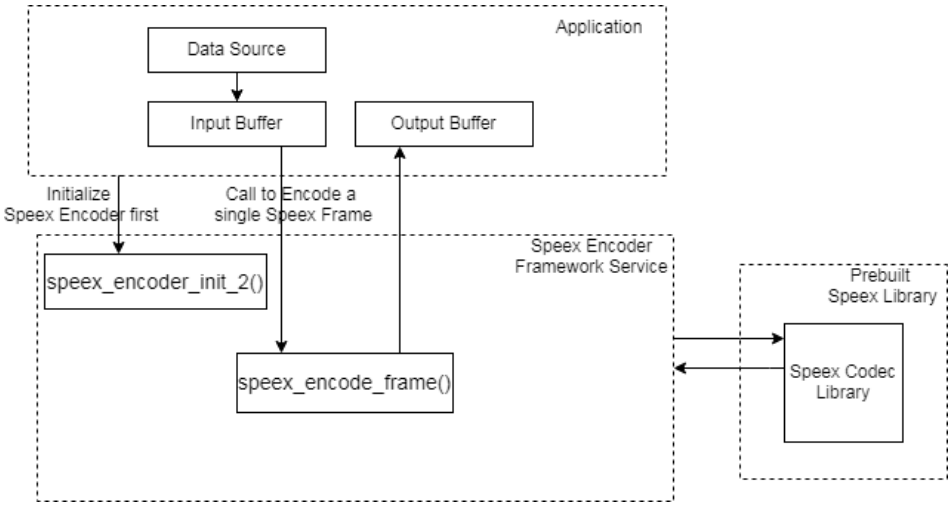
How the Library Works

This section describes how to work with the MPLAB Harmony Speex Encoder abstraction layer interface, which provides simplified APIs for using the Speex Encoder Library.

Description

For complete documentation and how to implement Speex, visit https://www.speex.org.

The following diagram describes the data flow between the Speex Encoder and an application.



Initializing the Speex Encoder

Initialize the Speex Encoder by calling the function `speex_encoder_init_2` from the `speex_enc.h` file. This function initializes the Speex Encoder state structure. The application can start to decode the Speex frame after initialization.

Decoding a Speex Frame

The `speex_encode_frame` function in `speex_enc.h` is used to encode a single Speex frame, and write back encoded data into an output buffer.

Code Example

The following code provides an example for initializing the Speex Encoder and encoding a packet.

```
bool encoder_init(EncoderType encoder_type)
{
// initialize encoder state
bool ret = false;
encoder_state.encoder_type = encoder_type;
ret = speex_encoder_init_2(stream_info.channel, stream_info.sample_rate);
return ret;
}
void App_Task()
{
while(1){
while(not the last packet of audio data){
// Encode one packet
bool ret = opus_encode_frame(pin, insize, pout, outsize);
if(ret == true)
{
// continue decoding
}else{
// handle decoding errors;
}
}
// Clean up
opus_encoder_free();
break;
}
}
```

Library Interface

This section describes the Application Programming Interface (API) functions of the Speex Encoder Library.

Refer to each section for a detailed description.

a) General Functions

b) Data Types and Constants

Files

This section lists the source and header files used by the Speex Encoder Library.

Graphics Libraries Help

This topic provides information about the graphics libraries that are available in MPLAB Harmony.

Currently, MPLAB Harmony provides two solutions for developing graphics firmware:

- The MPLAB Harmony Graphics Composer (MHGC) Suite - The MPLAB Harmony Graphics Composer Suite (MHGC) is a free, modular graphics stack and tools suite for use with Microchip PIC32 microcontrollers. The MHGC tool provides an easy to use GUI that works within the MPLAB X IDE environment.
- The SEGGER emWin Graphics Library - In addition to the standard Graphics Library, the MPLAB Harmony Integrated Software Framework also offers a third-party graphics library, emWin, from SEGGER Microcontroller GmbH & Co. KG. The SEGGER emWin Graphics Library provides an efficient, processor and LCD controller-independent Graphical User Interface (GUI) for applications that operate with a graphical LCD.

MPLAB Harmony Graphics Composer (MHGC) Suite

This section describes the MPLAB Harmony Graphics Composer (MHGC) Suite.

Introduction

This section provides an overview of the MPLAB Harmony Graphics Composer (MHGC) Suite.

Description

The MPLAB Harmony Graphics Composer (MHGC) Suite is a free, modular graphics stack and tools suite for use with Microchip PIC32 microcontrollers. The MHGC suite provides an easy to use GUI that works within the MPLAB X IDE environment. This is tightly coupled with MPLAB Harmony Configurator (MHC), code development, and other integrated debug features. The tools provide a simplified interface to create graphics content, target specific processor / display and touch interface hardware, and generate code. In most cases, no additional programming to support graphics is required at all, which reduces development time. For more information about the MHGC, refer to MPLAB Harmony Graphics Composer User's Guide.

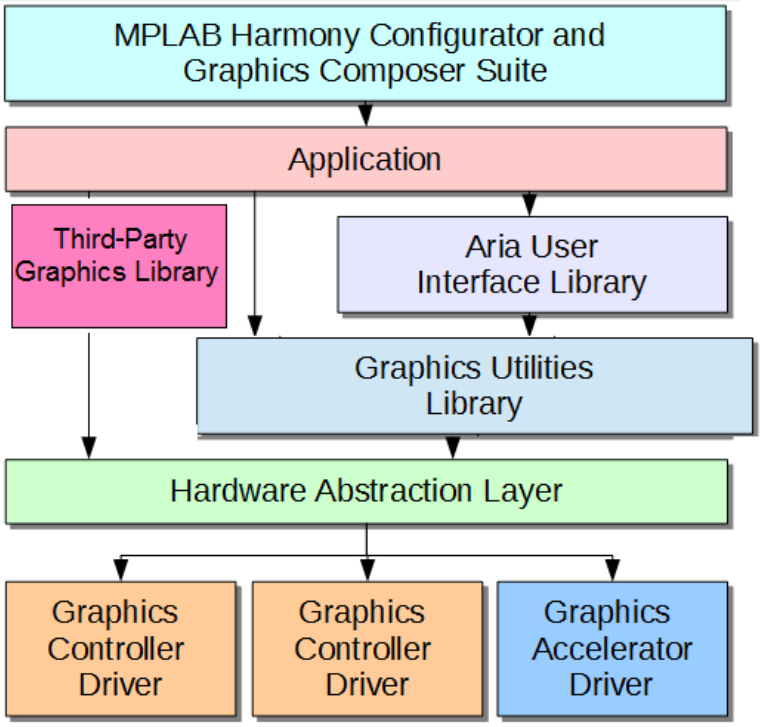
The MPLAB Harmony Graphics Stack consists of several layers that directly build on the capabilities of lower layers to provide a robust framework for displaying rich graphics on supported display devices. Higher layers can be removed as needed if their capabilities are not required.

Graphics Stack Architecture

This section describes the graphics stack architecture.

Description

The following is a diagram of the graphics stack architecture.



The functionality of each layer is summarized below, the details have been provided in the help document in the corresponding sections:

- Graphics Controller Driver – Software that talks directly to hardware. Multiple drivers for internal, external and no-controller options are available. These can be customized with the new Display Manager interface. No other software in the stack should have hardware access.
- Graphics Accelerator Driver- Software that interfaces with graphics accelerator hardware.
- Hardware Abstraction Layer (HAL) – A software layer that serves as a gate-keeper for all graphics controller and accelerator drivers. This layer is configured at initialization by the underlying graphics drivers and provides functionality such as: buffer management, primitive shape drawing, hardware abstraction, and draw state management. The presence of this layer serves as a means of protection for the drivers, frame buffers, and draw state in order to prevent state mismanagement by the application.
- Graphics Utilities Library – This library is primarily responsible for managing and decoding assets such as images, fonts, and strings. It provides the means for interacting with asset data, complex data decoding, data decompression, and string asset look-up. It also abstractly handles accessing external memory sources during asset decoding.
- Aria User Interface Library – This library provides the capability for interface generation, management, and interaction. This library provides the building blocks for constructing a user interface in the form of “Widgets” or user interface elements. These consist of things like buttons, check-boxes, images, etc. This library also handles user interaction events for things like touch actions.
- Third Party Graphics Library – The third party library can be used with the harmony framework to perform the graphics operations if desired by the user. The third party library has access to the hardware abstraction layer (HAL), which has been configured to supply the frame buffer to be filled in by the third-party graphics library.
- MPLAB Harmony Graphics Composer (MHGC) – This tools suite provides the capability to design a user interface using a graphical drag and drop interface. The tool can write all of the code needed to initialize, configure, and manage an Aria library context. The tools include:
- Graphics Asset Converter – new engine for importing multiple external image types, estimating and optimizing size,
- Image Editor - Enabling palette, compression, format changes and editing of images without external tools
- Resource Manager – Tabulated totals of memory usage for images, fonts and other elements used within the graphics design. These can be used to optimize a specific design to fit within a given device Flash memory.
- WYSIWYG GUI editor – Enables drag and drop capability to visualize your particular design
- Event Manager – Enables the user to customize the experience of touch and logical (application) events and to interact with graphical attributes
- Tree Manager – Enables the user to select the drawing priority and establish parent / child relationships so that objects can be grouped as desired
- String and Font Manager – Used to input strings in multiple languages for potential reuse, and optimization of fonts and memory requirements

The Graphics Library architecture components, display drivers, libAria APIs and demonstration applications are placed into the following locations during the installation of MPLAB Harmony:

- `/microchip/harmony/<version>/framework/gfx/hal`
- `/microchip/harmony/<version>/framework/gfx/utils`
- `/microchip/harmony/<version>/framework/gfx/libaria`
- `/microchip/harmony/<version>/apps/gfx/`

Graphics Composer Suite Salient Features

This section provides the highlights of the new MPLAB Harmony Graphics Composer Suite.

Description

Multiple new features have been added to the tools starting with the introduction of MPLAB Harmony v2.02.

These tools were reworked based on:

- New hardware capabilities from Microchip PIC32 products
- Numerous customer requests for updated features.

The tools include:

- New graphics import engine (GAC)
- Capability of image conversion and compression
- Hardware Abstraction Layer (HAL), support for GPU
- Entirely new graphics library (Aria User Interface Library)
- Localization font and string manager; font filtering
- Resource utilization manager
- 24-bit color (32-bit with alpha channel) and multi-layer support
- Multiple new widgets, support for primitive touch gestures
- Multiple new applications to demonstrate features (old apps will be retired)
- Tree drawing support, parent child association
- Revised WYSIWYG engine, updated accuracy and screen elements
- Revised clipping and object drawing support
- New interface for graphics events, and external / logical macros
- Integration of the Display Manager for automatic generation of display drivers

In addition to the rich features offered on introduction, the new architecture enables new capabilities that are planned in future releases.

These new features include:

- Integration of the PIC32MZ DA LCD driver (GLCD)
- Support for the PIC32MZ DA GPU library
- Mechanism for the motion/movement engine
- Mechanism for the simulation engine
- Editor/user customization of widgets
- Integrated image editor
- Touch screen gesture editing
- Memory-saving global pallet functions, optimized use of SRAM buffers

Graphics Composer Suite Goals

This section describes the MPLAB Harmony Graphics Composer Suite goals.

Description

The graphics tools and stack were designed with several goals in mind:

- Tight Integration Experience – Design and code generator tools are tightly integrated with the development environment for one-touch project generation
- User Experience – Libraries and tools are easy to learn and use
- Powerful User Interface Library – User interface library builds upon and expands previous capabilities to offer increased functionality
- Complete Code Generation – Can generate code for library initialization, library management, touch integration, color schemes, event handling, and screen macros
- Powerful Asset Converter – Can output several image formats, performs auto palette generation for image compression, supports run-length encoding, and supports several popular image asset formats. Also supports automatic font character inclusion and rasterization.
- Expanded Color Mode Support – The stack can manage frame buffers using 8-bit to 32-bit color
- Enhanced Resource Configuration – Tools provide the capability to manage assets more completely
- Text localization – The stack provides the capability to easily integrate international language characters into a design and seamlessly change between defined languages at run-time
- Abstract Hardware Support – Graphics controllers and accelerators should be able to be added or removed without any change to the application
- Enable future features – Including simulator and motion functions

Graphics Composer Porting

This section describes the MPLAB Harmony Graphics Composer porting process.

Description

Within MPLAB Harmony releases earlier than v2.02, the MPLAB Harmony Graphics Composer tool offered only a subset of the features currently provided. This feature subset included tools that were removed in the current release. These removed tools include:

- Graphics Object Library (GOL)
- Graphic Asset Converter (GAC)

Customers who must have legacy access to these tools can still find them in a parallel version of MPLAB Harmony. These tools will continue to be available within the v1.xx versions for some time.

- On update of the tools, any designs previously constructed using graphics will be offered an update. This process will port the old design to the new structure. While the process is automatic, it may take some engineering to refine items like widget compatibility. Most objects, their events, parameters and locations will be ported into the new design without further intervention.

Aria User Interface Library

This section describes the Aria User Interface for the graphics capabilities and operations.

Description

Introduction

Introduces the Aria User Interface Library.

Description

The Aria User Interface Library is primarily responsible for presenting a visual means of interaction between a user and an application. The library provides the building blocks to construct a complex user interface and is responsible for managing the interface once created. It is also responsible for responding to external input from users other sources and reacting appropriately. The goals of this library are to be:

- Able to provide a simple but powerful user experience
- Customizable to the needs of the application
- Light and flexible with regards to resource consumption
- Easily extensible to meet future design needs

Definitions

Alignment – Indicates the placement of objects within a given bounding area

Bounding Rectangle – The rectangle that an object occupies in a given space

Context – A discrete instance of the user interface library

Event – An indication of some kind of occurrence that may require attention

Layer – Directly related to the layers offered by the Hardware Abstraction Layer. Aria layers also function as direct children to a screen. Widgets are added to layers and become part of the overall widget tree.

Margin – A buffer area at the edge of a bounding rectangle

Occlusion – The state of being completely obstructed by another entity.

Rasterize – The process of translating a user interface model from a logical mathematical representation into a visual image.

Scheme – A list of colors that can be referenced for drawing purposes

Screen – The root node of a widget tree. Represents a discrete configuration of layers and widgets. Can have a unique life cycle for custom memory management.

String – A logical array of linguistic characters

Widget – An abstract object that is part of a user interface

Widget Tree – A tree data structure of widgets that, when rendered, generates a user interface image.

Overview

The Aria user interface library is primarily responsible for:

- HAL Configuration
- Widget Tree Management
- Event Management
- Input Handling

- Scene Rendering

HAL Configuration

The Aria User Interface library is context-based similar to other portions of the graphics stack. For ease of use, the library is responsible for creating and managing a HAL context internally. This releases the application from having to interact with the HAL API at all.

The context contains all of the information required to manage the state of the library. It contains the screen state, the event list, the input state, and various other settings.

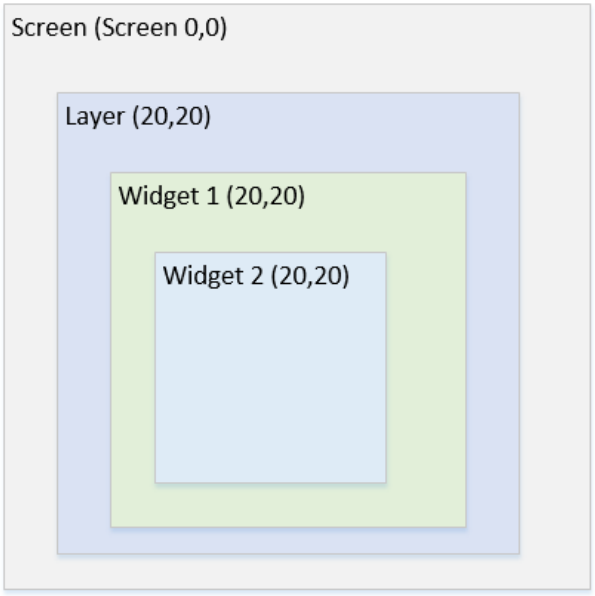
Widget Tree Management

The widget tree is a tree data structure comprised primarily of widgets. At its root is a screen object. Each of the screen object's direct children is a layer object. Any descendants of a layer are widgets.

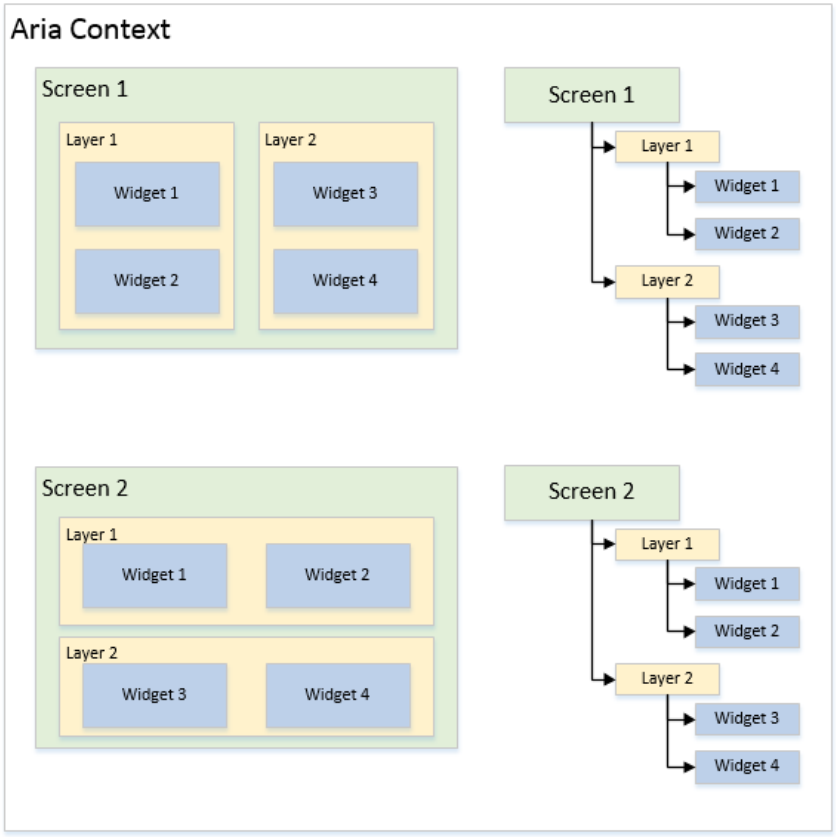
Heterogeneous Space

When dealing with objects in a tree it is helpful to understand objects do not live in the same coordinate space as their ancestors or descendants. Each level of the tree represents a unique area of spatial coordinates with the root coordinate space, or the screen space, being the physical space of the display device. Each space is a two dimensional Cartesian coordinate system in both the positive and negative directions.

For example, assume a widget is a child of a layer which is a child of a screen. The screen position is (0,0) in physical space. The layer position is (20,20). Widget 1 is at (20,20) and widget 2 is at (20,20). All of these coordinates aside from the screen are relative. Each widget is (20,20) offset from its parent. However, Widget 2 is not at (20,20) in physical space, it's actually (60,60). In global space each space builds on its parent, but it's entirely relative.



The following is two screen examples showing different visual representations with identical logical (tree) representations.



Using a tree to manage the logical state of a user interface provides numerous benefits.

- **Position Inheritance** – Child coordinate systems logically inherit from their parents but are not directly affected by them. Thus, if some ancestor changes position in its space, children likewise change overall position but their positions in their relative space do not change. This allows for easy manipulation of large portions of the user interface through very small changes.
- **Intelligent Rendering** – The tree structure allows for fast analysis of widget states when determining how and when to render the overall scene. Nodes in the tree track changes in the states of widgets and their descendants. This allows the library to use intelligent methods to cull portions of the user interface to avoid the processing overhead of redrawing widgets that have not changed.
- **Effect Propagation** – As with coordinate propagation, effects can also be inherited along tree branches. For instance, if some node in the tree is made invisible, all descendants are also made invisible. If a node is made partially transparent, then that transparency is propagated to all descendant nodes.

Screens

A screen is defined as the logical root of the user interface scene. Its direct descendants are always one or more layers, as seen in the above diagram. Its size always matches the physical dimensions of the display device used.

Life Cycle

The life cycle of a screen can be configured to better manage run-time memory usage. The relevant options are:

Persistent – By default screens will create their widget tree when shown and will free the memory consumed by their widget tree when they are hidden. A screen that is marked as persistent will not free their widget tree when hidden. This allows widgets in a screen to maintain their state when the screen is no longer visible. The downside is that more heap memory is consumed.

Create At Startup – By default screens are only created when they are shown thus keeping run-time memory usage to a minimum. However, the application may want to access widgets in a screen before it is shown for the first time. This option will cause the screen to allocate all of its memory when the screen is first added to the user interface library context.

Orientation

Because the Hardware Abstraction Layer supports dynamic orthogonal orientation, screens can take advantage of this feature. Thus, screens have the option to set a magnitude of rotation to some factor of 90 degrees.

Layers

User interface layers serve several functions. They function as the de-facto root parent for widgets, they directly configure hardware layers in the graphics driver, and they manage per-layer effects.

In the simplest case the hardware supports a single layer that is the same dimension as the physical display. More advanced cases may have several layers that can have unique coordinates and dimensions within the physical display space.

When a screen becomes active, it iterates over all of its layers and applies the settings of each through the appropriate HAL APIs to set up the

display state for that particular screen. Two screens may have different layer counts, layouts, and buffer counts.

Schemes

Schemes in Aria are simply collections of colors with given names. If a scheme is assigned to a widget then that scheme will be referenced by that widget during rendering. Aria has an internal scheme that all widgets use by default in the event that a scheme is not assigned.

Below is a list of scheme colors and a description of how it is often used. There is no restriction on how a widget references a scheme. The color names are merely a recommendation.

Scheme Colors

- **Base** – Default area fill
- **Highlight** – Light embossing
- **Highlight Light** – Very light embossing
- **Shadow** – Dark embossing
- **Shadow Dark** – Very dark embossing
- **Foreground** – A foreground color
- **Foreground Inactive** – Foreground color when inactive
- **Foreground Disabled** – Foreground color when disabled
- **Background** – A background color, usually to differentiate from Base
- **Background Inactive** – Background when inactive
- **Background Disabled** – Background when disabled
- **Text** – Text color
- **Text Highlight** – Text color background when highlighted
- **Text Highlight Text** – Text color when highlighted
- **Text Inactive** – Text color when inactive
- **Text Disabled** – Text color when disabled

Widgets

A widget is an abstract representation of an object in the user interface. In its most basic form it is a rectangle that is capable of drawing a border, a background color, and containing child widgets. More specific implementations extend the basic widget implementation to provide advanced functionality.

The Aria library relies heavily on function pointers to take advantage of some object oriented programming concepts like inheritance and polymorphism.

Widgets are typically created by calling their specific “new” function. For instance: “laWidget_New()” will allocate a new basic widget and return a pointer to it (similar to calling new in C++). Calling this function will automatically initialize the widget by calling the constructor for that widget. Deleting widgets is done through the use of the function “laWidget_Delete()”.

Widgets can then be added to layers or other widgets as desired.

Edit Widgets

Edit widgets are a special class of widget that inherits from the EditWidget base implementation instead of Widget. These widgets are capable of becoming the active “edit” widget which means that they will receive any edit events raised by a widget capable of issuing edit events, such as a key pad.

Widget Implementations

The following are descriptions of the widgets offered by Aria:

- Button
- Standard button type widget.
- Can have text and image icon.
- Has a toggle mode.
- Check Box
- Standard check box widget.
- Has built in image for checked and unchecked state.
- Can use custom image for checked and unchecked state.
- Circle
- Widget that draws a circle
- Draw Surface
- Widget that has a callback during its paint loop
- Allows application to make raw HAL draw calls during Aria’s paint loop
- Gradient
- Widget that draws linearly interpolated gradient for its background
- Can use as a parent for other widgets to achieve custom backgrounds
- Group Box

- Widget that functions as a decorated container
- Offers a line border and a horizontally aligned title
- Image
- Widget that draws an image
- Image is clipped to the bounds of the widget.
- Image can be vertically or horizontally aligned to the bounds of the widget
- Image Sequence
- Widget that functions as an automatic image slideshow renderer
- Can add a sequence of widgets and a list of time delays
- Can automatically cycle through list of images without application input
- Key Pad
- A grid of button widgets
- Buttons can be configured to send edit events to the library edit API
- Label
- Widget that draws a string
- Can be aligned vertically and horizontally
- Line
- Widget that draws a line between two specified coordinates
- List
- A list box of strings
- Strings can have icons
- Can be configured to have single, sequential, or multi-selection state
- List Wheel
- A rotating wheel of strings
- Cycles seamlessly through the list
- Responds to drag input
- Panel Widget
- Panels are containers of other widgets, including daughter panels, in support of a parent-child tree of widgets, with the Panel widget as the parent
- Progress Bar
- Widget that fills in a direction based on a given percentage
- Radio Button
- A button that can belong to a group of radio buttons
- Only one button in group can be selected at any one time
- Rectangle
- Widget that draws a rectangle
- Scroll Bar
- A scroll bar that has a configurable scroll range.
- Normally embedded in other widgets like the list box
- Slider
- A widget that slides between a min and max value
- Text Field
- A field of text that can be modified by edit event inputs
- Touch Text
- A widget that draws lines based on input events
- Helps to demonstrate input functionality
- Window
- A container that can be decorated with a title bar
- Title bar can have title text and an icon

Event Management

The Aria state maintains an internal list of events that must get serviced frequently. This is done by called by “laUpdate()”. This is known as the ‘update loop’.

Input Handling

The user interface library has no knowledge of existing hardware but it must provide the means for the user to interact with the scene. Aria thus provides several generic APIs to allow any source to inject input events into the system. These events are stored in the internal event list and are handled during the next update phase.

Scene Rendering

The widget tree is a logical representation of the state of the user interface. The library must be capable of transforming this information into a visual representation that can be sent to the graphics display. The actual rendering is handled by the HAL. The individual widgets contain the algorithms necessary to render themselves but Aria is responsible for telling the widgets when to render themselves. This is known as the ‘paint loop’

The library is responsible for evaluating the widget tree to detect widgets that indicate invalid visual states and managing the redraw. It is essential that widgets only redraw when necessary to avoid needlessly consuming processing resources. It is also important that the library not attempt to draw too much at once as that may starve the rest of the application.

How to Use the Library

```
// initialize the HAL layer
GFX_Initialize();

// initialize the user interface library
laInitialize();

// create a ui context and set active
laContext* uiContext;

iuContext = laContext_Create(0, 0, 0, GFX_COLOR_MODE_RGB_565, NULL);
laContext_SetActive(uiContext);

// create a screen
laScreen* screen;

screen = laScreen_New(LA_FALSE, LA_FALSE, &screenCreate);

// add screen to context
laContext_AddScreen(screen);

// this would be done inside a function called “screenCreate()”
// create layer
laLayer* layer0 = laLayer_New();
laWidget_SetPosition((laWidget*)layer0, 0, 0);
laWidget_SetSize((laWidget*)layer0, 480, 272);

// create a buffer in the layer
laLayer_SetBufferCount(layer0, 1);

// set the layer to the screen
laScreen_SetLayer(screen, 0, layer0);

// create a child widget
laButtonWidget* ButtonWidget1 = laButtonWidget_New();
laWidget_SetPosition((laWidget*)ButtonWidget1, 411, 201);
laWidget_SetSize((laWidget*)ButtonWidget1, 60, 60);
laWidget_SetLocalRedraw((laWidget*)ButtonWidget1, LA_TRUE);
laWidget_SetDrawBackground((laWidget*)ButtonWidget1, LA_FALSE);
laWidget_SetBorderType((laWidget*)ButtonWidget1, LA_WIDGET_BORDER_NONE);
laButtonWidget_SetPressedOffset(ButtonWidget1, 0);
laButtonWidget_SetReleasedEventCallback(ButtonWidget1, &ButtonWidget1_ReleasedEvent);

// add child to parent (layer 0)
laWidget_AddChild((laWidget*)layer0, (laWidget*)ButtonWidget1);

// do this inside application update loop
// update HAL
GFX_Update()

// set ui context as active
laContext_SetActive(uiContext);

// update context (argument is update time in ms)
laUpdate(0);
```

Aria User Interface Library Interface

a) Functions

	Name	Description
	laContext_AddScreen	Add screen to the list of screens in the current context
	laContext_Create	Creates an instance of the Aria user interface library
	laContext_Destroy	Destroys an Aria instance
	laContext_GetActive	Returns the current active context.
	laContext_GetActiveScreen	Returns the active screen of the current context
	laContext_GetActiveScreenIndex	Return the index of the active screen
	laContext_GetColorMode	Returns the color mode of the current context
	laContext_GetDefaultScheme	Returns the pointer to the default scheme of the current context
	laContext_GetEditWidget	Gets the widget that is currently recieving all widget edit events.
	laContext_GetFocusWidget	Return a pointer to the widget in focus
	laContext_GetPremptionLevel	Returns the preemption level for the screen
	laContext_GetScreenRect	Returns the display rectangle structure of the physical display
	laContext_GetStringLanguage	Returns the language index of the current context
	laContext_GetStringTable	Get a pointer to the GFXU_StringTableAsset structure that maintains the strings, associated fonts, etc
	laContext_HideActiveScreen	Hide the active screen
	laContext_RedrawAll	Forces the library to redraw the currently active screen in its entirety.
	laContext_RemoveScreen	Remove the specified screen from the list of screens in the current context
	laContext_SetActive	Make the specified context active
	laContext_SetActiveScreen	Change the active screen to the one specified by the index argument
	laContext_SetActiveScreenChangedCallback	Set the callback function pointer when the screen change event occurs
	laContext_SetEditWidget	Sets the currently active edit widget.
	laContext_SetFocusWidget	Set into focus the widget specified as the argument
	laContext_SetLanguageChangedCallback	Set the callback function pointer when the language change event occurs
	laContext_SetStringLanguage	Set the language index of the current context
	laContext_SetStringTable	Set the StringTable pointer to the specified new StringTableAsset structure
	laContext_Update	Runs the update loop for a library instance.
	laEditWidget_Accept	This is function laEditWidget_Accept.
	laEditWidget_Append	This is function laEditWidget_Append.
	laEditWidget_Backspace	This is function laEditWidget_Backspace.
	laEditWidget_Clear	This is function laEditWidget_Clear.
	laEditWidget_EndEdit	This is function laEditWidget_EndEdit.
	laEditWidget_Set	This is function laEditWidget_Set.
	laEditWidget_StartEdit	This is function laEditWidget_StartEdit.
	laList_Assign	Assignes a new pointer to an index in the list
	laList_Clear	Removes all nodes from a given list
	laList_Copy	Creates a duplicate of an existing list
	laList_Create	Initializes a new linked list
	laList_Destroy	Removes all nodes from a given list and frees the data of each node
	laList_Find	Retrieves the index of a value from the list
	laList_Get	Retrieves a value from the list
	laList_InsertAt	Inserts an item into a list at a given index. All existing from index are shifted right one place.
	laList_PopBack	Removes the last value from the list
	laList_PopFront	Removes the first value from the list
	laList_PushBack	Pushes a new node onto the back of the list
	laList_PushFront	Pushes a new node onto the front of the list

	laList_Remove	Removes an item from the list
	laList_RemoveAt	Removes an item from the list at an index
	laString_Allocate	Attempts to resize the local data buffer for a string.
	laString_Append	Appends a string onto the end of another string
	laString_Capacity	Returns the capacity of a string
	laString_CharAt	Extracts the code point for the character in a string at a given index.
	laString_Clear	Sets a string's length to zero and its string table reference to NULL. Does not free any associated data and preserves capacity.
	laString_Compare	Compares two string objects
	laString_CompareBuffer	Compares a string object and a GFXU_CHAR* buffer
	laString_Copy	Copies the values from one string into another
	laString_CreateFromBuffer	Creates a string object from a GFXU_CHAR buffer and a font asset pointer
	laString_CreateFromCharBuffer	Creates a string object from a const char* buffer and a font asset pointer. This method provides compatibility with standard c-style strings. Input string will be converted from 8-bit with to 32-bit width.
	laString_CreateFromID	Creates a string object that simply references a string in the string table.
	laString_Delete	Deletes all memory associated with a string object
	laString_Destroy	Destroys a string object. This frees the strings internal data buffer, if it exists, sets its string table reference to null, and clears all supporting attributes.
	laString_Draw	Wrapper around GFX Utility string draw function for Aria user interface library. Internal use only.
	laString_ExtractFromTable	Extracts a read-only string from the string table into a modifiable string object. This relies on the active context to indicate which string table to reference as well as which language entry to extract.
	laString_GetCharIndexAtPoint	Given an offset in pixels returns the corresponding character index.
	laString_GetCharOffset	Returns the offset of a given character index in pixels.
	laString_GetCharWidth	Given a character index, gets the width of that character. Only accurate if the string has a font associated with it and that font contains all the characters in the string in question.
	laString_GetHeight	Returns the height of a string by referencing its associated font asset data.
	laString_GetRect	Calculates the rectangle for a given string object. References the associated font for the height but must perform a summation for each character in the string by doing a font meta-data lookup.
	laString_Initialize	Initializes a string struct to default
	laString_Insert	Inserts a string into another string at a given index
	laString_Length	Calculates the length of a string in characters
	laString_New	Allocates a memory for a new string
	laString_ReduceLength	Reduces the length of a string. This simply slides the null terminator to the left and does not affect the string's capacity value.
	laString_Set	Attempts to set the local data buffer of a string to an input buffer
	laString_SetCapacity	Attempts to adjust the capacity of a string
	laString_ToCharBuffer	Extracts the data buffer from a string and copies it into the provided buffer argument.
	laButtonWidget_GetHAlignment	Gets the horizontal alignment setting for a button
	laButtonWidget_GetImageMargin	Gets the distance between the icon and the text
	laButtonWidget_GetImagePosition	Gets the position of the button icon
	laButtonWidget_GetPressed	Gets the pressed state of a button
	laButtonWidget_GetPressedEventCallback	Gets the callback associated with the button pressed event
	laButtonWidget_GetPressedImage	Gets the pressed image asset pointer for a button
	laButtonWidget_GetPressedOffset	Gets the offset of the button internals when pressed
	laButtonWidget_GetReleasedEventCallback	Gets the callback for the button released event
	laButtonWidget_GetReleasedImage	Gets the currently used released icon
	laButtonWidget_GetText	Gets the text for a button. If the button's string has local data then a duplicate of the string will be allocated. The caller is responsible for managing the memory for the duplicated string. If the button string is a string table reference then only the reference ID is copied.

	laButtonWidget_GetToggleable	Gets the value of this button's toggle flag
	laButtonWidget_GetVAlignment	Gets the vertical alignment setting for a button
	laButtonWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laButtonWidget_SetHAlignment	Sets the horizontal alignment value for a button
	laButtonWidget_SetImageMargin	Sets the distance between the icon and text
	laButtonWidget_SetImagePosition	Sets the position of the button icon
	laButtonWidget_SetPressed	Sets the pressed state for a button.
	laButtonWidget_SetPressedEventCallback	Sets the pressed event callback for the button
	laButtonWidget_SetPressedImage	Sets the image to be used as a pressed icon
	laButtonWidget_SetPressedOffset	Sets the offset of the button internals when pressed
	laButtonWidget_SetReleasedEventCallback	Sets the callback for the button released event
	laButtonWidget_SetReleasedImage	Sets the image to be used as the released icon
	laButtonWidget_SetText	Sets the text for a button. If the input string has local data then the data will be copied into the button's local string, causing a memory allocation. If the input string is a string table reference then only the reference will be copied. The input string can be safely modified and the button string will not be affected.
	laButtonWidget_SetToggleable	Enables the toggle mode for a button. When pressed, toggle buttons will stay down until pressed again.
	laButtonWidget_SetVAlignment	Sets the vertical alignment for a button
	laCheckBoxWidget_GetChecked	Gets the checked state of the check box
	laCheckBoxWidget_GetCheckedEventCallback	Gets the checked event callback
	laCheckBoxWidget_GetCheckedImage	Gets the checked image of the check box
	laCheckBoxWidget_GetHAlignment	Gets the horizontal alignment of the check box
	laCheckBoxWidget_GetImageMargin	Gets the distance between the image and the text
	laCheckBoxWidget_GetImagePosition	Gets the image position of the check box
	laCheckBoxWidget_GetText	Gets a copy of the checkbox text. If the text has local data the data will be duplicated. The caller is responsible for managing the memory as appropriate.
	laCheckBoxWidget_GetUncheckedEventCallback	Gets the unchecked event callback
	laCheckBoxWidget_GetUncheckedImage	Gets the unchecked image of the check box
	laCheckBoxWidget_GetVAlignment	Gets the vertical alignment of the check box
	laCheckBoxWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laCheckBoxWidget_SetChecked	Sets the checked state of the check box
	laCheckBoxWidget_SetCheckedEventCallback	Sets the checked event callback
	laCheckBoxWidget_SetCheckedImage	Sets the checked image of the check box
	laCheckBoxWidget_SetHAlignment	Sets the horizontal alignment of the check box.
	laCheckBoxWidget_SetImagePosition	Sets the image position of the check box
	laCheckBoxWidget_SetText	Sets the checkbox text to the input string. If the string has local data the data will be duplicated and copied to the checkboxes internal string.
	laCheckBoxWidget_SetUncheckedEventCallback	Sets the unchecked event callback
	laCheckBoxWidget_SetUncheckedImage	Sets the unchecked image of the check box
	laCheckBoxWidget_SetVAlignment	Sets the vertical alignment of the check box
	laCircleWidget_GetOrigin	Gets the origin coordiates of a circle widget
	laCircleWidget_GetRadius	Gets the radius of a circle widget
	laCircleWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laCircleWidget_SetOrigin	Sets the origin coordiates of a circle widget
	laCircleWidget_SetRadius	Sets the radius of a circle widget
	laDraw_1x2BevelBorder	Internal utility function to draw a 1x2 bevel border
	laDraw_2x1BevelBorder	Internal utility function to draw a 2x1 bevel border
	laDraw_2x2BevelBorder	Internal utility function to draw a 2x2 bevel border
	laDraw_LineBorder	Internal utility function to draw a basic line border

	laDrawSurfaceWidget_GetDrawCallback	Returns the pointer to the currently set draw callback.
	laDrawSurfaceWidget_New	Allocates memory for a new DrawSurface widget.
	laDrawSurfaceWidget_SetDrawCallback	Sets the draw callback pointer for the draw surface widget.
	laEvent_AddEvent	Add the mentioned event callback to the list of events maintained by the current context
	laEvent_ClearList	Clear the event list maintained by the current context.
	laEvent_GetCount	Returns the number of events listed in the current context
	laEvent_ProcessEvents	Processes the screen change as well as touch events
	laEvent_SetFilter	Set callback pointer for current context filter event
	laGradientWidget_GetDirection	Gets the gradient direction value for this widget.
	laGradientWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laGradientWidget_SetDirection	Sets the gradient direction value for this widget.
	laGroupBoxWidget_GetAlignment	Gets the horizontal alignmnet for the group box title text
	laGroupBoxWidget_GetText	Gets the text value for the group box.
	laGroupBoxWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laGroupBoxWidget_SetAlignment	Sets the alignment for the group box title text
	laGroupBoxWidget_SetText	Sets the text value for the group box.
	laImageSequenceWidget_GetImage	Gets the image asset pointer for an entry.
	laImageSequenceWidget_GetImageChangedEventCallback	Gets the image changed event callback pointer.
	laImageSequenceWidget_GetImageCount	Gets the number of image entries for this widget.
	laImageSequenceWidget_GetImageDelay	Gets the image delay for an entry.
	laImageSequenceWidget_GetImageHAlignment	Gets the horizontal alignment for an image entry
	laImageSequenceWidget_GetImageVAlignment	Sets the vertical alignment for an image entry
	laImageSequenceWidget_GetRepeat	Indicates if the widget will repeat through the image entries.
	laImageSequenceWidget_IsPlaying	Indicates if the widget is currently cycling through the image entries.
	laImageSequenceWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laImageSequenceWidget_Play	Starts the widget automatically cycling through the image entries.
	laImageSequenceWidget_Rewind	Resets the current image sequence display index to zero.
	laImageSequenceWidget_SetImage	Sets the image asset pointer for an entry.
	laImageSequenceWidget_SetImageChangedEventCallback	Sets the image changed event callback pointer. This callback is called whenever the active display index is changed.
	laImageSequenceWidget_SetImageCount	Sets the number of image entries for this widget. An image entry that is null will show nothing.
	laImageSequenceWidget_SetImageDelay	Sets the image delay for an entry.
	laImageSequenceWidget_SetImageHAlignment	Sets the horizontal alignment for an image entry.
	laImageSequenceWidget_SetImageVAlignment	Sets the vertical alignment value for an image entry
	laImageSequenceWidget_SetRepeat	Sets the repeat flag for the widget
	laImageSequenceWidget_ShowImage	Sets the active display index to the indicated value.
	laImageSequenceWidget_ShowNextImage	Sets the active display index to the next index value.
	laImageSequenceWidget_ShowPreviousImage	Sets the active display index to the previous index value.
	laImageSequenceWidget_Stop	Stops the widget from automatically cycling through the image entries.
	laImageWidget_GetHAlignment	Gets the image horizontal alignment value.
	laImageWidget_GetImage	Gets the image asset pointer for the widget.
	laImageWidget_GetVAlignment	Gets the image vertical alignment value.
	laImageWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laImageWidget_SetHAlignment	Sets the image horizontal alignment value.
	laImageWidget_SetImage	Sets the image asset pointer for the widget.
	laImageWidget_SetVAlignment	Sets the image vertical alignment value.
	laInput_GetEnabled	Returns the input enabled status of the current context

	laInput_InjectTouchDown	Register and track the touch down event and queue it for handling by associated widgets
	laInput_InjectTouchMoved	Register and track the touch moved event and queue it for handling by associated widgets
	laInput_InjectTouchUp	Register and track the touch up event and queue it for handling by associated widgets
	laInput_SetEnabled	Sets the input status of the current context with the specified input argument
	laKeyPadWidget_GetKeyAction	Gets the key pad cell action for a cell at row/column
	laKeyPadWidget_GetKeyClickEventCallback	Gets the current key click event callback pointer
	laKeyPadWidget_GetKeyDrawBackground	Gets the background type for a key pad cell at row/column
	laKeyPadWidget_GetKeyEnabled	Gets the enabled flag for a cell at a given row/column
	laKeyPadWidget_GetKeyImageMargin	Gets the key pad cell image margin value
	laKeyPadWidget_GetKeyImagePosition	Gets the image position for a key pad cell
	laKeyPadWidget_GetKeyPressedImage	Gets the pressed icon image asset pointer for the display image for a key pad cell
	laKeyPadWidget_GetKeyReleasedImage	Gets the released icon image asset pointer for the display image for a key pad cell
	laKeyPadWidget_GetKeyText	Returns a copy of the display text for a given cell at row/column
	laKeyPadWidget_GetKeyValue	Gets the edit text value for a given key pad cell.
	laKeyPadWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laKeyPadWidget_SetKeyAction	Sets the cell action type for a key pad cell at row/column
	laKeyPadWidget_SetKeyClickEventCallback	Sets the current key click event callback pointer
	laKeyPadWidget_SetKeyEnabled	Sets the enabled flag for a cell at the given row/column
	laKeyPadWidget_SetKeyImageMargin	Sets the key pad cell image margin value for a given cell at row/column
	laKeyPadWidget_SetKeyImagePosition	
	laKeyPadWidget_SetKeyPressedImage	Sets the pressed icon image asset pointer for a key pad cell
	laKeyPadWidget_SetKeyReleasedImage	Sets the released icon image asset pointer for a key pad cell
	laKeyPadWidget_SetKeyText	Sets the display text for a given cell at row/column
	laKeyPadWidget_SetKeyValue	Sets the edit value for a given key pad cell.
	laLabelWidget_GetHAlignment	Gets the text horizontal alignment value.
	laLabelWidget_GetText	Gets the text value for the label.
	laLabelWidget_GetVAlignment	Gets the current vertical text alignment
	laLabelWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laLabelWidget_SetHAlignment	Sets the text horizontal alignment value
	laLabelWidget_SetText	Sets the text value for the label.
	laLabelWidget_SetVAlignment	Sets the vertical text alignment value
	laLayer_Delete	Destructor for the layer object
	laLayer_GetAlphaAmount	Get's the amount of alpha blending for a given layer
	laLayer_GetAlphaEnable	Gets the layer alpha enable flag
	laLayer_GetBufferCount	Return the buffer count for the current layer
	laLayer_GetMaskColor	Returns the mask color value for the current layer
	laLayer_GetMaskEnable	Gets the layer mask enable flag
	laLayer_GetVSync	Gets the layer's vsync flag setting
	laLayer_New	Constructor for a new layer
	laLayer_SetAlphaAmount	Set's the amount of alpha blending for a given layer
	laLayer_SetAlphaEnable	Sets the layer alpha enable flag to the specified value
	laLayer_SetBufferCount	Set the buffer count for the current layer to the specified value
	laLayer_SetMaskColor	Set the mask color value for the current layer to the specified value
	laLayer_SetMaskEnable	Sets the layer mask enable flag to the specified value
	laLayer_SetVSync	Sets the layer's vsync flag.
	laLineWidget_GetEndPoint	Gets the coordinates for the second point of the line.
	laLineWidget_GetStartPoint	Gets the coordinates for the first point of the line.

	laLineWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laLineWidget_SetEndPoint	Sets the cooridnate for the second point of the line
	laLineWidget_SetStartPoint	Sets the cooridnate for the first point of the line
	laListWheelWidget_AppendItem	Appends a new item entry to the list. The initial value of the item will be empty.
	laListWheelWidget_GetAlignment	Gets the horizontal alignment for the list widget
	laListWheelWidget_GetIconMargin	Gets the icon margin value for the list wheel widget
	laListWheelWidget_GetIconPosition	Sets the icon position for the list wheel widget.
	laListWheelWidget_GetItemCount	Gets the number of items currently contained in the list
	laListWheelWidget_GetItemIcon	Gets the pointer to the image asset for the icon for the item at the given index.
	laListWheelWidget_GetItemText	Gets the text value for an item in the list.
	laListWheelWidget_GetSelectedItem	Returns the index of the currently selected item.
	laListWheelWidget_GetSelectedItemChangedEventCallback	Gets the callback for the item selected changed event
	laListWheelWidget_InsertItem	Attempts to insert a new item at the desired index. Existing items at idx or greater will be shuffled one index to the right.
	laListWheelWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laListWheelWidget_RemoveAllItems	Attempts to remove all items from the list.
	laListWheelWidget_RemoveItem	Attempts to remove an item from the list.
	laListWheelWidget_SelectNextItem	Attempts to move the selected item index to the next item in the list.
	laListWheelWidget_SelectPreviousItem	Attempts to move the selected item index to the previous item in the list.
	laListWheelWidget_SetAlignment	Sets the horizontal alignment mode for the list widget.
	laListWheelWidget_SetIconMargin	Sets the icon margin value for the list widget.
	laListWheelWidget_SetIconPosition	Sets the icon position for the list wheel widget
	laListWheelWidget_SetItemIcon	Sets the icon pointer for a given index.
	laListWheelWidget_SetItemText	Sets the text value for an item in the list.
	laListWheelWidget_SetSelectedItem	Attempts to set the selectedi tem index
	laListWheelWidget_SetSelectedItemChangedEventCallback	
	laListWidget_AppendItem	Appends a new item entry to the list. The initial value of the item will be empty.
	laListWidget_DeselectAll	Attempts to set all item states as not selected.
	laListWidget_GetAlignment	Gets the horizontal alignment for the list widget
	laListWidget_GetAllowEmptySelection	Returns true of the list allows an empty selection set
	laListWidget_GetFirstSelectedItem	Returns the lowest selected item index.
	laListWidget_GetIconMargin	Gets the icon margin value for the list widget
	laListWidget_GetIconPosition	Gets the icon position for the list
	laListWidget_GetItemCount	Gets the number of items currently contained in the list
	laListWidget_GetItemIcon	Gets the pointer to the image asset for the icon for the item at the given index.
	laListWidget_GetItemSelected	Returns true if the item at the given index is currently selected.
	laListWidget_GetItemText	Gets the text value for an item in the list.
	laListWidget_GetLastSelectedItem	Returns the highest selected item index.
	laListWidget_GetSelectedItemChangedEventCallback	Gets the callback for the item selected changed event
	laListWidget_GetSelectionCount	Returns the number of selected items in the list.
	laListWidget_GetSelectionMode	Gets the selection mode for the list
	laListWidget_InsertItem	Attempts to insert a new item at the desired index. Existing items at idx or greater will be shuffled one index to the right.
	laListWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laListWidget_RemoveAllItems	Attempts to remove all items from the list.
	laListWidget_RemoveItem	Attempts to remove an item from the list.
	laListWidget_SelectAll	Attempts to set all item states to selected.

	laListWidget_SetAlignment	Sets the horizontal alignment mode for the list widget.
	laListWidget_SetAllowEmptySelection	Configures the list to allow an empty selection set.
	laListWidget_SetIconMargin	Sets the icon margin value for the list widget.
	laListWidget_SetIconPosition	Sets the icon position for the list widget
	laListWidget_SetItemIcon	Sets the icon pointer for a given index.
	laListWidget_SetItemSelected	Attempts to set the item at idx as selected.
	laListWidget_SetItemText	Sets the text value for an item in the list.
	laListWidget_SetItemVisible	
	laListWidget_SetSelectedItemChangedEventCallback	Sets the callback for the item selected changed event
	laListWidget_SetSelectionMode	Set the list selection mode
	laListWidget_ToggleItemSelected	Attempts to toggle the selected state of the item at idx.
	laProgressBarWidget_GetDirection	Gets the fill direction value for a progress bar widget
	laProgressBarWidget_GetValue	Gets the percentage value for a progress bar.
	laProgressBarWidget_GetValueChangedEventCallback	Gets the currently set value changed event callback.
	laProgressBarWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laProgressBarWidget_SetDirection	Sets the fill direction for a progress bar widget
	laProgressBarWidget_SetValue	Sets the percentage value for a progress bar. Valid values are 0 - 100.
	laProgressBarWidget_SetValueChangedCallback	Sets the desired value changed event callback pointer
	laRadioButtonGroup_AddButton	Add a button widget to the button list of the selected Radio button group.
	laRadioButtonGroup_Create	This function creates a GFX_GOL_RADIOBUTTON group with the provided button list.
	laRadioButtonGroup_Destroy	This function destroys the GFX_GOL_RADIOBUTTON group
	laRadioButtonGroup_RemoveButton	Remove a button widget to the button list of the selected Radio button group.
	laRadioButtonGroup_SelectButton	Select the button widget specified from the button list for the Radio button group.
	laRadioButtonWidget_GetDeselectedEventCallback	Gets the current radio button deselected event callback
	laRadioButtonWidget_GetGroup	Returns the pointer to the currently set radio button group.
	laRadioButtonWidget_GetHAlignment	Gets the horizontal alignment setting for a button
	laRadioButtonWidget_GetImageMargin	Gets the distance between the icon and the text
	laRadioButtonWidget_GetImagePosition	Gets the current image position setting for the radio button
	laRadioButtonWidget_GetSelected	Returns true if this radio button is currently selected
	laRadioButtonWidget_GetSelectedEventCallback	Gets the current radio button selected event callback
	laRadioButtonWidget_GetSelectedImage	Gets the selected image asset pointer for a button
	laRadioButtonWidget_GetText	Gets the text value for the button.
	laRadioButtonWidget_GetUnselectedImage	Gets the image asset pointer currently used as the unselected icon
	laRadioButtonWidget_GetVAlignment	Sets the vertical alignment for a button
	laRadioButtonWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laRadioButtonWidget_SetDeselectedEventCallback	Sets the deselected callback pointer
	laRadioButtonWidget_SetHAlignment	Sets the horizontal alignment value for a button
	laRadioButtonWidget_SetImagePosition	Sets the image relative position setting for the radio button
	laRadioButtonWidget_SetSelected	Sets this button as selected.
	laRadioButtonWidget_SetSelectedEventCallback	Sets the radio button selected event callback
	laRadioButtonWidget_SetSelectedImage	Sets the image to be used as a selected icon
	laRadioButtonWidget_SetText	Sets the text value for the button.
	laRadioButtonWidget_SetUnselectedImage	Sets the asset pointer for the radio button's unselected image icon
	laRadioButtonWidget_SetVAlignment	Sets the vertical alignment for a button
	laRectangleWidget_GetThickness	Gets the rectangle border thickness setting
	laRectangleWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

	laScheme_Initialize	Initialize the scheme to the default values as per the specified color mode.
	laScreen_Delete	Frees all memory for all layers and widgets for this screen
	laScreen_GetHideEventCallback	Returns the hide call back event function pointer for the specified screen
	laScreen_GetLayerIndex	Returns the index of the layer for the screen specified.
	laScreen_GetOrientation	Returns the orientation object associated with the specified screen
	laScreen_GetShowEventCallback	Returns the show call back event function pointer for the specified screen
	laScreen_Hide	Hide the currently active screen This function has been deprecated in favor of laContext_SetActiveScreen
	laScreen_New	Create a new screen, initialize it to the values specified.
	laScreen_SetHideEventCallback	Set the hide call back event function pointer for the specified screen
	laScreen_SetLayer	Assigns the provided layer pointer to the screen at the given index This function has been deprecated in favor of laContext_SetActiveScreen
	laScreen_SetOrientation	Sets the orientation object to the specified screen
	laScreen_SetShowEventCallback	Set the show call back event function pointer for the specified screen
	laScreen_Show	Make the specified screen active and show it on the display
	laScrollBarWidget_GetExtentValue	Gets the current scroll bar extent value
	laScrollBarWidget_GetMaxinumValue	Gets the maximum scroll value
	laScrollBarWidget_GetOrientation	Gets the orientation value for the scroll bar
	laScrollBarWidget_GetScrollPercentage	Gets the current scroll value as a percentage
	laScrollBarWidget_GetScrollValue	Gets the current scroll value
	laScrollBarWidget_GetStepSize	Gets the current discreet step size
	laScrollBarWidget_GetValueChangedEventCallback	Gets the current value changed callback function pointer
	laScrollBarWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laScrollBarWidget_SetExtentValue	Sets the scroll bar extent value
	laScrollBarWidget_SetMaximumValue	Sets the maximum scroll value
	laScrollBarWidget_SetOrientation	Sets the orientation value of the scroll bar
	laScrollBarWidget_SetScrollPercentage	Sets the current scroll value using a percentage. Percentage should be a value from 0 - 100
	laScrollBarWidget_SetScrollValue	Sets the current scroll value
	laScrollBarWidget_SetStepSize	Sets the current step size
	laScrollBarWidget_SetValueChangedEventCallback	Sets the value changed event callback pointer
	laScrollBarWidget_StepBackward	Moves the scroll value back by the current step size
	laScrollBarWidget_StepForward	Moves the scroll value forward by the current step size
	laSliderWidget_GetGripSize	Gets the current grip size of the slider
	laSliderWidget_GetMaxinumValue	Gets the maximum value for the slider
	laSliderWidget_GetMininumValue	Gets the minimum value for the slider
	laSliderWidget_GetOrientation	Gets the orientation value for the slider
	laSliderWidget_GetSliderPercentage	Gets the slider value as a percentage
	laSliderWidget_GetSliderValue	Gets the current slider value
	laSliderWidget_GetValueChangedEventCallback	Gets the current value changed event callback pointer
	laSliderWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laSliderWidget_SetGripSize	Sets the grip size of the slider
	laSliderWidget_SetMaximumValue	Sets the maximum value for the slider
	laSliderWidget_SetMinimumValue	Sets the minimum value for the slider
	laSliderWidget_SetOrientation	
	laSliderWidget_SetSliderPercentage	Sets the slider value using a percentage. Value must be from 0 - 100.
	laSliderWidget_SetSliderValue	Sets the current slider value
	laSliderWidget_SetValueChangedEventCallback	Sets the value changed event callback pointer
	laSliderWidget_Step	Moves the slider by a given amount

	laTextFieldWidget_GetAlignment	Gets the text horizontal alignment value.
	laTextFieldWidget_GetCursorDelay	Gets the current cursor delay.
	laTextFieldWidget_GetCursorEnabled	Gets the cursor enabled value
	laTextFieldWidget_GetCursorPosition	Gets the current edit cursor position
	laTextFieldWidget_GetText	Gets the text value for the box.
	laTextFieldWidget_GetTextChangedEventCallback	Gets the current text changed event callback pointer
	laTextFieldWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laTextFieldWidget_SetAlignment	Sets the text horizontal alignment value
	laTextFieldWidget_SetCursorDelay	Sets the cursor delay value
	laTextFieldWidget_SetCursorEnabled	Sets the cursor enabled value flag
	laTextFieldWidget_SetCursorPosition	Sets the position of the cursor
	laTextFieldWidget_SetText	Sets the text value for the box.
	laTextFieldWidget_SetTextChangedEventCallback	Sets the text changed event callback pointer
	laTouchTest_AddPoint	Adds a point to the touch test widget. The point will then be displayed.
	laTouchTest_ClearPoints	Clears all of the existing touch points
	laTouchTestWidget_GetPointAddedEventCallback	Gets the current point added event callback
	laTouchTestWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laTouchTestWidget_SetPointAddedEventCallback	Sets the point added event callback
	laUtils_ArrangeRectangle	Calculates the position of a rectangle within the given bounds and in accordance with the given parameters. A use case for this is when an image and a text rectangle must be arranged in a button box. This version of the algorithm will calculate the location of the image rectangle.
	laUtils_ArrangeRectangleRelative	Calculates the position of a rectangle within the given bounds and in accordance with the given parameters. A use case for this is when an image and a text rectangle must be arranged in a button box. This version of the algorithm will calculate the location of the text rectangle.
	laUtils_ChildIntersectsParent	Performs an intersection test between a parent widget and a child widget
	laUtils_ClipRectToParent	Clips a rectangle to the parent of a widget
	laUtils_GetLayer	Finds the root parent of a widget, which should be a layer
	laUtils_ListOcclusionCullTest	Performs an occlusion test on a list of widgets an a rectangular area. This attempts to find only the topmost widgets for the given area. If a widget is completely occluded then it is removed from the list. Any widgets that remain in the list should be redrawn by the rasterizer.
	laUtils_OcclusionCullTest	Performs an occlusion test for a widget in the tree. A widget is occluded if it is completely covered by one or more widgets. This is useful for culling widgets before the rasterizing phase.
	laUtils_Pick	Finds the top-most visible widget in the tree at the given coordinates.
	laUtils_PickRect	Finds all of the visible widgets in the given rectangular area.
	laUtils_PointScreenToLocalSpace	Converts a point from layer space into the local space of a widget
	laUtils_RectFromParentSpace	Converts a rectangle from widget parent space to widget local space
	laUtils_RectToLayerSpace	Converts a rectangle from widget local space to layer space
	laUtils_RectToParentSpace	Converts a rectangle from widget local space to widget parent space. Widget must be a child of a layer for this to function.
	laUtils_RectToScreenSpace	Converts a rectangle from widget local space to screen space
	laWidget_AddChild	Adds the child to the parent widget specified in the argument
	laWidget_Delete	Delete the widget object specified
	laWidget_GetAlphaAmount	Return the widget's global alpha amount
	laWidget_GetAlphaEnable	Return the alpha enable property of the widget
	laWidget_GetBorderType	Return the border type associated with the widget object
	laWidget_GetChildAtIndex	Fetches the child at the specified index from the children list of the specified parent widget
	laWidget_GetChildCount	Returns the size of the children list of the specified parent widget
	laWidget_GetCumulativeAlphaAmount	Calculates the cumulative alpha amount for a hierarchy of widgets

	laWidget_GetCumulativeAlphaEnable	Determines if this or any ancestor widget has alpha enabled
	laWidget_GetEnabled	Returns the boolean value of the widget enabled property
	laWidget_GetHeight	Returns the widget rectangles height
	laWidget_GetIndexOfChild	Fetches the index of the child from the children list of the specified parent widget
	laWidget_GetMargin	Returns the margin value associated with the widget in the laMargin pointer
	laWidget_GetScheme	Returns the scheme associated with the specified widget
	laWidget_GetVisible	Returns the boolean value of the widget visible property
	laWidget_GetWidth	Returns the widget rectangles width
	laWidget_GetX	Returns the widget rectangles upper left corner x-coordinate
	laWidget_GetY	Returns the widget rectangles upper left corner y-coordinate
	laWidget_HasFocus	Checks if the widget specified has focus in the current context
	laWidget_Invalidate	Invalidates the specified widget.
	laWidget_isOpaque	Returns true if the widget is considered opaque.
	laWidget_New	Create a new widget.
	laWidget_OverrideTouchDownEvent	Replace the TouchDownEvent callback for the widget with the new function pointer specified
	laWidget_OverrideTouchMovedEvent	Replace the TouchMovedEvent callback for the widget with the new function pointer specified
	laWidget_OverrideTouchUpEvent	Replace the TouchUpEvent callback for the widget with the new function pointer specified
	laWidget_RectToLayerSpace	Transforms a widget rectangle from local space to its root layer space.
	laWidget_RectToParentSpace	Returns the rectangle containing the parent of the widget specified
	laWidget_RectToScreenSpace	Transforms a widget rectangle from local space to screen space coordinates.
	laWidget_RemoveChild	Removes the child from the parent widget specified in the argument
	laWidget_Resize	Changes the widget size by the new defined width and height increments.
	laWidget_SetAlphaAmount	Set the widget's global alpha amount to the specified alpha amount
	laWidget_SetAlphaEnable	Set the alpha enable property of the widget with the boolean value specified
	laWidget_SetBorderType	Set the border type associated with the widget object
	laWidget_SetEnabled	Sets the boolean value of the widget enabled property
	laWidget_SetFocus	Set the widget into focus for the current context.
	laWidget_SetHeight	Sets the widget's height value
	laWidget_SetMargins	Set the margin value for left, right, top and bottom margins associated with the widget
	laWidget_SetParent	Sets the parent of the child widget to that specified in the argument list
	laWidget_SetPosition	Changes the widget position to the new defined x and y coordinates.
	laWidget_SetScheme	Sets the scheme variable for the specified widget
	laWidget_SetSize	Changes the widget size to the new defined width and height dimensions.
	laWidget_SetVisible	Sets the boolean value of the widget visible property
	laWidget_SetWidth	Sets the widget's width value
	laWidget_SetX	Sets the widget's x coordinate position
	laWidget_SetY	Sets the widget's y coordinate position
	laWidget_Translate	Changes the widget position by moving the widget by the defined x and y increments.
	laWindowWidget_GetIcon	Gets the currently used window icon
	laWindowWidget_GetIconMargin	Gets the current image icon margin
	laWindowWidget_GetTitle	Gets the title text for this window.
	laWindowWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laWindowWidget_SetIcon	Sets the image to be used as a window icon
	laWindowWidget_SetIconMargin	Sets the image icon margin

	laWindowWidget_SetTitle	Sets the title text for the window.
	laCheckBoxWidget_SetImageMargin	Sets the distance between the image and the text
	laContext_SetPreemptionLevel	Set the preemption level to the specified value
	laKeyPadWidget_SetKeyBackgroundType	Sets the background type for a key pad cell at row/column
	laLayer_GetAllowInputPassThrough	Gets the layer's input passthrough setting
	laLayer_GetEnabled	Returns the boolean value of the layer enabled property
	laLayer_SetAllowInputPassthrough	Sets the layer's input passthrough flag.
	laLayer_SetEnabled	Sets the boolean value of the layer enabled property
	laListWheelWidget_GetFlickInitSpeed	Returns the flick init speed for the wheel.
	laListWheelWidget_GetIndicatorArea	Returns the spacing for the selected item indicator bars.
	laListWheelWidget_GetMaxMomentum	Returns the maximum momentum value for the wheel.
	laListWheelWidget_GetMomentumFalloffRate	Returns the momentum falloff rate for the wheel.
	laListWheelWidget_GetRotationUpdateRate	Returns the wheel rotation update rate.
	laListWheelWidget_GetShaded	Returns true if the list is using gradient shading to illustrate depth
	laListWheelWidget_GetShowIndicators	Returns true if the list is displaying its selected item indicators
	laListWheelWidget_GetVisibleItemCount	Returns the list's visible item count
	laListWheelWidget_SetFlickInitSpeed	Configures the flick init speed for the list wheel
	laListWheelWidget_SetIndicatorArea	Configures the display area for the list selection indicator bars
	laListWheelWidget_SetMaxMomentum	Configures the maximum momentum value for the wheel
	laListWheelWidget_SetMomentumFalloffRate	Configures the momentum falloff rate for the wheel
	laListWheelWidget_SetRotationUpdateRate	Configures the rotation update rate for a wheel
	laListWheelWidget_SetShaded	Configures the list to use gradient or flat background shading
	laListWheelWidget_SetShowIndicators	Configures the list to display the selected item indicator bars
	laListWheelWidget_SetVisibleItemCount	Sets the number of visible items in the list. Must be greater than or equal to three and must be an odd number.
	laRadioButtonWidget_SetImageMargin	Sets the distance between the icon and text
	laScreen_GetMirrored	Returns the mirror setting for the specified screen
	laScreen_SetMirrored	Sets the mirror setting for the specified screen
	laString_Remove	Removes a number of characters from a string at a given index
	laTextFieldWidget_SetClearOnFirstEdit	Sets the flag to indicate that the text field will be cleared on first edit.
	laUtils_PickFromLayer	Finds the top-most visible widget in a layer at the given coordinates.
	laUtils_PointToLayerSpace	Converts a point from widget space into layer space
	laUtils_ScreenToMirroredSpace	Takes a point in screen space and returns a transformed version in mirrored space.
	laUtils_ScreenToOrientedSpace	Takes a point in screen space and returns a transformed version in oriented space.
	laUtils_WidgetLocalRect	Returns the bounding rectangle of a widget in local space
	laWidget_GetBackgroundType	Return the property value 'background type' associated with the widget object
	laWidget_GetOptimizationFlags	Returns the optimization flags for the widget
	laWidget_SetBackgroundType	Set the property value 'background type' associated with the widget object
	laWidget_SetOptimizationFlags	Sets the optimizations for a widget
	laRectangleWidget_SetThickness	Sets the rectangle border thickness setting
	laString_DrawClipped	Wrapper around GFX Utility string draw function for Aria user interface library. Draws only a clipped area of a string. Internal use only.
	laString_IsEmpty	Returns a boolean indicating if the provided string contains data or has a link to the string table.
	laUtils_GetNextHighestWidget	Gets the next highest Z order widget in the tree from 'wgt'
	laUtils_RectFromLayerSpace	Converts a rectangle from layer space to widget local space
	laUtils_WidgetIsOccluded	This is function laUtils_WidgetIsOccluded.
	laUtils_WidgetLayerRect	Returns the bounding rectangle of a widget in layer space
	laWindowWidget_GetIconRect	This is function laWindowWidget_GetIconRect.
	laWindowWidget_GetTextRect	This is function laWindowWidget_GetTextRect.
	laWindowWidget_GetTitleBarRect	internal use only

	laContext_IsDrawing	Indicates if any layers of the active screen are currently drawing a frame.
	laContext_IsLayerDrawing	Indicates if the layer at the given index of the active screen is currently drawing.
	laLayer_IsDrawing	Queries a layer to find out if it is currently drawing a frame.
	laLayer_GetInputRect	Gets the layer's input rectangle.
	laLayer_GetInputRectLocked	Gets the layer's input rect locked flag
	laLayer_SetInputRect	Sets the layer's input rect dimensions.
	laLayer_SetInputRectLocked	Sets the layer's input rect locked flag.
	laScreen_GetLayerSwapSync	Returns the layer swap sync setting for the specified screen
	laScreen_SetLayerSwapSync	Sets the layer swap sync setting for the specified screen
	laWidget_DeleteAllDescendants	Deletes all of the descendants of the given widget.
	laImageWidget_SetCallBackEnd	This is function laImageWidget_SetCallBackEnd.
	laImageWidget_SetCallBackStart	This is function laImageWidget_SetCallBackStart.
	laString_DrawSubStringClipped	Wrapper around GFX Utility string draw function for Aria user interface library. Draws the substring between the start and end offset, and draws only the section of the string within the clipping rectangle. Internal use only.
	laString_GetLineRect	Calculates the rectangle for a line in a string object. References the associated font for the height but must perform a summation for each character in the string by doing a font meta-data lookup. The line ends when a line feed or end of string is reached.
	laString_GetMultiLineRect	Calculates the rectangle for a given multi-line string object. References the associated font for the height but must perform a summation for each character in the string by doing a font meta-data lookup. The height the sum of the heights of the bounding rectangles for each line and the width is the widest among the bounding rectangles.

b) Data Types and Constants

	Name	Description
	laBool_t	libaria bool values
	laContext_t	An instance of the Aria user interface library.
	laEditWidget_t	Specifies the edit widget structure to manage all properties and events associated with edit widgets
	laList_t	Linked list definition
	laListNode_t	Linked list node definition
	laMargin_t	libaria margin values
	laPreemptionLevel	libaria pre-emption level values
	laRelativePosition	libaria relative position values
	laResult_t	libaria results (success and failure codes).
	laString_t	String definition
	GFXU_StringTableAsset	Describes a string table asset. There is typically only ever one of these defined at any one time. header - standard asset header languageCount - the number of languages in the string table stringCount - the number of strings in the string table stringIndexTable - the pointer to the string index table. the string index table is a table that contains all of the unique strings defined in the string table. fontTable - the font table contains an array of pointers to all defined font assets that the string table references fontIndexTable - the font index table is a table... more
	laBool	libaria bool values
	laContext	An instance of the Aria user interface library.
	laContext_ActiveScreenChangedCallback_FnPtr	Callback pointer for the active screen change notification.
	laContext_LanguageChangedCallback_FnPtr	Callback pointer for when the language change event occurs.
	laEditWidget	Specifies the edit widget structure to manage all properties and events associated with edit widgets
	laEditWidget_Accept_FnPtr	This is type laEditWidget_Accept_FnPtr.
	laEditWidget_Append_FnPtr	This is type laEditWidget_Append_FnPtr.
	laEditWidget_Backspace_FnPtr	This is type laEditWidget_Backspace_FnPtr.
	laEditWidget_Clear_FnPtr	This is type laEditWidget_Clear_FnPtr.
	laEditWidget_EndEdit_FnPtr	This is type laEditWidget_EndEdit_FnPtr.

	laEditWidget_Set_FnPtr	This is type laEditWidget_Set_FnPtr.
	laEditWidget_StartEdit_FnPtr	This is type laEditWidget_StartEdit_FnPtr.
	laHAlignment	libaria horizontal alignment values
	laList	Linked list definition
	laListNode	Linked list node definition
	laMargin	libaria margin values
	laResult	libaria results (success and failure codes).
	laScreen	The structure to maintain the screen related variables and event handling
	laString	String definition
	laVAlignment	libaria vertical alignment values
	laBorderType_t	Specifies the different border types used for the widgets in the library
	laButtonState_t	Controls the button pressed state
	laButtonWidget_t	Implementation of a button widget. A button is an interactive element that simulates a typical button with a pressed an released state.
	laCheckBoxWidget_t	Implementation of a checkbox widget.
	laCircleWidget_t	Implementation of a circle widget.
	laDrawSurfaceWidget_t	Implementation of a Drawsurface widget.
	laEvent_t	Basic UI event definition
	laEventID_t	Defines internal event type IDs
	laEventState_t	Structure to manage the event lists, state and call back pointers
	laGestureID_t	Placeholder for eventual gesture support.
	laGradientWidget_t	Gradient widget struct definition.
	laGradientWidgetDirection_t	Implementation of a gradient widget.
	laGroupBoxWidget_t	Group box struct definition.
	laImageSequenceEntry_t	Image sequence entry definition
	laImageSequenceWidget_t	Image sequence widget struct definition
	laImageWidget_t	Image widget struct definition
	laInput_TouchDownEvent_t	Register and handle the touch press detect event
	laInput_TouchMovedEvent_t	Register and handle the touch coordinates changed event
	laInput_TouchUpEvent_t	Register and handle the touch release detect event
	laInputState_t	Maintain a history of touch states; currently libaria keeps track of the last touch state only.
	laKey_t	All values possible for key entry from the libaria keyboard widget
	laKeyPadCell_t	Defines a key pad cell struct
	laKeyPadCellAction_t	Defines an assigned action to a key pad cell
	laKeyPadWidget_t	Defines a key pad widget struct
	laLabelWidget_t	Implementation of a label widget struct
	laLayer_t	Primary definition of a layer. Builds on base functions of a standard widget. Should never have a direct parent.
	laLayerBuffer_t	Structure to maintain the buffer type and track the buffer location for each layer
	laLayerBufferType_t	Defines the type of a layer. If the layer has an explicit address then Aria tries to set that through the HAL when the layer is being set up.
	laLineWidget_t	Defines the implementation of a line widget struct
	laListItem_t	Defines a list item struct
	laListWheelItem_t	Implementation of a list wheel widget item struct
	laListWheelWidget_t	Implementation of a list wheel widget struct
	laListWidget_SelectionMode_t	Defines the list selection modes
	laListWidget_t	Defines the implementation of a list widget
	laMouseButton_t	All values possible for mouse key entry from the libaria mouse input
	laProgressBarDirection_t	Defines the valid values for the progress bar widget fill directions.
	laProgressBarWidget_t	Implementation of a progressbar widget struct
	laRadioButtonGroup_t	Defines the structure used for the Radio Button group.
	laRadioButtonWidget_t	Implementation of a radio button widget struct
	laRectangleWidget_t	Implementation of a rectangle widget struct
	laScheme_t	This structure specifies the style scheme components of an object.
	laScreen_t	The structure to maintain the screen related variables and event handling

	laScreenOrientation_t	Possible values for screen orientation.
	laScrollBarOrientation_t	Defines the scroll bar direction values
	laScrollBarState_t	Defines the various scroll bar state values
	laScrollBarWidget_t	Implementation of a scroll bar widget.
	laSliderOrientation_t	Slider orientations
	laSliderState_t	Describes various slider states
	laSliderWidget_t	Implementation of a slider widget struct
	laTextFieldWidget_t	Implementation of a text field widget.
	laTouchState_t	Manage the touch input state and track the touch coordinate
	laTouchTestState_t	Touch test states
	laTouchTestWidget_t	Implementation of a touch test widget struct
	laWidget_t	Specifies Graphics widget structure to manage all properties and events associated with the widget
	laWidgetDirtyState_t	Specifies the different dirty states the widget can be assigned
	laWidgetDrawState_t	Specifies the different draw states the widget can be assigned
	laWidgetEvent_t	Basic widget event definition
	laWidgetType_t	Specifies the different widget types used in the library
	laWindowWidget_t	Implementation of a window widget struct
	GFX_Point	A two dimensional Cartesian point.
	GFX_Rect	A rectangle definition.
	laBorderType	Specifies the different border types used for the widgets in the library
	laButtonState	Controls the button pressed state
	laButtonWidget	Implementation of a button widget. A button is an interactive element that simulates a typical button with a pressed an released state.
	laButtonWidget_PressedEvent	This is type laButtonWidget_PressedEvent.
	laButtonWidget_ReleasedEvent	This is type laButtonWidget_ReleasedEvent.
	laCheckBoxWidget	Implementation of a checkbox widget.
	laCheckBoxWidget_CheckedEvent	This is type laCheckBoxWidget_CheckedEvent.
	laCheckBoxWidget_UncheckedEvent	This is type laCheckBoxWidget_UncheckedEvent.
	laCircleWidget	Implementation of a circle widget.
	laDrawSurfaceWidget	Implementation of a Drawsurface widget.
	laDrawSurfaceWidget_DrawCallback	This is type laDrawSurfaceWidget_DrawCallback.
	laEvent	Basic UI event definition
	laEvent_FilterEvent	Function pointer to define an event filter. Event filters allow a receiver to discard undesirable events
	laEventID	Defines internal event type IDs
	laEventState	Structure to manage the event lists, state and call back pointers
	laGestureID	Placeholder for eventual gesture support.
	laGradientWidget	Gradient widget struct definition.
	laGradientWidgetDirection	Implementation of a gradient widget.
	laGroupBoxWidget	Group box struct definition.
	laImageSequenceEntry	Image sequence entry definition
	laImageSequenceImageChangedEvent_FnPtr	This is type laImageSequenceImageChangedEvent_FnPtr.
	laImageSequenceWidget	Image sequence widget struct definition
	laImageWidget	Image widget struct definition
	laInput_TouchDownEvent	Register and handle the touch press detect event
	laInput_TouchMovedEvent	Register and handle the touch coordinates changed event
	laInput_TouchUpEvent	Register and handle the touch release detect event
	laInputState	Maintain a history of touch states; currently libaria keeps track of the last touch state only.
	laKey	All values possible for key entry from the libaria keyboard widget
	laKeyPadCell	Defines a key pad cell struct
	laKeyPadCellAction	Defines an assigned action to a key pad cell
	laKeyPadWidget	Defines a key pad widget struct
	laKeyPadWidget_KeyClickEvent	This is type laKeyPadWidget_KeyClickEvent.
	laLabelWidget	Implementation of a label widget struct

	laLayer	Primary definition of a layer. Builds on base functions of a standard widget. Should never have a direct parent.
	laLayerBuffer	Structure to maintain the buffer type and track the buffer location for each layer
	laLayerBufferType	Defines the type of a layer. If the layer has an explicit address then Aria tries to set that through the HAL when the layer is being set up.
	laLineWidget	Defines the implementation of a line widget struct
	laListItem	Defines a list item struct
	laListWheelItem	Implementation of a list wheel widget item struct
	laListWheelWidget	Implementation of a list wheel widget struct
	laListWheelWidget_SelectedItemChangedEvent	This is type laListWheelWidget_SelectedItemChangedEvent.
	laListWidget	Defines the implementation of a list widget
	laListWidget_ItemSelectedChangedEvent	This is type laListWidget_ItemSelectedChangedEvent.
	laListWidget_SelectedItemChangedEvent	This is type laListWidget_SelectedItemChangedEvent.
	laListWidget_SelectionMode	Defines the list selection modes
	laMouseButton	All values possible for mouse key entry from the libaria mouse input
	laProgressBar	This is type laProgressBar.
	laProgressBar_ValueChangedEventCallback	This is type laProgressBar_ValueChangedEventCallback.
	laProgressBarDirection	Defines the valid values for the progress bar widget fill directions.
	laProgressBarWidget	Implementation of a progressbar widget struct
	laRadioButtonGroup	Defines the structure used for the Radio Button group.
	laRadioButtonWidget	Implementation of a radio button widget struct
	laRadioButtonWidget_DeselectedEvent	This is type laRadioButtonWidget_DeselectedEvent.
	laRadioButtonWidget_SelectedEvent	This is type laRadioButtonWidget_SelectedEvent.
	laRectangleWidget	Implementation of a rectangle widget struct
	laScheme	This structure specifies the style scheme components of an object.
	laScreen_CreateCallback_FnPtr	Callback pointer for a new screen create event notification. This is called when the library attempts to create a screen.
	laScreen_ShowHideCallback_FnPtr	Callback pointer for the active screen show or hide event change notification.
	laScreenOrientation	Possible values for screen orientation.
	laScrollBarOrientation	Defines the scroll bar direction values
	laScrollBarState	Defines the various scroll bar state values
	laScrollBarWidget	Implementation of a scroll bar widget.
	laScrollBarWidget_ValueChangedEvent	This is type laScrollBarWidget_ValueChangedEvent.
	laSliderOrientation	Slider orientations
	laSliderState	Describes various slider states
	laSliderWidget	Implementation of a slider widget struct
	laSliderWidget_ValueChangedEvent	This is type laSliderWidget_ValueChangedEvent.
	laTextFieldWidget	Implementation of a text field widget.
	laTextFieldWidget_TextChangedCallback	This is type laTextFieldWidget_TextChangedCallback.
	laTouchState	Manage the touch input state and track the touch coordinate
	laTouchTestState	Touch test states
	laTouchTestWidget	Implementation of a touch test widget struct
	laTouchTestWidget_PointAddedEventCallback	This is type laTouchTestWidget_PointAddedEventCallback.
	laWidget	Specifies Graphics widget structure to manage all properties and events associated with the widget
	laWidget_Constructor_FnPtr	This is type laWidget_Constructor_FnPtr.
	laWidget_Destructor_FnPtr	This is type laWidget_Destructor_FnPtr.
	laWidget_DrawFunction_FnPtr	This is type laWidget_DrawFunction_FnPtr.
	laWidget_Focus_FnPtr	This is type laWidget_Focus_FnPtr.
	laWidget_Moved_FnPtr	This is type laWidget_Moved_FnPtr.
	laWidget_Paint_FnPtr	This is type laWidget_Paint_FnPtr.
	laWidget_Resized_FnPtr	This is type laWidget_Resized_FnPtr.
	laWidget_TouchDownEvent_FnPtr	This is type laWidget_TouchDownEvent_FnPtr.
	laWidget_TouchMovedEvent_FnPtr	This is type laWidget_TouchMovedEvent_FnPtr.
	laWidget_TouchUpEvent_FnPtr	This is type laWidget_TouchUpEvent_FnPtr.
	laWidget_Update_FnPtr	This is type laWidget_Update_FnPtr.

	laWidgetDirtyState	Specifies the different dirty states the widget can be assigned
	laWidgetDrawState	Specifies the different draw states the widget can be assigned
	laWidgetEvent	Basic widget event definition
	laWidgetType	Specifies the different widget types used in the library
	laWindowWidget	Implementation of a window widget struct
	laBackgroundType_t	Specifies the different background types used for the widgets in the library
	laWidgetOptimizationFlags_t	Specifies the different draw optimization flags for a widget
	laBackgroundType	Specifies the different background types used for the widgets in the library
	laWidget_LanguageChangingEvent_FnPtr	This is type laWidget_LanguageChangingEvent_FnPtr.
	laWidgetOptimizationFlags	Specifies the different draw optimization flags for a widget
	LA_DEFAULT_SCHEME_COLOR_MODE	This is macro LA_DEFAULT_SCHEME_COLOR_MODE.
	LA_STRING_NULLIDX	This is macro LA_STRING_NULLIDX.
	DEFAULT_BORDER_MARGIN	This is macro DEFAULT_BORDER_MARGIN.
	LA_IMAGESEQ_RESTART	This is macro LA_IMAGESEQ_RESTART.
	LA_INPUT_PRIMARY_ID	This is macro LA_INPUT_PRIMARY_ID.
	LA_MAX_TOUCH_STATES	This is macro LA_MAX_TOUCH_STATES.
	LA_TOUCHTEST_MEMORY_SIZE	This is macro LA_TOUCHTEST_MEMORY_SIZE.
	NUM_BUTTONS	This is macro NUM_BUTTONS.
	NUM_KEYS	This is macro NUM_KEYS.
	laLayer_AddDamageRect	Adds a damaged rectangle to the list. Damage rectangles are used in minimal redraw algorithms.
	laEventResult	Defines what happened when processing an event
	laLayerFrameState	Defines the frame state of a layer. Certain actions must only be performed at the start of a new frame and other actions must wait until the end of the current frame.
	laRectArray	This is type laRectArray.
	laWidget_InvalidateBorderAreas_FnPtr	This is type laWidget_InvalidateBorderAreas_FnPtr.
	laEventResult_t	Defines what happened when processing an event
	laLayerFrameState_t	Defines the frame state of a layer. Certain actions must only be performed at the start of a new frame and other actions must wait until the end of the current frame.
	laContextFrameState_t	Possible values for context frame state.
	laContextFrameState	Possible values for context frame state.
	laImageWidget_DrawEventCallback	
	laContextUpdateState_t	Possible values for context update state.
	laWidgetUpdateState_t	Specifies the different update states the widget can be assigned
	laContextUpdateState	Possible values for context update state.
	laWidgetUpdateState	Specifies the different update states the widget can be assigned

Description

This section Aria User Interface Library Interface.

a) Functions

laContext_AddScreen Function

Add screen to the list of screens in the current context

File

libaria_context.h

C

```
LIB_EXPORT laResult laContext_AddScreen(laScreen* screen);
```

Returns

laResult

Description

Add screen to the list of screens in the current context

Function

laResult laContext_AddScreen(laScreen* screen)

laContext_Create Function

Creates an instance of the Aria user interface library

File

libaria_context.h

C

```
LIB_EXPORT laContext* laContext_Create(GFX_Driver driver, GFX_Display display, GFX_Processor processor,
GFX_ColorMode mode, GFXU_MemoryIntf* memoryIntf);
```

Returns

laContext* - a valid context pointer or NULL

Preconditions

Should have called laInitialize() before attempting to create a context

Parameters

Parameters	Description
GFX_Driver	the graphics controller the library will initialize the HAL with
GFX_Display	the graphics display the library will initialize the HAL with
GFX_ColorMode	the color mode the library will use and initialize the HAL with
GFXU_MemoryIntf*	the memory interface the library will use and will initialize the HAL with

Function

laContext* laContext_Create(laArray*)

laContext_Destroy Function

Destroys an Aria instance

File

libaria_context.h

C

```
LIB_EXPORT laResult laContext_Destroy(laContext* context);
```

Returns

laResult - indicates if the instance was successfully destroyed

Parameters

Parameters	Description
laContext*	a valid Aria pointer

Function

laResult laContext_Destroy(laContext*)

laContext_GetActive Function

Returns the current active context.

File

libaria_context.h

C

```
LIB_EXPORT laContext* laContext_GetActive();
```

Returns

laContext*

Function

laContext* laContext_GetActive()

laContext_GetActiveScreen Function

Returns the active screen of the current context

File

libaria_context.h

C

```
LIB_EXPORT laScreen* laContext_GetActiveScreen();
```

Returns

laScreen*

Description

Returns the active screen of the current context

Function

laScreen* laContext_GetActiveScreen()

laContext_GetActiveScreenIndex Function

Return the index of the active screen

File

libaria_context.h

C

```
LIB_EXPORT int32_t laContext_GetActiveScreenIndex();
```

Returns

int32_t

Description

Return the index of the active screen

Function

int32_t laContext_GetActiveScreenIndex()

laContext_GetColorMode Function

Returns the color mode of the current context

File

libaria_context.h

C

```
LIB_EXPORT GFX_ColorMode laContext_GetColorMode();
```

Returns

GFX_ColorMode

Function

GFX_ColorMode laContext_GetColorMode()

laContext_GetDefaultScheme Function

Returns the pointer to the default scheme of the current context

File

libaria_context.h

C

```
LIB_EXPORT laScheme* laContext_GetDefaultScheme();
```

Returns

laScheme*

Description

Returns the pointer to the default scheme of the current context

Function

laScheme* laContext_GetDefaultScheme()

laContext_GetEditWidget Function

Gets the widget that is currently recieving all widget edit events.

File

libaria_context.h

C

```
LIB_EXPORT laEditWidget* laContext_GetEditWidget();
```

Returns

laEditWidget*

Description

Edit widgets are widgets that inherit the 'edit widget' API function list. These widgets are capable of receiving edit events from other widgets that are edit event broadcasters. A broadcaster could be a 'key pad' and a receiver could be a 'text edit' box.

Function

laEditWidget* laContext_GetEditWidget()

laContext_GetFocusWidget Function

Return a pointer to the widget in focus

File

libaria_context.h

C

```
LIB_EXPORT laWidget* laContext_GetFocusWidget();
```

Returns

laWidget*

Description

The focus widget is the widget that is currently receiving all input events. This can happen when the user initiates a touch down event on the widget and is currently dragging their finger on the display. The widget will receive all touch moved events until a touch up event is received.

Function

laWidget* laContext_GetFocusWidget()

laContext_GetPremptionLevel Function

Returns the preemption level for the screen

File

libaria_context.h

C

```
LIB_EXPORT laPreemptionLevel laContext_GetPremptionLevel();
```

Returns

laPreemptionLevel

Description

Returns the preemption level for the screen

Function

laPreemptionLevel laContext_GetPreemptionLevel()

laContext_GetScreenRect Function

Returns the display rectangle structure of the physical display

File

libaria_context.h

C

```
LIB_EXPORT GFX_Rect laContext_GetScreenRect();
```

Returns

GFX_Rect

Description

Returns the display rectangle - width height and upper left corner coordinates of the physical display

Function

LIB_EXPORT GFX_Rect laContext_GetScreenRect()

laContext_GetStringLanguage Function

Returns the language index of the current context

File

libaria_context.h

C

```
LIB_EXPORT uint32_t laContext_GetStringLanguage();
```

Returns

uint32_t

Description

Returns the language index of the current context

Function

uint32_t laContext_GetStringLanguage()

laContext_GetStringTable Function

Get a pointer to the GFXU_StringTableAsset structure that maintains the strings, associated fonts, etc

File

libaria_context.h

C

```
LIB_EXPORT GFXU_StringTableAsset* laContext_GetStringTable();
```

Returns

GFXU_StringTableAsset*

Description

Get a pointer to the GFXU_StringTableAsset structure that maintains the strings, associated fonts, etc

Function

GFXU_StringTableAsset* laContext_GetStringTable()

laContext_HideActiveScreen Function

Hide the active screen

File

libaria_context.h

C

```
LIB_EXPORT GFX_DEPRECATED laResult laContext_HideActiveScreen();
```

Returns

void

Description

Hide the active screen. If the screen's persistent flag is set to true then the memory for the screen's widgets will not be deallocated. This will maintain the state of the screen.

Function

laResult laContext_HideActiveScreen()

laContext_RedrawAll Function

Forces the library to redraw the currently active screen in its entirety.

File

libaria_context.h

C

```
LIB_EXPORT void laContext_RedrawAll();
```

Returns

void

Function

void laContext_RedrawAll()

laContext_RemoveScreen Function

Remove the specified screen from the list of screens in the current context

File

libaria_context.h

C

```
LIB_EXPORT laResult laContext_RemoveScreen(laScreen* screen);
```

Returns

laResult

Description

Remove the specified screen from the list of screens in the current context

Function

laResult laContext_RemoveScreen(laScreen* screen)

laContext_SetActive Function

Make the specified context active

File

libaria_context.h

C

```
LIB_EXPORT laResult laContext_SetActive(laContext* context);
```

Returns

laResult - LA_SUCCESS if the context was successfully set as active

Function

laResult laContext_SetActive(laContext* context)

laContext_SetActiveScreen Function

Change the active screen to the one specified by the index argument

File

libaria_context.h

C

```
LIB_EXPORT laResult laContext_SetActiveScreen(uint32_t id);
```

Returns

void

Description

This operation will tear down the existing layer state of the driver if necessary and rebuild the frame buffers if the existing buffers can not be reused. This operation can be potentially slow and expensive. Widgets can be used to simulate screen transitions as applicable.

Function

laResult laContext_SetActiveScreen(uint32_t id)

laContext_SetActiveScreenChangedCallback Function

Set the callback function pointer when the screen change event occurs

File

libaria_context.h

C

```
LIB_EXPORT laResult laContext_SetActiveScreenChangedCallback(laContext_ActiveScreenChangedCallback_FnPtr
cb);
```

Returns

laResult

Description

Set the callback function pointer when the screen change event occurs

Function

laResult laContext_SetActiveScreenChangedCallback(laContext_ActiveScreenChangedCallback_FnPtr cb)

laContext_SetEditWidget Function

Sets the currently active edit widget.

File

libaria_context.h

C

```
LIB_EXPORT laResult laContext_SetEditWidget(laWidget* widget);
```

Returns

laResult

Parameters

Parameters	Description
laWidget*	a widget that inherits the edit widget API and has its 'editable' flag set to true.

Function

laResult laContext_SetEditWidget(laWidget* widget)

laContext_SetFocusWidget Function

Set into focus the widget specified as the argument

File

libaria_context.h

C

```
LIB_EXPORT laResult laContext_SetFocusWidget(laWidget* widget);
```

Returns

laResult

Description

Set into focus the widget specified as the argument

Function

laResult laContext_SetFocusWidget(laWidget* widget)

laContext_SetLanguageChangedCallback Function

Set the callback function pointer when the language change event occurs

File

libaria_context.h

C

```
LIB_EXPORT laResult laContext_SetLanguageChangedCallback(laContext_LanguageChangedCallback_FnPtr cb);
```

Returns

laResult

Description

Set the callback function pointer when the language change event occurs

Function

laResult laContext_SetLanguageChangedCallback(laContext_LanguageChangedCallback_FnPtr cb)

laContext_SetStringLanguage Function

Set the language index of the current context

File

libaria_context.h

C

```
LIB_EXPORT void laContext_SetStringLanguage(uint32_t id);
```

Returns

void

Description

Set the language index of the current context

Function

void laContext_SetStringLanguage(uint32_t id)

laContext_SetStringTable Function

Set the StringTable pointer to the specified new StringTableAsset structure

File

libaria_context.h

C

```
LIB_EXPORT void laContext_SetStringTable(GFXU_StringTableAsset* table);
```

Returns

void

Description

Set the StringTable pointer to the specified new StringTableAsset structure

Function

void laContext_SetStringTable(GFXU_StringTableAsset* table)

laContext_Update Function

Runs the update loop for a library instance.

File

libaria_context.h

C

```
LIB_EXPORT void laContext_Update(uint32_t dt);
```

Returns

void

Description

The update loop allows the library to service its event array and allows any intelligent widgets to perform active update tasks. This should be run periodically, but not often enough to starve other processes. Running too little may result in a loss of UI responsiveness.

Parameters

Parameters	Description
uint32_t dt	a delta time representing how much time has passed since the last time laContext_Update has been called. This is typically in milliseconds.

Function

void laContext_Update(uint32_t dt)

laEditWidget_Accept Function

File

libaria_editwidget.h

C

```
void laEditWidget_Accept();
```

Description

This is function laEditWidget_Accept.

laEditWidget_Append Function

File

libaria_editwidget.h

C

```
void laEditWidget_Append(laString str);
```

Description

This is function laEditWidget_Append.

laEditWidget_Backspace Function

File

libaria_editwidget.h

C

```
void laEditWidget_Backspace();
```

Description

This is function laEditWidget_Backspace.

laEditWidget_Clear Function

File

libaria_editwidget.h

C

```
void laEditWidget_Clear();
```

Description

This is function laEditWidget_Clear.

laEditWidget_EndEdit Function

File

libaria_editwidget.h

C

```
void laEditWidget_EndEdit();
```

Description

This is function laEditWidget_EndEdit.

laEditWidget_Set Function

File

libaria_editwidget.h

C

```
void laEditWidget_Set(laString str);
```

Description

This is function laEditWidget_Set.

laEditWidget_StartEdit Function

File

libaria_editwidget.h

C

```
laResult laEditWidget_StartEdit();
```

Description

This is function laEditWidget_StartEdit.

laList_Assign Function

Assignes a new pointer to an index in the list

File

libaria_list.h

C

```
LIB_EXPORT int32_t laList_Assign(laList* list, size_t idx, void* val);
```

Returns

int32_t - 0 if success, -1 if failure

Parameters

Parameters	Description
laList* list	pointer to the list to modify
size_t idx	the index to modify
void* val	the new value of the node

Function

int32_t laList_Assign(laList* list, size_t idx, void* val)

laList_Clear Function

Removes all nodes from a given list

File

libaria_list.h

C

```
LIB_EXPORT void laList_Clear(laList* list);
```

Returns

void

Parameters

Parameters	Description
laList* list	the list to modify

Function

void laList_Clear(laList* list)

laList_Copy Function

Creates a duplicate of an existing list

File

libaria_list.h

C

```
LIB_EXPORT int32_t laList_Copy(laList* l, laList* r);
```

Returns

int32_t - 0 if success, -1 if failure

Parameters

Parameters	Description
laList* l	the source list
laList* r	the result list

Function

int32_t laList_Copy(laList* l, laList* r)

laList_Create Function

Initializes a new linked list

File

libaria_list.h

C

```
LIB_EXPORT int32_t laList_Create(laList* list);
```

Returns

int32_t - 0 if success, -1 if failure

Parameters

Parameters	Description
laList* list	pointer to the list to initilaize

Function

int32_t laList_Create(laList* list)

laList_Destroy Function

Removes all nodes from a given list and frees the data of each node

File

libaria_list.h

C

```
LIB_EXPORT void laList_Destroy(laList* list);
```

Returns

void

Parameters

Parameters	Description
laList* list	the list to modify

Function

void laList_Destroy(laList* list)

laList_Find Function

Retrieves the index of a value from the list

File

libaria_list.h

C

```
LIB_EXPORT int32_t laList_Find(laList* list, void* val);
```

Returns

int32_t - the index of the value searched for

Parameters

Parameters	Description
laList* list	pointer to the list to reference
void* val	the value to search for

Function

int32_t laList_Find(laList* list, void* val)

laList_Get Function

Retrieves a value from the list

File

libaria_list.h

C

```
LIB_EXPORT void* laList_Get(laList* list, uint32_t idx);
```

Returns

void* - the retrieved value

Parameters

Parameters	Description
laList* list	pointer to the list to reference
uint32_t idx	the index of the value to retrieve

Function

void* laList_Get(laList* list, uint32_t idx)

laList_InsertAt Function

Inserts an item into a list at a given index. All existing from index are shifted right one place.

File

libaria_list.h

C

```
LIB_EXPORT int32_t laList_InsertAt(laList* list, void* val, uint32_t idx);
```

Returns

int32_t - 0 if success, -1 if failure

Parameters

Parameters	Description
laList* list	pointer to the list to modify
void* val	the value to insert
uint32_t idx	the position to insert the value

Function

int32_t laList_InsertAt(laList* list,
void* val,
uint32_t idx)

laList_PopBack Function

Removes the last value from the list

File

libaria_list.h

C

```
LIB_EXPORT int32_t laList_PopBack(laList* list);
```

Parameters

Parameters	Description
laList* list	pointer to the list to modify

Function

void laList_PopBack(laList* list)

laList_PopFront Function

Removes the first value from the list

File

libaria_list.h

C

```
LIB_EXPORT void laList_PopFront(laList* list);
```

Parameters

Parameters	Description
laList* list	pointer to the list to modify

Function

void laList_PopFront(laList* list)

laList_PushBack Function

Pushes a new node onto the back of the list

File

libaria_list.h

C

```
LIB_EXPORT int32_t laList_PushBack(laList* list, void* val);
```

Returns

int32_t - 0 if success, -1 if failure

Parameters

Parameters	Description
laList* list	pointer to the list to modify
void* val	the new value of the node

Function

int32_t laList_PushBack(laList* list, void* val)

laList_PushFront Function

Pushes a new node onto the front of the list

File

libaria_list.h

C

```
LIB_EXPORT int32_t laList_PushFront(laList* list, void*);
```

Returns

int32_t - 0 if success, -1 if failure

Parameters

Parameters	Description
laList* list	pointer to the list to modify
void* val	the new value of the node

Function

int32_t laList_PushFront(laList* list, void* val)

laList_Remove Function

Removes an item from the list

File

libaria_list.h

C

```
LIB_EXPORT int32_t laList_Remove(laList* list, void*);
```

Returns

int32_t - 0 if success, -1 if failure

Parameters

Parameters	Description
laList* list	pointer to the list to modify
void* val	the value to remove

Function

int32_t laList_Remove(laList* list, void*)

laList_RemoveAt Function

Removes an item from the list at an index

File

libaria_list.h

C

```
LIB_EXPORT int32_t laList_RemoveAt(laList* list, uint32_t idx);
```

Returns

int32_t - 0 if success, -1 if failure

Parameters

Parameters	Description
laList* list	pointer to the list to modify
uint32_t idx	the index of the value to remove

Function

int32_t laList_Remove(laList* list, uint32_t idx)

laString_Allocate Function

Attempts to resize the local data buffer for a string.

File

libaria_string.h

C

```
LIB_EXPORT laResult laString_Allocate(laString* str, uint32_t size);
```

Returns

laResult - LA_SUCCESS if the function succeeded

Remarks

If size is zero then the memory will be freed and the function will return success.

Parameters

Parameters	Description
laString* str	the string to modify
uint32_t size	the desired size of the string

Function

void laString_Allocate(laString* str, uint32_t size)

laString_Append Function

Appends a string onto the end of another string

File

libaria_string.h

C

```
LIB_EXPORT laResult laString_Append(laString* dst, const laString* src);
```

Returns

laResult - LA_SUCCESS if the operation succeeded

Parameters

Parameters	Description
laString* dst	the destination string
const laString* src	the source string

Function

void laString_Append(laString* dst, const laString* src)

laString_Capacity Function

Returns the capacity of a string

File

libaria_string.h

C

```
LIB_EXPORT uint32_t laString_Capacity(const laString* str);
```

Returns

uint32_t - the capacity of a string in characters

Parameters

Parameters	Description
const laString* str	the string to reference

Function

uint32_t laString_Capacity(const laString* str)

laString_CharAt Function

Extracts the code point for the character in a string at a given index.

File

libaria_string.h

C

```
LIB_EXPORT GFXU_CHAR laString_CharAt(const laString* str, uint32_t idx);
```

Returns

GFXU_CHAR - the code point of the character

Parameters

Parameters	Description
const laString* str	the string to reference
uint32_t idx	the character index to reference

Function

GFXU_CHAR laString_CharAt(const laString* str, uint32_t idx)

laString_Clear Function

Sets a string's length to zero and its string table reference to NULL. Does not free any associated data and preserves capacity.

File

libaria_string.h

C

```
LIB_EXPORT void laString_Clear(laString* str);
```

Returns

void

Parameters

Parameters	Description
laString* str	the string to modify

Function

void laString_Clear(laString* str)

laString_Compare Function

Compares two string objects

File

libaria_string.h

C

```
LIB_EXPORT int32_t laString_Compare(const laString* lstr, const laString* rstr);
```

Returns

int32_t - the result of the string comparison, 0 if the strings are equal see strcmp() for more information

Parameters

Parameters	Description
const laString* lstr	the left argument
const laString* rstr	the right argument

Function

int32_t laString_Compare(const laString* lstr, const laString* rstr)

laString_CompareBuffer Function

Compares a string object and a GFXU_CHAR* buffer

File

libaria_string.h

C

```
LIB_EXPORT int32_t laString_CompareBuffer(const laString* str, const GFXU_CHAR* buffer);
```

Returns

int32_t - the result of the string comparison, 0 if the strings are equal see strcmp() for more information

Parameters

Parameters	Description
const laString* lstr	the string
const GFXU_CHAR* buffer	the GFXU_CHAR buffer

Function

int32_t laString_Compare(const laString* lstr, const GFXU_CHAR* buffer)

laString_Copy Function

Copies the values from one string into another

File

libaria_string.h

C

```
LIB_EXPORT laResult laString_Copy(laString* dst, const laString* src);
```

Returns

laResult - LA_SUCCESS if the function succeeded

Remarks

Makes duplicate of a given string. Destination will have the same length and data but may not have the same overall capacity. The source may have lots of unused space and the destination may not match to avoid waste. Caller is responsible for the allocated memory but does not need to preserve the input string to maintain the destination string buffer state.

Caller must also ensure that the font contains all the glyphs for the string or rendering may not be possible.

Parameters

Parameters	Description
laString* dst	the destination string object
laString* src	the source string object

Function

laResult laString_Copy(laString* dst, const laString* src)

laString_CreateFromBuffer Function

Creates a string object from a GFXU_CHAR buffer and a font asset pointer

File

libaria_string.h

C

```
LIB_EXPORT laString laString_CreateFromBuffer(const GFXU_CHAR* chr, GFXU_FontAsset* fnt);
```

Returns

laString - created string object

Remarks

Makes an internal copy of the input buffer for the string object. Caller is responsible for the allocated memory but does not need to preserve the input buffer to maintain the string buffer state.

Caller must also ensure that the font contains all the glyphs for the string or rendering may not be possible.

Parameters

Parameters	Description
const GFXU_CHAR* chr	pointer to a GFXU_CHAR buffer, can be NULL
GFXU_FontAsset* fnt	pointer to a font asset, can be NULL

Function

laString laString_CreateFromBuffer(const GFXU_CHAR* chr, GFXU_FontAsset* fnt)

laString_CreateFromCharBuffer Function

Creates a string object from a const char* buffer and a font asset pointer. This method provides compatibility with standard c-style strings. Input string will be converted from 8-bit with to 32-bit width.

File

libaria_string.h

C

```
LIB_EXPORT laString laString_CreateFromCharBuffer(const char* chr, GFXU_FontAsset* fnt);
```

Returns

laString - created string object

Remarks

Makes an internal copy of the input buffer for the string object. Caller is responsible for the allocated memory but does not need to preserve the input buffer to maintain the string buffer state.

Caller must also ensure that the font contains all the glyphs for the string or rendering may not be possible.

Parameters

Parameters	Description
const char* chr	pointer to a const char* buffer, can be NULL
GFXU_FontAsset* fnt	pointer to a font asset, can be NULL

Function

laString laString_CreateFromCharBuffer(const char* chr, GFXU_FontAsset* fnt)

laString_CreateFromID Function

Creates a string object that simply references a string in the string table.

File

libaria_string.h

C

```
LIB_EXPORT laString laString_CreateFromID(uint32_t id);
```

Returns

laString - created string object

Remarks

Allocates no memory.

Parameters

Parameters	Description
uint32_t id	the string table id to use

Function

laString laString_CreateFromID(uint32_t id)

laString_Delete Function

Deletes all memory associated with a string object

File

libaria_string.h

C

```
LIB_EXPORT void laString_Delete(laString** str);
```

Returns

void

Remarks

Will free local string data and the memory for the string pointer itself, setting the pointer to NULL if successful

Parameters

Parameters	Description
laString** str	pointer to a pointer to a string object

Function

void laString_Delete(laString** str)

laString_Destroy Function

Destroys a string object. This frees the strings internal data buffer, if it exists, sets its string table reference to null, and clears all supporting attributes.

File

libaria_string.h

C

```
LIB_EXPORT void laString_Destroy(laString* str);
```

Parameters

Parameters	Description
laString* str	the string to modify

Function

void laString_Destroy(laString* str)

laString_Draw Function

Wrapper around GFX Utility string draw function for Aria user interface library. Internal use only.

File

libaria_string.h

C

```
LIB_EXPORT void laString_Draw(laString* str, int32_t x, int32_t y, GFXU_ExternalAssetReader** reader);
```

Returns

void

Parameters

Parameters	Description
laString* str	the string to draw
int32_t x	x position to render at
int32_t y	y position to render at
GFXU_ExternalAssetReader** reader	external reader state machine, if string font is located external

Function

void laString_Draw(laString* str,
int32_t x,
int32_t y,
GFXU_ExternalAssetReader** reader)

laString_ExtractFromTable Function

Extracts a read-only string from the string table into a modifiable string object. This relies on the active context to indicate which string table to reference as well as which language entry to extract.

File

libaria_string.h

C

```
LIB_EXPORT void laString_ExtractFromTable(laString* dst, uint32_t table_index);
```

Returns

void

Remarks

Caller is responsible for the allocated memory but does not need to preserve the input buffer to maintain the string buffer state.

Parameters

Parameters	Description
laString* dst	the destination string object
uint32_t table_index	the table index to extract

Function

void laString_ExtractFromTable(laString* dst, uint32_t table_index)

laString_GetCharIndexAtPoint Function

Given an offset in pixels returns the corresponding character index.

File

libaria_string.h

C

```
LIB_EXPORT uint32_t laString_GetCharIndexAtPoint(laString* str, int32_t x);
```

Returns

uint32_t - character index

Parameters

Parameters	Description
laString* str	the string to reference
int32_t x	x offset in pixels

Function

uint32_t laString_GetCharIndexAtPoint(laString* str, int32_t x)

laString_GetCharOffset Function

Returns the offset of a given character index in pixels.

File

libaria_string.h

C

```
LIB_EXPORT uint32_t laString_GetCharOffset(laString* str, uint32_t idx);
```

Returns

uint32_t - the offset in pixels

Parameters

Parameters	Description
laString* str	the string to reference
uint32_t idx	the character index offset to calculate

Function

uint32_t laString_GetCharOffset(laString* str, uint32_t idx)

laString_GetCharWidth Function

Given a character index, gets the width of that character. Only accurate if the string has a font associated with it and that font contains all the characters in the string in question.

File

libaria_string.h

C

```
LIB_EXPORT uint32_t laString_GetCharWidth(laString* str, uint32_t idx);
```

Returns

uint32_t - character width in pixels

Parameters

Parameters	Description
laString* str	the string to reference
uint32_t x	character index to reference

Function

uint32_t laString_GetCharWidth(laString* str, uint32_t idx)

laString_GetHeight Function

Returns the height of a string by referencing its associated font asset data.

File

libaria_string.h

C

```
LIB_EXPORT uint32_t laString_GetHeight(laString* str);
```

Returns

uint32_t - the height of the string

Parameters

Parameters	Description
laString* str	the string to reference

Function

uint32_t laString_GetHeight(laString* str)

laString_GetRect Function

Calculates the rectangle for a given string object. References the associated font for the height but must perform a summation for each character in the string by doing a font meta-data lookup.

File

libaria_string.h

C

```
LIB_EXPORT void laString_GetRect(laString* str, GFX_Rect* rect);
```

Returns

void

Parameters

Parameters	Description
laString* str	the string to reference
GFX_Rect* rect	the calculated string rectangle result

Function

void laString_GetRect(laString* str, GFX_Rect* rect)

laString_Initialize Function

Initializes a string struct to default

File

libaria_string.h

C

```
LIB_EXPORT void laString_Initialize(laString* str);
```

Returns

void

Remarks

Allocates no memory

Parameters

Parameters	Description
laString* str	pointer to a string object

Function

void laString_Initialize(laString* str)

laString_Insert Function

Inserts a string into another string at a given index

File

libaria_string.h

C

```
LIB_EXPORT laResult laString_Insert(laString* dst, const laString* src, uint32_t idx);
```

Returns

laResult - LA_SUCCESS if the operation succeeded

Parameters

Parameters	Description
laString* dst	the destination string
const laString* src	the source string
uint32_t idx	the insertion index

Function

void laString_Insert(laString* dst,const laString* src, uint32_t idx)

laString_Length Function

Calculates the length of a string in characters

File

libaria_string.h

C

```
LIB_EXPORT uint32_t laString_Length(const laString* str);
```

Returns

uint32_t - the number of characters in the string

Parameters

Parameters	Description
const laString* str	the string to reference

Function

uint32_t laString_Length(const laString* str)

laString_New Function

Allocates a memory for a new string

File

libaria_string.h

C

```
LIB_EXPORT laString* laString_New(laString* src);
```

Returns

laString* - pointer to the newly allocated string

Remarks

Caller is responsible for freeing the memory allocated by this function

Parameters

Parameters	Description
laString* src	a string to copy, can be NULL

Function

laString* laString_New(laString* src)

laString_ReduceLength Function

Reduces the length of a string. This simply slides the null terminator to the left and does not affect the string's capacity value.

File

libaria_string.h

C

```
LIB_EXPORT void laString_ReduceLength(laString* str, uint32_t length);
```

Returns

void

Parameters

Parameters	Description
laString* str	the string to modify
uint32_t length	the new desired length in characters

Function

void laString_ReduceLength(laString* str, uint32_t length)

laString_Set Function

Attempts to set the local data buffer of a string to an input buffer

File

libaria_string.h

C

```
LIB_EXPORT laResult laString_Set(laString* str, const GFXU_CHAR* buffer);
```

Returns

laResult - LA_SUCCESS if the function succeeded

Remarks

Makes an internal copy of the input buffer for the string object. Caller is responsible for the allocated memory but does not need to preserve the input buffer to maintain the string buffer state.

Caller must also ensure that the font contains all the glyphs for the string or rendering may not be possible.

Parameters

Parameters	Description
laString* str	the string to modify
const GFXU_CHAR* buffer	the input buffer

Function

laResult laString_Set(laString* str, const GFXU_CHAR* buffer)

laString_SetCapacity Function

Attempts to adjust the capacity of a string

File

libaria_string.h

C

```
LIB_EXPORT laResult laString_SetCapacity(laString* str, uint32_t cap);
```

Returns

laResult - LA_SUCCESS if the operation succeeded

Parameters

Parameters	Description
laString* str	the string to modify
uint32_t cap	the new desired capacity

Function

void laString_SetCapacity(laString* str, uint32_t cap)

laString_ToCharBuffer Function

Extracts the data buffer from a string and copies it into the provided buffer argument.

File

libaria_string.h

C

```
LIB_EXPORT uint32_t laString_ToCharBuffer(const laString* str, GFXU_CHAR* buffer, uint32_t size);
```

Returns

uint32_t - the number of characters copied

Parameters

Parameters	Description
laString* str	the string to reference
GFXU_CHAR* buffer	the destination buffer
uint32_t size	the max size of the destination buffer

Function

uint32_t laString_ToCharBuffer(const laString* str,
GFXU_CHAR* buffer,
uint32_t size)

laButtonWidget_GetHAlignment Function

Gets the horizontal alignment setting for a button

File

libaria_widget_button.h

C

```
LIB_EXPORT laHAlignment laButtonWidget_GetHAlignment(laButtonWidget* btn);
```

Returns

laHAlignment - the horizontal alignment value

Parameters

Parameters	Description
laButtonWidget* btn	the button to reference

Function

laHAlignment laButtonWidget_GetHAlignment(laButtonWidget* btn)

laButtonWidget_GetImageMargin Function

Gets the distance between the icon and the text

File

libaria_widget_button.h

C

```
LIB_EXPORT uint32_t laButtonWidget_GetImageMargin(laButtonWidget* btn);
```

Returns

uint32_t - the distance value

Parameters

Parameters	Description
laButtonWidget* btn	the widget

Function

uint32_t laButtonWidget_GetImageMargin(laButtonWidget* btn)

laButtonWidget_GetImagePosition Function

Gets the position of the button icon

File

libaria_widget_button.h

C

```
LIB_EXPORT laRelativePosition laButtonWidget_GetImagePosition(laButtonWidget* btn);
```

Returns

laRelativePosition

Parameters

Parameters	Description
laButtonWidget* btn	the button to reference

Function

laRelativePosition laButtonWidget_GetImagePosition(laButtonWidget* btn)

laButtonWidget_GetPressed Function

Gets the pressed state of a button

File

libaria_widget_button.h

C

```
LIB_EXPORT laBool laButtonWidget_GetPressed(laButtonWidget* btn);
```

Returns

laBool - the button pressed state

Parameters

Parameters	Description
laButtonWidget* btn	the button to reference

Function

laBool laButtonWidget_GetPressed(laButtonWidget* btn)

laButtonWidget_GetPressedEventCallback Function

Gets the callback associated with the button pressed event

File

libaria_widget_button.h

C

```
LIB_EXPORT laButtonWidget_PressedEvent laButtonWidget_GetPressedEventCallback(laButtonWidget* btn);
```

Returns

laButtonWidget_PressedEvent

Parameters

Parameters	Description
laButtonWidget* btn	the widget

Function

laButtonWidget_PressedEvent laButtonWidget_GetPressedEventCallback(laButtonWidget* btn)

laButtonWidget_GetPressedImage Function

Gets the pressed image asset pointer for a button

File

libaria_widget_button.h

C

```
LIB_EXPORT GFXU_ImageAsset* laButtonWidget_GetPressedImage(laButtonWidget* btn);
```

Returns

GFXU_ImageAsset* - the pressed asset pointer

Parameters

Parameters	Description
laButtonWidget* btn	the button to reference

Function

GFXU_ImageAsset* laButtonWidget_GetPressedImage(laButtonWidget* btn)

laButtonWidget_GetPressedOffset Function

Gets the offset of the button internals when pressed

File

libaria_widget_button.h

C

```
LIB_EXPORT int32_t laButtonWidget_GetPressedOffset(laButtonWidget* btn);
```

Returns

int32_t - the distance value

Parameters

Parameters	Description
laButtonWidget* btn	the widget

Function

int32_t laButtonWidget_GetPressedOffset(laButtonWidget* btn)

laButtonWidget_GetReleasedEventCallback Function

Gets the callback for the button released event

File

libaria_widget_button.h

C

```
LIB_EXPORT laButtonWidget_ReleasedEvent laButtonWidget_GetReleasedEventCallback(laButtonWidget* btn);
```

Returns

laButtonWidget_ReleasedEvent

Parameters

Parameters	Description
laButtonWidget* btn	the widget

Function

laButtonWidget_ReleasedEvent laButtonWidget_GetReleasedEventCallback(laButtonWidget* btn)

laButtonWidget_GetReleasedImage Function

Gets the currently used released icon

File

libaria_widget_button.h

C

```
LIB_EXPORT GFXU_ImageAsset* laButtonWidget_GetReleasedImage(laButtonWidget* btn);
```

Returns

GFXU_ImageAsset* - the released asset pointer

Parameters

Parameters	Description
laButtonWidget* btn	the button to reference

Function

GFXU_ImageAsset* laButtonWidget_GetReleasedImage(laButtonWidget* btn)

laButtonWidget_GetText Function

Gets the text for a button. If the button's string has local data then a duplicate of the string will be allocated. The caller is responsible for managing the memory for the duplicated string. If the button string is a string table reference then only the reference ID is copied.

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_GetText(laButtonWidget* btn, laString* str);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the button to reference
laString* str	pointer to a string to copy the button string into

Function

laResult laButtonWidget_GetText(laButtonWidget* btn, laString* str)

laButtonWidget_GetToggleable Function

Gets the value of this button's toggle flag

File

libaria_widget_button.h

C

```
LIB_EXPORT laBool laButtonWidget_GetToggleable(laButtonWidget* btn);
```

Returns

laBool - the value of the toggle flag

Parameters

Parameters	Description
laButtonWidget* btn	the button to reference

Function

laBool laButtonWidget_GetToggleable(laButtonWidget* btn)

laButtonWidget_GetVAlignment Function

Gets the vertical alignment setting for a button

File

libaria_widget_button.h

C

```
LIB_EXPORT laVAlignment laButtonWidget_GetVAlignment(laButtonWidget* btn);
```

Returns

laVAlignment - the vertical alignment setting for the button

Parameters

Parameters	Description
laButtonWidget* btn	the button to reference

Function

laVAlignment laButtonWidget_GetVAlignment(laButtonWidget* btn)

laButtonWidget_New Function

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_button.h

C

```
LIB_EXPORT laButtonWidget* laButtonWidget_New();
```

Returns

laButtonWidget* - pointer to a new button widget instance

Description

Creates a new button widget instance. Invokes the button constructor

Remarks

Caller is responsible for managing the memory allocated by this function until the widget is added to a valid widget tree.

Function

laButtonWidget* laButtonWidget_New()

laButtonWidget_SetHAlignment Function

Sets the horizontal alignment value for a button

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetHAlignment(laButtonWidget* btn, laHAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the button to modify
laHAlignment align	the desired alignment value

Function

laResult laButtonWidget_SetHAlignment(laButtonWidget* btn,
laHAlignment align)

laButtonWidget_SetImageMargin Function

Sets the distance between the icon and text

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetImageMargin(laButtonWidget* btn, uint32_t mg);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the widget
uint32_t	the distance value

Function

laResult laButtonWidget_SetImageMargin(laButtonWidget* btn,
uint32_t mg)

laButtonWidget_SetImagePosition Function

Sets the position of the button icon

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetImagePosition(laButtonWidget* btn, laRelativePosition pos);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the widget
laRelativePosition pos	the desired image position

Function

laResult laButtonWidget_SetImagePosition(laButtonWidget* btn,
laRelativePosition pos)

laButtonWidget_SetPressed Function

Sets the pressed state for a button.

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetPressed(laButtonWidget* btn, laBool pressed);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the button to modify
laBool pressed	the pressed state

Function

laResult laButtonWidget_SetPressed(laButtonWidget* btn, laBool pressed)

laButtonWidget_SetPressedEventCallback Function

Sets the pressed event callback for the button

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetPressedEventCallback(laButtonWidget* btn, laButtonWidget_PressedEvent
cb);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the widget
laButtonWidget_PressedEvent cb	a valid callback pointer or NULL

Function

laResult laButtonWidget_SetPressedEventCallback(laButtonWidget* btn,
laButtonWidget_PressedEvent cb)

laButtonWidget_SetPressedImage Function

Sets the image to be used as a pressed icon

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetPressedImage(laButtonWidget* btn, GFXU_ImageAsset* img);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the widget
GFXU_ImageAsset* img	pointer to an image asset

Function

laResult laButtonWidget_SetPressedImage(laButtonWidget* btn,
GFXU_ImageAsset* img)

laButtonWidget_SetPressedOffset Function

Sets the offset of the button internals when pressed

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetPressedOffset(laButtonWidget* btn, int32_t offs);
```

Returns

laResult - the operation result

Description

This value will be applied to all of the contents of the button when it is pressed. This helps to visualize the button being pressed.

Parameters

Parameters	Description
laButtonWidget* btn	the widget
int32_t	the distance value

Function

laResult laButtonWidget_SetPressedOffset(laButtonWidget* btn, int32_t offs)

laButtonWidget_SetReleasedEventCallback Function

Sets the callback for the button released event

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetReleasedEventCallback(laButtonWidget* btn,
laButtonWidget_ReleasedEvent cb);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the widget
laButtonWidget_ReleasedEvent cb	a valid callback pointer or NULL

Function

laResult laButtonWidget_SetReleasedEventCallback(laButtonWidget* btn,
laButtonWidget_ReleasedEvent cb)

laButtonWidget_SetReleasedImage Function

Sets the image to be used as the released icon

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetReleasedImage(laButtonWidget* btn, GFXU_ImageAsset* img);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the widget
GFXU_ImageAsset* img	the image asset to be used

Function

laResult laButtonWidget_SetReleasedImage(laButtonWidget* btn,
GFXU_ImageAsset* img)

laButtonWidget_SetText Function

Sets the text for a button. If the input string has local data then the data will be copied into the button's local string, causing a memory allocation. If the input string is a string table reference then only the reference will be copied. The input string can be safely modified and the button string will not be affected.

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetText(laButtonWidget* btn, laString str);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the button to modify
laString str	the string to set to the button

Function

laResult laButtonWidget_SetText(laButtonWidget* btn, laString str)

laButtonWidget_SetToggleable Function

Enables the toggle mode for a button. When pressed, toggle buttons will stay down until pressed again.

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetToggleable(laButtonWidget* btn, laBool toggleable);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the button to modify
laBool toggleable	the desired togglestate

Function

laResult laButtonWidget_SetToggleable(laButtonWidget* btn,
laBool toggleable)

laButtonWidget_SetVAlignment Function

Sets the vertical alignment for a button

File

libaria_widget_button.h

C

```
LIB_EXPORT laResult laButtonWidget_SetVAlignment(laButtonWidget* btn, laVAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laButtonWidget* btn	the btn to modify
laVAlignment align	the desired vertical alignment setting

Function

laResult laButtonWidget_SetVAlignment(laButtonWidget* btn,
laVAlignment align)

laCheckBoxWidget_GetChecked Function

Gets the checked state of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laBool laCheckBoxWidget_GetChecked(laCheckBoxWidget* cbox);
```

Returns

laBool - the checked flag value

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

Function

laBool laCheckBoxWidget_GetChecked(laCheckBoxWidget* cbox)

laCheckBoxWidget_GetCheckedEventCallback Function

Gets the checked event callback

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laCheckBoxWidget_CheckedEvent laCheckBoxWidget_GetCheckedEventCallback(laCheckBoxWidget* cbox);
```

Returns

laCheckBoxWidget_CheckedEvent - a valid callback pointer or NULL

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

Function

laCheckBoxWidget_CheckedEvent laCheckBoxWidget_GetCheckedEventCallback(laCheckBoxWidget* cbox)

laCheckBoxWidget_GetCheckedImage Function

Gets the checked image of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT GFXU_ImageAsset* laCheckBoxWidget_GetCheckedImage(laCheckBoxWidget* btn);
```

Returns

GFXU_ImageAsset* - the current checked image asset pointer

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

Function

GFXU_ImageAsset* laCheckBoxWidget_GetCheckedImage(laCheckBoxWidget* btn)

laCheckBoxWidget_GetHAlignment Function

Gets the horizontal alignment of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laHAlignment laCheckBoxWidget_GetHAlignment(laCheckBoxWidget* cbox);
```

Returns

laHAlignment - the current halign value

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

Function

laHAlignment laCheckBoxWidget_GetHAlignment(laCheckBoxWidget* cbox)

laCheckBoxWidget_GetImageMargin Function

Gets the distance between the image and the text

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT uint32_t laCheckBoxWidget_GetImageMargin(laCheckBoxWidget* btn);
```

Returns

uint32_t - the current image margin value

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

Function

uint32_t laCheckBoxWidget_GetImageMargin(laCheckBoxWidget* btn)

laCheckBoxWidget_GetImagePosition Function

Gets the image position of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laRelativePosition laCheckBoxWidget_GetImagePosition(laCheckBoxWidget* btn);
```

Returns

laRelativePosition - the current image position value

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

Function

laRelativePosition laCheckBoxWidget_GetImagePosition(laCheckBoxWidget* btn)

laCheckBoxWidget_GetText Function

Gets a copy of the checkbox text. If the text has local data the data will be duplicated. The caller is responsible for managing the memory as appropriate.

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_GetText(laCheckBoxWidget* cbox, laString* str);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget
str	pointer to an laString object

Function

laResult laCheckBoxWidget_GetText(laCheckBoxWidget* cbox, laString* str)

laCheckBoxWidget_GetUncheckedEventCallback Function

Gets the unchecked event callback

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laCheckBoxWidget_UncheckedEvent laCheckBoxWidget_GetUncheckedEventCallback(laCheckBoxWidget*
cbox);
```

Returns

laCheckBoxWidget_UncheckedEvent - a valid callback pointer or NULL

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

Function

laCheckBoxWidget_UncheckedEvent laCheckBoxWidget_GetUncheckedEventCallback(laCheckBoxWidget* cbox)

laCheckBoxWidget_GetUncheckedImage Function

Gets the unchecked image of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT GFXU_ImageAsset* laCheckBoxWidget_GetUncheckedImage(laCheckBoxWidget* btn);
```

Returns

GFXU_ImageAsset* - the current unchecked image asset pointer

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

Function

GFXU_ImageAsset* laCheckBoxWidget_GetUncheckedImage(laCheckBoxWidget* btn)

laCheckBoxWidget_GetVAlignment Function

Gets the vertical alignment of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laVAlignment laCheckBoxWidget_GetVAlignment(laCheckBoxWidget* cbox);
```

Returns

laVAlignment

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

Function

laVAlignment laCheckBoxWidget_GetVAlignment(laCheckBoxWidget* cbox)

laCheckBoxWidget_New Function

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is

added to a widget tree.

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laCheckBoxWidget* laCheckBoxWidget_New();
```

Returns

laCheckBoxWidget*

Function

laCheckBoxWidget* laCheckBoxWidget_New()

laCheckBoxWidget_SetChecked Function

Sets the checked state of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_SetChecked(laCheckBoxWidget* cbox, laBool checked);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget
laBool checked	the desired checked value

Function

laResult laCheckBoxWidget_SetChecked(laCheckBoxWidget* cbox,
laBool checked)

laCheckBoxWidget_SetCheckedEventCallback Function

Sets the checked event callback

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_SetCheckedEventCallback(laCheckBoxWidget* cbox,
laCheckBoxWidget_CheckedEvent cb);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget
laCheckBoxWidget_CheckedEvent cb	a valid callback pointer or NULL

Function

laResult laCheckBoxWidget_SetCheckedEventCallback(laCheckBoxWidget* cbox,
laCheckBoxWidget_CheckedEvent cb)

laCheckBoxWidget_SetCheckedImage Function

Sets the checked image of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_SetCheckedImage(laCheckBoxWidget* btn, GFXU_ImageAsset* img);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget
GFXU_ImageAsset* img	the desired checked image asset pointer

Function

laResult laCheckBoxWidget_SetCheckedImage(laCheckBoxWidget* btn,
GFXU_ImageAsset* img)

laCheckBoxWidget_SetHAlignment Function

Sets the horizontal alignment of the check box.

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_SetHAlignment(laCheckBoxWidget* cbox, laHAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget
laHAlignment align	the desired halign value

Function

laResult laCheckBoxWidget_SetHAlignment(laCheckBoxWidget* cbox,
laHAlignment align)

laCheckBoxWidget_SetImagePosition Function

Sets the image position of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_SetImagePosition(laCheckBoxWidget* btn, laRelativePosition pos);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

laRelativePosition pos	the desired image position value

Function

laResult laCheckBoxWidget_SetImagePosition(laCheckBoxWidget* btn,
laRelativePosition pos)

laCheckBoxWidget_SetText Function

Sets the checkbox text to the input string. If the string has local data the data will be duplicated and copied to the checkboxes internal string.

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_SetText(laCheckBoxWidget* cbox, laString str);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget

Function

laResult laCheckBoxWidget_SetText(laCheckBoxWidget* cbox, laString str)

laCheckBoxWidget_SetUncheckedEventCallback Function

Sets the unchecked event callback

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_SetUncheckedEventCallback(laCheckBoxWidget* cbox,
laCheckBoxWidget_UncheckedEvent cb);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget
laCheckBoxWidget_UncheckedEvent cb	a valid callback pointer or NULL

Function

laResult laCheckBoxWidget_SetUncheckedEventCallback(laCheckBoxWidget* cbox,
laCheckBoxWidget_UncheckedEvent cb)

laCheckBoxWidget_SetUncheckedImage Function

Sets the unchecked image of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_SetUncheckedImage(laCheckBoxWidget* btn, GFXU_ImageAsset* img);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget
GFXU_ImageAsset* img	the desired unchecked image asset pointer

Function

laResult laCheckBoxWidget_SetUncheckedImage(laCheckBoxWidget* btn,
GFXU_ImageAsset* img)

laCheckBoxWidget_SetVAlignment Function

Sets the vertical alignment of the check box

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_SetVAlignment(laCheckBoxWidget* cbox, laVAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget
laVAlignment align	the valign value

Function

laResult laCheckBoxWidget_SetVAlignment(laCheckBoxWidget* cbox,
laVAlignment align)

laCircleWidget_GetOrigin Function

Gets the origin coordiates of a circle widget

File

libaria_widget_circle.h

C

```
LIB_EXPORT laResult laCircleWidget_GetOrigin(laCircleWidget* cir, int32_t* x, int32_t* y);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCircleWidget* cir	the widget
int32_t* x	pointer to an integer pointer to store x
int32_t* y	pointer to an integer pointer to store y

Function

laResult laCircleWidget_GetOrigin(laCircleWidget* cir, int32_t* x, int32_t* y)

laCircleWidget_GetRadius Function

Gets the radius of a circle widget

File

libaria_widget_circle.h

C

```
LIB_EXPORT uint32_t laCircleWidget_GetRadius(laCircleWidget* cir);
```

Returns

uint32_t

Parameters

Parameters	Description
laCircleWidget* cir	the widget

Function

uint32_t laCircleWidget_GetRadius(laCircleWidget* cir)

laCircleWidget_New Function

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_circle.h

C

```
LIB_EXPORT laCircleWidget* laCircleWidget_New();
```

Returns

laCircleWidget*

Function

laCircleWidget* laCircleWidget_New()

laCircleWidget_SetOrigin Function

Sets the origin coordiates of a circle widget

File

libaria_widget_circle.h

C

```
LIB_EXPORT laResult laCircleWidget_SetOrigin(laCircleWidget* cir, int32_t x, int32_t y);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCircleWidget* cir	the widget
int32_t x	the desired x origin coordinate
int32_t y	the desired y origin coordinate

Function

laResult laCircleWidget_SetOrigin(laCircleWidget* cir, int32_t x, int32_t y)

laCircleWidget_SetRadius Function

Sets the radius of a circle widget

File

libaria_widget_circle.h

C

```
LIB_EXPORT laResult laCircleWidget_SetRadius(laCircleWidget* cir, uint32_t rad);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCircleWidget* cir	the widget
uint32_t red	the desired radius value

Function

laResult laCircleWidget_SetRadius(laCircleWidget* cir, uint32_t rad)

laDraw_1x2BevelBorder Function

Internal utility function to draw a 1x2 bevel border

File

libaria_draw.h

C

```
LIB_EXPORT void laDraw_1x2BevelBorder(GFX_Rect* rect, GFX_Color topColor, GFX_Color bottomInnerColor,
GFX_Color bottomOuterColor);
```

Parameters

Parameters	Description
GFX_Rect* rect	the rect to draw (screen space)
GFX_Color topColor	the color of the top left lines
GFX_Color bottomInnerColor	the color of the bottom inner line
GFX_Color bottomOuterColor	the color of the bottom outer line

Function

void laDraw_1x2BevelBorder(GFX_Rect* rect,
GFX_Color topColor,
GFX_Color bottomInnerColor,
GFX_Color bottomOuterColor)

laDraw_2x1BevelBorder Function

Internal utility function to draw a 2x1 bevel border

File

libaria_draw.h

C

```
LIB_EXPORT void laDraw_2x1BevelBorder(GFX_Rect* rect, GFX_Color topOuterColor, GFX_Color topInnerColor,
GFX_Color bottomOuterColor);
```

Parameters

Parameters	Description
GFX_Rect* rect	the rect to draw (screen space)
GFX_Color topOuterColor	the color of the top outer line
GFX_Color topInnerColor	the color of the top inner line
GFX_Color bottomOuterColor	the color of the bottom lines

Function

void laDraw_2x1BevelBorder(GFX_Rect* rect,
GFX_Color topOuterColor,

GFX_Color topInnerColor,
GFX_Color bottomOuterColor)

laDraw_2x2BevelBorder Function

Internal utility function to draw a 2x2 bevel border

File

libaria_draw.h

C

```
LIB_EXPORT void laDraw_2x2BevelBorder(GFX_Rect* rect, GFX_Color topOuterColor, GFX_Color topInnerColor,
GFX_Color bottomInnerColor, GFX_Color bottomOuterColor);
```

Parameters

Parameters	Description
GFX_Rect* rect	the rect to draw (screen space)
GFX_Color topOuterColor	the color of the top outer line
GFX_Color topInnerColor	the color of the top inner line
GFX_Color bottomInnerColor	the color of the bottom inner line
GFX_Color bottomOuterColor	the color of the bottom outer line

Function

void laDraw_2x2BevelBorder(GFX_Rect* rect,
GFX_Color topOuterColor,
GFX_Color topInnerColor,
GFX_Color bottomInnerColor,
GFX_Color bottomOuterColor)

laDraw_LineBorder Function

Internal utility function to draw a basic line border

File

libaria_draw.h

C

```
LIB_EXPORT void laDraw_LineBorder(GFX_Rect* rect, GFX_Color color);
```

Parameters

Parameters	Description
GFX_Rect* rect	the rect to draw (screen space)
GFX_Color color	the color to draw

Function

void laDraw_LineBorder(GFX_Rect* rect, GFX_Color color)

laDrawSurfaceWidget_GetDrawCallback Function

Returns the pointer to the currently set draw callback.

File

libaria_widget_drawsurface.h

C

```
LIB_EXPORT laDrawSurfaceWidget_DrawCallback laDrawSurfaceWidget_GetDrawCallback(laDrawSurfaceWidget* sfc);
```

Returns

laDrawSurfaceWidget_DrawCallback - a valid callback pointer or NULL

Parameters

Parameters	Description
laDrawSurfaceWidget* sfc	the widget

Function

laDrawSurfaceWidget_DrawCallback laDrawSurfaceWidget_GetDrawCallback(laDrawSurfaceWidget* sfc)

laDrawSurfaceWidget_New Function

Allocates memory for a new DrawSurface widget.

File

libaria_widget_drawsurface.h

C

```
LIB_EXPORT laDrawSurfaceWidget* laDrawSurfaceWidget_New();
```

Returns

laDrawSurfaceWidget*

Description

Allocates memory for a new DrawSurface widget. The application is responsible for the managment of this memory until the widget is added to a widget tree.

Function

laDrawSurfaceWidget* laDrawSurfaceWidget_New()

laDrawSurfaceWidget_SetDrawCallback Function

Sets the draw callback pointer for the draw surface widget.

File

libaria_widget_drawsurface.h

C

```
LIB_EXPORT laResult laDrawSurfaceWidget_SetDrawCallback(laDrawSurfaceWidget* sfc,
laDrawSurfaceWidget_DrawCallback cb);
```

Returns

laResult - the result of the operation

Description

Sets the draw callback pointer for the draw surface widget. This callback will be called during Aria's paint loop and allows the application to perform HAL draw calls. The application should not adjust HAL layer, buffer, or context options in any way during this phase.

The callback should return GFX_TRUE if it has completed drawing. Returning GFX_FALSE will indicate to the renderer that the DrawSurface requires more time to draw and will call it again during the next paint loop.

Parameters

Parameters	Description
laDrawSurfaceWidget* sfc	the widget
laDrawSurfaceWidget_DrawCallback	a valid callback pointer or NULL

Function

laResult laDrawSurfaceWidget_SetDrawCallback(laDrawSurfaceWidget* sfc,
laDrawSurfaceWidget_DrawCallback cb)

laEvent_AddEvent Function

Add the mentioned event callback to the list of events maintained by the current context

File

libaria_event.h

C

```
laResult laEvent_AddEvent(laEvent* evt);
```

Returns

laResult

Description

Add the mentioned event callback to the list of events maintained by the current context

Function

laResult laEvent_AddEvent(laEvent* evt)

laEvent_ClearList Function

Clear the event list maintained by the current context.

File

libaria_event.h

C

```
laResult laEvent_ClearList();
```

Returns

laResult

Description

Clear the event list maintained by the current context.

Function

laResult laEvent_ClearList()

laEvent_GetCount Function

Returns the number of events listed in the current context

File

libaria_event.h

C

```
LIB_EXPORT uint32_t laEvent_GetCount();
```

Returns

uint32_t

Description

Returns the number of events listed in the current context

Function

uint32_t laEvent_GetCount()

laEvent_ProcessEvents Function

Processes the screen change as well as touch events

File

libaria_event.h

C

```
laResult laEvent_ProcessEvents();
```

Returns

laResult

Description

When a screen change event occurs, the specific screen change event handler has to be called as well as some generic maintenance for the screen change like destroying or hiding screen resources needs to be done. This function handles these tasks. It also handles similarly the touch events for individual widgets in the same manner.

Function

laResult laEvent_ProcessEvents()

laEvent_SetFilter Function

Set callback pointer for current context filter event

File

libaria_event.h

C

```
LIB_EXPORT laResult laEvent_SetFilter(laEvent_FilterEvent cb);
```

Returns

laResult

Description

Set callback pointer for current context filter event

Function

laResult laEvent_SetFilter(laEvent_FilterEvent cb)

laGradientWidget_GetDirection Function

Gets the gradient direction value for this widget.

File

libaria_widget_gradient.h

C

```
LIB_EXPORT laGradientWidgetDirection laGradientWidget_GetDirection(laGradientWidget* grad);
```

Returns

laGradientWidgetDirection - the current gradient direction

Parameters

Parameters	Description
laGradientWidget* grad	the widget

Function

laGradientWidgetDirection laGradientWidget_GetDirection(laGradientWidget* grad)

laGradientWidget_New Function

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_gradient.h

C

```
LIB_EXPORT laGradientWidget* laGradientWidget_New();
```

Returns

laGradientWidget*

Function

laGradientWidget* laGradientWidget_New()

laGradientWidget_SetDirection Function

Sets the gradient direction value for this widget.

File

libaria_widget_gradient.h

C

```
LIB_EXPORT laResult laGradientWidget_SetDirection(laGradientWidget* grad, laGradientWidgetDirection dir);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laGradientWidget* grad	the widget
laGradientWidgetDirection dir	the desired gradient direction

Function

laResult laGradientWidget_SetDirection(laGradientWidget* grad, laGradientWidgetDirection dir)

laGroupBoxWidget_GetAlignment Function

Gets the horizontal alignmnet for the group box title text

File

libaria_widget_groupbox.h

C

```
LIB_EXPORT laHAlignment laGroupBoxWidget_GetAlignment(laGroupBoxWidget* box);
```

Returns

laHAlignment - the current halign value

Parameters

Parameters	Description
laGroupBoxWidget* box	the widget

Function

laHAlignment laGroupBoxWidget_GetAlignment(laGroupBoxWidget* box)

laGroupBoxWidget_GetText Function

Gets the text value for the group box.

File

libaria_widget_groupbox.h

C

```
LIB_EXPORT laResult laGroupBoxWidget_GetText(laGroupBoxWidget* box, laString* str);
```

Returns

laResult

Description

This function allocates memory and initializes the input string pointer. The caller is responsible for managing the memory once this function returns.

Parameters

Parameters	Description
laGroupBoxWidget* box	the widget
laString* str	a pointer to an laString object

Function

laResult laGroupBoxWidget_GetText(laGroupBoxWidget* lbl, laString* str)

laGroupBoxWidget_New Function

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_groupbox.h

C

```
LIB_EXPORT laGroupBoxWidget* laGroupBoxWidget_New();
```

Returns

laGroupBoxWidget*

Description

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

Function

laGroupBoxWidget* laGroupBoxWidget_New()

laGroupBoxWidget_SetAlignment Function

Sets the alignment for the group box title text

File

libaria_widget_groupbox.h

C

```
LIB_EXPORT laResult laGroupBoxWidget_SetAlignment(laGroupBoxWidget* box, laHAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laGroupBoxWidget* box	the widget
laHAlignment	the desired halign value

Function

laResult laGroupBoxWidget_SetAlignment(laGroupBoxWidget* box,
laHAlignment align)

laGroupBoxWidget_SetText Function

Sets the text value for the group box.

File

libaria_widget_groupbox.h

C

```
LIB_EXPORT laResult laGroupBoxWidget_SetText(laGroupBoxWidget* box, laString str);
```

Returns

void

Description

This function copies the contents of the input string into its internal string buffer. The input string can then be freed or altered without affecting the label's internal string value.

Parameters

Parameters	Description
laGroupBoxWidget* box	the widget
laString str	an laString object

Function

void laGroupBoxWidget_SetText(laGroupBoxWidget* box, laString str)

laImageSequenceWidget_GetImage Function

Gets the image asset pointer for an entry.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT GFXU_ImageAsset* laImageSequenceWidget_GetImage(laImageSequenceWidget* img, uint32_t idx);
```

Returns

GFXU_ImageAsset* - the image asset pointer

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
uint32_t idx	the index

Function

GFXU_ImageAsset* laImageSequenceWidget_GetImage(laImageSequenceWidget* img,
uint32_t idx)

laImageSequenceWidget_GetImageChangedEventCallback Function

Gets the image changed event callback pointer.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laImageSequenceImageChangedEvent_FnPtr
laImageSequenceWidget_GetImageChangedEventCallback(laImageSequenceWidget* img);
```

Returns

laImageSequenceImageChangedEvent_FnPtr - a valid callback pointer or NULL

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget

Function

laImageSequenceImageChangedEvent_FnPtr laImageSequenceWidget_GetImageChangedEventCallback(laImageSequenceWidget* img)

laImageSequenceWidget_GetImageCount Function

Gets the number of image entries for this widget.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT uint32_t laImageSequenceWidget_GetImageCount(laImageSequenceWidget* img);
```

Returns

uint32_t - the number of entries for this sequence widget

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget

Function

uint32_t laImageSequenceWidget_GetImageCount(laImageSequenceWidget* img)

laImageSequenceWidget_GetImageDelay Function

Gets the image delay for an entry.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT uint32_t laImageSequenceWidget_GetImageDelay(laImageSequenceWidget* img, uint32_t idx);
```

Returns

uint32_t - the delay value

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
uint32_t idx	the index

Function

uint32_t laImageSequenceWidget_GetImageDelay(laImageSequenceWidget* img,
uint32_t idx)

laImageSequenceWidget_GetImageHAlignment Function

Gets the horizontal alignment for an image entry

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laHAlignment laImageSequenceWidget_GetImageHAlignment(laImageSequenceWidget* img, uint32_t idx);
```

Returns

laHAlignment - the halign value

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
uint32_t idx	the index

Function

laHAlignment laImageSequenceWidget_GetImageHAlignment(laImageSequenceWidget* img,
uint32_t idx)

laImageSequenceWidget_GetImageVAlignment Function

Sets the vertical alignment for an image entry

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laVAlignment laImageSequenceWidget_GetImageVAlignment(laImageSequenceWidget* img, uint32_t idx);
```

Returns

laVAlignment - the valign value

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
uint32_t idx	the index

Function

laVAlignment laImageSequenceWidget_GetImageVAlignment(laImageSequenceWidget* img,
uint32_t idx)

laImageSequenceWidget_GetRepeat Function

Indicates if the widget will repeat through the image entries.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laBool laImageSequenceWidget_GetRepeat(laImageSequenceWidget* img);
```

Returns

laBool - indicates if the widget is automatically repeating

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget

Function

laBool laImageSequenceWidget_GetRepeat(laImageSequenceWidget* img)

laImageSequenceWidget_IsPlaying Function

Indicates if the widget is currently cycling through the image entries.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laBool laImageSequenceWidget_IsPlaying(laImageSequenceWidget* img);
```

Returns

laBool - indicates if the widget is automatically cycling

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget

Function

laBool laImageSequenceWidget_IsPlaying(laImageSequenceWidget* img)

laImageSequenceWidget_New Function

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laImageSequenceWidget* laImageSequenceWidget_New();
```

Returns

laImageSequenceWidget*

Description

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

Function

laImageSequenceWidget* laImageSequenceWidget_New()

laImageSequenceWidget_Play Function

Starts the widget automatically cycling through the image entries.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_Play(laImageSequenceWidget* img);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget

Function

laResult laImageSequenceWidget_Play(laImageSequenceWidget* img)

laImageSequenceWidget_Rewind Function

Resets the current image sequence display index to zero.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_Rewind(laImageSequenceWidget* img);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget

Function

laResult laImageSequenceWidget_Rewind(laImageSequenceWidget* img)

laImageSequenceWidget_SetImage Function

Sets the image asset pointer for an entry.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_SetImage(laImageSequenceWidget* img, uint32_t idx,
GFXU_ImageAsset* imgAst);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
uint32_t idx	the index
GFXU_ImageAsset* imgAst	the image asset pointer

Function

laResult laImageSequenceWidget_SetImage(laImageSequenceWidget* img,
uint32_t idx,
GFXU_ImageAsset* imgAst)

laImageSequenceWidget_SetImageChangedEventCallback Function

Sets the image changed event callback pointer. This callback is called whenever the active display index is changed.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_SetImageChangedEventCallback(laImageSequenceWidget* img,
laImageSequenceImageChangedEvent_FnPtr cb);
```

Returns

laResult

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
laImageSequenceImageChangedEvent_FnPtr cb	a valid callback pointer or NULL

Function

laResult laImageSequenceWidget_SetImageChangedEventCallback(laImageSequenceWidget* img,
laImageSequenceImageChangedEvent_FnPtr cb)

laImageSequenceWidget_SetImageCount Function

Sets the number of image entries for this widget. An image entry that is null will show nothing.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_SetImageCount(laImageSequenceWidget* img, uint32_t count);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
uint32_t count	the desired number of entries

Function

laResult laImageSequenceWidget_SetImageCount(laImageSequenceWidget* img,
uint32_t count)

laImageSequenceWidget_SetImageDelay Function

Sets the image delay for an entry.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_SetImageDelay(laImageSequenceWidget* img, uint32_t idx, uint32_t delay);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
uint32_t idx	the index
uint32_t delay	the delay value

Function

laResult laImageSequenceWidget_SetImageDelay(laImageSequenceWidget* img,
uint32_t idx,
uint32_t delay)

laImageSequenceWidget_SetImageHAlignment Function

Sets the horizontal alignment for an image entry.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_SetImageHAlignment(laImageSequenceWidget* img, uint32_t idx, laHAlignment align);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
uint32_t idx	the index
laHAlignment align	the halign value

Function

laResult laImageSequenceWidget_SetImageHAlignment(laImageSequenceWidget* img,
uint32_t idx,
laHAlignment align)

laImageSequenceWidget_SetImageVAlignment Function

Sets the vertical alignment value for an image entry

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_SetImageVAlignment(laImageSequenceWidget* img, uint32_t idx,
laVAlignment align);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
uint32_t idx	the index
laVAlignment align	the vertical alignment setting

Function

laResult laImageSequenceWidget_SetImageVAlignment(laImageSequenceWidget* img,
uint32_t idx,
laVAlignment align)

laImageSequenceWidget_SetRepeat Function

Sets the repeat flag for the widget

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_SetRepeat(laImageSequenceWidget* img, laBool repeat);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
laBool repeat	the desired repeat setting

Function

laResult laImageSequenceWidget_SetRepeat(laImageSequenceWidget* img,
laBool repeat)

laImageSequenceWidget_ShowImage Function

Sets the active display index to the indicated value.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_ShowImage(laImageSequenceWidget* img, uint32_t idx);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget
uint32_t idx	the desired index

Function

laResult laImageSequenceWidget_ShowImage(laImageSequenceWidget* img,
uint32_t idx)

laImageSequenceWidget_ShowNextImage Function

Sets the active display index to the next index value.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_ShowNextImage(laImageSequenceWidget* img);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget

Function

laResult laImageSequenceWidget_ShowNextImage(laImageSequenceWidget* img)

laImageSequenceWidget_ShowPreviousImage Function

Sets the active display index to the previous index value.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_ShowPreviousImage(laImageSequenceWidget* img);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget

Function

laResult laImageSequenceWidget_ShowPreviousImage(laImageSequenceWidget* img)

laImageSequenceWidget_Stop Function

Stops the widget from automatically cycling through the image entries.

File

libaria_widget_imagesequence.h

C

```
LIB_EXPORT laResult laImageSequenceWidget_Stop(laImageSequenceWidget* img);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laImageSequenceWidget* img	the widget

Function

laResult laImageSequenceWidget_Stop(laImageSequenceWidget* img)

laImageWidget_GetHAlignment Function

Gets the image horizontal alignment value.

File

libaria_widget_image.h

C

```
LIB_EXPORT laHAlignment laImageWidget_GetHAlignment(laImageWidget* img);
```

Returns

laHAlignment - the horizontal alignment value

Parameters

Parameters	Description
laImageWidget* img	the widget

Function

laHAlignment laImageWidget_GetHAlignment(laImageWidget* img)

laImageWidget_GetImage Function

Gets the image asset pointer for the widget.

File

libaria_widget_image.h

C

```
LIB_EXPORT GFXU_ImageAsset* laImageWidget_GetImage(laImageWidget* img);
```

Returns

GFXU_ImageAsset* - the image asset pointer

Parameters

Parameters	Description
laImageWidget* img	the widget

Function

GFXU_ImageAsset* laImageWidget_GetImage(laImageWidget* img)

laImageWidget_GetVAlignment Function

Gets the image vertical alignment value.

File

libaria_widget_image.h

C

```
LIB_EXPORT laVAlignment laImageWidget_GetVAlignment(laImageWidget* img);
```

Returns

laVAlignment - the vertical alignment setting

Parameters

Parameters	Description
laImageWidget* img	the widget

Function

laVAlignment laImageWidget_GetVAlignment(laImageWidget* img)

laImageWidget_New Function

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_image.h

C

```
LIB_EXPORT laImageWidget* laImageWidget_New();
```

Returns

laImageWidget* - the widget

Function

laImageWidget* laImageWidget_New()

laImageWidget_SetHAlignment Function

Sets the image horizontal alignment value.

File

libaria_widget_image.h

C

```
LIB_EXPORT laResult laImageWidget_SetHAlignment(laImageWidget* img, laHAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laImageWidget* img	the widget
laHAlignment align	the horizontal alignment value

Function

laResult laImageWidget_SetHAlignment(laImageWidget* img,

laHAlignment align)

laImageWidget_SetImage Function

Sets the image asset pointer for the widget.

File

libaria_widget_image.h

C

```
LIB_EXPORT laResult laImageWidget_SetImage(laImageWidget* img, GFXU_ImageAsset* imgAst);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
llaImageWidget* img	the widget
GFXU_ImageAsset* imgAst	the image asset pointer

Function

laResult laImageWidget_SetImage(laImageWidget* img,
GFXU_ImageAsset* imgAst)

laImageWidget_SetVAlignment Function

Sets the image vertical alignment value.

File

libaria_widget_image.h

C

```
LIB_EXPORT laResult laImageWidget_SetVAlignment(laImageWidget* img, laVAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laImageWidget* img	the widget
laVAlignment	the vertical alignment setting

Function

laResult laImageWidget_SetVAlignment(laImageWidget* img,
laVAlignment align)

laInput_GetEnabled Function

Returns the input enabled status of the current context

File

libaria_input.h

C

```
LIB_EXPORT laBool laInput_GetEnabled();
```

Returns

laBool

Description

Returns the input enabled status of the current context

Function

laBool laInput_GetEnabled()

laInput_InjectTouchDown Function

Register and track the touch down event and queue it for handling by associated widgets

File

libaria_input.h

C

```
LIB_EXPORT laResult laInput_InjectTouchDown(uint32_t id, int32_t x, int32_t y);
```

Returns

laResult

Description

Register and track the touch down event and queue it for handling by associated widgets

Function

laResult laInput_InjectTouchDown(uint32_t id, int32_t x, int32_t y)

laInput_InjectTouchMoved Function

Register and track the touch moved event and queue it for handling by associated widgets

File

libaria_input.h

C

```
LIB_EXPORT laResult laInput_InjectTouchMoved(uint32_t id, int32_t x, int32_t y);
```

Returns

laResult

Description

Register and track the touch moved event and queue it for handling by associated widgets

Function

laResult laInput_InjectTouchMoved(uint32_t id, int32_t x, int32_t y)

laInput_InjectTouchUp Function

Register and track the touch up event and queue it for handling by associated widgets

File

libaria_input.h

C

```
LIB_EXPORT laResult laInput_InjectTouchUp(uint32_t id, int32_t x, int32_t y);
```

Returns

laResult

Description

Register and track the touch up event and queue it for handling by associated widgets

Function

laResult laInput_InjectTouchUp(uint32_t id, int32_t x, int32_t y)

laInput_SetEnabled Function

Sets the input status of the current context with the specified input argument

File

libaria_input.h

C

```
LIB_EXPORT laResult laInput_SetEnabled(laBool enable);
```

Returns

laResult

Description

Sets the input status of the current context with the specified input argument

Function

laResult laInput_SetEnabled(laBool enable)

laKeyPadWidget_GetKeyAction Function

Gets the key pad cell action for a cell at row/column

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laKeyPadCellAction laKeyPadWidget_GetKeyAction(laKeyPadWidget* pad, uint32_t row, uint32_t col);
```

Returns

laKeyPadCellAction - the cell action value

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column

Function

laKeyPadCellAction laKeyPadWidget_GetKeyAction(laKeyPadWidget* pad,
uint32_t row,
uint32_t col)

laKeyPadWidget_GetKeyClickEventCallback Function

Gets the current key click event callback pointer

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laKeyPadWidget_KeyClickEvent laKeyPadWidget_GetKeyClickEventCallback(laKeyPadWidget* pad);
```

Returns

laKeyPadWidget_KeyClickEvent - the callback pointer

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget

Function

laKeyPadWidget_KeyClickEvent laKeyPadWidget_GetKeyClickEventCallback(laKeyPadWidget* pad)

laKeyPadWidget_GetKeyDrawBackground Function

Gets the background type for a key pad cell at row/column

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laBackgroundType laKeyPadWidget_GetKeyDrawBackground(laKeyPadWidget* pad, uint32_t row, uint32_t
col);
```

Returns

laBackgroundType - the cell background type

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column

Function

laBackgroundType laKeyPadWidget_GetKeyBackgroundType(laKeyPadWidget* pad,
uint32_t row,
uint32_t col)

laKeyPadWidget_GetKeyEnabled Function

Gets the enabled flag for a cell at a given row/column

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laBool laKeyPadWidget_GetKeyEnabled(laKeyPadWidget* pad, uint32_t row, uint32_t col);
```

Returns

laBool - the flag value

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column

Function

laBool laKeyPadWidget_GetKeyEnabled(laKeyPadWidget* pad,
uint32_t row,
uint32_t col)

laKeyPadWidget_GetKeyImageMargin Function

Gets the key pad cell image margin value

File

libaria_widget_keypad.h

C

```
LIB_EXPORT uint32_t laKeyPadWidget_GetKeyImageMargin(laKeyPadWidget* pad, uint32_t row, uint32_t col);
```

Returns

uint32_t - the margin value

Description

The image margin value is the space between the image and the text

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column

Function

uint32_t laKeyPadWidget_GetKeyImageMargin(laKeyPadWidget* pad,

uint32_t row,

uint32_t col)

laKeyPadWidget_GetKeyImagePosition Function

Gets the image position for a key pad cell

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laRelativePosition laKeyPadWidget_GetKeyImagePosition(laKeyPadWidget* pad, uint32_t row,
uint32_t col);
```

Returns

laRelativePosition - the image position

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column

Function

laRelativePosition laKeyPadWidget_GetKeyImagePosition(laKeyPadWidget* pad,

uint32_t row,

uint32_t col)

laKeyPadWidget_GetKeyPressedImage Function

Gets the pressed icon image asset pointer for the display image for a key pad cell

File

libaria_widget_keypad.h

C

```
LIB_EXPORT GFXU_ImageAsset* laKeyPadWidget_GetKeyPressedImage(laKeyPadWidget* pad, uint32_t row, uint32_t
col);
```

Returns

GFXU_ImageAsset* - pointer to the icon image asset

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column

Function

GFXU_ImageAsset* laKeyPadWidget_GetKeyPressedImage(laKeyPadWidget* pad,
uint32_t row,
uint32_t col)

laKeyPadWidget_GetKeyReleasedImage Function

Gets the released icon image asset pointer for the display image for a key pad cell

File

libaria_widget_keypad.h

C

```
LIB_EXPORT GFXU_ImageAsset* laKeyPadWidget_GetKeyReleasedImage(laKeyPadWidget* pad, uint32_t row, uint32_t
col);
```

Returns

GFXU_ImageAsset* - pointer to the icon image asset

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column

Function

GFXU_ImageAsset* laKeyPadWidget_GetKeyReleasedImage(laKeyPadWidget* pad,
uint32_t row,
uint32_t col)

laKeyPadWidget_GetKeyText Function

Returns a copy of the display text for a given cell at row/column

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_GetKeyText(laKeyPadWidget* pad, uint32_t row, uint32_t col, laString*
str);
```

Returns

laResult - the result of the operation

Description

This function allocates memory for the input string argument. The application becomes responsible for the management of the memory after function completion.

The input string does not need to be initialized in any fashion before calling this function.

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row

uint32_t col	the indicated column
laString* str	a pointer to an laString object

Function

laResult laKeyPadWidget_GetKeyText(laKeyPadWidget* pad,
uint32_t row,
uint32_t col,
laString* str)

laKeyPadWidget_GetKeyValue Function

Gets the edit text value for a given key pad cell.

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laString* laKeyPadWidget_GetKeyValue(laKeyPadWidget* pad, uint32_t row, uint32_t col);
```

Returns

laString* - an initialized string containing a copy of the key pad cell edit value text

Description

This function allocates memory and returns a valid laString pointer. The caller is responsible for managing the memory once this function returns.

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column

Function

laString* laKeyPadWidget_GetKeyValue(laKeyPadWidget* pad,
uint32_t row,
uint32_t col)

laKeyPadWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laKeyPadWidget* laKeyPadWidget_New(uint32_t rows, uint32_t cols);
```

Returns

laKeyPadWidget*

Parameters

Parameters	Description
uint32_t	number of rows to create number of columns to create

Function

laKeyPadWidget* laKeyPadWidget_New(uint32_t rows, uint32_t cols)

laKeyPadWidget_SetKeyAction Function

Sets the cell action type for a key pad cell at row/column

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_SetKeyAction(laKeyPadWidget* pad, uint32_t row, uint32_t col,
laKeyPadCellAction action);
```

Returns

laResult - the result of the operation

Description

The cell action is the action that is dispatched to the Aria edit event system. This event will then be received by the active edit event receptor widget if one exists.

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column
laKeyPadCellAction action	the desired edit action

Function

laResult laKeyPadWidget_SetKeyAction(laKeyPadWidget* pad,
uint32_t row,
uint32_t col,
laKeyPadCellAction action)

laKeyPadWidget_SetKeyClickEventCallback Function

Sets the current key click event callback pointer

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_SetKeyClickEventCallback(laKeyPadWidget* pad,
laKeyPadWidget_KeyClickEvent cb);
```

Returns

laResult - the result of the operation

Description

The key click event callback pointer is issued any time a button is interacted with.

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
laKeyPadWidget_KeyClickEvent cb	the callback pointer

Function

laResult laKeyPadWidget_SetKeyClickEventCallback(laKeyPadWidget* pad,
laKeyPadWidget_KeyClickEvent cb)

laKeyPadWidget_SetKeyEnabled Function

Sets the enabled flag for a cell at the given row/column

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_SetKeyEnabled(laKeyPadWidget* pad, uint32_t row, uint32_t col, laBool enabled);
```

Returns

laResult - the result of the operation

Description

The enabled flag controls the visibility and interactibility of a key pad cell. This enables the key pad to be configured to match such examples as a phone dialer key pad with twelve buttons total but the buttons to the left and right of the zero button not being drawn.

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column
laBool enabled	the flag value

Function

laResult laKeyPadWidget_SetKeyEnabled(laKeyPadWidget* pad,
uint32_t row,
uint32_t col,
laBool enabled)

laKeyPadWidget_SetKeyImageMargin Function

Sets the key pad cell image margin value for a given cell at row/column

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_SetKeyImageMargin(laKeyPadWidget* pad, uint32_t row, uint32_t col, uint32_t mg);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column
uint32_t mg	the desired margin value

Function

laResult laKeyPadWidget_SetKeyImageMargin(laKeyPadWidget* pad,
uint32_t row,
uint32_t col,
uint32_t mg)

laKeyPadWidget_SetKeyImagePosition Function

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_SetKeyImagePosition(laKeyPadWidget* pad, uint32_t row, uint32_t col, laRelativePosition pos);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column
laRelativePosition pos	the desired image position

Function

laResult laKeyPadWidget_SetKeyImagePosition(laKeyPadWidget* pad,
uint32_t row,
uint32_t col,
laRelativePosition pos)

laKeyPadWidget_SetKeyPressedImage Function

Sets the pressed icon image asset pointer for a key pad cell

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_SetKeyPressedImage(laKeyPadWidget* pad, uint32_t row, uint32_t col,
GFXU_ImageAsset* img);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column
GFXU_ImageAsset* img	pointer to an image asset

Function

laResult laKeyPadWidget_SetKeyPressedImage(laKeyPadWidget* pad,
uint32_t row,
uint32_t col,
GFXU_ImageAsset* img)

laKeyPadWidget_SetKeyReleasedImage Function

Sets the released icon image asset pointer for a key pad cell

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_SetKeyReleasedImage(laKeyPadWidget* pad, uint32_t row, uint32_t col,
GFXU_ImageAsset* img);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column
GFXU_ImageAsset* img	pointer to an image asset

Function

laResult laKeyPadWidget_SetKeyReleasedImage(laKeyPadWidget* pad,
uint32_t row,
uint32_t col,
GFXU_ImageAsset* img)

laKeyPadWidget_SetKeyText Function

Sets the display text for a given cell at row/column

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_SetKeyText(laKeyPadWidget* pad, uint32_t row, uint32_t col, laString str);
```

Returns

laResult - the result of the operation

Description

Sets the display text for a given cell at row/column

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column
laString str	an laString object

Function

laResult laKeyPadWidget_SetKeyText(laKeyPadWidget* pad,
uint32_t row,
uint32_t col,
laString str)

laKeyPadWidget_SetKeyValue Function

Sets the edit value for a given key pad cell.

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_SetKeyValue(laKeyPadWidget* pad, uint32_t row, uint32_t col, laString str);
```

Returns

laResult - the result of the operation

Description

The edit value for a key pad cell is the value that is passed to the Aria edit event management system. This may be different than the displayed

text of the cell or when the cell is using a picture icon and has no display text.

An input string that references the string table is a valid use case and the edit text will change as the active string table language changes.

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column
laString str	the string to set the key value to

Function

laResult laKeyPadWidget_SetKeyValue(laKeyPadWidget* pad,
uint32_t row,
uint32_t col,
laString str)

laLabelWidget_GetHAlignment Function

Gets the text horizontal alignment value.

File

libaria_widget_label.h

C

```
LIB_EXPORT laHAlignment laLabelWidget_GetHAlignment(laLabelWidget* lbl);
```

Returns

laHAlignment - the horizontal alignment value

Parameters

Parameters	Description
laLabelWidget*	the widget

Function

laHAlignment laLabelWidget_GetHAlignment(laLabelWidget* lbl)

laLabelWidget_GetText Function

Gets the text value for the label.

File

libaria_widget_label.h

C

```
LIB_EXPORT laResult laLabelWidget_GetText(laLabelWidget* lbl, laString* str);
```

Returns

laResult - the operation result

Description

This function allocates memory and initializes the input string pointer. The caller is responsible for managing the memory once this function returns.

Parameters

Parameters	Description
laLabelWidget* lbl	the widget
laString* str	a pointer to an laString object

Function

laResult laLabelWidget_GetText(laLabelWidget* lbl, laString* str)

laLabelWidget_GetVAlignment Function

Gets the current vertical text alignment

File

libaria_widget_label.h

C

```
LIB_EXPORT laVAlignment laLabelWidget_GetVAlignment(laLabelWidget* lbl);
```

Returns

laVAlignment - the vertical alignment setting

Parameters

Parameters	Description
laLabelWidget*	the widget

Function

laVAlignment laLabelWidget_GetVAlignment(laLabelWidget* lbl)

laLabelWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_label.h

C

```
LIB_EXPORT laLabelWidget* laLabelWidget_New();
```

Returns

laLabelWidget*

Function

laLabelWidget* laLabelWidget_New()

laLabelWidget_SetHAlignment Function

Sets the text horizontal alignment value

File

libaria_widget_label.h

C

```
LIB_EXPORT laResult laLabelWidget_SetHAlignment(laLabelWidget* lbl, laHAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laLabelWidget*	the widget
laHAlignment align	the horizontal alignment value

Function

laResult laLabelWidget_SetHAlignment(laLabelWidget* lbl,
laHAlignment align)

laLabelWidget_SetText Function

Sets the text value for the label.

File

libaria_widget_label.h

C

```
LIB_EXPORT laResult laLabelWidget_SetText(laLabelWidget* lbl, laString str);
```

Returns

laResult - the operation result

Description

This function copies the contents of the input string into its internal string buffer. The input string can then be freed or altered without affecting the label's internal string value.

Parameters

Parameters	Description
laLabelWidget* lbl	the widget
laString str	an laString object

Function

laResult laLabelWidget_SetText(laLabelWidget* lbl, laString str)

laLabelWidget_SetVAlignment Function

Sets the vertical text alignment value

File

libaria_widget_label.h

C

```
LIB_EXPORT laResult laLabelWidget_SetVAlignment(laLabelWidget* lbl, laVAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laLabelWidget*	the widget
laVAlignment align	the vertical alignment setting

Function

laResult laLabelWidget_SetVAlignment(laLabelWidget* lbl,
laVAlignment align)

laLayer_Delete Function

Destructor for the layer object

File

libaria_layer.h

C

```
LIB_EXPORT void laLayer_Delete(laLayer* layer);
```

Returns

void

Description

Destructor for the layer object

Function

void laLayer_Delete(laLayer* layer)

laLayer_GetAlphaAmount Function

Get's the amount of alpha blending for a given layer

File

libaria_layer.h

C

```
LIB_EXPORT uint32_t laLayer_GetAlphaAmount(const laLayer* layer);
```

Returns

uint32_t - an alpha channel value from 0 - 255

Parameters

Parameters	Description
laLayer* layer	the layer

Function

uint32_t laLayer_GetAlphaAmount(const laLayer* layer)

laLayer_GetAlphaEnable Function

Gets the layer alpha enable flag

File

libaria_layer.h

C

```
LIB_EXPORT laBool laLayer_GetAlphaEnable(const laLayer* layer);
```

Returns

laBool - the value of the alpha enable flag

Parameters

Parameters	Description
const laLayer*	the layer

Function

laBool laLayer_GetAlphaEnable(const laLayer* layer)

laLayer_GetBufferCount Function

Return the buffer count for the current layer

File

libaria_layer.h

C

```
LIB_EXPORT uint32_t laLayer_GetBufferCount(const laLayer* layer);
```

Returns

uint32_t - the current number of buffers for the layer

Description

Return the buffer count for the current layer

Parameters

Parameters	Description
laLayer* layer	the layer

Function

uint32_t laLayer_GetBufferCount(const laLayer* layer)

laLayer_GetMaskColor Function

Returns the mask color value for the current layer

File

libaria_layer.h

C

```
LIB_EXPORT GFX_Color laLayer_GetMaskColor(const laLayer* layer);
```

Returns

GFX_Color - the layer mask color value

Description

Returns the mask color value for the current layer

Parameters

Parameters	Description
laLayer* layer	the layer

Function

GFX_Color laLayer_GetMaskColor(const laLayer* layer)

laLayer_GetMaskEnable Function

Gets the layer mask enable flag

File

libaria_layer.h

C

```
LIB_EXPORT laBool laLayer_GetMaskEnable(const laLayer* layer);
```

Returns

laBool - the value of the mask enable flag

Description

Gets the layer mask enable flag

Parameters

Parameters	Description
laLayer* layer	the layer

Function

laBool laLayer_GetMaskEnable(const laLayer* layer)

laLayer_GetVSync Function

Gets the layer's vsync flag setting

File

libaria_layer.h

C

```
LIB_EXPORT laBool laLayer_GetVSync(const laLayer* layer);
```

Returns

laBool - the state of the layer's vsync flag

Parameters

Parameters	Description
const laLayer* layer	the layer

Function

laBool laLayer_GetVSync(const laLayer* layer)

laLayer_New Function

Constructor for a new layer

File

libaria_layer.h

C

```
LIB_EXPORT laLayer* laLayer_New();
```

Returns

laLayer*

Description

Constructor for a new layer, returns the layer object

Remarks

Allocates memory for a layer using the active context memory interface. Once added to a screen the it becomes the responsibility of the framework to free the memory.

Function

laLayer* laLayer_New()

laLayer_SetAlphaAmount Function

Set's the amount of alpha blending for a given layer

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_SetAlphaAmount(laLayer* layer, uint32_t amount);
```

Returns

laResult - success if the operation succeeded

Description

Set's the amount of alpha blending for a given layer

Parameters

Parameters	Description
laLayer* layer	the layer
uint32_t amount	an alpha amount from 0 - 255

Function

laResult laLayer_SetAlphaAmount(laLayer* layer, uint32_t amount)

laLayer_SetAlphaEnable Function

Sets the layer alpha enable flag to the specified value

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_SetAlphaEnable(laLayer* layer, laBool enable);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laLayer* layer	the layer
laBool enable	the desired value of the flag

Function

laResult laLayer_SetAlphaEnable(laLayer* layer, laBool enable)

laLayer_SetBufferCount Function

Set the buffer count for the current layer to the specified value

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_SetBufferCount(laLayer* layer, uint32_t count);
```

Returns

laResult - the result of the operation

Description

Set the buffer count for the current layer to the specified value

Parameters

Parameters	Description
laLayer* layer	the layer
uint32_t count	the desired number of buffers

Function

laResult laLayer_SetBufferCount(laLayer* layer, uint32_t count)

laLayer_SetMaskColor Function

Set the mask color value for the current layer to the specified value

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_SetMaskColor(laLayer* layer, GFX_Color color);
```

Returns

laResult - the result of the operation

Description

Set the mask color value for the current layer to the specified value

Parameters

Parameters	Description
laLayer* layer	the layer
GFX_color color	the desired mask color value

Function

void laLayer_SetMaskColor(laLayer* layer, GFX_Color color)

laLayer_SetMaskEnable Function

Sets the layer mask enable flag to the specified value

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_SetMaskEnable(laLayer* layer, laBool enable);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laLayer* layer	the layer
laBool enable	the desired value of the flag

Function

laResult laLayer_SetMaskEnable(laLayer* layer, laBool enable)

laLayer_SetVSync Function

Sets the layer's vsync flag.

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_SetVSync(laLayer* layer, laBool enable);
```

Returns

laResult - the result of the operation

Description

Sets the layer's vsync flag.

Parameters

Parameters	Description
const laLayer* layer	the layer

Function

void laLayer_SetVSync(laLayer* layer, laBool enable)

laLineWidget_GetEndPoint Function

Gets the coordinates for the second point of the line.

File

libaria_widget_line.h

C

```
LIB_EXPORT laResult laLineWidget_GetEndPoint(laLineWidget* line, int32_t* x, int32_t* y);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laLineWidget* line	the widget
int32_t* x	pointer to an int to store the x coordinate
int32_t* y	pointer to tan int to store the y coordinate

Function

laResult laLineWidget_GetEndPoint(laLineWidget* line, int32_t* x, int32_t* y)

laLineWidget_GetStartPoint Function

Gets the coordinates for the first point of the line.

File

libaria_widget_line.h

C

```
LIB_EXPORT laResult laLineWidget_GetStartPoint(laLineWidget* line, int32_t* x, int32_t* y);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laLineWidget* line	the widget
int32_t* x	pointer to an int to store the x coordinate
int32_t* y	pointer to tan int to store the y coordinate

Function

laResult laLineWidget_GetStartPoint(laLineWidget* line, int32_t* x, int32_t* y)

laLineWidget_New Function

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_line.h

C

```
LIB_EXPORT laLineWidget* laLineWidget_New();
```

Returns

laLineWidget*

Function

laLineWidget* laLineWidget_New()

laLineWidget_SetEndPoint Function

Sets the cooridnate for the second point of the line

File

libaria_widget_line.h

C

```
LIB_EXPORT laResult laLineWidget_SetEndPoint(laLineWidget* line, int32_t x, int32_t y);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laLineWidget* line	the widget
int32_t x	the x coordinate value
int32_t y	the y coordinate value

Function

laResult laLineWidget_SetEndPoint(laLineWidget* line, int32_t x, int32_t y)

laLineWidget_SetStartPoint Function

Sets the cooridnate for the first point of the line

File

libaria_widget_line.h

C

```
LIB_EXPORT laResult laLineWidget_SetStartPoint(laLineWidget* line, int32_t x, int32_t y);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laLineWidget* line	the widget
int32_t x	the x coordinate value
int32_t y	the y coordinate value

Function

laResult laLineWidget_SetStartPoint(laLineWidget* line, int32_t x, int32_t y)

laListWheelWidget_AppendItem Function

Appends a new item entry to the list. The initial value of the item will be empty.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT uint32_t laListWheelWidget_AppendItem(laListWheelWidget* whl);
```

Returns

uint32_t - the index of the newly appended item

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

uint32_t laListWheelWidget_AppendItem(laListWheelWidget* whl)

laListWheelWidget_GetAlignment Function

Gets the horizontal alignment for the list widget

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laHAlignment laListWheelWidget_GetAlignment(laListWheelWidget* whl);
```

Returns

laHAlignment - the current list halign mode

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

laHAlignment laListWheelWidget_GetAlignment(laListWheelWidget* whl)

laListWheelWidget_GetIconMargin Function

Gets the icon margin value for the list wheel widget

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT uint32_t laListWheelWidget_GetIconMargin(laListWheelWidget* whl);
```

Returns

uint32_t - the icon margin value

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

uint32_t laListWheelWidget_GetIconMargin(laListWheelWidget* whl)

laListWheelWidget_GetIconPosition Function

Sets the icon position for the list wheel widget.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laRelativePosition laListWheelWidget_GetIconPosition(laListWheelWidget* whl);
```

Returns

laRelativePosition - the current icon position

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

laRelativePosition laListWheelWidget_GetIconPosition(laListWheelWidget* whl)

laListWheelWidget_GetItemCount Function

Gets the number of items currently contained in the list

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT uint32_t laListWheelWidget_GetItemCount(laListWheelWidget* whl);
```

Returns

uint32_t - the number of items in the list

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

uint32_t laListWheelWidget_GetItemCount(laListWheelWidget* whl)

laListWheelWidget_GetItemIcon Function

Gets the pointer to the image asset for the icon for the item at the given index.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT GFXU_ImageAsset* laListWheelWidget_GetItemIcon(laListWheelWidget* whl, uint32_t index);
```

Returns

GFXU_ImageAsset* - the image asset pointer or NULL

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t idx	the index to consider

Function

GFXU_ImageAsset* laListWheelWidget_GetItemIcon(laListWheelWidget* whl,
uint32_t index)

laListWheelWidget_GetItemText Function

Gets the text value for an item in the list.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_GetItemText(laListWheelWidget* whl, uint32_t idx, laString* str);
```

Returns

laResult - the operation result

Description

This function allocates memory and initializes the input string pointer. The caller is responsible for managing the memory once this function returns.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t idx	the index to consider
laString* str	a pointer to an laString object

Function

laResult laListWheelWidget_GetItemText(laListWheelWidget* whl,
uint32_t idx,
laString* str)

laListWheelWidget_GetSelectedItem Function

Returns the index of the currently selected item.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT int32_t laListWheelWidget_GetSelectedItem(laListWheelWidget* whl);
```

Returns

int32_t - the index of the selected item or -1 if an error occured

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

int32_t laListWheelWidget_GetSelectedItem(laListWheelWidget* whl)

laListWheelWidget_GetSelectedItemChangedEventCallback Function

Gets the callback for the item selected changed event

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laListWheelWidget_SelectedItemChangedEvent
laListWheelWidget_GetSelectedItemChangedEventCallback(laListWheelWidget* whl);
```

Returns

laListWheelWidget_SelectedItemChangedEvent - the current pointer to the callback or NULL

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

laListWheelWidget_SelectedItemChangedEvent laListWheelWidget_GetSelectedItemChangedEventCallback(laListWheelWidget* whl)

laListWheelWidget_InsertItem Function

Attempts to insert a new item at the desired index. Existing items at idx or greater will be shuffled one index to the right.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT uint32_t laListWheelWidget_InsertItem(laListWheelWidget* whl, uint32_t idx);
```

Returns

uint32_t - the index of the inserted item

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t idx	the desired index of the new item

Function

uint32_t laListWheelWidget_InsertItem(laListWheelWidget* whl, uint32_t idx)

laListWheelWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laListWheelWidget* laListWheelWidget_New();
```

Returns

laListWheelWidget*

Function

laListWheelWidget* laListWheelWidget_New()

laListWheelWidget_RemoveAllItems Function

Attempts to remove all items from the list.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_RemoveAllItems(laListWheelWidget* whl);
```

Returns

laResult - the operation result

Remarks

All memory owned by each item string will be freed automatically.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

laResult laListWheelWidget_RemoveAllItems(laListWheelWidget* whl)

laListWheelWidget_RemoveItem Function

Attempts to remove an item from the list.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_RemoveItem(laListWheelWidget* whl, uint32_t idx);
```

Returns

laResult - the operation result

Remarks

The memory owned by the string item will be freed automatically.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t idx	the index to remove from the list

Function

laResult laListWheelWidget_RemoveItem(laListWheelWidget* whl, uint32_t idx)

laListWheelWidget_SelectNextItem Function

Attempts to move the selected item index to the next item in the list.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SelectNextItem(laListWheelWidget* whl);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

laResult laListWheelWidget_SelectNextItem(laListWheelWidget* whl)

laListWheelWidget_SelectPreviousItem Function

Attempts to move the selected item index to the previous item in the list.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SelectPreviousItem(laListWheelWidget* whl);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

laResult laListWheelWidget_SelectPreviousItem(laListWheelWidget* whl)

laListWheelWidget_SetAlignment Function

Sets the horizontal alignment mode for the list widget.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetAlignment(laListWheelWidget* whl, laHAlignment align);
```

Returns

laResult

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
laHAlignment align	the desired halign mode

Function

laResult laListWheelWidget_SetAlignment(laListWheelWidget* whl,
laHAlignment align)

laListWheelWidget_SetIconMargin Function

Sets the icon margin value for the list widget.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetIconMargin(laListWheelWidget* whl, uint32_t mg);
```

Returns

laResult - the operation result

Description

The icon margin value is the distance between the icon image and the text.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t mg	the margin value

Function

laResult laListWheelWidget_SetIconMargin(laListWheelWidget* whl, uint32_t mg)

laListWheelWidget_SetIconPosition Function

Sets the icon position for the list wheel widget

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetIconPosition(laListWheelWidget* whl, laRelativePosition pos);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
laRelativePosition pos	the relative position setting

Function

laResult laListWheelWidget_SetIconPosition(laListWheelWidget* whl,
laRelativePosition pos)

laListWheelWidget_SetItemIcon Function

Sets the icon pointer for a given index.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetItemIcon(laListWheelWidget* whl, uint32_t index, GFXU_ImageAsset*
img);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t idx	the index to configure
GFXU_ImageAsset*	the image asset pointer to use as the icon

Function

laResult laListWheelWidget_SetItemIcon(laListWheelWidget* whl,
uint32_t index,
GFXU_ImageAsset* img)

laListWheelWidget_SetItemText Function

Sets the text value for an item in the list.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetItemText(laListWheelWidget* whl, uint32_t index, laString str);
```

Returns

laResult - the operation result

Description

This function copies the contents of the input string into its internal string buffer. The input string can then be freed or altered without affecting the label's internal string value.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t idx	the index to consider
laString str	an laString object

Function

laResult laListWheelWidget_SetItemText(laListWheelWidget* whl,
uint32_t index,
laString str)

laListWheelWidget_SetSelectedItem Function

Attempts to set the selectedi tem index

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetSelectedItem(laListWheelWidget* whl, uint32_t idx);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t idx	the desired selected item index

Function

laResult laListWheelWidget_SetSelectedItem(laListWheelWidget* whl,
uint32_t idx)

laListWheelWidget_SetSelectedItemChangedEventCallback Function

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetSelectedItemChangedEventCallback(laListWheelWidget* whl,
laListWheelWidget_SelectedItemChangedEvent cb);
```

Returns

laResult - the operation result

Description

This callback is called whenver the wheel's selected item changes.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
laListWheelWidget_SelectedItemChangedEvent	the desired pointer to callback or NULL

Function

laResult laListWheelWidget_SetSelectedItemChangedEventCallback(laListWheelWidget* whl,
laListWheelWidget_SelectedItemChangedEvent cb)

laListWidget_AppendItem Function

Appends a new item entry to the list. The initial value of the item will be empty.

File

libaria_widget_list.h

C

```
LIB_EXPORT uint32_t laListWidget_AppendItem(laListWidget* lst);
```

Returns

uint32_t - the index of the newly appended item

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

uint32_t laListWidget_AppendItem(laListWidget* lst)

laListWidget_DeselectAll Function

Attempts to set all item states as not selected.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_DeselectAll(laListWidget* lst);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

laResult laListWidget_DeselectAll(laListWidget* lst)

laListWidget_GetAlignment Function

Gets the horizontal alignment for the list widget

File

libaria_widget_list.h

C

```
LIB_EXPORT laHAlignment laListWidget_GetAlignment(laListWidget* lst);
```

Returns

laHAlignment - the current list halign mode

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

laHAlignment laListWidget_GetAlignment(laListWidget* lst)

laListWidget_GetAllowEmptySelection Function

Returns true of the list allows an empty selection set

File

libaria_widget_list.h

C

```
LIB_EXPORT laBool laListWidget_GetAllowEmptySelection(laListWidget* lst);
```

Returns

laBool - true if the list allows an empty selection set

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

laBool laListWidget_GetAllowEmptySelection(laListWidget* lst)

laListWidget_GetFirstSelectedItem Function

Returns the lowest selected item index.

File

libaria_widget_list.h

C

```
LIB_EXPORT uint32_t laListWidget_GetFirstSelectedItem(laListWidget* lst);
```

Returns

uint32_t - the lowest selected item index or -1 if nothing is selected.

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

uint32_t laListWidget_GetFirstSelectedItem(laListWidget* lst)

laListWidget_GetIconMargin Function

Gets the icon margin value for the list widget

File

libaria_widget_list.h

C

```
LIB_EXPORT uint32_t laListWidget_GetIconMargin(laListWidget* lst);
```

Returns

uint32_t - the icon margin value

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

uint32_t laListWidget_GetIconMargin(laListWidget* lst)

laListWidget_GetIconPosition Function

Gets the icon position for the list

File

libaria_widget_list.h

C

```
LIB_EXPORT laRelativePosition laListWidget_GetIconPosition(laListWidget* lst);
```

Returns

laRelativePosition - the current icon position

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

laRelativePosition laListWidget_GetIconPosition(laListWidget* lst)

laListWidget_GetItemCount Function

Gets the number of items currently contained in the list

File

libaria_widget_list.h

C

```
LIB_EXPORT uint32_t laListWidget_GetItemCount(laListWidget* lst);
```

Returns

uint32_t - the number of items in the list

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

uint32_t laListWidget_GetItemCount(laListWidget* lst)

laListWidget_GetItemIcon Function

Gets the pointer to the image asset for the icon for the item at the given index.

File

libaria_widget_list.h

C

```
LIB_EXPORT GFXU_ImageAsset* laListWidget_GetItemIcon(laListWidget* lst, uint32_t idx);
```

Returns

GFXU_ImageAsset* - the image asset pointer or NULL

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t idx	the index to consider

Function

GFXU_ImageAsset* laListWidget_GetItemIcon(laListWidget* lst,
uint32_t idx)

laListWidget_GetItemSelected Function

Returns true if the item at the given index is currently selected.

File

libaria_widget_list.h

C

```
LIB_EXPORT laBool laListWidget_GetItemSelected(laListWidget* lst, uint32_t idx);
```

Returns

laBool - the selection state of the item

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t idx	the index to consider

Function

laBool laListWidget_GetItemSelected(laListWidget* lst,
uint32_t idx)

laListWidget_GetItemText Function

Gets the text value for an item in the list.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_GetItemText(laListWidget* lst, uint32_t idx, laString* str);
```

Returns

laResult - the operation result

Description

This function allocates memory and initializes the input string pointer. The caller is responsible for managing the memory once this function returns.

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t idx	the index to consider
laString* str	a pointer to an laString object

Function

laResult laListWidget_GetItemText(laListWidget* lst,
uint32_t idx,
laString* str)

laListWidget_GetLastSelectedItem Function

Returns the highest selected item index.

File

libaria_widget_list.h

C

```
LIB_EXPORT uint32_t laListWidget_GetLastSelectedItem(laListWidget* lst);
```

Returns

uint32_t - the highest selected item index or -1 if nothing is selected.

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

uint32_t laListWidget_GetLastSelectedItem(laListWidget* lst)

laListWidget_GetSelectedItemChangedEventCallback Function

Gets the callback for the item selected changed event

File

libaria_widget_list.h

C

```
LIB_EXPORT laListWidget_SelectedItemChangedEvent
```

```
laListWidget_GetSelectedItemChangedEventCallback(laListWidget* lst);
```

Returns

laListWidget_SelectedItemChangedEvent - the current pointer to callback or NULL

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

laListWidget_SelectedItemChangedEvent laListWidget_GetSelectedItemChangedEventCallback(laListWidget* lst)

laListWidget_GetSelectionCount Function

Returns the number of selected items in the list.

File

libaria_widget_list.h

C

```
LIB_EXPORT uint32_t laListWidget_GetSelectionCount(laListWidget* lst);
```

Returns

uint32_t - the number of selected items

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

uint32_t laListWidget_GetSelectionCount(laListWidget* lst)

laListWidget_GetSelectionMode Function

Gets the selection mode for the list

File

libaria_widget_list.h

C

```
LIB_EXPORT laListWidget_SelectionMode laListWidget_GetSelectionMode(laListWidget* lst);
```

Returns

laListWidget_SelectionMode - the list selection mode

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

laListWidget_SelectionMode laListWidget_GetSelectionMode(laListWidget* lst)

laListWidget_InsertItem Function

Attempts to insert a new item at the desired index. Existing items at idx or greater will be shuffled one index to the right.

File

libaria_widget_list.h

C

```
LIB_EXPORT uint32_t laListWidget_InsertItem(laListWidget* lst, uint32_t idx);
```

Returns

uint32_t - the index of the inserted item

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t idx	the desired index of the new item

Function

uint32_t laListWidget_InsertItem(laListWidget* lst, uint32_t idx)

laListWidget_New Function

Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_list.h

C

```
LIB_EXPORT laListWidget* laListWidget_New();
```

Returns

laListWidget* lst - the widget

Function

laListWidget* laListWidget_New()

laListWidget_RemoveAllItems Function

Attempts to remove all items from the list.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_RemoveAllItems(laListWidget* lst);
```

Returns

laResult - the operation result

Remarks

All memory owned by each item string will be freed automatically.

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

laResult laListWidget_RemoveAllItems(laListWidget* lst)

laListWidget_RemoveItem Function

Attempts to remove an item from the list.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_RemoveItem(laListWidget* lst, uint32_t idx);
```

Returns

laResult - the operation result

Remarks

The memory owned by the string item will be freed automatically.

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t idx	the index to remove from the list

Function

laResult laListWidget_RemoveItem(laListWidget* lst, uint32_t idx)

laListWidget_SelectAll Function

Attempts to set all item states to selected.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SelectAll(laListWidget* lst);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

laResult laListWidget_SelectAll(laListWidget* lst)

laListWidget_SetAlignment Function

Sets the horizontal alignment mode for the list widget.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SetAlignment(laListWidget* lst, laHAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWidget* lst	the widget
laHAlignment align	the desired halign mode

Function

laResult laListWidget_SetAlignment(laListWidget* lst,
laHAlignment align)

laListWidget_SetAllowEmptySelection Function

Configures the list to allow an empty selection set.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SetAllowEmptySelection(laListWidget* lst, laBool allow);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWidget* lst	the widget
laBool allow	the desired empty selection set mode

Function

laResult laListWidget_SetAllowEmptySelection(laListWidget* lst,
laBool allow)

laListWidget_SetIconMargin Function

Sets the icon margin value for the list widget.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SetIconMargin(laListWidget* lst, uint32_t mg);
```

Returns

laResult - the operation result

Description

The icon margin value is the distance between the icon image and the text.

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t mg	the margin value

Function

laResult laListWidget_SetIconMargin(laListWidget* lst, uint32_t mg)

laListWidget_SetIconPosition Function

Sets the icon position for the list widget

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SetIconPosition(laListWidget* lst, laRelativePosition pos);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWidget* lst	the widget
laRelativePosition pos	the relative position setting

Function

laResult laListWidget_SetIconPosition(laListWidget* lst,
laRelativePosition pos)

laListWidget_SetItemIcon Function

Sets the icon pointer for a given index.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SetItemIcon(laListWidget* lst, uint32_t idx, GFXU_ImageAsset* img);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t idx	the index to configure
GFXU_ImageAsset*	the image asset pointer to use as the icon

Function

laResult laListWidget_SetItemIcon(laListWidget* lst,
uint32_t idx,
GFXU_ImageAsset* img)

laListWidget_SetItemSelected Function

Attempts to set the item at idx as selected.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SetItemSelected(laListWidget* lst, uint32_t idx, laBool selected);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t idx	the index to consider
laBool	the select state to set to the item

Function

laResult laListWidget_SetItemSelected(laListWidget* lst,
uint32_t idx,
laBool selected)

laListWidget_SetItemText Function

Sets the text value for an item in the list.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SetItemText(laListWidget* lst, uint32_t index, laString str);
```

Returns

laResult - the operation result

Description

This function copies the contents of the input string into its internal string buffer. The input string can then be freed or altered without affecting the label's internal string value.

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t idx	the index to consider
laString str	an laString object

Function

laResult laListWidget_SetItemText(laListWidget* lst,
uint32_t index,
laString str)

laListWidget_SetItemVisible Function

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SetItemVisible(laListWidget* lst, uint32_t idx);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t index	the index to modify

Function

laResult laListWidget_SetItemVisible(laListWidget* lst,
uint32_t index)

laListWidget_SetSelectedItemChangedEventCallback Function

Sets the callback for the item selected changed event

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SetSelectedItemChangedEventCallback(laListWidget* lst,
laListWidget_SelectedItemChangedEvent cb);
```

Returns

laResult - the operation result

Description

This callback is called whenver an items selected state is modified.

Parameters

Parameters	Description
laListWidget* lst	the widget
laListWidget_SelectedItemChangedEvent	the desired pointer to callback or NULL

Function

laResult laListWidget_SetSelectedItemChangedEventCallback(laListWidget* lst,
laListWidget_SelectedItemChangedEvent cb)

laListWidget_SetSelectionMode Function

Set the list selection mode

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_SetSelectionMode(laListWidget* lst, laListWidget_SelectionMode mode);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWidget* lst	the widget
laListWidget_SelectionMode mode	the desired list selection mode

Function

laResult laListWidget_SetSelectionMode(laListWidget* lst,
laListWidget_SelectionMode mode)

laListWidget_ToggleItemSelected Function

Attempts to toggle the selected state of the item at idx.

File

libaria_widget_list.h

C

```
LIB_EXPORT laResult laListWidget_ToggleItemSelected(laListWidget* lst, uint32_t idx);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t idx	the index to consider

Function

laResult laListWidget_ToggleItemSelected(laListWidget* lst,
uint32_t idx)

laProgressBarWidget_GetDirection Function

Gets the fill direction value for a progress bar widget

File

libaria_widget_progressbar.h

C

```
LIB_EXPORT laProgressBarDirection laProgressBarWidget_GetDirection(laProgressBarWidget* bar);
```

Returns

laProgressBarDirection - the fill direction value

Parameters

Parameters	Description
laProgressBarWidget* bar	the widget

Function

laProgressBarDirection laProgressBarWidget_GetDirection(laProgressBarWidget* bar)

laProgressBarWidget_GetValue Function

Gets the percentage value for a progress bar.

File

libaria_widget_progressbar.h

C

```
LIB_EXPORT uint32_t laProgressBarWidget_GetValue(laProgressBarWidget* bar);
```

Returns

uint32_t

Parameters

Parameters	Description
laProgressBarWidget* bar	the widget

Function

uint32_t laProgressBarWidget_GetValue(laProgressBarWidget* bar)

laProgressBarWidget_GetValueChangedEventCallback Function

Gets the currently set value changed event callback.

File

libaria_widget_progressbar.h

C

```
LIB_EXPORT laProgressBar_ValueChangedEventCallback
laProgressBarWidget_GetValueChangedEventCallback(laProgressBarWidget* bar);
```

Returns

laProgressBar_ValueChangedEventCallback - the current callback pointer or NULL

Parameters

Parameters	Description
laProgressBarWidget* bar	the widget

Function

laProgressBar_ValueChangedEventCallback laProgressBarWidget_GetValueChangedEventCallback(laProgressBarWidget* bar)

laProgressBarWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_progressbar.h

C

```
LIB_EXPORT laProgressBarWidget* laProgressBarWidget_New();
```

Returns

laProgressBarWidget*

Function

laProgressBarWidget* laProgressBarWidget_New()

laProgressBarWidget_SetDirection Function

Sets the fill direction for a progress bar widget

File

libaria_widget_progressbar.h

C

```
LIB_EXPORT laResult laProgressBarWidget_SetDirection(laProgressBarWidget* bar, laProgressBarDirection dir);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laProgressBarWidget* bar	the widget
laProgressBarDirection dir	the desired fill direction

Function

laResult laProgressBarWidget_SetDirection(laProgressBarWidget* bar,
laProgressBarDirection dir)

laProgressBarWidget_SetValue Function

Sets the percentage value for a progress bar. Valid values are 0 - 100.

File

libaria_widget_progressbar.h

C

```
LIB_EXPORT laResult laProgressBarWidget_SetValue(laProgressBarWidget* bar, uint32_t value);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laProgressBarWidget* bar	the widget
uint32_t value	the desired value

Function

laResult laProgressBarWidget_SetValue(laProgressBarWidget* bar, uint32_t value)

laProgressBarWidget_SetValueChangedCallback Function

Sets the desired value changed event callback pointer

File

libaria_widget_progressbar.h

C

```
LIB_EXPORT laResult laProgressBarWidget_SetValueChangedCallback(laProgressBarWidget* bar,
laProgressBar_ValueChangedEventCallback cb);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laProgressBarWidget* bar	the widget
laProgressBar_ValueChangedEventCallback	a valid callback pointer or NULL

Function

laResult laProgressBarWidget_SetValueChangedCallback(laProgressBarWidget* bar, laProgressBar_ValueChangedEventCallback cb)

laRadioButtonGroup_AddButton Function

Add a button widget to the button list of the selected Radio button group.

File

libaria_radiobutton_group.h

C

```
LIB_EXPORT laResult laRadioButtonGroup_AddButton(laRadioButtonGroup* grp, laRadioButtonWidget* btn);
```

Returns

laResult

Description

Add a button widget to the button list of the selected Radio button group. The function makes sure the radio button grp is valid and the button widget to be added is not already a part of the group. The button is then added as the last button in the group button list

Function

laResult laRadioButtonGroup_AddButton(laRadioButtonGroup* grp,
laRadioButtonWidget* btn)

laRadioButtonGroup_Create Function

This function creates a GFX_GOL_RADIOBUTTON group with the provided button list.

File

libaria_radiobutton_group.h

C

```
LIB_EXPORT laResult laRadioButtonGroup_Create(laRadioButtonGroup** grp);
```

Returns

laResult

Description

This function creates a GFX_GOL_RADIOBUTTON group with the given pointer and the button list provided within the laRadioButtonGroup object.

Function

laResult laRadioButtonGroup_Create(laRadioButtonGroup** grp)

laRadioButtonGroup_Destroy Function

This function destroys the GFX_GOL_RADIOBUTTON group

File

libaria_radiobutton_group.h

C

```
LIB_EXPORT void laRadioButtonGroup_Destroy(laRadioButtonGroup* grp);
```

Returns

void

Description

This function destroys he GFX_GOL_RADIOBUTTON group with the given pointer. It frees the memory allocated to the button group and clears the button list.

Function

void laRadioButtonGroup_Destroy(laRadioButtonGroup* grp)

laRadioButtonGroup_RemoveButton Function

Remove a button widget to the button list of the selected Radio button group.

File

libaria_radiobutton_group.h

C

```
LIB_EXPORT laResult laRadioButtonGroup_RemoveButton(laRadioButtonGroup* grp, laRadioButtonWidget* btn);
```

Returns

laResult

Description

Remove a button widget to the button list of the selected Radio button group. The function makes sure the radio button grp is valid and the button widget to be removed is a part of the group. The button is then removed properly making sure to handle the list correctly. If the list size is 0, the group is destroyed.

Function

laResult laRadioButtonGroup_RemoveButton(laRadioButtonGroup* grp,
laRadioButtonWidget* btn);

laRadioButtonGroup_SelectButton Function

Select the button widget specified from the button list for the Radio button group.

File

libaria_radiobutton_group.h

C

```
LIB_EXPORT laResult laRadioButtonGroup_SelectButton(laRadioButtonGroup* grp, laRadioButtonWidget* btn);
```

Returns

laResult

Description

Select the button widget specified from the button list for the Radio button group. The function makes sure the specified button widget is a part of the group. It deselects the currently selected button widget and reassigns the focus to the button widget specified.

Function

laResult laRadioButtonGroup_SelectButton(laRadioButtonGroup* grp,
laRadioButtonWidget* btn)

laRadioButtonWidget_GetDeselectedEventCallback Function

Gets the current radio button deselected event callback

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laRadioButtonWidget_DeselectedEvent
laRadioButtonWidget_GetDeselectedEventCallback(laRadioButtonWidget* btn);
```

Returns

laRadioButtonWidget_DeselectedEvent - a valid callback pointer or NULL

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

laRadioButtonWidget_DeselectedEvent laRadioButtonWidget_GetDeselectedEventCallback(laRadioButtonWidget* btn)

laRadioButtonWidget_GetGroup Function

Returns the pointer to the currently set radio button group.

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laRadioButtonGroup* laRadioButtonWidget_GetGroup(laRadioButtonWidget* btn);
```

Returns

laRadioButtonGroup* - the currently assigned radio button group

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

laRadioButtonGroup* laRadioButtonWidget_GetGroup(laRadioButtonWidget* btn)

laRadioButtonWidget_GetHAlignment Function

Gets the horizontal alignment setting for a button

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laHAlignment laRadioButtonWidget_GetHAlignment(laRadioButtonWidget* btn);
```

Returns

laHAlignment - the horizontal alignment value

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

laHAlignment laRadioButtonWidget_GetHAlignment(laRadioButtonWidget* btn)

laRadioButtonWidget_GetImageMargin Function

Gets the distance between the icon and the text

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT uint32_t laRadioButtonWidget_GetImageMargin(laRadioButtonWidget* btn);
```

Returns

uint32_t - the distance value

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

uint16_t laRadioButtonWidget_GetImageMargin(laRadioButtonWidget* btn)

laRadioButtonWidget_GetImagePosition Function

Gets the current image position setting for the radio button

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laRelativePosition laRadioButtonWidget_GetImagePosition(laRadioButtonWidget* btn);
```

Returns

laRelativePosition - the current image relative position

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

laRelativePosition laRadioButtonWidget_GetImagePosition(laRadioButtonWidget* btn)

laRadioButtonWidget_GetSelected Function

Returns true if this radio button is currently selected

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laBool laRadioButtonWidget_GetSelected(laRadioButtonWidget* btn);
```

Returns

laBool - true if this button is currently selected

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

laBool laRadioButtonWidget_GetSelected(laRadioButtonWidget* btn)

laRadioButtonWidget_GetSelectedEventCallback Function

Gets the current radio button selected event callback

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laRadioButtonWidget_SelectedEvent
laRadioButtonWidget_GetSelectedEventCallback(laRadioButtonWidget* btn);
```

Returns

laRadioButtonWidget_SelectedEvent - a valid callback pointer or NULL

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

laRadioButtonWidget_SelectedEvent laRadioButtonWidget_GetSelectedEventCallback(laRadioButtonWidget* btn)

laRadioButtonWidget_GetSelectedImage Function

Gets the selected image asset pointer for a button

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT GFXU_ImageAsset* laRadioButtonWidget_GetSelectedImage(laRadioButtonWidget* btn);
```

Returns

GFXU_ImageAsset* - the selected asset pointer

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

GFXU_ImageAsset* laRadioButtonWidget_GetSelectedImage(laRadioButtonWidget* btn)

laRadioButtonWidget_GetText Function

Gets the text value for the button.

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_GetText(laRadioButtonWidget* btn, laString* str);
```

Returns

laResult - the operation result

Description

This function allocates memory and initializes the input string pointer. The caller is responsible for managing the memory once this function returns.

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget
laString* str	a pointer to an laString object

Function

laResult laRadioButtonWidget_GetText(laRadioButtonWidget* btn,
laString* str)

laRadioButtonWidget_GetUnselectedImage Function

Gets the image asset pointer currently used as the unselected icon

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT GFXU_ImageAsset* laRadioButtonWidget_GetUnselectedImage(laRadioButtonWidget* btn);
```

Returns

GFXU_ImageAsset* - the selected asset pointer

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

GFXU_ImageAsset* laRadioButtonWidget_GetUnselectedImage(laRadioButtonWidget* btn)

laRadioButtonWidget_GetVAlignment Function

Sets the vertical alignment for a button

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laVAlignment laRadioButtonWidget_GetVAlignment(laRadioButtonWidget* btn);
```

Returns

laVAlignment align - the desired vertical alignment setting

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

laVAlignment laRadioButtonWidget_GetVAlignment(laRadioButtonWidget* btn)

laRadioButtonWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laRadioButtonWidget* laRadioButtonWidget_New();
```

Returns

laProgressBarWidget*

Function

laRadioButtonWidget* laRadioButtonWidget_New()

laRadioButtonWidget_SetDeselectedEventCallback Function

Sets the deselected callback pointer

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_SetDeselectedEventCallback(laRadioButtonWidget* btn,
laRadioButtonWidget_DeselectedEvent cb);
```

Returns

laResult - the operation result

Description

This callback is called when this radio button is deselected

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget
laRadioButtonWidget_DeselectedEvent	a valid callback pointer or NULL

Function

laResult laRadioButtonWidget_SetDeselectedEventCallback(laRadioButtonWidget* btn,
laRadioButtonWidget_DeselectedEvent cb)

laRadioButtonWidget_SetHAlignment Function

Sets the horizontal alignment value for a button

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_SetHAlignment(laRadioButtonWidget* btn, laHAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget
laHAlignment align	the desired alignment value

Function

laResult laRadioButtonWidget_SetHAlignment(laRadioButtonWidget* btn,
laHAlignment align)

laRadioButtonWidget_SetImagePosition Function

Sets the image relative position setting for the radio button

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_SetImagePosition(laRadioButtonWidget* btn, laRelativePosition pos);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget
laRelativePosition pos	the desired image position

Function

laResult laRadioButtonWidget_SetImagePosition(laRadioButtonWidget* btn,
laRelativePosition pos)

laRadioButtonWidget_SetSelected Function

Sets this button as selected.

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_SetSelected(laRadioButtonWidget* btn);
```

Returns

laResult - the operation result

Description

If this button belongs to a radio button group then this function will potentially unselect another button and become selected.

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget

Function

laResult laRadioButtonWidget_SetSelected(laRadioButtonWidget* btn)

laRadioButtonWidget_SetSelectedEventCallback Function

Sets the radio button selected event callback

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_SetSelectedEventCallback(laRadioButtonWidget* btn,
laRadioButtonWidget_SelectedEvent cb);
```

Returns

laResult - the operation result

Description

This callback is called when the radio button becomes selected

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget
laRadioButtonWidget_SelectedEvent	a valid callback pointer or NULL

Function

laResult laRadioButtonWidget_SetSelectedEventCallback(laRadioButtonWidget* btn,
laRadioButtonWidget_SelectedEvent cb)

laRadioButtonWidget_SetSelectedImage Function

Sets the image to be used as a selected icon

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_SetSelectedImage(laRadioButtonWidget* btn, GFXU_ImageAsset* img);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget
GFXU_ImageAsset* img	the desired image asset pointer or NULL

Function

laResult laRadioButtonWidget_SetSelectedImage(laRadioButtonWidget* btn,
GFXU_ImageAsset* img)

laRadioButtonWidget_SetText Function

Sets the text value for the button.

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_SetText(laRadioButtonWidget* btn, laString str);
```

Returns

laResult - the operation result

Description

This function copies the contents of the input string into its internal string buffer. The input string can then be freed or altered without affecting the label's internal string value.

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget
laString str	an laString object

Function

laResult laRadioButtonWidget_SetText(laRadioButtonWidget* btn,
laString str)

laRadioButtonWidget_SetUnselectedImage Function

Sets the asset pointer for the radio button's unselected image icon

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_SetUnselectedImage(laRadioButtonWidget* btn, GFXU_ImageAsset* img);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget
GFXU_ImageAsset* img	the desired image asset pointer or NULL

Function

laResult laRadioButtonWidget_SetUnselectedImage(laRadioButtonWidget* btn,
GFXU_ImageAsset* img)

laRadioButtonWidget_SetVAlignment Function

Sets the vertical alignment for a button

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_SetVAlignment(laRadioButtonWidget* btn, laVAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget
laVAlignment align	the desired vertical alignment setting

Function

laResult laRadioButtonWidget_SetVAlignment(laRadioButtonWidget* btn,
laVAlignment align)

laRectangleWidget_GetThickness Function

Gets the rectangle border thickness setting

File

libaria_widget_rectangle.h

C

```
LIB_EXPORT int32_t laRectangleWidget_GetThickness(laRectangleWidget* rect);
```

Returns

int32_t - the border thickness setting

Parameters

Parameters	Description
laRectangleWidget* rect	the widget

Function

int32_t laRectangleWidget_GetThickness(laRectangleWidget* rect)

laRectangleWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_rectangle.h

C

```
LIB_EXPORT laRectangleWidget* laRectangleWidget_New();
```

Returns

laRectangleWidget*

Function

laRectangleWidget* laRectangleWidget_New()

laScheme_Initialize Function

Initialize the scheme to the default values as per the specified color mode.

File

libaria_scheme.h

C

```
LIB_EXPORT void laScheme_Initialize(laScheme* scheme, GFX_ColorMode mode);
```

Returns

void

Description

Initialize the scheme to the default values as per the specified color mode.

Parameters

Parameters	Description
laSceme* scheme	the scheme to modify
GFX_ColorMode	the color mode to use

Function

void laScheme_Initialize(laScheme* scheme, GFX_ColorMode mode)

laScreen_Delete Function

Frees all memory for all layers and widgets for this screen

File

libaria_screen.h

C

```
LIB_EXPORT void laScreen_Delete(laScreen* scr);
```

Returns

void

Parameters

Parameters	Description
laScreen* scr	the screen to destroy

Function

void laScreen_Delete(laScreen* scr)

laScreen_GetHideEventCallback Function

Returns the hide call back event function pointer for the specified screen

File

libaria_screen.h

C

```
LIB_EXPORT laScreen_ShowHideCallback_FnPtr laScreen_GetHideEventCallback(laScreen* scr);
```

Returns

laScreen_ShowHideCallback_FnPtr

Description

Returns the hide call back event function pointer for the specified screen

Parameters

Parameters	Description
laScreen* scr	the screen to reference

Function

aScreen_ShowHideCallback_FnPtr laScreen_GetHideEventCallback(laScreen* scr)

laScreen_GetLayerIndex Function

Returns the index of the layer for the screen specified.

File

libaria_screen.h

C

```
LIB_EXPORT int32_t laScreen_GetLayerIndex(laScreen* scr, laLayer* layer);
```

Returns

uint32_t - the index of the layer

Description

Returns the index of the layer for the screen specified.

Parameters

Parameters	Description
laScreen* scr	the screen to reference
laLayer* layer	the layer to search for

Function

int32_t laScreen_GetLayerIndex(laScreen* scr, laLayer* layer)

laScreen_GetOrientation Function

Returns the orientation object associated with the specified screen

File

libaria_screen.h

C

```
LIB_EXPORT laScreenOrientation laScreen_GetOrientation(laScreen* scr);
```

Returns

laScreenOrientation - the screen orientation

Description

Returns the orientation object associated with the specified screen

Parameters

Parameters	Description
laScreen* scr	the screen to reference

Function

laScreenOrientation laScreen_GetOrientation(laScreen* scr)

laScreen_GetShowEventCallback Function

Returns the show call back event function pointer for the specified screen

File

libaria_screen.h

C

```
LIB_EXPORT laScreen_ShowHideCallback_FnPtr laScreen_GetShowEventCallback(laScreen* scr);
```

Returns

laScreen_ShowHideCallback_FnPtr

Description

Returns the show call back event function pointer for the specified screen

Parameters

Parameters	Description
laScreen* scr	the screen to reference

Function

laScreen_ShowHideCallback_FnPtr laScreen_GetShowEventCallback(laScreen* scr)

laScreen_Hide Function

Hide the currently active screen

This function has been deprecated in favor of laContext_SetActiveScreen

File

libaria_screen.h

C

```
LIB_EXPORT GFX_DEPRECATED laResult laScreen_Hide(laScreen* scr);
```

Returns

laResult

Description

The function makes sure that the specified screen is currently active, hides the screen by calling the hide callback function pointer, if the persistent flag is not marked for that screen, delete the screen and free memory. Reset or turn off the Layers allocated for the screen.

Parameters

Parameters	Description
laScreen* scr	the screen to hide

Function

laResult laScreen_Hide(laScreen* scr)

laScreen_New Function

Create a new screen, initialize it to the values specified.

File

libaria_screen.h

C

```
LIB_EXPORT laScreen* laScreen_New(laBool persistent, laBool createAtStartup, laScreen_CreateCallback_FnPtr cb);
```

Returns

void

Description

Create a new screen, initialize it to the values specified. The key properties to specify include screen persistence, call backs for screen creation, initialize the screen to default values either specified through MHGC or manually by user.

Parameters

Parameters	Description
laBool persistent	indicates that the screen should not free the memory of its layers when it is hidden
laBool createAtStartup	indicates that the screen should be created as soon as possible to make its widgets accessible to the application
laScreen_CreateCallback_FnPtr cb	the function that should be called to initialize the screen at a later time

Function

laScreen* laScreen_New(laBool persistent,
laBool createAtStartup,
laScreen_CreateCallback_FnPtr cb)

laScreen_SetHideEventCallback Function

Set the hide call back event function pointer for the specified screen

File

libaria_screen.h

C

```
LIB_EXPORT laResult laScreen_SetHideEventCallback(laScreen* scr, laScreen_ShowHideCallback_FnPtr cb);
```

Returns

laResult

Description

Set the hide call back event function pointer for the specified screen

Parameters

Parameters	Description
laScreen* scr	the screen to modify laScreen_ShowHideCallback_FnPtr

Function

laResult laScreen_SetHideEventCallback(laScreen* scr,
laScreen_ShowHideCallback_FnPtr cb)

laScreen_SetLayer Function

Assigns the provided layer pointer to the screen at the given index

This function has been deprecated in favor of laContext_SetActiveScreen

File

libaria_screen.h

C

```
LIB_EXPORT laResult laScreen_SetLayer(laScreen* scr, uint32_t idx, laLayer* layer);
```

Returns

laResult - the result of the operation

Description

Screens contain an internal list of layer pointers. This API assigns a layer to a screen. If the screen is currently active the library attempts to immediately enable the new layer in the HAL.

Parameters

Parameters	Description
laScreen* scr	the screen to modify
uint32_t idx	the index of the layer
laLayer* layer	the layer pointer to assign to the screen

Function

laResult laScreen_SetLayer(laScreen* scr, uint32_t idx, laLayer* layer)

laScreen_SetOrientation Function

Sets the orientation object to the specified screen

File

libaria_screen.h

C

```
LIB_EXPORT laResult laScreen_SetOrientation(laScreen* scr, laScreenOrientation ori);
```

Returns

laResult - the result of the operation

Description

Sets the orientation object to the specified screen

Parameters

Parameters	Description
laScreen* scr	the screen to modify

laScreenOrientation	the new orientation setting

Function

laResult laScreen_SetOrientation(laScreen* scr, laScreenOrientation ori)

laScreen_SetShowEventCallback Function

Set the show call back event function pointer for the specified screen

File

libaria_screen.h

C

```
LIB_EXPORT laResult laScreen_SetShowEventCallback(laScreen* scr, laScreen_ShowHideCallback_FnPtr cb);
```

Returns

laResult - the result of the operation

Description

Set the show call back event function pointer for the specified screen

Parameters

Parameters	Description
laScreen* scr	the screen to modify
laScreen_ShowHideCallback_FnPtr	the function pointer to use

Function

laResult laScreen_SetShowEventCallback(laScreen* scr,
laScreen_ShowHideCallback_FnPtr cb)

laScreen_Show Function

Make the specified screen active and show it on the display

File

libaria_screen.h

C

```
LIB_EXPORT GFX_DEPRECATED laResult laScreen_Show(laScreen* scr);
```

Returns

void

Description

The function makes sure that the specified screen is not already active, creates it if it is is not already created, sets the appropriate color mode, make it active and call the show callback function pointer.

Parameters

Parameters	Description
laScreen* scr	the screen to show

Function

laResult laScreen_Show(laScreen* scr)

laScrollBarWidget_GetExtentValue Function

Gets the current scroll bar extent value

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT uint32_t laScrollBarWidget_GetExtentValue(laScrollBarWidget* bar);
```

Returns

uint32_t - the extent value

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget

Function

uint32_t laScrollBarWidget_GetExtentValue(laScrollBarWidget* bar)

laScrollBarWidget_GetMaxinumValue Function

Gets the maximum scroll value

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT uint32_t laScrollBarWidget_GetMaxinumValue(laScrollBarWidget* bar);
```

Returns

uint32_t - the maximum scroll value

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget

Function

uint32_t laScrollBarWidget_GetMaxinumValue(laScrollBarWidget* bar)

laScrollBarWidget_GetOrientation Function

Gets the orientation value for the scroll bar

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laScrollBarOrientation laScrollBarWidget_GetOrientation(laScrollBarWidget* bar);
```

Returns

laScrollBarOrientation - the orientation value

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget

Function

laScrollBarOrientation laScrollBarWidget_GetOrientation(laScrollBarWidget* bar)

laScrollBarWidget_GetScrollPercentage Function

Gets the current scroll value as a percentage

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT uint32_t laScrollBarWidget_GetScrollPercentage(laScrollBarWidget* bar);
```

Returns

uint32_t - the scroll percentage

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget

Function

uint32_t laScrollBarWidget_GetScrollPercentage(laScrollBarWidget* bar)

laScrollBarWidget_GetScrollValue Function

Gets the current scroll value

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT uint32_t laScrollBarWidget_GetScrollValue(laScrollBarWidget* bar);
```

Returns

uint32_t - the scroll value

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget

Function

uint32_t laScrollBarWidget_GetScrollValue(laScrollBarWidget* bar)

laScrollBarWidget_GetStepSize Function

Gets the current discreet step size

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT uint32_t laScrollBarWidget_GetStepSize(laScrollBarWidget* bar);
```

Returns

uint32_t - the current step size

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget

Function

uint32_t laScrollBarWidget_GetStepSize(laScrollBarWidget* bar)

laScrollBarWidget_GetValueChangedEventCallback Function

Gets the current value changed callback function pointer

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laScrollBarWidget_ValueChangedEvent
laScrollBarWidget_GetValueChangedEventCallback(laScrollBarWidget* bar);
```

Returns

laScrollBarWidget_ValueChangedEvent - a valid pointer or NULL

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget

Function

laScrollBarWidget_ValueChangedEvent laScrollBarWidget_GetValueChangedEventCallback(laScrollBarWidget* bar)

laScrollBarWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laScrollBarWidget* laScrollBarWidget_New();
```

Returns

laScrollBarWidget*

Function

laScrollBarWidget* laScrollBarWidget_New()

laScrollBarWidget_SetExtentValue Function

Sets the scroll bar extent value

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laResult laScrollBarWidget_SetExtentValue(laScrollBarWidget* bar, uint32_t val);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget
uint32_t val	the extent value

Function

laResult laScrollBarWidget_SetExtentValue(laScrollBarWidget* bar,
uint32_t val)

laScrollBarWidget_SetMaximumValue Function

Sets the maximum scroll value

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laResult laScrollBarWidget_SetMaximumValue(laScrollBarWidget* bar, uint32_t val);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget
uint32_t val	the desired maximum scroll value

Function

laResult laScrollBarWidget_SetMaximumValue(laScrollBarWidget* bar,
uint32_t val)

laScrollBarWidget_SetOrientation Function

Sets the orientation value of the scroll bar

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laResult laScrollBarWidget_SetOrientation(laScrollBarWidget* bar, laScrollBarOrientation align,
laBool swapDimensions);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget
laScrollBarOrientation	the desired orientation value

Function

laResult laScrollBarWidget_SetOrientation(laScrollBarWidget* bar,
laScrollBarOrientation align)

laScrollBarWidget_SetScrollPercentage Function

Sets the current scroll value using a percentage. Percentage should be a value from 0 - 100

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laResult laScrollBarWidget_SetScrollPercentage(laScrollBarWidget* bar, uint32_t val);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget
uint32_t val	a value from 0 - 100

Function

laResult laScrollBarWidget_SetScrollPercentage(laScrollBarWidget* bar,
uint32_t val)

laScrollBarWidget_SetScrollValue Function

Sets the current scroll value

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laResult laScrollBarWidget_SetScrollValue(laScrollBarWidget* bar, uint32_t val);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget
uint32_t	the desired scroll value

Function

laResult laScrollBarWidget_SetScrollValue(laScrollBarWidget* bar,
uint32_t val)

laScrollBarWidget_SetStepSize Function

Sets the current step size

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laResult laScrollBarWidget_SetStepSize(laScrollBarWidget* bar, uint32_t val);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget
uint32_t val	the desired step size

Function

laResult laScrollBarWidget_SetStepSize(laScrollBarWidget* bar,
uint32_t val)

laScrollBarWidget_SetValueChangedEventCallback Function

Sets the value changed event callback pointer

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laResult laScrollBarWidget_SetValueChangedEventCallback(laScrollBarWidget* bar,
laScrollBarWidget_ValueChangedEvent cb);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget
laScrollBarWidget_ValueChangedEvent	a valid pointer or NULL

Function

laResult laScrollBarWidget_SetValueChangedEventCallback(laScrollBarWidget* bar,
laScrollBarWidget_ValueChangedEvent cb)

laScrollBarWidget_StepBackward Function

Moves the scroll value back by the current step size

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laResult laScrollBarWidget_StepBackward(laScrollBarWidget* bar);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget

Function

laResult laScrollBarWidget_StepBackward(laScrollBarWidget* bar)

laScrollBarWidget_StepForward Function

Moves the scroll value forward by the current step size

File

libaria_widget_scrollbar.h

C

```
LIB_EXPORT laResult laScrollBarWidget_StepForward(laScrollBarWidget* bar);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laScrollBarWidget* bar	the widget

Function

laResult laScrollBarWidget_StepForward(laScrollBarWidget* bar)

laSliderWidget_GetGripSize Function

Gets the current grip size of the slider

File

libaria_widget_slider.h

C

```
LIB_EXPORT uint32_t laSliderWidget_GetGripSize(laSliderWidget* sld);
```

Returns

uint32_t - the current grip size

Parameters

Parameters	Description
laSliderWidget* sld	the widget

Function

uint32_t laSliderWidget_GetGripSize(laSliderWidget* sld)

laSliderWidget_GetMaxinumValue Function

Gets the maximum value for the slider

File

libaria_widget_slider.h

C

```
LIB_EXPORT uint32_t laSliderWidget_GetMaxinumValue(laSliderWidget* sld);
```

Returns

uint32_t - the maximum value for the slider

Parameters

Parameters	Description
laSliderWidget* sld	the widget

Function

uint32_t laSliderWidget_GetMaxinumValue(laSliderWidget* sld)

laSliderWidget_GetMininumValue Function

Gets the minimum value for the slider

File

libaria_widget_slider.h

C

```
LIB_EXPORT uint32_t laSliderWidget_GetMininumValue(laSliderWidget* sld);
```

Returns

uint32_t - the minimum slider value

Parameters

Parameters	Description
laSliderWidget* sld	the widget

Function

uint32_t laSliderWidget_GetMininumValue(laSliderWidget* sld)

laSliderWidget_GetOrientation Function

Gets the orientation value for the slider

File

libaria_widget_slider.h

C

```
LIB_EXPORT laSliderOrientation laSliderWidget_GetOrientation(laSliderWidget* sld);
```

Returns

laSliderOrientation

Parameters

Parameters	Description
laSliderWidget* sld	the widget

Function

laSliderOrientation laSliderWidget_GetOrientation(laSliderWidget* sld)

laSliderWidget_GetSliderPercentage Function

Gets the slider value as a percentage

File

libaria_widget_slider.h

C

```
LIB_EXPORT uint32_t laSliderWidget_GetSliderPercentage(laSliderWidget* sld);
```

Returns

uint32_t - the slider value as a percentage

Parameters

Parameters	Description
laSliderWidget* sld	the widget

Function

uint32_t laSliderWidget_GetSliderPercentage(laSliderWidget* sld)

laSliderWidget_GetSliderValue Function

Gets the current slider value

File

libaria_widget_slider.h

C

```
LIB_EXPORT int32_t laSliderWidget_GetSliderValue(laSliderWidget* sld);
```

Returns

uint32_t - the current slider value

Parameters

Parameters	Description
laSliderWidget* sld	the widget

Function

uint32_t laSliderWidget_GetSliderValue(laSliderWidget* sld)

laSliderWidget_GetValueChangedEventCallback Function

Gets the current value changed event callback pointer

File

libaria_widget_slider.h

C

```
LIB_EXPORT laSliderWidget_ValueChangedEvent laSliderWidget_GetValueChangedEventCallback(laSliderWidget*
sld);
```

Returns

laSliderWidget_ValueChangedEvent - a valid callback or NULL

Parameters

Parameters	Description
laSliderWidget* sld	the widget

Function

laSliderWidget_ValueChangedEvent laSliderWidget_GetValueChangedEventCallback(laSliderWidget* sld)

laSliderWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_slider.h

C

```
LIB_EXPORT laSliderWidget* laSliderWidget_New();
```

Returns

laSliderWidget*

Function

laSliderWidget* laSliderWidget_New()

laSliderWidget_SetGripSize Function

Sets the grip size of the slider

File

libaria_widget_slider.h

C

```
LIB_EXPORT laResult laSliderWidget_SetGripSize(laSliderWidget* sld, uint32_t size);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laSliderWidget* sld	the widget
uint32_t size	the desired grip size

Function

laResult laSliderWidget_SetGripSize(laSliderWidget* sld,

uint32_t size)

laSliderWidget_SetMaximumValue Function

Sets the maximum value for the slider

File

libaria_widget_slider.h

C

```
LIB_EXPORT laResult laSliderWidget_SetMaximumValue(laSliderWidget* sld, uint32_t val);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laSliderWidget* sld	the widget
uint32_t val	the desired maximum value for the slider

Function

laResult laSliderWidget_SetMaximumValue(laSliderWidget* sld,
uint32_t val)

laSliderWidget_SetMinimumValue Function

Sets the minimum value for the slider

File

libaria_widget_slider.h

C

```
LIB_EXPORT laResult laSliderWidget_SetMinimumValue(laSliderWidget* sld, uint32_t val);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laSliderWidget* sld	the widget
uint32_t val	the desired minimum value

Function

laResult laSliderWidget_SetMinimumValue(laSliderWidget* sld,
uint32_t val)

laSliderWidget_SetOrientation Function

File

libaria_widget_slider.h

C

```
LIB_EXPORT laResult laSliderWidget_SetOrientation(laSliderWidget* sld, laSliderOrientation align, laBool
swapDimensions);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laSliderWidget* sld	the widget

laSliderOrientation	the desired slider orientation
laBool	indicates if the width and height of the slider should be swapped

Function

laResult laSliderWidget_SetOrientation(laSliderWidget* sld,
laSliderOrientation align,
laBool swapDimensions)

laSliderWidget_SetSliderPercentage Function

Sets the slider value using a percentage. Value must be from 0 - 100.

File

libaria_widget_slider.h

C

```
LIB_EXPORT laResult laSliderWidget_SetSliderPercentage(laSliderWidget* sld, uint32_t val);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laSliderWidget* sld	the widget
uint32_t val	a percentage value from 0 - 100

Function

laResult laSliderWidget_SetSliderPercentage(laSliderWidget* sld,
uint32_t val)

laSliderWidget_SetSliderValue Function

Sets the current slider value

File

libaria_widget_slider.h

C

```
LIB_EXPORT laResult laSliderWidget_SetSliderValue(laSliderWidget* sld, int32_t val);
```

Returns

laResult - the operation result

Description

Must be between slider min and max

Parameters

Parameters	Description
laSliderWidget* sld	the widget
uint32_t val	the desired slider value

Function

laResult laSliderWidget_SetSliderValue(laSliderWidget* sld,
int32_t val)

laSliderWidget_SetValueChangedEventCallback Function

Sets the value changed event callback pointer

File

libaria_widget_slider.h

C

```
LIB_EXPORT laResult laSliderWidget_SetValueChangedEventCallback(laSliderWidget* sld,
laSliderWidget_ValueChangedEvent cb);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laSliderWidget* sld	the widget
laSliderWidget_ValueChangedEvent	a valid pointer or NULL

Function

laResult laSliderWidget_SetValueChangedEventCallback(laSliderWidget* sld,
laSliderWidget_ValueChangedEvent cb)

laSliderWidget_Step Function

Moves the slider by a given amount

File

libaria_widget_slider.h

C

```
LIB_EXPORT laResult laSliderWidget_Step(laSliderWidget* sld, int32_t amount);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laSliderWidget* sld	the widget
int32_t amount	the amount by which to adjust the current slider value

Function

laResult laSliderWidget_Step(laSliderWidget* sld, int32_t amount)

laTextFieldWidget_GetAlignment Function

Gets the text horizontal alignment value.

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laHAlignment laTextFieldWidget_GetAlignment(laTextFieldWidget* txt);
```

Returns

laHAlignment - the horizontal alignment value

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget

Function

laHAlignment laTextFieldWidget_GetAlignment(laTextFieldWidget* txt)

laTextFieldWidget_GetCursorDelay Function

Gets the current cursor delay.

File

libaria_widget_textfield.h

C

```
LIB_EXPORT uint32_t laTextFieldWidget_GetCursorDelay(laTextFieldWidget* txt);
```

Returns

uint32_t - the current delay value

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget

Function

uint32_t laTextFieldWidget_GetCursorDelay(laTextFieldWidget* txt)

laTextFieldWidget_GetCursorEnabled Function

Gets the cursor enabled value

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laBool laTextFieldWidget_GetCursorEnabled(laTextFieldWidget* txt);
```

Returns

laBool - the cursor enabled flag value

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget

Function

laBool laTextFieldWidget_GetCursorEnabled(laTextFieldWidget* txt)

laTextFieldWidget_GetCursorPosition Function

Gets the current edit cursor position

File

libaria_widget_textfield.h

C

```
LIB_EXPORT uint32_t laTextFieldWidget_GetCursorPosition(laTextFieldWidget* txt);
```

Returns

uint32_t - the index of the cursor

Description

This cursor will appear to the left of the character at index of the string

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget

Function

uint32_t laTextFieldWidget_GetCursorPosition(laTextFieldWidget* txt)

laTextFieldWidget_GetText Function

Gets the text value for the box.

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laResult laTextFieldWidget_GetText(laTextFieldWidget* txt, laString* str);
```

Returns

laResult - the operation result

Description

This function allocates memory and initializes the input string pointer. The caller is responsible for managing the memory once this function returns.

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget
laString* str	a pointer to an laString object

Function

laResult laTextFieldWidget_GetText(laTextFieldWidget* txt, laString* str)

laTextFieldWidget_GetTextChangedEventCallback Function

Gets the current text changed event callback pointer

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laTextFieldWidget_TextChangedCallback
laTextFieldWidget_GetTextChangedEventCallback(laTextFieldWidget* txt);
```

Returns

laTextFieldWidget_TextChangedCallback - a valid pointer or NULL

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget

Function

laTextFieldWidget_TextChangedCallback laTextFieldWidget_GetTextChangedEventCallback(laTextFieldWidget* txt)

laTextFieldWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laTextFieldWidget* laTextFieldWidget_New();
```

Returns

laTextFieldWidget*

Function

laTextFieldWidget* laTextFieldWidget_New()

laTextFieldWidget_SetAlignment Function

Sets the text horizontal alignment value

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laResult laTextFieldWidget_SetAlignment(laTextFieldWidget* txt, laHAlignment align);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget
laHAlignment	the horizontal alignment value

Function

laResult laTextFieldWidget_SetAlignment(laTextFieldWidget* txt,
laHAlignment align)

laTextFieldWidget_SetCursorDelay Function

Sets the cursor delay value

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laResult laTextFieldWidget_SetCursorDelay(laTextFieldWidget* txt, uint32_t dt);
```

Returns

laResult - the operation result

Description

This value is typically expressed in milliseconds

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget
uint32_t dt	the cursor delay value

Function

laResult laTextFieldWidget_SetCursorDelay(laTextFieldWidget* txt,
uint32_t dt)

laTextFieldWidget_SetCursorEnabled Function

Sets the cursor enabled value flag

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laResult laTextFieldWidget_SetCursorEnabled(laTextFieldWidget* txt, laBool en);
```

Returns

laResult - the operation result

Description

The cursor enabled flag controls whether the cursor will display or not

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget
laBool en	the desired flag state

Function

laResult laTextFieldWidget_SetCursorEnabled(laTextFieldWidget* txt,
laBool en)

laTextFieldWidget_SetCursorPosition Function

Sets the position of the cursor

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laResult laTextFieldWidget_SetCursorPosition(laTextFieldWidget* txt, uint32_t pos);
```

Returns

laResult - the operation result

Description

The cursor will appear to the left of the character at pos

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget
uint32_t pos	the position of the cursor in character indices

Function

laResult laTextFieldWidget_SetCursorPosition(laTextFieldWidget* txt,
uint32_t pos)

laTextFieldWidget_SetText Function

Sets the text value for the box.

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laResult laTextFieldWidget_SetText(laTextFieldWidget* txt, laString str);
```

Returns

laResult - the operation result

Description

This function copies the contents of the input string into its internal string buffer. The input string can then be freed or altered without affecting the label's internal string value.

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget

laString str	an laString object

Function

laResult laTextFieldWidget_SetText(laTextFieldWidget* txt, laString str)

laTextFieldWidget_SetTextChangedEventCallback Function

Sets the text changed event callback pointer

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laResult laTextFieldWidget_SetTextChangedEventCallback(laTextFieldWidget* txt,
laTextFieldWidget_TextChangedCallback cb);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget
laTextFieldWidget_TextChangedCallback	a valid pointer or NULL

Function

laResult laTextFieldWidget_SetTextChangedEventCallback(laTextFieldWidget* txt,
laTextFieldWidget_TextChangedCallback cb)

laTouchTest_AddPoint Function

Adds a point to the touch test widget. The point will then be displayed.

File

libaria_widget_touchtest.h

C

```
LIB_EXPORT laResult laTouchTest_AddPoint(laTouchTestWidget* tch, GFX_Point* pnt);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laTouchTestWidget* tch	the widget
GFX_Point* pnt	a pointer to the point to add

Function

laResult laTouchTest_AddPoint(laTouchTestWidget* tch, GFX_Point* pnt)

laTouchTest_ClearPoints Function

Clears all of the existing touch points

File

libaria_widget_touchtest.h

C

```
LIB_EXPORT laResult laTouchTest_ClearPoints(laTouchTestWidget* tch);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laTouchTestWidget* tch	the widget

Function

laResult laTouchTest_ClearPoints(laTouchTestWidget* tch)

laTouchTestWidget_GetPointAddedEventCallback Function

Gets the current point added event callback

File

libaria_widget_touchtest.h

C

```
LIB_EXPORT laTouchTestWidget_PointAddedEventCallback
laTouchTestWidget_GetPointAddedEventCallback(laTouchTestWidget* txt);
```

Returns

laTouchTestWidget_PointAddedEventCallback - a valid pointer or NULL

Parameters

Parameters	Description
laTouchTestWidget* tch	the widget

Function

laTouchTestWidget_PointAddedEventCallback laTouchTestWidget_GetPointAddedEventCallback(laTouchTestWidget* txt)

laTouchTestWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_touchtest.h

C

```
LIB_EXPORT laTouchTestWidget* laTouchTestWidget_New();
```

Returns

laTouchTestWidget*

Function

laTouchTestWidget* laTouchTestWidget_New()

laTouchTestWidget_SetPointAddedEventCallback Function

Sets the point added event callback

File

libaria_widget_touchtest.h

C

```
LIB_EXPORT laResult laTouchTestWidget_SetPointAddedEventCallback(laTouchTestWidget* txt,
laTouchTestWidget_PointAddedEventCallback cb);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laTouchTestWidget* tch	the widget
laTouchTestWidget_PointAddedEventCallback cb	a valid pointer or NULL

Function

laResult laTouchTestWidget_SetPointAddedEventCallback(laTouchTestWidget* txt,
laTouchTestWidget_PointAddedEventCallback cb)

laUtils_ArrangeRectangle Function

Calculates the position of a rectangle within the given bounds and in accordance with the given parameters. A use case for this is when an image and a text rectangle must be arranged in a button box. This version of the algorithm will calculate the location of the image rectangle.

File

libaria_utils.h

C

```
void laUtils_ArrangeRectangle(GFX_Rect* sub, GFX_Rect obj, GFX_Rect bounds, laHAlignment hAlignment,
laVAlignment vAlignment, laRelativePosition position, uint8_t leftMargin, uint8_t topMargin, uint8_t
rightMargin, uint8_t bottomMargin, uint16_t rectMargin);
```

Returns

void

Remarks

The x and y position of sub will be manipulated by this function. The dimensions of the rectangle should be set before calling and should remain unchanged after execution.

Parameters

Parameters	Description
GFX_Rect* sub	the bounds of the subject rectangle (image)
GFX_Rect obj	the bounds of the object rectangle (text)
GFX_Rect bounds	the bounds of the bounding rectangle (widget)
laHAlignment hAlignment	the horizontal alignment of the rects
laVAlignment vAlignment	the vertical alignment of the rects
laRelativePosition position	the relative position of the rectangles
uint8_t leftMargin	the left margin of the bounding rectangle
uint8_t topMargin	the top margin of the bounding rectangle
uint8_t rightMargin	the right margin of the bounding rectangle
uint8_t bottomMargin	the bottom margin of the bounding rectangle
uint16_t rectMargin	the distance between the image and the text rects

Function

void laUtils_ArrangeRectangle(GFX_Rect* sub,
GFX_Rect obj,
GFX_Rect bounds,
laHAlignment hAlignment,
laVAlignment vAlignment,
laRelativePosition position,
uint8_t leftMargin,
uint8_t topMargin,
uint8_t rightMargin,
uint8_t bottomMargin,
uint16_t rectMargin)

laUtils_ArrangeRectangleRelative Function

Calculates the position of a rectangle within the given bounds and in accordance with the given parameters. A use case for this is when an image and a text rectangle must be arranged in a button box. This version of the algorithm will calculate the location of the text rectangle.

File

libaria_utils.h

C

```
void laUtils_ArrangeRectangleRelative(GFX_Rect* sub, GFX_Rect obj, GFX_Rect bounds, laHAlignment
hAlignment, laVAlignment vAlignment, laRelativePosition position, uint8_t leftMargin, uint8_t topMargin,
uint8_t rightMargin, uint8_t bottomMargin, uint16_t rectMargin);
```

Returns

void

Remarks

The x and y position of sub will be manipulated by this function. The dimensions of the rectangle should be set before calling and should remain unchanged after execution.

Parameters

Parameters	Description
GFX_Rect* sub	the bounds of the subject rectangle (text)
GFX_Rect obj	the bounds of the object rectangle (image)
GFX_Rect bounds	the bounds of the bounding rectangle (widget)
laHAlignment hAlignment	the horizontal alignment of the rects
laVAlignment vAlignment	the vertical alignment of the rects
laRelativePosition position	the relative position of the rectangles
uint8_t leftMargin	the left margin of the bounding rectangle
uint8_t topMargin	the top margin of the bounding rectangle
uint8_t rightMargin	the right margin of the bounding rectangle
uint8_t bottomMargin	the bottom margin of the bounding rectangle
uint16_t rectMargin	the distance between the image and the text rects

Function

void laUtils_ArrangeRectangleRelative(GFX_Rect* sub,
GFX_Rect obj,
GFX_Rect bounds,
laHAlignment hAlignment,
laVAlignment vAlignment,
laRelativePosition position,
uint8_t leftMargin,
uint8_t topMargin,
uint8_t rightMargin,
uint8_t bottomMargin,
uint16_t rectMargin)

laUtils_ChildIntersectsParent Function

Performs an intersection test between a parent widget and a child widget

File

libaria_utils.h

C

```
laBool laUtils_ChildIntersectsParent(laWidget* parent, laWidget* child);
```

Returns

laBool - result of the intersection test

Parameters

Parameters	Description
laWidget* parent	the parent widget
laWidget* child	the child widget

Function

laBool laUtils_ChildIntersectsParent(laWidget* parent, laWidget* child)

laUtils_ClipRectToParent Function

Clips a rectangle to the parent of a widget

File

libaria_utils.h

C

```
void laUtils_ClipRectToParent(laWidget* widget, GFX_Rect* rect);
```

Returns

void

Parameters

Parameters	Description
laWidget* widget	the subject widget
GFX_Rect* rect	the rectangle to clip

Function

void laUtils_ClipRectToParent(laWidget* widget, GFX_Rect* rect)

laUtils_GetLayer Function

Finds the root parent of a widget, which should be a layer

File

libaria_utils.h

C

```
laLayer* laUtils_GetLayer(laWidget* widget);
```

Returns

laLayer* - the widget's owning layer

Parameters

Parameters	Description
laWidget* widget	the subject widget

Function

laLayer* laUtils_GetLayer(laWidget* widget)

laUtils_ListOcclusionCullTest Function

Performs an occlusion test on a list of widgets an a rectangular area. This attempts to find only the topmost widgets for the given area. If a widget is completely occluded then it is removed from the list. Any widgets that remain in the list should be redrawn by the rasterizer.

File

libaria_utils.h

C

```
void laUtils_ListOcclusionCullTest(laList* list, GFX_Rect rect);
```

Returns

void

Parameters

Parameters	Description
laList* list	the widget list to test
GFX_Rect rect	the occlusion area

Function

void laUtils_ListOcclusionCullTest(laList* list, GFX_Rect rect)

laUtils_OcclusionCullTest Function

Performs an occlusion test for a widget in the tree. A widget is occluded if it is completely covered by one or more widgets. This is useful for culling widgets before the rasterizing phase.

File

libaria_utils.h

C

```
laBool laUtils_OcclusionCullTest(laWidget* widget);
```

Returns

laBool - result of the occlusion test

Parameters

Parameters	Description
laWidget* widget	the widget to test

Function

laBool laUtils_OcclusionCullTest(laWidget* widget)

laUtils_Pick Function

Finds the top-most visible widget in the tree at the given coordinates.

File

libaria_utils.h

C

```
LIB_EXPORT laWidget* laUtils_Pick(int32_t x, int32_t y);
```

Returns

laWidget* - the result widget

Parameters

Parameters	Description
int32_t x	the x coordinate of the pick point
int32_t y	the y coordinate of the pick point

Function

laWidget* laUtils_Pick(int32_t x, int32_t y)

laUtils_PickRect Function

Finds all of the visible widgets in the given rectangular area.

File

libaria_utils.h

C

```
void laUtils_PickRect(laLayer* layer, GFX_Rect rect, laList* list);
```

Returns

void

Parameters

Parameters	Description
laLayer* layer	the layer to analyze
GFX_Rect	the rectangle pick area
laList* list	the result list

Function

void laUtils_PickRect(laLayer* layer, GFX_Rect rect, laList* list)

laUtils_PointScreenToLocalSpace Function

Converts a point from layer space into the local space of a widget

File

libaria_utils.h

C

```
void laUtils_PointScreenToLocalSpace(laWidget* widget, GFX_Point* pnt);
```

Returns

void

Parameters

Parameters	Description
laWidget* widget	the subject widget
GFX_Point* pnt	the point to convert

Function

void laUtils_PointLayerToLocalSpace(laWidget* widget, GFX_Point* pnt)

laUtils_RectFromParentSpace Function

Converts a rectangle from widget parent space to widget local space

File

libaria_utils.h

C

```
void laUtils_RectFromParentSpace(laWidget* widget, GFX_Rect* rect);
```

Returns

void

Parameters

Parameters	Description
laWidget* widget	the subject widget
GFX_Rect* rect	the rectangle to convert

Function

void laUtils_RectFromParentSpace(laWidget* widget, GFX_Rect* rect)

laUtils_RectToLayerSpace Function

Converts a rectangle from widget local space to layer space

File

libaria_utils.h

C

```
void laUtils_RectToLayerSpace(laWidget* widget, GFX_Rect* rect);
```

Returns

void

Parameters

Parameters	Description
laWidget* widget	the subject widget
GFX_Rect* rect	the rectangle to convert

Function

void laUtils_RectToLayerSpace(laWidget* widget, GFX_Rect* rect)

laUtils_RectToParentSpace Function

Converts a rectangle from widget local space to widget parent space. Widget must be a child of a layer for this to function.

File

libaria_utils.h

C

```
void laUtils_RectToParentSpace(laWidget* widget, GFX_Rect* rect);
```

Returns

void

Parameters

Parameters	Description
laWidget* widget	the subject widget
GFX_Rect* rect	the rectangle to convert

Function

void laUtils_RectToParentSpace(laWidget* widget, GFX_Rect* rect)

laUtils_RectToScreenSpace Function

Converts a rectangle from widget local space to screen space

File

libaria_utils.h

C

```
void laUtils_RectToScreenSpace(laWidget* widget, GFX_Rect* rect);
```

Returns

void

Parameters

Parameters	Description
laWidget* widget	the subject widget
GFX_Rect* rect	the rectangle to convert

Function

void laUtils_RectToScreenSpace(laWidget* widget, GFX_Rect* rect)

laWidget_AddChild Function

Adds the child to the parent widget specified in the argument

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_AddChild(laWidget* parent, laWidget* child);
```

Returns

laResult - the operation result

Description

The function checks to see if the child and parent are valid, removes the child from its current parents children list, and assigns the child to the parent widget specified. The child is attached at the end of the list of the parent widgets children list.

Parameters

Parameters	Description
laWidget* parent	the parent widget
laWidget* child	the child to add

Function

laResult laWidget_AddChild(laWidget* parent, laWidget* child)

laWidget_Delete Function

Delete the widget object specified

File

libaria_widget.h

C

```
LIB_EXPORT void laWidget_Delete(laWidget* wgt);
```

Returns

void

Description

Delete a widget object specified, de-allocate memory for the widget through the current active context. All child widgets are also destructed and freed.

Function

void laWidget_Delete(laWidget* wgt)

laWidget_GetAlphaAmount Function

Return the widget's global alpha amount

File

libaria_widget.h

C

```
LIB_EXPORT uint32_t laWidget_GetAlphaAmount(laWidget* wgt);
```

Returns

uint32_t - the widget's global alpha amount

Description

Return the widget's global alpha amount

Parameters

Parameters	Description
lawidget* wgt	the widget

Function

uint32_t laWidget_GetAlphaAmount(laWidget* wgt)

laWidget_GetAlphaEnable Function

Return the alpha enable property of the widget

File

libaria_widget.h

C

```
LIB_EXPORT laBool laWidget_GetAlphaEnable(laWidget* wgt);
```

Returns

laBool - the widget's alpha enable flag value

Description

Return the alpha enable property of the widget

Parameters

Parameters	Description
lawidget* wgt	the widget

Function

laBool laWidget_GetAlphaEnable(laWidget* wgt)

laWidget_GetBorderType Function

Return the border type associated with the widget object

File

libaria_widget.h

C

```
LIB_EXPORT laBorderType laWidget_GetBorderType(laWidget* wgt);
```

Returns

laBorderType - the current widget border type

Description

Return the border type associated with the widget object

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

laBorderType laWidget_GetBorderType(laWidget* wgt)

laWidget_GetChildAtIndex Function

Fetches the child at the specified index from the children list of the specified parent widget

File

libaria_widget.h

C

```
LIB_EXPORT laWidget* laWidget_GetChildAtIndex(laWidget* parent, uint32_t idx);
```

Returns

laWidget* - a valid child pointer or NULL

Description

Fetches the child at the specified index from the children list of the specified parent widget

Parameters

Parameters	Description
laWidget* wgt	the widget
uint32_t idx	the desired child index

Function

laWidget* laWidget_GetChildAtIndex(laWidget* parent, uint32_t idx)

laWidget_GetChildCount Function

Returns the size of the children list of the specified parent widget

File

libaria_widget.h

C

```
LIB_EXPORT uint32_t laWidget_GetChildCount(laWidget* parent);
```

Returns

uint32_t - the number of children of this widget

Description

Returns the size of the children list of the specified parent widget

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

uint32_t laWidget_GetChildCount(laWidget* parent)

laWidget_GetCumulativeAlphaAmount Function

Calculates the cumulative alpha amount for a hierarchy of widgets

File

libaria_widget.h

C

```
LIB_EXPORT uint32_t laWidget_GetCumulativeAlphaAmount(laWidget* wgt);
```

Returns

uint32_t - the cumulative blending amount

Description

Alpha blending amounts are cumulative from parent to child. If a parent is blended at 50% then logically a child should also implicitely be blended at 50%. If a child further explictely enables blending at 50% then the cumulative amount is 25%.

Parameters

Parameters	Description
lawidget* wgt	the widget

Function

uint32_t laWidget_GetCumulativeAlphaAmount(laWidget* wgt)

laWidget_GetCumulativeAlphaEnable Function

Determines if this or any ancestor widget has alpha enabled

File

libaria_widget.h

C

```
LIB_EXPORT laBool laWidget_GetCumulativeAlphaEnable(laWidget* wgt);
```

Returns

laBool - whether the widget has alpha enabled

Parameters

Parameters	Description
lawidget* wgt	the widget

Function

laBool laWidget_GetCumulativeAlphaEnable(laWidget* wgt)

laWidget_GetEnabled Function

Returns the boolean value of the widget enabled property

File

libaria_widget.h

C

```
LIB_EXPORT laBool laWidget_GetEnabled(laWidget* wgt);
```

Returns

laBool - the value of the enabled flag

Description

Returns the boolean value of the widget enabled property. The widget enable flag often governs things like appearing 'greyed out' and prohibits user interactiong if it is false. Widgets must individually support this flag.

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

laBool laWidget_GetEnabled(laWidget* wgt)

laWidget_GetHeight Function

Returns the widget rectangles height

File

libaria_widget.h

C

```
LIB_EXPORT int32_t laWidget_GetHeight(laWidget* wgt);
```

Returns

uint32_t - the widget's width value

Description

Returns the widget rectangles height

Parameters

Parameters	Description
lawidget* wgt	the widget

Function

int32_t laWidget_GetHeight(laWidget* wgt)

laWidget_GetIndexOfChild Function

Fetches the index of the child from the children list of the specified parent widget

File

libaria_widget.h

C

```
LIB_EXPORT int32_t laWidget_GetIndexOfChild(laWidget* parent, laWidget* child);
```

Returns

int32_t - the index of the given child pointer or -1 if not found

Description

Traverses the children list of the specified parent widget and finds the index of the child widget specified.

Parameters

Parameters	Description
laWidget* parent	the parent widget
laWidget* child	the child widget

Function

int32_t laWidget_GetIndexOfChild(laWidget* parent, laWidget* child)

laWidget_GetMargin Function

Returns the margin value associated with the widget in the laMargin pointer

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_GetMargin(laWidget* wgt, laMargin* mg);
```

Returns

laResult - the operation result

Description

Returns the margin value associated with the widget in the laMargin pointer

Parameters

Parameters	Description
laWidget* wgt	the widget
laMargin* mg	a pointer to an laMargin object to store the margin values

Function

laResult laWidget_GetMargin (laWidget* wgt, laMargin* mg)

laWidget_GetScheme Function

Returns the scheme associated with the specified widget

File

libaria_widget.h

C

```
LIB_EXPORT laScheme* laWidget_GetScheme(laWidget* wgt);
```

Returns

laScheme* - a pointer to the active scheme for a widget

Description

Returns the scheme associated with the specified widget

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

laScheme* laWidget_GetScheme(laWidget* wgt)

laWidget_GetVisible Function

Returns the boolean value of the widget visible property

File

libaria_widget.h

C

```
LIB_EXPORT laBool laWidget_GetVisible(laWidget* wgt);
```

Returns

laBool - the flag value

Description

Returns the boolean value of the widget visible property. Widgets that are invisible will be skipped during the rendering phase. All descendants also logically become invisible when an ancestor does.

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

laBool laWidget_GetVisible(laWidget* wgt)

laWidget_GetWidth Function

Returns the widget rectangles width

File

libaria_widget.h

C

```
LIB_EXPORT int32_t laWidget_GetWidth(laWidget* wgt);
```

Returns

uint32_t - the widget's y coordinate value

Description

Returns the widget rectangles width

Parameters

Parameters	Description
lawidget* wgt	the widget

Function

int32_t laWidget_GetWidth(laWidget* wgt)

laWidget_GetX Function

Returns the widget rectangles upper left corner x-coordinate

File

libaria_widget.h

C

```
LIB_EXPORT int32_t laWidget_GetX(laWidget* wgt);
```

Returns

uint32_t

Description

Returns the widget rectangles upper left corner x-coordinate

Parameters

Parameters	Description
lawidget* wgt	the widget

Function

int32_t laWidget_GetX(laWidget* wgt)

laWidget_GetY Function

Returns the widget rectangles upper left corner y-coordinate

File

libaria_widget.h

C

```
LIB_EXPORT int32_t laWidget_GetY(laWidget* wgt);
```

Returns

uint32_t - the y value

Description

Returns the widget rectangles upper left corner y-coordinate

Parameters

Parameters	Description
lawidget* wgt	the widget

Function

int32_t laWidget_GetY(laWidget* wgt)

laWidget_HasFocus Function

Checks if the widget specified has focus in the current context

File

libaria_widget.h

C

```
LIB_EXPORT laBool laWidget_HasFocus(laWidget* wgt);
```

Returns

laBool - true of the widget currently has context focus

Description

Checks if the widget specified has focus in the current context

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

laBool laWidget_HasFocus(laWidget* wgt)

laWidget_Invalidate Function

Invalidates the specified widget.

File

libaria_widget.h

C

```
LIB_EXPORT void laWidget_Invalidate(laWidget* wgt);
```

Returns

void

Description

This function invalidates the specified widget. Invalid widgets are redrawn during the next paint loop call. This function may also invalidate the widget's parent, siblings, ancestors, or cousins.

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

void laWidget_Invalidate(laWidget* wgt)

laWidget_isOpaque Function

Returns true if the widget is considered opaque.

File

libaria_widget.h

C

```
LIB_EXPORT laBool laWidget_isOpaque(laWidget* wgt);
```

Returns

laBool - true if the widget is fully opaque

Description

Opacity is determined by a number of factors including: cumulative alpha amount, background type, and the opaque optimization flag.

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

laBool laWidget_isOpaque(laWidget* wgt)

laWidget_New Function

Create a new widget.

File

libaria_widget.h

C

```
LIB_EXPORT laWidget* laWidget_New();
```

Returns

lawidget*

Description

Create a new widget, alocate memory for the widget through the current active context. Returns a widget object pointer. Application is responsible for managing the widget pointer until the widget is added to a widget tree.

Function

laWidget* laWidget_New()

laWidget_OverrideTouchDownEvent Function

Replace the TouchDownEvent callback for the widget with the new function pointer specified

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_OverrideTouchDownEvent(laWidget* wgt, laWidget_TouchDownEvent_FnPtr ptr);
```

Returns

laResult - the operation result

Description

This function will replace the current touch down event handler for a widget. Widgets may have their own internal override for this function and replacing it will break their internal capabilties.

Parameters

Parameters	Description
laWidget* wgt	the widget
laWidget_TouchDownEvent_FnPtr	a valid pointer or NULL

Function

laResult laWidget_OverrideTouchDownEvent(laWidget* wgt,
laWidget_TouchDownEvent_FnPtr ptr)

laWidget_OverrideTouchMovedEvent Function

Replace the TouchMovedEvent callback for the widget with the new function pointer specified

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_OverrideTouchMovedEvent(laWidget* wgt, laWidget_TouchMovedEvent_FnPtr ptr);
```

Returns

laResult - the operation result

Description

This function will replace the current touch moved event handler for a widget. Widgets may have their own internal override for this function and replacing it will break their internal capabilties.

Parameters

Parameters	Description
laWidget* wgt	the widget
laWidget_TouchMovedEvent_FnPtr	a valid pointer or NULL

Function

laResult laWidget_OverrideTouchMovedEvent(laWidget* wgt,
laWidget_TouchMovedEvent_FnPtr ptr)

laWidget_OverrideTouchUpEvent Function

Replace the TouchUpEvent callback for the widget with the new function pointer specified

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_OverrideTouchUpEvent(laWidget* wgt, laWidget_TouchUpEvent_FnPtr ptr);
```

Returns

laResult - the operation result

Description

This function will replace the current touch up event handler for a widget. Widgets may have their own internal override for this function and replacing it will break their internal capabilties.

Parameters

Parameters	Description
laWidget* wgt	the widget
laWidget_TouchUpEvent_FnPtr	a valid pointer or NULL

Function

laResult laWidget_OverrideTouchUpEvent(laWidget* wgt,
laWidget_TouchUpEvent_FnPtr ptr)

laWidget_RectToLayerSpace Function

Transforms a widget rectangle from local space to its root layer space.

File

libaria_widget.h

C

```
LIB_EXPORT GFX_Rect laWidget_RectToLayerSpace(laWidget* wgt);
```

Returns

GFX_Rect - the transformed rectangle

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

GFX_Rect laWidget_RectToLayerSpace(laWidget* wgt)

laWidget_RectToParentSpace Function

Returns the rectangle containing the parent of the widget specified

File

libaria_widget.h

C

```
LIB_EXPORT GFX_Rect laWidget_RectToParentSpace(laWidget* wgt);
```

Returns

GFX_Rect - the widget rectangle in parent space

Description

Returns the rectangle containing the parent of the widget specified If the widget and the parent are not null, the rectangle defining the parent widget with its upper left corner x and y coordinates is returned

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

GFX_Rect laWidget_RectToParentSpace(laWidget* wgt)

laWidget_RectToScreenSpace Function

Transforms a widget rectangle from local space to screen space coordinates.

File

libaria_widget.h

C

```
LIB_EXPORT GFX_Rect laWidget_RectToScreenSpace(laWidget* wgt);
```

Returns

GFX_Rect - the transformed rectangle

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

GFX_Rect laWidget_RectToScreenSpace(laWidget* wgt)

laWidget_RemoveChild Function

Removes the child from the parent widget specified in the argument

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_RemoveChild(laWidget* parent, laWidget* child);
```

Returns

laResult - the operation result

Description

The function checks to see if the child and parent are valid, removes the child from its current parents children list

Parameters

Parameters	Description
laWidget* parent	the parent widget
laWidget* child	the child to remove

Function

laResult laWidget_RemoveChild(laWidget* parent, laWidget* child)

laWidget_Resize Function

Changes the widget size by the new defined width and height increments.

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_Resize(laWidget* wgt, int32_t width, int32_t height);
```

Returns

laResult - the operation result

Description

Changes the widget size by the new defined width and height increments.

Parameters

Parameters	Description
laWidget* wgt	the widget
int32_t width	the amount to change the width by
int32_t height	the amount ot change the height by

Function

void laWidget_Resize(laWidget* wgt, int32_t width, int32_t height)

laWidget_SetAlphaAmount Function

Set the widget's global alpha amount to the specified alpha amount

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetAlphaAmount(laWidget* wgt, uint32_t alpha);
```

Returns

laResult - the result of the operation

Description

Set the widget's global alpha amount to the specified alpha amount. Widgets may enable alpha blending even for color modes that don't support an alpha channel.

Parameters

Parameters	Description
laWidget* wgt	the widget
uint32_t alpha	the desired global alpha amount

Function

laResult laWidget_SetAlphaAmount(laWidget* wgt, uint32_t alpha)

laWidget_SetAlphaEnable Function

Set the alpha enable property of the widget with the boolean value specified

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetAlphaEnable(laWidget* wgt, laBool enable);
```

Returns

laResult - the result of the operation

Description

Set the alpha enable property of the widget with the boolean value specified

Parameters

Parameters	Description
lawidget* wgt	the widget
laBool enable	the desired alpha enable flag value

Function

laResult laWidget_SetAlphaEnable(laWidget* wgt, laBool enable)

laWidget_SetBorderType Function

Set the border type associated with the widget object

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetBorderType(laWidget* wgt, laBorderType type);
```

Returns

laResult - the operation result

Description

Set the border type associated with the widget object

Parameters

Parameters	Description
laWidget* wgt	the widget
laBorderType type	the desired border type

Function

laResult laWidget_SetBorderType(laWidget* wgt, laBorderType type)

laWidget_SetEnabled Function

Sets the boolean value of the widget enabled property

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetEnabled(laWidget* wgt, laBool enable);
```

Returns

laResult - the operation result

Description

Sets the boolean value of the widget enabled property

Parameters

Parameters	Description
laWidget* wgt	the widget
laBool	the desired enabled flag value

Function

laResult laWidget_SetEnabled(laWidget* wgt, laBool enable)

laWidget_SetFocus Function

Set the widget into focus for the current context.

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetFocus(laWidget* wgt);
```

Returns

laResult - the operation result

Description

Set the widget into focus for the current context. The input events etc are received by the widget once it is in focus

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

laResult laWidget_SetFocus(laWidget* wgt)

laWidget_SetHeight Function

Sets the widget's height value

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetHeight(laWidget* wgt, int32_t height);
```

Returns

laResult - result of the operation

Description

Sets the widget's height value

Parameters

Parameters	Description
lawidget* wgt	the widget
int32_t height	the desired height value, must be > 0

Function

laResult laWidget_SetHeight(laWidget* wgt, int32_t height)

laWidget_SetMargins Function

Set the margin value for left, right, top and bottom margins associated with the widget

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetMargins(laWidget* wgt, uint32_t left, uint32_t top, uint32_t right,
uint32_t bottom);
```

Returns

laResult - the operation result

Description

Set the margin value for left, right, top and bottom margins associated with the widget. Margins are a generic property and it is up to the individual widget to implement them (or not).

Parameters

Parameters	Description
laWidget* wgt	the widget
uint32_t left	the left margin value
uint32_t top	the top margin value
uint32_t right	the right margin value
uint32_t bottom	the bottom margin value

Function

laResult laWidget_SetMargins(laWidget* wgt,
uint32_t left,
uint32_t top,
uint32_t right,
uint32_t bottom)

laWidget_SetParent Function

Sets the parent of the child widget to that specified in the argument list

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetParent(laWidget* wgt, laWidget* parent);
```

Returns

laResult - the operation result

Description

The function checks to see if the child and parent are valid, removes the child from its current parents children list, and assigns the child to the parent widget specified. The child is attached at the end of the list of the parent widgets children list.

Parameters

Parameters	Description
laWidget* wgt	the widget
laWidget* parent	the desired parent widget

Function

laResult laWidget_SetParent(laWidget* wgt, laWidget* parent)

laWidget_SetPosition Function

Changes the widget position to the new defined x and y coordinates.

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetPosition(laWidget* wgt, int32_t x, int32_t y);
```

Returns

laResult - the operation result

Description

Changes the widget position to the new defined x and y coordinates. Moving widgets can be expensive as it needs to repaint multiple areas of its parent widget.

Parameters

Parameters	Description
laWidget* wgt	the widget
int32_t x	the new x coordinate
int32_t y	the new y coordinate

Function

void laWidget_SetPosition(laWidget* wgt, int32_t x, int32_t y)

laWidget_SetScheme Function

Sets the scheme variable for the specified widget

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetScheme(laWidget* wgt, laScheme* scheme);
```

Returns

laResult - the operation result

Description

Sets the scheme variable for the specified widget. The scheme defines the appearance of the widget. Setting this to NULL may result in undefined behavior if the widget doesn't properly support a NULL scheme.

Parameters

Parameters	Description
laWidget* wgt	the widget
laScheme* scheme	a pointer to a scheme or NULL

Function

void laWidget_SetScheme(laWidget* wgt, laScheme* scheme)

laWidget_SetSize Function

Changes the widget size to the new defined width and height dimensions.

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetSize(laWidget* wgt, uint32_t width, uint32_t height);
```

Returns

laResult - the operation result

Description

Changes the widget size to the new width and height dimensions.

Parameters

Parameters	Description
laWidget* wgt	the widget
int32_t width	the new width size
int32_t height	the new height size

Function

void laWidget_SetSize(laWidget* wgt, uint32_t width, uint32_t height)

laWidget_SetVisible Function

Sets the boolean value of the widget visible property

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetVisible(laWidget* wgt, laBool visible);
```

Returns

laResult - the operation result

Description

Sets the boolean value of the widget visible property

Remarks

This value has no effect on layer objects. Use laLayer_SetEnabled instead.

Parameters

Parameters	Description
laWidget* wgt	the widget
laBool	the desired setting

Function

laResult laWidget_SetVisible(laWidget* wgt, laBool visible)

laWidget_SetWidth Function

Sets the widget's width value

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetWidth(laWidget* wgt, int32_t width);
```

Returns

laResult - result of the operation

Description

Sets the widget's width value

Parameters

Parameters	Description
lawidget* wgt	the widget
int32_t width	the desired width value, must be > 0

Function

laResult laWidget_SetWidth(laWidget* wgt, int32_t width)

laWidget_SetX Function

Sets the widget's x coordinate position

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetX(laWidget* wgt, int32_t x);
```

Returns

laResult - result of the operation

Description

Sets the widget's x coordinate position

Parameters

Parameters	Description
lawidget* wgt	the widget
int32_t x	the desired x value

Function

laResult laWidget_SetX(laWidget* wgt, int32_t x)

laWidget_SetY Function

Sets the widget's y coordinate position

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetY(laWidget* wgt, int32_t y);
```

Returns

laResult - result of the operation

Description

Sets the widget's y coordinate position

Parameters

Parameters	Description
lawidget* wgt	the widget
int32_t y	the desired y value

Function

laResult laWidget_SetY(laWidget* wgt, int32_t y)

laWidget_Translate Function

Changes the widget position by moving the widget by the defined x and y increments.

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_Translate(laWidget* wgt, int32_t x, int32_t y);
```

Returns

laResult - the operation result

Description

Changes the widget position by moving the widget by the defined x and y increments.Moving widgets can be expensive as it needs to repaint multiple areas of its parent widget.

Parameters

Parameters	Description
laWidget* wgt	the widget
int32_t x	the amount to move in x
int32_t y	the amount to move in y

Function

void laWidget_Translate(laWidget* wgt, int32_t x, int32_t y)

laWindowWidget_GetIcon Function

Gets the currently used window icon

File

libaria_widget_window.h

C

```
LIB_EXPORT GFXU_ImageAsset* laWindowWidget_GetIcon(laWindowWidget* win);
```

Returns

GFXU_ImageAsset*

Parameters

Parameters	Description
laWindowWidget* win	the widget

Function

GFXU_ImageAsset* laWindowWidget_GetIcon(laWindowWidget* win)

laWindowWidget_GetIconMargin Function

Gets the current image icon margin

File

libaria_widget_window.h

C

```
LIB_EXPORT uint32_t laWindowWidget_GetIconMargin(laWindowWidget* win);
```

Returns

uint32_t - the icon margin

Parameters

Parameters	Description
laWindowWidget* win	the widget

Function

uint32_t laWindowWidget_GetIconMargin(laWindowWidget* win)

laWindowWidget_GetTitle Function

Gets the title text for this window.

File

libaria_widget_window.h

C

```
LIB_EXPORT laResult laWindowWidget_GetTitle(laWindowWidget* win, laString* str);
```

Returns

laResult - the operation result

Description

This function allocates memory and initializes the input string pointer. The caller is responsible for managing the memory once this function returns.

Parameters

Parameters	Description
laWindowWidget* win	the widget
laString* str	a pointer to an laString object

Function

laResult laWindowWidget_GetTitle(laWindowWidget* win, laString* str)

laWindowWidget_New Function

Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

File

libaria_widget_window.h

C

```
LIB_EXPORT laWindowWidget* laWindowWidget_New();
```

Returns

laWindowWidget*

Function

laWindowWidget* laWindowWidget_New()

laWindowWidget_SetIcon Function

Sets the image to be used as a window icon

File

libaria_widget_window.h

C

```
LIB_EXPORT laResult laWindowWidget_SetIcon(laWindowWidget* win, GFXU_ImageAsset* img);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laWindowWidget* win	the widget
GFXU_ImageAsset*	pointer to an image asset

Function

laResult laWindowWidget_SetIcon(laWindowWidget* win,
GFXU_ImageAsset* img)

laWindowWidget_SetIconMargin Function

Sets the image icon margin

File

libaria_widget_window.h

C

```
LIB_EXPORT laResult laWindowWidget_SetIconMargin(laWindowWidget* win, uint32_t mg);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laWindowWidget* win	the widget
uint32_t mg	the image icon margin value

Function

laResult laWindowWidget_SetIconMargin(laWindowWidget* win, uint32_t mg)

laWindowWidget_SetTitle Function

Sets the title text for the window.

File

libaria_widget_window.h

C

```
LIB_EXPORT laResult laWindowWidget_SetTitle(laWindowWidget* win, laString str);
```

Returns

laResult - the operation result

Description

This function copies the contents of the input string into its internal string buffer. The input string can then be freed or altered without affecting the label's internal string value.

Parameters

Parameters	Description
laWindowWidget* win	the widget
laString str	an laString object

Function

laResult laWindowWidget_SetTitle(laWindowWidget* win, laString str)

laCheckBoxWidget_SetImageMargin Function

Sets the distance between the image and the text

File

libaria_widget_checkbox.h

C

```
LIB_EXPORT laResult laCheckBoxWidget_SetImageMargin(laCheckBoxWidget* btn, uint32_t mg);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laCheckBoxWidget* cbox	the widget
uint32_t mg	the desired image margin value

Function

laResult laCheckBoxWidget_SetImageMargin(laCheckBoxWidget* btn, uint32_t mg)

laContext_SetPreemptionLevel Function

Set the preemption level to the specified value

File

libaria_context.h

C

```
LIB_EXPORT laResult laContext_SetPreemptionLevel(laPreemptionLevel level);
```

Returns

laResult

Description

Set the preemption level to the specified value

Function

laResult laContext_SetPreemptionLevel(laPreemptionLevel level)

laKeyPadWidget_SetKeyBackgroundType Function

Sets the background type for a key pad cell at row/column

File

libaria_widget_keypad.h

C

```
LIB_EXPORT laResult laKeyPadWidget_SetKeyBackgroundType(laKeyPadWidget* pad, uint32_t row, uint32_t col,
laBackgroundType type);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laKeyPadWidget* pad	the widget
uint32_t row	the indicated row
uint32_t col	the indicated column
laBackgroundType type	the desired background type

Function

laResult laKeyPadWidget_SetKeyBackgroundType(laKeyPadWidget* pad,
uint32_t row,
uint32_t col,
laBackgroundType type)

laLayer_GetAllowInputPassThrough Function

Gets the layer's input passthrough setting

File

libaria_layer.h

C

```
LIB_EXPORT laBool laLayer_GetAllowInputPassThrough(const laLayer* layer);
```

Returns

laBool - the state of the layer's passthrough flag

Description

The input passthrough setting is used to prohibit or allow input events to pass through a layer. If a layer is opaque or semi-opaque input events should probably not be allowed to pass through. If the layer is completely transparent then input events may be allowed to pass through to interact with widgets on layers further back in the hierarchy.

An application that disables this is responsible for ensuring that it is modified when the dimensions of the layer change.

Parameters

Parameters	Description
const laLayer* layer	the layer

Function

laBool laLayer_GetAllowInputPassThrough(const laLayer* layer)

laLayer_GetEnabled Function

Returns the boolean value of the layer enabled property

File

libaria_layer.h

C

```
LIB_EXPORT laBool laLayer_GetEnabled(const laLayer* layer);
```

Returns

laBool - the flag value

Description

Returns the boolean value of the layer enabled property

Parameters

Parameters	Description
laLayer*	the layer

Function

laBool laLayer_GetEnabled(const laLayer* layer)

laLayer_SetAllowInputPassthrough Function

Sets the layer's input passthrough flag.

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_SetAllowInputPassthrough(laLayer* layer, laBool enable);
```

Returns

laResult - the result of the operation

Description

Sets the layer's input passthrough flag.

Parameters

Parameters	Description
const laLayer* layer	the layer

Function

laResult laLayer_SetAllowInputPassthrough(laLayer* layer, laBool enable)

laLayer_SetEnabled Function

Sets the boolean value of the layer enabled property

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_SetEnabled(laLayer* widget, laBool enable);
```

Returns

laResult - the result of the operation

Description

Sets the boolean value of the layer enabled property

Remarks

The enabled flag for a layer will often control the hardware setting for layer usage, depending on the display driver

Parameters

Parameters	Description
laLayer*	the layer
laBool	the desired enabled value

Function

laResult laLayer_SetEnabled(laLayer* widget, laBool enable)

laListWheelWidget_GetFlickInitSpeed Function

Returns the flick init speed for the wheel.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT uint32_t laListWheelWidget_GetFlickInitSpeed(laListWheelWidget* whl);
```

Returns

uint32_t - the flick init speed value

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

uint32_t laListWheelWidget_GetFlickInitSpeed(laListWheelWidget* whl)

laListWheelWidget_GetIndicatorArea Function

Returns the spacing for the selected item indicator bars.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT uint32_t laListWheelWidget_GetIndicatorArea(laListWheelWidget* whl);
```

Returns

uint32_t - the display area

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

uint32_t laListWheelWidget_GetIndicatorArea(laListWheelWidget* whl)

laListWheelWidget_GetMaxMomentum Function

Returns the maximum momentum value for the wheel.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT uint32_t laListWheelWidget_GetMaxMomentum(laListWheelWidget* whl);
```

Returns

uint32_t - the maximum momentum value.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

uint32_t laListWheelWidget_GetMaxMomentum(laListWheelWidget* whl)

laListWheelWidget_GetMomentumFalloffRate Function

Returns the momentum falloff rate for the wheel.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT uint32_t laListWheelWidget_GetMomentumFalloffRate(laListWheelWidget* whl);
```

Returns

uint32_t - the momentum falloff rate value.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

uint32_t laListWheelWidget_GetMomentumFalloffRate(laListWheelWidget* whl)

laListWheelWidget_GetRotationUpdateRate Function

Returns the wheel rotation update rate.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT uint32_t laListWheelWidget_GetRotationUpdateRate(laListWheelWidget* whl);
```

Returns

uint32_t - the rotation update rate value.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

uint32_t laListWheelWidget_GetRotationUpdateRate(laListWheelWidget* whl)

laListWheelWidget_GetShaded Function

Returns true if the list is using gradient shading to illustrate depth

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laBool laListWheelWidget_GetShaded(laListWheelWidget* whl);
```

Returns

laBool - true gradient shading is being used

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

laBool laListWheelWidget_GetShaded(laListWheelWidget* whl)

laListWheelWidget_GetShowIndicators Function

Returns true if the list is displaying its selected item indicators

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laBool laListWheelWidget_GetShowIndicators(laListWheelWidget* whl);
```

Returns

laBool - true if the indicators are being shown

Parameters

Parameters	Description
laListWheelWidget* whl	the widget

Function

laBool laListWheelWidget_GetShowIndicators(laListWheelWidget* whl)

laListWheelWidget_GetVisibleItemCount Function

Returns the list's visible item count

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT uint32_t laListWheelWidget_GetVisibleItemCount(laListWheelWidget* whl);
```

Returns

uint32_t - the number of visible items

Parameters

Parameters	Description
laListWidget* lst	the widget

Function

uint32_t laListWheelWidget_GetVisibleItemCount(laListWheelWidget* whl)

laListWheelWidget_SetFlickInitSpeed Function

Configures the flick init speed for the list wheel

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetFlickInitSpeed(laListWheelWidget* whl, uint32_t speed);
```

Returns

laResult - the operation result

Description

The flick init speed is the drag distance needed to move the wheel into momentum mode. It is the distance that must be covered from one Aria update frame to another.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t speed	the flick init speed value

Function

laResult laListWheelWidget_SetFlickInitSpeed(laListWheelWidget* whl,
uint32_t speed)

laListWheelWidget_SetIndicatorArea Function

Configures the display area for the list selection indicator bars

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetIndicatorArea(laListWheelWidget* whl, uint32_t area);
```

Returns

laResult - the operation result

Description

This space is measured from the middle of the widget outward.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t area	the display area for the indicator bars

Function

laResult laListWheelWidget_SetIndicatorArea(laListWheelWidget* whl,
uint32_t area)

laListWheelWidget_SetMaxMomentum Function

Configures the maximum momentum value for the wheel

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetMaxMomentum(laListWheelWidget* whl, uint32_t max);
```

Returns

laResult - the operation result

Description

When a wheel is in momenum mode addition drag/flick gestures will add more momentum to the wheel. The maximum momentum value governs the maximum speed at which the wheel can rotate at any single point in time.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t max	the maximum momentum value

Function

laResult laListWheelWidget_SetMaxMomentum(laListWheelWidget* whl,
uint32_t max)

laListWheelWidget_SetMomentumFalloffRate Function

Configures the momentum falloff rate for the wheel

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetMomentumFalloffRate(laListWheelWidget* whl, uint32_t rate);
```

Returns

laResult - the operation result

Description

When a wheel is in momenum mode and during each rotation update tick the wheel will reduce its current momentum value by this falloff percentage. The higher this value is the faster a wheel will slow down. The wheel is limited to integer math so the lowest this value can be is one.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t max	the momentum falloff value

Function

laResult laListWheelWidget_SetMomentumFalloffRate(laListWheelWidget* whl,
uint32_t rate)

laListWheelWidget_SetRotationUpdateRate Function

Configures the rotation update rate for a wheel

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetRotationUpdateRate(laListWheelWidget* whl, uint32_t ms);
```

Returns

laResult - the operation result

Description

When a wheel is in momenum mode it may be too costly to update with every Aria update loop call. This value can delay a wheel update. For instance, if Aria is updating every 20ms, the wheel can be set to update every 60ms and it will update approximately every three to four Aria updates. This can cut down on the number of repaints the wheel needs to perform and can also slow the wheel down it if is rotating too fast for the application to handle. This value is typically expressed in milliseconds.

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
uint32_t ms	the desired rotation update rate

Function

laResult laListWheelWidget_SetRotationUpdateRate(laListWheelWidget* whl,
uint32_t ms)

laListWheelWidget_SetShaded Function

Configures the list to use gradient or flat background shading

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetShaded(laListWheelWidget* whl, laBool b);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
laBool b	true if gradient shading should be used

Function

laResult laListWheelWidget_SetShaded(laListWheelWidget* whl,
laBool b)

laListWheelWidget_SetShowIndicators Function

Configures the list to display the selected item indicator bars

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetShowIndicators(laListWheelWidget* whl, laBool b);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWheelWidget* whl	the widget
laBool b	configures the indicator bar display state

Function

laResult laListWheelWidget_SetShowIndicators(laListWheelWidget* whl,
laBool b)

laListWheelWidget_SetVisibleItemCount Function

Sets the number of visible items in the list. Must be greater than or equal to three and must be an odd number.

File

libaria_widget_listwheel.h

C

```
LIB_EXPORT laResult laListWheelWidget_SetVisibleItemCount(laListWheelWidget* whl, uint32_t cnt);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laListWidget* lst	the widget
uint32_t cnt	the desired number of items

Function

laResult laListWheelWidget_SetVisibleItemCount(laListWheelWidget* whl,
uint32_t cnt)

laRadioButtonWidget_SetImageMargin Function

Sets the distance between the icon and text

File

libaria_widget_radiobutton.h

C

```
LIB_EXPORT laResult laRadioButtonWidget_SetImageMargin(laRadioButtonWidget* btn, uint32_t mg);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laRadioButtonWidget* btn	the widget
uint32_t mg	the distance value

Function

laResult laRadioButtonWidget_SetImageMargin(laRadioButtonWidget* btn,
uint32_t mg)

laScreen_GetMirrored Function

Returns the mirror setting for the specified screen

File

libaria_screen.h

C

```
LIB_EXPORT laBool laScreen_GetMirrored(laScreen* scr);
```

Returns

laBool - the mirror setting

Description

Returns the mirror setting for the specified screen

Parameters

Parameters	Description
laScreen* scr	the screen to reference

Function

laBool laScreen_GetMirrored(laScreen* scr)

laScreen_SetMirrored Function

Sets the mirror setting for the specified screen

File

libaria_screen.h

C

```
LIB_EXPORT laResult laScreen_SetMirrored(laScreen* scr, laBool mirr);
```

Returns

laResult - the result of the operation

Description

Sets the mirror setting for the specified screen

Parameters

Parameters	Description
laScreen* scr	the screen to modify
laBool	the mirror setting

Function

laResult laScreen_SetMirrored(laScreen* scr, laBool mirr)

laString_Remove Function

Removes a number of characters from a string at a given index

File

libaria_string.h

C

```
LIB_EXPORT uint32_t laString_Remove(laString* str, uint32_t idx, uint32_t count);
```

Returns

uint32_t - the number of characters removed

Parameters

Parameters	Description
laString* str	the string to operate on
uint32_t idx	the index to remove from the number of characters to remove

Function

uint32_t laString_Remove(laString* str, uint32_t idx, uint32_t count)

laTextFieldWidget_SetClearOnFirstEdit Function

Sets the flag to indicate that the text field will be cleared on first edit.

File

libaria_widget_textfield.h

C

```
LIB_EXPORT laResult laTextFieldWidget_SetClearOnFirstEdit(laTextFieldWidget* txt, laBool clear);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laTextFieldWidget* txt	the widget
laBool clear	the desired flag state

Function

laResult laTextFieldWidget_SetClearOnFirstEdit(laTextFieldWidget* txt,
laBool clear)

laUtils_PickFromLayer Function

Finds the top-most visible widget in a layer at the given coordinates.

File

libaria_utils.h

C

```
LIB_EXPORT laWidget* laUtils_PickFromLayer(const laLayer* layer, int32_t x, int32_t y);
```

Returns

laWidget* - the result widget

Parameters

Parameters	Description
int32_t x	the x coordinate of the pick point
int32_t y	the y coordinate of the pick point

Function

laWidget* laUtils_PickFromLayer(const laLayer* layer, int32_t x, int32_t y)

laUtils_PointToLayerSpace Function

Converts a point from widget space into layer space

File

libaria_utils.h

C

```
void laUtils_PointToLayerSpace(laWidget* widget, GFX_Point* pnt);
```

Returns

void

Parameters

Parameters	Description
laWidget* widget	the subject widget
GFX_Point* pnt	the point to convert

Function

void laUtils_PointToLayerSpace(laWidget* widget, GFX_Point* pnt)

laUtils_ScreenToMirroredSpace Function

Takes a point in screen space and returns a transformed version in mirrored space.

File

libaria_utils.h

C

```
GFX_Point laUtils_ScreenToMirroredSpace(const GFX_Point* pnt, const GFX_Rect* rect, GFX_Orientation ori);
```

Returns

GFX_Point

Parameters

Parameters	Description
const GFX_Point* point	the point to transform
const GFX_Rect* rect	the screen dimensionrectangle
GFX_Orientation	the orientation setting

Function

void laUtils_ScreenToMirroredSpace(const GFX_Point* point,
const GFX_Rect* rect,
GFX_Orientation ori)

laUtils_ScreenToOrientedSpace Function

Takes a point in screen space and returns a transformed version in oriented space.

File

libaria_utils.h

C

```
GFX_Point laUtils_ScreenToOrientedSpace(const GFX_Point* pnt, const GFX_Rect* rect, GFX_Orientation ori);
```

Returns

GFX_Point

Parameters

Parameters	Description
const GFX_Point* point	the point to transform
const GFX_Rect* rect	the screen dimensionrectangle
GFX_Orientation	the orientation setting

Function

void laUtils_ScreenToOrientedSpace(const GFX_Point* point,
const GFX_Rect* rect,
GFX_Orientation ori)

laUtils_WidgetLocalRect Function

Returns the bounding rectangle of a widget in local space

File

libaria_utils.h

C

```
GFX_Rect laUtils_WidgetLocalRect(laWidget* widget);
```

Returns

GFX_Rect - the bounding rectangle

Parameters

Parameters	Description
laWidget* widget	the subject widget

Function

GFX_Rect laUtils_WidgetLocalRect(laWidget* widget)

laWidget_GetBackgroundType Function

Return the property value 'background type' associated with the widget object

File

libaria_widget.h

C

```
LIB_EXPORT laBackgroundType laWidget_GetBackgroundType(laWidget* wgt);
```

Returns

laBackgroundType - the current background type

Description

Return the property value 'background type' associated with the widget object The background type property decides if the widget background is drawn and re-drawn. If background is none, the entire parent widget will be re-drawn in the event that the widget gets dirty and needs re-drawing.

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

laBackgroundType laWidget_GetBackgroundType(laWidget* wgt)

laWidget_GetOptimizationFlags Function

Returns the optimization flags for the widget

File

libaria_widget.h

C

```
LIB_EXPORT laBool laWidget_GetOptimizationFlags(laWidget* wgt);
```

Returns

laBool - the flag value

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

laBool laWidget_GetOptimizationFlags(laWidget* wgt)

laWidget_SetBackgroundType Function

Set the property value 'background type' associated with the widget object

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetBackgroundType(laWidget* wgt, laBackgroundType type);
```

Returns

laResult - the operation result

Description

Set the property value 'draw background' associated with the widget object

Parameters

Parameters	Description
laWidget* wgt	the widget
laBackgroundType type	the desired background type

Function

laResult laWidget_SetBackgroundType(laWidget* wgt, laBackgroundType type)

laWidget_SetOptimizationFlags Function

Sets the optimizations for a widget

File

libaria_widget.h

C

```
LIB_EXPORT laResult laWidget_SetOptimizationFlags(laWidget* wgt, uint32_t flags);
```

Returns

laResult - the operation result

Description

See the optimizations enum for a descriptions of the individual flags

Parameters

Parameters	Description
laWidget* wgt	the widget

Function

laResult laWidget_SetOptimizationFlags(laWidget* wgt, uint32_t flags)

laRectangleWidget_SetThickness Function

Sets the rectangle border thickness setting

File

libaria_widget_rectangle.h

C

```
LIB_EXPORT laResult laRectangleWidget_SetThickness(laRectangleWidget* rect, int32_t thk);
```

Returns

laResult - the operation result

Parameters

Parameters	Description
laRectangleWidget* rect	the widget
int32_t thk	the thickness setting

Function

laResult laRectangleWidget_SetThickness(laRectangleWidget* rect,
int32_t thk)

laString_DrawClipped Function

Wrapper around GFX Utility string draw function for Aria user interface library. Draws only a clipped area of a string. Internal use only.

File

libaria_string.h

C

```
LIB_EXPORT void laString_DrawClipped(laString* str, int32_t strX, int32_t strY, int32_t strWidth, int32_t
strHeight, int32_t x, int32_t y, GFXU_ExternalAssetReader** reader);
```

Returns

void

Parameters

Parameters	Description
laString* str	the string to draw
int32_t strX	clipped x position
int32_t strY	clipped y position
int32_t strWidth	clipped rectangle width
int32_t strHeight	clipped rectangle height
int32_t x	x position to render at
int32_t y	y position to render at
GFXU_ExternalAssetReader** reader	external reader state machine, if string font is located external

Function

void laString_DrawClipped(laString* str,
int32_t strX,
int32_t strY,
int32_t strWidth,
int32_t strHeight,
int32_t x,
int32_t y,
GFXU_ExternalAssetReader** reader)

laString_IsEmpty Function

Returns a boolean indicating if the provided string contains data or has a link to the string table.

File

libaria_string.h

C

```
LIB_EXPORT laBool laString_IsEmpty(const laString* str);
```

Returns

laBool - LA_TRUE if the string has data, LA_FALSE if not

Parameters

Parameters	Description
const laString* str	the string to analyze

Function

laBool laString_IsEmpty(laString* str)

laUtils_GetNextHighestWidget Function

Gets the next highest Z order widget in the tree from 'wgt'

File

libaria_utils.h

C

```
laWidget* laUtils_GetNextHighestWidget(laWidget* wgt);
```

Returns

laWidget* - the next highest widget or NULL if 'wgt' is already the highest

Parameters

Parameters	Description
laWidget* wgt	the widget to analyze

Function

laBool laUtils_GetNextHighestWidget(laWidget* wgt)

laUtils_RectFromLayerSpace Function

Converts a rectangle from layer space to widget local space

File

libaria_utils.h

C

```
void laUtils_RectFromLayerSpace(laWidget* widget, GFX_Rect* rect);
```

Returns

void

Parameters

Parameters	Description
laWidget* widget	the subject widget
GFX_Rect* rect	the rectangle to convert

Function

void laUtils_RectFromLayerSpace(laWidget* widget, GFX_Rect* rect)

laUtils_WidgetIsOccluded Function

File

libaria_utils.h

C

```
laBool laUtils_WidgetIsOccluded(laWidget* wgt, const GFX_Rect* rect);
```

Description

This is function laUtils_WidgetIsOccluded.

laUtils_WidgetLayerRect Function

Returns the bounding rectangle of a widget in layer space

File

libaria_utils.h

C

```
GFX_Rect laUtils_WidgetLayerRect(laWidget* widget);
```

Returns

GFX_Rect - the bounding rectangle

Parameters

Parameters	Description
laWidget* widget	the subject widget

Function

GFX_Rect laUtils_WidgetLayerRect(laWidget* widget)

laWindowWidget_GetIconRect Function

File

libaria_widget_window.h

C

```
void laWindowWidget_GetIconRect(laWindowWidget* win, GFX_Rect* imgRect, GFX_Rect* imgSrcRect);
```

Description

This is function laWindowWidget_GetIconRect.

laWindowWidget_GetTextRect Function

File

libaria_widget_window.h

C

```
void laWindowWidget_GetTextRect(laWindowWidget* win, GFX_Rect* textRect, GFX_Rect* drawRect);
```

Description

This is function laWindowWidget_GetTextRect.

laWindowWidget_GetTitleBarRect Function

File

libaria_widget_window.h

C

```
void laWindowWidget_GetTitleBarRect(laWindowWidget* win, GFX_Rect* barRect);
```

Description

internal use only

laContext_IsDrawing Function

Indicates if any layers of the active screen are currently drawing a frame.

File

libaria_context.h

C

```
LIB_EXPORT laBool laContext_IsDrawing();
```

Returns

laResult

Description

Indicates if any layers are currently drawing a frame. Because frame updates can happen long after making changes to the UI state it is best to only make updates to the state of a layer tree only when the layer is not drawing.

Requires an active context and active screen.

Function

laBool laContext_IsDrawing()

laContext_IsLayerDrawing Function

Indicates if the layer at the given index of the active screen is currently drawing.

File

libaria_context.h

C

```
LIB_EXPORT laBool laContext_IsLayerDrawing(uint32_t idx);
```

Returns

laResult

Description

Indicates if the layer at the given index is currently drawing a frame. Because frame updates can happen long after making changes to the UI state it is best to only make updates to the state of a layer tree only when the layer is not drawing.

Requires an active context and active screen.

Parameters

Parameters	Description
uint32_t idx	the index of the layer to query

Function

laBool laContext_IsLayerDrawing(uint32_t idx)

laLayer_IsDrawing Function

Queries a layer to find out if it is currently drawing a frame.

File

libaria_layer.h

C

```
LIB_EXPORT laBool laLayer_IsDrawing(laLayer* layer);
```

Returns

laBool - the result of the operation

Parameters

Parameters	Description
laLayer* layer	the layer

Function

laBool laLayer_IsDrawing(laLayer* layer)

laLayer_GetInputRect Function

Gets the layer's input rectangle.

File

libaria_layer.h

C

```
LIB_EXPORT GFX_Rect laLayer_GetInputRect(const laLayer* layer);
```

Returns

GFX_Rect - the input rectangle

Description

Gets the layer's input rectangle.

Parameters

Parameters	Description
const laLayer* layer	the layer

Function

GFX_Rect laLayer_GetInputRect(const laLayer* layer)

laLayer_GetInputRectLocked Function

Gets the layer's input rect locked flag

File

libaria_layer.h

C

```
LIB_EXPORT laBool laLayer_GetInputRectLocked(const laLayer* layer);
```

Returns

laBool - the state of the layer's input rect locked flag

Description

This flag controls whether the layer input rectangle is locked to match the size of the layer's actual dimensions.

Parameters

Parameters	Description
const laLayer* layer	the layer

Function

laBool laLayer_GetInputRectLocked(const laLayer* layer)

laLayer_SetInputRect Function

Sets the layer's input rect dimensions.

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_SetInputRect(laLayer* layer, int32_t x, int32_t y, int32_t width, int32_t
height);
```

Returns

laResult - the result of the operation

Description

Sets the layer's input rect dimensions. This rectangle controls the input area of the layer. Some use cases may require a layer to accept input even if the input is outside of the physical dimensions of the layer. One example is a touch glass that is larger than the size of a display. Widgets may need to be placed in this invisible external area and still be capable of receiving input events.

Parameters

Parameters	Description
const laLayer* layer	the layer
int32_t x	the x position of the rectangle
int32_t y	the y position of the rectangle
int32_t width	the width of the rectangle
int32_t height	the height of the rectangle

Function

laResult laLayer_SetInputRect(laLayer* layer, laBool enable)

laLayer_SetInputRectLocked Function

Sets the layer's input rect locked flag.

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_SetInputRectLocked(laLayer* layer, laBool locked);
```

Returns

laResult - the result of the operation

Description

Sets the layer's input rect locked flag. This flag controls whether the input rectangle is locked to match the size of the layer's actual dimensions. When enabled, any change to the layer's size will be propagated to the input area as well. The default value is true.

Parameters

Parameters	Description
const laLayer* layer	the layer

Function

laResult laLayer_SetInputRectLocked(laLayer* layer, laBool enable)

laScreen_GetLayerSwapSync Function

Returns the layer swap sync setting for the specified screen

File

libaria_screen.h

C

```
LIB_EXPORT laBool laScreen_GetLayerSwapSync(laScreen* scr);
```

Returns

laBool - the sync setting

Description

Returns the layer swap sync setting for the specified screen

Parameters

Parameters	Description
laScreen* scr	the screen to reference

Function

laBool laScreen_GetLayerSwapSync(laScreen* scr)

laScreen_SetLayerSwapSync Function

Sets the layer swap sync setting for the specified screen

File

libaria_screen.h

C

```
LIB_EXPORT laResult laScreen_SetLayerSwapSync(laScreen* scr, laBool sync);
```

Returns

laResult - the result of the operation

Description

Layer synchronization allows for the configuration timing of the buffer swap chain. In the case where multiple layers are being modified at the same time, it is often desirable to have the updates appear on the display at the same time. Layer sync will gate all layer swapping until all dirty layers have finished drawing. All layers will then swap at same time.

Parameters

Parameters	Description
laScreen* scr	the screen to modify
laBool	the sync setting

Function

laResult laScreen_SetLayerSwapSync(laScreen* scr, laBool sync)

laWidget_DeleteAllDescendants Function

Deletes all of the descendants of the given widget.

File

libaria_widget.h

C

```
LIB_EXPORT void laWidget_DeleteAllDescendants(laWidget* wgt);
```

Returns

void

Description

All descendants of this widget are removed and deleted.

Function

void laWidget_DeleteAllDescendants(laWidget* wgt)

laImageWidget_SetCallBackEnd Function

File

libaria_widget_image.h

C

```
void laImageWidget_SetCallBackEnd(laImageWidget* image, laImageWidget_DrawEventCallback cb);
```

Description

This is function laImageWidget_SetCallBackEnd.

laImageWidget_SetCallBackStart Function

File

libaria_widget_image.h

C

```
void laImageWidget_SetCallBackStart(laImageWidget* image, laImageWidget_DrawEventCallback cb);
```

Description

This is function laImageWidget_SetCallBackStart.

laString_DrawSubStringClipped Function

Wrapper around GFX Utility string draw function for Aria user interface library. Draws the substring between the start and end offset, and draws only the section of the string within the clipping rectangle. Internal use only.

File

libaria_string.h

C

```
LIB_EXPORT void laString_DrawSubStringClipped(laString* str, uint32_t start, uint32_t end, int32_t clipX,
int32_t clipY, int32_t clipWidth, int32_t clipHeight, int32_t x, int32_t y, GFXU_ExternalAssetReader**
reader);
```

Returns

void

Parameters

Parameters	Description
laString* str	the string to draw
uint32_t start	the start position of the substring
uint32_t end	the end position of the substring
int32_t strX	clipped x position
int32_t strY	clipped y position
int32_t strWidth	clipped rectangle width
int32_t strHeight	clipped rectangle height
int32_t x	x position to render at
int32_t y	y position to render at

GFXU_ExternalAssetReader** reader	external reader state machine, if string font is located external

Function

void laString_DrawSubStringClipped(laString* str,
int32_t strX,
int32_t strY,
int32_t strWidth,
int32_t strHeight,
int32_t x,
int32_t y,
GFXU_ExternalAssetReader** reader)

laString_GetLineRect Function

Calculates the rectangle for a line in a string object. References the associated font for the height but must perform a summation for each character in the string by doing a font meta-data lookup. The line ends when a line feed or end of string is reached.

File

libaria_string.h

C

```
LIB_EXPORT void laString_GetLineRect(laString* str, uint32_t start, GFX_Rect* rect, uint32_t * end);
```

Returns

void

Parameters

Parameters	Description
laString* str	the string to reference
uint32_t start	the start offset of the line in the string
GFX_Rect* rect	the calculated string rectangle result
uint32_t * end	the calculated end of the line (including line feed or end of string)

Function

void laString_GetLineRect(laString* str, uint32_t offset, GFX_Rect* rect, uint32_t * endoffset)

laString_GetMultiLineRect Function

Calculates the rectangle for a given multi-line string object. References the associated font for the height but must perform a summation for each character in the string by doing a font meta-data lookup. The height the sum of the heights of the bounding rectangles for each line and the width is the widest among the bounding rectangles.

File

libaria_string.h

C

```
LIB_EXPORT void laString_GetMultiLineRect(laString* str, GFX_Rect* rect);
```

Returns

void

Parameters

Parameters	Description
laString* str	the string to reference
GFX_Rect* rect	the calculated string rectangle result

Function

void laString_GetMultiLineRect(laString* str, GFX_Rect* rect)

b) Data Types and Constants

laContext_t Structure

An instance of the Aria user interface library.

File

libaria_context.h

C

```
struct laContext_t {
  GFX_Display displayIndex;
  void* gfxContext;
  GFXU_MemoryIntf memIntf;
  laPreemptionLevel preemptLevel;
  laArray screenList;
  laScreen* activeScreen;
  uint32_t frameState;
  uint32_t currentLayer;
  laInputState input;
  GFXU_StringTableAsset* stringTable;
  uint32_t languageID;
  uint32_t widgetIDs;
  laScheme defaultScheme;
  GFX_ColorMode colorMode;
  laWidget* focus;
  laEditWidget* edit;
  laContext_ActiveScreenChangedCallback_FnPtr screenChangedCB;
  laContext_LanguageChangedCallback_FnPtr languageChangedCB;
};
```

Members

Members	Description
GFX_Display displayIndex;	the display the library is using
void* gfxContext;	the HAL context the library owns
GFXU_MemoryIntf memIntf;	the memory interface the library is using
laPreemptionLevel preemptLevel;	the preemption level the library is using
laArray screenList;	the list of the screens in the context
laScreen* activeScreen;	the currently active screen
uint32_t frameState;	the context frame state
uint32_t currentLayer;	the current drawing layer
laInputState input;	the input state of the instance
GFXU_StringTableAsset* stringTable;	the string table for the instance
uint32_t languageID;	the currently active language
uint32_t widgetIDs;	the next unique widget ID
laScheme defaultScheme;	an internal default scheme that widgets use by default if the user doesn't set one
GFX_ColorMode colorMode;	the color mode the library uses for all layers
laWidget* focus;	the widget that currently has focus
laEditWidget* edit;	the widget that is currently receiving edit events
laContext_ActiveScreenChangedCallback_FnPtr screenChangedCB;	screen changed callback
laContext_LanguageChangedCallback_FnPtr languageChangedCB;	language changed callback

Description

Structure: laContext

The context represents an discrete instance of Aria user interface library. The library is designed to be multi-instance and fully re-entrant. The entire state of the library is stored and referenced through the context pointer.

Remarks

None.

laList_t Structure

Linked list definition

File

libaria_list.h

C

```
struct laList_t {
  laListNode* head;
  laListNode* tail;
  size_t size;
};
```

Description

Structure: laList_t

Remarks

None.

laPreemptionLevel Enumeration

libaria pre-emption level values

File

libaria_common.h

C

```
enum laPreemptionLevel {
  LA_PREEMPTION_LEVEL_0,
  LA_PREEMPTION_LEVEL_1,
  LA_PREEMPTION_LEVEL_2
};
```

Members

Members	Description
LA_PREEMPTION_LEVEL_0	draw cycle always completes
LA_PREEMPTION_LEVEL_1	preempts after each widget fully draws
LA_PREEMPTION_LEVEL_2	preempts after each widget draw step completes

Description

Enumeration: laPreemptionLevel

libaria pre-emption level values

Remarks

None.

laRelativePosition Enumeration

libaria relative position values

File

libaria_common.h

C

```
enum laRelativePosition {
  LA_RELATIVE_POSITION_LEFTOF,
  LA_RELATIVE_POSITION_ABOVE,
  LA_RELATIVE_POSITION_RIGHTOF,
  LA_RELATIVE_POSITION_BELOW,
  LA_RELATIVE_POSITION_BEHIND
};
```

Description

Enumeration: laRelativePosition

libaria relative position values

Remarks

None.

GFXU_StringTableAsset Structure

Describes a string table asset. There is typically only ever one of these defined at any one time.

header - standard asset header languageCount - the number of languages in the string table stringCount - the number of strings in the string table stringIndexTable - the pointer to the string index table. the string index table is a table that contains all of the unique strings defined in the string table. fontTable - the font table contains an array of pointers to all defined font assets that the string table references fontIndexTable - the font index table is a table that maps strings to font indices which can then be used to get an actual font pointer from the font table encodingMode - indicates how strings are encoded in the stringIndexTable

File

gfxu_string.h

C

```
typedef struct GFXU_StringTableAsset_t {
  GFXU_AssetHeader header;
  uint32_t languageCount;
  uint32_t stringCount;
  uint8_t* stringIndexTable;
  GFXU_FontAsset** fontTable;
  uint8_t* fontIndexTable;
  GFXU_StringEncodingMode encodingMode;
} GFXU_StringTableAsset;
```

Description

Structure: GFXU_StringTableAsset_t

laBool Enumeration

libaria bool values

File

libaria_common.h

C

```
typedef enum laBool_t {
  LA_FALSE = 0,
  LA_TRUE
} laBool;
```

Description

Enumeration: laBool

libaria bool values

Remarks

None.

laContext Type

An instance of the Aria user interface library.

File

libaria_string.h

C

```
typedef struct laContext_t laContext;
```

Description

Structure: laContext

The context represents an discrete instance of Aria user interface library. The library is designed to be multi-instance and fully re-entrant. The entire state of the library is stored and referenced through the context pointer.

Remarks

None.

laContext_ActiveScreenChangedCallback_FnPtr Type

Callback pointer for the active screen change notification.

File

libaria_context.h

C

```
typedef void (* laContext_ActiveScreenChangedCallback_FnPtr)(int32_t, int32_t);
```

Description

Type: laContext_ActiveScreenChangedCallback_FnPtr

Callback pointer for the active screen change notification.

laContext_LanguageChangedCallback_FnPtr Type

Callback pointer for when the language change event occurs.

File

libaria_context.h

C

```
typedef void (* laContext_LanguageChangedCallback_FnPtr)(uint32_t);
```

Description

Type: laContext_LanguageChangedCallback_FnPtr

Callback pointer for when the language change event occurs.

laEditWidget Structure

Specifies the edit widget structure to manage all properties and events associated with edit widgets

File

libaria_editwidget.h

C

```
typedef struct laEditWidget_t {
  laWidget widget;
  laEditWidget_StartEdit_FnPtr startEdit;
  laEditWidget_EndEdit_FnPtr endEdit;
  laEditWidget_Clear_FnPtr clear;
  laEditWidget_Accept_FnPtr accept;
  laEditWidget_Set_FnPtr set;
  laEditWidget_Append_FnPtr append;
  laEditWidget_Backspace_FnPtr backspace;
} laEditWidget;
```

Description

Structure: laEditWidget_t

Edit widgets are a subset of normal widgets that are capable of receiving edit events from the UI kernel. Specialized widgets are capable of broadcasting edit events and the active edit event will react to them.

Remarks

None.

laEditWidget_Accept_FnPtr Type

File

libaria_editwidget.h

C

```
typedef void (* laEditWidget_Accept_FnPtr)(laEditWidget*);
```

Description

This is type laEditWidget_Accept_FnPtr.

laEditWidget_Append_FnPtr Type

File

libaria_editwidget.h

C

```
typedef void (* laEditWidget_Append_FnPtr)(laEditWidget*, laString);
```

Description

This is type laEditWidget_Append_FnPtr.

laEditWidget_Backspace_FnPtr Type

File

libaria_editwidget.h

C

```
typedef void (* laEditWidget_Backspace_FnPtr)(laEditWidget*);
```

Description

This is type laEditWidget_Backspace_FnPtr.

laEditWidget_Clear_FnPtr Type

File

libaria_editwidget.h

C

```
typedef void (* laEditWidget_Clear_FnPtr)(laEditWidget*);
```

Description

This is type laEditWidget_Clear_FnPtr.

laEditWidget_EndEdit_FnPtr Type

File

libaria_editwidget.h

C

```
typedef void (* laEditWidget_EndEdit_FnPtr)(laEditWidget*);
```

Description

This is type laEditWidget_EndEdit_FnPtr.

laEditWidget_Set_FnPtr Type

File

libaria_editwidget.h

C

```
typedef void (* laEditWidget_Set_FnPtr)(laEditWidget*, laString);
```

Description

This is type laEditWidget_Set_FnPtr.

laEditWidget_StartEdit_FnPtr Type

File

libaria_editwidget.h

C

```
typedef laResult (* laEditWidget_StartEdit_FnPtr)(laEditWidget*);
```

Description

This is type laEditWidget_StartEdit_FnPtr.

laHAlignment Enumeration

libaria horizontal alignment values

File

libaria_common.h

C

```
typedef enum {
  LA_HALIGN_LEFT,
  LA_HALIGN_CENTER,
  LA_HALIGN_RIGHT
} laHAlignment;
```

Description

Enumeration: laHAlignment

libaria horizontal alignment values

Remarks

None.

laList Type

Linked list definition

File

libaria_utils.h

C

```
typedef struct laList_t laList;
```

Description

Structure: laList_t

Remarks

None.

laListNode Structure

Linked list node definition

File

libaria_list.h

C

```
typedef struct laListNode_t {
  struct laListNode_t* next;
  void* val;
} laListNode;
```

Description

Structure: laListNode_t

Remarks

None.

laMargin Structure

libaria margin values

File

libaria_common.h

C

```
typedef struct laMargin_t {
  uint8_t left;
  uint8_t top;
  uint8_t right;
  uint8_t bottom;
} laMargin;
```

Description

Enumeration: laMargin

libaria margin values

Remarks

None.

laResult Enumeration

libaria results (success and failure codes).

File

libaria_common.h

C

```
typedef enum laResult_t {
  LA_FAILURE = -1,
  LA_SUCCESS = 0
} laResult;
```

Description

Enumeration: laResult

Various definitions for success and failure codes.

Remarks

None.

laScreen Structure

The structure to maintain the screen related variables and event handling

File

libaria_screen.h

C

```
typedef struct laScreen_t {
  uint32_t id;
  laString name;
  laBool persistent;
  laScreen_CreateCallback_FnPtr createCB;
  laBool created;
  laLayer* layers[LA_MAX_LAYERS];
  laScreenOrientation orientation;
  laBool mirrored;
  laBool layerSwapSync;
  laScreen_ShowHideCallback_FnPtr showCB;
  laScreen_ShowHideCallback_FnPtr hideCB;
} laScreen;
```

Members

Members	Description
uint32_t id;	the id of the screen
laString name;	the name of the screen
laBool persistent;	indicates that the screen should not free its widgets when it hides
laScreen_CreateCallback_FnPtr createCB;	the function that is called to create the contents of the screen
laBool created;	indicates if the screen currently exists
laLayer* layers[LA_MAX_LAYERS];	the layer array for the screen
laScreenOrientation orientation;	the orientation of the screen
laBool mirrored;	the mirror flag of the screen
laBool layerSwapSync;	the layerSwapSync flag of the screen
laScreen_ShowHideCallback_FnPtr showCB;	a callback that is called when the screen is shown
laScreen_ShowHideCallback_FnPtr hideCB;	a callback that is called when the screen is hidden

Description

Structure: laScreen_t

Maintains the layers associated with the screen. Marks the screen as persistent or not, which either destroys the screen when changed or preserves it for future reloading. Allocates and manages the event handling when screen change / show / hide events occur.

Remarks

None.

laString Structure

String definition

File

libaria_string.h

C

```
typedef struct laString_t {
  GFXU_CHAR* data;
  uint32_t capacity;
  uint32_t length;
  GFXU_FontAsset* font;
  int32_t table_index;
} laString;
```

Members

Members	Description
GFXU_CHAR* data;	local string data storage
uint32_t capacity;	actual memory capacity of the string
uint32_t length;	actual length of the string, typically this is capacity - 1, but can be less.
GFXU_FontAsset* font;	the font that contains the glyph raster data for this string
int32_t table_index;	if this is not LA_STRING_NULLIDX then this string is referencing an index in the string table. string table references are read-only but can be extracted to local modifiable versions

Description

Structure: laString_t

Remarks

None.

laVAlignment Enumeration

libaria vertical alignment values

File

libaria_common.h

C

```
typedef enum {
  LA_VALIGN_TOP,
  LA_VALIGN_MIDDLE,
  LA_VALIGN_BOTTOM
} laVAlignment;
```

Description

Enumeration: laVAlignment

libaria vertical alignment values

Remarks

None.

laButtonWidget_t Structure

Implementation of a button widget. A button is an interactive element that simulates a typical button with a pressed an released state.

File

libaria_widget_button.h

C

```
struct laButtonWidget_t {
  laWidget widget;
  laButtonState state;
  uint8_t toggleable;
  laString text;
  laHAlignment halign;
  laVAlignment valign;
  GFXU_ImageAsset* pressedImage;
  GFXU_ImageAsset* releasedImage;
  laRelativePosition imagePosition;
  uint32_t imageMargin;
  int32_t pressedOffset;
  laButtonWidget_PressedEvent pressedEvent;
  laButtonWidget_ReleasedEvent releasedEvent;
  GFXU_ExternalAssetReader* reader;
};
```

Members

Members	Description
laWidget widget;	base widget header
laButtonState state;	button state
uint8_t toggleable;	indicates if the button is toggleable
laString text;	the string that holds the button text
laHAlignment halign;	horizontal alignment of the button
laVAlignment valign;	vertical alignment of the button
GFXU_ImageAsset* pressedImage;	button pressed icon image
GFXU_ImageAsset* releasedImage;	button released icon image
laRelativePosition imagePosition;	icon position in relation to text
uint32_t imageMargin;	distance between text and icon
int32_t pressedOffset;	pressed text offset distance
laButtonWidget_PressedEvent pressedEvent;	pressed event callback
laButtonWidget_ReleasedEvent releasedEvent;	released event callback
GFXU_ExternalAssetReader* reader;	external asset reader state

Description

Structure: laButtonWidget_t

Remarks

None.

laLayer_t Structure

Primary definition of a layer. Builds on base functions of a standard widget. Should never have a direct parent.

File

libaria_layer.h

C

```
struct laLayer_t {
  laWidget widget;
  laScreen* screen;
  laBool deleting;
  uint32_t bufferCount;
  laLayerBuffer buffers[GFX_MAX_BUFFER_COUNT];
  laBool alphaEnable;
  laBool maskEnable;
  GFX_Color maskColor;
  laBool vsync;
  laRectArray prevDamageRects;
  laRectArray currentDamageRects;
  laRectArray pendingDamageRects;
  laRectArray scratchRectList;
  laRectArray frameRectList;
  uint32_t frameRectIdx;
  GFX_Rect clippedDrawingRect;
  laBool drawingPrev;
  laLayerFrameState frameState;
  uint32_t layerDrawCount;
  uint32_t frameDrawCount;
  GFX_Rect inputRect;
  laBool inputRectLocked;
  laBool allowInputPassThrough;
  uint32_t deltaTime;
};
```

Members

Members	Description
laWidget widget;	base widget
laScreen* screen;	owning screen pointer

laBool deleting;	flag indicating that no changes should be made to the layer because it is in the process of being deleted
uint32_t bufferCount;	number of buffers in the layer
laLayerBuffer buffers[GFX_MAX_BUFFER_COUNT];	buffer array
laBool alphaEnable;	layer-based alpha blending enable flag
laBool maskEnable;	layer-based color masking enable flag
GFX_Color maskColor;	layer-based masking color value
laBool vsync;	layer vsync flag
laRectArray prevDamageRects;	previous damaged rectangle list
laRectArray currentDamageRects;	queued damaged rectangle list
laRectArray pendingDamageRects;	pending damaged rectangle list these are rectangles added during a frame in progress
laRectArray scratchRectList;	used for rectangle culling phase
laRectArray frameRectList;	this of rects to draw for a frame GFX_Rect currentDrawingRect; // the current damage rectangle
GFX_Rect clippedDrawingRect;	the current damage rectangle clipped to the currently rendering widget
laBool drawingPrev;	indicates if the layer is currently drawing from its previous rectangle array
laLayerFrameState frameState;	the current frame render state of the layer
uint32_t layerDrawCount;	the number of times this layer has drawn
uint32_t frameDrawCount;	the number of widgets that have rendered on this layer this frame
GFX_Rect inputRect;	layer input area
laBool inputRectLocked;	input area matches layer dimensions
laBool allowInputPassThrough;	indicates that input events should be propagated through the layer node to left siblings
uint32_t deltaTime;	stores delta time for updates that happen during rendering

Description

Structure: laLayer_t

Remarks

None.

laRadioButtonGroup_t Structure

Defines the structure used for the Radio Button group.

File

libaria_radiobutton_group.h

C

```
struct laRadioButtonGroup_t {
  laArray buttonList;
  laBool initialized;
  laRadioButtonWidget* selected;
};
```

Description

Structure laRadioButtonGroup_t

Defines the parameters required for a Radio Button group. Marks the current selected Radio button within the group

Remarks

None.

GFX_Point Type

A two dimensional Cartesian point.

File

libaria_utils.h

C

```
typedef struct GFX_Point_t GFX_Point;
```

Description

Structure: GFX_Point_t

GFX_Rect Type

A rectangle definition.

File

libaria_utils.h

C

```
typedef struct GFX_Rect_t GFX_Rect;
```

Description

Structure: GFX_Rect_t

laBorderType Enumeration

Specifies the different border types used for the widgets in the library

File

libaria_widget.h

C

```
typedef enum laBorderType_t {
  LA_WIDGET_BORDER_NONE,
  LA_WIDGET_BORDER_LINE,
  LA_WIDGET_BORDER_BEVEL,
  LA_WIDGET_BORDER_LAST = LA_WIDGET_BORDER_BEVEL
} laBorderType;
```

Description

Enumeration: laBorderType_t

Specifies the different border types used for the widgets in the library

Remarks

None.

laButtonState Enumeration

Controls the button pressed state

File

libaria_widget_button.h

C

```
typedef enum laButtonState_t {
  LA_BUTTON_STATE_UP,
  LA_BUTTON_STATE_DOWN,
  LA_BUTTON_STATE_TOGGLED
} laButtonState;
```

Description

Enumeration: laButtonState_t

laButtonWidget Type

Implementation of a button widget. A button is an interactive element that simulates a typical button with a pressed an released state.

File

libaria_widget_keypad.h

C

```
typedef struct laButtonWidget_t laButtonWidget;
```

Description

Structure: laButtonWidget_t

Remarks

None.

laButtonWidget_PressedEvent Type

File

libaria_widget_button.h

C

```
typedef void (* laButtonWidget_PressedEvent)(laButtonWidget*);
```

Description

This is type laButtonWidget_PressedEvent.

laButtonWidget_ReleasedEvent Type

File

libaria_widget_button.h

C

```
typedef void (* laButtonWidget_ReleasedEvent)(laButtonWidget*);
```

Description

This is type laButtonWidget_ReleasedEvent.

laCheckBoxWidget Structure

Implementation of a checkbox widget.

File

libaria_widget_checkbox.h

C

```
typedef struct laCheckBoxWidget_t {
  laWidget widget;
  laBool checked;
  laString text;
  laHAlignment halign;
  laVAlignment valign;
  GFXU_ImageAsset* checkedImage;
  GFXU_ImageAsset* uncheckedImage;
  laRelativePosition imagePosition;
  uint32_t imageMargin;
  GFXU_ExternalAssetReader* reader;
  laCheckBoxWidget_CheckedEvent checkedEvent;
  laCheckBoxWidget_CheckedEvent uncheckedEvent;
} laCheckBoxWidget;
```

Members

Members	Description
laWidget widget;	base class properties
laBool checked;	the state of the box
laString text;	the text of the box

laHAlignment halign;	the horizontal alignment of the box contents
laVAlignment valign;	the vertical alignment of the box contents
GFXU_ImageAsset* checkedImage;	pointer to a custom image to use for the checked image
GFXU_ImageAsset* uncheckedImage;	pointer to a custom image to use for the unchecked image
laRelativePosition imagePosition;	postition of the image relative to the text of the box
uint32_t imageMargin;	the distance between the image and the text
GFXU_ExternalAssetReader* reader;	an external asset reader pointer
laCheckBoxWidget_CheckedEvent checkedEvent;	callback for checked events
laCheckBoxWidget_CheckedEvent uncheckedEvent;	callback for unchecked events

Description

Structure: laCheckBoxWidget_t

A check box widget contains an interactive two-state box indicating on or off. The check box may also contain descriptive text. Custom images for the check box may be used in place of the default box graphic.

Remarks

None.

laCheckBoxWidget_CheckedEvent Type

File

libaria_widget_checkbox.h

C

```
typedef void (* laCheckBoxWidget_CheckedEvent)(laCheckBoxWidget*);
```

Description

This is type laCheckBoxWidget_CheckedEvent.

laCheckBoxWidget_UncheckedEvent Type

File

libaria_widget_checkbox.h

C

```
typedef void (* laCheckBoxWidget_UncheckedEvent)(laCheckBoxWidget*);
```

Description

This is type laCheckBoxWidget_UncheckedEvent.

laCircleWidget Structure

Implementation of a circle widget.

File

libaria_widget_circle.h

C

```
typedef struct laCircleWidget_t {
  laWidget widget;
  int32_t x;
  int32_t y;
  int32_t radius;
} laCircleWidget;
```

Members

Members	Description
laWidget widget;	base widget header

int32_t x;	the origin x cooridnate
int32_t y;	the origin y coordinate
int32_t radius;	the radius of the circle

Description

Structure: laCircleWidget_t

A circle widget draws a circle of the specified origin and radius inside the widget bounds. All coordinates are expressed in local widget space.

The color of the circle is determined by the widget scheme's 'foreground' color.

Remarks

None.

laDrawSurfaceWidget Structure

Implementation of a Drawsurface widget.

File

libaria_widget_drawsurface.h

C

```
typedef struct laDrawSurfaceWidget_t {
  laWidget widget;
  laDrawSurfaceWidget_DrawCallback cb;
} laDrawSurfaceWidget;
```

Members

Members	Description
laWidget widget;	the widget base class
laDrawSurfaceWidget_DrawCallback cb;	the draw callback

Description

Structure: laDrawSurfaceWidget_t

A draw surface widget is a special widget that allows an application to perform custom HAL draw calls during Aria's paint loop. To use, create and add a draw surface widget to the desired place in the widget tree. Then register for the callback through the API 'laDrawSurfaceWidget_SetDrawCallback'. This callback occurs during the paint loop. The application should then be free to adjust the HAL draw state and issue draw calls as desired. The HAL layer, buffer, or context state must not be adjusted in any way.

It is also important to not stall for too long during the draw callback.

Remarks

None.

laDrawSurfaceWidget_DrawCallback Type

File

libaria_widget_drawsurface.h

C

```
typedef laBool (* laDrawSurfaceWidget_DrawCallback)(laDrawSurfaceWidget* sfc, GFX_Rect* bounds);
```

Description

This is type laDrawSurfaceWidget_DrawCallback.

laEvent Structure

Basic UI event definition

File

libaria_event.h

C

```
typedef struct laEvent_t {
```

```
  laEventID id;
} laEvent;
```

Description

Structure: laEvent_t

laEvent_FilterEvent Type

Function pointer to define an event filter. Event filters allow a receiver to discard undesirable events

File

libaria_event.h

C

```
typedef laBool (* laEvent_FilterEvent)(laEvent*);
```

Description

Function Pointer: laEvent_FilterEvent

laEventID Enumeration

Defines internal event type IDs

File

libaria_event.h

C

```
typedef enum laEventID_t {
  LA_EVENT_NONE,
  LA_EVENT_SCREEN_CHANGE,
  LA_EVENT_TOUCH_DOWN,
  LA_EVENT_TOUCH_UP,
  LA_EVENT_TOUCH_MOVED
} laEventID;
```

Members

Members	Description
LA_EVENT_NONE	internal events

Description

Enumeration: laEventID

laEventState Structure

Structure to manage the event lists, state and call back pointers

File

libaria_event.h

C

```
typedef struct laEventState_t {
  OSAL_SEM_HANDLE_TYPE eventCountSem;
  OSAL_MUTEX_HANDLE_TYPE eventLock;
  laList events;
  laEvent_FilterEvent filter;
} laEventState;
```

Description

Structure: laEventState_t

Remarks

None.

laGestureID Enumeration

Placeholder for eventual gesture support.

File

libaria_input.h

C

```
typedef enum laGestureID_t {
  LA_GESTURE_NONE = 0
} laGestureID;
```

Description

Enumeration: laGestureID

Remarks

None.

laGradientWidget Structure

Gradient widget struct definition.

File

libaria_widget_gradient.h

C

```
typedef struct laGradientWidget_t {
  laWidget widget;
  laGradientWidgetDirection dir;
} laGradientWidget;
```

Members

Members	Description
laWidget widget;	widget base class
laGradientWidgetDirection dir;	gradient direction

Description

Enumeration: laGradientWidget_t

Remarks

None.

laGradientWidgetDirection Enumeration

Implementation of a gradient widget.

File

libaria_widget_gradient.h

C

```
typedef enum laGradientWidgetDirection_t {
  LA_GRADIENT_DIRECTION_RIGHT,
  LA_GRADIENT_DIRECTION_DOWN,
  LA_GRADIENT_DIRECTION_LEFT,
  LA_GRADIENT_DIRECTION_UP
} laGradientWidgetDirection;
```

Description

Enumeration: laGradientWidgetDirection_t

A gradient widget is similar to a panel widget with the exception that it can draw a gradient color for its background. This operation can be more costly than drawing a solid color and should be used sparingly.

Gradient uses 'foreground' and 'foreground inactive' as its interpolated background draw colors.

Remarks

None.

laGroupBoxWidget Structure

Group box struct definition.

File

libaria_widget_groupbox.h

C

```
typedef struct laGroupBoxWidget_t {
  laWidget widget;
  laString text;
  laHAlignment halign;
  GFXU_ExternalAssetReader* reader;
} laGroupBoxWidget;
```

Members

Members	Description
laWidget widget;	widget base class
laString text;	group box title text
laHAlignment halign;	group box text alignment
GFXU_ExternalAssetReader* reader;	asset reader

Description

Enumeration: laGroupBoxWidget_t

A group box is a widget that is similar to a basic panel but provides a line border and title text. Used for grouping and describing widgets of similar function.

Remarks

None.

laImageSequenceEntry Structure

Image sequence entry definition

File

libaria_widget_imagesequence.h

C

```
typedef struct laImageSequenceEntry_t {
  GFXU_ImageAsset* image;
  uint32_t delay;
  laHAlignment halign;
  laVAlignment valign;
} laImageSequenceEntry;
```

Members

Members	Description
GFXU_ImageAsset* image;	image asset pointer
uint32_t delay;	how many time units to display this entry
laHAlignment halign;	the horizontal alignment for this entry
laVAlignment valign;	the vertical alignment for this entry

Description

Enumeration: laImageSequenceEntry_t

Defines a single entry for the image sequence widget

Remarks

None.

laImageSequenceImageChangedEvent_FnPtr Type

File

libaria_widget_imagesequence.h

C

```
typedef void (* laImageSequenceImageChangedEvent_FnPtr)(laImageSequenceWidget*);
```

Description

This is type laImageSequenceImageChangedEvent_FnPtr.

laImageSequenceWidget Structure

Image sequence widget struct definition

File

libaria_widget_imagesequence.h

C

```
typedef struct laImageSequenceWidget_t {
  laWidget widget;
  uint32_t count;
  laImageSequenceEntry* images;
  int32_t activeIdx;
  laBool playing;
  uint32_t time;
  laBool repeat;
  laImageSequenceImageChangedEvent_FnPtr cb;
  GFXU_ExternalAssetReader* reader;
} laImageSequenceWidget;
```

Members

Members	Description
laWidget widget;	widget base class
uint32_t count;	number of image entries for this widget
laImageSequenceEntry* images;	image entry array
int32_t activeIdx;	currently displayed entry
laBool playing;	indicates that the widget is automatically cycling
uint32_t time;	current cycle time
laBool repeat;	indicates that the sequence should repeat when it reaches the end of the sequence
laImageSequenceImageChangedEvent_FnPtr cb;	callback when the image changes
GFXU_ExternalAssetReader* reader;	asset reader pointer

Description

Enumeration: laImageSequenceWidget_t

An image sequence widget is similar to an image widget with the additional capability of showing a sequence of images and automating the transition between them.

This widget is dependent on the time value provided to laUpdate. If laUpdate is not provided with time information this widget will not be able to automatically cycle.

Remarks

None.

laImageWidget Structure

Image widget struct definition

File

libaria_widget_image.h

C

```
typedef struct laImageWidget_t {
  laWidget widget;
  laHAlignment halign;
  laVAlignment valign;
  GFXU_ImageAsset* image;
  GFXU_ExternalAssetReader* reader;
  laImageWidget_DrawEventCallback ImageDrawStart;
  laImageWidget_DrawEventCallback ImageDrawEnd;
} laImageWidget;
```

Members

Members	Description
laWidget widget;	widget base class
laHAlignment halign;	image horizontal alignment
laVAlignment valign;	image vertical alignment
GFXU_ImageAsset* image;	pointer to image asset
GFXU_ExternalAssetReader* reader;	asset reader

Description

Enumeration: laImageWidget_t

An image widget displays an image asset.

Remarks

None.

laInput_TouchDownEvent Structure

Register and handle the touch press detect event

File

libaria_input.h

C

```
typedef struct laInput_TouchDownEvent_t {
  int32_t touchID;
  int32_t x;
  int32_t y;
} laInput_TouchDownEvent;
```

Description

Structure: laInput_TouchDownEvent_t

Register and handle the touch press detect event

Remarks

None.

laInput_TouchMovedEvent Structure

Register and handle the touch coordinates changed event

File

libaria_input.h

C

```
typedef struct laInput_TouchMovedEvent_t {
  int32_t touchID;
  int32_t prevX;
  int32_t prevY;
  int32_t x;
  int32_t y;
} laInput_TouchMovedEvent;
```

Description

Structure: laInput_TouchMovedEvent_t

Register and handle the touch coordinates changed event

Remarks

None.

laInput_TouchUpEvent Structure

Register and handle the touch release detect event

File

libaria_input.h

C

```
typedef struct laInput_TouchUpEvent_t {
  int32_t touchID;
  int32_t x;
  int32_t y;
} laInput_TouchUpEvent;
```

Description

Structure: laInput_TouchUpEvent_t

Register and handle the touch release detect event

Remarks

None.

laInputState Structure

Maintain a history of touch states; currently libaria keeps track of the last touch state only.

File

libaria_input.h

C

```
typedef struct laInputState_t {
  laBool enabled;
  laTouchState touch[LA_MAX_TOUCH_STATES];
} laInputState;
```

Description

Structure: laInputState_t

Maintain a history of touch states; currently libaria keeps track of the last touch state only.

Remarks

None.

laKey Enumeration

All values possible for key entry from the libaria keyboard widget

File

libaria_input.h

C

```
typedef enum laKey_t {
  KEY_NULL = 0,
  KEY_ESCAPE,
  KEY_F1,
  KEY_F2,
  KEY_F3,
  KEY_F4,
```

```
    KEY_F5,
    KEY_F6,
    KEY_F7,
    KEY_F8,
    KEY_F9,
    KEY_F10,
    KEY_F11,
    KEY_F12,
    KEY_PRINTSCREEN,
    KEY_SCROLLLOCK,
    KEY_PAUSE,
    KEY_1,
    KEY_2,
    KEY_3,
    KEY_4,
    KEY_5,
    KEY_6,
    KEY_7,
    KEY_8,
    KEY_9,
    KEY_0,
    KEY_BACKQUOTE,
    KEY_TAB,
    KEY_CAPSLOCK,
    KEY_BRACKET_LEFT,
    KEY_BRACKET_RIGHT,
    KEY_SLASH,
    KEY_SEMICOLON,
    KEY_QUOTE,
    KEY_BACKSLASH,
    KEY_EQUALS,
    KEY_BACKSPACE,
    KEY_MINUS,
    KEY_COMMA,
    KEY_ENTER,
    KEY_PERIOD,
    KEY_A,
    KEY_B,
    KEY_C,
    KEY_D,
    KEY_E,
    KEY_F,
    KEY_G,
    KEY_H,
    KEY_I,
    KEY_J,
    KEY_K,
    KEY_L,
    KEY_M,
    KEY_N,
    KEY_O,
    KEY_P,
    KEY_Q,
    KEY_R,
    KEY_S,
    KEY_T,
    KEY_U,
    KEY_V,
    KEY_W,
    KEY_X,
    KEY_Y,
    KEY_Z,
    KEY_SPACE,
    KEY_LCTRL,
    KEY_RCTRL,
    KEY_LSHIFT,
    KEY_RSHIFT,
    KEY_LALT,
    KEY_RALT,
    KEY_LMETA,
    KEY_RMETA,
    KEY_INSERT,
    KEY_HOME,
    KEY_PAGEUP,
    KEY_END,
```

```
  KEY_PAGEDOWN,
  KEY_RIGHT,
  KEY_LEFT,
  KEY_DOWN,
  KEY_UP,
  KEY_NUMLOCK,
  KEY_KP_DIVIDE,
  KEY_KP_MULTIPLY,
  KEY_KP_MINUS,
  KEY_KP_PLUS,
  KEY_KP_ENTER,
  KEY_KP_1,
  KEY_KP_2,
  KEY_KP_3,
  KEY_KP_4,
  KEY_KP_5,
  KEY_KP_6,
  KEY_KP_7,
  KEY_KP_8,
  KEY_KP_9,
  KEY_KP_0,
  KEY_KP_PERIOD,
  KEY_LAST = KEY_KP_PERIOD
} laKey;
```

Description

Enumeration: laKey

All values possible for key entry from the libaria keyboard widget

Remarks

None.

laKeyPadCell Structure

Defines a key pad cell struct

File

libaria_widget_keypad.h

C

```
typedef struct laKeyPadCell_t {
  laBool enabled;
  laButtonWidget* button;
  laKeyPadCellAction action;
  laString value;
} laKeyPadCell;
```

Members

Members	Description
laBool enabled;	indicates if the cell should be drawn
laButtonWidget* button;	the button that handles the cell input events and rendering
laKeyPadCellAction action;	the action that occurs when the cell is activated
laString value;	the value that is passed to the edit event system

Description

Structure: laKeyPadCell_t

A key pad is made up of an array of key pad cells. Each cell is individually an laButtonWidget, an action, a value, and a few other options.

Remarks

None.

laKeyPadCellAction Enumeration

Defines an assigned action to a key pad cell

File

libaria_widget_keypad.h

C

```
typedef enum laKeyPadCellAction_t {
  LA_KEYPAD_CELL_ACTION_NONE,
  LA_KEYPAD_CELL_ACTION_APPEND,
  LA_KEYPAD_CELL_ACTION_SET,
  LA_KEYPAD_CELL_ACTION_BACKSPACE,
  LA_KEYPAD_CELL_ACTION_CLEAR,
  LA_KEYPAD_CELL_ACTION_ACCEPT
} laKeyPadCellAction;
```

Description

Structure: laKeyPadCellAction_t

Remarks

None.

laKeyPadWidget Structure

Defines a key pad widget struct

File

libaria_widget_keypad.h

C

```
typedef struct laKeyPadWidget_t {
  laWidget widget;
  uint32_t rows;
  uint32_t cols;
  laKeyPadActionTrigger trigger;
  laKeyPadCell* cells;
  laKeyPadWidget_KeyClickEvent clickEvt;
  GFXU_ExternalAssetReader* reader;
} laKeyPadWidget;
```

Members

Members	Description
laWidget widget;	widget base class
uint32_t rows;	number of button rows
uint32_t cols;	number of button columns
laKeyPadActionTrigger trigger;	trigger for action and events
laKeyPadCell* cells;	key cell array
laKeyPadWidget_KeyClickEvent clickEvt;	key click callback event
GFXU_ExternalAssetReader* reader;	asset reader

Description

Structure: laKeyPadCell_t

A key pad is a widget that is comprised of an array of laButtonWidgets. This widget serves to issue edit events based on application or input interaction. Receptor edit widgets can then receive these edit events and react accordingly.

Remarks

None.

laKeyPadWidget_KeyClickEvent Type

File

libaria_widget_keypad.h

C

```
typedef void (* laKeyPadWidget_KeyClickEvent)(laKeyPadWidget*, laButtonWidget*, uint32_t, uint32_t);
```

Description

This is type laKeyPadWidget_KeyClickEvent.

laLabelWidget Structure

Implementation of a label widget struct

File

libaria_widget_label.h

C

```
typedef struct laLabelWidget_t {
  laWidget widget;
  laString text;
  laHAlignment halign;
  laVAlignment valign;
  GFXU_ExternalAssetReader* reader;
} laLabelWidget;
```

Members

Members	Description
laWidget widget;	widget base class
laString text;	string to draw
laHAlignment halign;	horizontal alignment of string
laVAlignment valign;	vertical alignment of string
GFXU_ExternalAssetReader* reader;	asset reader

Description

Structure: laLabelWidget_t

A label widget is a simple widget that draws a string of text.

Remarks

None.

laLayer Type

Primary definition of a layer. Builds on base functions of a standard widget. Should never have a direct parent.

File

libaria_utils.h

C

```
typedef struct laLayer_t laLayer;
```

Description

Structure: laLayer_t

Remarks

None.

laLayerBuffer Structure

Structure to maintain the buffer type and track the buffer location for each layer

File

libaria_layer.h

C

```
typedef struct laLayerBuffer_t {
  laLayerBufferType type;
  void* address;
} laLayerBuffer;
```

Description

Structure: laLayerBuffer_t

Structure to maintain the buffer type and track the buffer location for each layer

Remarks

None.

laLayerBufferType Enumeration

Defines the type of a layer. If the layer has an explicit address then Aria tries to set that through the HAL when the layer is being set up.

File

libaria_layer.h

C

```
typedef enum laLayerBufferType_t {
  LA_BUFFER_TYPE_AUTO,
  LA_BUFFER_TYPE_ADDRESS
} laLayerBufferType;
```

Description

Enumeration: laLayerBufferType_t

Remarks

None.

laLineWidget Structure

Defines the implementation of a line widget struct

File

libaria_widget_line.h

C

```
typedef struct laLineWidget_t {
  laWidget widget;
  int32_t x1;
  int32_t y1;
  int32_t x2;
  int32_t y2;
} laLineWidget;
```

Members

Members	Description
laWidget widget;	widget base class
int32_t x1;	point 1 x
int32_t y1;	point 1 y
int32_t x2;	point 2 x
int32_t y2;	point 2 y

Description

Structure: laLineWidget_t

A line widget draws a simple line shape within the confines of its bounding rectangle. All coordinates are expressed in local widget space.

The color of the line is determined by the widget scheme's 'foreground' color.

Remarks

None.

laListItem Structure

Defines a list item struct

File

libaria_widget_list.h

C

```
typedef struct laListItem_t {
  laString string;
  GFXU_ImageAsset* icon;
  laBool selected;
  GFX_Rect rowRect;
} laListItem;
```

Members

Members	Description
laString string;	list item string
GFXU_ImageAsset* icon;	list item icon
laBool selected;	list item selected flag
GFX_Rect rowRect;	list item row rectangle

Description

Structure: laListItem_t

Remarks

None.

laListWheelItem Structure

Implementation of a list wheel widget item struct

File

libaria_widget_listwheel.h

C

```
typedef struct laListWheelItem_t {
  laString string;
  GFXU_ImageAsset* icon;
} laListWheelItem;
```

Description

Structure: laListWheelItem_t

A list wheel item contains either a text string, an icon, or both

Remarks

None.

laListWheelWidget Structure

Implementation of a list wheel widget struct

File

libaria_widget_listwheel.h

C

```
typedef struct laListWheelWidget_t {
  laWidget widget;
  laArray items;
  int32_t selectedItem;
  int32_t visibleItems;
  int32_t topItem;
  laHAlignment halign;
  laRelativePosition iconPos;
  uint32_t iconMargin;
  laBool showIndicators;
  uint32_t indicatorArea;
  uint32_t shaded;
```

```
  int32_t cycleDistance;
  int32_t cycleDelta;
  int32_t firstTouchY;
  int32_t touchY;
  int32_t lastTouchY;
  laBool stillTouching;
  int32_t minFlickDelta;
  int32_t momentum;
  int32_t maxMomentum;
  int32_t momentumFalloff;
  int32_t rotation;
  int32_t rotationCounter;
  int32_t rotationTick;
  laBool snapPending;
  laListWheelIndicatorFill indicatorFill;
  laListWheelZoomEffects zoomEffects;
  laBool autoHideWheel;
  laBool hideWheel;
  struct {
    int32_t y;
    int32_t per;
    uint32_t nextItem;
  } paintState;
  laListWheelWidget_SelectedItemChangedEvent cb;
  laBorderType borderTypeCache;
  laBackgroundType backgroundTypeCache;
  GFXU_ExternalAssetReader* reader;
} laListWheelWidget;
```

Members

Members	Description
laWidget widget;	widget base class
laArray items;	list of items for the wheel
int32_t selectedItem;	currently selected item
int32_t visibleItems;	number of visible items in the wheel must be odd and >= 3
int32_t topItem;	the current top item
laHAlignment halign;	the horizontal alignment of the items
laRelativePosition iconPos;	the icon position of the items
uint32_t iconMargin;	the icon margin of the items
laBool showIndicators;	controls the visibility of the horizontal indicator bars in the center of the widget
uint32_t indicatorArea;	controls the distance between the indicator bars
uint32_t shaded;	determins if the background of the widget uses gradient shading to show depth
int32_t cycleDistance;	determins the amount of drag distance needed to cycle between items
int32_t cycleDelta;	tracks the current amount of drag distance
int32_t firstTouchY;	these track drag movement over time
int32_t minFlickDelta;	amount of distance that must be dragged in a single frame to trigger momentum mode
int32_t momentum;	current momentum value
int32_t maxMomentum;	maximum momentum value
int32_t momentumFalloff;	momentum falloff rate
int32_t rotation;	determines actual rotation of the wheel
int32_t rotationCounter;	time-based limiter for rotation calculations
int32_t rotationTick;	rotation time accumulator
laListWheelIndicatorFill indicatorFill;	the indicator's fill type
laListWheelZoomEffects zoomEffects;	zoomEffects
laBool autoHideWheel;	auto hides the wheel
laBool hideWheel;	flag to hide/show the wheel
laListWheelWidget_SelectedItemChangedEvent cb;	item changed callback
laBorderType borderTypeCache;	Copy of border type, used to restore borders on auto-hide
laBackgroundType backgroundTypeCache;	Copy of background type, used to restore borders on auto-hide
GFXU_ExternalAssetReader* reader;	asset reader

Description

Structure: laListWheelWidget_t

A list wheel widget is a widget that is similar to a normal list widget but can be dragged up or down to cycle through a single active value. This widget is also capable of momentum and motion over time.

Remarks

None.

laListWheelWidget_SelectedItemChangedEvent Type

File

libaria_widget_listwheel.h

C

```
typedef void (* laListWheelWidget_SelectedItemChangedEvent)(laListWheelWidget*, uint32_t idx);
```

Description

This is type laListWheelWidget_SelectedItemChangedEvent.

laListWidget Structure

Defines the implementation of a list widget

File

libaria_widget_list.h

C

```
typedef struct laListWidget_t {
  laWidget widget;
  laListWidget_SelectionMode mode;
  laBool allowEmpty;
  laArray items;
  laHAlignment halign;
  laRelativePosition iconPos;
  uint32_t iconMargin;
  uint32_t itemDown;
  laScrollBarWidget* scrollbar;
  struct {
    laListItem* item;
    GFX_Rect itemRect;
    int32_t y;
    uint32_t nextItem;
  } paintState;
  laListWidget_ItemSelectedChangedEvent cb;
  GFXU_ExternalAssetReader* reader;
} laListWidget;
```

Members

Members	Description
laWidget widget;	list base class
laListWidget_SelectionMode mode;	list selection mode
laBool allowEmpty;	indicates if the list must always have at least one selected item
laArray items;	list containing the list items
laHAlignment halign;	horizontal alignment of the list
laRelativePosition iconPos;	icon position for the list icons
uint32_t iconMargin;	margin for the list icons
uint32_t itemDown;	tracks whether an input event is in process
laScrollBarWidget* scrollbar;	internal scrollbar for this widget
laListWidget_ItemSelectedChangedEvent cb;	item selected changed event

Description

Structure: laListWidget_t

A list widget is a widget that contains a series of vertical nodes. Each node can have text, an image, or both, and can be selected or not. The list has a built-in scrollbar. This allows the list to be larger than the visible area of the widget.

Remarks

None.

laListWidget_ItemSelectedChangedEvent Type

File

libaria_widget_list.h

C

```
typedef void (* laListWidget_ItemSelectedChangedEvent)(laListWidget*, uint32_t idx, laBool selected);
```

Description

This is type laListWidget_ItemSelectedChangedEvent.

laListWidget_SelectedItemChangedEvent Type

File

libaria_widget_list.h

C

```
typedef void (* laListWidget_SelectedItemChangedEvent)(laListWidget*, uint32_t idx, laBool selected);
```

Description

This is type laListWidget_SelectedItemChangedEvent.

laListWidget_SelectionMode Enumeration

Defines the list selection modes

File

libaria_widget_list.h

C

```
typedef enum laListWidget_SelectionMode_t {
  LA_LIST_WIDGET_SELECTION_MODE_SINGLE,
  LA_LIST_WIDGET_SELECTION_MODE_MULTIPLE,
  LA_LIST_WIDGET_SELECTION_MODE_CONTIGUOUS
} laListWidget_SelectionMode;
```

Description

Enumeration: laListWidget_SelectionMode_t

Single - a single selection from the list is allowed at any one time Multiple - any number of selected items is allowed at any one time Contiguous - any number of selected items in a contiguous serious is allowed at any one time

Remarks

None.

laMouseButton Enumeration

All values possible for mouse key entry from the libaria mouse input

File

libaria_input.h

C

```
typedef enum laMouseButton_t {
  BUTTON_NONE = 0,
  BUTTON_LEFT,
  BUTTON_MIDDLE,
  BUTTON_RIGHT,
```

```
  BUTTON_WHEEL_UP,
  BUTTON_WHEEL_DOWN,
  BUTTON_LAST = BUTTON_WHEEL_DOWN
} laMouseButton;
```

Description

Enumeration: laMouseButton

All values possible for mouse key entry from the libaria mouse input

Remarks

None.

laProgressBar Type

File

libaria_widget_progressbar.h

C

```
typedef struct laProgressBarWidget_t laProgressBar;
```

Description

This is type laProgressBar.

laProgressBar_ValueChangedEventCallback Type

File

libaria_widget_progressbar.h

C

```
typedef void (* laProgressBar_ValueChangedEventCallback)(laProgressBar*, uint32_t);
```

Description

This is type laProgressBar_ValueChangedEventCallback.

laProgressBarDirection Enumeration

Defines the valid values for the progress bar widget fill directions.

File

libaria_widget_progressbar.h

C

```
typedef enum laProgressBarDirection_t {
  LA_PROGRESSBAR_DIRECTION_RIGHT,
  LA_PROGRESSBAR_DIRECTION_UP,
  LA_PROGRESSBAR_DIRECTION_LEFT,
  LA_PROGRESSBAR_DIRECTION_DOWN
} laProgressBarDirection;
```

Description

Enumeration: laProgressBarDirection_t

Remarks

None.

laProgressBarWidget Structure

Implementation of a progressbar widget struct

File

libaria_widget_progressbar.h

C

```
typedef struct laProgressBarWidget_t {
  laWidget widget;
  laProgressBarDirection direction;
  uint32_t value;
  laProgressBar_ValueChangedEventCallback cb;
} laProgressBarWidget;
```

Members

Members	Description
laWidget widget;	base widget class
laProgressBarDirection direction;	the fill direction of the bar
uint32_t value;	fill percentage
laProgressBar_ValueChangedEventCallback cb;	value changed callback

Description

Structure: laProgressBarDirection_t

A progress bar widget is a widget that can fill itself with a color based on a given percentage from 0-100. This is often used to visually illustrate the progress of some other activity over time.

Remarks

None.

laRadioButtonGroup Type

Defines the structure used for the Radio Button group.

File

libaria_widget_radiobutton.h

C

```
typedef struct laRadioButtonGroup_t laRadioButtonGroup;
```

Description

Structure laRadioButtonGroup_t

Defines the parameters required for a Radio Button group. Marks the current selected Radio button within the group

Remarks

None.

laRadioButtonWidget Structure

Implementation of a radio button widget struct

File

libaria_widget_radiobutton.h

C

```
typedef struct laRadioButtonWidget_t {
  laWidget widget;
  laBool selected;
  laString text;
  laHAlignment halign;
  laVAlignment valign;
  GFXU_ImageAsset* selectedImage;
  GFXU_ImageAsset* unselectedImage;
  laRelativePosition imagePosition;
  uint32_t imageMargin;
  uint32_t circleButtonSize;
  laRadioButtonWidget_SelectedEvent selectedEvent;
  laRadioButtonWidget_DeselectedEvent deselectedEvent;
  struct {
    uint8_t enabled;
  } paintData;
```

```
  GFXU_ExternalAssetReader* reader;
  laRadioButtonGroup* group;
} laRadioButtonWidget;
```

Members

Members	Description
laWidget widget;	widget base class
laBool selected;	indicates if the radio button is selected
laString text;	radio button text
laHAlignment halign;	horizontal alignment
laVAlignment valign;	vertical alignment
GFXU_ImageAsset* selectedImage;	button custom selected image
GFXU_ImageAsset* unselectedImage;	buton custom unselected image
laRelativePosition imagePosition;	image icon relative position
uint32_t imageMargin;	image margin
uint32_t circleButtonSize;	size of radio circle button in pixels
laRadioButtonWidget_SelectedEvent selectedEvent;	button selected event callback
laRadioButtonWidget_DeselectedEvent deselectedEvent;	button deselected event callback
GFXU_ExternalAssetReader* reader;	asset reader
laRadioButtonGroup* group;	radio button group

Description

Enumeration: laRadioButtonWidget_t

A radio button is similar to a checkbox widget in that it has an on and off state. It is further capable of being added to a radio button group. This group provides a mutually exclusive selection capability so that only one radio button may be selected at any one time.

Remarks

None.

laRadioButtonWidget_DeselectedEvent Type

File

libaria_widget_radiobutton.h

C

```
typedef void (* laRadioButtonWidget_DeselectedEvent)(laRadioButtonWidget*);
```

Description

This is type laRadioButtonWidget_DeselectedEvent.

laRadioButtonWidget_SelectedEvent Type

File

libaria_widget_radiobutton.h

C

```
typedef void (* laRadioButtonWidget_SelectedEvent)(laRadioButtonWidget*);
```

Description

This is type laRadioButtonWidget_SelectedEvent.

laRectangleWidget Structure

Implementation of a rectangle widget struct

File

libaria_widget_rectangle.h

C

```
typedef struct laRectangleWidget_t {
  laWidget widget;
  int32_t thickness;
} laRectangleWidget;
```

Members

Members	Description
laWidget widget;	widget base class
int32_t thickness;	rectangle border thickness

Description

Enumeration: laRectangleWidget_t

A rectangle widget draws a basic rectangle of a given thickness using the widget's bounding box as the dimensions.

Remarks

None.

laScheme Structure

This structure specifies the style scheme components of an object.

File

libaria_scheme.h

C

```
typedef struct laScheme_t {
  GFX_Color base;
  GFX_Color highlight;
  GFX_Color highlightLight;
  GFX_Color shadow;
  GFX_Color shadowDark;
  GFX_Color foreground;
  GFX_Color foregroundInactive;
  GFX_Color foregroundDisabled;
  GFX_Color background;
  GFX_Color backgroundInactive;
  GFX_Color backgroundDisabled;
  GFX_Color text;
  GFX_Color textHighlight;
  GFX_Color textHighlightText;
  GFX_Color textInactive;
  GFX_Color textDisabled;
} laScheme;
```

Description

Enumeration: laScheme_t

A scheme is a collection of colors that can be referenced by widgets or other objects. While the color names strive to be intuitive they aren't always used in the manner in which they describe.

Remarks

None.

laScreen_CreateCallback_FnPtr Type

Callback pointer for a new screen create event notification. This is called when the library attempts to create a screen.

File

libaria_screen.h

C

```
typedef void (* laScreen_CreateCallback_FnPtr)(laScreen*);
```

Description

Type: laScreen_CreateCallback_FnPtr

laScreen_ShowHideCallback_FnPtr Type

Callback pointer for the active screen show or hide event change notification.

File

libaria_screen.h

C

```
typedef void (* laScreen_ShowHideCallback_FnPtr)(laScreen*);
```

Description

Type: laScreen_ShowHideCallback_FnPtr

Callback pointer for the active screen show or hide event change notification.

laScreenOrientation Enumeration

Possible values for screen orientation.

File

libaria_screen.h

C

```
typedef enum laScreenOrientation_t {
  LA_SCREEN_ORIENTATION_0 = 0x0,
  LA_SCREEN_ORIENTATION_90,
  LA_SCREEN_ORIENTATION_180,
  LA_SCREEN_ORIENTATION_270
} laScreenOrientation;
```

Description

Enumeration: laScreenOrientation_t

Possible values for screen orientation.

Remarks

None.

laScrollBarOrientation Enumeration

Defines the scroll bar direction values

File

libaria_widget_scrollbar.h

C

```
typedef enum laScrollBarOrientation_t {
  LA_SCROLLBAR_ORIENT_VERTICAL,
  LA_SCROLLBAR_ORIENT_HORIZONTAL
} laScrollBarOrientation;
```

Description

Enumeration: laScrollBarOrientation_t

Remarks

None.

laScrollBarState Enumeration

Defines the various scroll bar state values

File

libaria_widget_scrollbar.h

C

```
typedef enum laScrollBarState_t {
  LA_SCROLLBAR_STATE_NONE,
  LA_SCROLLBAR_STATE_TOP_PRESSED,
  LA_SCROLLBAR_STATE_TOP_INSIDE,
  LA_SCROLLBAR_STATE_BOTTOM_PRESSED,
  LA_SCROLLBAR_STATE_BOTTOM_INSIDE,
  LA_SCROLLBAR_STATE_HANDLE_DOWN
} laScrollBarState;
```

Description

Enumeration: laScrollBarState_t

Remarks

None.

laScrollBarWidget Structure

Implementation of a scroll bar widget.

File

libaria_widget_scrollbar.h

C

```
typedef struct laScrollBarWidget_t {
  laWidget widget;
  laScrollBarState state;
  laScrollBarOrientation alignment;
  uint32_t max;
  uint32_t extent;
  uint32_t value;
  uint32_t step;
  laScrollBarWidget_ValueChangedEvent valueChangedEvent;
  GFX_Point handleDownOffset;
} laScrollBarWidget;
```

Members

Members	Description
laWidget widget;	widget base class
laScrollBarState state;	scrollbar input state
laScrollBarOrientation alignment;	scroll bar direction
uint32_t max;	maximum scroll value
uint32_t extent;	visible space/handle size
uint32_t value;	current scroll value
uint32_t step;	discreet scroll stepping value
laScrollBarWidget_ValueChangedEvent valueChangedEvent;	value changed callback

Description

Structure: laScrollBarWidget_t

A scroll bar is a widget that is capable of displaying a range and a scroll handle. The handle can grow and shrink in size depending on the scroll range and visible scroll space and can be interacted with to scroll through the available space.

Remarks

None.

laScrollBarWidget_ValueChangedEvent Type

File

libaria_widget_scrollbar.h

C

```
typedef void (* laScrollBarWidget_ValueChangedEvent)(laScrollBarWidget*);
```

Description

This is type laScrollBarWidget_ValueChangedEvent.

laSliderOrientation Enumeration

Slider orientations

File

libaria_widget_slider.h

C

```
typedef enum laSliderOrientation_t {
  LA_SLIDER_ORIENT_VERTICAL,
  LA_SLIDER_ORIENT_HORIZONTAL
} laSliderOrientation;
```

Description

Enumeration: laSliderOrientation_t

Remarks

None.

laSliderState Enumeration

Describes various slider states

File

libaria_widget_slider.h

C

```
typedef enum laSliderState_t {
  LA_SLIDER_STATE_NONE,
  LA_SLIDER_STATE_HANDLE_DOWN,
  LA_SLIDER_STATE_AREA_DOWN
} laSliderState;
```

Description

Enumeration: laSliderState_t

Remarks

None.

laSliderWidget Structure

Implementation of a slider widget struct

File

libaria_widget_slider.h

C

```
typedef struct laSliderWidget_t {
  laWidget widget;
  laSliderState state;
  laSliderOrientation alignment;
  int32_t min;
```

```
  int32_t max;
  int32_t value;
  uint32_t grip;
  laSliderWidget_ValueChangedEvent valueChangedEvent;
  GFX_Point handleDownOffset;
} laSliderWidget;
```

Members

Members	Description
laWidget widget;	widget base class
laSliderState state;	slider state
laSliderOrientation alignment;	slider alignment
int32_t min;	slider min value
int32_t max;	slider max value
int32_t value;	slider current value
uint32_t grip;	slider grip size
laSliderWidget_ValueChangedEvent valueChangedEvent;	value changed event

Description

Structure: laSliderWidget_t

A slider bar is a widget that is capable of displaying a range and a slider handle. The slider can be moved between two discreet values and can have a variable min and max range.

Remarks

None.

laSliderWidget_ValueChangedEvent Type

File

libaria_widget_slider.h

C

```
typedef void (* laSliderWidget_ValueChangedEvent)(laSliderWidget*);
```

Description

This is type laSliderWidget_ValueChangedEvent.

laTextFieldWidget Structure

Implementation of a text field widget.

File

libaria_widget_textfield.h

C

```
typedef struct laTextFieldWidget_t {
  laEditWidget editWidget;
  laString text;
  laHAlignment halign;
  uint32_t cursorPos;
  uint32_t cursorDelay;
  uint32_t cursorTime;
  laBool cursorEnable;
  laBool cursorVisible;
  laBool clearOnFirstEdit;
  laTextFieldWidget_TextChangedCallback textChangedEvent;
  GFXU_ExternalAssetReader* reader;
} laTextFieldWidget;
```

Members

Members	Description
laEditWidget editWidget;	edit widget base class

laString text;	the text to edit
laHAlignment halign;	horizontal alignment
uint32_t cursorPos;	current cursor position
uint32_t cursorDelay;	cursor blink delay
uint32_t cursorTime;	current cursor tick counter
laBool cursorEnable;	cursor enabled flag
laBool cursorVisible;	cursor visbility flag
laBool clearOnFirstEdit;	needs clear on first edit
laTextFieldWidget_TextChangedCallback textChangedEvent;	text changed event
GFXU_ExternalAssetReader* reader;	asset reader

Description

Enumeration: laTextFieldWidget_t

A text field widget is a widget that is capable of displaying a single line of editable text. This widget is capable of receiving edit events from the Aria edit event system. It can also display a blinking cursor.

Remarks

None.

laTextFieldWidget_TextChangedCallback Type

File

libaria_widget_textfield.h

C

```
typedef void (* laTextFieldWidget_TextChangedCallback)(laTextFieldWidget*);
```

Description

This is type laTextFieldWidget_TextChangedCallback.

laTouchState Structure

Manage the touch input state and track the touch coordinate

File

libaria_input.h

C

```
typedef struct laTouchState_t {
  uint32_t valid;
  int32_t x;
  int32_t y;
} laTouchState;
```

Description

Structure: laTouchState

Manage the touch input state and track the touch coordinate

Remarks

None.

laTouchTestState Enumeration

Touch test states

File

libaria_widget_touchtest.h

C

```
typedef enum laTouchTestState_t {
```

```
  LA_TOUCHTEST_STATE_UP,
  LA_TOUCHTEST_STATE_DOWN
} laTouchTestState;
```

Description

Enumeration: laTouchTestState_t

Remarks

None.

laTouchTestWidget Structure

Implementation of a touch test widget struct

File

libaria_widget_touchtest.h

C

```
typedef struct laTouchTestWidget_t {
  laWidget widget;
  laTouchTestState state;
  GFX_Point pnts[LA_TOUCHTEST_MEMORY_SIZE];
  uint32_t size;
  uint32_t start;
  uint32_t next;
  laTouchTestWidget_PointAddedEventCallback cb;
} laTouchTestWidget;
```

Members

Members	Description
laWidget widget;	widget base class
laTouchTestState state;	touch test state
GFX_Point pnts[LA_TOUCHTEST_MEMORY_SIZE];	touch point array
uint32_t size;	current number of valid touch points
uint32_t start;	first valid touch point
uint32_t next;	next available touch point entry
laTouchTestWidget_PointAddedEventCallback cb;	point added callback

Description

Structure: laTouchTestWidget_t

The touch test widget is a specialized widget that displays intersecting lines based on input events. This can help visualize touch interaction and aid determining accurate input coordinates.

Remarks

None.

laTouchTestWidget_PointAddedEventCallback Type

File

libaria_widget_touchtest.h

C

```
typedef void (* laTouchTestWidget_PointAddedEventCallback)(laTouchTestWidget*, GFX_Point*);
```

Description

This is type laTouchTestWidget_PointAddedEventCallback.

laWidget Structure

Specifies Graphics widget structure to manage all properties and events associated with the widget

File

libaria_widget.h

C

```
typedef struct laWidget_t {
  uint32_t id;
  laWidgetType type;
  laBool editable;
  laBool visible;
  laBool enabled;
  GFX_Rect rect;
  uint32_t cornerRadius;
  laMargin margin;
  laBorderType borderType;
  laBackgroundType backgroundType;
  uint32_t optimizationFlags;
  uint32_t drawCount;
  GFX_PixelBuffer* cache;
  laBool cacheInvalid;
  laBool alphaEnabled;
  uint32_t alphaAmount;
  uint32_t dirtyState;
  uint32_t drawState;
  laWidget_DrawFunction_FnPtr drawFunc;
  laScheme* scheme;
  laBool root;
  laWidget* parent;
  laArray children;
  laWidget_Destructor_FnPtr destructor;
  laWidget_Moved_FnPtr moved;
  laWidget_Resized_FnPtr resized;
  laWidget_Focus_FnPtr focusGained;
  laWidget_Focus_FnPtr focusLost;
  laWidget_Update_FnPtr update;
  laWidget_Paint_FnPtr paint;
  laWidget_TouchDownEvent_FnPtr touchDown;
  laWidget_TouchUpEvent_FnPtr touchUp;
  laWidget_TouchMovedEvent_FnPtr touchMoved;
  laWidget_LanguageChangingEvent_FnPtr languageChangeEvent;
  laWidget_InvalidateBorderAreas_FnPtr invalidateBorderAreas;
} laWidget;
```

Members

Members	Description
uint32_t id;	the id of the widget
laWidgetType type;	the type of the widget
laBool editable;	indicates if this widget implements the editable interface
laBool visible;	the widget visible flag
laBool enabled;	the widget enabled flag
GFX_Rect rect;	the bounding rectangle of the widget
uint32_t cornerRadius;	corner radius, draws round corners if > 0
laMargin margin;	the margin settings for the widget
laBorderType borderType;	the widget border type
laBackgroundType backgroundType;	the widget background type
uint32_t optimizationFlags;	optimization flags
uint32_t drawCount;	number of times this widget has been drawn for the active screen
GFX_PixelBuffer* cache;	the local framebuffer cache for the widget this can be used to avoid costly parent redraw operations at the cost of using more memory
laBool cacheInvalid;	indicates that the local cache is invalid and needs to be refilled
laBool alphaEnabled;	indicates that the global alpha blending setting is enabled for this widget
uint32_t alphaAmount;	the global alpha amount to apply to this widget (cumulative with parent widgets)
uint32_t dirtyState;	the widget's dirty state
uint32_t drawState;	the widget's draw state
laWidget_DrawFunction_FnPtr drawFunc;	the next draw function to call
laScheme* scheme;	the widget's color scheme

laBool root;	indicates if this widget is a root widget
laWidget* parent;	pointer to the widget's parent
laArray children;	pointers for the widget's children
laWidget_Destructor_FnPtr destructor;	the widget's destructor
laWidget_Moved_FnPtr moved;	moved function pointer
laWidget_Resized_FnPtr resized;	resized function pointer
laWidget_Focus_FnPtr focusGained;	focus gained function pointer
laWidget_Focus_FnPtr focusLost;	focus lost function pointer
laWidget_Update_FnPtr update;	update function pointer
laWidget_Paint_FnPtr paint;	paint function pointer
laWidget_TouchDownEvent_FnPtr touchDown;	touch down function pointer
laWidget_TouchUpEvent_FnPtr touchUp;	touch up function pointer
laWidget_TouchMovedEvent_FnPtr touchMoved;	touch moved function pointer
laWidget_LanguageChangingEvent_FnPtr languageChangeEvent;	languaged event pointer

Description

Structure: laWidget_t

Specifies Graphics widget structure to manage all properties and events associated with the widget. It also contains information about the parent and children for the widget to manage the tree structure that the library supports.

Remarks

None.

laWidget_Constructor_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_Constructor_FnPtr)(laWidget*);
```

Description

This is type laWidget_Constructor_FnPtr.

laWidget_Destructor_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_Destructor_FnPtr)(laWidget*);
```

Description

This is type laWidget_Destructor_FnPtr.

laWidget_DrawFunction_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_DrawFunction_FnPtr)(void*);
```

Description

This is type laWidget_DrawFunction_FnPtr.

laWidget_Focus_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_Focus_FnPtr)(laWidget*);
```

Description

This is type laWidget_Focus_FnPtr.

laWidget_Moved_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_Moved_FnPtr)(laWidget*);
```

Description

This is type laWidget_Moved_FnPtr.

laWidget_Paint_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_Paint_FnPtr)(laWidget*);
```

Description

This is type laWidget_Paint_FnPtr.

laWidget_Resized_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_Resized_FnPtr)(laWidget*);
```

Description

This is type laWidget_Resized_FnPtr.

laWidget_TouchDownEvent_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_TouchDownEvent_FnPtr)(laWidget*, laInput_TouchDownEvent*);
```

Description

This is type laWidget_TouchDownEvent_FnPtr.

laWidget_TouchMovedEvent_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_TouchMovedEvent_FnPtr)(laWidget*, laInput_TouchMovedEvent*);
```

Description

This is type laWidget_TouchMovedEvent_FnPtr.

laWidget_TouchUpEvent_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_TouchUpEvent_FnPtr)(laWidget*, laInput_TouchUpEvent*);
```

Description

This is type laWidget_TouchUpEvent_FnPtr.

laWidget_Update_FnPtr Type

File

libaria_widget.h

C

```
typedef laWidgetUpdateState (* laWidget_Update_FnPtr)(laWidget*, uint32_t);
```

Description

This is type laWidget_Update_FnPtr.

laWidgetDirtyState Enumeration

Specifies the different dirty states the widget can be assigned

File

libaria_widget.h

C

```
typedef enum laWidgetDirtyState_t {
  LA_WIDGET_DIRTY_STATE_CLEAN,
  LA_WIDGET_DIRTY_STATE_CHILD,
  LA_WIDGET_DIRTY_STATE_DIRTY
} laWidgetDirtyState;
```

Description

Enumeration: laWidgetDirtyState_t

Specifies the different dirty states the widget can be assigned This decides whether the particular widget would be re-drawn or not. Dirty widget are re-drawn and clean are not painted over.

Remarks

None.

laWidgetDrawState Enumeration

Specifies the different draw states the widget can be assigned

File

libaria_widget.h

C

```
typedef enum laWidgetDrawState_t {
  LA_WIDGET_DRAW_STATE_READY,
  LA_WIDGET_DRAW_STATE_DONE
} laWidgetDrawState;
```

Description

Enumeration: laWidgetDrawState_t

Specifies the different draw states the widget can be assigned

Remarks

None.

laWidgetEvent Structure

Basic widget event definition

File

libaria_event.h

C

```
typedef struct laWidgetEvent_t {
  laEventID id;
  laWidget* source;
  laWidget* target;
  laBool accepted;
} laWidgetEvent;
```

Description

Structure: laWidgetEvent_t

laWidgetType Enumeration

Specifies the different widget types used in the library

File

libaria_widget.h

C

```
typedef enum laWidgetType_t {
  LA_WIDGET_WIDGET,
  LA_WIDGET_LAYER,
  LA_WIDGET_ARC,
  LA_WIDGET_BAR_GRAPH,
  LA_WIDGET_BUTTON,
  LA_WIDGET_CHECKBOX,

  LA_WIDGET_RECTANGLE,
  LA_WIDGET_SCROLLBAR,
  LA_WIDGET_SLIDER,
  LA_WIDGET_TEXTFIELD,
  LA_WIDGET_TOUCHTEST,
  LA_WIDGET_WINDOW
} laWidgetType;
```

Description

Enumeration: laWidgetType_t

This enumeration specifies the different widget types used in the library.

Remarks

None.

laWindowWidget Structure

Implementation of a window widget struct

File

libaria_widget_window.h

C

```
typedef struct laWindowWidget_t {
  laWidget widget;
  laString title;
  GFXU_ImageAsset* icon;
  uint32_t iconMargin;
  struct {
    GFX_Rect barRect;
  } paintData;
  GFXU_ExternalAssetReader* reader;
} laWindowWidget;
```

Members

Members	Description
laWidget widget;	base widget class
laString title;	title text
GFXU_ImageAsset* icon;	title icon
uint32_t iconMargin;	title icon margin
GFXU_ExternalAssetReader* reader;	asset reader

Description

Structure: laWindowWidget_t

A window widget is an extension of a basic panel. It adds a title bar with text and an icon.

Remarks

None.

laBackgroundType Enumeration

Specifies the different background types used for the widgets in the library

File

libaria_widget.h

C

```
typedef enum laBackgroundType_t {
  LA_WIDGET_BACKGROUND_NONE,
  LA_WIDGET_BACKGROUND_FILL,
  LA_WIDGET_BACKGROUND_CACHE,
  LA_WIDGET_BACKGROUND_LAST = LA_WIDGET_BACKGROUND_CACHE
} laBackgroundType;
```

Description

Enumeration: laBackgroundType_t

Specifies the different background types used for the widgets in the library

None - No background fill. Widget must defer to its parent to erase dirty pixels. This may cause additional overhead as clean pixels may be repainted as well.

Fill - a scheme color is used to fill the widget rectangle.

Cache - a local framebuffer cache is maintained by the widget and used to clean up dirty pixels. Will not cause a parent repaint event but will use additional memory to contain the cache.

Remarks

None.

laWidget_LanguageChangingEvent_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_LanguageChangingEvent_FnPtr)(laWidget*);
```

Description

This is type laWidget_LanguageChangingEvent_FnPtr.

laWidgetOptimizationFlags Enumeration

Specifies the different draw optimization flags for a widget

File

libaria_widget.h

C

```
typedef enum laWidgetOptimizationFlags_t {
  LA_WIDGET_OPT_LOCAL_REDRAW = 0x1,
  LA_WIDGET_OPT_DRAW_ONCE = 0x2,
  LA_WIDGET_OPT_OPAQUE = 0x4
} laWidgetOptimizationFlags;
```

Members

Members	Description
LA_WIDGET_OPT_LOCAL_REDRAW = 0x1	local redraw If a widget has no background then normally the parent would need to redraw to erase the contents of the widget. This flag indicates to the renderer to not redraw the parent event if the widget has no background
LA_WIDGET_OPT_DRAW_ONCE = 0x2	draw once Indicates that a widget should draw once per screen show event all other attempts to invalidate or paint a widget will be rejected
LA_WIDGET_OPT_OPAQUE = 0x4	opaque Indicates that a widget is fully opaque regardless of its background setting. This is often used for cases like image widgets where the image fills the entire widget space but you don't want the overhead of drawing a background behind it as well. This flag helps widgets without backgrounds to pass occlusion tests.

Description

Enumeration: laWidgetOptimizationFlags_t

Specifies the different draw optimization flags for a widget

Remarks

None.

LA_DEFAULT_SCHEME_COLOR_MODE Macro

File

libaria_common.h

C

```
#define LA_DEFAULT_SCHEME_COLOR_MODE GFX_COLOR_MODE_RGB_565
```

Description

This is macro LA_DEFAULT_SCHEME_COLOR_MODE.

LA_STRING_NULLIDX Macro

File

libaria_string.h

C

```
#define LA_STRING_NULLIDX -1
```

Description

This is macro LA_STRING_NULLIDX.

DEFAULT_BORDER_MARGIN Macro

File

libaria_widget.h

C

```
#define DEFAULT_BORDER_MARGIN 4
```

Description

This is macro DEFAULT_BORDER_MARGIN.

LA_IMAGESEQ_RESTART Macro

File

libaria_widget_imagesequence.h

C

```
#define LA_IMAGESEQ_RESTART -1
```

Description

This is macro LA_IMAGESEQ_RESTART.

LA_INPUT_PRIMARY_ID Macro

File

libaria_input.h

C

```
#define LA_INPUT_PRIMARY_ID 0
```

Description

This is macro LA_INPUT_PRIMARY_ID.

LA_MAX_TOUCH_STATES Macro

File

libaria_input.h

C

```
#define LA_MAX_TOUCH_STATES 2
```

Description

This is macro LA_MAX_TOUCH_STATES.

LA_TOUCHTEST_MEMORY_SIZE Macro

File

libaria_widget_touchtest.h

C

```
#define LA_TOUCHTEST_MEMORY_SIZE 20
```

Description

This is macro LA_TOUCHTEST_MEMORY_SIZE.

NUM_BUTTONS Macro

File

libaria_input.h

C

```
#define NUM_BUTTONS BUTTON_LAST + 1
```

Description

This is macro NUM_BUTTONS.

NUM_KEYS Macro

File

libaria_input.h

C

```
#define NUM_KEYS KEY_LAST + 1
```

Description

This is macro NUM_KEYS.

laLayer_AddDamageRect Function

Adds a damaged rectangle to the list. Damage rectangles are used in minimal redraw algorithms.

File

libaria_layer.h

C

```
LIB_EXPORT laResult laLayer_AddDamageRect(laLayer* layer, const GFX_Rect* rect, laBool noCombine);
```

Returns

laResult - the result of the operation

Parameters

Parameters	Description
laLayer* layer	the layer
const GFX_Rect* rect	the rectangle

Function

laResult laLayer_AddDamageRect(laLayer* layer, const GFX_Rect* rect)

laEventResult Enumeration

Defines what happened when processing an event

File

libaria_event.h

C

```
typedef enum laEventResult_t {
  LA_EVENT_HANDLED,
  LA_EVENT_DEFERRED,
  LA_EVENT_RESET_QUEUE
} laEventResult;
```

Members

Members	Description
LA_EVENT_HANDLED	the event was handled
LA_EVENT_DEFERRED	the event needs to wait
LA_EVENT_RESET_QUEUE	the entire event queue should be flushed and reset

Description

Enumeration: laEventResult

laLayerFrameState Enumeration

Defines the frame state of a layer. Certain actions must only be performed at the start of a new frame and other actions must wait until the end of the current frame.

File

libaria_layer.h

C

```
typedef enum laLayerFrameState_t {
  LA_LAYER_FRAME_READY,
  LA_LAYER_FRAME_PREFRAME,
  LA_LAYER_FRAME_IN_PROGRESS,
  LA_LAYER_FRAME_COMPLETE
} laLayerFrameState;
```

Description

Enumeration: laLayerFrameState

Remarks

None.

laRectArray Type

File

libaria_widget.h

C

```
typedef struct laRectArray_t laRectArray;
```

Description

This is type laRectArray.

laWidget_InvalidateBorderAreas_FnPtr Type

File

libaria_widget.h

C

```
typedef void (* laWidget_InvalidateBorderAreas_FnPtr)(laWidget*);
```

Description

This is type laWidget_InvalidateBorderAreas_FnPtr.

laContextFrameState Enumeration

Possible values for context frame state.

File

libaria_context.h

C

```
typedef enum laContextFrameState_t {
  LA_CONTEXT_FRAME_READY = 0,
  LA_CONTEXT_FRAME_PREFRAME,
  LA_CONTEXT_FRAME_PRELAYER,
  LA_CONTEXT_FRAME_DRAWING,
  LA_CONTEXT_FRAME_POSTLAYER
} laContextFrameState;
```

Description

Enumeration: laContextFrameState_t

Possible values for context frame state.

Remarks

None.

laImageWidget_DrawEventCallback Type

File

libaria_widget_image.h

C

```
typedef void (* laImageWidget_DrawEventCallback)(laImageWidget*);
```

Section

Data Types and Constants

laContextUpdateState Enumeration

Possible values for context update state.

File

libaria_context.h

C

```
typedef enum laContextUpdateState_t {
  LA_CONTEXT_UPDATE_DONE = 0,
  LA_CONTEXT_UPDATE_PENDING
} laContextUpdateState;
```

Description

Enumeration: laContextUpdateState

Possible values for context update state.

Remarks

None.

laWidgetUpdateState Enumeration

Specifies the different update states the widget can be assigned

File

libaria_widget.h

C

```
typedef enum laWidgetUpdateState_t {
  LA_WIDGET_UPDATE_STATE_DONE,
  LA_WIDGET_UPDATE_STATE_PENDING
} laWidgetUpdateState;
```

Description

Enumeration: laWidgetUpdateState_t

Specifies the different update states the widget can be assigned

Remarks

None.

Description

libaria_common.h

This file defines the common macros and definitions used by the gfx definition and implementation headers.

Enumerations

	Name	Description
	laBool_t	libaria bool values
	laPreemptionLevel	libaria pre-emption level values
	laRelativePosition	libaria relative position values
	laResult_t	libaria results (success and failure codes).
	laBool	libaria bool values
	laHAlignment	libaria horizontal alignment values
	laResult	libaria results (success and failure codes).
	laVAlignment	libaria vertical alignment values

Macros

	Name	Description
	LA_DEFAULT_SCHEME_COLOR_MODE	This is macro LA_DEFAULT_SCHEME_COLOR_MODE.

Structures

	Name	Description
	laMargin_t	libaria margin values
	laMargin	libaria margin values

Description

Module for Microchip Graphics Library - Aria User Interface Library

This file defines the common macros and definitions used by the gfx definition and the implementation header.

Remarks

The directory in which this file resides should be added to the compiler's search path for header files.

File Name

libaria_common.h

Company

Microchip Technology Inc.

libaria_context.h

Context definition for the Aria user interface library.

Enumerations

	Name	Description
	laContextFrameState_t	Possible values for context frame state.

	laContextUpdateState_t	Possible values for context update state.
	laContextFrameState	Possible values for context frame state.
	laContextUpdateState	Possible values for context update state.

Functions

	Name	Description
	laContext_AddScreen	Add screen to the list of screens in the current context
	laContext_Create	Creates an instance of the Aria user interface library
	laContext_Destroy	Destroys an Aria instance
	laContext_GetActive	Returns the current active context.
	laContext_GetActiveScreen	Returns the active screen of the current context
	laContext_GetActiveScreenIndex	Return the index of the active screen
	laContext_GetColorMode	Returns the color mode of the current context
	laContext_GetDefaultScheme	Returns the pointer to the default scheme of the current context
	laContext_GetEditWidget	Gets the widget that is currently recieving all widget edit events.
	laContext_GetFocusWidget	Return a pointer to the widget in focus
	laContext_GetPremptionLevel	Returns the preemption level for the screen
	laContext_GetScreenRect	Returns the display rectangle structure of the physical display
	laContext_GetStringLanguage	Returns the language index of the current context
	laContext_GetStringTable	Get a pointer to the GFXU_StringTableAsset structure that maintains the strings, associated fonts, etc
	laContext_HideActiveScreen	Hide the active screen
	laContext_IsDrawing	Indicates if any layers of the active screen are currently drawing a frame.
	laContext_IsLayerDrawing	Indicates if the layer at the given index of the active screen is currently drawing.
	laContext_RedrawAll	Forces the library to redraw the currently active screen in its entirety.
	laContext_RemoveScreen	Remove the specified screen from the list of screens in the current context
	laContext_SetActive	Make the specified context active
	laContext_SetActiveScreen	Change the active screen to the one specified by the index argument
	laContext_SetActiveScreenChangedCallback	Set the callback function pointer when the screen change event occurs
	laContext_SetEditWidget	Sets the currently active edit widget.
	laContext_SetFocusWidget	Set into focus the widget specified as the argument
	laContext_SetLanguageChangedCallback	Set the callback function pointer when the language change event occurs
	laContext_SetPreemptionLevel	Set the preemption level to the specified value
	laContext_SetStringLanguage	Set the language index of the current context
	laContext_SetStringTable	Set the StringTable pointer to the specified new StringTableAsset structure
	laContext_Update	Runs the update loop for a library instance.

Structures

	Name	Description
	laContext_t	An instance of the Aria user interface library.

Types

	Name	Description
	laContext_ActiveScreenChangedCallback_FnPtr	Callback pointer for the active screen change notification.
	laContext_LanguageChangedCallback_FnPtr	Callback pointer for when the language change event occurs.

Description

Module for Microchip Graphics Library - Aria User Interface Library

File Name

libaria_context.h

Company

Microchip Technology Inc.

libaria_draw.h

Internal standard drawing help function definitions.

Functions

	Name	Description
	laDraw_1x2BevelBorder	Internal utility function to draw a 1x2 bevel border
	laDraw_2x1BevelBorder	Internal utility function to draw a 2x1 bevel border
	laDraw_2x2BevelBorder	Internal utility function to draw a 2x2 bevel border
	laDraw_LineBorder	Internal utility function to draw a basic line border

Description

Module for Microchip Graphics Library - Aria User Interface Library

File Name

libaria_draw.h

Company

Microchip Technology Inc.

libaria_editwidget.h

Functions

	Name	Description
	laEditWidget_Accept	This is function laEditWidget_Accept.
	laEditWidget_Append	This is function laEditWidget_Append.
	laEditWidget_Backspace	This is function laEditWidget_Backspace.
	laEditWidget_Clear	This is function laEditWidget_Clear.
	laEditWidget_EndEdit	This is function laEditWidget_EndEdit.
	laEditWidget_Set	This is function laEditWidget_Set.
	laEditWidget_StartEdit	This is function laEditWidget_StartEdit.

Structures

	Name	Description
	laEditWidget_t	Specifies the edit widget structure to manage all properties and events associated with edit widgets
	laEditWidget	Specifies the edit widget structure to manage all properties and events associated with edit widgets

Types

	Name	Description
	laEditWidget_Accept_FnPtr	This is type laEditWidget_Accept_FnPtr.
	laEditWidget_Append_FnPtr	This is type laEditWidget_Append_FnPtr.
	laEditWidget_Backspace_FnPtr	This is type laEditWidget_Backspace_FnPtr.
	laEditWidget_Clear_FnPtr	This is type laEditWidget_Clear_FnPtr.
	laEditWidget_EndEdit_FnPtr	This is type laEditWidget_EndEdit_FnPtr.
	laEditWidget_Set_FnPtr	This is type laEditWidget_Set_FnPtr.
	laEditWidget_StartEdit_FnPtr	This is type laEditWidget_StartEdit_FnPtr.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements the routines to enable edit of library widgets.

File Name

libaria_editwidget.h

Company

Microchip Technology Inc.

libaria_event.h

Defines events that are used in the UI library. Events are created and stored for later processing during a library context's update loop.

Enumerations

	Name	Description
	laEventID_t	Defines internal event type IDs
	laEventResult_t	Defines what happened when processing an event
	laEventID	Defines internal event type IDs
	laEventResult	Defines what happened when processing an event

Functions

	Name	Description
	laEvent_AddEvent	Add the mentioned event callback to the list of events maintained by the current context
	laEvent_ClearList	Clear the event list maintained by the current context.
	laEvent_GetCount	Returns the number of events listed in the current context
	laEvent_ProcessEvents	Processes the screen change as well as touch events
	laEvent_SetFilter	Set callback pointer for current context filter event

Structures

	Name	Description
	laEvent_t	Basic UI event definition
	laEventState_t	Structure to manage the event lists, state and call back pointers
	laWidgetEvent_t	Basic widget event definition
	laEvent	Basic UI event definition
	laEventState	Structure to manage the event lists, state and call back pointers
	laWidgetEvent	Basic widget event definition

Types

	Name	Description
	laEvent_FilterEvent	Function pointer to define an event filter. Event filters allow a receiver to discard undesirable events

Description

Module for Microchip Graphics Library - Aria User Interface Library

File Name

libaria_event.h

Company

Microchip Technology Inc.

libaria_global.h

This file contains global definitions used by the Aria user interface library.

Description

Module for Microchip Graphics Library - Aria User Interface Library

File Name

libaria_global.h

Company

Microchip Technology Inc.

libaria_input.h

Enumerations

	Name	Description
	laGestureID_t	Placeholder for eventual gesture support.
	laKey_t	All values possible for key entry from the libaria keyboard widget
	laMouseButton_t	All values possible for mouse key entry from the libaria mouse input
	laGestureID	Placeholder for eventual gesture support.
	laKey	All values possible for key entry from the libaria keyboard widget
	laMouseButton	All values possible for mouse key entry from the libaria mouse input

Functions

	Name	Description
	laInput_GetEnabled	Returns the input enabled status of the current context
	laInput_InjectTouchDown	Register and track the touch down event and queue it for handling by associated widgets
	laInput_InjectTouchMoved	Register and track the touch moved event and queue it for handling by associated widgets
	laInput_InjectTouchUp	Register and track the touch up event and queue it for handling by associated widgets
	laInput_SetEnabled	Sets the input status of the current context with the specified input argument

Macros

	Name	Description
	LA_INPUT_PRIMARY_ID	This is macro LA_INPUT_PRIMARY_ID.
	LA_MAX_TOUCH_STATES	This is macro LA_MAX_TOUCH_STATES.
	NUM_BUTTONS	This is macro NUM_BUTTONS.
	NUM_KEYS	This is macro NUM_KEYS.

Structures

	Name	Description
	laInput_TouchDownEvent_t	Register and handle the touch press detect event
	laInput_TouchMovedEvent_t	Register and handle the touch coordinates changed event
	laInput_TouchUpEvent_t	Register and handle the touch release detect event
	laInputState_t	Maintain a history of touch states; currently libaria keeps track of the last touch state only.
	laTouchState_t	Manage the touch input state and track the touch coordinate
	laInput_TouchDownEvent	Register and handle the touch press detect event
	laInput_TouchMovedEvent	Register and handle the touch coordinates changed event
	laInput_TouchUpEvent	Register and handle the touch release detect event
	laInputState	Maintain a history of touch states; currently libaria keeps track of the last touch state only.
	laTouchState	Manage the touch input state and track the touch coordinate

Description

Module for Microchip Graphics Library - Aria User Interface Library

File Name

libaria_input.h

Company

Microchip Technology Inc.

libaria_layer.h

Aria layers map directly to layers provided by the Graphics Hardware Abstraction layer. HAL layers map directly to hardware layers provided by graphics hardware. UI layers are logical containers for widgets and provide many of the same features.

Enumerations

	Name	Description
	laLayerBufferType_t	Defines the type of a layer. If the layer has an explicit address then Aria tries to set that through the HAL when the layer is being set up.
	laLayerFrameState_t	Defines the frame state of a layer. Certain actions must only be performed at the start of a new frame and other actions must wait until the end of the current frame.
	laLayerBufferType	Defines the type of a layer. If the layer has an explicit address then Aria tries to set that through the HAL when the layer is being set up.
	laLayerFrameState	Defines the frame state of a layer. Certain actions must only be performed at the start of a new frame and other actions must wait until the end of the current frame.

Functions

	Name	Description
	laLayer_AddDamageRect	Adds a damaged rectangle to the list. Damage rectangles are used in minimal redraw algorithms.
	laLayer_Delete	Destructor for the layer object
	laLayer_GetAllowInputPassThrough	Gets the layer's input passthrough setting
	laLayer_GetAlphaAmount	Get's the amount of alpha blending for a given layer
	laLayer_GetAlphaEnable	Gets the layer alpha enable flag
	laLayer_GetBufferCount	Return the buffer count for the current layer
	laLayer_GetEnabled	Returns the boolean value of the layer enabled property
	laLayer_GetInputRect	Gets the layer's input rectangle.
	laLayer_GetInputRectLocked	Gets the layer's input rect locked flag
	laLayer_GetMaskColor	Returns the mask color value for the current layer
	laLayer_GetMaskEnable	Gets the layer mask enable flag
	laLayer_GetVSync	Gets the layer's vsync flag setting
	laLayer_IsDrawing	Queries a layer to find out if it is currently drawing a frame.
	laLayer_New	Constructor for a new layer
	laLayer_SetAllowInputPassthrough	Sets the layer's input passthrough flag.
	laLayer_SetAlphaAmount	Set's the amount of alpha blending for a given layer
	laLayer_SetAlphaEnable	Sets the layer alpha enable flag to the specified value
	laLayer_SetBufferCount	Set the buffer count for the current layer to the specified value
	laLayer_SetEnabled	Sets the boolean value of the layer enabled property
	laLayer_SetInputRect	Sets the layer's input rect dimensions.
	laLayer_SetInputRectLocked	Sets the layer's input rect locked flag.
	laLayer_SetMaskColor	Set the mask color value for the current layer to the specified value
	laLayer_SetMaskEnable	Sets the layer mask enable flag to the specified value
	laLayer_SetVSync	Sets the layer's vsync flag.

Structures

	Name	Description
	laLayer_t	Primary definition of a layer. Builds on base functions of a standard widget. Should never have a direct parent.
	laLayerBuffer_t	Structure to maintain the buffer type and track the buffer location for each layer
	laLayerBuffer	Structure to maintain the buffer type and track the buffer location for each layer

Description

Module for Microchip Graphics Library - Aria User Interface Library

File Name

libaria_layer.h

Company

Microchip Technology Inc.

libaria_list.h

A linked list implementation for the Aria user interface library

Functions

	Name	Description
	laList_Assign	Assignes a new pointer to an index in the list
	laList_Clear	Removes all nodes from a given list
	laList_Copy	Creates a duplicate of an existing list
	laList_Create	Initializes a new linked list
	laList_Destroy	Removes all nodes from a given list and frees the data of each node
	laList_Find	Retrieves the index of a value from the list
	laList_Get	Retrieves a value from the list
	laList_InsertAt	Inserts an item into a list at a given index. All existing from index are shifted right one place.
	laList_PopBack	Removes the last value from the list
	laList_PopFront	Removes the first value from the list
	laList_PushBack	Pushes a new node onto the back of the list
	laList_PushFront	Pushes a new node onto the front of the list
	laList_Remove	Removes an item from the list
	laList_RemoveAt	Removes an item from the list at an index

Structures

	Name	Description
	laList_t	Linked list definition
	laListNode_t	Linked list node definition
	laListNode	Linked list node definition

Description

Module for Microchip Graphics Library - Aria User Interface Library

This is a linked list implementation that is used internally by the Aria user interface library. All of the memory operations are handled by the memory interface that is provided by the active libaria context. Applications that wish to use this implementation must ensure that the appropriate libaria context is active when calling these functions.

File Name

libaria_list.h

Company

Microchip Technology Inc.

libaria_math.h

This is file libaria_math.h.

libaria_radiobutton_group.h

Functions

	Name	Description
	laRadioButtonGroup_AddButton	Add a button widget to the button list of the selected Radio button group.
	laRadioButtonGroup_Create	This function creates a GFX_GOL_RADIOBUTTON group with the provided button list.
	laRadioButtonGroup_Destroy	This function destroys the GFX_GOL_RADIOBUTTON group
	laRadioButtonGroup_RemoveButton	Remove a button widget to the button list of the selected Radio button group.
	laRadioButtonGroup_SelectButton	Select the button widget specified from the button list for the Radio button group.

Structures

	Name	Description
	laRadioButtonGroup_t	Defines the structure used for the Radio Button group.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements functions to control a radio button group.

File Name

libaria_radiobutton_group.h

Company

Microchip Technology Inc.

libaria_scheme.h

A scheme is a collection of colors that can be referenced by one or more widgets. Widgets may use schemes in different ways. While the color names strive to be intuitive they aren't always used in the manner in which they describe.

Functions

	Name	Description
	laScheme_Initialize	Initialize the scheme to the default values as per the specified color mode.

Structures

	Name	Description
	laScheme_t	This structure specifies the style scheme components of an object.
	laScheme	This structure specifies the style scheme components of an object.

Description

Module for Microchip Graphics Library - Aria User Interface Library

File Name

libaria_scheme.h

Company

Microchip Technology Inc.

libaria_screen.h

A screen describes the state of a set of layers. It can be orthogonally rotated and its life-cycle can be configured.

Enumerations

	Name	Description
	laScreenOrientation_t	Possible values for screen orientation.
	laScreenOrientation	Possible values for screen orientation.

Functions

	Name	Description
	laScreen_Delete	Frees all memory for all layers and widgets for this screen
	laScreen_GetHideEventCallback	Returns the hide call back event function pointer for the specified screen
	laScreen_GetLayerIndex	Returns the index of the layer for the screen specified.
	laScreen_GetLayerSwapSync	Returns the layer swap sync setting for the specified screen
	laScreen_GetMirrored	Returns the mirror setting for the specified screen
	laScreen_GetOrientation	Returns the orientation object associated with the specified screen
	laScreen_GetShowEventCallback	Returns the show call back event function pointer for the specified screen
	laScreen_Hide	Hide the currently active screen This function has been deprecated in favor of laContext_SetActiveScreen
	laScreen_New	Create a new screen, initialize it to the values specified.
	laScreen_SetHideEventCallback	Set the hide call back event function pointer for the specified screen
	laScreen_SetLayer	Assigns the provided layer pointer to the screen at the given index This function has been deprecated in favor of laContext_SetActiveScreen
	laScreen_SetLayerSwapSync	Sets the layer swap sync setting for the specified screen

	laScreen_SetMirrored	Sets the mirror setting for the specified screen
	laScreen_SetOrientation	Sets the orientation object to the specified screen
	laScreen_SetShowEventCallback	Set the show call back event function pointer for the specified screen
	laScreen_Show	Make the specified screen active and show it on the display

Structures

	Name	Description
	laScreen_t	The structure to maintain the screen related variables and event handling
	laScreen	The structure to maintain the screen related variables and event handling

Types

	Name	Description
	laScreen_CreateCallback_FnPtr	Callback pointer for a new screen create event notification. This is called when the library attempts to create a screen.
	laScreen_ShowHideCallback_FnPtr	Callback pointer for the active screen show or hide event change notification.

Description

Module for Microchip Graphics Library - Aria User Interface Library

File Name

libaria_screen.h

Company

Microchip Technology Inc.

libaria_string.h

A string library implementation for the Aria user interface library.

Functions

	Name	Description
	laString_Allocate	Attempts to resize the local data buffer for a string.
	laString_Append	Appends a string onto the end of another string
	laString_Capacity	Returns the capacity of a string
	laString_CharAt	Extracts the code point for the character in a string at a given index.
	laString_Clear	Sets a string's length to zero and its string table reference to NULL. Does not free any associated data and preserves capacity.
	laString_Compare	Compares two string objects
	laString_CompareBuffer	Compares a string object and a GFXU_CHAR* buffer
	laString_Copy	Copies the values from one string into another
	laString_CreateFromBuffer	Creates a string object from a GFXU_CHAR buffer and a font asset pointer
	laString_CreateFromCharBuffer	Creates a string object from a const char* buffer and a font asset pointer. This method provides compatibility with standard c-style strings. Input string will be converted from 8-bit with to 32-bit width.
	laString_CreateFromID	Creates a string object that simply references a string in the string table.
	laString_Delete	Deletes all memory associated with a string object
	laString_Destroy	Destroys a string object. This frees the strings internal data buffer, if it exists, sets its string table reference to null, and clears all supporting attributes.
	laString_Draw	Wrapper around GFX Utility string draw function for Aria user interface library. Internal use only.
	laString_DrawClipped	Wrapper around GFX Utility string draw function for Aria user interface library. Draws only a clipped area of a string. Internal use only.
	laString_DrawSubStringClipped	Wrapper around GFX Utility string draw function for Aria user interface library. Draws the substring between the start and end offset, and draws only the section of the string within the clipping rectangle. Internal use only.
	laString_ExtractFromTable	Extracts a read-only string from the string table into a modifiable string object. This relies on the active context to indicate which string table to reference as well as which language entry to extract.
	laString_GetCharIndexAtPoint	Given an offset in pixels returns the corresponding character index.

	laString_GetCharOffset	Returns the offset of a given character index in pixels.
	laString_GetCharWidth	Given a character index, gets the width of that character. Only accurate if the string has a font associated with it and that font contains all the characters in the string in question.
	laString_GetHeight	Returns the height of a string by referencing its associated font asset data.
	laString_GetLineRect	Calculates the rectangle for a line in a string object. References the associated font for the height but must perform a summation for each character in the string by doing a font meta-data lookup. The line ends when a line feed or end of string is reached.
	laString_GetMultiLineRect	Calculates the rectangle for a given multi-line string object. References the associated font for the height but must perform a summation for each character in the string by doing a font meta-data lookup. The height the sum of the heights of the bounding rectangles for each line and the width is the widest among the bounding rectangles.
	laString_GetRect	Calculates the rectangle for a given string object. References the associated font for the height but must perform a summation for each character in the string by doing a font meta-data lookup.
	laString_Initialize	Initializes a string struct to default
	laString_Insert	Inserts a string into another string at a given index
	laString_IsEmpty	Returns a boolean indicating if the provided string contains data or has a link to the string table.
	laString_Length	Calculates the length of a string in characters
	laString_New	Allocates a memory for a new string
	laString_ReduceLength	Reduces the length of a string. This simply slides the null terminator to the left and does not affect the string's capacity value.
	laString_Remove	Removes a number of characters from a string at a given index
	laString_Set	Attempts to set the local data buffer of a string to an input buffer
	laString_SetCapacity	Attempts to adjust the capacity of a string
	laString_ToCharBuffer	Extracts the data buffer from a string and copies it into the provided buffer argument.

Macros

	Name	Description
	LA_STRING_NULLIDX	This is macro LA_STRING_NULLIDX.

Structures

	Name	Description
	laString_t	String definition
	laString	String definition

Types

	Name	Description
	laContext	An instance of the Aria user interface library.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This is a string library implementation that is used internally by the Aria user interface library. All of the memory operations are handled by the memory interface that is provided by the active libaria context. Applications that wish to use this implementation must ensure that the appropriate libaria context is active when calling these functions.

This implementation relies on the GFXU_CHAR definition for characters provided by the GFX Utils library. This chararcter definition is 32 bits in size and allows libaria to support international character code points and Unicode encoding standards.

File Name

libaria_string.h

Company

Microchip Technology Inc.

libaria_utils.h

General internal utilities for the library

Functions

	Name	Description
	laUtils_ArrangeRectangle	Calculates the position of a rectangle within the given bounds and in accordance with the given parameters. A use case for this is when an image and a text rectangle must be arranged in a button box. This version of the algorithm will calculate the location of the image rectangle.
	laUtils_ArrangeRectangleRelative	Calculates the position of a rectangle within the given bounds and in accordance with the given parameters. A use case for this is when an image and a text rectangle must be arranged in a button box. This version of the algorithm will calculate the location of the text rectangle.
	laUtils_ChildIntersectsParent	Performs an intersection test between a parent widget and a child widget
	laUtils_ClipRectToParent	Clips a rectangle to the parent of a widget
	laUtils_GetLayer	Finds the root parent of a widget, which should be a layer
	laUtils_GetNextHighestWidget	Gets the next highest Z order widget in the tree from 'wgt'
	laUtils_ListOcclusionCullTest	Performs an occlusion test on a list of widgets an a rectangular area. This attempts to find only the topmost widgets for the given area. If a widget is completely occluded then it is removed from the list. Any widgets that remain in the list should be redrawn by the rasterizer.
	laUtils_OcclusionCullTest	Performs an occlusion test for a widget in the tree. A widget is occluded if it is completely covered by one or more widgets. This is useful for culling widgets before the rasterizing phase.
	laUtils_Pick	Finds the top-most visible widget in the tree at the given coordinates.
	laUtils_PickFromLayer	Finds the top-most visible widget in a layer at the given coordinates.
	laUtils_PickRect	Finds all of the visible widgets in the given rectangular area.
	laUtils_PointScreenToLocalSpace	Converts a point from layer space into the local space of a widget
	laUtils_PointToLayerSpace	Converts a point from widget space into layer space
	laUtils_RectFromLayerSpace	Converts a rectangle from layer space to widget local space
	laUtils_RectFromParentSpace	Converts a rectangle from widget parent space to widget local space
	laUtils_RectToLayerSpace	Converts a rectangle from widget local space to layer space
	laUtils_RectToParentSpace	Converts a rectangle from widget local space to widget parent space. Widget must be a child of a layer for this to function.
	laUtils_RectToScreenSpace	Converts a rectangle from widget local space to screen space
	laUtils_ScreenToMirroredSpace	Takes a point in screen space and returns a transformed version in mirrored space.
	laUtils_ScreenToOrientedSpace	Takes a point in screen space and returns a transformed version in oriented space.
	laUtils_WidgetIsOccluded	This is function laUtils_WidgetIsOccluded.
	laUtils_WidgetLayerRect	Returns the bounding rectangle of a widget in layer space
	laUtils_WidgetLocalRect	Returns the bounding rectangle of a widget in local space

Types

	Name	Description
	GFX_Point	A two dimensional Cartesian point.
	GFX_Rect	A rectangle definition.
	laLayer	Primary definition of a layer. Builds on base functions of a standard widget. Should never have a direct parent.
	laList	Linked list definition

Description

Module for Microchip Graphics Library - Aria User Interface Library

File Name

libaria_utils.h

Company

Microchip Technology Inc.

libaria_widget.h

Enumerations

	Name	Description
	laBackgroundType_t	Specifies the different background types used for the widgets in the library

	laBorderType_t	Specifies the different border types used for the widgets in the library
	laWidgetDirtyState_t	Specifies the different dirty states the widget can be assigned
	laWidgetDrawState_t	Specifies the different draw states the widget can be assigned
	laWidgetOptimizationFlags_t	Specifies the different draw optimization flags for a widget
	laWidgetType_t	Specifies the different widget types used in the library
	laWidgetUpdateState_t	Specifies the different update states the widget can be assigned
	laBackgroundType	Specifies the different background types used for the widgets in the library
	laBorderType	Specifies the different border types used for the widgets in the library
	laWidgetDirtyState	Specifies the different dirty states the widget can be assigned
	laWidgetDrawState	Specifies the different draw states the widget can be assigned
	laWidgetOptimizationFlags	Specifies the different draw optimization flags for a widget
	laWidgetType	Specifies the different widget types used in the library
	laWidgetUpdateState	Specifies the different update states the widget can be assigned

Functions

	Name	Description
	laWidget_AddChild	Adds the child to the parent widget specified in the argument
	laWidget_Delete	Delete the widget object specified
	laWidget_DeleteAllDescendants	Deletes all of the descendants of the given widget.
	laWidget_GetAlphaAmount	Return the widget's global alpha amount
	laWidget_GetAlphaEnable	Return the alpha enable property of the widget
	laWidget_GetBackgroundType	Return the property value 'background type' associated with the widget object
	laWidget_GetBorderType	Return the border type associated with the widget object
	laWidget_GetChildAtIndex	Fetches the child at the specified index from the children list of the specified parent widget
	laWidget_GetChildCount	Returns the size of the children list of the specified parent widget
	laWidget_GetCumulativeAlphaAmount	Calculates the cumulative alpha amount for a hierarchy of widgets
	laWidget_GetCumulativeAlphaEnable	Determines if this or any ancestor widget has alpha enabled
	laWidget_GetEnabled	Returns the boolean value of the widget enabled property
	laWidget_GetHeight	Returns the widget rectangles height
	laWidget_GetIndexOfChild	Fetches the index of the child from the children list of the specified parent widget
	laWidget_GetMargin	Returns the margin value associated with the widget in the laMargin pointer
	laWidget_GetOptimizationFlags	Returns the optimization flags for the widget
	laWidget_GetScheme	Returns the scheme associated with the specified widget
	laWidget_GetVisible	Returns the boolean value of the widget visible property
	laWidget_GetWidth	Returns the widget rectangles width
	laWidget_GetX	Returns the widget rectangles upper left corner x-coordinate
	laWidget_GetY	Returns the widget rectangles upper left corner y-coordinate
	laWidget_HasFocus	Checks if the widget specified has focus in the current context
	laWidget_Invalidate	Invalidates the specified widget.
	laWidget_isOpaque	Returns true if the widget is considered opaque.
	laWidget_New	Create a new widget.
	laWidget_OverrideTouchDownEvent	Replace the TouchDownEvent callback for the widget with the new function pointer specified
	laWidget_OverrideTouchMovedEvent	Replace the TouchMovedEvent callback for the widget with the new function pointer specified
	laWidget_OverrideTouchUpEvent	Replace the TouchUpEvent callback for the widget with the new function pointer specified
	laWidget_RectToLayerSpace	Transforms a widget rectangle from local space to its root layer space.
	laWidget_RectToParentSpace	Returns the rectangle containing the parent of the widget specified
	laWidget_RectToScreenSpace	Transforms a widget rectangle from local space to screen space coordinates.
	laWidget_RemoveChild	Removes the child from the parent widget specified in the argument
	laWidget_Resize	Changes the widget size by the new defined width and height increments.
	laWidget_SetAlphaAmount	Set the widget's global alpha amount to the specified alpha amount
	laWidget_SetAlphaEnable	Set the alpha enable property of the widget with the boolean value specified
	laWidget_SetBackgroundType	Set the property value 'background type' associated with the widget object
	laWidget_SetBorderType	Set the border type associated with the widget object

	laWidget_SetEnabled	Sets the boolean value of the widget enabled property
	laWidget_SetFocus	Set the widget into focus for the current context.
	laWidget_SetHeight	Sets the widget's height value
	laWidget_SetMargins	Set the margin value for left, right, top and bottom margins associated with the widget
	laWidget_SetOptimizationFlags	Sets the optimizations for a widget
	laWidget_SetParent	Sets the parent of the child widget to that specified in the argument list
	laWidget_SetPosition	Changes the widget position to the new defined x and y coordinates.
	laWidget_SetScheme	Sets the scheme variable for the specified widget
	laWidget_SetSize	Changes the widget size to the new defined width and height dimensions.
	laWidget_SetVisible	Sets the boolean value of the widget visible property
	laWidget_SetWidth	Sets the widget's width value
	laWidget_SetX	Sets the widget's x coordinate position
	laWidget_SetY	Sets the widget's y coordinate position
	laWidget_Translate	Changes the widget position by moving the widget by the defined x and y increments.

Macros

	Name	Description
	DEFAULT_BORDER_MARGIN	This is macro DEFAULT_BORDER_MARGIN.

Structures

	Name	Description
	laWidget_t	Specifies Graphics widget structure to manage all properties and events associated with the widget
	laWidget	Specifies Graphics widget structure to manage all properties and events associated with the widget

Types

	Name	Description
	laRectArray	This is type laRectArray.
	laWidget_Constructor_FnPtr	This is type laWidget_Constructor_FnPtr.
	laWidget_Destructor_FnPtr	This is type laWidget_Destructor_FnPtr.
	laWidget_DrawFunction_FnPtr	This is type laWidget_DrawFunction_FnPtr.
	laWidget_Focus_FnPtr	This is type laWidget_Focus_FnPtr.
	laWidget_InvalidateBorderAreas_FnPtr	This is type laWidget_InvalidateBorderAreas_FnPtr.
	laWidget_LanguageChangingEvent_FnPtr	This is type laWidget_LanguageChangingEvent_FnPtr.
	laWidget_Moved_FnPtr	This is type laWidget_Moved_FnPtr.
	laWidget_Paint_FnPtr	This is type laWidget_Paint_FnPtr.
	laWidget_Resized_FnPtr	This is type laWidget_Resized_FnPtr.
	laWidget_TouchDownEvent_FnPtr	This is type laWidget_TouchDownEvent_FnPtr.
	laWidget_TouchMovedEvent_FnPtr	This is type laWidget_TouchMovedEvent_FnPtr.
	laWidget_TouchUpEvent_FnPtr	This is type laWidget_TouchUpEvent_FnPtr.
	laWidget_Update_FnPtr	This is type laWidget_Update_FnPtr.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements top level widget control functions.

File Name

libaria_widget.h

Company

Microchip Technology Inc.

libaria_widget_button.h

Defines a button widget

Enumerations

	Name	Description
	laButtonState_t	Controls the button pressed state
	laButtonState	Controls the button pressed state

Functions

	Name	Description
	laButtonWidget_GetHAlignment	Gets the horizontal alignment setting for a button
	laButtonWidget_GetImageMargin	Gets the distance between the icon and the text
	laButtonWidget_GetImagePosition	Gets the position of the button icon
	laButtonWidget_GetPressed	Gets the pressed state of a button
	laButtonWidget_GetPressedEventCallback	Gets the callback associated with the button pressed event
	laButtonWidget_GetPressedImage	Gets the pressed image asset pointer for a button
	laButtonWidget_GetPressedOffset	Gets the offset of the button internals when pressed
	laButtonWidget_GetReleasedEventCallback	Gets the callback for the button released event
	laButtonWidget_GetReleasedImage	Gets the currently used released icon
	laButtonWidget_GetText	Gets the text for a button. If the button's string has local data then a duplicate of the string will be allocated. The caller is responsible for managing the memory for the duplicated string. If the button string is a string table reference then only the reference ID is copied.
	laButtonWidget_GetToggleable	Gets the value of this button's toggle flag
	laButtonWidget_GetVAlignment	Gets the vertical alignment setting for a button
	laButtonWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laButtonWidget_SetHAlignment	Sets the horizontal alignment value for a button
	laButtonWidget_SetImageMargin	Sets the distance between the icon and text
	laButtonWidget_SetImagePosition	Sets the position of the button icon
	laButtonWidget_SetPressed	Sets the pressed state for a button.
	laButtonWidget_SetPressedEventCallback	Sets the pressed event callback for the button
	laButtonWidget_SetPressedImage	Sets the image to be used as a pressed icon
	laButtonWidget_SetPressedOffset	Sets the offset of the button internals when pressed
	laButtonWidget_SetReleasedEventCallback	Sets the callback for the button released event
	laButtonWidget_SetReleasedImage	Sets the image to be used as the released icon
	laButtonWidget_SetText	Sets the text for a button. If the input string has local data then the data will be copied into the button's local string, causing a memory allocation. If the input string is a string table reference then only the reference will be copied. The input string can be safely modified and the button string will not be affected.
	laButtonWidget_SetToggleable	Enables the toggle mode for a button. When pressed, toggle buttons will stay down until pressed again.
	laButtonWidget_SetVAlignment	Sets the vertical alignment for a button

Structures

	Name	Description
	laButtonWidget_t	Implementation of a button widget. A button is an interactive element that simulates a typical button with a pressed an released state.

Types

	Name	Description
	laButtonWidget_PressedEvent	This is type laButtonWidget_PressedEvent.
	laButtonWidget_ReleasedEvent	This is type laButtonWidget_ReleasedEvent.

Description

Module for Microchip Graphics Library - Aria User Interface Library

File Name

libaria_widget_button.h

Company

Microchip Technology Inc.

libaria_widget_checkbox.h

Functions

	Name	Description
	laCheckBoxWidget_GetChecked	Gets the checked state of the check box
	laCheckBoxWidget_GetCheckedEventCallback	Gets the checked event callback
	laCheckBoxWidget_GetCheckedImage	Gets the checked image of the check box
	laCheckBoxWidget_GetHAlignment	Gets the horizontal alignment of the check box
	laCheckBoxWidget_GetImageMargin	Gets the distance between the image and the text
	laCheckBoxWidget_GetImagePosition	Gets the image position of the check box
	laCheckBoxWidget_GetText	Gets a copy of the checkbox text. If the text has local data the data will be duplicated. The caller is responsible for managing the memory as appropriate.
	laCheckBoxWidget_GetUncheckedEventCallback	Gets the unchecked event callback
	laCheckBoxWidget_GetUncheckedImage	Gets the unchecked image of the check box
	laCheckBoxWidget_GetVAlignment	Gets the vertical alignment of the check box
	laCheckBoxWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laCheckBoxWidget_SetChecked	Sets the checked state of the check box
	laCheckBoxWidget_SetCheckedEventCallback	Sets the checked event callback
	laCheckBoxWidget_SetCheckedImage	Sets the checked image of the check box
	laCheckBoxWidget_SetHAlignment	Sets the horizontal alignment of the check box.
	laCheckBoxWidget_SetImageMargin	Sets the distance between the image and the text
	laCheckBoxWidget_SetImagePosition	Sets the image position of the check box
	laCheckBoxWidget_SetText	Sets the checkbox text to the input string. If the string has local data the data will be duplicated and copied to the checkboxes internal string.
	laCheckBoxWidget_SetUncheckedEventCallback	Sets the unchecked event callback
	laCheckBoxWidget_SetUncheckedImage	Sets the unchecked image of the check box
	laCheckBoxWidget_SetVAlignment	Sets the vertical alignment of the check box

Structures

	Name	Description
	laCheckBoxWidget_t	Implementation of a checkbox widget.
	laCheckBoxWidget	Implementation of a checkbox widget.

Types

	Name	Description
	laCheckBoxWidget_CheckedEvent	This is type laCheckBoxWidget_CheckedEvent.
	laCheckBoxWidget_UncheckedEvent	This is type laCheckBoxWidget_UncheckedEvent.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements button widget functions.

File Name

libaria_widget_button.h

Company

Microchip Technology Inc.

libaria_widget_circle.h

Functions

	Name	Description
	laCircleWidget_GetOrigin	Gets the origin coordiates of a circle widget
	laCircleWidget_GetRadius	Gets the radius of a circle widget
	laCircleWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laCircleWidget_SetOrigin	Sets the origin coordiates of a circle widget
	laCircleWidget_SetRadius	Sets the radius of a circle widget

Structures

	Name	Description
	laCircleWidget_t	Implementation of a circle widget.
	laCircleWidget	Implementation of a circle widget.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements circle drawing widget functions.

File Name

libaria_widget_circle.h

Company

Microchip Technology Inc.

libaria_widget_drawsurface.h

Functions

	Name	Description
	laDrawSurfaceWidget_GetDrawCallback	Returns the pointer to the currently set draw callback.
	laDrawSurfaceWidget_New	Allocates memory for a new DrawSurface widget.
	laDrawSurfaceWidget_SetDrawCallback	Sets the draw callback pointer for the draw surface widget.

Structures

	Name	Description
	laDrawSurfaceWidget_t	Implementation of a Drawsurface widget.
	laDrawSurfaceWidget	Implementation of a Drawsurface widget.

Types

	Name	Description
	laDrawSurfaceWidget_DrawCallback	This is type laDrawSurfaceWidget_DrawCallback.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements surface container drawing functions.

File Name

Company

Microchip Technology Inc.

libaria_widget_gradient.h

Enumerations

	Name	Description
	laGradientWidgetDirection_t	Implementation of a gradient widget.
	laGradientWidgetDirection	Implementation of a gradient widget.

Functions

	Name	Description
	laGradientWidget_GetDirection	Gets the gradient direction value for this widget.
	laGradientWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laGradientWidget_SetDirection	Sets the gradient direction value for this widget.

Structures

	Name	Description
	laGradientWidget_t	Gradient widget struct definition.
	laGradientWidget	Gradient widget struct definition.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements gradient drawing widget functions.

File Name

libaria_widget_gradient.h

Company

Microchip Technology Inc.

libaria_widget_groupbox.h

Functions

	Name	Description
	laGroupBoxWidget_GetAlignment	Gets the horizontal alignmnet for the group box title text
	laGroupBoxWidget_GetText	Gets the text value for the group box.
	laGroupBoxWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laGroupBoxWidget_SetAlignment	Sets the alignment for the group box title text
	laGroupBoxWidget_SetText	Sets the text value for the group box.

Structures

	Name	Description
	laGroupBoxWidget_t	Group box struct definition.
	laGroupBoxWidget	Group box struct definition.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements group box widget functions.

File Name

libaria_widget_image.h

Functions

	Name	Description
	laImageWidget_GetHAlignment	Gets the image horizontal alignment value.
	laImageWidget_GetImage	Gets the image asset pointer for the widget.
	laImageWidget_GetVAlignment	Gets the image vertical alignment value.
	laImageWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laImageWidget_SetCallBackEnd	This is function laImageWidget_SetCallBackEnd.
	laImageWidget_SetCallBackStart	This is function laImageWidget_SetCallBackStart.
	laImageWidget_SetHAlignment	Sets the image horizontal alignment value.
	laImageWidget_SetImage	Sets the image asset pointer for the widget.
	laImageWidget_SetVAlignment	Sets the image vertical alignment value.

Structures

	Name	Description
	laImageWidget_t	Image widget struct definition
	laImageWidget	Image widget struct definition

Types

	Name	Description
	laImageWidget_DrawEventCallback	

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements image widget functions.

File Name

libaria_widget_image.h

Company

Microchip Technology Inc.

libaria_widget_imagesequence.h

Functions

	Name	Description
	laImageSequenceWidget_GetImage	Gets the image asset pointer for an entry.
	laImageSequenceWidget_GetImageChangedEventCallback	Gets the image changed event callback pointer.
	laImageSequenceWidget_GetImageCount	Gets the number of image entries for this widget.
	laImageSequenceWidget_GetImageDelay	Gets the image delay for an entry.
	laImageSequenceWidget_GetImageHAlignment	Gets the horizontal alignment for an image entry
	laImageSequenceWidget_GetImageVAlignment	Sets the vertical alignment for an image entry
	laImageSequenceWidget_GetRepeat	Indicates if the widget will repeat through the image entries.
	laImageSequenceWidget_IsPlaying	Indicates if the widget is currently cycling through the image entries.
	laImageSequenceWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laImageSequenceWidget_Play	Starts the widget automatically cycling through the image entries.
	laImageSequenceWidget_Rewind	Resets the current image sequence display index to zero.
	laImageSequenceWidget_SetImage	Sets the image asset pointer for an entry.
	laImageSequenceWidget_SetImageChangedEventCallback	Sets the image changed event callback pointer. This callback is called whenever the active display index is changed.
	laImageSequenceWidget_SetImageCount	Sets the number of image entries for this widget. An image entry that is null will show nothing.

	laImageSequenceWidget_SetImageDelay	Sets the image delay for an entry.
	laImageSequenceWidget_SetImageHAlignment	Sets the horizontal alignment for an image entry.
	laImageSequenceWidget_SetImageVAlignment	Sets the vertical alignment value for an image entry
	laImageSequenceWidget_SetRepeat	Sets the repeat flag for the widget
	laImageSequenceWidget_ShowImage	Sets the active display index to the indicated value.
	laImageSequenceWidget_ShowNextImage	Sets the active display index to the next index value.
	laImageSequenceWidget_ShowPreviousImage	Sets the active display index to the previous index value.
	laImageSequenceWidget_Stop	Stops the widget from automatically cycling through the image entries.

Macros

	Name	Description
	LA_IMAGESEQ_RESTART	This is macro LA_IMAGESEQ_RESTART.

Structures

	Name	Description
	laImageSequenceEntry_t	Image sequence entry definition
	laImageSequenceWidget_t	Image sequence widget struct definition
	laImageSequenceEntry	Image sequence entry definition
	laImageSequenceWidget	Image sequence widget struct definition

Types

	Name	Description
	laImageSequenceImageChangedEvent_FnPtr	This is type laImageSequenceImageChangedEvent_FnPtr.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements image sequence (slide show) widget drawing functions.

File Name

libaria_widget_imagesequence.h

Company

Microchip Technology Inc.

libaria_widget_keypad.h

Enumerations

	Name	Description
	laKeyPadCellAction_t	Defines an assigned action to a key pad cell
	laKeyPadCellAction	Defines an assigned action to a key pad cell

Functions

	Name	Description
	laKeyPadWidget_GetKeyAction	Gets the key pad cell action for a cell at row/column
	laKeyPadWidget_GetKeyClickEventCallback	Gets the current key click event callback pointer
	laKeyPadWidget_GetKeyDrawBackground	Gets the background type for a key pad cell at row/column
	laKeyPadWidget_GetKeyEnabled	Gets the enabled flag for a cell at a given row/column
	laKeyPadWidget_GetKeyImageMargin	Gets the key pad cell image margin value
	laKeyPadWidget_GetKeyImagePosition	Gets the image position for a key pad cell
	laKeyPadWidget_GetKeyPressedImage	Gets the pressed icon image asset pointer for the display image for a key pad cell
	laKeyPadWidget_GetKeyReleasedImage	Gets the released icon image asset pointer for the display image for a key pad cell
	laKeyPadWidget_GetKeyText	Returns a copy of the display text for a given cell at row/column
	laKeyPadWidget_GetKeyValue	Gets the edit text value for a given key pad cell.
	laKeyPadWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laKeyPadWidget_SetKeyAction	Sets the cell action type for a key pad cell at row/column

	laKeyPadWidget_SetKeyBackgroundType	Sets the background type for a key pad cell at row/column
	laKeyPadWidget_SetKeyClickEventCallback	Sets the current key click event callback pointer
	laKeyPadWidget_SetKeyEnabled	Sets the enabled flag for a cell at the given row/column
	laKeyPadWidget_SetKeyImageMargin	Sets the key pad cell image margin value for a given cell at row/column
	laKeyPadWidget_SetKeyImagePosition	
	laKeyPadWidget_SetKeyPressedImage	Sets the pressed icon image asset pointer for a key pad cell
	laKeyPadWidget_SetKeyReleasedImage	Sets the released icon image asset pointer for a key pad cell
	laKeyPadWidget_SetKeyText	Sets the display text for a given cell at row/column
	laKeyPadWidget_SetKeyValue	Sets the edit value for a given key pad cell.

Structures

	Name	Description
	laKeyPadCell_t	Defines a key pad cell struct
	laKeyPadWidget_t	Defines a key pad widget struct
	laKeyPadCell	Defines a key pad cell struct
	laKeyPadWidget	Defines a key pad widget struct

Types

	Name	Description
	laButtonWidget	Implementation of a button widget. A button is an interactive element that simulates a typical button with a pressed an released state.
	laKeyPadWidget_KeyClickEvent	This is type laKeyPadWidget_KeyClickEvent.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements keypad widget functions.

File Name

libaria_widget_keypad.h

Company

Microchip Technology Inc.

libaria_widget_label.h

Functions

	Name	Description
	laLabelWidget_GetHAlignment	Gets the text horizontal alignment value.
	laLabelWidget_GetText	Gets the text value for the label.
	laLabelWidget_GetVAlignment	Gets the current vertical text alignment
	laLabelWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laLabelWidget_SetHAlignment	Sets the text horizontal alignment value
	laLabelWidget_SetText	Sets the text value for the label.
	laLabelWidget_SetVAlignment	Sets the vertical text alignment value

Structures

	Name	Description
	laLabelWidget_t	Implementation of a label widget struct
	laLabelWidget	Implementation of a label widget struct

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements label (text) widget functions.

File Name

libaria_widget_label.h

Company

Microchip Technology Inc.

libaria_widget_line.h

Functions

	Name	Description
	laLineWidget_GetEndPoint	Gets the coordinates for the second point of the line.
	laLineWidget_GetStartPoint	Gets the coordinates for the first point of the line.
	laLineWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laLineWidget_SetEndPoint	Sets the cooridnate for the second point of the line
	laLineWidget_SetStartPoint	Sets the cooridnate for the first point of the line

Structures

	Name	Description
	laLineWidget_t	Defines the implementation of a line widget struct
	laLineWidget	Defines the implementation of a line widget struct

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements line draw widget functions.

File Name

libaria_widget_line.h

Company

Microchip Technology Inc.

libaria_widget_list.h

Enumerations

	Name	Description
	laListWidget_SelectionMode_t	Defines the list selection modes
	laListWidget_SelectionMode	Defines the list selection modes

Functions

	Name	Description
	laListWidget_AppendItem	Appends a new item entry to the list. The initial value of the item will be empty.
	laListWidget_DeselectAll	Attempts to set all item states as not selected.
	laListWidget_GetAlignment	Gets the horizontal alignment for the list widget
	laListWidget_GetAllowEmptySelection	Returns true of the list allows an empty selection set
	laListWidget_GetFirstSelectedItem	Returns the lowest selected item index.
	laListWidget_GetIconMargin	Gets the icon margin value for the list widget
	laListWidget_GetIconPosition	Gets the icon position for the list
	laListWidget_GetItemCount	Gets the number of items currently contained in the list
	laListWidget_GetItemIcon	Gets the pointer to the image asset for the icon for the item at the given index.
	laListWidget_GetItemSelected	Returns true if the item at the given index is currently selected.
	laListWidget_GetItemText	Gets the text value for an item in the list.
	laListWidget_GetLastSelectedItem	Returns the highest selected item index.
	laListWidget_GetSelectedItemChangedEventCallback	Gets the callback for the item selected changed event
	laListWidget_GetSelectionCount	Returns the number of selected items in the list.
	laListWidget_GetSelectionMode	Gets the selection mode for the list

	laListWidget_InsertItem	Attempts to insert a new item at the desired index. Existing items at idx or greater will be shuffled one index to the right.
	laListWidget_New	Allocates memory for and initializes a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laListWidget_RemoveAllItems	Attempts to remove all items from the list.
	laListWidget_RemoveItem	Attempts to remove an item from the list.
	laListWidget_SelectAll	Attempts to set all item states to selected.
	laListWidget_SetAlignment	Sets the horizontal alignment mode for the list widget.
	laListWidget_SetAllowEmptySelection	Configures the list to allow an empty selection set.
	laListWidget_SetIconMargin	Sets the icon margin value for the list widget.
	laListWidget_SetIconPosition	Sets the icon position for the list widget
	laListWidget_SetItemIcon	Sets the icon pointer for a given index.
	laListWidget_SetItemSelected	Attempts to set the item at idx as selected.
	laListWidget_SetItemText	Sets the text value for an item in the list.
	laListWidget_SetItemVisible	
	laListWidget_SetSelectedItemChangedEventCallback	Sets the callback for the item selected changed event
	laListWidget_SetSelectionMode	Set the list selection mode
	laListWidget_ToggleItemSelected	Attempts to toggle the selected state of the item at idx.

Structures

	Name	Description
	laListItem_t	Defines a list item struct
	laListWidget_t	Defines the implementation of a list widget
	laListItem	Defines a list item struct
	laListWidget	Defines the implementation of a list widget

Types

	Name	Description
	laListWidget_ItemSelectedChangedEvent	This is type laListWidget_ItemSelectedChangedEvent.
	laListWidget_SelectedItemChangedEvent	This is type laListWidget_SelectedItemChangedEvent.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements list box widget functions.

File Name

libaria_widget_list.h

Company

Microchip Technology Inc.

libaria_widget_listwheel.h

Functions

	Name	Description
	laListWheelWidget_AppendItem	Appends a new item entry to the list. The initial value of the item will be empty.
	laListWheelWidget_GetAlignment	Gets the horizontal alignment for the list widget
	laListWheelWidget_GetFlickInitSpeed	Returns the flick init speed for the wheel.
	laListWheelWidget_GetIconMargin	Gets the icon margin value for the list wheel widget
	laListWheelWidget_GetIconPosition	Sets the icon position for the list wheel widget.
	laListWheelWidget_GetIndicatorArea	Returns the spacing for the selected item indicator bars.
	laListWheelWidget_GetItemCount	Gets the number of items currently contained in the list
	laListWheelWidget_GetItemIcon	Gets the pointer to the image asset for the icon for the item at the given index.
	laListWheelWidget_GetItemText	Gets the text value for an item in the list.

	laListWheelWidget_GetMaxMomentum	Returns the maximum momentum value for the wheel.
	laListWheelWidget_GetMomentumFalloffRate	Returns the momentum falloff rate for the wheel.
	laListWheelWidget_GetRotationUpdateRate	Returns the wheel rotation update rate.
	laListWheelWidget_GetSelectedItem	Returns the index of the currently selected item.
	laListWheelWidget_GetSelectedItemChangedEventCallback	Gets the callback for the item selected changed event
	laListWheelWidget_GetShaded	Returns true if the list is using gradient shading to illustrate depth
	laListWheelWidget_GetShowIndicators	Returns true if the list is displaying its selected item indicators
	laListWheelWidget_GetVisibleItemCount	Returns the list's visible item count
	laListWheelWidget_InsertItem	Attempts to insert a new item at the desired index. Existing items at idx or greater will be shuffled one index to the right.
	laListWheelWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laListWheelWidget_RemoveAllItems	Attempts to remove all items from the list.
	laListWheelWidget_RemoveItem	Attempts to remove an item from the list.
	laListWheelWidget_SelectNextItem	Attempts to move the selected item index to the next item in the list.
	laListWheelWidget_SelectPreviousItem	Attempts to move the selected item index to the previous item in the list.
	laListWheelWidget_SetAlignment	Sets the horizontal alignment mode for the list widget.
	laListWheelWidget_SetFlickInitSpeed	Configures the flick init speed for the list wheel
	laListWheelWidget_SetIconMargin	Sets the icon margin value for the list widget.
	laListWheelWidget_SetIconPosition	Sets the icon position for the list wheel widget
	laListWheelWidget_SetIndicatorArea	Configures the display area for the list selection indicator bars
	laListWheelWidget_SetItemIcon	Sets the icon pointer for a given index.
	laListWheelWidget_SetItemText	Sets the text value for an item in the list.
	laListWheelWidget_SetMaxMomentum	Configures the maximum momentum value for the wheel
	laListWheelWidget_SetMomentumFalloffRate	Configures the momentum falloff rate for the wheel
	laListWheelWidget_SetRotationUpdateRate	Configures the rotation update rate for a wheel
	laListWheelWidget_SetSelectedItem	Attempts to set the selectedi tem index
	laListWheelWidget_SetSelectedItemChangedEventCallback	
	laListWheelWidget_SetShaded	Configures the list to use gradient or flat background shading
	laListWheelWidget_SetShowIndicators	Configures the list to display the selected item indicator bars
	laListWheelWidget_SetVisibleItemCount	Sets the number of visible items in the list. Must be greater than or equal to three and must be an odd number.

Structures

	Name	Description
	laListWheelItem_t	Implementation of a list wheel widget item struct
	laListWheelWidget_t	Implementation of a list wheel widget struct
	laListWheelItem	Implementation of a list wheel widget item struct
	laListWheelWidget	Implementation of a list wheel widget struct

Types

	Name	Description
	laListWheelWidget_SelectedItemChangedEvent	This is type laListWheelWidget_SelectedItemChangedEvent.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements list wheel (drawing-style list box) widget functions.

File Name

libaria_widget_listwheel.h

Company

Microchip Technology Inc.

libaria_widget_progressbar.h

Enumerations

	Name	Description
	laProgressBarDirection_t	Defines the valid values for the progress bar widget fill directions.
	laProgressBarDirection	Defines the valid values for the progress bar widget fill directions.

Functions

	Name	Description
	laProgressBarWidget_GetDirection	Gets the fill direction value for a progress bar widget
	laProgressBarWidget_GetValue	Gets the percentage value for a progress bar.
	laProgressBarWidget_GetValueChangedEventCallback	Gets the currently set value changed event callback.
	laProgressBarWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laProgressBarWidget_SetDirection	Sets the fill direction for a progress bar widget
	laProgressBarWidget_SetValue	Sets the percentage value for a progress bar. Valid values are 0 - 100.
	laProgressBarWidget_SetValueChangedCallback	Sets the desired value changed event callback pointer

Structures

	Name	Description
	laProgressBarWidget_t	Implementation of a progressbar widget struct
	laProgressBarWidget	Implementation of a progressbar widget struct

Types

	Name	Description
	laProgressBar	This is type laProgressBar.
	laProgressBar_ValueChangedEventCallback	This is type laProgressBar_ValueChangedEventCallback.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements progress bar widget functions.

File Name

libaria_widget_progressbar.h

Company

Microchip Technology Inc.

libaria_widget_radiobutton.h

Functions

	Name	Description
	laRadioButtonWidget_GetDeselectedEventCallback	Gets the current radio button deselected event callback
	laRadioButtonWidget_GetGroup	Returns the pointer to the currently set radio button group.
	laRadioButtonWidget_GetHAlignment	Gets the horizontal alignment setting for a button
	laRadioButtonWidget_GetImageMargin	Gets the distance between the icon and the text
	laRadioButtonWidget_GetImagePosition	Gets the current image position setting for the radio button
	laRadioButtonWidget_GetSelected	Returns true if this radio button is currently selected
	laRadioButtonWidget_GetSelectedEventCallback	Gets the current radio button selected event callback
	laRadioButtonWidget_GetSelectedImage	Gets the selected image asset pointer for a button
	laRadioButtonWidget_GetText	Gets the text value for the button.
	laRadioButtonWidget_GetUnselectedImage	Gets the image asset pointer currently used as the unselected icon
	laRadioButtonWidget_GetVAlignment	Sets the vertical alignment for a button
	laRadioButtonWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.

	laRadioButtonWidget_SetDeselectedEventCallback	Sets the deselected callback pointer
	laRadioButtonWidget_SetHAlignment	Sets the horizontal alignment value for a button
	laRadioButtonWidget_SetImageMargin	Sets the distance between the icon and text
	laRadioButtonWidget_SetImagePosition	Sets the image relative position setting for the radio button
	laRadioButtonWidget_SetSelected	Sets this button as selected.
	laRadioButtonWidget_SetSelectedEventCallback	Sets the radio button selected event callback
	laRadioButtonWidget_SetSelectedImage	Sets the image to be used as a selected icon
	laRadioButtonWidget_SetText	Sets the text value for the button.
	laRadioButtonWidget_SetUnselectedImage	Sets the asset pointer for the radio button's unselected image icon
	laRadioButtonWidget_SetVAlignment	Sets the vertical alignment for a button

Structures

	Name	Description
	laRadioButtonWidget_t	Implementation of a radio button widget struct
	laRadioButtonWidget	Implementation of a radio button widget struct

Types

	Name	Description
	laRadioButtonGroup	Defines the structure used for the Radio Button group.
	laRadioButtonWidget_DeselectedEvent	This is type laRadioButtonWidget_DeselectedEvent.
	laRadioButtonWidget_SelectedEvent	This is type laRadioButtonWidget_SelectedEvent.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements radio button widget functions.

File Name

libaria_widget_radiobutton.h

Company

Microchip Technology Inc.

libaria_widget_rectangle.h

Functions

	Name	Description
	laRectangleWidget_GetThickness	Gets the rectangle border thickness setting
	laRectangleWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laRectangleWidget_SetThickness	Sets the rectangle border thickness setting

Structures

	Name	Description
	laRectangleWidget_t	Implementation of a rectangle widget struct
	laRectangleWidget	Implementation of a rectangle widget struct

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements rectangle drawing widget functions.

File Name

libaria_widget_rectangle.h

Company

Microchip Technology Inc.

libaria_widget_scrollbar.h

Enumerations

	Name	Description
	laScrollBarOrientation_t	Defines the scroll bar direction values
	laScrollBarState_t	Defines the various scroll bar state values
	laScrollBarOrientation	Defines the scroll bar direction values
	laScrollBarState	Defines the various scroll bar state values

Functions

	Name	Description
	laScrollBarWidget_GetExtentValue	Gets the current scroll bar extent value
	laScrollBarWidget_GetMaxinumValue	Gets the maximum scroll value
	laScrollBarWidget_GetOrientation	Gets the orientation value for the scroll bar
	laScrollBarWidget_GetScrollPercentage	Gets the current scroll value as a percentage
	laScrollBarWidget_GetScrollValue	Gets the current scroll value
	laScrollBarWidget_GetStepSize	Gets the current discreet step size
	laScrollBarWidget_GetValueChangedEventCallback	Gets the current value changed callback function pointer
	laScrollBarWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laScrollBarWidget_SetExtentValue	Sets the scroll bar extent value
	laScrollBarWidget_SetMaximumValue	Sets the maximum scroll value
	laScrollBarWidget_SetOrientation	Sets the orientation value of the scroll bar
	laScrollBarWidget_SetScrollPercentage	Sets the current scroll value using a percentage. Percentage should be a value from 0 - 100
	laScrollBarWidget_SetScrollValue	Sets the current scroll value
	laScrollBarWidget_SetStepSize	Sets the current step size
	laScrollBarWidget_SetValueChangedEventCallback	Sets the value changed event callback pointer
	laScrollBarWidget_StepBackward	Moves the scroll value back by the current step size
	laScrollBarWidget_StepForward	Moves the scroll value forward by the current step size

Structures

	Name	Description
	laScrollBarWidget_t	Implementation of a scroll bar widget.
	laScrollBarWidget	Implementation of a scroll bar widget.

Types

	Name	Description
	laScrollBarWidget_ValueChangedEvent	This is type laScrollBarWidget_ValueChangedEvent.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements scroll bar widget functions.

File Name

libaria_widget_scrollbar.h

Company

Microchip Technology Inc.

libaria_widget_slider.h

Enumerations

	Name	Description
	laSliderOrientation_t	Slider orientations

	laSliderState_t	Describes various slider states
	laSliderOrientation	Slider orientations
	laSliderState	Describes various slider states

Functions

	Name	Description
	laSliderWidget_GetGripSize	Gets the current grip size of the slider
	laSliderWidget_GetMaxinumValue	Gets the maximum value for the slider
	laSliderWidget_GetMininumValue	Gets the minimum value for the slider
	laSliderWidget_GetOrientation	Gets the orientation value for the slider
	laSliderWidget_GetSliderPercentage	Gets the slider value as a percentage
	laSliderWidget_GetSliderValue	Gets the current slider value
	laSliderWidget_GetValueChangedEventCallback	Gets the current value changed event callback pointer
	laSliderWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laSliderWidget_SetGripSize	Sets the grip size of the slider
	laSliderWidget_SetMaximumValue	Sets the maximum value for the slider
	laSliderWidget_SetMinimumValue	Sets the minimum value for the slider
	laSliderWidget_SetOrientation	
	laSliderWidget_SetSliderPercentage	Sets the slider value using a percentage. Value must be from 0 - 100.
	laSliderWidget_SetSliderValue	Sets the current slider value
	laSliderWidget_SetValueChangedEventCallback	Sets the value changed event callback pointer
	laSliderWidget_Step	Moves the slider by a given amount

Structures

	Name	Description
	laSliderWidget_t	Implementation of a slider widget struct
	laSliderWidget	Implementation of a slider widget struct

Types

	Name	Description
	laSliderWidget_ValueChangedEvent	This is type laSliderWidget_ValueChangedEvent.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements slider control widget functions.

File Name

libaria_widget_slider.h

Company

Microchip Technology Inc.

libaria_widget_textfield.h

Functions

	Name	Description
	laTextFieldWidget_GetAlignment	Gets the text horizontal alignment value.
	laTextFieldWidget_GetCursorDelay	Gets the current cursor delay.
	laTextFieldWidget_GetCursorEnabled	Gets the cursor enabled value
	laTextFieldWidget_GetCursorPosition	Gets the current edit cursor position
	laTextFieldWidget_GetText	Gets the text value for the box.
	laTextFieldWidget_GetTextChangedEventCallback	Gets the current text changed event callback pointer
	laTextFieldWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laTextFieldWidget_SetAlignment	Sets the text horizontal alignment value

	laTextFieldWidget_SetClearOnFirstEdit	Sets the flag to indicate that the text field will be cleared on first edit.
	laTextFieldWidget_SetCursorDelay	Sets the cursor delay value
	laTextFieldWidget_SetCursorEnabled	Sets the cursor enabled value flag
	laTextFieldWidget_SetCursorPosition	Sets the position of the cursor
	laTextFieldWidget_SetText	Sets the text value for the box.
	laTextFieldWidget_SetTextChangedEventCallback	Sets the text changed event callback pointer

Structures

	Name	Description
	laTextFieldWidget_t	Implementation of a text field widget.
	laTextFieldWidget	Implementation of a text field widget.

Types

	Name	Description
	laTextFieldWidget_TextChangedCallback	This is type laTextFieldWidget_TextChangedCallback.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements text field widget functions.

File Name

libaria_widget_textfield.h

Company

Microchip Technology Inc.

libaria_widget_touchtest.h

Enumerations

	Name	Description
	laTouchTestState_t	Touch test states
	laTouchTestState	Touch test states

Functions

	Name	Description
	laTouchTest_AddPoint	Adds a point to the touch test widget. The point will then be displayed.
	laTouchTest_ClearPoints	Clears all of the existing touch points
	laTouchTestWidget_GetPointAddedEventCallback	Gets the current point added event callback
	laTouchTestWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laTouchTestWidget_SetPointAddedEventCallback	Sets the point added event callback

Macros

	Name	Description
	LA_TOUCHTEST_MEMORY_SIZE	This is macro LA_TOUCHTEST_MEMORY_SIZE.

Structures

	Name	Description
	laTouchTestWidget_t	Implementation of a touch test widget struct
	laTouchTestWidget	Implementation of a touch test widget struct

Types

	Name	Description
	laTouchTestWidget_PointAddedEventCallback	This is type laTouchTestWidget_PointAddedEventCallback.

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements graphical touch test (box) widget functions.

libaria_widget_window.h

Window Widget

Functions

	Name	Description
	laWindowWidget_GetIcon	Gets the currently used window icon
	laWindowWidget_GetIconMargin	Gets the current image icon margin
	laWindowWidget_GetIconRect	This is function laWindowWidget_GetIconRect.
	laWindowWidget_GetTextRect	This is function laWindowWidget_GetTextRect.
	laWindowWidget_GetTitle	Gets the title text for this window.
	laWindowWidget_GetTitleBarRect	internal use only
	laWindowWidget_New	Allocates memory for a new widget of this type. The application is responsible for the managment of this memory until the widget is added to a widget tree.
	laWindowWidget_SetIcon	Sets the image to be used as a window icon
	laWindowWidget_SetIconMargin	Sets the image icon margin
	laWindowWidget_SetTitle	Sets the title text for the window.

Structures

	Name	Description
	laWindowWidget_t	Implementation of a window widget struct
	laWindowWidget	Implementation of a window widget struct

Description

Module for Microchip Graphics Library - Aria User Interface Library

This module implements window container widget functions.

File Name

libaria_widget_window.h

Microchip Technology Inc.

Hardware Abstraction Layer (HAL)

This topic describes the Hardware Abstraction Layer (HAL) of the MPLAB Harmony Graphics Composer (MHGC) Suite, which is a component of MHGC Suite.

Introduction

This section introduces the Hardware Abstraction Layer (HAL) of the MPLAB Harmony Graphics Composer (MHGC) Suite.

Description

The HAL serves to abstract the details of the hardware away from the application and protect the graphics state from mismanagement. This layer is designed to be similar to industry-standard graphics APIs, such as OpenGL from SGI, and DirectX from Microsoft. Applications that use graphics should only communicate with this layer at a minimum, and should not attempt to communicate with display drivers directly.

Before looking at the operation and structure of the HAL, the following definitions of the different keywords and concepts explained within the HAL are provided.

Hardware Abstraction Layer Definitions:

- *Alpha blending*: An operation that combines two colors into a single color, based on one or more percentage values
- *Blit*: Writing an area of pixel data to a buffer

- *Buffer swap*: Cycling through a buffer chain, therefore changing the read and write buffer pointers
- *Cache coherent*: Data that must always be current in memory, such as data that is accessed by a peripheral, which should use coherent memory
- *Clipping*: Comparing a point to a rectangle, or a rectangle to a rectangle, to assess whether the point is contained inside the rectangle or conforming the area of one rectangle to fit inside another
- *Color masking*: An operation that compares a color value with a color mask value. If the values are equal, the color is ignored and not rendered to the write buffer.
- *Color mode*: Defines how pixel data is stored in memory. Some color modes consume less memory than others.
- *Context*: An instance of the hardware abstraction layer. Combines a display, a driver, and possibly a graphics accelerator.
- *Display*: A display device capable of rendering color data
- *Draw Target*: An application-defined area of memory to be used as the target for draw operations. This is often different than the active frame buffer and can be used for off-screen rendering operations.
- *Driver*: A software program that communicates directly with, and manages, hardware
- *Double buffer*: A display configuration in which multiple frame buffers are chained together to avoid screen tearing artifacts
- *Frame buffer*: An area of memory that contains pixel data. Pixel data is one of several color modes with each mode consuming various quantities of memory.
- *Heap*: A pool of memory that can be dynamically allocated
- *HSync*: A refresh state of a display device when the device is being refreshed outside the horizontal viewing area
- *Layer*: A rectangular area of space that contains one or more frame buffers. Can directly correspond to a hardware-managed layer.
- *Pixel*: A single color value stored in a predefined mode. Usually 8 to 32 bits in size.
- *Pixel buffer*: A struct that describes a rectangle of pixel data. May or may not actually contain valid pixel data.
- *Point*: A two dimensional Cartesian coordinate consisting of a horizontal “x” value and a vertical “y” value
- *Raster operation*: Any operation or algorithm that writes pixel data to the write buffer
- *Read buffer*: A buffer that is currently being used to feed display data to display hardware
- *Size*: A two dimensional measurement of magnitude consisting of a “width” and a “height” value
- *VSync*: A refresh state of a display device when the device is being refreshed outside the vertical viewing area
- *Write buffer*: A buffer that is designated as the receiver of raster operations

HAL Features

What does the Hardware Abstraction Layer do?

The HAL serves four main purposes:

- Configure abstract graphics and display hardware
- Managing frame buffer memory
- Manage draw state
- Draw shapes

Graphics and Display Hardware Configuration

The HAL serves as an intermediary between the higher level stack layers and the hardware drivers. Drivers are expected to conform to the HAL specification and applications interface with drivers through a simple set of APIs. The main purpose of this is to allow the framework to use various hardware drivers without ever having to make changes to the application. Each driver will interface with the HAL according to its specific needs and capabilities.

Frame Buffer Memory Management

Memory management is handled by the HAL for all drivers, libraries, and applications. This may include; buffer creation, buffer resizing, freeing buffer memory, buffer swapping, etc. The application simply requests buffer functions through the HAL APIs. Drivers may restrict how buffers are managed based on specific graphics controller needs and capabilities.

Draw State Management

The HAL maintains a state that indicates how raster operations should be performed.

Shape Drawing

The HAL provides APIs for basic pixel, line, circle, and rectangle drawing. These are rendered according to the draw state.

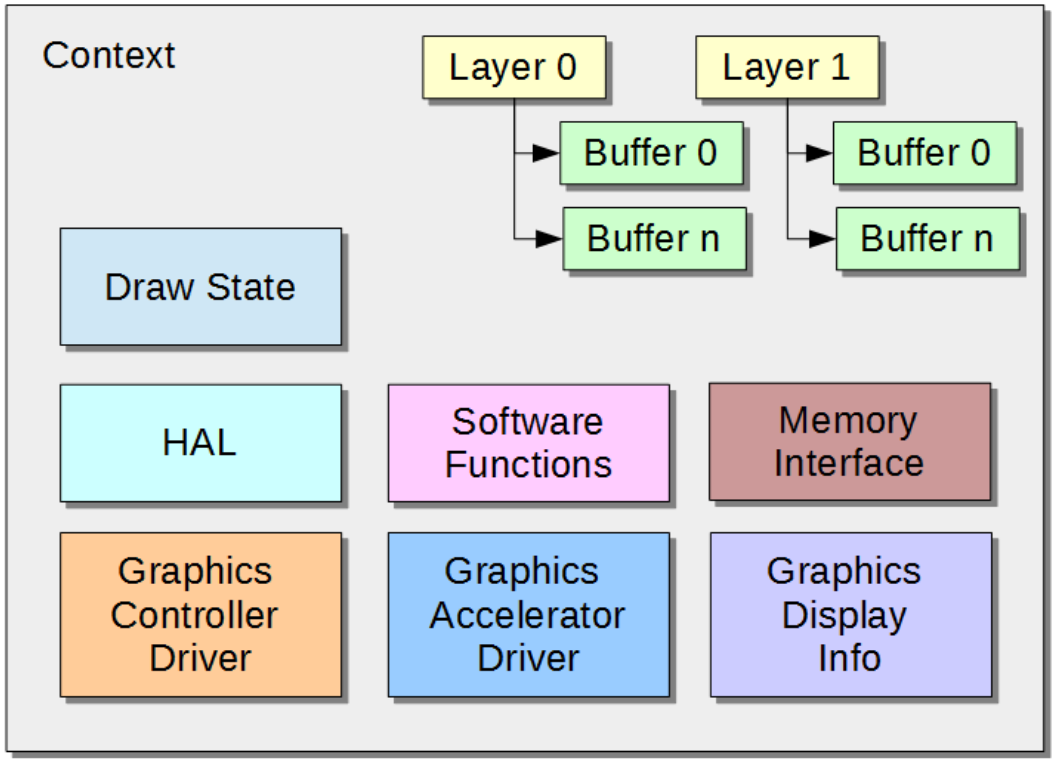
HAL Context

What is a context?

The HAL is designed to be multi-instance, which means it supports multiple drivers and displays concurrently. This is accomplished by using a *context* or *layer* state. A context is essentially the combination of a single display descriptor, and a single graphics driver. Graphics processors may also be part of a context. The HAL allows only a single context to be *active* or in use at any one time, but the application may switch contexts at any time in order to act on another state.

Note: Graphics drivers must also be able to support multi-instancing in order for the application to use multiple contexts.

The following block diagram shows a high-level representation of what the context contains. A description of each block follows the diagram.



Graphics Display Info

The application uses a “Display” definition to obtain knowledge about the displays that are available through the HAL. This definition contains information such as:

- *Name*: A short identifier for the display
- *Color Modes*: The color modes the display supports
- *Size*: A width and height
- *Timing settings*: Values for the front porches, back porches, pulse widths, etc.

Display definitions are generated through the use of HConfig and Freemarker templates. These definitions are created during the code generation phase of MHC and are expected to exist at run-time.

Graphics Controller Driver

The application uses a “Driver” definition to obtain information from the HAL about the available drivers in the system.

The driver definition consists of the following information:

- *Name*: A short identifier for the controller
- *Color Modes*: The color modes the controller supports
- *Layer Count*: The number of hardware layers the controller supports

Driver integration with the HAL will be covered in a subsequent section.

Graphics Accelerator Driver

A Graphics Processing Unit (GPU) may be present in the system. If one exists, the context must reroute GPU supported raster operations to the graphics accelerator driver for handling.

Layer

A HAL layer is a representation of a hardware based display layer most likely provided by a graphics controller. Applications are capable of using one or more of these layers up to the max value indicated by a hardware driver. Layers have a width, height, and a position in absolute space on the display.

Layers may have one or more frame buffers associated with them. Layers with two buffers are often called *double buffered*. Multiple buffers of a layer are connected to form a buffer chain, and are cycled through as needed via pointer swapping. Layers have, at all times, one buffer considered to be the *read buffer* and one buffer considered to be the *write buffer*. In a single buffer layer, the read and write buffers are the same. When drawing single buffer layers, rendering artifacts such as screen tearing may be observed. This is because a single buffer may be written to, and read from at the same time. Double buffering alleviates screen tearing as all raster operations are performed on the hidden *write buffer* and the buffers are only swapped once the *write buffer* has been fully crafted. Further, by acting during display blanking periods, the driver can swap the read and write buffer pointers during periods when the display is not actively drawing. This should completely eliminate screen tearing.

A context has one active layer at all times and all operations are performed on the active layer.

Frame Buffer

An extension of a pixel buffer, frame buffers are used by layers to track frame buffer states. Frame buffers contain a pixel buffer, but also contain the following:

- *Pixel Buffer State*: An indication of the origin of the data for the pixel buffer. This can indicate that the buffer contains no pixel data, that the pixel data was allocated from the heap, or that the buffer and associated pixel data is owned and managed by the graphics driver. The latter state is used to prevent the application from freeing buffers managed by the graphic driver.
- *Coherent*: An indication that the buffer should be allocated from cache coherent memory when it is dynamically allocated

Memory Interface

By default, the HAL uses standard library memory management functions, such as malloc, free, calloc, etc. However, in the presence of memory peripherals, the application may want the Graphics Stack to utilize a custom memory manager instead. This is accomplished by providing a memory interface definition.

This definition simply provides alternate function pointers for standard memory allocation functions.

Draw State

The context's draw state is simply a list of hints that the context feeds into raster operation functions such as a line draw. The state indicates what the draw color is, if alpha blending is enabled, if the final raster point should be adjusted for orientation or mirroring, if there is a masking or transparency color enabled, etc.

HAL

One of the most important functions of the context is to provide hardware abstraction. By default, all raster operations are handled in software, or in the Software Functions module. However, if a GPU exists, any supported raster operation requests must be rerouted to the GPU driver for handling. In other cases, the driver may need to restrict context options or handle an operation in a manner that is different from the default implementation. Therefore, the driver may change the function routing in the context's HAL state as it sees fit. However, if the driver implements non-default functionality, it must ensure that overall functionality of the context is not compromised.

Software Functions

The HAL contains a series of default implementation functions for most operations. These are represented by the Software Functions module.

Color Support

The HAL is able to create and manage a context using one of several color formats.

- GS8: 8-bit gray scale
- RGB_332: 8-bit, 256 colors
- RGB_565: 16-bit, 65536 colors
- RGB_5551: 15-bit color, 1-bit alpha, 32767 colors
- RGB_888: 24-bit color, 16 million colors
- RGBA_8888: 24-bit color, 8-bit alpha, 16 million colors
- ARGB_8888: 24-bit color 8-bit alpha, 16 million colors

All buffers that are created by the context will use this color mode. This can affect the sizes of the frame buffers that will be created.

HAL State Management

The HAL is primarily interacted with through the GFX_Get and GFX_Set functions. These variable argument functions always take as the first argument an operation ID. Then, follow a variable number of supporting arguments to either set or get data. For example:

```
GFX_Set(GFXF_DRAW_COLOR, 0xFFFF);
```

This code would set the current draw color for the active context to white, assuming a 16-bit color space. The first argument is one of the values listed in the GFX_FLAG enum and the second is the argument expected by that operation.

To get the current draw color the code would appear as follows:

```
GFX_Get(GFXF_DRAW_COLOR, &color);
```

These get and set functions can return these status values:

- GFX_FAILURE: An error occurred during this operation
- GFX_SUCCESS: The operation was successful
- GFX_UNSUPPORTED: The operation is not supported by the context

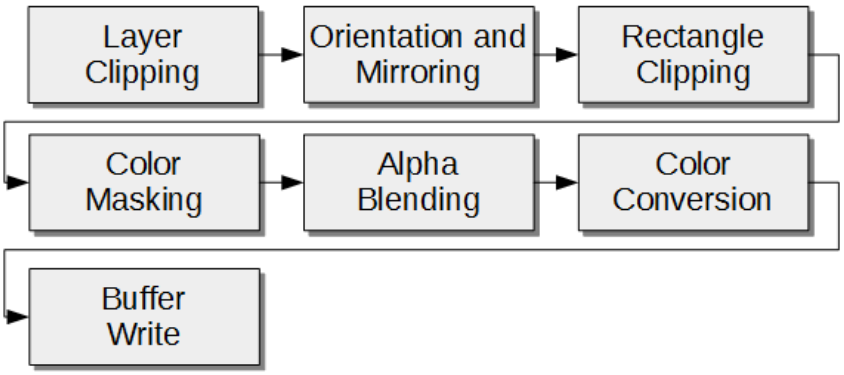
Notes:

1. All features may not be supported by all drivers. Software fall backs and default implementations may be provided for some features when hardware support is not available.
2. Most flags have a get and set mode. A few are get only and a few are set only. For detailed interface information, refer to `gfx_common.h`.

Pixel Transformation Pipeline

Overview of the Pixel Transformation Pipeline.

The HAL uses a multi-stage pixel rendering pipeline to apply the various effects that may have been enabled by the application. The stages are shown in the following figure:



Stage Description

- *Layer Clipping*: The pixel is clipped to the destination layer. It is rejected if it falls outside the layer. Writing outside of the layer can cause memory out-of-bounds exceptions.
- *Orientation and Mirroring*: The pixel's destination point is rotated and mirrored according to the draw state
- *Rectangle Clipping*: The pixel is containment evaluated with the context's clipping rectangle and rejected if it is out of bounds
- *Color Masking*: The pixel is compared to the context's color mask value. If the color matches the value it is rejected
- *Alpha Blending*: The source pixel is blended with the destination pixel. Both the color's alpha channel and the global alpha blending value is taken into consideration. A color without an alpha channel is upscaled to 32-bits and its alpha channel is set to max.
- *Color Conversion*: The color is converted to the color mode of the destination buffer. This only applies to blits.
- *Buffer Write*: The result color is written to the frame buffer at the potentially transformed point

Note:

1. These stages can be disabled in the GFX Options in the MHC option tree. Disabling them can increase speed but can cause the program to become unstable or draw incorrectly.
2. This flow is meant to show how the stages might interact but the exact order of execution is dependent on the state of the HAL and the operation being performed.

Using The Library

To access the HAL, simply include the header file `gfx.h` in your application. This is assuming that the appropriate flags have been checked in the configuration.

The HAL APIs typically fall into one of several groups:

- *Initialization*: Interfaces in the MHC configuration that are responsible for setting up the state of the HAL
- *Context Management*: Interfaces that create or destroy a graphics context
- *Context Maintenance*: Interfaces that allow the context to perform tasks such as HAL or driver state updates
- *Draw State Management*: This consists of two generic interfaces that allow the application to manage the state of a context. This is accomplished by indicating the get/set operation from a predefined list of option IDs, and sending the appropriate arguments into the variable argument functions
- *Blitting and Shape Drawing*: These interfaces perform raster operations on the active frame buffer according to the current draw state of the HAL

The following sample code displays how to initialize the HAL, create a context, create some layers and buffers, and draw a rectangle.

Note: The following code example is not performing any return value checking.

```
// context variable
GFX_Handle* context;

// initialize the HAL layer
GFX_Initialize();

// create a context.  the zeros indicate the display and driver to
// use.  the third argument would be for a custom memory interface
context = GFX_Open(0, 0, NULL);

// make sure the context is active
```

```
GFX_ContextActiveSet(context);

// set the context color mode to RGB_565
GFX_Set(GFXF_COLOR_MODE, GFX_COLOR_MODE_RGB_565);

// make sure the zeroth layer is active, enabled and visible
GFX_Set(GFXF_LAYER_ACTIVE, 0);
GFX_Set(GFXF_LAYER_ENABLED, GFX_TRUE);
GFX_Set(GFXF_LAYER_VISIBLE, GFX_TRUE);

// typically the bottom layer is going to fill the entire
// display area but for demonstration purposes change
// the position and size of the layer
GFX_Set(GFXF_LAYER_POSITION, 100, 100); // x = 100, y = 100
GFX_Set(GFXF_LAYER_SIZE, 320, 200); // width = 320, height = 200

// set the layer to two buffers and set to use coherent memory
GFX_Set(GFXF_LAYER_BUFFER_COUNT, 2);
GFX_Set(GFXF_LAYER_BUFFER_COHERENT, 0, GFX_TRUE);
GFX_Set(GFXF_LAYER_BUFFER_COHERENT, 1, GFX_TRUE);

// allocate the buffers
GFX_Set(GFXF_LAYER_BUFFER_ALLOCATE, 0);
GFX_Set(GFXF_LAYER_BUFFER_ALLOCATE, 1);

// set the draw mode and color
GFX_Set(GFXF_DRAW_MODE, GFX_DRAW_FILL);
GFX_Set(GFXF_DRAW_COLOR, 0xFFFF);

// indicate intent to draw, if this returns GFX_FAILURE then
// draw operations will fail
GFX_Begin();

// fill the entire layer with white
GFX_DrawRect(0, 0, 320, 200); // x, y, width, height

GFX_Set(GFXF_DRAW_COLOR,
        GFX_ColorValue(GFX_COLOR_MODE_RGB_565, GFX_COLOR_MAGENTA));

// draw a smaller magenta rectangle
GFX_DrawRect(10, 10, 100, 100);

// finish drawing
GFX_End();

// swap the buffers
GFX_Set(GFXF_LAYER_SWAP, GFX_TRUE);
```

Library Interface

a) Functions

	Name	Description
	GFX_AbsoluteValue	Calculates the absolute value of a signed integer.
	GFX_ActiveContext	Gets the current set active HAL context.
	GFX_Clampf	Clamps a float between a min and max
	GFX_Clampi	Clamps an integer between a min and max
	GFX_ColorChannelAlpha	Used for getting the alpha color channel of a given color value.
	GFX_ColorChannelGreen	Used for getting the green color channel of a given color value.
	GFX_ColorChannelRed	Used for getting the red color channel of a given color value.
	GFX_ColorConvert	Converts a color value from one mode to another
	GFX_ColorLerp	Linear interpolation between two colors
	GFX_ColorModeInfoGet	
	GFX_ColorValue	Used for getting a color value by name.
	GFX_ContextActiveSet	Sets the active context

	GFX_LayerReadBuffer	Gets the pointer to the layer's current read pixel buffer.
	GFX_LayerRotate	Swaps the width and height dimensions of a layer. Can be used for run-time display orientation
	GFX_LayerSwap	Performs a swap operation on the given layer. This advances the pointers of layer's buffer chain. The current write buffer becomes the new read buffer and a new buffer is chosen as the new write buffer. Has no effect in single buffer environments.
	GFX_LayerWriteBuffer	Gets the pointer to the layer's current write pixel buffer.
	GFX_Lerp	Performs a linear interpolation of an integer based on a percentage between two signed points.
	GFX_Maxf	Returns the larger of two floats.
	GFX_Maxi	Returns the larger of two integers.
	GFX_Minf	Returns the smaller of two floats.
	GFX_Mini	Returns the smaller of two integers.
	GFX_Percent	Calculates the percentage of one number when applied to another. Integer based. Accuracy for higher numbers is not guaranteed. The result is the decimal percentage multiplied by 100.
	GFX_PercentOf	Calculates the percentage of a number. Returns a whole number with no decimal component.
	GFX_PercentWholeRounded	Calculates the percentage of one number when applied to another. Integer based. Accuracy for higher numbers is not guaranteed. The difference between this and GFX_Percent is that the decimal portion of the whole number is rounded off.
	GFX_PixelBufferAreaFill	Fills an area of a pixel buffer with a solid color. Caller is responsible for ensuring that the color is the same color format as the destination buffer.
	GFX_PixelBufferAreaFill_Unsafe	Fills an area of a pixel buffer with a solid color. Caller is responsible for ensuring that the color is the same color format as the destination buffer. Like GFX_PixelBufferAreaFill but performs no bounds checking.
	GFX_PixelBufferAreaGet	Extracts a rectanglar section of pixels from a pixel buffer.
	GFX_PixelBufferAreaGet_Unsafe	Extracts a rectanglar section of pixels from a pixel buffer. Like GFX_PixelBufferAreaGet but performs no clipping between the rectangles of the extract area and the source buffer.
	GFX_PixelBufferAreaSet	Copies an area of pixels from a source buffer to a destination buffer. If the source buffer format does not match the destination format the data will be converted to match during the copy operation.
	GFX_PixelBufferAreaSet_Unsafe	Copies an area of pixels from a source buffer to a destination buffer. If the source buffer format does not match the destination format the data will be converted to match during the copy operation. Like GFX_PixelBufferAreaSet but performs no bounds checking.
	GFX_PixelBufferClipRect	Clips a rectangle against a pixel buffer. The result is guaranteed to fit inside the buffer's area.
	GFX_PixelBufferConvert	Duplicates a pixel buffer and converts the copy to another color mode.
	GFX_PixelBufferCopy	Creates a copy of the input buffer. If the input buffer's pixel data is not null then the data will be duplicated for the result buffer.
	GFX_PixelBufferCreate	Initializes a pixel buffer struct. Does not actually allocate any memory.
	GFX_PixelBufferDestroy	Destroys a pixel buffer construct. If the buffer's pixels pointer is not zero this function will attempt to free it using the provided GFX_MemoryIntf memory interface.
	GFX_PixelBufferGet	Gets the value of the pixel that resides at the provided point in the given buffer.
	GFX_PixelBufferGet_Unsafe	Gets the value of the pixel that resides at the provided point in the given buffer. Like GFX_PixelBufferGet but performs no bounds checking.
	GFX_PixelBufferGetIndex	Interprets the pixel buffer as a table of indices and looks up a specific index at position 'idx'. Indices may be 1bpp, 4bpp, or 8bpp in size and are indicated by the color mode of the pixel buffer.
	GFX_PixelBufferOffsetGet	Gets the offset address of the pixel that resides at the provided point in the given buffer.
	GFX_PixelBufferOffsetGet_Unsafe	Gets the offset address of the pixel that resides at the provided point in the given buffer. Similar to GFX_PixelBufferOffsetGet but performs no bounds checking.
	GFX_PixelBufferSet	Sets a pixel in a pixel buffer at a point to a specified color. Caller is responsible for ensuring that the input color is in the same color format as the pixel buffer.
	GFX_PixelBufferSet_Unsafe	Sets a pixel in a pixel buffer at a point to a specified color. Caller is responsible for ensuring that the input color is in the same color format as the pixel buffer. Like GFX_PixelBufferSet but performs no bounds checking.
	GFX_RectClip	Clips a rectangle to the space of another rectangle. The result rectangle is a rectangle that will fit inside both of the given rectangles.
	GFX_RectContainsPoint	Determines if a point is inside a rectangle.
	GFX_RectContainsRect	Determines if a rectangle is completely inside another rectangle. Still returns true if the edges are touching.

	GFX_RectIntersects	Determines if two rectangles are intersecting
	GFX_ScaleInteger	Scales an integer from one number range of 0 -> n0 to another range 0 -> n1 based on percentages.
	createDefaultMemIntf	internal use only
	GFX_ColorBilerp	Calculates bilinear interpolation between four colors
	GFX_ColorBlend_RGBA_8888	Blends two RGBA8888 colors together using their alpha channel values.
	GFX_ColorChannelBlue	Used for getting the blue color channel of a given color value.
	GFX_DivideRounding	This is function GFX_DivideRounding.
	GFX_DrawBlit	Blits a buffer of pixels into the frame buffer.
	GFX_DrawCircle	Draws a circle from using the specified dimensions and the current draw state.
	GFX_DrawLine	Draws a line from (x1,y1) to (x2,y2) using the current draw state.
	GFX_DrawPixel	Sets the pixel at X and Y using the current draw state.
	GFX_DrawRect	Draws a rectangle using the specified dimensions and the current draw state.
	GFX_DrawStretchBlit	Blits a buffer of pixels into the frame buffer.
	GFX_LayerFromOrientedSpace	Transforms a layer oriented space to screen space.
	GFX_LayerPointFromOrientedSpace	Transforms a point from oriented space to screen space given a layer, a display orientation, and a mirroring setting.
	GFX_LayerPointToOrientedSpace	Transforms a point from screen space to oriented space given a layer, a display orientation, and a mirroring setting.
	GFX_LayerRectFromOrientedSpace	Transforms a layer point from oriented space to screen space given a layer, a display orientation, and a mirroring setting.
	GFX_LayerRectToOrientedSpace	Transforms a rectangle from screen space to oriented space given a layer, a display orientation, and a mirroring setting.
	GFX_LayerToOrientedSpace	Transforms a layer from screen space to oriented space.
	GFX_PercentOfDec	This is function GFX_PercentOfDec.
	GFX_RectClipAdj	This is function GFX_RectClipAdj.
	GFX_RectFromPoints	This is function GFX_RectFromPoints.
	GFX_RectSplit	This is function GFX_RectSplit.
	GFX_RectToPoints	This is function GFX_RectToPoints.
	GFX_UtilMirrorPoint	Reorients a point to a given mirrored orientation.
	GFX_UtilOrientPoint	Reorients a point to a given orthogonal orientation.
	GFX_UtilPointFromOrientedSpace	Transforms a point from an oriented rectangle space to an outer space given a display orientation and a mirroring setting.
	GFX_UtilPointToOrientedSpace	Transforms a point to an oriented rectangle space to an outer space given a display orientation and a mirroring setting.
	GFX_UtilSizeFromOrientedSpace	Transforms a size tuple from oriented space to screen space
	GFX_UtilSizeToOrientedSpace	Transforms a size tuple from screen space to oriented space
	GFX_UtilSortPointsX	Sorts two points in the X axis
	GFX_UtilSortPointsY	Sorts two points in the Y axis
	GFX_RectCombine	Combines the area of two rectangles into a single rectangle.
	GFX_DrawDirectBlit	Blits a buffer of pixels into the frame buffer without performing per-pixel operations on the data.
	GFX_RectCompare	This is function GFX_RectCompare.
	GFX_RectsAreSimilar	This is function GFX_RectsAreSimilar.
	GFX_ScaleIntegerSigned	Scales a signed integer from one number range of 0 -> n0 to another range 0 -> n1 based on percentages.

b) Data Types and Constants

	Name	Description
	GFX_AntialiasMode_t	Enables anti-aliased drawing hint
	GFX_BitsPerPixel_t	List of available bits-per-pixel sizes.
	GFX_BlendMode_t	Blend mode masks
	GFX_BufferSelection_t	Buffer selector used when querying layers for certain buffer states.
	GFX_BufferState_t	Frame buffer memory states
	GFX_ColorMask_t	Maskable list of color valies.
	GFX_ColorMode_t	List of available color modes.
	GFX_ColorModeInfo_t	Struct that provides information about a color mode.

	GFX_ColorName_t	Color name reference table
	GFX_Context_t	An instance of the hardware abstraction layer.
	GFX_DisplayInfo_t	Describes a graphical display device.
	GFX_DrawMode_t	Gradient draw modes.
	GFX_DrawState_t	A list of drawing hints for shape drawing algorithms
	GFX_DriverInfo_t	A driver description structure.
	GFX_Flag_t	Hardware abstraction state interface flags. See gfx.h for a comprehensive description.
	GFX_FrameBuffer_t	A frame buffer is a wrapper around a pixel buffer construct that is used by display drivers to manage frame buffers.
	GFX_HAL_t	Hardware Abstraction Function Table * • This is the core hardware abtraction table that makes everything work. Drivers are • expected to reroute the functionality of this table to hardware specific implementations • to provide accelerated performance and features.
	GFX_Layer_t	Layers describe basic display drawing areas and are meant to map directly to graphics controller hardware layers.
	GFX_MemoryIntf_t	Custom memory manager interface.
	GFX_Orientation_t	Orthogonal orientation settings.
	GFX_PixelBuffer_t	A pixel buffer is a wrapper around a basic data pointer. A pixel buffer has a color mode, a pixel count, a rectangular dimension, a pixel count, and a lenght in bytes.
	GFX_Point_t	A two dimensional Cartesian point.
	GFX_Rect_t	A rectangle definition.
	GFX_Size_t	A two dimensional indication of size. Values are signed but should never be negative.
	begin_FnPtr	This is type begin_FnPtr.
	boolGet_FnPtr	This is type boolGet_FnPtr.
	boolSet_FnPtr	This is type boolSet_FnPtr.
	brightnessGet_FnPtr	This is type brightnessGet_FnPtr.
	brightnessRangeGet_FnPtr	This is type brightnessRangeGet_FnPtr.
	brightnessSet_FnPtr	This is type brightnessSet_FnPtr.
	colorModeGet_FnPtr	This is type colorModeGet_FnPtr.
	colorModeSet_FnPtr	This is type colorModeSet_FnPtr.
	destroy_FnPtr	This is type destroy_FnPtr.
	drawAlphaValueGet_FnPtr	This is type drawAlphaValueGet_FnPtr.
	drawAlphaValueSet_FnPtr	This is type drawAlphaValueSet_FnPtr.
	drawBlendModeGet_FnPtr	This is type drawBlendModeGet_FnPtr.
	drawBlendModeSet_FnPtr	This is type drawBlendModeSet_FnPtr.
	drawBlit_FnPtr	This is type drawBlit_FnPtr.
	drawCircle_FnPtr	This is type drawCircle_FnPtr.
	drawClipRectGet_FnPtr	This is type drawClipRectGet_FnPtr.
	drawClipRectSet_FnPtr	This is type drawClipRectSet_FnPtr.
	drawColorGet_FnPtr	This is type drawColorGet_FnPtr.
	drawColorSet_FnPtr	This is type drawColorSet_FnPtr.
	drawGradientColorGet_FnPtr	This is type drawGradientColorGet_FnPtr.
	drawGradientColorSet_FnPtr	This is type drawGradientColorSet_FnPtr.
	drawLine_FnPtr	This is type drawLine_FnPtr.
	drawLock_FnPtr	This is type drawLock_FnPtr.
	drawMaskValueGet_FnPtr	This is type drawMaskValueGet_FnPtr.
	drawMaskValueSet_FnPtr	This is type drawMaskValueSet_FnPtr.
	drawModeGet_FnPtr	This is type drawModeGet_FnPtr.
	drawModeSet_FnPtr	This is type drawModeSet_FnPtr.
	drawPaletteGet_FnPtr	This is type drawPaletteGet_FnPtr.
	drawPaletteSet_FnPtr	This is type drawPaletteSet_FnPtr.
	drawPixel_FnPtr	This is type drawPixel_FnPtr.
	drawRect_FnPtr	This is type drawRect_FnPtr.
	drawThicknessGet_FnPtr	This is type drawThicknessGet_FnPtr.
	drawThicknessSet_FnPtr	This is type drawThicknessSet_FnPtr.
	drawUnlock_FnPtr	This is type drawUnlock_FnPtr.

	GFX_AntialiasMode	Enables anti-aliased drawing hint
	GFX_BitsPerPixel	List of available bits-per-pixel sizes.
	GFX_BlendMode	Blend mode masks
	GFX_Bool	This is type GFX_Bool.
	GFX_Buffer	This is type GFX_Buffer.
	GFX_BufferSelection	Buffer selector used when querying layers for certain buffer states.
	GFX_BufferState	Frame buffer memory states
	GFX_Calloc_FnPtr	Simple wrapper around the standard calloc function pointer. Used for redirecting memory allocation to other memory management systems.
	GFX_Color	This is type GFX_Color.
	GFX_ColorMask	Maskable list of color valies.
	GFX_ColorMode	List of available color modes.
	GFX_ColorModeInfo	Struct that provides information about a color mode.
	GFX_ColorName	Color name reference table
	GFX_Context	An instance of the hardware abstraction layer.
	GFX_Display	This is type GFX_Display.
	GFX_DisplayInfo	Describes a graphical display device.
	GFX_DrawMode	Gradient draw modes.
	GFX_DrawState	A list of drawing hints for shape drawing algorithms
	GFX_Driver	This is type GFX_Driver.
	GFX_DriverInfo	A driver description structure.
	GFX_Flag	Hardware abstraction state interface flags. See gfx.h for a comprehensive description.
	GFX_FrameBuffer	A frame buffer is a wrapper around a pixel buffer construct that is used by display drivers to manage frame buffers.
	GFX_Free_FnPtr	Simple wrapper around the standard free function pointer. Used for redirecting memory free to other memory management systems.
	GFX_HAL	Hardware Abstraction Function Table * • This is the core hardware abtraction table that makes everything work. Drivers are • expected to reroute the functionality of this table to hardware specific implementations • to provide accelerated performance and features.
	GFX_Handle	This is type GFX_Handle.
	GFX_Layer	Layers describe basic display drawing areas and are meant to map directly to graphics controller hardware layers.
	GFX_Malloc_FnPtr	Simple wrapper around the standard malloc function pointer. Used for redirecting memory allocation to other memory management systems.
	GFX_Memcpy_FnPtr	Simple wrapper around the standard memcpy function pointer. Used for redirecting memcpy to other memory management systems.
	GFX_MemoryIntf	Custom memory manager interface.
	GFX_Memset_FnPtr	Simple wrapper around the standard memset function pointer. Used for redirecting memset to other memory management systems.
	GFX_Orientation	Orthogonal orientation settings.
	GFX_PixelBuffer	A pixel buffer is a wrapper around a basic data pointer. A pixel buffer has a color mode, a pixel count, a rectangular dimension, a pixel count, and a lenght in bytes.
	end_FnPtr	This is type end_FnPtr.
	GFX_Processor	This is type GFX_Processor.
	GFX_Realloc_FnPtr	Simple wrapper around the standard realloc function pointer. Used for redirecting memory allocation to other memory management systems.
	GFX_Result	This is type GFX_Result.
	GFX_Size	A two dimensional indication of size. Values are signed but should never be negative.
	GFX_SyncCallback_FnPtr	This is type GFX_SyncCallback_FnPtr.
	layerActiveGet_FnPtr	This is type layerActiveGet_FnPtr.
	layerActiveSet_FnPtr	This is type layerActiveSet_FnPtr.
	layerAlphaAmountGet_FnPtr	This is type layerAlphaAmountGet_FnPtr.
	layerAlphaAmountSet_FnPtr	This is type layerAlphaAmountSet_FnPtr.
	layerBufferAddressGet_FnPtr	This is type layerBufferAddressGet_FnPtr.
	layerBufferAddressSet_FnPtr	This is type layerBufferAddressSet_FnPtr.
	layerBufferAllocate_FnPtr	This is type layerBufferAllocate_FnPtr.

	layerBufferCoherentGet_FnPtr	This is type layerBufferCoherentGet_FnPtr.
	layerBufferCoherentSet_FnPtr	This is type layerBufferCoherentSet_FnPtr.
	layerBufferCountGet_FnPtr	This is type layerBufferCountGet_FnPtr.
	layerBufferCountSet_FnPtr	This is type layerBufferCountSet_FnPtr.
	layerBufferFree_FnPtr	This is type layerBufferFree_FnPtr.
	layerBufferIsAllocated_FnPtr	This is type layerBufferIsAllocated_FnPtr.
	layerMaskColorGet_FnPtr	This is type layerMaskColorGet_FnPtr.
	layerMaskColorSet_FnPtr	This is type layerMaskColorSet_FnPtr.
	layerPositionGet_FnPtr	This is type layerPositionGet_FnPtr.
	layerPositionSet_FnPtr	This is type layerPositionSet_FnPtr.
	layerSizeGet_FnPtr	This is type layerSizeGet_FnPtr.
	layerSizeSet_FnPtr	This is type layerSizeSet_FnPtr.
	layerSwapped_FnPtr	This is type layerSwapped_FnPtr.
	orientationGet_FnPtr	This is type orientationGet_FnPtr.
	orientationSet_FnPtr	This is type orientationSet_FnPtr.
	pixelGet_FnPtr	This is type pixelGet_FnPtr.
	pixelSet_FnPtr	This is type pixelSet_FnPtr.
	syncCallbackGet_FnPtr	This is type syncCallbackGet_FnPtr.
	syncCallbackSet_FnPtr	This is type syncCallbackSet_FnPtr.
	syncCallbackSt_FnPtr	This is type syncCallbackSt_FnPtr.
	update_FnPtr	This is type update_FnPtr.
	GFX_ColorInfo	This is variable GFX_ColorInfo.
	GFX_Rect_Zero	This is variable GFX_Rect_Zero.
	AGBA_8888_ALPHA_MASK	This is macro AGBA_8888_ALPHA_MASK.
	AGBA_8888_BLUE_MASK	This is macro AGBA_8888_BLUE_MASK.
	AGBA_8888_GREEN_MASK	This is macro AGBA_8888_GREEN_MASK.
	AGBA_8888_RED_MASK	This is macro AGBA_8888_RED_MASK.
	GFX_ANTIALIAS_MODE_COUNT	This is macro GFX_ANTIALIAS_MODE_COUNT.
	GFX_COLOR_MAX_SIZE	This is macro GFX_COLOR_MAX_SIZE.
	GFX_COLOR_MODE_COUNT	This is macro GFX_COLOR_MODE_COUNT.
	GFX_COLOR_MODE_IS_ALPHA	This is macro GFX_COLOR_MODE_IS_ALPHA.
	GFX_COLOR_MODE_IS_INDEX	This is macro GFX_COLOR_MODE_IS_INDEX.
	GFX_COLOR_MODE_IS_PIXEL	This is macro GFX_COLOR_MODE_IS_PIXEL.
	GFX_COLOR_MODE_LAST_COLOR	This is macro GFX_COLOR_MODE_LAST_COLOR.
	GFX_DRAW_MODE_COUNT	This is macro GFX_DRAW_MODE_COUNT.
	GFX_FAILURE	This is macro GFX_FAILURE.
	GFX_FALSE	This is macro GFX_FALSE.
	GFX_MAX_BUFFER_COUNT	This is macro GFX_MAX_BUFFER_COUNT.
	GFX_NULL	This is macro GFX_NULL.
	GFX_NUM_FLAGS	This is macro GFX_NUM_FLAGS.
	GFX_SUCCESS	This is macro GFX_SUCCESS.
	GFX_TRUE	This is macro GFX_TRUE.
	GFX_UNSUPPORTED	This is macro GFX_UNSUPPORTED.
	RGB_2_BITS	This is macro RGB_2_BITS.
	RGB_3_BITS	This is macro RGB_3_BITS.
	RGB_332_BLUE_MASK	This is macro RGB_332_BLUE_MASK.
	RGB_332_GREEN_MASK	This is macro RGB_332_GREEN_MASK.
	RGB_332_RED_MASK	This is macro RGB_332_RED_MASK.
	RGB_5_BITS	This is macro RGB_5_BITS.
	RGB_565_BLUE_MASK	This is macro RGB_565_BLUE_MASK.
	RGB_565_GREEN_MASK	This is macro RGB_565_GREEN_MASK.
	RGB_565_RED_MASK	This is macro RGB_565_RED_MASK.
	RGB_6_BITS	This is macro RGB_6_BITS.
	RGB_8_BITS	This is macro RGB_8_BITS.
	RGB_888_BLUE_MASK	This is macro RGB_888_BLUE_MASK.

	RGB_888_GREEN_MASK	This is macro RGB_888_GREEN_MASK.
	RGB_888_RED_MASK	This is macro RGB_888_RED_MASK.
	RGBA_5551_ALPHA_MASK	This is macro RGBA_5551_ALPHA_MASK.
	RGBA_5551_BLUE_MASK	This is macro RGBA_5551_BLUE_MASK.
	RGBA_5551_GREEN_MASK	This is macro RGBA_5551_GREEN_MASK.
	RGBA_5551_RED_MASK	This is macro RGBA_5551_RED_MASK.
	RGBA_8888_ALPHA_MASK	This is macro RGBA_8888_ALPHA_MASK.
	RGBA_8888_BLUE_MASK	This is macro RGBA_8888_BLUE_MASK.
	RGBA_8888_GREEN_MASK	This is macro RGBA_8888_GREEN_MASK.
	RGBA_8888_RED_MASK	This is macro RGBA_8888_RED_MASK.
	initialize_FnPtr	This is type initialize_FnPtr.
	interrupt_FnPtr	GFX_DRAW_PIPELINE_ENABLED
	GFX_DrawPipeline_t	
	GFX_PipelineMode_t	Hardware draw path settings.
	GFX_ResizeMode_t	This is type GFX_ResizeMode.
	GFXU_ImageFlags_t	A list of flags describing an image asset
	blendColor_FnPtr	This is type blendColor_FnPtr.
	blendGetPoint_FnPtr	This is type blendGetPoint_FnPtr.
	drawPipelineModeGet_FnPtr	This is type drawPipelineModeGet_FnPtr.
	drawPipelineModeSet_FnPtr	This is type drawPipelineModeSet_FnPtr.
	drawResizeModeGet_FnPtr	This is type drawResizeModeGet_FnPtr.
	drawResizeModeSet_FnPtr	This is type drawResizeModeSet_FnPtr.
	drawStretchBlit_FnPtr	This is type drawStretchBlit_FnPtr.
	drawTargetGet_FnPtr	This is type drawTargetGet_FnPtr.
	drawTargetSet_FnPtr	This is type drawTargetSet_FnPtr.
	GFX_DrawPipeline	
	GFX_PipelineMode	Hardware draw path settings.
	GFX_ResizeMode	This is type GFX_ResizeMode.
	GFXU_ImageFlags	A list of flags describing an image asset
	layerSwapPending_FnPtr	This is type layerSwapPending_FnPtr.
	maskColor_FnPtr	This is type maskColor_FnPtr.
	mirrorPoint_FnPtr	This is type mirrorPoint_FnPtr.
	orientPoint_FnPtr	This is type orientPoint_FnPtr.
	pixelGetArray_FnPtr	This is type pixelGetArray_FnPtr.
	GFX_PIPELINE_MODE_COUNT	This is macro GFX_PIPELINE_MODE_COUNT.
	GFX_RESIZE_MODE_COUNT	This is macro GFX_RESIZE_MODE_COUNT.
	GFX_ASSERT	This is macro GFX_ASSERT.
	GFX_GLOBAL_PALETTE_SIZE	This is macro GFX_GLOBAL_PALETTE_SIZE.
	GFX_GlobalPalette	This is type GFX_GlobalPalette.
	globalPaletteGet_FnPtr	This is type globalPaletteGet_FnPtr.
	globalPaletteSet_FnPtr	This is type globalPaletteSet_FnPtr.
	layerEffectSet_FnPtr	This is type layerEffectSet_FnPtr.
	GFX_DEPRECATED	This is macro GFX_DEPRECATED.

Description

This section describes the Aria User Interface Library Hardware Abstraction Layer interface.

a) Functions

GFX_AbsoluteValue Function

Calculates the absolute value of a signed integer.

File

gfx_math.h

C

```
LIB_EXPORT uint32_t GFX_AbsoluteValue(int32_t val);
```

Returns

uint32_t - the absolute value

Parameters

Parameters	Description
val	the number to consider

Function

uint32_t GFX_AbsoluteValue(int32_t val);

GFX_ActiveContext Function

Gets the current set active HAL context.

File

gfx_context.h

C

```
LIB_EXPORT GFX_Context* GFX_ActiveContext();
```

Returns

GFX_Context* - the active context or NULL

Function

GFX_Context* GFX_ActiveContext(void)

GFX_Clampf Function

Clamps a float between a min and max

File

gfx_math.h

C

```
LIB_EXPORT float GFX_Clampf(float min, float max, float f);
```

Returns

float - the clamped value

Parameters

Parameters	Description
min	the minimum value
max	the maximum value
i	the float to clamp

Function

float GFX_Clampi(float min, float max, float i);

GFX_Clampi Function

Clamps an integer between a min and max

File

gfx_math.h

C

```
LIB_EXPORT int32_t GFX_Clampi(int32_t min, int32_t max, int32_t i);
```

Returns

int32_t - the clamped value

Parameters

Parameters	Description
min	the minimum value
max	the maximum value
i	the number to clamp

Function

int32_t GFX_Clampi(int32_t min, int32_t max, int32_t i);

GFX_ColorChannelAlpha Function

Used for getting the alpha color channel of a given color value.

File

gfx_color.h

C

```
LIB_EXPORT uint32_t GFX_ColorChannelAlpha(GFX_Color clr, GFX_ColorMode mode);
```

Returns

uint32_t - the alpha color channel

Parameters

Parameters	Description
GFX_Color	the source color value
GFX_ColorMode	the source color mode

Function

uint32_t GFX_ColorChannelAlpha(GFX_Color clr, GFX_ColorMode mode)

GFX_ColorChannelGreen Function

Used for getting the green color channel of a given color value.

File

gfx_color.h

C

```
LIB_EXPORT uint32_t GFX_ColorChannelGreen(GFX_Color clr, GFX_ColorMode mode);
```

Returns

uint32_t - the green color channel

Parameters

Parameters	Description
GFX_Color	the source color value
GFX_ColorMode	the source color mode

Function

uint32_t GFX_ColorChannelGreen(GFX_Color clr, GFX_ColorMode mode)

GFX_ColorChannelRed Function

Used for getting the red color channel of a given color value.

File

gfx_color.h

C

```
LIB_EXPORT uint32_t GFX_ColorChannelRed(GFX_Color clr, GFX_ColorMode mode);
```

Returns

uint32_t - the red color channel

Parameters

Parameters	Description
GFX_Color	the source color value
GFX_ColorMode	the source color mode

Function

uint32_t GFX_ColorChannelRed(GFX_Color clr, GFX_ColorMode mode)

GFX_ColorConvert Function

Converts a color value from one mode to another

File

gfx_color.h

C

```
LIB_EXPORT GFX_Color GFX_ColorConvert(GFX_ColorMode mode_in, GFX_ColorMode mode_out, GFX_Color color);
```

Returns

GFX_Color - the result color

Parameters

Parameters	Description
GFX_ColorMode	the input color mode the output color mode
GFX_Color	the source color

Function

GFX_Color GFX_ColorConvert(GFX_ColorMode mode_in,
GFX_ColorMode mode_out,
GFX_Color color)

GFX_ColorLerp Function

Linear interpolation between two colors

File

gfx_color.h

C

```
LIB_EXPORT GFX_Color GFX_ColorLerp(GFX_Color l, GFX_Color r, uint32_t percent, GFX_ColorMode mode);
```

Returns

GFX_Color - the result color

Parameters

Parameters	Description
GFX_Color	first color input second color input
uint32_t	percentage of interpolation [0-100]
GFX_ColorMode	input color mode

Function

GFX_Color GFX_ColorLerp(GFX_Color l,
GFX_Color r,

uint32_t percent,
GFX_ColorMode mode)

GFX_ColorModeInfoGet Function

File

gfx_color.h

C

```
LIB_EXPORT GFX_ColorModeInfo GFX_ColorModeInfoGet(GFX_ColorMode mode);
```

Section

Routines

GFX_ColorValue Function

Used for getting a color value by name.

File

gfx_color.h

C

```
LIB_EXPORT GFX_Color GFX_ColorValue(GFX_ColorMode mode, GFX_ColorName name);
```

Returns

GFX_Color - the color value of the given name in the specified format

Parameters

Parameters	Description
GFX_ColorMode	the color mode for the return type
GFX_ColorName	the name of the color to retrieve

Function

GFX_Color GFX_ColorValue(GFX_ColorMode mode, GFX_ColorName name)

GFX_ContextActiveSet Function

Sets the active context

File

gfx_context.h

C

```
void GFX_ContextActiveSet(GFX_Context* const context);
```

Parameters

Parameters	Description
GFX_Context*	the new active context or NULL

Function

void GFX_ContextActiveSet(GFX_Context* const context)

GFX_LayerReadBuffer Function

Gets the pointer to the layer's current read pixel buffer.

File

gfx_layer.h

C

```
GFX_PixelBuffer* GFX_LayerReadBuffer(GFX_Layer* layer);
```

Returns

GFX_PixelBuffer* - the pointer to the read pixel buffer

Parameters

Parameters	Description
GFX_Layer*	the pointer to the layer

Function

GFX_PixelBuffer* GFX_LayerReadBuffer(GFX_Layer* layer)

GFX_LayerRotate Function

Swaps the width and height dimensions of a layer. Can be used for run-time display orientation

File

gfx_layer.h

C

```
void GFX_LayerRotate(GFX_Layer* layer);
```

Parameters

Parameters	Description
GFX_Layer*	the layer to operate on

Function

void GFX_LayerRotate(GFX_Layer* layer)

GFX_LayerSwap Function

Performs a swap operation on the given layer. This advances the pointers of layer's buffer chain. The current write buffer becomes the new read buffer and a new buffer is chosen as the new write buffer. Has no effect in single buffer environments.

File

gfx_layer.h

C

```
void GFX_LayerSwap(GFX_Layer* layer);
```

Parameters

Parameters	Description
GFX_Layer*	the layer to operate on

Function

void GFX_LayerSwap(GFX_Layer* layer)

GFX_LayerWriteBuffer Function

Gets the pointer to the layer's current write pixel buffer.

File

gfx_layer.h

C

```
GFX_PixelBuffer* GFX_LayerWriteBuffer(GFX_Layer* layer);
```

Returns

GFX_PixelBuffer* - the pointer to the write pixel buffer

Parameters

Parameters	Description
GFX_Layer*	the pointer to the layer

Function

GFX_PixelBuffer* GFX_LayerWriteBuffer(GFX_Layer* layer)

GFX_Lerp Function

Performs a linear interpolation of an integer based on a percentage between two signed points.

File

gfx_math.h

C

```
LIB_EXPORT int32_t GFX_Lerp(int32_t x, int32_t y, uint32_t per);
```

Returns

int32_t - the interpolated value

Parameters

Parameters	Description
x	the first point to consider
y	the second point to consider
per	the percentage of interpolation

Function

int32_t GFX_Lerp(int32_t x, int32_t y, uint32_t per);

GFX_Maxf Function

Returns the larger of two floats.

File

gfx_math.h

C

```
LIB_EXPORT float GFX_Maxf(float l, float r);
```

Returns

float - the larger of the two floats

Parameters

Parameters	Description
l	the first float to test
r	the second float to test

Function

float GFX_Maxf(float l, float r);

GFX_Maxi Function

Returns the larger of two integers.

File

gfx_math.h

C

```
LIB_EXPORT int32_t GFX_Maxi(int32_t l, int32_t r);
```

Returns

int32_t - the larger of the two numbers

Parameters

Parameters	Description
l	the first number to test
r	the second number to test

Function

int32_t GFX_Maxi(int32_t l, int32_t r);

GFX_Minf Function

Returns the smaller of two floats.

File

gfx_math.h

C

```
LIB_EXPORT float GFX_Minf(float l, float r);
```

Returns

float - the smaller of the two floats

Parameters

Parameters	Description
l	the first float to test
r	the second float to test

Function

float GFX_Minf(float l, float r);

GFX_Mini Function

Returns the smaller of two integers.

File

gfx_math.h

C

```
LIB_EXPORT int32_t GFX_Mini(int32_t l, int32_t r);
```

Returns

int32_t - the smaller of the two numbers

Parameters

Parameters	Description
l	the first number to test
r	the second number to test

Function

int32_t GFX_Mini(int32_t l, int32_t r);

GFX_Percent Function

Calculates the percentage of one number when applied to another. Integer based. Accuracy for higher numbers is not guaranteed.

The result is the decimal percentage multiplied by 100.

File

gfx_math.h

C

```
LIB_EXPORT uint32_t GFX_Percent(uint32_t l, uint32_t r);
```

Returns

uint32_t - the percentage represented as a whole number

Parameters

Parameters	Description
l	the first number of the equation
r	the second number of the equation

Function

uint32_t GFX_Percent(uint32_t l, uint32_t r);

GFX_PercentOf Function

Calculates the percentage of a number. Returns a whole number with no decimal component.

File

gfx_math.h

C

```
LIB_EXPORT uint32_t GFX_PercentOf(uint32_t num, uint32_t percent);
```

Returns

uint32_t - the resultant percentage of the number

Parameters

Parameters	Description
num	the number to consider
percent	the percentage to apply

Function

uint32_t GFX_PercentOf(uint32_t l, uint32_t percent);

GFX_PercentWholeRounded Function

Calculates the percentage of one number when applied to another. Integer based. Accuracy for higher numbers is not guaranteed.

The difference between this and GFX_Percent is that the decimal portion of the whole number is rounded off.

File

gfx_math.h

C

```
LIB_EXPORT uint32_t GFX_PercentWholeRounded(uint32_t l, uint32_t r);
```

Returns

uint32_t - the percentage represented as a whole number

Parameters

Parameters	Description
l	the first number of the equation
r	the second number of the equation

Function

uint32_t GFX_PercentWholeRounded(uint32_t l, uint32_t r);

GFX_PixelBufferAreaFill Function

Fills an area of a pixel buffer with a solid color. Caller is responsible for ensuring that the color is the same color format as the destination buffer.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferAreaFill(const GFX_PixelBuffer* const buffer, const GFX_Rect* const
rect, const GFX_Color color);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const buffer	the buffer to manipulate
const GFX_Rect* const rect	the rectangle of the buffer to fill
const GFX_Color color	the color to use for the fill operation

Function

GFX_Result GFX_PixelBufferAreaFill(const GFX_PixelBuffer* const buffer,
const GFX_Rect* const rect,
const GFX_Color color)

GFX_PixelBufferAreaFill_Unsafe Function

Fills an area of a pixel buffer with a solid color. Caller is responsible for ensuring that the color is the same color format as the destination buffer. Like GFX_PixelBufferAreaFill but performs no bounds checking.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferAreaFill_Unsafe(const GFX_PixelBuffer* const buffer, const GFX_Rect*
const rect, const GFX_Color color);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const buffer	the buffer to manipulate
const GFX_Rect* const rect	the rectangle of the buffer to fill
const GFX_Color color	the color to use for the fill operation

Function

GFX_Result GFX_PixelBufferAreaFill_Unsafe(const GFX_PixelBuffer* const buffer,
const GFX_Rect* const rect,
const GFX_Color color)

GFX_PixelBufferAreaGet Function

Extracts a rectanglar section of pixels from a pixel buffer.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferAreaGet(const GFX_PixelBuffer* const buffer, const GFX_Rect* const
rect, GFX_MemoryIntf* mem_intf, GFX_PixelBuffer* out);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const buffer	the source buffer
const GFX_Rect* rect	the area to extract
GFX_MemoryIntf*	the memory interface to use for memory operations
GFX_PixelBuffer*	the resultant pixel buffer

Function

GFX_Result GFX_PixelBufferAreaGet(const GFX_PixelBuffer* const buffer,
const GFX_Rect* const rect,
GFX_MemoryIntf* mem_intf,
GFX_PixelBuffer* out)

GFX_PixelBufferAreaGet_Unsafe Function

Extracts a rectanglar section of pixels from a pixel buffer. Like GFX_PixelBufferAreaGet but performs no clipping between the rectangles of the extract area and the source buffer.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferAreaGet_Unsafe(const GFX_PixelBuffer* const buffer, const GFX_Rect*
const rect, GFX_MemoryIntf* mem_intf, GFX_PixelBuffer* out);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const buffer	the source buffer
const GFX_Rect* rect	the area to extract
GFX_MemoryIntf*	the memory interface to use for memory operations
GFX_PixelBuffer*	the resultant pixel buffer

Function

GFX_Result GFX_PixelBufferAreaGet_Unsafe(const GFX_PixelBuffer* const buffer,
const GFX_Rect* const rect,
GFX_MemoryIntf* mem_intf,
GFX_PixelBuffer* out)

GFX_PixelBufferAreaSet Function

Copies an area of pixels from a source buffer to a destination buffer. If the source buffer format does not match the destination format the data will be converted to match during the copy operation.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferAreaSet(const GFX_PixelBuffer* const source, const GFX_Rect* const
source_rect, const GFX_PixelBuffer* const dest, const GFX_Point* const pnt, GFX_MemoryIntf* mem_intf);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const source	the source buffer

const GFX_Rect* const source_rect	the rectangle of the source buffer to use
const GFX_PixelBuffer* const dest	the destination buffer to copy to
const GFX_Point* const pnt	the location of the destination to copy to
GFX_MemoryIntf*	the memory interface to use for memory operations

Function

GFX_Result GFX_PixelBufferAreaSet(const GFX_PixelBuffer* const source,
const GFX_Rect* const source_rect,
const GFX_PixelBuffer* const dest,
const GFX_Point* const pnt,
GFX_MemoryIntf* mem_intf)

GFX_PixelBufferAreaSet_Unsafe Function

Copies an area of pixels from a source buffer to a destination buffer. If the source buffer format does not match the destination format the data will be converted to match during the copy operation. Like GFX_PixelBufferAreaSet but performs no bounds checking.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferAreaSet_Unsafe(const GFX_PixelBuffer* const source, const GFX_Rect*
const source_rect, const GFX_PixelBuffer* const dest, const GFX_Point* const pnt, GFX_MemoryIntf* mem_intf);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const source	the source buffer
const GFX_Rect* const source_rect	the rectangle of the source buffer to use
const GFX_PixelBuffer* const dest	the destination buffer to copy to
const GFX_Point* const pnt	the location of the destination to copy to
GFX_MemoryIntf*	the memory interface to use for memory operations

Function

GFX_Result GFX_PixelBufferAreaSet_Unsafe(const GFX_PixelBuffer* const source,
const GFX_Rect* const source_rect,
const GFX_PixelBuffer* const dest,
const GFX_Point* const pnt,
GFX_MemoryIntf* mem_intf)

GFX_PixelBufferClipRect Function

Clips a rectangle against a pixel buffer. The result is guaranteed to fit inside the buffer's area.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferClipRect(const GFX_PixelBuffer* const buffer, const GFX_Rect* const
rect, GFX_Rect* result);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const buffer	the source buffer

const GFX_Rect* const	the rectangle to analyze
GFX_Rect* result	the clipped rectangle

Function

GFX_Result GFX_PixelBufferClipRect(const GFX_PixelBuffer* const buffer,
const GFX_Rect* const rect,
GFX_Rect* result)

GFX_PixelBufferConvert Function

Duplicates a pixel buffer and converts the copy to another color mode.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferConvert(const GFX_PixelBuffer* const source, const GFX_ColorMode
result_mode, GFX_MemoryIntf* mem_intf, GFX_PixelBuffer* result);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const source	the source buffer
const GFX_ColorMode result_mode	the desired color mode
GFX_MemoryIntf*	the memory interface to use for memory operations
GFX_PixelBuffer*	the resultant pixel buffer

Function

GFX_Result GFX_PixelBufferConvert(const GFX_PixelBuffer* const source,
const GFX_ColorMode result_mode,
GFX_MemoryIntf* mem_intf,
GFX_PixelBuffer* result)

GFX_PixelBufferCopy Function

Creates a copy of the input buffer. If the input buffer's pixel data is not null then the data will be duplicated for the result buffer.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferCopy(const GFX_PixelBuffer* const buffer, GFX_MemoryIntf* mem_intf,
GFX_PixelBuffer* result);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const buffer	the source buffer
GFX_MemoryIntf*	the memory interface to use for memory operations
GFX_PixelBuffer*	the result buffer

Function

GFX_Result GFX_PixelBufferCopy(const GFX_PixelBuffer* const buffer,
GFX_MemoryIntf* mem_intf,
GFX_PixelBuffer* result)

GFX_PixelBufferCreate Function

Initializes a pixel buffer struct. Does not actually allocate any memory.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferCreate(const int32_t width, const int32_t height, const GFX_ColorMode
mode, const void* const address, GFX_PixelBuffer* buffer);
```

Returns

GFX_Result

Parameters

Parameters	Description
const int32_t	the width of the buffer the height of the buffer
const GFX_ColorMode	the color mode of the buffer
const void*	the data addres of the buffer (may be NULL)
GFX_PixelBuffer*	pointer of the pixel buffer buffer to initialize

Function

GFX_Result GFX_PixelBufferCreate(const int32_t width,
const int32_t height,
const GFX_ColorMode mode,
const void* const address,
GFX_PixelBuffer* buffer)

GFX_PixelBufferDestroy Function

Destroys a pixel buffer construct. If the buffer's pixels pointer is not zero this function will attempt to free it using the provided GFX_MemoryIntf memory interface.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferDestroy(GFX_PixelBuffer* const buffer, GFX_MemoryIntf* mem_intf);
```

Returns

GFX_Result

Parameters

Parameters	Description
GFX_PixelBuffer*	the buffer to destroy
GFX_MemoryIntf*	the memory interface to reference for free()

Function

GFX_Result GFX_PixelBufferDestroy(GFX_PixelBuffer* const buffer,
GFX_MemoryIntf* mem_intf)

GFX_PixelBufferGet Function

Gets the value of the pixel that resides at the provided point in the given buffer.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Color GFX_PixelBufferGet(const GFX_PixelBuffer* const buffer, const GFX_Point* const pnt);
```

Returns

GFX_Color - the value of the pixel at the point in the source buffer

Parameters

Parameters	Description
const GFX_PixelBuffer*	the source buffer
const GFX_Point*	the point for which the offset should be calculated

Function

GFX_Color GFX_PixelBufferGet(const GFX_PixelBuffer* const buffer,
const GFX_Point* const pnt)

GFX_PixelBufferGet_Unsafe Function

Gets the value of the pixel that resides at the provided point in the given buffer. Like GFX_PixelBufferGet but performs no bounds checking.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Color GFX_PixelBufferGet_Unsafe(const GFX_PixelBuffer* const buffer, const GFX_Point* const pnt);
```

Returns

GFX_Color - the value of the pixel at the point in the source buffer

Parameters

Parameters	Description
const GFX_PixelBuffer*	the source buffer
const GFX_Point*	the point for which the offset should be calculated

Function

GFX_Color GFX_PixelBufferGet_Unsafe(const GFX_PixelBuffer* const buffer,
const GFX_Point* const pnt)

GFX_PixelBufferGetIndex Function

Interprets the pixel buffer as a table of indices and looks up a specific index at position 'idx'. Indices may be 1bpp, 4bpp, or 8bpp in size and are indicated by the color mode of the pixel buffer.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Color GFX_PixelBufferGetIndex(const GFX_PixelBuffer* const buffer, const int32_t idx);
```

Returns

GFX_Color - the resultant value that was retrieved

Parameters

Parameters	Description
const GFX_PixelBuffer* const	the input buffer
const int32_t	the index to retrieve

Function

GFX_Color GFX_PixelBufferGetIndex(const GFX_PixelBuffer* const buffer,
const int32_t idx)

GFX_PixelBufferOffsetGet Function

Gets the offset address of the pixel that resides at the provided point in the given buffer.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Buffer GFX_PixelBufferOffsetGet(const GFX_PixelBuffer* const buffer, const GFX_Point* const pnt);
```

Returns

GFX_Buffer - the pointer to the offset point in the source buffer

Parameters

Parameters	Description
const GFX_PixelBuffer*	the source buffer
const GFX_Point*	the point for which the offset should be calculated

Function

GFX_Buffer GFX_PixelBufferOffsetGet(const GFX_PixelBuffer* const buffer,
const GFX_Point* const pnt)

GFX_PixelBufferOffsetGet_Unsafe Function

Gets the offset address of the pixel that resides at the provided point in the given buffer. Similar to GFX_PixelBufferOffsetGet but performs no bounds checking.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Buffer GFX_PixelBufferOffsetGet_Unsafe(const GFX_PixelBuffer* const buffer, const GFX_Point* const pnt);
```

Returns

GFX_Buffer - the pointer to the offset point in the source buffer

Parameters

Parameters	Description
const GFX_PixelBuffer*	the source buffer
const GFX_Point*	the point for which the offset should be calculated

Function

GFX_Buffer GFX_PixelBufferOffsetGet_Unsafe(const GFX_PixelBuffer* const buffer,
const GFX_Point* const pnt)

GFX_PixelBufferSet Function

Sets a pixel in a pixel buffer at a point to a specified color. Caller is responsible for ensuring that the input color is in the same color format as the pixel buffer.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferSet(const GFX_PixelBuffer* const buffer, const GFX_Point* const pnt, GFX_Color color);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const buffer	the buffer to operate on
const GFX_Point* const	the location of the pixel to set
GFX_Color	the color to set the pixel to. must be the same format as the buffer

Function

GFX_Result GFX_PixelBufferSet(const GFX_PixelBuffer* const buffer,
const GFX_Point* const pnt,
GFX_Color color)

GFX_PixelBufferSet_Unsafe Function

Sets a pixel in a pixel buffer at a point to a specified color. Caller is responsible for ensuring that the input color is in the same color format as the pixel buffer. Like GFX_PixelBufferSet but performs no bounds checking.

File

gfx_pixel_buffer.h

C

```
LIB_EXPORT GFX_Result GFX_PixelBufferSet_Unsafe(const GFX_PixelBuffer* const buffer, const GFX_Point* const pnt, GFX_Color color);
```

Returns

GFX_Result

Parameters

Parameters	Description
const GFX_PixelBuffer* const buffer	the buffer to operate on
const GFX_Point* const	the location of the pixel to set
GFX_Color	the color to set the pixel to. must be the same format as the buffer

Function

GFX_Result GFX_PixelBufferSet_Unsafe(const GFX_PixelBuffer* const buffer,
const GFX_Point* const pnt,
GFX_Color color)

GFX_RectClip Function

Clips a rectangle to the space of another rectangle. The result rectangle is a rectangle that will fit inside both of the given rectangles.

File

gfx_rect.h

C

```
LIB_EXPORT void GFX_RectClip(const GFX_Rect* l_rect, const GFX_Rect* r_rect, GFX_Rect* result);
```

Returns

void

Remarks

result will equals l_rect if the rectangles aren't intersecting

Parameters

Parameters	Description
const GFX_Rect* l_rect	the subject rectangle
const GFX_Rect* r_rect	the object rectangle
GFX_Rect* result	the result rectangle

Function

void GFX_RectClip(const GFX_Rect* l_rect,
const GFX_Rect* r_rect,
GFX_Rect* result)

GFX_RectContainsPoint Function

Determines if a point is inside a rectangle.

File

gfx_rect.h

C

```
LIB_EXPORT GFX_Bool GFX_RectContainsPoint(const GFX_Rect* rect, const GFX_Point* point);
```

Returns

GFX_Bool - GFX_TRUE if the point is inside the rectangle

Parameters

Parameters	Description
const GFX_Rect* rect	the rectangle to test
const GFX_Point* point	the point to use for the test

Function

GFX_Bool GFX_RectContainsPoint(const GFX_Rect* rect, const GFX_Point* point)

GFX_RectContainsRect Function

Determines if a rectangle is completely inside another rectangle. Still returns true if the edges are touching.

File

gfx_rect.h

C

```
LIB_EXPORT GFX_Bool GFX_RectContainsRect(const GFX_Rect* l_rect, const GFX_Rect* r_rect);
```

Returns

GFX_Bool - returns GFX_TRUE if r_rect is completly inside l_rect

Parameters

Parameters	Description
const GFX_Rect* l_rect	the subject rectangle
const GFX_Rect* r_rect	the object rectangle

Function

GFX_Bool GFX_RectContainsRect(const GFX_Rect* l_rect, const GFX_Rect* r_rect)

GFX_RectIntersects Function

Determines if two rectangles are intersecting

File

gfx_rect.h

C

```
LIB_EXPORT GFX_Bool GFX_RectIntersects(const GFX_Rect* l_rect, const GFX_Rect* r_rect);
```

Returns

GFX_Bool - returns GFX_TRUE if l_rect and r_rect are intersecting

Parameters

Parameters	Description
const GFX_Rect* l_rect	rectangle argument
const GFX_Rect* r_rect	rectangle argument

Function

GFX_Bool GFX_RectIntersects(const GFX_Rect* l_rect, const GFX_Rect* r_rect)

GFX_ScaleInteger Function

Scales an integer from one number range of 0 -> n0 to another range 0 -> n1 based on percentages.

File

gfx_math.h

C

```
LIB_EXPORT uint32_t GFX_ScaleInteger(uint32_t num, uint32_t oldMax, uint32_t newMax);
```

Returns

uint32_t - the number as defined in the new number range

Parameters

Parameters	Description
num	the number to consider
oldMax	the old range maximum
newMax	the new range maximum

Function

uint32_t GFX_ScaleInteger(uint32_t num, uint32_t oldMax, uint32_t newMax);

createDefaultMemIntf Function

File

gfxu_image_utils.h

C

```
void createDefaultMemIntf(GFXU_MemoryIntf* memIntf);
```

Description

internal use only

GFX_ColorBilerp Function

Calculates bilinear interpolation between four colors

File

gfx_color.h

C

```
LIB_EXPORT GFX_Color GFX_ColorBilerp(GFX_Color c00, GFX_Color c01, GFX_Color c10, GFX_Color c11, uint32_t
xper, uint32_t yper, GFX_ColorMode mode);
```

Returns

GFX_Color - the result color

Parameters

Parameters	Description
GFX_Color c00	top left color input
GFX_Color c01	top right color input

GFX_Color c10	bottom left color input
GFX_Color c11	bottom right color input
uint32_t xper	percentage of interpolation in x [0-100]
uint32_t yper	percentage of interpolation in y [0-100]
GFX_ColorMode	input color mode

Function

GFX_Color GFX_ColorBilerp(GFX_Color c00,
GFX_Color c01,
GFX_Color c10,
GFX_Color c11,
uint32_t xper,
uint32_t yper,
GFX_ColorMode mode)

GFX_ColorBlend_RGBA_8888 Function

Blends two RGBA8888 colors together using their alpha channel values.

File

gfx_color.h

C

```
LIB_EXPORT GFX_Color GFX_ColorBlend_RGBA_8888(GFX_Color fore, GFX_Color back);
```

Returns

GFX_Color - the blended result color

Parameters

Parameters	Description
GFX_Color	the foreground color the background color

Function

GFX_Color GFX_ColorBlend_RGBA_8888(GFX_Color fore, GFX_Color back)

GFX_ColorChannelBlue Function

Used for getting the blue color channel of a given color value.

File

gfx_color.h

C

```
LIB_EXPORT uint32_t GFX_ColorChannelBlue(GFX_Color clr, GFX_ColorMode mode);
```

Returns

uint32_t - the blue color channel

Parameters

Parameters	Description
GFX_Color	the source color value
GFX_ColorMode	the source color mode

Function

uint32_t GFX_ColorChannelBlue(GFX_Color clr, GFX_ColorMode mode)

GFX_DivideRounding Function

File

gfx_math.h

C

```
LIB_EXPORT int32_t GFX_DivideRounding(int32_t num, int32_t denom);
```

Description

This is function GFX_DivideRounding.

GFX_DrawBlit Function

Blits a buffer of pixels into the frame buffer.

File

gfx_draw.h

C

```
LIB_EXPORT GFX_Result GFX_DrawBlit(GFX_PixelBuffer* buffer, int32_t src_x, int32_t src_y, int32_t
src_width, int32_t src_height, int32_t dest_x, int32_t dest_y);
```

Returns

GFX_Result - Returns GFX_TRUE if the blit was drawn successfully. Otherwise returns GFX_FALSE.

Description

A pixel buffer is an array of pixel data that can be applied in bulk, or 'blit'ed, to the frame buffer. Pixel buffers may be of a different color mode and will be converted to match the destination frame buffer before application.

Parameters

Parameters	Description
buffer	the pointer to the source pixel buffer
src_x	the x component of the rectangle of the buffer to blit, usually 0
src_y	the y component of the rectangle of the buffer to blit, usually 0
src_width	width of the rectangle of the buffer to blit, usually the entire with of the source buffer
src_height	height of the rectangle of the buffer to blit, usually the entire height of the source buffer
dest_x	the x position to blit the source rectangle in the destination buffer the y position to blit the source rectangle in the destination buffer

Function

GFX_Result GFX_Result GFX_DrawBlit(GFX_PixelBuffer* buffer,
int32_t src_x,
int32_t src_y,
int32_t src_width,
int32_t src_height,
int32_t dest_x,
int32_t dest_y);

GFX_DrawCircle Function

Draws a circle from using the specified dimensions and the current draw state.

File

gfx_draw.h

C

```
LIB_EXPORT GFX_Result GFX_DrawCircle(int32_t x, int32_t y, int32_t radius);
```

Returns

GFX_Result - Returns GFX_TRUE if the circle was drawn successfully. Otherwise returns GFX_FALSE.

Parameters

Parameters	Description
x	the x component of the origin position
y	the y component of the origin position
radius	the radius of the circle in pixels

Function

GFX_Result GFX_Result GFX_DrawCircle(int32_t x,
int32_t y,
int32_t radius);

GFX_DrawLine Function

Draws a line from (x1,y1) to (x2,y2) using the current draw state.

File

gfx_draw.h

C

```
LIB_EXPORT GFX_Result GFX_DrawLine(int32_t x1, int32_t y1, int32_t x2, int32_t y2);
```

Returns

GFX_Result - Returns GFX_TRUE if the line was drawn successfully. Otherwise returns GFX_FALSE.

Parameters

Parameters	Description
x1	the x component of the first coordinate of the line
y1	the y component of the first coordinate of the line
x2	the x component of the second coordinate of the line
y2	the y component of the second coordinate of the line

Function

GFX_Result GFX_Result GFX_DrawLine(int32_t x1,
int32_t y1,
int32_t x2,
int32_t y2);

GFX_DrawPixel Function

Sets the pixel at X and Y using the current draw state.

File

gfx_draw.h

C

```
LIB_EXPORT GFX_Result GFX_DrawPixel(int32_t x, int32_t y);
```

Returns

GFX_Result - Returns GFX_TRUE if the pixel was drawn successfully. Otherwise returns GFX_FALSE.

Parameters

Parameters	Description
x	the x coordinate of the pixel
y	the y coordinate of the pixel

Function

GFX_Result GFX_DrawPixel(int32_t x, int32_t y);

GFX_DrawRect Function

Draws a rectangle using the specified dimensions and the current draw state.

File

gfx_draw.h

C

```
LIB_EXPORT GFX_Result GFX_DrawRect(int32_t x, int32_t y, int32_t width, int32_t height);
```

Returns

GFX_Result - Returns GFX_TRUE if the rectangle was drawn successfully. Otherwise returns GFX_FALSE.

Description

Draws a rectangle using the coordinates: x,y x + width - 1, y

x, y + height - 1 x + width - 1, y + height - 1

Parameters

Parameters	Description
x	the x position of the top left point of the rectangle
y	the y position of the top left point of the rectangle
width	the width of the rectangle in pixels
height	the height of the rectangle in pixels

Function

GFX_Result GFX_Result GFX_DrawLine(int32_t x,

int32_t x,

int32_t width,

int32_t height);

GFX_DrawStretchBlit Function

Blits a buffer of pixels into the frame buffer.

File

gfx_draw.h

C

```
LIB_EXPORT GFX_Result GFX_DrawStretchBlit(GFX_PixelBuffer* buffer, int32_t src_x, int32_t src_y, int32_t
src_width, int32_t src_height, int32_t dest_x, int32_t dest_y, int32_t dest_width, int32_t dest_height);
```

Returns

GFX_Result - Returns GFX_TRUE if the blit was drawn successfully. Otherwise returns GFX_FALSE.

Description

A pixel buffer is an array of pixel data that can be applied in bulk, or 'blit'ed, to the frame buffer. Pixel buffers may be of a different color mode and will be converted to match the destination frame buffer before application. This version can resize the source data before blitting. The option GFXF_RESIZE_METHOD selects the resize technique.

Parameters

Parameters	Description
buffer	the pointer to the source pixel buffer
src_x	the x component of the rectangle of the buffer to blit, usually 0
src_y	the y component of the rectangle of the buffer to blit, usually 0
src_width	width of the rectangle of the buffer to blit, usually the entire with of the source buffer
src_height	height of the rectangle of the buffer to blit, usually the entire height of the source buffer

dest_x	the x position to blit the source rectangle in the destination buffer the y position to blit the source rectangle in the destination buffer
dest_width	the desired resize width
dest_height	the desired resize height

Function

GFX_Result GFX_DrawStretchBlit(GFX_PixelBuffer* buffer,
int32_t src_x,
int32_t src_y,
int32_t src_width,
int32_t src_height,
int32_t dest_x,
int32_t dest_y,
int32_t dest_width,
int32_t dest_height);

GFX_LayerFromOrientedSpace Function

Transforms a layer oriented space to screen space.

File

gfx_layer.h

C

```
void GFX_LayerFromOrientedSpace(GFX_Rect* displayRect, GFX_Layer* layer, GFX_Orientation ori, GFX_Bool
mirrored);
```

Returns

void

Parameters

Parameters	Description
GFX_Rect* dispayRect	the rectangle of the display
GFX_Layert* layer	the layer
GFX_Orientation	the orientation setting
GFX_Bool	the mirroring setting

Function

void GFX_LayerFromOrientedSpace(GFX_Rect* displayRect,
GFX_Layer* layer,
GFX_Orientation ori,
GFX_Bool mirrored)

GFX_LayerPointFromOrientedSpace Function

Transforms a point from oriented space to screen space given a layer, a display orientation, and a mirroring setting.

File

gfx_layer.h

C

```
LIB_EXPORT GFX_Point GFX_LayerPointFromOrientedSpace(const GFX_Layer* layer, const GFX_Point* point,
GFX_Orientation ori, GFX_Bool mirrored);
```

Returns

GFX_Point

Parameters

Parameters	Description
const GFX_Layer* layer	the layer
const GFX_Point* point	the point
GFX_Orientation	the orientation setting
GFX_Bool	the mirroring setting

Function

GFX_Point GFX_LayerPointFromOrientedSpace(const GFX_Layer* layer,
const GFX_Point* point,
GFX_Orientation ori,
GFX_Bool mirrored)

GFX_LayerPointToOrientedSpace Function

Transforms a point from screen space to oriented space given a layer, a display orientation, and a mirroring setting.

File

gfx_layer.h

C

```
LIB_EXPORT GFX_Point GFX_LayerPointToOrientedSpace(const GFX_Layer* layer, const GFX_Point* point,
GFX_Orientation ori, GFX_Bool mirrored);
```

Returns

GFX_Point

Parameters

Parameters	Description
const GFX_Layer* layer	the layer
const GFX_Point* point	the point to transform
GFX_Orientation	the orientation setting
GFX_Bool	the mirroring setting

Function

GFX_Point GFX_LayerPointToOrientedSpace(const GFX_Rect* layerRect,
const GFX_Point* point,
GFX_Orientation ori,
GFX_Bool mirrored)

GFX_LayerRectFromOrientedSpace Function

Transforms a layer point from oriented space to screen space given a layer, a display orientation, and a mirroring setting.

File

gfx_layer.h

C

```
LIB_EXPORT GFX_Rect GFX_LayerRectFromOrientedSpace(const GFX_Layer* layer, const GFX_Rect* rect,
GFX_Orientation ori, GFX_Bool mirrored);
```

Returns

GFX_Point

Parameters

Parameters	Description
const GFX_Layer* layer	the layer
const GFX_Rect* rect	the rectangle to transform

GFX_Orientation	the orientation setting
GFX_Bool	the mirroring setting

Function

GFX_Rect GFX_LayerRectFromOrientedSpace(const GFX_Layer* layer,
const GFX_Rect* rect,
GFX_Orientation ori,
GFX_Bool mirrored)

GFX_LayerRectToOrientedSpace Function

Transforms a rectangle from screen space to oriented space given a layer, a display orientation, and a mirroring setting.

File

gfx_layer.h

C

```
LIB_EXPORT GFX_Rect GFX_LayerRectToOrientedSpace(const GFX_Layer* layer, const GFX_Rect* rect,
GFX_Orientation ori, GFX_Bool mirrored);
```

Returns

GFX_Point

Parameters

Parameters	Description
const GFX_Layer* layer	the layer
const GFX_Rect* rect	the rectangle to transform
GFX_Orientation	the orientation setting
GFX_Bool	the mirroring setting

Function

GFX_Rect GFX_LayeRectToOrientedSpace(const GFX_Rect* layerRect,
const GFX_Rect* rect,
GFX_Orientation ori,
GFX_Bool mirrored)

GFX_LayerToOrientedSpace Function

Transforms a layer from screen space to oriented space.

File

gfx_layer.h

C

```
void GFX_LayerToOrientedSpace(GFX_Rect* displayRect, GFX_Layer* layer, GFX_Orientation ori, GFX_Bool
mirrored);
```

Returns

void

Parameters

Parameters	Description
GFX_Rect* dispayRect	the rectangle of the display
GFX_Rect* layer	the layer
GFX_Orientation	the orientation setting
GFX_Bool	the mirroring setting

Function

void GFX_LayerToOrientedSpace(GFX_Rect* displayRect,

GFX_Layer* layer,
GFX_Orientation ori,
GFX_Bool mirrored)

GFX_PercentOfDec Function

File

gfx_math.h

C

```
LIB_EXPORT void GFX_PercentOfDec(uint32_t num, uint32_t percent, uint32_t* whl, uint32_t* dec);
```

Description

This is function GFX_PercentOfDec.

GFX_RectClipAdj Function

File

gfx_rect.h

C

```
LIB_EXPORT GFX_Rect GFX_RectClipAdj(const GFX_Rect* l_rect, const GFX_Rect* r_rect, GFX_Rect* adj);
```

Description

This is function GFX_RectClipAdj.

GFX_RectFromPoints Function

File

gfx_rect.h

C

```
LIB_EXPORT GFX_Rect GFX_RectFromPoints(const GFX_Point* p1, const GFX_Point* p2);
```

Description

This is function GFX_RectFromPoints.

GFX_RectSplit Function

File

gfx_rect.h

C

```
LIB_EXPORT uint32_t GFX_RectSplit(const GFX_Rect* sub, const GFX_Rect* obj, GFX_Rect res[4]);
```

Description

This is function GFX_RectSplit.

GFX_RectToPoints Function

File

gfx_rect.h

C

```
LIB_EXPORT void GFX_RectToPoints(const GFX_Rect* rect, GFX_Point* p1, GFX_Point* p2);
```

Description

This is function GFX_RectToPoints.

GFX_UtilMirrorPoint Function

Reorients a point to a given mirrored orientation.

File

gfx_util.h

C

```
GFX_Point GFX_UtilMirrorPoint(const GFX_Point* point, const GFX_Rect* rect, GFX_Orientation ori);
```

Returns

GFX_Point

Parameters

Parameters	Description
const GFX_Point* point	the point to reorient
const GFX_Rect* rect	the bounding rectangle space
GFX_Orientation	the orientation setting

Function

void GFX_UtilMirrorPoint(const GFX_Point* point,
const GFX_Rect* rect,
GFX_Orientation ori)

GFX_UtilOrientPoint Function

Reorients a point to a given orthogonal orientation.

File

gfx_util.h

C

```
GFX_Point GFX_UtilOrientPoint(const GFX_Point* point, const GFX_Rect* rect, GFX_Orientation ori);
```

Returns

GFX_Point

Parameters

Parameters	Description
const GFX_Point* point	the point to reorient
const GFX_Rect* rect	the bounding rectangle space
GFX_Orientation	the orientation setting

Function

void GFX_UtilOrientPoint(const GFX_Point* point,
const GFX_Rect* rect,
GFX_Orientation ori)

GFX_UtilPointFromOrientedSpace Function

Transforms a point from an oriented rectangle space to an outer space given a display orientation and a mirroring setting.

File

gfx_util.h

C

```
GFX_Point GFX_UtilPointFromOrientedSpace(const GFX_Rect* outerRect, const GFX_Rect* innerRect, const
GFX_Point* pnt, GFX_Orientation ori, GFX_Bool mirrored);
```

Returns

GFX_Point

Parameters

Parameters	Description
const GFX_Rect* outerRect	the outer rectangle
const GFX_Rect* subRect	the inner rectangle
const GFX_Point* point	the point
GFX_Orientation	the orientation setting
GFX_Bool	the mirroring setting

Function

GFX_Point GFX_UtilPointFromOrientedSpace(const GFX_Rect* displayRect,
const GFX_Rect* innerRect,
const GFX_Point* pnt,
GFX_Orientation ori,
GFX_Bool mirrored)

GFX_UtilPointToOrientedSpace Function

Transforms a point to an oriented rectangle space to an outer space given a display orientation and a mirroring setting.

File

gfx_util.h

C

```
GFX_Point GFX_UtilPointToOrientedSpace(const GFX_Rect* outerRect, const GFX_Rect* innerRect, const
GFX_Point* pnt, GFX_Orientation ori, GFX_Bool mirrored);
```

Returns

GFX_Point

Parameters

Parameters	Description
const GFX_Rect* outerRect	the outer rectangle
const GFX_Rect* subRect	the inner rectangle
const GFX_Point* point	the point
GFX_Orientation	the orientation setting
GFX_Bool	the mirroring setting

Function

GFX_Point GFX_UtilPointToOrientedSpace(const GFX_Rect* displayRect,
const GFX_Rect* layerRect,
const GFX_Point* point,
GFX_Orientation ori,
GFX_Bool mirrored)

GFX_UtilSizeFromOrientedSpace Function

Transforms a size tuple from oriented space to screen space

File

gfx_util.h

C

```
GFX_Size GFX_UtilSizeFromOrientedSpace(const GFX_Size* size, GFX_Orientation ori);
```

Returns

GFX_Size

Parameters

Parameters	Description
const GFX_Size* size	the size dimension
GFX_Orientation	the orientation setting

Function

GFX_Size GFX_UtilSizeFromOrientedSpace(const GFX_Size* size, GFX_Orientation ori)

GFX_UtilSizeToOrientedSpace Function

Transforms a size tuple from screen space to oriented space

File

gfx_util.h

C

```
GFX_Size GFX_UtilSizeToOrientedSpace(const GFX_Size* size, GFX_Orientation ori);
```

Returns

GFX_Size

Parameters

Parameters	Description
const GFX_Size* size	the size dimension
GFX_Orientation	the orientation setting

Function

void GFX_UtilSizeToOrientedSpace(const GFX_Size* size, GFX_Orientation ori)

GFX_UtilSortPointsX Function

Sorts two points in the X axis

File

gfx_util.h

C

```
void GFX_UtilSortPointsX(GFX_Point* p1, GFX_Point* p2);
```

Returns

void

Parameters

Parameters	Description
GFX_Point* p1	the first point to sort
GFX_Point* p2	the second point to sort

Function

void GFX_UtilSortPointsX(GFX_Point* p1, GFX_Point* p2)

GFX_UtilSortPointsY Function

Sorts two points in the Y axis

File

gfx_util.h

C

```
void GFX_UtilSortPointsY(GFX_Point* p1, GFX_Point* p2);
```

Returns

void

Parameters

Parameters	Description
GFX_Point* p1	the first point to sort
GFX_Point* p2	the second point to sort

Function

void GFX_UtilSortPointsY(GFX_Point* p1, GFX_Point* p2)

GFX_RectCombine Function

Combines the area of two rectangles into a single rectangle.

File

gfx_rect.h

C

```
LIB_EXPORT GFX_Rect GFX_RectCombine(const GFX_Rect* l_rect, const GFX_Rect* r_rect);
```

Returns

void

Parameters

Parameters	Description
const GFX_Rect* l_rect	the first rectangle
const GFX_Rect* r_rect	the second rectangle

Function

GFX_Rect GFX_RectCombine(const GFX_Rect* l_rect,
const GFX_Rect* r_rect)

GFX_DrawDirectBlit Function

Blits a buffer of pixels into the frame buffer without performing per-pixel operations on the data.

File

gfx_draw.h

C

```
LIB_EXPORT GFX_Result GFX_DrawDirectBlit(GFX_PixelBuffer* buffer, int32_t src_x, int32_t src_y, int32_t
src_width, int32_t src_height, int32_t dest_x, int32_t dest_y);
```

Returns

GFX_Result - Returns GFX_TRUE if the blit was drawn successfully. Otherwise returns GFX_FALSE.

Description

A pixel buffer is an array of pixel data that can be applied in bulk, or 'blit'ed, to the frame buffer. This method will not perform per-pixel operations on the incoming data. The incoming pixel data color format must match the format of the current target buffer. Area clipping operations are still performed if enabled.

Parameters

Parameters	Description
buffer	the pointer to the source pixel buffer
src_x	the x component of the rectangle of the buffer to blit, usually 0
src_y	the y component of the rectangle of the buffer to blit, usually 0

src_width	width of the rectangle of the buffer to blit, usually the entire with of the source buffer
src_height	height of the rectangle of the buffer to blit, usually the entire height of the source buffer
dest_x	the x position to blit the source rectangle in the destination buffer the y position to blit the source rectangle in the destination buffer

Function

GFX_Result GFX_DrawDirectBlit(GFX_PixelBuffer* buffer,
int32_t src_x,
int32_t src_y,
int32_t src_width,
int32_t src_height,
int32_t dest_x,
int32_t dest_y);

GFX_RectCompare Function

File

gfx_rect.h

C

```
LIB_EXPORT int32_t GFX_RectCompare(const GFX_Rect* l, const GFX_Rect* r);
```

Description

This is function GFX_RectCompare.

GFX_RectsAreSimilar Function

File

gfx_rect.h

C

```
LIB_EXPORT GFX_Bool GFX_RectsAreSimilar(const GFX_Rect* l, const GFX_Rect* r);
```

Description

This is function GFX_RectsAreSimilar.

GFX_ScaleIntegerSigned Function

Scales a signed integer from one number range of 0 -> n0 to another range 0 -> n1 based on percentages.

File

gfx_math.h

C

```
LIB_EXPORT int32_t GFX_ScaleIntegerSigned(int32_t num, int32_t oldMax, int32_t newMax);
```

Returns

int32_t - the number as defined in the new number range

Parameters

Parameters	Description
num	the number to consider
oldMax	the old range maximum
newMax	the new range maximum

Function

int32_t GFX_ScaleIntegerSigned(int32_t num, int32_t oldMax, int32_t newMax);

b) Data Types and Constants

GFX_ColorMode_t Enumeration

List of available color modes.

File

gfx_color.h

C

```
enum GFX_ColorMode_t {
  GFX_COLOR_MODE_GS_8 = 0x0,
  GFX_COLOR_MODE_RGB_332,
  GFX_COLOR_MODE_RGB_565,
  GFX_COLOR_MODE_RGBA_5551,
  GFX_COLOR_MODE_RGB_888,
  GFX_COLOR_MODE_RGBA_8888,
  GFX_COLOR_MODE_ARGB_8888,
  GFX_COLOR_MODE_YUV,
  GFX_COLOR_MODE_INDEX_1,
  GFX_COLOR_MODE_INDEX_4,
  GFX_COLOR_MODE_INDEX_8,
  GFX_COLOR_MODE_LAST = GFX_COLOR_MODE_INDEX_8
};
```

Description

Enumeration: GFX_ColorMode_t

GFX_DriverInfo_t Structure

A driver description structure.

File

gfx_driver_interface.h

C

```
struct GFX_DriverInfo_t {
  char name[16];
  GFX_ColorMask color_formats;
  uint32_t layer_count;
};
```

Description

Structure: GFX_DriverInfo_t

name - a short human-readable name. color formats - a mask of supported color formats layer_count - number of layers supported by the driver

Remarks

None.

GFX_Point_t Structure

A two dimensional Cartesian point.

File

gfx_common.h

C

```
struct GFX_Point_t {
  int32_t x;
  int32_t y;
};
```

Description

Structure: GFX_Point_t

GFX_Rect_t Structure

A rectangle definition.

File

gfx_common.h

C

```
struct GFX_Rect_t {
  int32_t x;
  int32_t y;
  int32_t width;
  int32_t height;
};
```

Description

Structure: GFX_Rect_t

begin_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* begin_FnPtr)(void);
```

Description

This is type begin_FnPtr.

boolGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Bool (* boolGet_FnPtr)(void);
```

Description

This is type boolGet_FnPtr.

boolSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* boolSet_FnPtr)(GFX_Bool);
```

Description

This is type boolSet_FnPtr.

brightnessGet_FnPtr Type

File

gfx_hal.h

C

```
typedef uint32_t (* brightnessGet_FnPtr)(void);
```

Description

This is type brightnessGet_FnPtr.

brightnessRangeGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* brightnessRangeGet_FnPtr)(uint32_t*, uint32_t*);
```

Description

This is type brightnessRangeGet_FnPtr.

brightnessSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* brightnessSet_FnPtr)(uint32_t);
```

Description

This is type brightnessSet_FnPtr.

colorModeGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_ColorMode (* colorModeGet_FnPtr)(void);
```

Description

This is type colorModeGet_FnPtr.

colorModeSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* colorModeSet_FnPtr)(GFX_ColorMode);
```

Description

This is type colorModeSet_FnPtr.

destroy_FnPtr Type

File

gfx_hal.h

C

```
typedef void (* destroy_FnPtr)(GFX_Context*);
```

Description

This is type destroy_FnPtr.

drawAlphaValueGet_FnPtr Type

File

gfx_hal.h

C

```
typedef uint32_t (* drawAlphaValueGet_FnPtr)(void);
```

Description

This is type drawAlphaValueGet_FnPtr.

drawAlphaValueSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawAlphaValueSet_FnPtr)(uint32_t);
```

Description

This is type drawAlphaValueSet_FnPtr.

drawBlendModeGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_BlendMode (* drawBlendModeGet_FnPtr)(void);
```

Description

This is type drawBlendModeGet_FnPtr.

drawBlendModeSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawBlendModeSet_FnPtr)(GFX_BlendMode);
```

Description

This is type drawBlendModeSet_FnPtr.

drawBlit_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawBlit_FnPtr)(const GFX_PixelBuffer*, const GFX_Rect*, const GFX_Point*, const
GFX_DrawState*);
```

Description

This is type drawBlit_FnPtr.

drawCircle_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawCircle_FnPtr)(const GFX_Point*, int32_t, const GFX_DrawState*);
```

Description

This is type drawCircle_FnPtr.

drawClipRectGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawClipRectGet_FnPtr)(GFX_Rect*);
```

Description

This is type drawClipRectGet_FnPtr.

drawClipRectSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawClipRectSet_FnPtr)(const GFX_Rect*);
```

Description

This is type drawClipRectSet_FnPtr.

drawColorGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Color (* drawColorGet_FnPtr)(void);
```

Description

This is type drawColorGet_FnPtr.

drawColorSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawColorSet_FnPtr)(GFX_Color);
```

Description

This is type drawColorSet_FnPtr.

drawGradientColorGet_FnPtr Type

File

gfx_hal.h

C

```
typedef void (* drawGradientColorGet_FnPtr)(GFX_Color*, GFX_Color*, GFX_Color*, GFX_Color*);
```

Description

This is type drawGradientColorGet_FnPtr.

drawGradientColorSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawGradientColorSet_FnPtr)(GFX_Color, GFX_Color, GFX_Color, GFX_Color);
```

Description

This is type drawGradientColorSet_FnPtr.

drawLine_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawLine_FnPtr)(const GFX_Point*, const GFX_Point*, const GFX_DrawState*);
```

Description

This is type drawLine_FnPtr.

drawLock_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawLock_FnPtr)(void);
```

Description

This is type drawLock_FnPtr.

drawMaskValueGet_FnPtr Type

File

gfx_hal.h

C

```
typedef uint32_t (* drawMaskValueGet_FnPtr)(void);
```

Description

This is type drawMaskValueGet_FnPtr.

drawMaskValueSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawMaskValueSet_FnPtr)(uint32_t);
```

Description

This is type drawMaskValueSet_FnPtr.

drawModeGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_DrawMode (* drawModeGet_FnPtr)(void);
```

Description

This is type drawModeGet_FnPtr.

drawModeSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawModeSet_FnPtr)(GFX_DrawMode);
```

Description

This is type drawModeSet_FnPtr.

drawPaletteGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawPaletteGet_FnPtr)(GFX_PixelBuffer*);
```

Description

This is type drawPaletteGet_FnPtr.

drawPaletteSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawPaletteSet_FnPtr)(const GFX_PixelBuffer*);
```

Description

This is type drawPaletteSet_FnPtr.

drawPixel_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawPixel_FnPtr)(const GFX_Point*, const GFX_DrawState*);
```

Description

This is type drawPixel_FnPtr.

drawRect_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawRect_FnPtr)(const GFX_Rect*, const GFX_DrawState*);
```

Description

This is type drawRect_FnPtr.

drawThicknessGet_FnPtr Type

File

gfx_hal.h

C

```
typedef uint32_t (* drawThicknessGet_FnPtr)(void);
```

Description

This is type drawThicknessGet_FnPtr.

drawThicknessSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawThicknessSet_FnPtr)(uint32_t);
```

Description

This is type drawThicknessSet_FnPtr.

drawUnlock_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawUnlock_FnPtr)(void);
```

Description

This is type drawUnlock_FnPtr.

GFX_AntialiasMode Enumeration

Enables anti-aliased drawing hint

File

gfx_draw.h

C

```
typedef enum GFX_AntialiasMode_t {
  GFX_ANTIALIAS_OFF = 0x0,
  GFX_ANTIALIAS_ON = 0x1
} GFX_AntialiasMode;
```

Description

Enumeration: GFX_AntialiasMode_t

Remarks

None.

GFX_BitsPerPixel Enumeration

List of available bits-per-pixel sizes.

File

gfx_color.h

C

```
typedef enum GFX_BitsPerPixel_t {
  GFX_BPP1,
  GFX_BPP4,
  GFX_BPP8,
  GFX_BPP16,
  GFX_BPP24,
  GFX_BPP32
} GFX_BitsPerPixel;
```

Description

Enumeration: GFX_BitsPerPixel_t

GFX_BlendMode Enumeration

Blend mode masks

File

gfx_common.h

C

```
typedef enum GFX_BlendMode_t {
  GFX_BLEND_NONE = 0x0,
  GFX_BLEND_CHANNEL = 0x1,
  GFX_BLEND_GLOBAL = 0x2,
  GFX_BLEND_ALL = GFX_BLEND_CHANNEL|GFX_BLEND_GLOBAL
} GFX_BlendMode;
```

Description

Enumeration: GFX_BlendMode_t

GFX_Bool Type

File

gfx_common.h

C

```
typedef uint32_t GFX_Bool;
```

Description

This is type GFX_Bool.

GFX_Buffer Type

File

gfx_common.h

C

```
typedef void* GFX_Buffer;
```

Description

This is type GFX_Buffer.

GFX_BufferSelection Enumeration

Buffer selector used when querying layers for certain buffer states.

File

gfx_common.h

C

```
typedef enum GFX_BufferSelection_t {
  GFX_BUFFER_READ,
  GFX_BUFFER_WRITE
} GFX_BufferSelection;
```

Description

Enumeration: GFX_BufferSelection_t

GFX_BufferState Enumeration

Frame buffer memory states

File

gfx_common.h

C

```
typedef enum GFX_BufferState_t {
  GFX_BS_NONE = 0x0,
  GFX_BS_ADDRESS,
  GFX_BS_MALLOC,
  GFX_BS_MANAGED
} GFX_BufferState;
```

Description

Enumeration: GFX_BufferState_t

address - The buffer is set to a discrete address. This could be an address located in DDR memory, a buffer allocated by the application, or some other location.

malloc - The buffer has been dynamically allocated from some form of heap or memory manager. These can be freed as desired.

managed - The buffer is owned by the system and cannot be allocated or freed, it just is. This is common in systems where the memory is owned by the graphics driver or the memory resides on the graphics controller.

Remarks

None.

GFX_Calloc_FnPtr Type

Simple wrapper around the standard calloc function pointer. Used for redirecting memory allocation to other memory management systems.

File

gfx_common.h

C

```
typedef void* (* GFX_Calloc_FnPtr)(size_t, size_t);
```

Description

Function pointer

Function

typedef void* (*GFX_Calloc_FnPtr)(size_t, size_t);

GFX_Color Type

File

gfx_common.h

C

```
typedef uint32_t GFX_Color;
```

Description

This is type GFX_Color.

GFX_ColorMask Enumeration

Maskable list of color valies.

File

gfx_color.h

C

```
typedef enum GFX_ColorMask_t {
  GFX_COLOR_MASK_GS_8 = 0x1,
  GFX_COLOR_MASK_RGB_332 = 0x4,
  GFX_COLOR_MASK_RGB_565 = 0x8,
  GFX_COLOR_MASK_RGBA_5551 = 0x10,
  GFX_COLOR_MASK_RGB_888 = 0x20,
  GFX_COLOR_MASK_RGBA_8888 = 0x40,
  GFX_COLOR_MASK_ARGB_8888 = 0x80,
  GFX_COLOR_MASK_YUV = 0x100,
  GFX_COLOR_MASK_ALL =
GFX_COLOR_MASK_GS_8|GFX_COLOR_MASK_RGB_332|GFX_COLOR_MASK_RGB_565|GFX_COLOR_MASK_RGBA_5551|GFX_COLOR_MASK_RG
B_888|GFX_COLOR_MASK_RGBA_8888|GFX_COLOR_MASK_ARGB_8888|GFX_COLOR_MASK_YUV
} GFX_ColorMask;
```

Description

Enumeration: GFX_ColorMask_t

GFX_ColorMode Type

List of available color modes.

File

gfx_common.h

C

```
typedef enum GFX_ColorMode_t GFX_ColorMode;
```

Description

Enumeration: GFX_ColorMode_t

GFX_ColorModeInfo Structure

Struct that provides information about a color mode.

File

gfx_color.h

C

```
typedef struct GFX_ColorModeInfo_t {
  uint32_t size;
  uint32_t bpp;
  GFX_BitsPerPixel bppOrdinal;
  struct masks {
    uint32_t red;
    uint32_t green;
    uint32_t blue;
    uint32_t alpha;
  } mask;
  struct shifts {
    uint8_t red;
    uint8_t green;
    uint8_t blue;
    uint8_t alpha;
  } shift;
} GFX_ColorModeInfo;
```

Description

Structure: GFX_ColorModeInfo_t

size - size in bytes bpp - bpp value bppOrdinal - bpp enum value masks - the masks used for extracting individual color channel information

Remarks

None.

GFX_ColorName Enumeration

Color name reference table

File

gfx_color.h

C

```
typedef enum GFX_ColorName_t {
  GFX_COLOR_BLACK,
  GFX_COLOR_WHITE,
  GFX_COLOR_RED,
  GFX_COLOR_LIME,
  GFX_COLOR_BLUE,
  GFX_COLOR_YELLOW,
  GFX_COLOR_CYAN,
  GFX_COLOR_MAGENTA,
  GFX_COLOR_SILVER,
  GFX_COLOR_DARKGRAY,
  GFX_COLOR_GRAY,
  GFX_COLOR_LIGHTGRAY,
  GFX_COLOR_MAROON,
  GFX_COLOR_OLIVE,
  GFX_COLOR_GREEN,
  GFX_COLOR_PURPLE,
  GFX_COLOR_TEAL,
  GFX_COLOR_NAVY,
  GFX_COLOR_LAST
} GFX_ColorName;
```

Description

Structure: GFX_ColorName_t

GFX_Context Structure

An instance of the hardware abstraction layer.

File

gfx_context.h

C

```
typedef struct GFX_Context_t {
  GFX_Display display_idx;
  GFX_DisplayInfo* display_info;
  struct {
    uint32_t count;
    uint32_t active_idx;
    GFX_Layer* active;
    GFX_Layer* layers;
  } layer;
  uint32_t brightness;
  GFX_Orientation orientation;
  GFX_Bool mirrored;
  GFX_Bool layerSwapSync;
  GFX_ColorMode colorMode;
  GFX_GlobalPalette globalPalette;
  GFX_DrawState draw;
  GFX_SyncCallback_FnPtr vsyncCB;
  GFX_SyncCallback_FnPtr hsyncCB;
  GFX_HAL hal;
  GFX_MemoryIntf memory;
  void* driver_data;
} GFX_Context;
```

Members

Members	Description
GFX_SyncCallback_FnPtr vsyncCB;	GFX_DRAW_PIPELINE_ENABLED

Description

Stucture: GFX_Context_t

The context is an instance of the hardware abstraction layer. It is essentially the marriage between a graphics driver, a display description, and possibly a graphics processor. It contains the data that describes the layout of the display, the buffers that store the display data, the current draw state, and the function map that controls everything.

Members: display_idx - the display associated with this context display_info - a pointer to the information for the display for this context

layer.count - the number of existing layers layer.active_idx - the index of the active layer layer.active - the pointer to the active layer layer.layers - the array of layers for this context

brightness - the brightness setting for this context orientation - the orientation mode for this context mirrored - the mirror mode for this context

colorMode - the color mode for this context, all buffers of all layers use this mode

draw - the current draw state of this context

vsyncCB - the callback to invoke when the driver enters vsync mode hsyncCB - the callback to invoke when the driver enters hsync mode

hal - the function table for this context

memory - the memory management interface for this context

driver_data - a pointer that can be used for driver-specific data purposes

Remarks

None.

GFX_Display Type

File

gfx_common.h

C

```
typedef uint32_t GFX_Display;
```

Description

This is type GFX_Display.

GFX_DisplayInfo Structure

Describes a graphical display device.

File

gfx_display.h

C

```
typedef struct GFX_DisplayInfo_t {
  const char name[16];
  GFX_ColorMask color_formats;
  GFX_Rect rect;
  struct attributes_t {
    int8_t data_width;
    struct horizontal_t {
      int8_t pulse_width;
      int8_t back_porch;
      int8_t front_porch;
    } horz;
    struct vertical_t {
      int8_t pulse_width;
      int8_t back_porch;
      int8_t front_porch;
    } vert;
    int32_t inv_left_shift;
  } attributes;
} GFX_DisplayInfo;
```

Description

Structure: GFX_DisplayInfo_t

name - a short human-readable name color_formats - mask of color formats this display supports rect - the size of the display

Remarks

None.

GFX_DrawMode Enumeration

Gradient draw modes.

File

gfx_draw.h

C

```
typedef enum GFX_DrawMode_t {
  GFX_DRAW_LINE = 0x0,
  GFX_DRAW_FILL,
  GFX_DRAW_GRADIENT_LEFT_RIGHT,
  GFX_DRAW_GRADIENT_TOP_BOTTOM
} GFX_DrawMode;
```

Description

Enumeration: GFX_DrawMode_t

line - draws the outline of a shape fill - draws a filled shape gradient left/right - draws a gradient from left to right, uses the first two gradient colors gradient top/bottom - draws a gradient from top to bottom, uses the first two gradient colors

Remarks

None.

GFX_DrawState Structure

A list of drawing hints for shape drawing algorithms

File

gfx_draw.h

C

```
typedef struct GFX_DrawState_t {
  GFX_DrawMode mode;
  GFX_Color color;
  GFX_ColorMode colorMode;
```

```
    struct {
      GFX_Color c0;
      GFX_Color c1;
      GFX_Color c2;
      GFX_Color c3;
    } gradient;
    GFX_PixelBuffer palette;
    const GFX_PixelBuffer* target;
    GFX_Rect targetClipRect;
    GFX_BlendMode blendMode;
    GFX_Bool alphaEnable;
    uint32_t globalAlphaValue;
    GFX_Bool maskEnable;
    uint32_t maskValue;
    GFX_Bool antialias;
    uint32_t thickness;
    GFX_Bool clipEnable;
    GFX_Rect clipRect;
    GFX_ResizeMode resizeMode;
    GFX_PipelineMode pipelineMode;
    GFX_DrawPipeline* pipeline;
  } GFX_DrawState;
```

Description

Structure: GFX_DrawState_t

mode - the shape drawing mode

color - the draw color

gradient - the list of gradient colors

palette - the palette lookup table for blits

alphaEnable - indicates if alpha blending is enabled alphaValue - the desired alpha blending amount

maskEnable - indicates if pixel masking is enabled maskValue - the mask/transparency color value

clipEnable - indicate of pixel clipping is enabled clipRect - the pixel clipping rectangle

Remarks

None.

GFX_Driver Type

File

gfx_common.h

C

```
typedef uint32_t GFX_Driver;
```

Description

This is type GFX_Driver.

GFX_DriverInfo Type

A driver description structure.

File

gfx_hal.h

C

```
typedef struct GFX_DriverInfo_t GFX_DriverInfo;
```

Description

Structure: GFX_DriverInfo_t

name - a short human-readable name. color formats - a mask of supported color formats layer_count - number of layers supported by the driver

Remarks

None.

GFX_Flag Enumeration

Hardware abstraction state interface flags. See gfx.h for a comprehensive description.

File

gfx_common.h

C

```
typedef enum GFX_Flag_t {
  GFXF_NONE = 0,
  GFXF_DISPLAY_COUNT,
  GFXF_DISPLAY_INFO,
  GFXF_DRIVER_COUNT,
  GFXF_DRIVER_INFO,
  GFXF_BRIGHTNESS_RANGE,
  GFXF_BRIGHTNESS,
  GFXF_VSYNC_CALLBACK,
  GFXF_HSYNC_CALLBACK,
  GFXF_ORIENTATION,
  GFXF_MIRRORED,
  GFXF_COLOR_MODE,
  GFXF_GLOBAL_PALETTE,
  GFXF_LAYER_COUNT,
  GFXF_LAYER_ACTIVE,
  GFXF_LAYER_ENABLED,
  GFXF_LAYER_VISIBLE,
  GFXF_LAYER_VSYNC,
  GFXF_LAYER_INVALID,
  GFXF_LAYER_SWAP_SYNC,
  GFXF_LAYER_SWAP,
  GFXF_LAYER_POSITION,
  GFXF_LAYER_SIZE,
  GFXF_LAYER_ALPHA_ENABLE,
  GFXF_LAYER_ALPHA_AMOUNT,
  GFXF_LAYER_MASK_ENABLE,
  GFXF_LAYER_MASK_COLOR,
  GFXF_LAYER_BUFFER_COUNT,
  GFXF_LAYER_BUFFER_ADDRESS,
  GFXF_LAYER_BUFFER_COHERENT,
  GFXF_LAYER_BUFFER_ALLOCATE,
  GFXF_LAYER_BUFFER_FREE,
  GFXF_DRAW_PIPELINE_MODE,
  GFXF_DRAW_MODE,
  GFXF_DRAW_COLOR,
  GFXF_DRAW_GRADIENT_COLOR,
  GFXF_DRAW_PALETTE,
  GFXF_DRAW_TARGET,
  GFXF_DRAW_THICKNESS,
  GFXF_DRAW_BLEND_MODE,
  GFXF_DRAW_RESIZE_MODE,
  GFXF_DRAW_ALPHA_ENABLE,
  GFXF_DRAW_ALPHA_VALUE,
  GFXF_DRAW_MASK_ENABLE,
  GFXF_DRAW_MASK_VALUE,
  GFXF_DRAW_CLIP_ENABLE,
  GFXF_DRAW_CLIP_RECT,
  GFXF_LAST_FLAG
} GFX_Flag;
```

Description

Enumeration: GFX_Flag_t

GFX_FrameBuffer Structure

A frame buffer is a wrapper around a pixel buffer construct that is used by display drivers to manage frame buffers.

File

gfx_layer.h

C

```
typedef struct GFX_FrameBuffer_t {
  GFX_PixelBuffer pb;
  GFX_BufferState state;
  GFX_Bool coherent;
  void* driver_data;
} GFX_FrameBuffer;
```

Description

Structure: GFX_FrameBuffer_t

pb - The pixel buffer description of the frame buffer. state - The state of the frame buffer. coherent - Indicates if the frame buffer is allocated from coherent dynamic memory

Remarks

None.

GFX_Free_FnPtr Type

Simple wrapper around the standard free function pointer. Used for redirecting memory free to other memory management systems.

File

gfx_common.h

C

```
typedef void (* GFX_Free_FnPtr)(void*);
```

Description

Function pointer

Function

typedef void (*GFX_Free_FnPtr)(void*);

GFX_HAL Structure

File

gfx_hal.h

C

```
typedef struct GFX_HAL_t {
  initialize_FnPtr initialize;
  destroy_FnPtr destroy;
  begin_FnPtr begin;
  end_FnPtr end;
  update_FnPtr update;
  brightnessRangeGet_FnPtr brightnessRangeGet;

interrupt_FnPtr interrupt;	GFX_DRAW_PIPELINE_ENABLED

Description

Hardware Abstraction Function Table *

- This is the core hardware abtraction table that makes everything work. Drivers are
- expected to reroute the functionality of this table to hardware specific implementations
- to provide accelerated performance and features.

GFX_Handle Type

File

gfx_common.h

C

```
typedef void* GFX_Handle;
```

Description

This is type GFX_Handle.

GFX_Layer Structure

Layers describe basic display drawing areas and are meant to map directly to graphics controller hardware layers.

File

gfx_layer.h

C

```
typedef struct GFX_Layer_t {
  uint32_t id;
  struct {
    GFX_Rect display;
    GFX_Rect local;
  } rect;
  uint32_t pixel_size;
  GFX_Bool alphaEnable;
  uint32_t alphaAmount;
  GFX_Bool maskEnable;
  uint32_t maskColor;
  uint32_t buffer_count;
  uint32_t buffer_read_idx;
  uint32_t buffer_write_idx;
  GFX_FrameBuffer buffers[GFX_MAX_BUFFER_COUNT];
  GFX_Bool enabled;
  GFX_Bool visible;
  GFX_Bool swap;
  uint32_t swapCount;
  GFX_Bool locked;
  GFX_Bool invalid;
  GFX_Bool vsync;
  void* driver_data;
} GFX_Layer;
```

Members

Members	Description
GFX_Rect display;	represents area in display space
GFX_Rect local;	represents position in local space

Description

Structure: GFX_Layer_t

Graphics controllers will typically offer at least one drawing layer for drawing purposes. More advanced controllers may offer several. Layers are often configurable, offering independent positioning, sizing, color formats, and drawing features.

uint32_t id - the unique id of the layer

struct { GFX_Rect display - represents area in display space GFX_Rect local - represents position in local space } rect;

uint32_t pixel_size - size of a layer pixel in bytes

GFX_Bool alphaEnable - indicates if layer alpha blending is enabled uint32_t alphaAmount - indicates the amount of alpha blending

GFX_Bool maskEnable - indicates if layer masking/transparency is enabled uint32_t maskColor - the color to mask

uint32_t buffer_count - the number of buffers this layer owns uint32_t buffer_read_idx - the index of the current read buffer uint32_t buffer_write_idx - the index of the current write buffer GFX_FrameBuffer buffers[GFX_MAX_BUFFER_COUNT] - the layer buffer array

GFX_Bool enabled - indicates if the layer is enabled GFX_Bool visible - indicates if the layer is visible

GFX_Bool swap - indicates if the layer is waiting to advance its buffer chain

GFX_Bool locked - indicates if the layer's buffers are locked for manipulation. this is typically meant to prevent things like swapping before drawing operations have been completed

GFX_Bool vsync - indicates if this layer should swap during the display driver's blanking period. if this is true then it is the responsibility of the display driver to call GFX_LayerSwap on this layer during vblank. If this is false then the layer will swap immediately upon application request.

void* driver_data - this is a pointer that may be allocated by the display driver to store driver-specific per layer data. the driver is responsible for the management of this pointer during the application life cycle

Remarks

None.

GFX_Malloc_FnPtr Type

Simple wrapper around the standard malloc function pointer. Used for redirecting memory allocation to other memory management systems.

File

gfx_common.h

C

```
typedef void* (* GFX_Malloc_FnPtr)(size_t);
```

Description

memory abstraction

****

Function pointer

Function

typedef void* (*GFX_Malloc_FnPtr)(size_t);

GFX_Memcpy_FnPtr Type

Simple wrapper around the standard memcpy function pointer. Used for redirecting memcpy to other memory management systems.

File

gfx_common.h

C

```
typedef void* (* GFX_Memcpy_FnPtr)(void*, const void*, size_t);
```

Description

Function pointer

Function

typedef void* (*GFX_Memcpy_FnPtr)(void*, const void*, size_t);

GFX_MemoryIntf Structure

Custom memory manager interface.

File

gfx_common.h

C

```
typedef struct GFX_MemoryIntf_t {
  GFX_Malloc_FnPtr malloc;
  GFX_Malloc_FnPtr coherent_alloc;
  GFX_Calloc_FnPtr calloc;
  GFX_Realloc_FnPtr realloc;
  GFX_Free_FnPtr free;
  GFX_Free_FnPtr coherent_free;
  GFX_Memset_FnPtr memset;
  GFX_Memcpy_FnPtr memcpy;
} GFX_MemoryIntf;
```

Description

Structure: GFX_MemoryIntf_t

Applications utilizing the hardware abstraction layer may want to implement or utilize memory managers other than the standard library. This interface is the method for notifying the HAL of that manager.

The application must create a GFX_MemoryIntf struct, populate it with the fuction pointers that point to the custom memory manager, and pass the struct in to GFX_Open when the HAL context is created.

If no GFX_MemoryIntf is provided then the standard library memory management APIs will be used by default.

Remarks

None.

GFX_Memset_FnPtr Type

Simple wrapper around the standard memset function pointer. Used for redirecting memset to other memory management systems.

File

gfx_common.h

C

```
typedef void* (* GFX_Memset_FnPtr)(void*, int32_t, size_t);
```

Description

Function pointer

Function

typedef void* (*GFX_Memset_FnPtr)(void*, int32_t, size_t);

GFX_Orientation Enumeration

Orthogonal orientation settings.

File

gfx_common.h

C

```
typedef enum GFX_Orientation_t {
  GFX_ORIENTATION_0 = 0x0,
  GFX_ORIENTATION_90,
  GFX_ORIENTATION_180,
  GFX_ORIENTATION_270
} GFX_Orientation;
```

Description

Enumeration: GFX_Orientation_t

GFX_PixelBuffer Structure

A pixel buffer is a wrapper around a basic data pointer. A pixel buffer has a color mode, a pixel count, a rectangular dimension, a pixel count, and a lenght in bytes.

File

gfx_pixel_buffer.h

C

```
typedef struct GFX_PixelBuffer_t {
  GFX_ColorMode mode;
  GFX_Size size;
  int32_t pixel_count;
  uint32_t buffer_length;
  GFX_Buffer pixels;
} GFX_PixelBuffer;
```

Description

Structure: GFX_PixelBuffer_t

mode - the color mode of the pixel buffer size - the width and height dimension of the pixel buffer pixel_count - the total number of pixels in the buffer buffer_length - the total size of the buffer in bytes pixels - the pointer to the pixel data for the buffer

Remarks

None.

end_FnPtr Type

File

gfx_hal.h

C

```
typedef void (* end_FnPtr)(void);
```

Description

This is type end_FnPtr.

GFX_Processor Type

File

gfx_common.h

C

```
typedef uint32_t GFX_Processor;
```

Description

This is type GFX_Processor.

GFX_Realloc_FnPtr Type

Simple wrapper around the standard realloc function pointer. Used for redirecting memory allocation to other memory management systems.

File

gfx_common.h

C

```
typedef void* (* GFX_Realloc_FnPtr)(void*, size_t);
```

Description

Function pointer

Function

typedef void* (*GFX_Realloc_FnPtr)(void*, size_t);

GFX_Result Type

File

gfx_common.h

C

```
typedef int32_t GFX_Result;
```

Description

This is type GFX_Result.

GFX_Size Structure

A two dimensional indication of size. Values are signed but should never be negative.

File

gfx_common.h

C

```
typedef struct GFX_Size_t {
  int32_t width;
  int32_t height;
} GFX_Size;
```

Description

Structure: GFX_Size_t

GFX_SyncCallback_FnPtr Type

File

gfx_common.h

C

```
typedef void (* GFX_SyncCallback_FnPtr)(void);
```

Description

This is type GFX_SyncCallback_FnPtr.

layerActiveGet_FnPtr Type

File

gfx_hal.h

C

```
typedef uint32_t (* layerActiveGet_FnPtr)(void);
```

Description

This is type layerActiveGet_FnPtr.

layerActiveSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerActiveSet_FnPtr)(uint32_t);
```

Description

This is type layerActiveSet_FnPtr.

layerAlphaAmountGet_FnPtr Type

File

gfx_hal.h

C

```
typedef uint32_t (* layerAlphaAmountGet_FnPtr)(void);
```

Description

This is type layerAlphaAmountGet_FnPtr.

layerAlphaAmountSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerAlphaAmountSet_FnPtr)(uint32_t, GFX_Bool);
```

Description

This is type layerAlphaAmountSet_FnPtr.

layerBufferAddressGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Buffer (* layerBufferAddressGet_FnPtr)(uint32_t);
```

Description

This is type layerBufferAddressGet_FnPtr.

layerBufferAddressSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerBufferAddressSet_FnPtr)(uint32_t, GFX_Buffer);
```

Description

This is type layerBufferAddressSet_FnPtr.

layerBufferAllocate_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerBufferAllocate_FnPtr)(uint32_t);
```

Description

This is type layerBufferAllocate_FnPtr.

layerBufferCoherentGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Bool (* layerBufferCoherentGet_FnPtr)(uint32_t);
```

Description

This is type layerBufferCoherentGet_FnPtr.

layerBufferCoherentSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerBufferCoherentSet_FnPtr)(uint32_t, GFX_Bool);
```

Description

This is type layerBufferCoherentSet_FnPtr.

layerBufferCountGet_FnPtr Type

File

gfx_hal.h

C

```
typedef uint32_t (* layerBufferCountGet_FnPtr)(void);
```

Description

This is type layerBufferCountGet_FnPtr.

layerBufferCountSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerBufferCountSet_FnPtr)(uint32_t);
```

Description

This is type layerBufferCountSet_FnPtr.

layerBufferFree_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerBufferFree_FnPtr)(uint32_t);
```

Description

This is type layerBufferFree_FnPtr.

layerBufferIsAllocated_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Bool (* layerBufferIsAllocated_FnPtr)(uint32_t);
```

Description

This is type layerBufferIsAllocated_FnPtr.

layerMaskColorGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Color (* layerMaskColorGet_FnPtr)(void);
```

Description

This is type layerMaskColorGet_FnPtr.

layerMaskColorSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerMaskColorSet_FnPtr)(GFX_Color mask, GFX_Bool);
```

Description

This is type layerMaskColorSet_FnPtr.

layerPositionGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerPositionGet_FnPtr)(int32_t*, int32_t*);
```

Description

This is type layerPositionGet_FnPtr.

layerPositionSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerPositionSet_FnPtr)(int32_t, int32_t);
```

Description

This is type layerPositionSet_FnPtr.

layerSizeGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerSizeGet_FnPtr)(int32_t* width, int32_t* height);
```

Description

This is type layerSizeGet_FnPtr.

layerSizeSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerSizeSet_FnPtr)(int32_t width, int32_t height);
```

Description

This is type layerSizeSet_FnPtr.

layerSwapped_FnPtr Type

File

gfx_hal.h

C

```
typedef void (* layerSwapped_FnPtr)(GFX_Layer*);
```

Description

This is type layerSwapped_FnPtr.

orientationGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Orientation (* orientationGet_FnPtr)(void);
```

Description

This is type orientationGet_FnPtr.

orientationSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* orientationSet_FnPtr)(GFX_Orientation);
```

Description

This is type orientationSet_FnPtr.

pixelGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Color (* pixelGet_FnPtr)(const GFX_PixelBuffer*, const GFX_Point*);
```

Description

This is type pixelGet_FnPtr.

pixelSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* pixelSet_FnPtr)(const GFX_PixelBuffer*, const GFX_Point*, GFX_Color color);
```

Description

This is type pixelSet_FnPtr.

syncCallbackGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_SyncCallback_FnPtr (* syncCallbackGet_FnPtr)(void);
```

Description

This is type syncCallbackGet_FnPtr.

syncCallbackSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* syncCallbackSet_FnPtr)(GFX_SyncCallback_FnPtr);
```

Description

This is type syncCallbackSet_FnPtr.

syncCallbackSt_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* syncCallbackSt_FnPtr)(GFX_SyncCallback_FnPtr);
```

Description

This is type syncCallbackSt_FnPtr.

update_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* update_FnPtr)(void);
```

Description

This is type update_FnPtr.

GFX_ColorInfo Variable

File

gfx_color.h

C

```
LIB_EXPORT GFX_ColorModeInfo GFX_ColorInfo[GFX_COLOR_MODE_COUNT];
```

Description

This is variable GFX_ColorInfo.

GFX_Rect_Zero Variable

File

gfx_rect.h

C

```
const GFX_Rect GFX_Rect_Zero = {0, 0, 0, 0};
```

Description

This is variable GFX_Rect_Zero.

AGBA_8888_ALPHA_MASK Macro

File

gfx_color.h

C

```
#define AGBA_8888_ALPHA_MASK 0xFF000000
```

Description

This is macro AGBA_8888_ALPHA_MASK.

AGBA_8888_BLUE_MASK Macro

File

gfx_color.h

C

```
#define AGBA_8888_BLUE_MASK 0xFF
```

Description

This is macro AGBA_8888_BLUE_MASK.

AGBA_8888_GREEN_MASK Macro

File

gfx_color.h

C

```
#define AGBA_8888_GREEN_MASK 0xFF00
```

Description

This is macro AGBA_8888_GREEN_MASK.

AGBA_8888_RED_MASK Macro

File

gfx_color.h

C

```
#define AGBA_8888_RED_MASK 0xFF0000
```

Description

This is macro AGBA_8888_RED_MASK.

GFX_ANTIALIAS_MODE_COUNT Macro

File

gfx_draw.h

C

```
#define GFX_ANTIALIAS_MODE_COUNT (GFX_ANTIALIAS_ON+1)
```

Description

This is macro GFX_ANTIALIAS_MODE_COUNT.

GFX_COLOR_MAX_SIZE Macro

File

gfx_color.h

C

```
#define GFX_COLOR_MAX_SIZE 4
```

Description

This is macro GFX_COLOR_MAX_SIZE.

GFX_COLOR_MODE_COUNT Macro

File

gfx_color.h

C

```
#define GFX_COLOR_MODE_COUNT (GFX_COLOR_MODE_LAST + 1)
```

Description

This is macro GFX_COLOR_MODE_COUNT.

GFX_COLOR_MODE_IS_ALPHA Macro

File

gfx_color.h

C

```
#define GFX_COLOR_MODE_IS_ALPHA(mode) ((mode == GFX_COLOR_MODE_RGBA_5551) || (mode ==
GFX_COLOR_MODE_RGBA_8888) || (mode == GFX_COLOR_MODE_ARGB_8888))
```

Description

This is macro GFX_COLOR_MODE_IS_ALPHA.

GFX_COLOR_MODE_IS_INDEX Macro

File

gfx_color.h

```
typedef GFX_Result (* drawPipelineModeSet_FnPtr)(GFX_PipelineMode);
```

Description

This is type drawPipelineModeSet_FnPtr.

drawResizeModeGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_ResizeMode (* drawResizeModeGet_FnPtr)(void);
```

Description

This is type drawResizeModeGet_FnPtr.

drawResizeModeSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawResizeModeSet_FnPtr)(GFX_ResizeMode);
```

Description

This is type drawResizeModeSet_FnPtr.

drawStretchBlit_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawStretchBlit_FnPtr)(const GFX_PixelBuffer*, const GFX_Rect*, const GFX_Rect*,
const GFX_DrawState*);
```

Description

This is type drawStretchBlit_FnPtr.

drawTargetGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawTargetGet_FnPtr)(GFX_PixelBuffer**);
```

Description

This is type drawTargetGet_FnPtr.

drawTargetSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* drawTargetSet_FnPtr)(const GFX_PixelBuffer*);
```

Description

This is type drawTargetSet_FnPtr.

GFX_DrawPipeline Structure

File

gfx_hal.h

C

```
typedef struct GFX_DrawPipeline_t {
  drawPixel_FnPtr drawPixel[GFX_ANTIALIAS_MODE_COUNT];
  drawLine_FnPtr drawLine[GFX_DRAW_MODE_COUNT][GFX_ANTIALIAS_MODE_COUNT];
  drawLine_FnPtr drawHorzLine[GFX_DRAW_MODE_COUNT][GFX_ANTIALIAS_MODE_COUNT];
  drawLine_FnPtr drawVertLine[GFX_DRAW_MODE_COUNT][GFX_ANTIALIAS_MODE_COUNT];
  drawRect_FnPtr drawRect[GFX_DRAW_MODE_COUNT][GFX_ANTIALIAS_MODE_COUNT];
  drawCircle_FnPtr drawCircle[GFX_DRAW_MODE_COUNT][GFX_ANTIALIAS_MODE_COUNT];
  drawArc_FnPtr drawArc[GFX_DRAW_MODE_COUNT][GFX_ANTIALIAS_MODE_COUNT];
  drawEllipse_FnPtr drawEllipse[GFX_DRAW_MODE_COUNT][GFX_ANTIALIAS_MODE_COUNT];
  drawBlit_FnPtr drawBlit;
  drawStretchBlit_FnPtr drawStretchBlit[GFX_RESIZE_MODE_COUNT];
  drawBlit_FnPtr drawDirectBlit;
  pixelGet_FnPtr pixelGet;
  pixelGetArray_FnPtr pixelArrayGet;
  pixelSet_FnPtr pixelSet;
} GFX_DrawPipeline;
```

Members

Members	Description
drawPixel_FnPtr drawPixel[GFX_ANTIALIAS_MODE_COUNT];	draw functions

Section

Data Types and Constants

GFX_PipelineMode Enumeration

Hardware draw path settings.

File

gfx_common.h

C

```
typedef enum GFX_PipelineMode_t {
  GFX_PIPELINE_SOFTWARE = 0,
  GFX_PIPELINE_GCU = 1,
  GFX_PIPELINE_GPU = 2,
  GFX_PIPELINE_GCUGPU = 3
} GFX_PipelineMode;
```

Section

Data Types and Constants

****

Enumeration:

GFX_HardwareMode_t

GFX_ResizeMode Enumeration

File

gfx_draw.h

C

```
typedef enum GFX_ResizeMode_t {
  GFX_RESIZE_NEARESTNEIGHBOR = 0x0,
  GFX_RESIZE_BILINEAR
} GFX_ResizeMode;
```

Description

This is type GFX_ResizeMode.

GFXU_ImageFlags Enumeration

A list of flags describing an image asset

File

gfxu_image.h

C

```
typedef enum GFXU_ImageFlags_t {
  GFXU_IMAGE_USE_MASK = 0x1,
  GFXU_IMAGE_SUPPORTS_CLIPPING = 0x2,
  GFXU_IMAGE_DIRECT_BLIT = 0x4
} GFXU_ImageFlags;
```

Description

Enumeration: GFXU_ImageFlags_t

layerSwapPending_FnPtr Type

File

gfx_hal.h

C

```
typedef void (* layerSwapPending_FnPtr)(GFX_Layer*);
```

Description

This is type layerSwapPending_FnPtr.

maskColor_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Bool (* maskColor_FnPtr)(const GFX_DrawState* state, GFX_Color color);
```

Description

This is type maskColor_FnPtr.

mirrorPoint_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Point (* mirrorPoint_FnPtr)(const GFX_Point* pnt, const GFX_Rect* rect, GFX_Orientation ori);
```

Description

This is type mirrorPoint_FnPtr.

orientPoint_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Point (* orientPoint_FnPtr)(const GFX_Point* pnt, const GFX_Rect* rect, GFX_Orientation ori);
```

Description

This is type orientPoint_FnPtr.

pixelGetArray_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* pixelGetArray_FnPtr)(GFX_BufferSelection source, const GFX_Rect*, GFX_PixelBuffer*);
```

Description

This is type pixelGetArray_FnPtr.

GFX_PIPELINE_MODE_COUNT Macro

File

gfx_common.h

C

```
#define GFX_PIPELINE_MODE_COUNT (GFX_PIPELINE_GCUGPU + 1)
```

Description

This is macro GFX_PIPELINE_MODE_COUNT.

GFX_RESIZE_MODE_COUNT Macro

File

gfx_draw.h

C

```
#define GFX_RESIZE_MODE_COUNT (GFX_RESIZE_BILINEAR+1)
```

Description

This is macro GFX_RESIZE_MODE_COUNT.

GFX_ASSERT Macro

File

gfx_common.h

C

```
#define GFX_ASSERT(x) { }
```

Description

This is macro GFX_ASSERT.

GFX_GLOBAL_PALETTE_SIZE Macro

File

gfx_common.h

C

```
#define GFX_GLOBAL_PALETTE_SIZE 256
```

Description

This is macro GFX_GLOBAL_PALETTE_SIZE.

GFX_GlobalPalette Type

File

gfx_common.h

C

```
typedef void* GFX_GlobalPalette;
```

Description

This is type GFX_GlobalPalette.

globalPaletteGet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_GlobalPalette (* globalPaletteGet_FnPtr)(void);
```

Description

This is type globalPaletteGet_FnPtr.

globalPaletteSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* globalPaletteSet_FnPtr)(GFX_GlobalPalette);
```

Description

This is type globalPaletteSet_FnPtr.

layerEffectSet_FnPtr Type

File

gfx_hal.h

C

```
typedef GFX_Result (* layerEffectSet_FnPtr)(GFX_Bool, GFX_Bool);
```

Description

This is type layerEffectSet_FnPtr.

GFX_DEPRECATED Macro

File

gfx_common.h

C

```
#define GFX_DEPRECATED __attribute__ ((deprecated))
```

Description

This is macro GFX_DEPRECATED.

Description

gfx_common.h

Common definitions for MPLAB Harmony Graphics Hardware Abstraction Layer

Enumerations

	Name	Description
	GFX_BlendMode_t	Blend mode masks

	GFX_BufferSelection_t	Buffer selector used when querying layers for certain buffer states.
	GFX_BufferState_t	Frame buffer memory states
	GFX_Flag_t	Hardware abstraction state interface flags. See gfx.h for a comprehensive description.
	GFX_Orientation_t	Orthogonal orientation settings.
	GFX_PipelineMode_t	Hardware draw path settings.
	GFX_BlendMode	Blend mode masks
	GFX_BufferSelection	Buffer selector used when querying layers for certain buffer states.
	GFX_BufferState	Frame buffer memory states
	GFX_Flag	Hardware abstraction state interface flags. See gfx.h for a comprehensive description.
	GFX_Orientation	Orthogonal orientation settings.
	GFX_PipelineMode	Hardware draw path settings.

Macros

	Name	Description
	GFX_ASSERT	This is macro GFX_ASSERT.
	GFX_DEPRECATED	This is macro GFX_DEPRECATED.
	GFX_FAILURE	This is macro GFX_FAILURE.
	GFX_FALSE	This is macro GFX_FALSE.
	GFX_GLOBAL_PALETTE_SIZE	This is macro GFX_GLOBAL_PALETTE_SIZE.
	GFX_MAX_BUFFER_COUNT	This is macro GFX_MAX_BUFFER_COUNT.
	GFX_NULL	This is macro GFX_NULL.
	GFX_NUM_FLAGS	This is macro GFX_NUM_FLAGS.
	GFX_PIPELINE_MODE_COUNT	This is macro GFX_PIPELINE_MODE_COUNT.
	GFX_SUCCESS	This is macro GFX_SUCCESS.
	GFX_TRUE	This is macro GFX_TRUE.
	GFX_UNSUPPORTED	This is macro GFX_UNSUPPORTED.

Structures

	Name	Description
	GFX_MemoryIntf_t	Custom memory manager interface.
	GFX_Point_t	A two dimensional Cartesian point.
	GFX_Rect_t	A rectangle definition.
	GFX_Size_t	A two dimensional indication of size. Values are signed but should never be negative.
	GFX_MemoryIntf	Custom memory manager interface.
	GFX_Size	A two dimensional indication of size. Values are signed but should never be negative.

Types

	Name	Description
	GFX_Bool	This is type GFX_Bool.
	GFX_Buffer	This is type GFX_Buffer.
	GFX_Calloc_FnPtr	Simple wrapper around the standard calloc function pointer. Used for redirecting memory allocation to other memory management systems.
	GFX_Color	This is type GFX_Color.
	GFX_ColorMode	List of available color modes.
	GFX_Display	This is type GFX_Display.
	GFX_Driver	This is type GFX_Driver.
	GFX_Free_FnPtr	Simple wrapper around the standard free function pointer. Used for redirecting memory free to other memory management systems.
	GFX_GlobalPalette	This is type GFX_GlobalPalette.
	GFX_Handle	This is type GFX_Handle.
	GFX_Malloc_FnPtr	Simple wrapper around the standard malloc function pointer. Used for redirecting memory allocation to other memory management systems.
	GFX_Memcpy_FnPtr	Simple wrapper around the standard memcpy function pointer. Used for redirecting memcpy to other memory management systems.
	GFX_Memset_FnPtr	Simple wrapper around the standard memset function pointer. Used for redirecting memset to other memory management systems.
	GFX_Processor	This is type GFX_Processor.

	GFX_Realloc_FnPtr	Simple wrapper around the standard realloc function pointer. Used for redirecting memory allocation to other memory management systems.
	GFX_Result	This is type GFX_Result.
	GFX_SyncCallback_FnPtr	This is type GFX_SyncCallback_FnPtr.

Description

Module for Microchip Graphics Library - Hardware Abstraction Layer

Type definitions for common functions.

File Name

gfx_common.h

Company

Microchip Technology Inc.

gfx_color.h

Contains functions for color information and manipulation operations

Enumerations

	Name	Description
	GFX_BitsPerPixel_t	List of available bits-per-pixel sizes.
	GFX_ColorMask_t	Maskable list of color valies.
	GFX_ColorMode_t	List of available color modes.
	GFX_ColorName_t	Color name reference table
	GFX_BitsPerPixel	List of available bits-per-pixel sizes.
	GFX_ColorMask	Maskable list of color valies.
	GFX_ColorName	Color name reference table

Functions

	Name	Description
	GFX_ColorBilerp	Calculates bilinear interpolation between four colors
	GFX_ColorBlend_RGBA_8888	Blends two RGBA8888 colors together using their alpha channel values.
	GFX_ColorChannelAlpha	Used for getting the alpha color channel of a given color value.
	GFX_ColorChannelBlue	Used for getting the blue color channel of a given color value.
	GFX_ColorChannelGreen	Used for getting the green color channel of a given color value.
	GFX_ColorChannelRed	Used for getting the red color channel of a given color value.
	GFX_ColorConvert	Converts a color value from one mode to another
	GFX_ColorLerp	Linear interpolation between two colors
	GFX_ColorModeInfoGet	
	GFX_ColorValue	Used for getting a color value by name.

Macros

	Name	Description
	AGBA_8888_ALPHA_MASK	This is macro AGBA_8888_ALPHA_MASK.
	AGBA_8888_BLUE_MASK	This is macro AGBA_8888_BLUE_MASK.
	AGBA_8888_GREEN_MASK	This is macro AGBA_8888_GREEN_MASK.
	AGBA_8888_RED_MASK	This is macro AGBA_8888_RED_MASK.
	GFX_COLOR_MAX_SIZE	This is macro GFX_COLOR_MAX_SIZE.
	GFX_COLOR_MODE_COUNT	This is macro GFX_COLOR_MODE_COUNT.
	GFX_COLOR_MODE_IS_ALPHA	This is macro GFX_COLOR_MODE_IS_ALPHA.
	GFX_COLOR_MODE_IS_INDEX	This is macro GFX_COLOR_MODE_IS_INDEX.
	GFX_COLOR_MODE_IS_PIXEL	This is macro GFX_COLOR_MODE_IS_PIXEL.
	GFX_COLOR_MODE_LAST_COLOR	This is macro GFX_COLOR_MODE_LAST_COLOR.
	RGB_2_BITS	This is macro RGB_2_BITS.
	RGB_3_BITS	This is macro RGB_3_BITS.
	RGB_332_BLUE_MASK	This is macro RGB_332_BLUE_MASK.

	RGB_332_GREEN_MASK	This is macro RGB_332_GREEN_MASK.
	RGB_332_RED_MASK	This is macro RGB_332_RED_MASK.
	RGB_5_BITS	This is macro RGB_5_BITS.
	RGB_565_BLUE_MASK	This is macro RGB_565_BLUE_MASK.
	RGB_565_GREEN_MASK	This is macro RGB_565_GREEN_MASK.
	RGB_565_RED_MASK	This is macro RGB_565_RED_MASK.
	RGB_6_BITS	This is macro RGB_6_BITS.
	RGB_8_BITS	This is macro RGB_8_BITS.
	RGB_888_BLUE_MASK	This is macro RGB_888_BLUE_MASK.
	RGB_888_GREEN_MASK	This is macro RGB_888_GREEN_MASK.
	RGB_888_RED_MASK	This is macro RGB_888_RED_MASK.
	RGBA_5551_ALPHA_MASK	This is macro RGBA_5551_ALPHA_MASK.
	RGBA_5551_BLUE_MASK	This is macro RGBA_5551_BLUE_MASK.
	RGBA_5551_GREEN_MASK	This is macro RGBA_5551_GREEN_MASK.
	RGBA_5551_RED_MASK	This is macro RGBA_5551_RED_MASK.
	RGBA_8888_ALPHA_MASK	This is macro RGBA_8888_ALPHA_MASK.
	RGBA_8888_BLUE_MASK	This is macro RGBA_8888_BLUE_MASK.
	RGBA_8888_GREEN_MASK	This is macro RGBA_8888_GREEN_MASK.
	RGBA_8888_RED_MASK	This is macro RGBA_8888_RED_MASK.

Structures

	Name	Description
	GFX_ColorModeInfo_t	Struct that provides information about a color mode.
	GFX_ColorModeInfo	Struct that provides information about a color mode.

Variables

	Name	Description
	GFX_ColorInfo	This is variable GFX_ColorInfo.

Description

Module for Microchip Graphics Library - Hardware Abstraction Layer

Color conversion and color channel management

File Name

gfx_color.h

Company

Microchip Technology Inc.

gfx_context.h

Defines MPLAB Harmony Graphics Hardware Abstraction Layer Context

Functions

	Name	Description
	GFX_ActiveContext	Gets the current set active HAL context.
	GFX_ContextActiveSet	Sets the active context

Structures

	Name	Description
	GFX_Context_t	An instance of the hardware abstraction layer.
	GFX_Context	An instance of the hardware abstraction layer.

Description

Module for Microchip Graphics Library - Hardware Abstraction Layer

HAL context management functions.

File Name

gfx_context.h

Company

Microchip Technology Inc.

gfx_default_impl.h

This is file gfx_default_impl.h.

gfx_display.h

Defines MPLAB Harmony Graphics Hardware Abstraction Layer display information struct

Structures

	Name	Description
	GFX_DisplayInfo_t	Describes a graphical display device.
	GFX_DisplayInfo	Describes a graphical display device.

Description

Module for Microchip Graphics Library - Hardware Abstraction Layer
Display information.

File Name

gfx_display.h

Company

Microchip Technology Inc.

gfx_draw.h

Main header file for MPLAB Harmony Graphics Hardware Abstraction primitive draw functions

Enumerations

	Name	Description
	GFX_AntialiasMode_t	Enables anti-aliased drawing hint
	GFX_DrawMode_t	Gradient draw modes.
	GFX_ResizeMode_t	This is type GFX_ResizeMode.
	GFX_AntialiasMode	Enables anti-aliased drawing hint
	GFX_DrawMode	Gradient draw modes.
	GFX_ResizeMode	This is type GFX_ResizeMode.

Functions

	Name	Description
	GFX_DrawBlit	Blits a buffer of pixels into the frame buffer.
	GFX_DrawCircle	Draws a circle from using the specified dimensions and the current draw state.
	GFX_DrawDirectBlit	Blits a buffer of pixels into the frame buffer without performing per-pixel operations on the data.
	GFX_DrawLine	Draws a line from (x1,y1) to (x2,y2) using the current draw state.
	GFX_DrawPixel	Sets the pixel at X and Y using the current draw state.
	GFX_DrawRect	Draws a rectangle using the specified dimensions and the current draw state.
	GFX_DrawStretchBlit	Blits a buffer of pixels into the frame buffer.

Macros

	Name	Description
	GFX_ANTIALIAS_MODE_COUNT	This is macro GFX_ANTIALIAS_MODE_COUNT.
	GFX_DRAW_MODE_COUNT	This is macro GFX_DRAW_MODE_COUNT.
	GFX_RESIZE_MODE_COUNT	This is macro GFX_RESIZE_MODE_COUNT.

Structures

	Name	Description
	GFX_DrawState_t	A list of drawing hints for shape drawing algorithms
	GFX_DrawState	A list of drawing hints for shape drawing algorithms

Description

Module for Microchip Graphics Library - Hardware Abstraction Layer

Shape drawing functions.

File Name

gfx_draw.h

Company

Microchip Technology Inc.

gfx_draw_blit.h

This is file gfx_draw_blit.h.

gfx_draw_circle.h

This is file gfx_draw_circle.h.

gfx_draw_line.h

This is file gfx_draw_line.h.

gfx_draw_pixel.h

This is file gfx_draw_pixel.h.

gfx_draw_rect.h

This is file gfx_draw_rect.h.

gfx_driver_interface.h

Defines MPLAB Harmony Graphics Hardware Abstraction Layer driver interface struct

Structures

	Name	Description
	GFX_DriverInfo_t	A driver description structure.

Description

Module for Microchip Graphics Library - Hardware Abstraction Layer

Display driver information, internal use.

File Name

gfx_draw_interface.h

Company

Microchip Technology Inc.

gfx_hal.h

Structures

	Name	Description
	GFX_DrawPipeline_t	
	GFX_HAL_t	Hardware Abstraction Function Table * • This is the core hardware abtraction table that makes everything work. Drivers are • expected to reroute the functionality of this table to hardware specific implementations • to provide accelerated performance and features.
	GFX_DrawPipeline	
	GFX_HAL	Hardware Abstraction Function Table * • This is the core hardware abtraction table that makes everything work. Drivers are • expected to reroute the functionality of this table to hardware specific implementations • to provide accelerated performance and features.

Types

	Name	Description
	begin_FnPtr	This is type begin_FnPtr.
	blendColor_FnPtr	This is type blendColor_FnPtr.
	blendGetPoint_FnPtr	This is type blendGetPoint_FnPtr.
	boolGet_FnPtr	This is type boolGet_FnPtr.
	boolSet_FnPtr	This is type boolSet_FnPtr.
	brightnessGet_FnPtr	This is type brightnessGet_FnPtr.
	brightnessRangeGet_FnPtr	This is type brightnessRangeGet_FnPtr.
	brightnessSet_FnPtr	This is type brightnessSet_FnPtr.
	colorModeGet_FnPtr	This is type colorModeGet_FnPtr.
	colorModeSet_FnPtr	This is type colorModeSet_FnPtr.
	destroy_FnPtr	This is type destroy_FnPtr.
	drawAlphaValueGet_FnPtr	This is type drawAlphaValueGet_FnPtr.
	drawAlphaValueSet_FnPtr	This is type drawAlphaValueSet_FnPtr.
	drawBlendModeGet_FnPtr	This is type drawBlendModeGet_FnPtr.
	drawBlendModeSet_FnPtr	This is type drawBlendModeSet_FnPtr.
	drawBlit_FnPtr	This is type drawBlit_FnPtr.
	drawCircle_FnPtr	This is type drawCircle_FnPtr.
	drawClipRectGet_FnPtr	This is type drawClipRectGet_FnPtr.
	drawClipRectSet_FnPtr	This is type drawClipRectSet_FnPtr.
	drawColorGet_FnPtr	This is type drawColorGet_FnPtr.
	drawColorSet_FnPtr	This is type drawColorSet_FnPtr.
	drawGradientColorGet_FnPtr	This is type drawGradientColorGet_FnPtr.
	drawGradientColorSet_FnPtr	This is type drawGradientColorSet_FnPtr.
	drawLine_FnPtr	This is type drawLine_FnPtr.
	drawLock_FnPtr	This is type drawLock_FnPtr.
	drawMaskValueGet_FnPtr	This is type drawMaskValueGet_FnPtr.
	drawMaskValueSet_FnPtr	This is type drawMaskValueSet_FnPtr.
	drawModeGet_FnPtr	This is type drawModeGet_FnPtr.
	drawModeSet_FnPtr	This is type drawModeSet_FnPtr.
	drawPaletteGet_FnPtr	This is type drawPaletteGet_FnPtr.
	drawPaletteSet_FnPtr	This is type drawPaletteSet_FnPtr.
	drawPipelineModeGet_FnPtr	This is type drawPipelineModeGet_FnPtr.
	drawPipelineModeSet_FnPtr	This is type drawPipelineModeSet_FnPtr.
	drawPixel_FnPtr	This is type drawPixel_FnPtr.
	drawRect_FnPtr	This is type drawRect_FnPtr.
	drawResizeModeGet_FnPtr	This is type drawResizeModeGet_FnPtr.
	drawResizeModeSet_FnPtr	This is type drawResizeModeSet_FnPtr.

	drawStretchBlit_FnPtr	This is type drawStretchBlit_FnPtr.
	drawTargetGet_FnPtr	This is type drawTargetGet_FnPtr.
	drawTargetSet_FnPtr	This is type drawTargetSet_FnPtr.
	drawThicknessGet_FnPtr	This is type drawThicknessGet_FnPtr.
	drawThicknessSet_FnPtr	This is type drawThicknessSet_FnPtr.
	drawUnlock_FnPtr	This is type drawUnlock_FnPtr.
	end_FnPtr	This is type end_FnPtr.
	GFX_DriverInfo	A driver description structure.
	globalPaletteGet_FnPtr	This is type globalPaletteGet_FnPtr.
	globalPaletteSet_FnPtr	This is type globalPaletteSet_FnPtr.
	initialize_FnPtr	This is type initialize_FnPtr.
	interrupt_FnPtr	GFX_DRAW_PIPELINE_ENABLED
	layerActiveGet_FnPtr	This is type layerActiveGet_FnPtr.
	layerActiveSet_FnPtr	This is type layerActiveSet_FnPtr.
	layerAlphaAmountGet_FnPtr	This is type layerAlphaAmountGet_FnPtr.
	layerAlphaAmountSet_FnPtr	This is type layerAlphaAmountSet_FnPtr.
	layerBufferAddressGet_FnPtr	This is type layerBufferAddressGet_FnPtr.
	layerBufferAddressSet_FnPtr	This is type layerBufferAddressSet_FnPtr.
	layerBufferAllocate_FnPtr	This is type layerBufferAllocate_FnPtr.
	layerBufferCoherentGet_FnPtr	This is type layerBufferCoherentGet_FnPtr.
	layerBufferCoherentSet_FnPtr	This is type layerBufferCoherentSet_FnPtr.
	layerBufferCountGet_FnPtr	This is type layerBufferCountGet_FnPtr.
	layerBufferCountSet_FnPtr	This is type layerBufferCountSet_FnPtr.
	layerBufferFree_FnPtr	This is type layerBufferFree_FnPtr.
	layerBufferIsAllocated_FnPtr	This is type layerBufferIsAllocated_FnPtr.
	layerEffectSet_FnPtr	This is type layerEffectSet_FnPtr.
	layerMaskColorGet_FnPtr	This is type layerMaskColorGet_FnPtr.
	layerMaskColorSet_FnPtr	This is type layerMaskColorSet_FnPtr.
	layerPositionGet_FnPtr	This is type layerPositionGet_FnPtr.
	layerPositionSet_FnPtr	This is type layerPositionSet_FnPtr.
	layerSizeGet_FnPtr	This is type layerSizeGet_FnPtr.
	layerSizeSet_FnPtr	This is type layerSizeSet_FnPtr.
	layerSwapped_FnPtr	This is type layerSwapped_FnPtr.
	layerSwapPending_FnPtr	This is type layerSwapPending_FnPtr.
	maskColor_FnPtr	This is type maskColor_FnPtr.
	mirrorPoint_FnPtr	This is type mirrorPoint_FnPtr.
	orientationGet_FnPtr	This is type orientationGet_FnPtr.
	orientationSet_FnPtr	This is type orientationSet_FnPtr.
	orientPoint_FnPtr	This is type orientPoint_FnPtr.
	pixelGet_FnPtr	This is type pixelGet_FnPtr.
	pixelGetArray_FnPtr	This is type pixelGetArray_FnPtr.
	pixelSet_FnPtr	This is type pixelSet_FnPtr.
	syncCallbackGet_FnPtr	This is type syncCallbackGet_FnPtr.
	syncCallbackSet_FnPtr	This is type syncCallbackSet_FnPtr.
	syncCallbackSt_FnPtr	This is type syncCallbackSt_FnPtr.
	update_FnPtr	This is type update_FnPtr.

Description

This is file gfx_hal.h.

gfx_interface.h

This is file gfx_interface.h.

gfx_layer.h

Defines the graphics layer construct

Functions

	Name	Description
	GFX_LayerFromOrientedSpace	Transforms a layer oriented space to screen space.
	GFX_LayerPointFromOrientedSpace	Transforms a point from oriented space to screen space given a layer, a display orientation, and a mirroring setting.
	GFX_LayerPointToOrientedSpace	Transforms a point from screen space to oriented space given a layer, a display orientation, and a mirroring setting.
	GFX_LayerReadBuffer	Gets the pointer to the layer's current read pixel buffer.
	GFX_LayerRectFromOrientedSpace	Transforms a layer point from oriented space to screen space given a layer, a display orientation, and a mirroring setting.
	GFX_LayerRectToOrientedSpace	Transforms a rectangle from screen space to oriented space given a layer, a display orientation, and a mirroring setting.
	GFX_LayerRotate	Swaps the width and height dimensions of a layer. Can be used for run-time display orientation
	GFX_LayerSwap	Performs a swap operation on the given layer. This advances the pointers of layer's buffer chain. The current write buffer becomes the new read buffer and a new buffer is chosen as the new write buffer. Has no effect in single buffer environments.
	GFX_LayerToOrientedSpace	Transforms a layer from screen space to oriented space.
	GFX_LayerWriteBuffer	Gets the pointer to the layer's current write pixel buffer.

Structures

	Name	Description
	GFX_FrameBuffer_t	A frame buffer is a wrapper around a pixel buffer construct that is used by display drivers to manage frame buffers.
	GFX_Layer_t	Layers describe basic display drawing areas and are meant to map directly to graphics controller hardware layers.
	GFX_FrameBuffer	A frame buffer is a wrapper around a pixel buffer construct that is used by display drivers to manage frame buffers.
	GFX_Layer	Layers describe basic display drawing areas and are meant to map directly to graphics controller hardware layers.

Description

Module for Microchip Graphics Library - Hardware Abstraction Layer

Layer and buffer management.

gfx_math.h

Contains some general purpose math functions

Functions

	Name	Description
	GFX_AbsoluteValue	Calculates the absolute value of a signed integer.
	GFX_Clampf	Clamps a float between a min and max
	GFX_Clampi	Clamps an integer between a min and max
	GFX_DivideRounding	This is function GFX_DivideRounding.
	GFX_Lerp	Performs a linear interpolation of an integer based on a percentage between two signed points.
	GFX_Maxf	Returns the larger of two floats.
	GFX_Maxi	Returns the larger of two integers.

	GFX_Minf	Returns the smaller of two floats.
	GFX_Mini	Returns the smaller of two integers.
	GFX_Percent	Calculates the percentage of one number when applied to another. Integer based. Accuracy for higher numbers is not guaranteed. The result is the decimal percentage multiplied by 100.
	GFX_PercentOf	Calculates the percentage of a number. Returns a whole number with no decimal component.
	GFX_PercentOfDec	This is function GFX_PercentOfDec.
	GFX_PercentWholeRounded	Calculates the percentage of one number when applied to another. Integer based. Accuracy for higher numbers is not guaranteed. The difference between this and GFX_Percent is that the decimal portion of the whole number is rounded off.
	GFX_ScaleInteger	Scales an integer from one number range of 0 -> n0 to another range 0 -> n1 based on percentages.
	GFX_ScaleIntegerSigned	Scales a signed integer from one number range of 0 -> n0 to another range 0 -> n1 based on percentages.

Description

Module for Microchip Graphics Library - Hardware Abstraction Layer

Math support functions.

File Name

gfx_layer.h

Microchip Technology Inc.

gfx_pixel_buffer.h

Defines a general purpose pixel buffer construct.

Functions

	Name	Description
	GFX_PixelBufferAreaFill	Fills an area of a pixel buffer with a solid color. Caller is responsible for ensuring that the color is the same color format as the destination buffer.
	GFX_PixelBufferAreaFill_Unsafe	Fills an area of a pixel buffer with a solid color. Caller is responsible for ensuring that the color is the same color format as the destination buffer. Like GFX_PixelBufferAreaFill but performs no bounds checking.
	GFX_PixelBufferAreaGet	Extracts a rectanglar section of pixels from a pixel buffer.
	GFX_PixelBufferAreaGet_Unsafe	Extracts a rectanglar section of pixels from a pixel buffer. Like GFX_PixelBufferAreaGet but performs no clipping between the rectangles of the extract area and the source buffer.
	GFX_PixelBufferAreaSet	Copies an area of pixels from a source buffer to a destination buffer. If the source buffer format does not match the destination format the data will be converted to match during the copy operation.
	GFX_PixelBufferAreaSet_Unsafe	Copies an area of pixels from a source buffer to a destination buffer. If the source buffer format does not match the destination format the data will be converted to match during the copy operation. Like GFX_PixelBufferAreaSet but performs no bounds checking.
	GFX_PixelBufferClipRect	Clips a rectangle against a pixel buffer. The result is guaranteed to fit inside the buffer's area.
	GFX_PixelBufferConvert	Duplicates a pixel buffer and converts the copy to another color mode.
	GFX_PixelBufferCopy	Creates a copy of the input buffer. If the input buffer's pixel data is not null then the data will be duplicated for the result buffer.
	GFX_PixelBufferCreate	Initializes a pixel buffer struct. Does not actually allocate any memory.
	GFX_PixelBufferDestroy	Destroys a pixel buffer construct. If the buffer's pixels pointer is not zero this function will attempt to free it using the provided GFX_MemoryIntf memory interface.
	GFX_PixelBufferGet	Gets the value of the pixel that resides at the provided point in the given buffer.
	GFX_PixelBufferGet_Unsafe	Gets the value of the pixel that resides at the provided point in the given buffer. Like GFX_PixelBufferGet but performs no bounds checking.
	GFX_PixelBufferGetIndex	Interprets the pixel buffer as a table of indices and looks up a specific index at position 'idx'. Indices may be 1bpp, 4bpp, or 8bpp in size and are indicated by the color mode of the pixel buffer.
	GFX_PixelBufferOffsetGet	Gets the offset address of the pixel that resides at the provided point in the given buffer.
	GFX_PixelBufferOffsetGet_Unsafe	Gets the offset address of the pixel that resides at the provided point in the given buffer. Similar to GFX_PixelBufferOffsetGet but performs no bounds checking.

	GFX_PixelBufferSet	Sets a pixel in a pixel buffer at a point to a specified color. Caller is responsible for ensuring that the input color is in the same color format as the pixel buffer.
	GFX_PixelBufferSet_Unsafe	Sets a pixel in a pixel buffer at a point to a specified color. Caller is responsible for ensuring that the input color is in the same color format as the pixel buffer. Like GFX_PixelBufferSet but performs no bounds checking.

Structures

	Name	Description
	GFX_PixelBuffer_t	A pixel buffer is a wrapper around a basic data pointer. A pixel buffer has a color mode, a pixel count, a rectangular dimension, a pixel count, and a lenght in bytes.
	GFX_PixelBuffer	A pixel buffer is a wrapper around a basic data pointer. A pixel buffer has a color mode, a pixel count, a rectangular dimension, a pixel count, and a lenght in bytes.

Description

Module for Microchip Graphics Library - Hardware Abstraction Layer

Pixel buffer generation and management functions.

File Name

Microchip Technology Inc.

gfx_rect.h

Defines general purposes rectangle functions.

Functions

	Name	Description
	GFX_RectClip	Clips a rectangle to the space of another rectangle. The result rectangle is a rectangle that will fit inside both of the given rectangles.
	GFX_RectClipAdj	This is function GFX_RectClipAdj.
	GFX_RectCombine	Combines the area of two rectangles into a single rectangle.
	GFX_RectCompare	This is function GFX_RectCompare.
	GFX_RectContainsPoint	Determines if a point is inside a rectangle.
	GFX_RectContainsRect	Determines if a rectangle is completely inside another rectangle. Still returns true if the edges are touching.
	GFX_RectFromPoints	This is function GFX_RectFromPoints.
	GFX_RectIntersects	Determines if two rectangles are intersecting
	GFX_RectsAreSimilar	This is function GFX_RectsAreSimilar.
	GFX_RectSplit	This is function GFX_RectSplit.
	GFX_RectToPoints	This is function GFX_RectToPoints.

Variables

	Name	Description
	GFX_Rect_Zero	This is variable GFX_Rect_Zero.

Description

Module for Microchip Graphics Library - Hardware Abstraction Layer

Rectangle management functions.

File Name

gfx_rect.h

Company

Microchip Technology Inc.

gfx_util.h

Utility functions for the Hardware Abstraction Layer

Functions

	Name	Description
	GFX_UtilMirrorPoint	Reorients a point to a given mirrored orientation.
	GFX_UtilOrientPoint	Reorients a point to a given orthogonal orientation.
	GFX_UtilPointFromOrientedSpace	Transforms a point from an oriented rectangle space to an outer space given a display orientation and a mirroring setting.
	GFX_UtilPointToOrientedSpace	Transforms a point to an oriented rectangle space to an outer space given a display orientation and a mirroring setting.
	GFX_UtilSizeFromOrientedSpace	Transforms a size tuple from oriented space to screen space
	GFX_UtilSizeToOrientedSpace	Transforms a size tuple from screen space to oriented space
	GFX_UtilSortPointsX	Sorts two points in the X axis
	GFX_UtilSortPointsY	Sorts two points in the Y axis

Aria HAL Driver Examples

ILI9488 Display Controller Driver Library

Provides information on the ILI9488 Display Controller Driver Library

Description

This driver library provides an API interface to configure and use an external LCD module with an ILI9488 controller on a Microchip MCU. The driver is designed to work with the MPLAB Harmony Graphics Library.

Introduction

Introduces the driver library.

Description

The ILI9488 Display Controller Driver is a example implementation of a MPLAB Harmony Aria HAL driver, which supports DBI Type C 3-Line Serial Interface for MCUs with SPI peripheral, or DBI Type B 16-/8-bit parallel interface for MCUs with a Static Memory Controller (SMC) peripheral.

On these interfaces, the driver library provides APIs to:

- Send write and read commands to configure the ILI9488 Display Controller
- Write and read pixel(s) in the ILI9488's Graphics RAM (GRAM)

Using the Library

This topic describes the basic architecture of the ILI9488 Display Controller Driver Library and provides information and examples on how to use it.

Description

Interface Header File: `drv_gfx_ili9488.h`

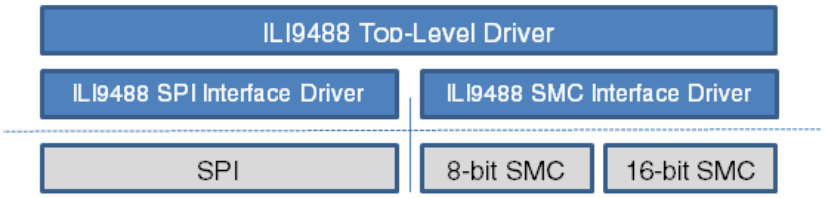
The top-level interface to the ILI9488 Display Controller Driver Library is defined in the `drv_gfx_ili9488.h` header file. Any C language source (`.c`), particularly in the graphics framework, file that uses the ILI9488 Display Controller Driver Library should include `drv_gfx_ili9488.h`.

Abstraction Model

This section describes how the ILI9488 Display Controller Driver Library provides the APIs that abstracts the interface-specific implementation from the application layer.

Description

The following figure shows a high-level block diagram that describes the structure of the display driver.



The top-level driver does the following:

- Glues the interface driver to the MPLAB Harmony Graphics Library's hardware abstraction layer
- Contains the ILI9488 setup routines and initialization commands, and calls to the interface driver layer
- Manages the buffer that contains pixel data that is sent to the ILI9488 Controller for display

The interface drivers provide the basic APIs for sending read/write commands, and reading/writing pixel data. The APIs contain corresponding calls to the interface's peripheral drivers (SPI or SMC) for communicating with the ILI9488 Controller.

LIbrary Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the ILI9488 Display Controller Driver.

Library Interface Section	Description
Top-level Driver Functions	Functions that glues to the MPLAB Harmony graphics library and contains APIs for the graphics library to draw pixels to the ILI9488 GRAM.
Interface Driver Functions	Interface-specific APIs for sending write/read commands and pixel data to the ILI9488. These functions perform the necessary peripheral calls based on the selected interface (SPI or SMC).

How the Library Works

This section describes how the ILI9488 Display Controller Driver Library works .

Description

The library provides interfaces to support

- Initialization and setup of the ILI9488 Display Controller
- Sending read/write commands to the ILI9488 Display Controller using either the DBI-B parallel or DBI-C 4-Line SPI interface
- Reading/writing pixel data in the ILI9488 graphics RAM

Initialization

Before the driver can be used, it needs to be initialized. In ILI9488_ContextInitialize, the top-level driver registers itself to the MPLAB Harmony Graphics HAL, so that its initialization routine is automatically called when the graphics library initializes.

The initialization process involves allocating the pixel buffer and opening the interface to the ILI9488 Display Controller module. The top-level driver calls ILI9488_Intf_Open to open the peripheral interface, issues a hardware reset and sends the setup commands to the ILI9488. initCmdParm contains a list of the basic commands needed to set up the ILI9488 and these commands are sent through the interface driver using the ILI9488_Intf_WriteCmd API.

Displaying Frames

The top-level driver can be configured to write pixel data to the ILI9488 GRAM per pixel or per line. Per frame writes is also supported, but only in 16-bit DBI-B parallel mode. Per frame writes provides the fastest update rate, but requires more memory to allocate a full frame buffer. Writing per line has less memory space requirements, but requires an overhead to read the current pixel line data before it is updated and written back. This is done because the graphics library may update individual pixels only and not the whole line, thus the rest of the pixel buffer data must contain valid data before it is written back to the ILI9488 GRAM. Otherwise, the pixel buffer will contain pixel data from other lines and cause display artifacts.

To read and write pixel data, the top-level driver calls ILI9488_Intf_ReadPixels and ILI9488_Intf_WritePixels, respectively.

Library Interface

a) Functions

	Name	Description
	ILI9488_Intf_Close	Closes the HW interface to the ILI9488 device
	ILI9488_Intf_Open	Opens the specified port to the ILI9488 device
	ILI9488_Intf_ReadCmd	Sends read command and reads response from ILI9488
	ILI9488_Intf_ReadPixels	Read pixel data from specified position in ILI9488 GRAM
	ILI9488_Intf_WriteCmd	Sends write command and parameters to the ILI9488 device
	ILI9488_Intf_WritePixels	Writes pixel data to ILI9488 GRAM from specified position

b) Data Types and Constants

	Name	Description
	ILI9488_CMD_PARAM	Structure contains command and parameter information
	ILI9488_DRV_STATE	Enum of ILI9488 driver states
	ILI9488_DRV	Structure contains driver-specific data and ops pointers
	ILI9488_Backlight_Off	This is macro ILI9488_Backlight_Off.
	ILI9488_Backlight_On	This is macro ILI9488_Backlight_On.
	ILI9488_Reset_Assert	This is macro ILI9488_Reset_Assert.
	ILI9488_Reset_Deassert	This is macro ILI9488_Reset_Deassert.
	ILI9488_SPI_DCX_Command	This is macro ILI9488_SPI_DCX_Command.
	ILI9488_SPI_DCX_Data	This is macro ILI9488_SPI_DCX_Data.
	ILI9488_SPI_SS_Assert	This is macro ILI9488_SPI_SS_Assert.
	ILI9488_SPI_SS_Deassert	This is macro ILI9488_SPI_SS_Deassert.

Description

The interface described in the following sections are provided as an example of the Aria User Library Interface Hardware Abstraction Layer. This example can be used as a starting point for developing your own Aria HAL driver.

a) Functions

ILI9488_Intf_Close Function

Closes the HW interface to the ILI9488 device

File

help_drv_gfx_ili9488_common.h

C

```
void ILI9488_Intf_Close(ILI9488_DRV * drv);
```

Returns

None.

Description

This function will close the specified interface, free the port-specific data structures and unset the port operation handler functions.

Parameters

Parameters	Description
drv	ILI9488 driver handle

Function

void ILI9488_Intf_Close(ILI9488_DRV *drv)

ILI9488_Intf_Open Function

Opens the specified port to the ILI9488 device

File

help_drv_gfx_ili9488_common.h

C

```
GFX_Result ILI9488_Intf_Open(ILI9488_DRV * drv, unsigned int index);
```

Returns

- GFX_SUCCESS - Operation successful
- GFX_FAILURE - Operation failed

Description

In SPI mode, this function will open the SPI port, allocate the port-specific data structures and set the port operation handler functions. When done using the port, ILI9488_Intf_Close must be called to free up the data structures and close the port.

Parameters

Parameters	Description
drv	ILI9488 driver handle
index	Port index

Function

GFX_Result ILI9488_Intf_Open(ILI9488_DRV *drv, unsigned int index)

ILI9488_Intf_ReadCmd Function

Sends read command and reads response from ILI9488

File

help_drv_gfx_ili9488_common.h

C

```
GFX_Result ILI9488_Intf_ReadCmd(struct ILI9488_DRV * drv, uint8_t cmd, uint8_t * data, int bytes);
```

Returns

- GFX_SUCCESS Operation successful
- GFX_FAILURE Operation failed

Description

This function will fist write the the read command and then read back the response from the ILI9488 GRAM.

Remarks

This function only supports 8-, 24- or 32-bit reads. This function performs multiple full-blocking write/read calls to the SPI port and won't return until the SPI transaction completes.

Parameters

Parameters	Description
drv	ILI9488 driver handle
cmd	Read command
data	Buffer to store the read data to
bytes	Number of bytes to read

Function

GFX_Result ILI9488_Intf_ReadCmd(struct ILI9488_DRV *drv,

uint8_t cmd,

uint8_t *data,

int bytes);

ILI9488_Intf_ReadPixels Function

Read pixel data from specified position in ILI9488 GRAM

File

help_drv_gfx_ili9488_common.h

C

```
GFX_Result ILI9488_Intf_ReadPixels(struct ILI9488_DRV * drv, uint32_t x, uint32_t y, uint8_t * value,
unsigned int num_pixels);
```

Returns

- GFX_SUCCESS - Operation successful
- GFX_FAILURE - Operation failed

Description

This function will first write the start column, page information, then read the pixel data from the ILI9488 GRAM.

Remarks

For SPI mode, this function performs multiple full-blocking write/read calls to the SPI port and won't return until the SPI transaction completes.

Parameters

Parameters	Description
drv	ILI9488 driver handle
x	Column position
y	Page position
value	Value to store the read pixel color (8-bit/pixel RGB)
num_pixels	Number of pixels to read

Function

GFX_Result ILI9488_Intf_ReadPixels(struct ILI9488_DRV *drv,
uint32_t x,
uint32_t y,
uint16_t *value,
unsigned int num_pixels)

ILI9488_Intf_WriteCmd Function

Sends write command and parameters to the ILI9488 device

File

help_drv_gfx_ili9488_common.h

C

```
GFX_Result ILI9488_Intf_WriteCmd(struct ILI9488_DRV * drv, uint8_t cmd, uint8_t * parms, int num_parms);
```

Returns

- GFX_SUCCESS - Operation successful
- GFX_FAILURE - Operation failed

Description

This function will do a write operation to send the write command and its parameters to the ILI9488.

Remarks

In SPI mode, this is a full-blocking call and waits for the SPI transaction to complete.

Parameters

Parameters	Description
drv	ILI9488 driver handle
cmd	Write command
parms	Pointer to array of 8-bit parameters
bytes	number of command parameters

Function

GFX_Result ILI9488_Intf_WriteCmd(struct ILI9488_DRV *drv,
uint8_t cmd,
uint8_t *parms,
int num_parms)

ILI9488_Intf_WritePixels Function

Writes pixel data to ILI9488 GRAM from specified position

File

help_drv_gfx_ili9488_common.h

C

```
GFX_Result ILI9488_Intf_WritePixels(struct ILI9488_DRV * drv, uint32_t start_x, uint32_t start_y, uint8_t *
data, unsigned int num_pixels);
```

Returns

- GFX_SUCCESS - Operation successful
- GFX_FAILURE - Operation failed

Description

This function will fist write the start column, page information, then write the pixel data to the ILI9488 GRAM.

Remarks

In SPI mode, this function performs multiple full-blocking write calls to the SPI port and won't return until the SPI transaction completes.

Parameters

Parameters	Description
drv	ILI9488 driver handle
start_x	Start column position
start_y	Start page position
data	Array of 8-bit pixel data (8-bit/pixel RGB)
num_pixels	Number of pixels

Function

GFX_Result ILI9488_Intf_WritePixels(struct ILI9488_DRV *drv,

uint32_t start_x,

uint32_t start_y,

uint8_t *data,

unsigned int num_pixels)

b) Data Types and Constants

ILI9488_CMD_PARAM Structure

Structure contains command and parameter information

File

help_drv_gfx_ili9488_common.h

C

```
typedef struct {
  uint8_t cmd;
  uint8_t parmCount;
  uint8_t parms[4];
} ILI9488_CMD_PARAM;
```

Members

Members	Description
uint8_t cmd;	Command
uint8_t parmCount;	Number of command parameters
uint8_t parms[4];	Command parameters, max of 4

Description

- ILI9488_CMD_PARAM

ILI9488_DRV_STATE Enumeration

Enum of ILI9488 driver states

File

help_drv_gfx_ili9488_common.h

C

```
typedef enum {
  INIT = 0,
  RUN
} ILI9488_DRV_STATE;
```

Description

- ILI9488_DRV_STATE

ILI9488_DRV Structure

Structure contains driver-specific data and ops pointers

File

help_drv_gfx_ili9488_common.h

C

```
struct ILI9488_DRV {
  GFX_Context* gfx;
  ILI9488_DRV_STATE state;
  uint8_t * pixelBuffer;
  int currentLine;
  int lineX_Start;
  int lineX_End;
  GFX_Bool linePending;
  unsigned int bytesPerPixelBuffer;
  void * port_priv;
};
```

Members

Members	Description
GFX_Context* gfx;	GFX context pointer
ILI9488_DRV_STATE state;	Driver state
uint8_t * pixelBuffer;	Line buffer information
unsigned int bytesPerPixelBuffer;	bytes per pixel buffer
void * port_priv;	Port-specific private data

Description

- ILI9488_DRV

ILI9488_Backlight_Off Macro

File

help_drv_gfx_ili9488_common.h

C

```
#define ILI9488_Backlight_Off BSP_DisplayBacklightStateSet(0)
```

Description

This is macro ILI9488_Backlight_Off.

ILI9488_Backlight_On Macro

File

help_drv_gfx_ili9488_common.h

C

```
#define ILI9488_Backlight_On BSP_DisplayBacklightStateSet(1)
```

Description

This is macro ILI9488_Backlight_On.

ILI9488_Reset_Assert Macro

File

help_drv_gfx_ili9488_common.h

C

```
#define ILI9488_Reset_Assert BSP_DisplayResetStateSet(0)
```

Description

This is macro ILI9488_Reset_Assert.

ILI9488_Reset_Deassert Macro

File

help_drv_gfx_ili9488_common.h

C

```
#define ILI9488_Reset_Deassert BSP_DisplayResetStateSet(1)
```

Description

This is macro ILI9488_Reset_Deassert.

ILI9488_SPI_DCX_Command Macro

File

help_drv_gfx_ili9488_common.h

C

```
#define ILI9488_SPI_DCX_Command BSP_ILI9488_SPI_DCXStateSet(0)
```

Description

This is macro ILI9488_SPI_DCX_Command.

ILI9488_SPI_DCX_Data Macro

File

help_drv_gfx_ili9488_common.h

C

```
#define ILI9488_SPI_DCX_Data BSP_ILI9488_SPI_DCXStateSet(1)
```

Description

This is macro ILI9488_SPI_DCX_Data.

ILI9488_SPI_SS_Assert Macro

File

help_drv_gfx_ili9488_common.h

C

```
#define ILI9488_SPI_SS_Assert BSP_ILI9488_SPI_CSXStateSet(0)
```

Description

This is macro ILI9488_SPI_SS_Assert.

ILI9488_SPI_SS_Deassert Macro

File

help_drv_gfx_ili9488_common.h

C

```
#define ILI9488_SPI_SS_Deassert BSP_ILI9488_SPI_CSXStateSet(1)
```

Description

This is macro ILI9488_SPI_SS_Deassert.

Nano2D Graphics Processing Unit (GPU) Driver Library

Provides information on the Nano 2-Dimensional (Nano2D) Driver Library.

Description

Nano 2-Dimensional (Nano2D) is a driver library for rendering 2-Dimensional computer graphics. It is the means for hardware-accelerated graphics on PIC32MZ microcontrollers containing the 2-Dimensional Graphics Processing Unit (2-D GPU).

Introduction

This topic provides the introduction to the Nano2D Driver Library.

Description

The Nano2D Library API provides full functionality of the PIC32MZ 2-D GPU module, which includes lines, rectangles, bit block transfers (blits), transparency, and binary Raster Operations (ROP2). These features are employed in GFX application demonstrations compiled with Nano2D on 2-D GPU enabled microcontrollers. Blits can be used to quickly transfer pre-rendered images directly to the display's frame buffer. (Pre-rendering images converts image pixels from JPEG or some other format into raw RGB or RGBA bits.)

In Harmony 2.06 there is a new tool, the DDR Organizer, that assists in managing buffers, raw images, and other memory resources in the DDR memory of DA devices. Images can quickly and easily be organized for pre-rendering at boot-up so that later image draws will use the device's Nano2D GPU.

The library provides low-level 2D primitives while containing no facilities for GUI development, therefore, it can be used as a stand-alone API. If GUI development is desired, it can be achieved using a higher level widget library such as, libAria which is embedded in the MPLAB Harmony Graphics Suite.

Note: Nano2D requires MPLAB Harmony v2.02b or later.

MPLAB Harmony Graphics Suite has two memory rendering options:

- Aria – Uses Hardware-independent software rasterizer – software fallback
- Nano2D – Uses 2-D GPU hardware accelerated peripheral

In MPLAB Harmony v2.03 and later, the MPLAB Harmony Graphics Suite uses Nano2D as its default memory buffer rendering interface when developing for PIC32 2D-GPU enabled devices. This default can be overridden in MHC by user deselection of Nano2D Graphics Processor.

Nano2D provides the API for drawing accelerated raster graphics onto memory buffers. The actual drawing happens in the 2-D GPU peripheral. Nano2D can be a better option over libAria's hardware-independent graphics primitives because Nano2D uses little to no CPU resources. The use of the Nano2D library requires that the DA's built-in 2D graphics processor be enabled. Under *Harmony Framework Configuration* > *Graphics Stack* > *Graphics Processor*, select the NANO 2D processor.

Using the Library

This topic describes how to use the Nano2D Driver Library.

Description

Interface Header File: `libnano2d.h`

The interface to the Nano2D Library is defined in the `libnano2d.h` header file. Any C language source (`.c`) file that uses the Nano2D Library should include `libnano2d.h`. The header file can be found within the following MPLAB Harmony directory.

`<install_dir>/framework/gfx/driver/processor/nano2d/libnano2D.a`

Library File: `libnano2d.a`

The Nano2D Library archive (libnano2d.a) file is installed with MPLAB Harmony. The header file can be found within the following MPLAB Harmony directory.

`<install_dir>/framework/bin/driver/processor/nano2d/libnano2D.a`

Please refer to What is MPLAB Harmony? for how the Nano2D Library interacts with the framework.

`<install_dir>/framework/gfx/driver/processor/nano2d/libnano2D.h`

Abstraction Model

Provides information on the abstraction model for the library.

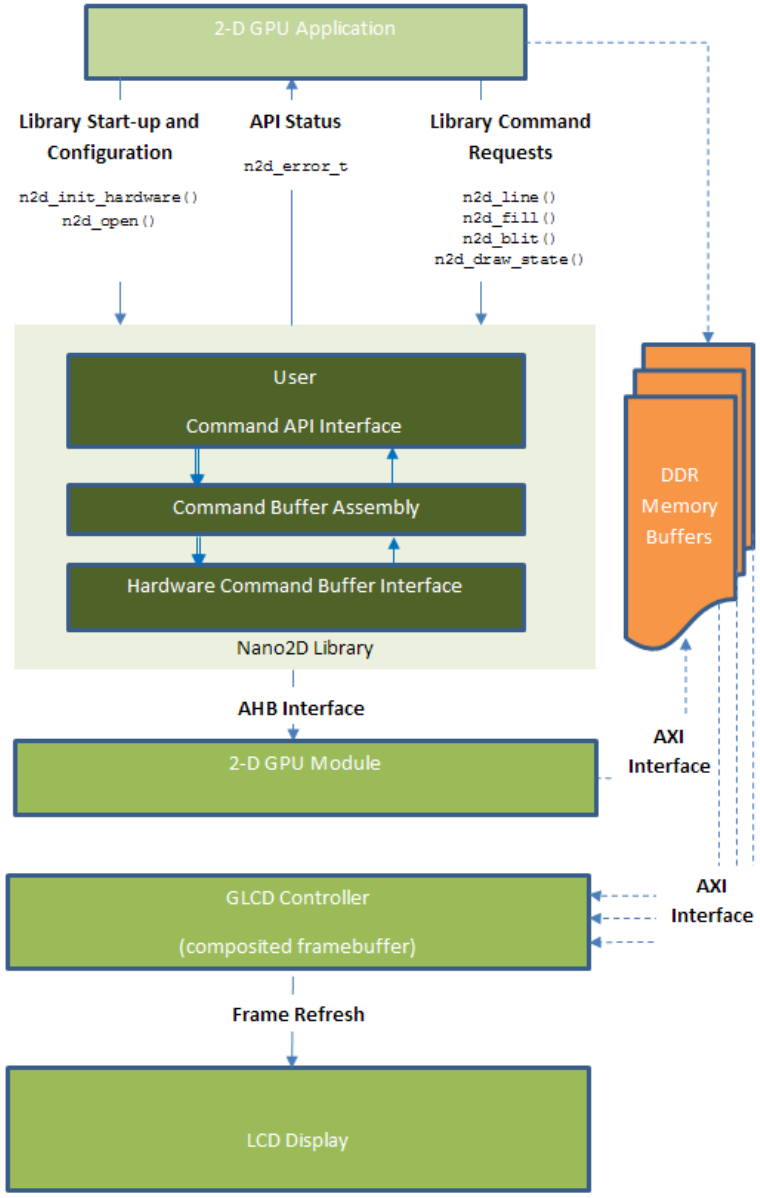
Description

The Nano2D Driver Library is the single interface to the 2-D GPU Module. The 2-D GPU does not have Special Function Register (SFR) access like many PIC32 peripherals. Alternatively, Nano2D uses a command buffer, shared between it and the 2-D GPU, to communicate request. Nano2D Driver Library builds the command buffer content based on each API request and makes it available at a physical address known to the GPU. The address of the command buffer address location is established at startup before any request arrives.

The communication between application and Nano2D is C synchronous function calls. Each function returns on completion of requested. This is typically between 0 -1ms. The communication between Nano2D and 2-GPU is the command buffer and internal well-known status registers. These registers are not exposed to the application.

The Nano2D Driver Library commits a complex command buffer protocol for each GPU request. The Nano2D Driver Library removes the overhead of command buffer assembly and status from the application. This leaves the application with an easy to use, synchronous, return code interface.

Nano2D Software Abstraction Block Diagram



Library Overview

Refer to the Driver Library Overview section for information on how the driver operates in a system.

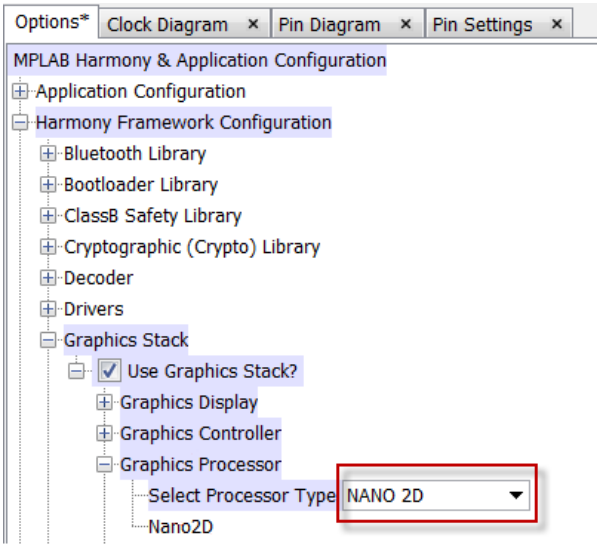
The library interface routines are divided into various sub-sections, which address one of the blocks or the overall operation of the Nano2D Driver.

How the Library Works

This topic provides information on how the library works.

Description

The Nano2D Driver Library service provides general APIs for graphics application use. To enable Nano2D, the user is required to select the Nano2D as the graphics processor using MHC within the “Options*” tab. Upon generation, the `libnano2d.a` library, Nano2D initialization code, and header file will be added to the project. There is no additional configuration required.



The following app.c code example shows typical usage of this Nano2D Library.
[Code Example]

```
void APP_Tasks ( void )
{
/* Check the application's current state. */
switch ( appData.state )
{
/* Application's initial state. */
case APP_STATE_INIT:
{
bool appInitialized = true;

if (appInitialized)
{
appData.state = APP_STATE_GPU_FILL;
}
break;
}

case APP_STATE_GPU_FILL:
{
n2d_rectangle_t rect;
n2d_color_t redColor = 0x00ff000000;
n2d_color_t greenColor = 0x0000ff0000;

/* create GPU buffer for GLCD layer 0 (dest) */
layer0.format = N2D_RGBA8888;
layer0.gpu = KVA_TO_PA(0xA8000000); //GLCD display layer 0
layer0.memory = (void*)0xA8000000;

n2d_fill(layer0, N2D_NULL, redColor, N2D_BLEND_NONE);

/* create a clipping rectangle for layer0 */
rect.x = 0; rect.y = 0; rect.width = 100; rect.height = 100;

/* fill 100x100 rectangle with green ADDITIVE blend to
make color brown */
n2d_fill(layer0, &rect, greenColor, N2D_BLEND_ADDITIVE);

appData.state = APP_STATE_IDLE;

}
}
```

Drawing

Nano2D provides basic drawing primitives: n2n_line and n2n_rect. These functions support integer only coordinates. If more complex graphics is required, the user will need to use a higher level graphics library, such as Aria Graphics Library which is one part of the MPLAB Harmony Graphics Suite. Aria can be configured to call Nano2D as its 2D primitive memory interface renderer for acceleration.

The Line operation, n2n_line, draws a line. Two points are given: start point and end point. The end point is not drawn for point to point figure drawing is required. Lines are rendered using the Breshenham algorithm. Clipping is supported for lines on a per pixel basis. To draw a line, use the following statement:

```
n2d_line(destination, start, end, clip, color, blend);
```

The Rectangle operation, n2n_rect, draws a rectangle. It fills or draws a rectangle area with a given color. A rectangle is given the top left coordination and bottom right coordinate of the fill region, the fill color, clipping region, and blending mode which is applied to each pixel. To draw a rectangle, use the following statement:

```
n2d_fill(destination, rectangle, color, blend);
```

There are 7 types of blend modes:

- N2D_BLEND_NONE - S, i.e. no blending
- N2D_BLEND_SRC_OVER - S + (1 - Sa) * D
- N2D_BLEND_DST_OVER - (1 - Da) * S + D
- N2D_BLEND_SRC_IN - Da * S
- N2D_BLEND_DST_IN - Sa * D
- N2D_BLEND_ADDITIVE - S + D
- N2D_BLEND_SUBTRACT - D * (1 - S)

Where, Sa and Da represent the source and destination alpha channels.

Block Transfers of Pixels (Blitting)

Nano2D provides the following blit operations: Blit, Stretch/Shrink Blit, Mask, Blit, and automatic Filter blit during stretch and shrink.

The Blit operation transfers data from one area of a memory source to another area of a memory destination. The source and destination can be from the same or from different memory locations. Both source and destination must be described by a rectangle. Blitting supports automatic behavior:

- Stretch/Shrink – If source and destination rectangles are different sizes the operation becomes a stretch or a shrink blit
- Mask – use of ROPs for transparent pixels
- Monochrome – using ROPs for monochrome images

Stretch blit is not allowed to overlap, that is no part of the source and destination can share the same portion of memory. Non-stretch blits can overlap.

Blits supports the 7 blending modes discussed previously which are applied to each pixel.

To blit, use the following statement:

```
n2d_blit(dst, dst_rect, src, src_rect, blend);
```

Transparency

Nano2D provides a means of controlling transparency applied to each pixel for subsequent draw commands. Transparency is also synonymous to masking and operation. Nano2D uses Binary Raster Operations (ROP2) to affect action on each pixel during blitting. The user can set a transparency mode or turn off transparency.

The Draw State operation, n2n_draw_state, sets the drawing operation for subsequent n2d_blit() calls.

To change draw state, use the following statement:

```
n2d_draw_state (transparency, color, src, foreground_rop, background_rop);
```

The statement is executed like the C condition “?” ternary operator that takes three values. It reads: If color in transparency_mode is true then perform foreground_rop on matching color otherwise perform background_rop on all other non-matching colors. Color equates to a pixel.

The following standard Binary ROPs are supported:

ROP	Formula	Description
0x0	`0`	Set all destination bits to 0.
0x1	`~(D|S)`	Inverse of merge source and destination.
0x2	`D&~S`	Inverse of merge source and destination.
0x3	`~S`	Inverse of merge source and destination.
0x4	`S&~D`	Mask source and inverse of destination.
0x5	`~D`	Invert destination.
0x6	`D^S`	Exclusive or of source and destination.
0x7	`~(D&S)`	Inverse of mask source and destination.
0x8	`D&S`	Inverse of mask source and destination.

0x9	~(D^S)	Inverse of mask source and destination.
0xA	D	Copy destination.
0xB	D|~S	Merge inverse of source and destination.
0xC	S	Copy source.
0xD	S|~D	Merge source and inverse of destination.
0xE	D|S	Merge source and destination.
0xF	1	Set all destination bits to 1.

Clipping

Nano2D provides a clipping rectangle for line, rectangles and blits. Clipping is performed on a per pixel basis. For all functions, the clipping area is defined by n2d_rectangle_t.

Memory Buffers

Nano2D provides an abstraction over a memory buffer region. Each function defined in `libnano2D.h` uses the n2d_buffer_t to establish the portion of shared memory used as a source or destination buffer. The structure contains all the information the libnano2D APIs is required to complete a GPU render command request. See "Data Types and Constants" in the Library Interface section.

The Nano2D library supports four buffer and their alpha swizzle formats. They are: RGBA8888, RGB565, RGB4444, and A8. When using Nano2D through Aria Library, only supports the two major RGB formats RGB8888 and RGB565.

RGBA8888 (24bit true-color) memory buffer establishes green blue red channels for color space with an extra alpha channel for color blending. Requiring 32bits per-pixel, it will consume a large buffer space to hold display content.

RGB565 (reduced color) memory buffer uses half the color space, has no alpha channel, and, with CPU processing, proves to be a higher performer than RGBA8888.

A8 is an all-alpha buffer. It is can be used to produced a greyscale (dimming) of an existing RBGA8888 buffer.

The buffer supports the following:

- `width` - Width of the buffer in pixels
- `height` - Height of the buffer in pixels
- `stride` - Stride of the buffer in bytes
- `format` - Pixel format of the buffer
- `orientation` - Buffer's orientation: 0, 90, 180, 270
- `memory` - Logical pointer to the buffer's memory for the CPU
- `gpu` - Physical address of the buffer's memory the hardware can access

Detailed Use

The 2-D GPU is made available through the Nano2D Library Module. In future releases, MHGC will be its higher level access. The remainder of these sections will describe how to command the 2-D GPU directly without using MHGC using customized C code.

Unlike most controller peripherals, 2-D GPU command register is not available to application developers. There are no Special Function Registers (SFRs). As a replacement to SFR access, the Nano2D Library provides a C interface API implemented within the libnano2D.a object file. When linked to the application, these entities provide command access to 2-D GPU.

Nano2D Library and 2-D GPU communicate through a shared buffer region residing in physical memory. This memory location is provided by default in Harmony. For rendering, Nano2D uses user supplied source and destination buffers. These buffers communicate the necessary details of the memory region which includes size, color depth, location, and orientation. One or more of these buffers are required for 2-D GPU rendering APIs using `libnano2D.a`.

Creating a Pixel Buffer

An n2d_buffer_t data structure maintains the context of the rendering memory buffer. A memory buffer can point to a scratch buffer or to the active framebuffer. In these examples, we will draw to the active framebuffer as well as scratch memory buffers.

The characteristics of the currently displayed framebuffer must be understood. These include the physical address of the framebuffer, its size, color depth, and orientation. An n2d_buffer_t structure must be created to contain this information. If the n2d_buffer_t is different than the framebuffer, rendered graphics will have unexpected behavior. After generation, the user will need to view the generated `system_config.h` file and `libnano2d.h`. Use the following steps to create an n2d_buffer_t structure that points to the active framebuffer.

```
n2d_buffer_t layer0;

layer0.width = GFX_GLCD_LAYER0_RES_X; // see system_config.h
layer0.height = GFX_GLCD_LAYER0_RES_Y;
layer0.stride = layer0.width * 32 /8; // 32bits/8 == 4 bytes
layer0.format = N2D_RGBA8888; // Red Green Blue Alpha 32bbp
layer0.orientation = N2D_0; // 0 degree orientation
layer0.handle = GFX_NULL; // handle is unused
layer0.memory = (void*)GFX_GLCD_LAYER0_BASEADDR;
```

```
layer0.gpu = KVA_TO_PA(GFX_GLCD_LAYER0_BASEADDR);
```

`layer0.gpu` is the starting location in DDR memory from which 2-D GPU will read or write. This is a physical memory address. If the application must modify data at this location, it must use layer0.memory which maintains the virtual (accessible) address.

Drawing a Grid of Lines

Lines are primitive graphic items necessary to higher level widgets. To render a line directly to the framebuffer, the user will need to know the location of the framebuffer, the start and end of the line, the color, and blend factors of the line.

Note: The color parameter is in ARGB format and is not aligned with the buffer format. The following code example demonstrates line drawing by creating a perpendicular grid.

```
n2d_buffer_t * buffer = layer0;
n2d_point_t start, end;
n2d_color_t color;
n2d_int32_t i;

color = 0xff00ffff;

n2d_fill(buffer, N2D_NULL, color, N2D_BLEND_NONE);

/* Draw vertical line. */
start.x = 0;
start.y = 5;
end.x = 0;
end.y = buffer->height - 5;

color = 0xffff0000;

for (i = 0; i < buffer->width / 10; i++)
{
n2d_line(buffer, start, end, N2D_NULL, color, N2D_BLEND_NONE);

start.x += 10;
end.x += 10;
}

/* Draw horizontal line. */
start.x = 5;
start.y = 0;
end.x = buffer->width - 5;
end.y = 0;

for (i = 0; i < buffer->height / 10; i++)
{
n2d_line(buffer, start, end, N2D_NULL, color, N2D_BLEND_NONE);

start.y += 10;
end.y += 10;
}
```

Drawing Cascading Blended Rectangles

Rectangles are primitive graphic items necessary to higher level widgets. The 2-D GPU can render these quickly with alpha-blending and orientation settings. To render cascading rectangles directly to the framebuffer, the user will need to know the location of the framebuffer, the top, left, width, height (rect), the color, and blend factors of the rect. The following code example integrates rectangle drawing by creating a rectangles in a cascading order using different colors.

```
n2d_buffer_t * buffer = layer0;
n2d_point_t start, end;
n2d_color_t color;
n2d_int32_t i;

/* Clear background color to black. */
color = 0xff000000;
n2d_fill(buffer, N2D_NULL, color, N2D_BLEND_NONE);

rect.x = 0;
rect.y = 0;
rect.width = buffer->width / 4;
```

```
rect.height = buffer->height / 4;
n2d_fill(buffer, &rect, 0xffff0000, N2D_BLEND_SRC_OVER);

rect.x = buffer->width / 8;
rect.y = buffer->height / 8;
rect.width = buffer->width / 4;
rect.height = buffer->height / 4;

n2d_fill(buffer, &rect, 0x7f00ff00, N2D_BLEND_SRC_OVER);

rect.x = buffer->width / 4;
rect.y = buffer->height / 4;
rect.width = buffer->width / 4;
rect.height = buffer->height / 4;
n2d_fill(buffer, &rect, 0xffffffff, N2D_BLEND_SRC_OVER);

rect.x = buffer->width * 3 / 8;
rect.y = buffer->height * 3 / 8;
rect.width = buffer->width / 4;
rect.height = buffer->height / 4;
n2d_fill(buffer, &rect, 0x700000ff, N2D_BLEND_SRC_OVER);

rect.x = buffer->width * 4 / 8;
rect.y = buffer->height * 4 / 8;
rect.width = buffer->width / 4;
rect.height = buffer->height / 4;
n2d_fill(buffer, &rect, 0xffffff00, N2D_BLEND_SRC_OVER);

rect.x = buffer->width * 5 / 8;
rect.y = buffer->height * 5 / 8;
rect.width = buffer->width / 4;
rect.height = buffer->height / 4;
n2d_fill(buffer, &rect, 0x7fff00ff, N2D_BLEND_SRC_OVER);

rect.x = buffer->width * 6 / 8;
rect.y = buffer->height * 6 / 8;
rect.width = buffer->width / 4;
rect.height = buffer->height / 4;
n2d_fill(buffer, &rect, 0xff00ffff, N2D_BLEND_SRC_OVER);
```

Image Source and Destination Rotation

A copy of one buffer source region to another is called blitting. The example below, blits an image rendered to a source buffer onto a destination buffer. The destination buffer points to the framebuffer. For this example, a staging src buffer to hold the image is established. Also a small set of GFX Hal APIs are used to decode the image to the src buffer.

```
n2d_buffer_t src0;
src0.format = N2D_RGBA8888;
src0.gpu = KVA_TO_PA(0xA8465000);
src0.memory = (void*)0xA8465000;
src0.width = 256;
src0.height = 256;
src0.orientation = N2D_0;
src0.stride = src0.width * 32 / 8;

/* use gfx hal to render image to source buffer 0 */
GFX_PixelBufferCreate(256,
256,
GFX_COLOR_MODE_RGBA_8888,
(uint32_t*)src0.memory,
&pixelBuffer);

GFX_Begin();
GFX_Set(GFXF_DRAW_TARGET, &pixelBuffer);
GFXU_DrawImage(&image0,
0,
0,
256,
256,
0,
```

```
0,
NULL,
NULL);
GFX_Set(GFXF_DRAW_TARGET, NULL);
GFX_End();

/* use gfx hal to render image to source buffer 1 */
GFX_PixelBufferCreate(256,
256,
GFX_COLOR_MODE_RGBA_8888,
(uint32_t*)src1.memory,
&pixelBuffer);

GFX_Begin();
GFX_Set(GFXF_DRAW_TARGET, &pixelBuffer);
GFXU_DrawImage(&image1,
0,
0,
256,
256,
0,
0,
NULL,
NULL);
GFX_Set(GFXF_DRAW_TARGET, NULL);
GFX_End();
```

Raster Operations

The processing of source pixels onto destination pixels is called a raster operation. The 2-D GPU through the libnano2D library support two input (binary) Raster Operations (ROP2). These are industry standard bitwise logical operations defined by 16 possible functions listed above in the Transparency section.

In order to set the operation for subsequent draw functions, n2d_buffer_t is used. The function can be continuously used to set mask/filter operations or turn transparency off.

Its arguments are similar to C conditional “?” statements. The first argument determines the operation mode. The operation mode determines whether color is to be applied to N2D_TRANSPARENCY_NONE (no pixels) or N2D_TRANSPARENCY_SOURCE or N2D_TRANSPARENCY_DESTINATION buffer. If the color matches, then the foreground operation is applied, otherwise the background operation is applied.

Consider the following example statement:

```
n2d_draw_state(N2D_TRANSPARENCY_SOURCE, 0xff0000, 0xe, 0xc);
```

The statement will inform the GPU to look for the color red in the source the source buffer during n2d_blit. If the pixel is found, the final pixel will become a merge of the original source and destination pixels, otherwise the pixel will become a copy of the original source pixel.

The following code example applies all 16 ROP functions on green (source) and blue (destination) pixels.

```
n2d_buffer_t src, *buffer;
n2d_uint8_t rop = 0;
n2d_uint32_t x, y;
n2d_int32_t deltaX, deltaY;
n2d_rectangle_t rect;

buffer = &layer0;

deltaX = buffer->width >> 2;
deltaY = buffer->height >> 2;

/* Fill the source buffer with green color. */
n2d_fill(&src, N2D_NULL, 0xff00, N2D_BLEND_NONE);

/* Fill the dst buffer with blue color. */
n2d_fill(buffer, N2D_NULL, 0xff, N2D_BLEND_NONE);

/* Loop all rop values. */
for (y = 0; y < 4; y++)
{
for (x = 0; x < 4; x++)
{
rect.x = x * deltaX;
rect.y = y * deltaY;
rect.width = deltaX;
```

```
rect.height = deltaY;

/* Set rop. */
n2d_draw_state(N2D_TRANSPARENCY_NONE, 0x0, rop, rop);

n2d_blit(buffer, &rect, &src, &rect, N2D_BLEND_NONE);
rop++;
}
}

n2d_draw_state(N2D_TRANSPARENCY_NONE, 0x0, 0xc, 0xc);
Alpha Greyscale -<< Red Color "section"
/* alpha buffer for blending */
alpha.format = N2D_A8;
alpha.gpu = KVA_TO_PA(0xA85DC000);
alpha.memory = (void*)0xA85DC000;
alpha.width = appData.display_info->rect.width;
alpha.height = appData.display_info->rect.height;
alpha.orientation = orientation;
alpha.stride = alpha.width * 8 / 8;
/* dim pixels within a rectangle area */
/* Init the alpha buffer with an alpha channel. */
memset(alpha.memory, 0x07, alpha.stride * alpha.height);
/* Blit – subtract alpha value on all pixels of destination */
 n2d_blit(&layer0, N2D_NULL, &alpha, N2D_NULL, N2D_BLEND_SUBTRACT);
```

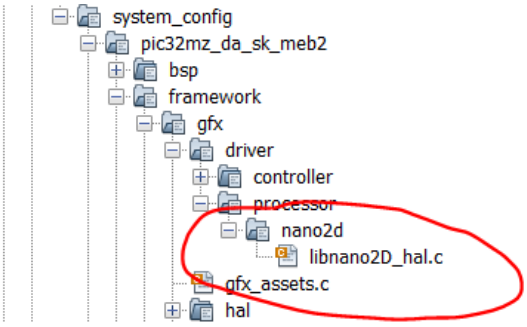
Configuring the Library

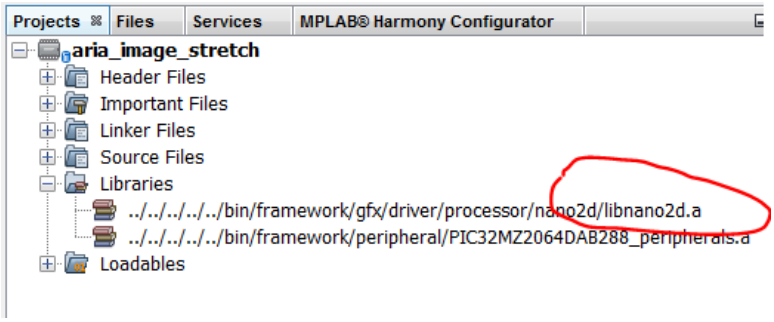
This topic describes how to configure the Nano2D Driver Library.

Description

The configuration of the Nano2D module is based on Nano2D processor selections of MHC. There are no additional configurations available for Nano2D. To enable Nano2D, the user is required to select the Nano2D as the graphics processor using MHC under “Options*”. Upon generation, the `libnano2d.a` library, Nano2D initialization code, and header file will be added to the project.

Upon generation, the `libnano2d.a` library, Nano2D initialization code, Nano2D thin adapter file, and header file will be added to the project.





Building the Library

This topic explains building the Nano2D Driver Library.

Description

The library is provided in binary form only, and comes prebuilt when you install MPLAB Harmony. In addition, the library is added to your project when Nano2D is selected and the project is generated.

The following three tables list and describe the header (`.h`) and source (`.c`) files that implement this library. The parent folder for these files is `<install-dir>/framework/gfx/driver/processor/nano2d`.

Interface File(s)

This table lists and describes the header files that must be included (i.e., using `#include`) by any code that uses this library.

Source File Name	Description
`/libnano2D.h`	Header file that exports the driver API.

Library File(s)

All of the required files listed in the following table are automatically added into the MPLAB X IDE project by the MHC when the library is selected for use.

This table lists and describes the source and header files that must *always* be included in the MPLAB X IDE project to build this library.

Source File Name	Description
`/libnano2D.a`	The static library that contains the implementation of `libnano2D.h`.

Optional File(s)

This table lists and describes the source and header files that may optionally be included if required for the desired implementation.

Source File Name	Description
N/A	No optional files are available for this library.

Module Dependencies

The Nano2D Driver Library depends on the following modules:

- GLCD Graphics Display Controller (currently, the Nano2D module is initialized within the GLCD display controller)

Library Interface

This section describes the Application Programming Interface (API) functions of the Nano2D module.

a) Functions

	Name	Description
	n2d_blit	Copy a source buffer to the the destination buffer
	n2d_draw_state	Set the drawing state for any following Nano2D API draw call
	n2d_fill	Fill a (partial) buffer with a specified color
	n2d_init_hardware	Initializes the n2d driver and peripheral hardware
	n2d_line	Draw a line
	n2d_open	Open Nano2d context
	n2d_dither	Enable or disable dithering

b) Data Types and Constants

	Name	Description
	n2d_blend	List of blending modes
	n2d_buffer	A wrapper structure for any image or render target
	n2d_buffer_format	List of blending modes
	n2d_error	Error codes that the Nano2D functions can return
	n2d_module_parameters	GPU peripheral Initialization parameters
	n2d_orientation	List of blending modes
	n2d_point	A position on a pixel
	n2d_rectangle	A rectangle
	n2d_transparency	Transparency modes
	n2d_blend_t	List of blending modes

	n2d_buffer_format_t	List of blending modes
	n2d_buffer_t	A wrapper structure for any image or render target
	n2d_color_t	Identifies a specific pixel color
	n2d_error_t	Error codes that the Nano2D functions can return
	n2d_module_parameters_t	GPU peripheral Initialization parameters
	n2d_orientation_t	List of blending modes
	n2d_point_t	A position on a pixel
	n2d_rectangle_t	A rectangle
	n2d_transparency_t	Transparency modes
	n2d_bool_t	This is type n2d_bool_t.
	n2d_float_t	This is type n2d_float_t.
	n2d_int16_t	This is type n2d_int16_t.
	n2d_int32_t	This is type n2d_int32_t.
	n2d_size_t	This is type n2d_size_t.
	n2d_uint16_t	This is type n2d_uint16_t.
	n2d_uint32_t	This is type n2d_uint32_t.
	n2d_uint64_t	This is type n2d_uint64_t.
	n2d_uint8_t	This is type n2d_uint8_t.
	__gcmALIGN	This is macro __gcmALIGN.
	__gcmEND	This is macro __gcmEND.
	__gcmGETSIZE	This is macro __gcmGETSIZE.
	__gcmMASK	This is macro __gcmMASK.
	__gcmSTART	This is macro __gcmSTART.
	_nano2D_types_h__	This is macro _nano2D_types_h__.
	gcmALIGN	This is macro gcmALIGN.
	gcmCOUNTOF	This is macro gcmCOUNTOF.
	gcmGETFIELD	This is macro gcmGETFIELD.
	gcmINT2PTR	This is macro gcmINT2PTR.
	gcmMAX	This is macro gcmMAX.
	gcmMIN	This is macro gcmMIN.
	gcmPTR2INT	This is macro gcmPTR2INT.
	gcmSETFIELD	This is macro gcmSETFIELD.
	gcmSETFIELDVALUE	This is macro gcmSETFIELDVALUE.
	gcmSETMASKEDFIELD	This is macro gcmSETMASKEDFIELD.
	gcmSETMASKEDFIELDVALUE	This is macro gcmSETMASKEDFIELDVALUE.
	gcmVERIFYFIELDVALUE	This is macro gcmVERIFYFIELDVALUE.
	IN	This is macro IN.
	N2D_FALSE	This is macro N2D_FALSE.
	N2D_INFINITE	This is macro N2D_INFINITE.
	N2D_IS_ERROR	This is macro N2D_IS_ERROR.
	N2D_IS_SUCCESS	This is macro N2D_IS_SUCCESS.
	N2D_NULL	This is macro N2D_NULL.
	N2D_ON_ERROR	This is macro N2D_ON_ERROR.
	N2D_TRUE	This is macro N2D_TRUE.
	OUT	This is macro OUT.

Description

Refer to each section for a detailed description.

a) Functions

n2d_blit Function

Copy a source buffer to the the destination buffer

File

libnano2D.h

C

```
n2d_error_t n2d_blit(n2d_buffer_t * destination, n2d_rectangle_t * destination_rectangle, n2d_buffer_t *
source, n2d_rectangle_t * source_rectangle, n2d_blend_t blend);
```

Returns

Returns the status as defined by n2d_error_t

Description

The specified region of the source buffer is copied to the specified region of the destination buffer. If the regions are different in size, simple low-quality scaling will automatically be performed.

An optional blend mode can be specified that defines the blending of the source onto the destination.

Remarks

This function will wait until the hardware is complete, i.e. it is synchronous.

Parameters

Parameters	Description
destination	Pointer to a n2d_buffer_t structure that describes the destination of the blit
destination_rectangle	Optional pointer to the rectangle that defines the region inside the destination buffer. If this rectangle is not specified, the entire destination buffer is used as the destination region
source	Pointer to a n2d_buffer_t structure that describes the source of the blit
source_rectangle	Optional pointer to the rectangle that defines the region inside the source buffer. If this rectangle is not specified, the entire source buffer is used as the source region
blend	Optional blending mode to be applied to each pixel. If no blending is required, set this value to N2D_BLEND_NONE (0)

Function

n2d_error_t n2d_blit()

n2d_draw_state Function

Set the drawing state for any following Nano2D API draw call

File

libnano2D.h

C

```
n2d_error_t n2d_draw_state(n2d_transparency_t transparency, n2d_color_t color, n2d_uint8_t foreground_rop,
n2d_uint8_t background_rop);
```

Returns

Returns the status as defined by n2d_error_t

Description

In order to setup transparency for the n2d_blit function, this function needs to be called. Note that this function is static, so set once, all draw commands that follow this function will take this transparency into effect. Call this function again with different parameters to set another transparency mode or turn transparency off.

It will return N2D_INVALID_ARGUMENT if the source defines the transparency but the rop has nothing to do with the source buffer.

The default transparency mode for any newly opened context is N2D_TRANSPARENCY_NONE, using a foreground_rop of 0xC (copy source).

Binary ROPs supported in both foreground and background operations: ROP Formula Description 0x0 0 Set all destination bits to 0. 0x1 ~(D|S) Inverse of merge source and destination. 0x2 D&~S Mask inverse of source and destination. 0x3 ~S Copy inverse of source. 0x4 S&~D Mask source and inverse of destination. 0x5 ~D Invert destination. 0x6 D^S Exclusive or of source and destination. 0x7 ~(D&S) Inverse of mask source and destination. 0x8 D&S Mask source and destination. 0x9 ~(D^S) Inverse of exclusive or of source and destination. 0xA D Copy destination. 0xB D|~S Merge inverse of source and destination. 0xC S Copy source. 0xD S|~D Merge source and inverse of destination. 0xE D|S Merge source and destination. 0xF 1 Set all destination bits to 1.

Remarks

When using a source buffer with the A8 pixel format, transparency must be enabled to N2D_TRANSPARENCY_SOURCE and the alpha channel of color will be used to check for transparency. If the pixel is not transparent, the RGB channels of color value will be used as the color for the pixel.

Parameters

Parameters	Description
transparency	The transparency mode applied to each pixel. See n2d_transparency_t for a list of all supported transparency modes
color	If transparency is not N2D_TRANSPARENCY_NONE, this color value specifies if a pixel is a foreground or a background pixel. If the color matches, it is a background pixel, otherwise it is a foreground pixel
foreground_rop	A Binary ROP (ROP2) code that gets executed by the hardware for each foreground pixel
background_rop	A Binary ROP (ROP2) code that gets executed by the hardware for each background pixel

Function

n2d_error_t n2d_draw_state()

n2d_fill Function

Fill a (partial) buffer with a specified color

File

libnano2D.h

C

```
n2d_error_t n2d_fill(n2d_buffer_t * destination, n2d_rectangle_t * rectangle, n2d_color_t color,
n2d_blend_t blend);
```

Returns

Returns the status as defined by n2d_error_t

Description

Draws and fills a rectangle with a specific color onto destination buffer.

An optional blend mode can be specified that defines the blending of the color onto the destination.

Remarks

This function will wait until the hardware is complete, i.e. it is synchronous

Parameters

Parameters	Description
destination	Pointer to a n2d_buffer_t structure that describes the buffer to be filled
rectangle	Pointer to a rectangle that specifies the area to be filled. If rectangle is NULL, the entire buffer will be filled with the specified color
color	The color value to use for filling the buffer
blend	The blending mode to be applied to each pixel. If no blending is required, set this value to N2D_BLEND_NONE (0)

Function

n2d_error_t n2d_fill()

n2d_init_hardware Function

Initializes the n2d driver and peripheral hardware

File

libnano2D.h

C

```
n2d_error_t n2d_init_hardware(n2d_module_parameters_t * params);
```

Returns

Returns the status as defined by n2d_error_t

Description

The initializes the memory region, sets base address, establishes the irq and connects the hardware to application.

Remarks

For PIC32MZ DA, registerMemBase2D is 0xBF8EB000 and baseAddress is 0

Parameters

Parameters	Description
params	Initialization parameters. See n2d_module_parameters_t

Function

n2d_error_t n2d_init_hardware()

n2d_line Function

Draw a line

File

libnano2D.h

C

```
n2d_error_t n2d_line(n2d_buffer_t * destination, n2d_point_t start, n2d_point_t end, n2d_rectangle_t *
clip, n2d_color_t color, n2d_blend_t blend);
```

Returns

Returns the status as defined by n2d_error_t

Description

Draw a line with a specific color. The last pixel of the line will not be drawn.

An optional blend mode can be specified that defines the blending of the color onto the destination.

Remarks

This function will wait until the hardware is complete, i.e. it is synchronous

Parameters

Parameters	Description
destination	Pointer to a n2d_buffer_t structure that describes the buffer to be used to draw the line into.
start	The starting point of the line, given in destination coordinates.
end	The ending point of the line, given in destination coordinates. The last pixel will not be drawn.
clip	Optional pointer to a rectangle that specifies the clipping region of the destination. If clip is NULL, the clipping region will be the entire destination buffer.
color	The color value to use for drawing the line.
blend	The blending mode to be applied to each pixel on the line. If no blending is required, set this value to N2D_BLEND_NONE (0).

Function

n2d_error_t n2d_line()

n2d_open Function

Open Nano2d context

File

libnano2D.h

C

```
n2d_error_t n2d_open();
```

Returns

Returns the status as defined by n2d_error_t.

Description

The n2d_line, n2d_fill, n2d_blit, and n2d_draw_state functions require a Nano2D context to be opened. This function is the first interface that accesses the hardware. The hardware will be turned on and initialized.

Remarks

There is only one Nano2d context per application, so this function must be called once in your application.

Function

n2d_error_t n2d_open()

n2d_dither Function

Enable or disable dithering

File

libnano2D.h

C

```
n2d_error_t n2d_dither(n2d_bool_t enable);
```

Returns

Returns the status as defined by n2d_error_t

Description

Sets the capability to scatter or approximate colors when using less than 32bpp or 16bpp color depth. Dither attempts to improve the overall appearance of low resolution images. Dithering is on when enable is true, otherwise, dithering is off.

Remarks

This function will wait until the hardware is complete, i.e. it is synchronous.

Parameters

Parameters	Description
enable	defines whether dither is set on or off.

Function

n2d_error_t n2d_dither()

b) Data Types and Constants

n2d_blend_t Enumeration

List of blending modes

File

libnano2D.h

C

```
typedef enum n2d_blend {
  N2D_BLEND_NONE,
  N2D_BLEND_SRC_OVER,
  N2D_BLEND_DST_OVER,
  N2D_BLEND_SRC_IN,
  N2D_BLEND_DST_IN,
  N2D_BLEND_ADDITIVE,
  N2D_BLEND_SUBTRACT
} n2d_blend_t;
```

Description

Structure: n2d_blend

N2D_BLEND_NONE - S, i.e. no blending N2D_BLEND_SRC_OVER - S + (1 - Sa) * D N2D_BLEND_DST_OVER - (1 - Da) * S + D N2D_BLEND_SRC_IN - Da * S N2D_BLEND_DST_IN - Sa * D N2D_BLEND_ADDITIVE - S + D N2D_BLEND_SUBTRACT - D * (1 - S)

Remarks

Some of the Nano2D API functions calls support blending. S and D represent source and destination color channels and Sa and Da represent the source and destination alpha channels

n2d_buffer_format_t Enumeration

List of blending modes

File

libnano2D.h

C

```
typedef enum n2d_buffer_format {
  N2D_RGBA8888,
  N2D_BGRA8888,
  N2D_RGB565,
  N2D_BGR565,
  N2D_RGBA4444,
  N2D_BGRA4444,
  N2D_A8
} n2d_buffer_format_t;
```

Members

Members	Description
N2D_RGBA4444	currently not available in MPLAB Harmony HAL
N2D_BGRA4444	currently not available in MPLAB Harmony HAL

Description

Structure: n2d_buffer_format

N2D_RGBA8888 - 32-bit RGBA format with 8 bits per color channel. Red is in bits 7:0, green in bits 15:8, blue in bits 23:16, and the alpha channel is in bits 31:24 N2D_BGRA8888 - 32-bit RGBA format with 8 bits per color channel. Red is in bits 23:16, green in bits 15:8, blue in bits 7:0, and the alpha channel is in bits 31:24 N2D_RGB565 - 16-bit RGB format with 5 and 6 bits per color channel. Red is in bits 4:0, green in bits 10:5, and the blue color channel is in bits 15:11 N2D_BGR565 - 16-bit RGB format with 5 and 6 bits per color channel. Red is in bits 15:11, green in bits 10:5, and the blue color channel is in bits 4:0 N2D_RGBA4444 - 16-bit RGBA format with 4 bits per color channel. Red is in bits 3:0, green in bits 7:4, blue in bits 11:8 and the alpha channel is in bits 15:12. Note: currently not available in HAL N2D_BGRA4444 - 16-bit RGBA format with 4 bits per color channel. Red is in bits 11:8, green in bits 7:4, blue in bits 3:0 and the alpha channel is in bits 15:12. Note: currently not available in HAL N2D_A8 - 8-bit alpha format. There are no RGB values.

Remarks

The pixel type for a n2d_buffer_t structure

n2d_buffer_t Structure

A wrapper structure for any image or render target

File

libnano2D.h

C

```
typedef struct n2d_buffer {
  n2d_int32_t width;
  n2d_int32_t height;
  n2d_int32_t stride;
  n2d_buffer_format_t format;
  n2d_orientation_t orientation;
  void * handle;
  void * memory;
  n2d_uint32_t gpu;
} n2d_buffer_t;
```

Description

Structure: n2d_buffer

width - Width of the buffer in pixels height - Height of the buffer in pixels stride - Stride of the buffer in bytes format - Pixel format of the buffer orientation - Buffer's orientation memory - Logical pointer to the buffer's memory for the CPU gpu - Physical address of the buffer's memory the hardware can access

Remarks

Each piece of memory, whether it is an image used as a source or a buffer used as a destination, requires a structure to define it. This structure contains all the information the Nano2D API requires to access the buffer's memory by the hardware

n2d_color_t Type

Identifies a specific pixel color

File

libnano2D.h

C

```
typedef n2d_int32_t n2d_color_t;
```

Description

Color

Color container

n2d_error_t Enumeration

Error codes that the Nano2D functions can return

File

libnano2D.h

C

```
typedef enum n2d_error {
  N2D_SUCCESS = 0,
  N2D_INVALID_ARGUMENT,
  N2D_OUT_OF_MEMORY,
  N2D_NO_CONTEXT,
  N2D_TIMEOUT,
  N2D_OUT_OF_RESOURCES,
  N2D_GENERIC_IO,
  N2D_NOT_SUPPORTED
} n2d_error_t;
```

Description

Structure: n2d_error

N2D_SUCCESS - Success N2D_INVALID_ARGUMENT - An invalid argument was specified N2D_OUT_OF_MEMORY - Out of memory N2D_NO_CONTEXT - No open context is present N2D_TIMEOUT - A timeout has accored during a wait N2D_OUT_OF_RESOURCES - Out of system resources N2D_GENERIC_IO - Cannot communicate with the kernel driver N2D_NOT_SUPPORTED - The request is not supported

Remarks

All API functions return a status code. On success, N2D_SUCCESS will be returned when a function is successful. This value is set to zero, so if any function returns a non-zero value, an error has occured

n2d_module_parameters_t Structure

GPU peripheral Initialization parameters

File

libnano2D.h

C

```
typedef struct n2d_module_parameters {
  n2d_int32_t irqLine2D;
  n2d_uint32_t registerMemBase2D;
  n2d_uint32_t registerMemSize2D;
  n2d_uint32_t contiguousSize;
  n2d_uint32_t contiguousBase;
  n2d_uint32_t baseAddress;
} n2d_module_parameters_t;
```

Description

Structure: n2d_module_parameters

irqLine2D - command completion interrupt pin registerMemBase2D - base address of gpu (physical address) registerMemsize2D - size of gpu address space contiguousSize - size of memory pool contiguousBase - start address of memory (virtual address) baseAddress - base address display buffer

Remarks

None

n2d_orientation_t Enumeration

List of blending modes

File

libnano2D.h

C

```
typedef enum n2d_orientation {
  N2D_0,
  N2D_90,
  N2D_180,
  N2D_270
} n2d_orientation_t;
```

Description

Structure: n2d_orientation

N2D_0 - Buffer is 0 degrees rotated. N2D_90 - Buffer is 90 degrees rotated. N2D_180 - Buffer is 180 degrees rotated. N2D_270 - Buffer is 270 degrees rotated.

Remarks

Orientation is orthogonal. Rotation which is not parallel to the x or y axis is not supported.

n2d_point_t Structure

A position on a pixel

File

libnano2D.h

C

```
typedef struct n2d_point {
  n2d_int32_t x;
  n2d_int32_t y;
} n2d_point_t;
```

Description

Structure: n2d_point

Defines a position on the screen

x - horizontal coordinate of the point y - vertical coordinate of the point

n2d_rectangle_t Structure

A rectangle

File

libnano2D.h

C

```
typedef struct n2d_rectangle {
  n2d_int32_t x;
  n2d_int32_t y;
  n2d_int32_t width;
  n2d_int32_t height;
} n2d_rectangle_t;
```

Description

Structure: n2d_rectangle

Defines a rectangular shape area of the screen

x - Left coordinate of the rectangle y - Top coordinate of the rectangle width - Width of the rectangle height - Height of the rectangle

n2d_transparency_t Enumeration

Transparency modes

File

libnano2D.h

C

```
typedef enum n2d_transparency {
  N2D_TRANSPARENCY_NONE,
```

```
    N2D_TRANSPARENCY_SOURCE,
    N2D_TRANSPARENCY_DESTINATION
} n2d_transparency_t;
```

Description

Structure: n2d_transparency

N2D_TRANSPARENCY_NONE - No transparency N2D_TRANSPARENCY_SOURCE - The source defines the transparency N2D_TRANSPARENCY_DESTINATION - The destination defines the transparency

Remarks

The Nano2D hardware can be programmed to use transparency, extracted from either the source or the destination

n2d_bool_t Type

File

libnano2D_types.h

C

```
typedef int n2d_bool_t;
```

Description

This is type n2d_bool_t.

n2d_float_t Type

File

libnano2D_types.h

C

```
typedef float n2d_float_t;
```

Description

This is type n2d_float_t.

n2d_int16_t Type

File

libnano2D_types.h

C

```
typedef short n2d_int16_t;
```

Description

This is type n2d_int16_t.

n2d_int32_t Type

File

libnano2D_types.h

C

```
typedef int n2d_int32_t;
```

Description

This is type n2d_int32_t.

n2d_size_t Type

File

libnano2D_types.h

C

```
typedef unsigned int n2d_size_t;
```

Description

This is type n2d_size_t.

n2d_uint16_t Type

File

libnano2D_types.h

C

```
typedef unsigned short n2d_uint16_t;
```

Description

This is type n2d_uint16_t.

n2d_uint32_t Type

File

libnano2D_types.h

C

```
typedef unsigned int n2d_uint32_t;
```

Description

This is type n2d_uint32_t.

n2d_uint64_t Type

File

libnano2D_types.h

C

```
typedef unsigned long long n2d_uint64_t;
```

Description

This is type n2d_uint64_t.

n2d_uint8_t Type

File

libnano2D_types.h

C

```
typedef unsigned char n2d_uint8_t;
```

Description

This is type n2d_uint8_t.

__gcmALIGN Macro

File

libnano2D_types.h

C

```
#define __gcmALIGN(data, reg_field) \
    (((n2d_uint32_t) (data)) << __gcmSTART(reg_field))
```

Description

This is macro __gcmALIGN.

__gcmEND Macro

File

libnano2D_types.h

C

```
#define __gcmEND(reg_field) \
    (1 ? reg_field)
```

Description

This is macro __gcmEND.

__gcmGETSIZE Macro

File

libnano2D_types.h

C

```
#define __gcmGETSIZE(reg_field) \
    (__gcmEND(reg_field) - __gcmSTART(reg_field) + 1)
```

Description

This is macro __gcmGETSIZE.

__gcmMASK Macro

File

libnano2D_types.h

C

```
#define __gcmMASK(reg_field) \
    ((n2d_uint32_t) ((__gcmGETSIZE(reg_field) == 32) \
        ?  ~0 \
        : (~(~0 << __gcmGETSIZE(reg_field)))))
```

Description

This is macro __gcmMASK.

__gcmSTART Macro

File

libnano2D_types.h

C

```
#define __gcmSTART(reg_field) \
    (0 ? reg_field)
```

Description

This is macro __gcmSTART.

_nano2D_types_h__ Macro

File

libnano2D_types.h

C

```
#define _nano2D_types_h__
```

Description

This is macro _nano2D_types_h__.

gcmALIGN Macro

File

libnano2D_types.h

C

```
#define gcmALIGN(n, align) \
( \
    ((n) + ((align) - 1)) & ~((align) - 1) \
)
```

Description

This is macro gcmALIGN.

gcmCOUNTOF Macro

File

libnano2D_types.h

C

```
#define gcmCOUNTOF(array) \
        (sizeof(array) / sizeof(array[0]))
```

Description

This is macro gcmCOUNTOF.

gcmGETFIELD Macro

File

libnano2D_types.h

C

```
#define gcmGETFIELD(data, reg, field) \
( \
    ((((n2d_uint32_t) (data)) >> __gcmSTART(reg##_##field)) \
        & __gcmMASK(reg##_##field)) \
)
```

Description

This is macro gcmGETFIELD.

gcmINT2PTR Macro

File

libnano2D_types.h

C

```
#define gcmINT2PTR(i) \
( \
    (void *)(n2d_uint32_t)(i) \
)
```

Description

This is macro gcmINT2PTR.

gcmMAX Macro

File

libnano2D_types.h

C

```
#define gcmMAX(x, y) \
( \
    ((x) >= (y)) \
        ? (x) \
        : (y) \
)
```

Description

This is macro gcmMAX.

gcmMIN Macro

File

libnano2D_types.h

C

```
#define gcmMIN(x, y) \
( \
    ((x) <= (y)) \
        ? (x) \
```

```
        : (y) \
)
```

Description

This is macro gcmMIN.

gcmPTR2INT Macro

File

libnano2D_types.h

C

```
#define gcmPTR2INT(p) \
( \
    (n2d_uint32_t)(p) \
)
```

Description

This is macro gcmPTR2INT.

gcmSETFIELD Macro

File

libnano2D_types.h

C

```
#define gcmSETFIELD(data, reg, field, value) \
( \
    (((n2d_uint32_t) (data)) \
        & ~__gcmALIGN(__gcmMASK(reg##_##field), reg##_##field)) \
        |  __gcmALIGN((n2d_uint32_t) (value) \
            & __gcmMASK(reg##_##field), reg##_##field) \
)
```

Description

This is macro gcmSETFIELD.

gcmSETFIELDVALUE Macro

File

libnano2D_types.h

C

```
#define gcmSETFIELDVALUE(data, reg, field, value) \
( \
    (((n2d_uint32_t) (data)) \
        & ~__gcmALIGN(__gcmMASK(reg##_##field), reg##_##field)) \
        |  __gcmALIGN(reg##_##field##_##value \
            & __gcmMASK(reg##_##field), reg##_##field) \
)
```

Description

This is macro gcmSETFIELDVALUE.

gcmSETMASKEDFIELD Macro

File

libnano2D_types.h

C

```
#define gcmSETMASKEDFIELD(reg, field, value) \
( \
    gcmSETFIELD     (~0, reg,          field, value) & \
    gcmSETFIELDVALUE(~0, reg, MASK_ ## field, ENABLED) \
)
```

Description

This is macro gcmSETMASKEDFIELD.

gcmSETMASKEDFIELDVALUE Macro

File

libnano2D_types.h

C

```
#define gcmSETMASKEDFIELDVALUE(reg, field, value) \
( \
    gcmSETFIELDVALUE(~0, reg,          field, value) & \
    gcmSETFIELDVALUE(~0, reg, MASK_ ## field, ENABLED) \
)
```

Description

This is macro gcmSETMASKEDFIELDVALUE.

gcmVERIFYFIELDVALUE Macro

File

libnano2D_types.h

C

```
#define gcmVERIFYFIELDVALUE(data, reg, field, value) \
( \
    (((n2d_uint32_t) (data)) >> __gcmSTART(reg##_##field) & \
                            __gcmMASK(reg##_##field)) \
        == \
    (reg##_##field##_##value & __gcmMASK(reg##_##field)) \
)
```

Description

This is macro gcmVERIFYFIELDVALUE.

IN Macro

File

libnano2D_types.h

C

```
#define IN
```

Description

This is macro IN.

N2D_FALSE Macro

File

libnano2D_types.h

C

```
#define N2D_FALSE 0
```

Description

This is macro N2D_FALSE.

N2D_INFINITE Macro

File

libnano2D_types.h

C

```
#define N2D_INFINITE ((n2d_uint32_t) ~0U)
```

Description

This is macro N2D_INFINITE.

N2D_IS_ERROR Macro

File

libnano2D_types.h

C

```
#define N2D_IS_ERROR(error) (error != N2D_SUCCESS)
```

Description

This is macro N2D_IS_ERROR.

N2D_IS_SUCCESS Macro

File

libnano2D_types.h

C

```
#define N2D_IS_SUCCESS(error) (error == N2D_SUCCESS)
```

Description

This is macro N2D_IS_SUCCESS.

N2D_NULL Macro

File

libnano2D_types.h

C

```
#define N2D_NULL ((void *) 0)
```

Description

This is macro N2D_NULL.

N2D_ON_ERROR Macro

File

libnano2D_types.h

C

```
#define N2D_ON_ERROR(func) \
    do \
    { \
        error = func; \
        if (N2D_IS_ERROR(error)) \
        { \
            goto on_error; \
        } \
    } \
    while (0)
```

Description

This is macro N2D_ON_ERROR.

N2D_TRUE Macro

File

libnano2D_types.h

C

```
#define N2D_TRUE 1
```

Description

This is macro N2D_TRUE.

OUT Macro

File

libnano2D_types.h

C

```
#define OUT
```

Description

This is macro OUT.

Files

This section describes the Application Programming Interface (API) functions of the Nano2D module.

Files

Name	Description
libnano2D.h	Main header file for MPLAB Harmony Graphics Driver libnano2D GPU functions
libnano2D_types.h	Defines libnano2D data types and constants

Description

Source File Name	Description
`libnano2D.h`	Header file that includes all of the nano2d APIs
`libnano2D_types.h`	Header file that includes all the nano2d data types
`libnano2D.a`	Static library file which must be linked to the application. This library implements all Nano2D feature APIs

libnano2D.h

Main header file for MPLAB Harmony Graphics Driver libnano2D GPU functions

Enumerations

	Name	Description
	n2d_blend	List of blending modes
	n2d_buffer_format	List of blending modes
	n2d_error	Error codes that the Nano2D functions can return
	n2d_orientation	List of blending modes
	n2d_transparency	Transparency modes
	n2d_blend_t	List of blending modes
	n2d_buffer_format_t	List of blending modes
	n2d_error_t	Error codes that the Nano2D functions can return
	n2d_orientation_t	List of blending modes
	n2d_transparency_t	Transparency modes

Functions

	Name	Description
	n2d_blit	Copy a source buffer to the the destination buffer
	n2d_dither	Enable or disable dithering
	n2d_draw_state	Set the drawing state for any following Nano2D API draw call
	n2d_fill	Fill a (partial) buffer with a specified color
	n2d_init_hardware	Initializes the n2d driver and peripheral hardware
	n2d_line	Draw a line
	n2d_open	Open Nano2d context

Structures

	Name	Description
	n2d_buffer	A wrapper structure for any image or render target
	n2d_module_parameters	GPU peripheral Initialization parameters

	n2d_point	A position on a pixel
	n2d_rectangle	A rectangle
	n2d_buffer_t	A wrapper structure for any image or render target
	n2d_module_parameters_t	GPU peripheral Initialization parameters
	n2d_point_t	A position on a pixel
	n2d_rectangle_t	A rectangle

Types

	Name	Description
	n2d_color_t	Identifies a specific pixel color

Description

Module for Microchip Graphics Library - Graphics Driver Layer

The API functions to be used for the Nano2D graphics accelerator.

File Name

libnano2D.h

Company

Microchip Technology Inc.

libnano2D_types.h

Defines libnano2D data types and constants

Macros

	Name	Description
	__gcmALIGN	This is macro __gcmALIGN.
	__gcmEND	This is macro __gcmEND.
	__gcmGETSIZE	This is macro __gcmGETSIZE.
	__gcmMASK	This is macro __gcmMASK.
	__gcmSTART	This is macro __gcmSTART.
	_nano2D_types_h__	This is macro _nano2D_types_h__.
	gcmALIGN	This is macro gcmALIGN.
	gcmCOUNTOF	This is macro gcmCOUNTOF.
	gcmGETFIELD	This is macro gcmGETFIELD.
	gcmINT2PTR	This is macro gcmINT2PTR.
	gcmMAX	This is macro gcmMAX.
	gcmMIN	This is macro gcmMIN.
	gcmPTR2INT	This is macro gcmPTR2INT.
	gcmSETFIELD	This is macro gcmSETFIELD.
	gcmSETFIELDVALUE	This is macro gcmSETFIELDVALUE.
	gcmSETMASKEDFIELD	This is macro gcmSETMASKEDFIELD.
	gcmSETMASKEDFIELDVALUE	This is macro gcmSETMASKEDFIELDVALUE.
	gcmVERIFYFIELDVALUE	This is macro gcmVERIFYFIELDVALUE.
	IN	This is macro IN.
	N2D_FALSE	This is macro N2D_FALSE.
	N2D_INFINITE	This is macro N2D_INFINITE.
	N2D_IS_ERROR	This is macro N2D_IS_ERROR.
	N2D_IS_SUCCESS	This is macro N2D_IS_SUCCESS.
	N2D_NULL	This is macro N2D_NULL.
	N2D_ON_ERROR	This is macro N2D_ON_ERROR.
	N2D_TRUE	This is macro N2D_TRUE.
	OUT	This is macro OUT.

Types

	Name	Description
	n2d_bool_t	This is type n2d_bool_t.

	n2d_float_t	This is type n2d_float_t.
	n2d_int16_t	This is type n2d_int16_t.
	n2d_int32_t	This is type n2d_int32_t.
	n2d_size_t	This is type n2d_size_t.
	n2d_uint16_t	This is type n2d_uint16_t.
	n2d_uint32_t	This is type n2d_uint32_t.
	n2d_uint64_t	This is type n2d_uint64_t.
	n2d_uint8_t	This is type n2d_uint8_t.

Description

Module for Microchip Graphics Library - Graphics Driver Layer

This is a definition file for libnano2d types and constants used in the library and applications.

File Name

libnano2D_types.h

Company

Microchip Technology Inc.

Graphics Utilities Library

This section provides information about the Graphics Utilities Library within the MPLAB Harmony framework for graphics applications.

Description

This library is primarily responsible for managing and decoding assets such as images, fonts, and strings. It provides the means for interacting with asset data, complex data decoding, data decompression, and string asset lookup. The library also abstractly handles the accessing of external memory sources during asset decoding.

Definitions

- Anti-aliasing – Uses transparency to achieve a less jagged look when rasterizing pixel information.
- ASCII – The standard 8-bit-per-character text representation.
- Asset – A generic term for any resource that consists of blocks of binary data. Can be images, raw files, fonts, strings, and so on.
- Binary Asset – A chunk of raw data.
- Codepoint – The numerical ID of a glyph, typically four bytes in size
- External Asset – An asset that is stored on an external storage peripheral not directly accessible from the CPU.
- Font – A collection of images that represent linguistic characters. Each font has a distinct look and feel.
- Glyph – A linguistic character.
- Image Asset – A collection of pixel data that, when rendered, forms a visual image.
- Index Map – An image that is stored as a series of lookup table indices, rather than raw pixel data.
- Palette Asset – A form of image compression. Palettes are lookup tables of color information.
- Run-length Encoding (RLE) – A simple form of data compression that indexes long strings of duplicate bytes into a single value with an associated length value. Data blocks with long runs of duplicate characters are good candidates for RLE compression. Poor candidates will see the data size increase rather than decrease.
- String – A series of characters often used to form linguistic sentences.
- UTF8 – The encoding format for Unicode characters that favors space over decoding speed.
- UTF16 – The encoding format for Unicode characters that favors decoding speed over space.

Graphics Utilities Library Objective

The library serves four main purposes:

- Provides a common definition for asset description.
- Provides APIs for asset indexing, decoding, and rendering.
- Provides an abstract API for asset decoders.
- Provides state machines for accessing assets located in external memory locations.

Asset Common Definition

All assets share a common header “GFXU_AssetHeader”. This header is defined as follows:

```
typedef struct GFXU_AssetHeader_t
{
 uint32_t type;
 uint32_t dataLocation;
```

```
 void* dataAddress;
 uint32_t dataSize;
} GFXU_AssetHeader;
```

- type – the type of an asset
- dataLocation – The location ID for the asset. A location of “0” always indicates internal flash memory.
- dataAddress – The address of the asset. Depending on memory location, this address may not be accessible from the CPU.
- dataSize – The size of the asset in bytes.

Image Decoding and Rendering

Image Asset Descriptor

The image asset descriptor is defined as follows:

```
typedef struct GFXU_ImageAsset_t
{
 GFXU_AssetHeader header;
 GFXU_ImageFormat format;
 uint32_t width;
 uint32_t height;
 GFX_ColorMode colorMode;
 GFXU_ImageCompressionType compType;
 GFX_Bool useMask;
 GFX_Color mask;
 GFXU_PaletteAsset* palette;
} GFXU_ImageAsset;
```

- header – The common asset header.
- format – The format of the image data.
- width – The width of the image.
- height – The height of the image.
- colorMode – The format of the image's pixel data.
- compType – If compressed, indicates the compression type.
- useMask – Indicates whether the image specifies a pixel transparency mask.
- mask – The value of the image transparency mask.
- palette – If the color mode is an index format, then this is the address of the lookup table to reference.

Image decoding with the GFX Utilities library is meant to be simple and straightforward. The library provides a single API that clients can use to render image assets.

```
GFX_Result GFXU_DrawImage(GFXU_ImageAsset* img,
 int32_t src_x,
 int32_t src_y,
 int32_t src_width,
 int32_t src_height,
 int32_t dest_x,
 int32_t dest_y,
 GFXU_MemoryIntf* read_cb,
 GFXU_ExternalAssetReader** reader);
```

This function accepts a pointer to an image header and rendering dimensions for rendering sub-sections of the image. The last two arguments refer to external memory access and will be described later. If the type of an image specifies an image decoder, then that decoder is automatically invoked by the library. If an image is stored as an index map, then its associated palette is referenced during decoding.

Image Palette Asset

Palette assets are color lookup tables that can be referenced when decoding indexed images. The index format can be 1bpp, 4bpp, or 8bpp large, resulting in a maximum of 1, 16, or 256 colors, respectively.

The palette descriptor is defined as follows:

```
typedef struct GFXU_PaletteAsset_t
{
 GFXU_AssetHeader header;
 uint32_t colorCount;
 GFX_ColorMode colorMode;
} GFXU_PaletteAsset;
```

- header – The common asset header.
- colorCount – The number of colors in this palette.
- colorMode – The color format of this palette.

Font Assets

Fonts are chunks of data that contain color information for drawing individual linguistic characters. Font glyph data can either be stored by using a 1bpp or 8bpp format. The larger format is for storing transparency information for use in drawing anti-aliased characters.

The font descriptor is as follows:

```
typedef struct GFXU_FontAsset_t
{
 GFXU_AssetHeader header;
 uint32_t height;
 uint32_t ascent;
 uint32_t descent;
 uint32_t baseline;
 GFXU_FontAssetBPP bpp;
 GFXU_FontGlyphIndexTable* indexTable;
} GFXU_FontAsset;
```

- header – The common asset header.
- height – The height of the font.
- ascent – The ascent of the font.
- descent – The descent of the font.
- baseline – The baseline of the font.
- bpp – The size of the per-pixel font data.
- indexTable – The pointer to the font index table.

Font Index Table

Each font provides an index table for quickly locating pixel data inside the font data chunk. The index table specifies the number of individual ranges or series of glyphs that it provides, followed by the actual range data.

A typical font range table entry is as follows:

```
typedef struct GFXU_FontGlyphRange_t
{
 uint32_t glyphCount;
 uint32_t startID;
 uint32_t endID;
 uint8_t* lookupTable;
} GFXU_FontGlyphRange;
```

- glyphCount – The number of glyphs in this range.
- startID – The starting glyph codepoint.
- endID – The ending glyph codepoint.
- lookupTable – The pointer to the lookup table for this range.

Font Lookup Table

The font lookup table contains location and size data for referencing glyphs in the font data chunk. This table provides with values to allow geometric analysis of font glyphs without having to render any data.

The data in a font lookup table is defined as follows:

- Byte 1 – The size of the offset values in the lookup table. 1-4 bytes possible depending on the max size of the font data chunk.
- Byte 2 – The size of the width values in the lookup table. This depends on the font size. The maximum size is 0xFFFF.

Repeating 'glyphCount' number of times:

- Offset value – Read offset value of 1-4 bytes, depending on the header.
- Width value – Read width value of 1-2 bytes, depending on the header

Font Glyph Raster Data

Font raster data is stored in a single chunk of memory and is referenced through the previously mentioned lookup tables. When rendering a font, the decoder uses the code point to find the appropriate lookup table and then uses that table to get the offset of the glyph. The width value says how large the glyph is in pixels, which could be 1bpp or 8bpp, depending on the anti-alias setting. The decoder then reads "width" number of pixels starting at "offset". The pixel data offsets are always byte-aligned.

String Table

The graphics utilities library defines a special asset called the "String Table". This table is a predefined lookup table of strings, languages, and their associated fonts. This construct makes runtime localization possible for user interface libraries.

Graphics Utilities Interface

a) Functions

	Name	Description
	convertColorAndSetDraw	internal use only
	getDiscreteValueAtIndex	internal use only
	getOffsetFromIndexAndBPP	internal use only
	getRLEDataAtIndex	internal use only
	GFXU_CalculateCharStringWidth	Gets the width of a string buffer in pixels.
	GFXU_CalculatePartialCharStringWidth	Gets the width of a partial string buffer in pixels.

	GFXU_CalculatePartialStringWidth	Gets the partial width, starting from the left, of a string contained in the string table.
	GFXU_CalculateStringWidth	Gets the width of a string contained in the string table.
	GFXU_CompareString	Compares a string table entry and a GFXU_CHAR type string.
	GFXU_DecodeCodePoint	internal use only
	GFXU_DecodeUTF16	internal use only
	GFXU_DecodeUTF8	internal use only
	GFXU_DrawCharString	Draws a clipped string at the given coordinates. Strings are drawn from the top down.
	GFXU_DrawImage	Draws a portion of the given image at the specified coordinates.
	GFXU_DrawString	Draws a string at the given coordinates. Strings are drawn from the top down.
	GFXU_ExtractString	Extracts a string from the string table into a local character buffer. The local buffer must have already been allocated. Will attempt to write 'size - 1' number of characters into the buffer with the last being a zero terminator.
	GFXU_FontGetGlyphInfo	internal use only
	GFXU_FontGetLookupTableEntry	internal use only
	GFXU_GetCharAt	Gets a character of a string contained in the string table.
	GFXU_GetCharWidth	Gets the width of a character for a given font.
	GFXU_GetStringHeight	Gets the height of a string contained in the string table.
	GFXU_GetStringLength	Gets the length of a string contained in a string table.
	GFXU_GetStringRect	Gets the bounding rectangle for a string contained in the string table.
	GFXU_GetStringSizeInBytes	Gets the size of a string contained in a string table, in bytes.
	GFXU_PaletteGetColor	Gets a color from a palette asset given an index value.
	GFXU_StringFontIndexLookup	internal use only
	GFXU_StringIndexLookup	internal use only
	GFXU_StringLookup	internal use only
	GFXU_DecodeAndDrawString	internal use only
	GFXU_DrawCharStringClipped	Draws a clipped string at the given coordinates. Strings are drawn from the top down.
	GFXU_DrawGlyph	internal use only
	GFXU_DrawGlyphRow	internal use only
	GFXU_DrawStringClipped	Draws a clipped string at the given coordinates. Strings are drawn from the top down.
	GFXU_DrawUnknownGlyph	internal use only
	GFXU_GetGlyphRowDataSize	internal use only
	GFXU_PreprocessImage	Preprocesses an image to a specified memory address.
	GFXU_DecodeAndDrawSubString	internal use only
	GFXU_DrawCharSubStringClipped	Draws a clipped string at the given coordinates. Strings are drawn from the top down.
	GFXU_DrawSubStringClipped	Draws a sub-string from a string asset in a clipped rectangle at the given coordinates. Strings are drawn from the top down.
	GFXU_GetCharStringLineRect	Gets the bounding rectangle for a line in a character string.
	GFXU_GetStringLineRect	Gets the bounding rectangle for a line in a string asset.

b) Data Types and Constants

	Name	Description
	GFXU_AssetHeader_t	Defines a common header for all assets supported by the generic decoder interface.
	GFXU_AssetType_t	Enumerates known asset types.
	GFXU_BinaryAsset_t	A binary asset type. Generic data that can be of any type
	GFXU_ExternalAssetReader_t	Defines the base description of an external asset reader. Specific decoder implementations will build on this foundation for each decoder type.
	GFXU_ExternalAssetReaderStatus_t	Enumerates external reader state machine states. Invalid - state machine hasn't been initialized Read - state machine is ready to begin processing but hasn't been run yet Waiting - state machine is waiting for a memory operation to complete Drawing - state machine is waiting for a drawing operation to complete Finished - state machine has finished drawing the entire asset Aborted - state machine encountered an error and has aborted
	GFXU_FontAsset_t	Describes a font asset. A font asset is a series of raster images that represet linguistic characters. These characters are referenced by an index called a 'code point'. This code point is 1-4 bytes in length. Code points may be encoded to save space. Fonts also contain kerning data that describes character positioning data. header - standard asset header height - font height in pixels ascent - font ascent in pixels descent - font descent in pixels baseline - font baseline in pixels bpp - font pixel size, either 1 or 8. 8 is for anti-aliased font data indexTable -... more

	GFXU_FontAssetBPP	Indicates the bits per pixel mode of a font
	GFXU_FontGlyphIndexTable_t	Describes a font glyph index table. Essentially a series of glyph look up tables where each non-consecutive range of glyphs occupies one range entry count - number of ranges in the index table ranges - the glyph range array
	GFXU_FontGlyphRange_t	Describes a range of glyphs for a font. All IDs are in raw code points and are not encoded in any way glyphCount - number of glyphs in the range startID - the starting glyph id endID - the ending glyph id lookupTable - the corresponding look up table to find the glyph raster data
	GFXU_ImageAsset_t	Describes an image asset. header - standard asset header format - the format of the image. this directly affects which decoder is invoked when rendering the image width - the width of the image in pixels height - the height of the image in pixels colorMode - the color mode of the image compType - the compression mode of the image useMask - indicates of the mask field is used mask - may contain a masking color for the image. blit operations may reference this value and reject image pixels that match this value palette - will contain a valid... more
	GFXU_ImageCompressionType_t	Indicates the image compression type, only applies to RAW types
	GFXU_ImageFormat_t	Indicates the image encoding format
	GFXU_MemoryIntf_t	Defines a memory interface for all memory operations. Essentially wraps a GFX_MemoryIntf with the notable addition lf a GFXU_MemoryReadRequest_FnPtr. The 'read' function pointer will be invoked when a decoder attempts to access an asset that has a location that is greater than zero. The application must then look at the asset's location id and determine which peripheral to communicate with.
	GFXU_PaletteAsset_t	Describes a palette asset. A palette is a lookup table for unique colors. Given in an index, a color can be retrieved. header - standard asset header colorCount - the number of colors contained in the palette colorMode - the color mode of the image
	GFXU_StringEncodingMode_t	Indicates the string encoding mode type. Any characters above 255 must use UTF8 or UTF16
	GFXU_StringTableAsset_t	Describes a string table asset. There is typically only ever one of these defined at any one time. header - standard asset header languageCount - the number of languages in the string table stringCount - the number of strings in the string table stringIndexTable - the pointer to the string index table. the string index table is a table that contains all of the unique strings defined in the string table. fontTable - the font table contains an array of pointers to all defined font assets that the string table references fontIndexTable - the font index table is a table... more
	GFXU_AssetHeader	Defines a common header for all assets supported by the generic decoder interface.
	GFXU_AssetType	Enumerates known asset types.
	GFXU_BinaryAsset	A binary asset type. Generic data that can be of any type
	GFXU_CHAR	strings are defined as having 32bit characters due to the need to support international code points and unicode strings encoded using these types will not be compatible with standard library string functions like strlen or strcat
	GFXU_ExternalAssetReader	Defines the base description of an external asset reader. Specific decoder implementations will build on this foundation for each decoder type.
	GFXU_ExternalAssetReaderRun_FnPtr	This function pointer represents a function that maintains the state of an external reader state machine. The argument is the state machine to process.
	GFXU_ExternalAssetReaderStatus	Enumerates external reader state machine states. Invalid - state machine hasn't been initialized Read - state machine is ready to begin processing but hasn't been run yet Waiting - state machine is waiting for a memory operation to complete Drawing - state machine is waiting for a drawing operation to complete Finished - state machine has finished drawing the entire asset Aborted - state machine encountered an error and has aborted
	GFXU_FontAsset	Describes a font asset. A font asset is a series of raster images that represet linguistic characters. These characters are referenced by an index called a 'code point'. This code point is 1-4 bytes in length. Code points may be encoded to save space. Fonts also contain kerning data that describes character positioning data. header - standard asset header height - font height in pixels ascent - font ascent in pixels descent - font descent in pixels baseline - font baseline in pixels bpp - font pixel size, either 1 or 8. 8 is for anti-aliased font data indexTable -... more
	GFXU_FontGlyphIndexTable	Describes a font glyph index table. Essentially a series of glyph look up tables where each non-consecutive range of glyphs occupies one range entry count - number of ranges in the index table ranges - the glyph range array

	GFXU_FontGlyphRange	Describes a range of glyphs for a font. All IDs are in raw code points and are not encoded in any way glyphCount - number of glyphs in the range startID - the starting glyph id endID - the ending glyph id lookupTable - the corresponding look up table to find the glyph raster data
	GFXU_ImageAsset	Describes an image asset. header - standard asset header format - the format of the image. this directly affects which decoder is invoked when rendering the image width - the width of the image in pixels height - the height of the image in pixels colorMode - the color mode of the image compType - the compression mode of the image useMask - indicates of the mask field is used mask - may contain a masking color for the image. blit operations may reference this value and reject image pixels that match this value palette - will contain a valid... more
	GFXU_ImageCompressionType	Indicates the image compression type, only applies to RAW types
	GFXU_ImageFormat	Indicates the image encoding format
	GFXU_MemoryIntf	Defines a memory interface for all memory operations. Essentially wraps a GFX_MemoryIntf with the notable addition lf a GFXU_MemoryReadRequest_FnPtr. The 'read' function pointer will be invoked when a decoder attempts to access an asset that has a location that is greater than zero. The application must then look at the asset's location id and determine which peripheral to communicate with.
	GFXU_PaletteAsset	Describes a palette asset. A palette is a lookup table for unique colors. Given in an index, a color can be retrieved. header - standard asset header colorCount - the number of colors contained in the palette colorMode - the color mode of the image
	GFXU_StringEncodingMode	Indicates the string encoding mode type. Any characters above 255 must use UTF8 or UTF16
	GFXU_ASSET_LOCATION_INTERNAL	This is macro GFXU_ASSET_LOCATION_INTERNAL.
	GFXU_STRING_ARRAY_SIZE	defines meta data sizes for the string table, don't change!
	GFXU_STRING_ENTRY_SIZE	This is macro GFXU_STRING_ENTRY_SIZE.
	GFXU_STRING_MAX_CHAR_WIDTH	This is macro GFXU_STRING_MAX_CHAR_WIDTH.
	GFXU_MediaCloseRequest_FnPtr	A callback that indicates that a media decoder is finished with a given media location and that the application can close if it. The argument is the asset that was being read.
	GFXU_MediaOpenRequest_FnPtr	A callback that indicates that a media decoder wishes to read from an external media source and that the application should prepare that source. The argument is the asset that needs to be read. If the result is false then the decoder will abort.
	GFXU_MediaReadRequest_FnPtr	callback
	GFXU_MediaReadRequestCallback_FnPtr	A callback that signifies that a media read request has been fulfilled. Often signals a state machine to continue processing a decode operation. The argument is the reader that requested the memory.

Description

This section describes the interface for the Graphics Utilities Library.

a) Functions

convertColorAndSetDraw Function

File

gfxu_image_utils.h

C

```
GFX_Result convertColorAndSetDraw(uint32_t color, GFX_ColorMode mode);
```

Description

internal use only

getDiscreteValueAtIndex Function

File

gfxu_image_utils.h

C

```
uint32_t getDiscreteValueAtIndex(uint32_t index, uint32_t value, GFX_ColorMode mode);
```

Description

internal use only

getOffsetFromIndexAndBPP Function

File

gfxu_image_utils.h

C

```
uint32_t getOffsetFromIndexAndBPP(uint32_t index, GFX_BitsPerPixel bpp);
```

Description

internal use only

getRLEDataAtIndex Function

File

gfxu_image_utils.h

C

```
uint32_t getRLEDataAtIndex(uint8_t* data, uint32_t max, uint32_t idx, uint32_t* startBlock, uint32_t*
startOffset);
```

Description

internal use only

GFXU_CalculateCharStringWidth Function

Gets the width of a string buffer in pixels.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_CalculateCharStringWidth(GFXU_CHAR* str, GFXU_FontAsset* fnt);
```

Returns

uint32_t - the width of the string buffer

Parameters

Parameters	Description
GFXU_CHAR* str	the string buffer, terimated with a zero value
GFXU_FontAsset* fnt	the font asset to reference

Function

uint32_t GFXU_CalculateCharStringWidth(GFXU_CHAR* str,
GFXU_FontAsset* fnt)

GFXU_CalculatePartialCharStringWidth Function

Gets the width of a partial string buffer in pixels.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_CalculatePartialCharStringWidth(GFXU_CHAR* str, GFXU_FontAsset* fnt, uint32_t length);
```

Returns

uint32_t - the width of the partial string buffer

Parameters

Parameters	Description
GFXU_CHAR* str	the string buffer, terimated with a zero value
GFXU_FontAsset* fnt	the font asset to reference
uint32_t length	the number of characters to include

Function

uint32_t GFXU_CalculatePartialCharStringWidth(GFXU_CHAR* str,
GFXU_FontAsset* fnt,
uint32_t length)

GFXU_CalculatePartialStringWidth Function

Gets the partial width, starting from the left, of a string contained in the string table.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_CalculatePartialStringWidth(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang, uint32_t length);
```

Returns

uint32_t - the width of the sub-string

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up
uint32_t length	the number of characters to include in the sub-string

Function

uint32_t GFXU_CalculatePartialStringWidth(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang,
uint32_t length)

GFXU_CalculateStringWidth Function

Gets the width of a string contained in the string table.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_CalculateStringWidth(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang);
```

Returns

uint32_t - the width of the string

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up

Function

uint32_t GFXU_CalculateStringWidth(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang)

GFXU_CompareString Function

Compares a string table entry and a GFXU_CHAR type string.

File

gfxu_string.h

C

```
LIB_EXPORT int32_t GFXU_CompareString(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang, GFXU_CHAR*
buffer);
```

Returns

int32_t - the compare result, should be identical to strcmp()

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up
GFXU_CHAR* buffer	char buffer to compare

Function

int32_t GFXU_CompareString(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang,
GFXU_CHAR* buffer)

GFXU_DecodeCodePoint Function

File

gfxu_string_utils.h

C

```
GFX_Result GFXU_DecodeCodePoint(uint32_t encoding, uint8_t* data, uint32_t max, uint32_t* codePoint,
uint32_t* offset);
```

Description

internal use only

GFXU_DecodeUTF16 Function

File

gfxu_string_utils.h

C

```
GFX_Result GFXU_DecodeUTF16(uint8_t* val, uint32_t max, uint32_t* codePoint, uint32_t* size);
```

Description

internal use only

GFXU_DecodeUTF8 Function

File

gfxu_string_utils.h

C

```
GFX_Result GFXU_DecodeUTF8(uint8_t* val, uint32_t max, uint32_t* codePoint, uint32_t* size);
```

Description

internal use only

GFXU_DrawCharString Function

Draws a clipped string at the given coordinates. Strings are drawn from the top down.

File

gfxu_string.h

C

```
LIB_EXPORT GFX_Result GFXU_DrawCharString(GFXU_CHAR* str, GFXU_FontAsset* fnt, int32_t x, int32_t y,
GFXU_MemoryIntf* memoryInterface, GFXU_ExternalAssetReader** reader);
```

Returns

GFX_Result

Parameters

Parameters	Description
GFXU_CHAR* str	the string buffer to draw
int32_t x	the x position to which to draw the string
int32_t y	the y position to which to draw the string
GFXU_MemoryIntf* memoryInterface	a pointer to a memory interface to use for memory operations, not needed for internal assets
GFXU_ExternalAssetReader** reader	will return as a valid pointer if the image asset is located in an external source. If this is the case then the caller is responsible for servicing the external asset reader state machine until completion. The caller is then responsible for freeing the reader's memory.

Function

GFX_Result GFXU_DrawCharString(GFXU_CHAR* str,
GFXU_FontAsset* fnt
int32_t x,
int32_t y,
GFXU_MemoryIntf* memoryInterface,
GFXU_ExternalAssetReader** reader)

GFXU_DrawImage Function

Draws a portion of the given image at the specified coordinates.

File

gfxu_image.h

C

```
LIB_EXPORT GFX_Result GFXU_DrawImage(GFXU_ImageAsset* img, int32_t src_x, int32_t src_y, int32_t src_width,
int32_t src_height, int32_t dest_x, int32_t dest_y, GFXU_MemoryIntf* read_cb, GFXU_ExternalAssetReader**
reader);
```

Returns

GFX_Result

Parameters

Parameters	Description
GFXU_ImageAsset* img	pointer to the image asset to draw
int32_t src_x	the x position of the source image to draw (0 if whole image)
int32_t src_y	the y position of the source image to draw (0 if whole image)
int32_t src_width	the width of the source rectangle to draw (source width if whole image) the height of the source rectangle to draw (source height if whole image)
int32_t dest_x	the x position to draw to
int32_t dest_y	the y position to draw to
GFXU_MemoryIntf* read_cb	a pointer to a memory interface to use for memory operations, not needed for internal assets
GFXU_ExternalAssetReader** reader	will return as a valid pointer if the image asset is located in an external source. If this is the case then the caller is responsible for servicing the external asset reader state machine until completion. The caller is then responsible for freeing the reader's memory.

Function

GFX_Result GFXU_DrawImage(void);

GFXU_DrawString Function

Draws a string at the given coordinates. Strings are drawn from the top down.

File

gfxu_string.h

C

```
LIB_EXPORT GFX_Result GFXU_DrawString(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang, int32_t x,
int32_t y, GFXU_MemoryIntf* memoryInterface, GFXU_ExternalAssetReader** reader);
```

Returns

GFX_Result

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up
int32_t x	the x position to which to draw the string
int32_t y	the y position to which to draw the string
GFXU_MemoryIntf* memoryInterface	a pointer to a memory interface to use for memory operations, not needed for internal assets
GFXU_ExternalAssetReader** reader	will return as a valid pointer if the image asset is located in an external source. If this is the case then the caller is responsible for servicing the external asset reader state machine until completion. The caller is then responsible for freeing the reader's memory.

Function

GFX_Result GFXU_DrawString(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang,
int32_t x,
int32_t y,
GFXU_MemoryIntf* memoryInterface,
GFXU_ExternalAssetReader** reader)

GFXU_ExtractString Function

Extracts a string from the string table into a local character buffer. The local buffer must have already been allocated. Will attempt to write 'size - 1' number of characters into the buffer with the last being a zero terminator.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_ExtractString(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang, GFXU_CHAR*
buffer, uint32_t size, uint32_t offset);
```

Returns

uint32_t - the number of characters written

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to reference
uint32_t lang	the id of the language to reference
GFXU_CHAR* buffer	the pointer to the buffer to write to
uint32_t size	the maximum size of the buffer to write to
uint32_t offset	the buffer write offset if any

Function

uint32_t GFXU_ExtractString(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang,
GFXU_CHAR* buffer,
uint32_t size,
uint32_t offset)

GFXU_FontGetGlyphInfo Function

File

gfxu_string_utils.h

C

```
GFX_Result GFXU_FontGetGlyphInfo(GFXU_FontAsset* fnt, uint32_t glyph, uint32_t* offset, uint32_t* width);
```

Description

internal use only

GFXU_FontGetLookupTableEntry Function

File

gfxu_string_utils.h

C

```
GFX_Result GFXU_FontGetLookupTableEntry(uint8_t* table, uint32_t index, uint32_t max, uint32_t* offset,
uint32_t* width);
```

Description

internal use only

GFXU_GetCharAt Function

Gets a character of a string contained in the string table.

File

gfxu_string.h

C

```
LIB_EXPORT GFXU_CHAR GFXU_GetCharAt(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang, uint32_t idx);
```

Returns

GFXU_CHAR - the code point of the character

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up
uint32_t idx	the index of the characer

Function

GFXU_CHAR GFXU_GetCharAt(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang,
uint32_t idx)

GFXU_GetCharWidth Function

Gets the width of a character for a given font.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_GetCharWidth(GFXU_CHAR chr, GFXU_FontAsset* fnt);
```

Returns

uint32_t - the width of the character or zero if the font doesn't contain that character

Parameters

Parameters	Description
GFXU_CHAR chr	the code point of the character
GFXU_FontAsset* fnt	the font to reference

Function

uint32_t GFXU_GetCharWidth(GFXU_CHAR chr, GFXU_FontAsset* fnt)

GFXU_GetStringHeight Function

Gets the height of a string contained in the string table.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_GetStringHeight(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang);
```

Returns

uint32_t - the height of the string

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up

Function

uint32_t GFXU_GetStringHeight(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang)

GFXU_GetStringLength Function

Gets the length of a string contained in a string table.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_GetStringLength(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang);
```

Returns

uint32_t - the length of the string entry

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up

Function

uint32_t GFXU_GetStringLength(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang)

GFXU_GetStringRect Function

Gets the bounding rectangle for a string contained in the string table.

File

gfxu_string.h

C

```
LIB_EXPORT GFX_Result GFXU_GetStringRect(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang, GFX_Rect*
rect);
```

Returns

GFX_Result

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up
GFX_Rect* rect	the resultant rectangle of the string

Function

GFX_Result GFXU_GetStringRect(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang,
GFX_Rect* rect)

GFXU_GetStringSizeInBytes Function

Gets the size of a string contained in a string table, in bytes.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_GetStringSizeInBytes(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang);
```

Returns

uint32_t - the size of the string entry in bytes

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up

Function

uint32_t GFXU_GetStringSizeInBytes(GFXU_StringTableAsset* tbl,

uint32_t id,

uint32_t lang)

GFXU_PaletteGetColor Function

Gets a color from a palette asset given an index value.

File

gfxu_palette.h

C

```
GFX_Color GFXU_PaletteGetColor(GFXU_PaletteAsset* pal, uint32_t idx, GFXU_MemoryIntf* read_cb,
GFXU_ExternalAssetReader** reader);
```

Returns

GFX_Color - the color that was retrieved

Parameters

Parameters	Description
GFXU_PaletteAsset* pal	pointer to the palette to read
uint32_t idx	the index of the color to look up
GFXU_MemoryIntf* read_cb	a pointer to a memory interface to use for memory operations, not needed for internal assets
GFXU_ExternalAssetReader** reader	will return as a valid pointer if the palette asset is located in an external source. If this is the case then the caller is responsible for servicing the external asset reader state machine until completion. The caller is then responsible for freeing the reader's memory.

Function

GFX_Result GFXU_PaletteGetColor(void);

GFXU_StringFontIndexLookup Function

File

gfxu_string_utils.h

C

```
LIB_EXPORT GFXU_FontAsset* GFXU_StringFontIndexLookup(GFXU_StringTableAsset* table, uint32_t stringID,
uint32_t languageID);
```

Description

internal use only

GFXU_StringIndexLookup Function

File

gfxu_string_utils.h

C

```
uint16_t GFXU_StringIndexLookup(GFXU_StringTableAsset* table, uint32_t stringID, uint32_t languageID);
```

Description

internal use only

GFXU_StringLookup Function

File

gfxu_string_utils.h

C

```
GFX_Result GFXU_StringLookup(GFXU_StringTableAsset* table, uint32_t stringIndex, uint8_t** stringAddress,
uint32_t* stringSize);
```

Description

internal use only

GFXU_DecodeAndDrawString Function

File

gfxu_string_utils.h

C

```
GFX_Result GFXU_DecodeAndDrawString(uint8_t* string, uint32_t length, GFXU_StringEncodingMode mode,
GFXU_FontAsset* fnt, int32_t clipX, int32_t clipY, int32_t clipWidth, int32_t clipHeight, int32_t x,
int32_t y);
```

Description

internal use only

GFXU_DrawCharStringClipped Function

Draws a clipped string at the given coordinates. Strings are drawn from the top down.

File

gfxu_string.h

C

```
LIB_EXPORT GFX_Result GFXU_DrawCharStringClipped(GFXU_CHAR* str, GFXU_FontAsset* fnt, int32_t clipX,
int32_t clipY, int32_t clipWidth, int32_t clipHeight, int32_t x, int32_t y, GFXU_MemoryIntf*
memoryInterface, GFXU_ExternalAssetReader** reader);
```

Returns

GFX_Result

Parameters

Parameters	Description
GFXU_CHAR* str	the string buffer to draw
int32_t clipX	clipped x position
int32_t clipY	clipped y position
int32_t clipWidth	clipped rectangle width
int32_t clipHeight	clipped rectangle height
int32_t x	the x position to which to draw the string
int32_t y	the y position to which to draw the string
GFXU_MemoryIntf* memoryInterface	a pointer to a memory interface to use for memory operations, not needed for internal assets
GFXU_ExternalAssetReader** reader	will return as a valid pointer if the image asset is located in an external source. If this is the case then the caller is responsible for servicing the external asset reader state machine until completion. The caller is then responsible for freeing the reader's memory.

Function

GFX_Result GFXU_DrawCharStringClipped(GFXU_CHAR* str,
GFXU_FontAsset* fnt
int32_t clipX,
int32_t clipY,
int32_t clipWidth,
int32_t clipHeight,
int32_t x,
int32_t y,
GFXU_MemoryIntf* memoryInterface,
GFXU_ExternalAssetReader** reader)

GFXU_DrawGlyph Function

File

gfxu_string_utils.h

C

```
int32_t GFXU_DrawGlyph(GFXU_FontAsset* fnt, uint32_t glyph, int32_t clipX, int32_t clipY, int32_t
clipWidth, int32_t clipHeight, int32_t x, int32_t y);
```

Description

internal use only

GFXU_DrawGlyphRow Function

File

gfxu_string_utils.h

C

```
void GFXU_DrawGlyphRow(GFXU_FontAssetBPP bpp, uint8_t* data, int32_t width, int32_t x, int32_t y, int32_t
clipXStart, int32_t clipXEnd);
```

Description

internal use only

GFXU_DrawStringClipped Function

Draws a clipped string at the given coordinates. Strings are drawn from the top down.

File

gfxu_string.h

C

```
LIB_EXPORT GFX_Result GFXU_DrawStringClipped(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang,
int32_t clipX, int32_t clipY, int32_t clipWidth, int32_t clipHeight, int32_t x, int32_t y, GFXU_MemoryIntf*
memoryInterface, GFXU_ExternalAssetReader** reader);
```

Returns

GFX_Result

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up
int32_t clipX	clipped x position
int32_t clipY	clipped y position

int32_t clipWidth	clipped rectangle width
int32_t clipHeight	clipped rectangle height
int32_t x	the x position to which to draw the string
int32_t y	the y position to which to draw the string
GFXU_MemoryIntf* memoryInterface	a pointer to a memory interface to use for memory operations, not needed for internal assets
GFXU_ExternalAssetReader** reader	will return as a valid pointer if the image asset is located in an external source. If this is the case then the caller is responsible for servicing the external asset reader state machine until completion. The caller is then responsible for freeing the reader's memory.

Function

GFX_Result GFXU_DrawStringClipped(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang,
int32_t clipX,
int32_t clipY,
int32_t clipWidth,
int32_t clipHeight,
int32_t x,
int32_t y,
GFXU_MemoryIntf* memoryInterface,
GFXU_ExternalAssetReader** reader)

GFXU_DrawUnknownGlyph Function

File

gfxu_string_utils.h

C

```
int32_t GFXU_DrawUnknownGlyph(int32_t x, int32_t y, int32_t height, int32_t clipX, int32_t clipY, int32_t clipWidth, int32_t clipHeight);
```

Description

internal use only

GFXU_GetGlyphRowDataSize Function

File

gfxu_string_utils.h

C

```
int32_t GFXU_GetGlyphRowDataSize(GFXU_FontAssetBPP bpp, int32_t width);
```

Description

internal use only

GFXU_PreprocessImage Function

Preprocesses an image to a specified memory address.

File

gfxu_image.h

C

```
LIB_EXPORT GFX_Result GFXU_PreprocessImage(GFXU_ImageAsset* img, uint32_t destAddress, GFX_ColorMode destMode, GFX_Bool padBuffer);
```

Returns

GFX_Result - the result of the operation

Description

This function preprocesses an image asset through the HAL pipeline and renders it to a given address, in a given color mode, and can pad the image buffer dimensions to be powers of 2 as required by some graphics accelerators.

This function is also useful for pre-staging images into run-time memory locations.

The caller is required to ensure that the destination address is capable of containing the result. The size can be calculated by using the method:

GFX_ColorInfo[destMode].size * img->width * img->height

This function only works with images that are located in a core accessible memory location like SRAM or DDR. If the image is located in an external source then GFXU_DrawImage should be called directly. The caller will then need to service the media streaing state machine. Once finished the image asset descriptor must be changed manually. This function can be used as a reference on how to accomplish this.

Parameters

Parameters	Description
GFXU_ImageAsset* img	pointer to the image asset to draw
uint32_t destAddress	the address to render the image to
GFX_ColorMode destMode	the desired output mode of the image
GFX_Bool padBuffer	indicates that the image buffer dimensions should be padded to equal powers of 2 (required by some GPUs)
GFXU_MemoryIntf* read_cb	a pointer to a memory interface to use for memory operations, not needed for internal assets
GFXU_ExternalAssetReader** reader	will return as a valid pointer if the image asset is located in an external source. If this is the case then the caller is responsible for servicing the external asset reader state machine until completion. The caller is then responsible for freeing the reader's memory.

Function

GFX_Result GFXU_PreprocessImage(GFXU_ImageAsset* img,
uint32_t destAddress,
GFX_ColorMode destMode,
GFX_Bool padBuffer);

GFXU_DecodeAndDrawSubString Function

File

gfxu_string_utils.h

C

```
GFX_Result GFXU_DecodeAndDrawSubString(uint8_t* string, uint32_t length, GFXU_StringEncodingMode mode,
GFXU_FontAsset* fnt, uint32_t start, uint32_t end, int32_t clipX, int32_t clipY, int32_t clipWidth, int32_t
clipHeight, int32_t x, int32_t y);
```

Description

internal use only

GFXU_DrawCharSubStringClipped Function

Draws a clipped string at the given coordinates. Strings are drawn from the top down.

File

gfxu_string.h

C

```
LIB_EXPORT GFX_Result GFXU_DrawCharSubStringClipped(GFXU_CHAR* str, GFXU_FontAsset* fnt, uint32_t start,
uint32_t end, int32_t clipX, int32_t clipY, int32_t clipWidth, int32_t clipHeight, int32_t x, int32_t y,
GFXU_MemoryIntf* memoryInterface, GFXU_ExternalAssetReader** reader);
```

Returns

GFX_Result

Parameters

Parameters	Description
GFXU_CHAR* str	the string buffer to draw

GFXU_FontAsset* fnt	font asset to use
uint32_t start	start offset of substring
uint32_t end	end offset of substring
int32_t clipX	clipped x position
int32_t clipY	clipped y position
int32_t clipWidth	clipped rectangle width
int32_t clipHeight	clipped rectangle height
int32_t x	the x position to which to draw the string
int32_t y	the y position to which to draw the string
GFXU_MemoryIntf* memoryInterface	a pointer to a memory interface to use for memory operations, not needed for internal assets
GFXU_ExternalAssetReader** reader	will return as a valid pointer if the image asset is located in an external source. If this is the case then the caller is responsible for servicing the external asset reader state machine until completion. The caller is then responsible for freeing the reader's memory.

Function

GFX_Result GFXU_DrawCharSubStringClipped(GFXU_CHAR* str,
GFXU_FontAsset* fnt
uint32_t start,
uint32_t end,
int32_t clipX,
int32_t clipY,
int32_t clipWidth,
int32_t clipHeight,
int32_t x,
int32_t y,
GFXU_MemoryIntf* memoryInterface,
GFXU_ExternalAssetReader** reader)

GFXU_DrawSubStringClipped Function

Draws a sub-string from a string asset in a clipped rectangle at the given coordinates. Strings are drawn from the top down.

File

gfxu_string.h

C

```
LIB_EXPORT GFX_Result GFXU_DrawSubStringClipped(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang,
uint32_t start, uint32_t end, int32_t clipX, int32_t clipY, int32_t clipWidth, int32_t clipHeight, int32_t
x, int32_t y, GFXU_MemoryIntf* memoryInterface, GFXU_ExternalAssetReader** reader);
```

Returns

GFX_Result

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up
uint32_t start	offset of first character of substring
uint32_t end	offset of last character of substring
int32_t clipX	clipped x position
int32_t clipY	clipped y position
int32_t clipWidth	clipped rectangle width
int32_t clipHeight	clipped rectangle height
int32_t x	the x position to which to draw the string
int32_t y	the y position to which to draw the string
GFXU_MemoryIntf* memoryInterface	a pointer to a memory interface to use for memory operations, not needed for internal assets

GFXU_ExternalAssetReader** reader	will return as a valid pointer if the image asset is located in an external source. If this is the case then the caller is responsible for servicing the external asset reader state machine until completion. The caller is then responsible for freeing the reader's memory.

Function

GFX_Result GFXU_DrawSubStringClipped(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang,
uint32_t start,
uint32_t end,
int32_t clipX,
int32_t clipY,
int32_t clipWidth,
int32_t clipHeight,
int32_t x,
int32_t y,
GFXU_MemoryIntf* memoryInterface,
GFXU_ExternalAssetReader** reader)

GFXU_GetCharStringLineRect Function

Gets the bounding rectangle for a line in a character string.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_GetCharStringLineRect(GFXU_CHAR* str, GFXU_FontAsset* font, uint32_t offset,
GFX_Rect* rect);
```

Returns

The offset of end of line (including line feed or end of string)

Parameters

Parameters	Description
GFXU_CHAR* str	the string buffer, terimated with a zero value
GFXU_FontAsset* fnt	the font asset to reference
uint32_t offset	the start offset of the first character in the line
uint32_t length	the number of characters to include

Function

uint32_t GFXU_GetCharStringLineRect(GFXU_CHAR* str,
GFXU_FontAsset* font,
uint32_t offset,
GFX_Rect* rect)

GFXU_GetStringLineRect Function

Gets the bounding rectangle for a line in a string asset.

File

gfxu_string.h

C

```
LIB_EXPORT uint32_t GFXU_GetStringLineRect(GFXU_StringTableAsset* tbl, uint32_t id, uint32_t lang, uint32_t
offset, GFX_Rect* rect);
```

Returns

The offset of end of line (including line feed or end of string)

Parameters

Parameters	Description
GFXU_StringTableAsset* tbl	the string table to reference
uint32_t id	the id of the string to look up
uint32_t lang	the language entry to look up
uint32_t offset	the start offset of the first character in the line
GFX_Rect* rect	the resultant rectangle of the string

Function

uint32_t GFXU_GetStringLineRect(GFXU_StringTableAsset* tbl,
uint32_t id,
uint32_t lang,
uint32_t offset,
GFX_Rect* rect)

b) Data Types and Constants

GFXU_FontAsset_t Structure

Describes a font asset. A font asset is a series of raster images that represet linguistic characters. These characters are referenced by an index called a 'code point'. This code point is 1-4 bytes in length. Code points may be encoded to save space. Fonts also contain kerning data that describes character positioning data.

header - standard asset header height - font height in pixels ascent - font ascent in pixels descent - font descent in pixels baseline - font baseline in pixels bpp - font pixel size, either 1 or 8. 8 is for anti-aliased font data indexTable - pointer to the corresponding glyph index table. this table is used to reference code points to glyph data.

File

gfxu_font.h

C

```
struct GFXU_FontAsset_t {
  GFXU_AssetHeader header;
  uint32_t height;
  uint32_t ascent;
  uint32_t descent;
  uint32_t baseline;
  GFXU_FontAssetBPP bpp;
  GFXU_FontGlyphIndexTable* indexTable;
};
```

Description

Structure: GFXU_FontAsset_t

GFXU_FontAssetBPP Enumeration

Indicates the bits per pixel mode of a font

File

gfxu_font.h

C

```
enum GFXU_FontAssetBPP {
  GFXU_FONT_BPP_1,
  GFXU_FONT_BPP_8
};
```

Members

Members	Description
GFXU_FONT_BPP_1	standard
GFXU_FONT_BPP_8	antialiased

Description

Enumeration: GFXU_FontAssetBPP

GFXU_AssetHeader Structure

Defines a common header for all assets supported by the generic decoder interface.

File

gfxu_global.h

C

```
typedef struct GFXU_AssetHeader_t {
  uint32_t type;
  uint32_t dataLocation;
  void* dataAddress;
  uint32_t dataSize;
} GFXU_AssetHeader;
```

Description

Structure: GFXU_AssetHeader_t

type - GFXU_AssetType - indicates the type of the asset dataLocation - indicates the location of the asset data. 0 is always internal flash. any other number must be understood by the application dataAddress - the address at which the data resides. may be a local pointer or a location in some external storage location not in the local memory map. dataSize - the size of the asset data in bytes

GFXU_AssetType Enumeration

Enumerates known asset types.

File

gfxu_global.h

C

```
typedef enum GFXU_AssetType_t {
  GFXU_ASSET_TYPE_IMAGE = 0,
  GFXU_ASSET_TYPE_PALETTE,
  GFXU_ASSET_TYPE_FONT,
  GFXU_ASSET_TYPE_BINARY,
  GFXU_ASSET_TYPE_STRINGTABLE
} GFXU_AssetType;
```

Description

enum: GFXU_AssetType_t

GFXU_BinaryAsset Structure

A binary asset type. Generic data that can be of any type

File

gfxu_binary.h

C

```
typedef struct GFXU_BinaryAsset_t {
  GFXU_AssetHeader header;
} GFXU_BinaryAsset;
```

Members

Members	Description
GFXU_AssetHeader header;	generic asset header

Description

Structure: GFXU_BinaryAsset_t

GFXU_CHAR Type

File

gfxu_string.h

C

```
typedef uint32_t GFXU_CHAR;
```

Description

strings are defined as having 32bit characters due to the need to support international code points and unicode strings encoded using these types will not be compatible with standard library string functions like strlen or strcat

GFXU_ExternalAssetReader Structure

Defines the base description of an external asset reader. Specific decoder implementations will build on this foundation for each decoder type.

File

gfxu_global.h

C

```
typedef struct GFXU_ExternalAssetReader_t {
  GFXU_ExternalAssetReaderStatus status;
  uint32_t state;
  int32_t result;
  GFXU_MemoryIntf* memIntf;
  GFXU_ExternalAssetReaderRun_FnPtr run;
  void* userData;
} GFXU_ExternalAssetReader;
```

Description

Structure: GFXU_MemoryIntf_t

status - the overall status of the decoder state machine state - mostly for decoder internal use result - can be used for an overall result of the state of an operation memIntf - the memory interface the decoder is using for memory operations run - the run pointer that must be called periodically to allow the state machine to process to completion.

GFXU_ExternalAssetReaderRun_FnPtr Type

This function pointer represents a function that maintains the state of an external reader state machine.

The argument is the state machine to process.

File

gfxu_global.h

C

```
typedef GFX_Result (* GFXU_ExternalAssetReaderRun_FnPtr)(GFXU_ExternalAssetReader*);
```

Description

typedef: GFXU_ExternalAssetReaderRun_FnPtr

GFXU_ExternalAssetReaderStatus Enumeration

Enumerates external reader state machine states.

Invalid - state machine hasn't been initialized Read - state machine is ready to begin processing but hasn't been run yet Waiting - state machine is waiting for a memory operation to complete Drawing - state machine is waiting for a drawing operation to complete Finished - state machine has finished drawing the entire asset Aborted - state machine encountered an error and has aborted

File

gfxu_global.h

C

```
typedef enum GFXU_ExternalAssetReaderStatus_t {
  GFXU_READER_STATUS_INVALID = 0,
```

```
  GFXU_READER_STATUS_READY,
  GFXU_READER_STATUS_WAITING,
  GFXU_READER_STATUS_DRAWING,
  GFXU_READER_STATUS_FINISHED,
  GFXU_READER_STATUS_ABORTED
} GFXU_ExternalAssetReaderStatus;
```

Description

enum: GFXU_ExternalAssetReaderStatus_t

GFXU_FontAsset Type

Describes a font asset. A font asset is a series of raster images that represet linguistic characters. These characters are referenced by an index called a 'code point'. This code point is 1-4 bytes in length. Code points may be encoded to save space. Fonts also contain kerning data that describes character positioning data.

header - standard asset header height - font height in pixels ascent - font ascent in pixels descent - font descent in pixels baseline - font baseline in pixels bpp - font pixel size, either 1 or 8. 8 is for anti-aliased font data indexTable - pointer to the corresponding glyph index table. this table is used to reference code points to glyph data.

File

gfxu_string.h

C

```
typedef struct GFXU_FontAsset_t GFXU_FontAsset;
```

Description

Structure: GFXU_FontAsset_t

GFXU_FontGlyphIndexTable Structure

Describes a font glyph index table. Essentially a series of glyph look up tables where each non-consecutive range of glyphs occupies one range entry

count - number of ranges in the index table ranges - the glyph range array

File

gfxu_font.h

C

```
typedef struct GFXU_FontGlyphIndexTable_t {
  uint32_t count;
  GFXU_FontGlyphRange ranges[];
} GFXU_FontGlyphIndexTable;
```

Description

Structure: GFXU_FontGlyphIndexTable_t

GFXU_FontGlyphRange Structure

Describes a range of glyphs for a font. All IDs are in raw code points and are not encoded in any way

glyphCount - number of glyphs in the range startID - the starting glyph id endID - the ending glyph id lookupTable - the corresponding look up table to find the glyph raster data

File

gfxu_font.h

C

```
typedef struct GFXU_FontGlyphRange_t {
  uint32_t glyphCount;
  uint32_t startID;
  uint32_t endID;
  uint8_t* lookupTable;
} GFXU_FontGlyphRange;
```

Description

Structure: GFXU_FontGlyphRange_t

GFXU_ImageAsset Structure

Describes an image asset.

header - standard asset header format - the format of the image. this directly affects which decoder is invoked when rendering the image width - the width of the image in pixels height - the height of the image in pixels colorMode - the color mode of the image compType - the compression mode of the image useMask - indicates of the mask field is used mask - may contain a masking color for the image. blit operations may reference this value and reject image pixels that match this value palette - will contain a valid pointer to a palette asset if thie image is an index map instead of a color image

File

gfxu_image.h

C

```
typedef struct GFXU_ImageAsset_t {
  GFXU_AssetHeader header;
  GFXU_ImageFormat format;
  uint32_t width;
  uint32_t height;
  uint32_t bufferWidth;
  uint32_t bufferHeight;
  GFX_ColorMode colorMode;
  GFXU_ImageCompressionType compType;
  GFXU_ImageFlags flags;
  GFX_Color mask;
  GFXU_PaletteAsset* palette;
} GFXU_ImageAsset;
```

Description

Structure: GFXU_ImageAsset_t

GFXU_ImageCompressionType Enumeration

Indicates the image compression type, only applies to RAW types

File

gfxu_image.h

C

```
typedef enum GFXU_ImageCompressionType_t {
  GFXU_IMAGE_COMPRESSION_NONE = 0,
  GFXU_IMAGE_COMPRESSION_RLE
} GFXU_ImageCompressionType;
```

Description

Enumeration: GFXU_ImageCompressionType_t

GFXU_ImageFormat Enumeration

Indicates the image encoding format

File

gfxu_image.h

C

```
typedef enum GFXU_ImageFormat_t {
  GFXU_IMAGE_FORMAT_RAW = 0,
  GFXU_IMAGE_FORMAT_JPEG,
  GFXU_IMAGE_FORMAT_PNG
} GFXU_ImageFormat;
```

Description

Enumeration: GFXU_ImageFormat_t

GFXU_MemoryIntf Structure

Defines a memory interface for all memory operations. Essentially wraps a GFX_MemoryIntf with the notable addition If a GFXU_MemoryReadRequest_FnPtr.

The 'read' function pointer will be invoked when a decoder attempts to access an asset that has a location that is greater than zero. The application must then look at the asset's location id and determine which peripheral to communicate with.

File

gfxu_global.h

C

```
typedef struct GFXU_MemoryIntf_t {
  GFX_MemoryIntf heap;
  GFXU_MediaOpenRequest_FnPtr open;
  GFXU_MediaReadRequest_FnPtr read;
  GFXU_MediaCloseRequest_FnPtr close;
} GFXU_MemoryIntf;
```

Description

Structure: GFXU_MemoryIntf_t

heap - function pointer for memory operations read - function pointer to use for memory read requests

GFXU_PaletteAsset Structure

Describes a palette asset. A palette is a lookup table for unique colors. Given in an index, a color can be retrieved.

header - standard asset header colorCount - the number of colors contained in the palette colorMode - the color mode of the image

File

gfxu_palette.h

C

```
typedef struct GFXU_PaletteAsset_t {
  GFXU_AssetHeader header;
  uint32_t colorCount;
  GFX_ColorMode colorMode;
} GFXU_PaletteAsset;
```

Description

Structure: GFXU_PaletteAsset_t

GFXU_StringEncodingMode Enumeration

Indicates the string encoding mode type. Any characters above 255 must use UTF8 or UTF16

File

gfxu_string.h

C

```
typedef enum GFXU_StringEncodingMode_t {
  GFXU_STRING_ENCODING_ASCII,
  GFXU_STRING_ENCODING_UTF8,
  GFXU_STRING_ENCODING_UTF16
} GFXU_StringEncodingMode;
```

Description

Enumeration: GFXU_StringEncodingMode_t

GFXU_ASSET_LOCATION_INTERNAL Macro

File

gfxu_global.h

C

```
#define GFXU_ASSET_LOCATION_INTERNAL 0
```

Description

This is macro GFXU_ASSET_LOCATION_INTERNAL.

GFXU_STRING_ARRAY_SIZE Macro

File

gfxu_string.h

C

```
#define GFXU_STRING_ARRAY_SIZE 4
```

Description

defines meta data sizes for the string table, don't change!

GFXU_STRING_ENTRY_SIZE Macro

File

gfxu_string.h

C

```
#define GFXU_STRING_ENTRY_SIZE 2
```

Description

This is macro GFXU_STRING_ENTRY_SIZE.

GFXU_STRING_MAX_CHAR_WIDTH Macro

File

gfxu_string.h

C

```
#define GFXU_STRING_MAX_CHAR_WIDTH 6
```

Description

This is macro GFXU_STRING_MAX_CHAR_WIDTH.

GFXU_MediaCloseRequest_FnPtr Type

A callback that indicates that a media decoder is finished with a given media location and that the application can close if it.

The argument is the asset that was being read.

File

gfxu_global.h

C

```
typedef void (* GFXU_MediaCloseRequest_FnPtr)(GFXU_AssetHeader* ast);
```

Description

typedef: GFXU_MediaCloseRequest_FnPtr

GFXU_MediaOpenRequest_FnPtr Type

A callback that indicates that a media decoder wishes to read from an external media source and that the application should prepare that source.

The argument is the asset that needs to be read.

If the result is false then the decoder will abort.

File

gfxu_global.h

C

```
typedef GFX_Result (* GFXU_MediaOpenRequest_FnPtr)(GFXU_AssetHeader* ast);
```

Description

typedef: GFXU_MediaOpenRequest_FnPtr

GFXU_MediaReadRequest_FnPtr Type

File

gfxu_global.h

C

```
typedef GFX_Result (* GFXU_MediaReadRequest_FnPtr)(GFXU_ExternalAssetReader* reader, GFXU_AssetHeader*
asset, void*, uint32_t, uint8_t*, GFXU_MediaReadRequestCallback_FnPtr);
```

Description

callback

GFXU_MediaReadRequestCallback_FnPtr Type

A callback that signifies that a media read request has been fulfilled. Often signals a state machine to continue processing a decode operation. The argument is the reader that requested the memory.

File

gfxu_global.h

C

```
typedef void (* GFXU_MediaReadRequestCallback_FnPtr)(GFXU_ExternalAssetReader*);
```

Description

typedef: GFXU_MediaReadRequestCallback_FnPtr

gfxu_string.h

Defines string table struct, string / character functions

Enumerations

	Name	Description
	GFXU_StringEncodingMode_t	Indicates the string encoding mode type. Any characters above 255 must use UTF8 or UTF16
	GFXU_StringEncodingMode	Indicates the string encoding mode type. Any characters above 255 must use UTF8 or UTF16

Functions

	Name	Description
	GFXU_CalculateCharStringWidth	Gets the width of a string buffer in pixels.
	GFXU_CalculatePartialCharStringWidth	Gets the width of a partial string buffer in pixels.
	GFXU_CalculatePartialStringWidth	Gets the partial width, starting from the left, of a string contained in the string table.
	GFXU_CalculateStringWidth	Gets the width of a string contained in the string table.
	GFXU_CompareString	Compares a string table entry and a GFXU_CHAR type string.
	GFXU_DrawCharString	Draws a clipped string at the given coordinates. Strings are drawn from the top down.
	GFXU_DrawCharStringClipped	Draws a clipped string at the given coordinates. Strings are drawn from the top down.
	GFXU_DrawCharSubStringClipped	Draws a clipped string at the given coordinates. Strings are drawn from the top down.
	GFXU_DrawString	Draws a string at the given coordinates. Strings are drawn from the top down.
	GFXU_DrawStringClipped	Draws a clipped string at the given coordinates. Strings are drawn from the top down.
	GFXU_DrawSubStringClipped	Draws a sub-string from a string asset in a clipped rectangle at the given coordinates. Strings are drawn from the top down.

	GFXU_ExtractString	Extracts a string from the string table into a local character buffer. The local buffer must have already been allocated. Will attempt to write 'size - 1' number of characters into the buffer with the last being a zero terminator.
	GFXU_GetCharAt	Gets a character of a string contained in the string table.
	GFXU_GetCharStringLineRect	Gets the bounding rectangle for a line in a character string.
	GFXU_GetCharWidth	Gets the width of a character for a given font.
	GFXU_GetStringHeight	Gets the height of a string contained in the string table.
	GFXU_GetStringLength	Gets the length of a string contained in a string table.
	GFXU_GetStringLineRect	Gets the bounding rectangle for a line in a string asset.
	GFXU_GetStringRect	Gets the bounding rectangle for a string contained in the string table.
	GFXU_GetStringSizeInBytes	Gets the size of a string contained in a string table, in bytes.

Macros

	Name	Description
	GFXU_STRING_ARRAY_SIZE	defines meta data sizes for the string table, don't change!
	GFXU_STRING_ENTRY_SIZE	This is macro GFXU_STRING_ENTRY_SIZE.
	GFXU_STRING_MAX_CHAR_WIDTH	This is macro GFXU_STRING_MAX_CHAR_WIDTH.

Structures

	Name	Description
	GFXU_StringTableAsset_t	Describes a string table asset. There is typically only ever one of these defined at any one time. header - standard asset header languageCount - the number of languages in the string table stringCount - the number of strings in the string table stringIndexTable - the pointer to the string index table. the string index table is a table that contains all of the unique strings defined in the string table. fontTable - the font table contains an array of pointers to all defined font assets that the string table references fontIndexTable - the font index table is a table... more

SEGGER emWin Graphics Library

This topic is a reference for the third-party SEGGER Microcontroller GmbH & Co. KG emWin software graphics library.

Description

In addition to the standard Graphics Library, the MPLAB Harmony Integrated Software Framework also offers a third-party graphics library, emWin, from SEGGER Microcontroller GmbH & Co. KG. emWin is a software graphics library that provides an efficient, processor and LCD controller-independent Graphical User Interface (GUI) for applications that operate with a graphical LCD. This library package, which includes the binary library, headers, and utility tools, is free to use as part of development using 32-bit and 16-bit products from Microchip.

The choice of using the standard MPLAB Harmony Graphics Library and/or the SEGGER emWin Graphics Library can be made during application development through the use of the MPLAB Harmony Configurator (MHC) in MPLAB Harmony.

For details about using the emWin graphics library, refer to SEGGER emWin Graphics Library.

A detailed description of the architecture and capabilities of the SEGGER emWin Graphics Library is available on the official SEGGER website at: https://www.segger.com/emwin.html https://www.segger.com/emwin.html
